Each predefined status field sets a value for <code>IsClosed</code>. To obtain picklist values, query <code>TaskStatus</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| Subject | <p><b>Type</b><br/>combobox</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>Contains the subject of the task or event.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| WhatId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The <code>WhatId</code> represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. <code>WhatIds</code> are polymorphic. Polymorphic means a <code>WhatId</code> is equivalent to the ID of a related object. The label is <code>Related To ID</code>.</p>                                                                                                                                                                                                                                                                                  |
| WhoId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The <code>WhoId</code> represents a human such as a lead or a contact. <code>WhoId</code>s are polymorphic. Polymorphic means a <code>WhoId</code> is equivalent to a contact's ID or a lead's ID. The label is <code>Name ID</code>.<br/><br/>If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the <code>WhoId</code> field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is <code>Name ID</code>.</p> |

## Usage

### Query activities that are related to an object

1. Optionally, issue a describe call against the object whose activities you want to query, to get a suggestion of the correct SOQL query to use.

2. Issue a SOQL relationship query with a main clause that references the object and an inner clause that references the activity history. For example:

```
SELECT
  (SELECT ActivityDate, Description
   FROM OpenActivities)
FROM Account
WHERE Name Like 'XYZ%'
```

The user interface enforces sharing rules, filtering out related-list items that a user doesn't have permission to see.

The following constraints on users who don't have the "View All Data" permission help prevent performance issues.

- In the main clause of the relationship query, you can reference only one record. For example, you can't filter on all records where the account name starts with "A." Instead, you must reference a single account record.

```
SELECT
  (SELECT ActivityDate, Description
   FROM OpenActivities
   ORDER BY ActivityDate ASC NULLS LAST, LastModifiedDate DESC
   LIMIT 500)
FROM Account
WHERE Name = 'Acme'
LIMIT 1
```

- In the inner clause of the query, you can't use `WHERE`.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
- In the inner clause of the query, you must sort on `ActivityDate` in ascending order and `LastModifiedDate` in descending order. You can optionally display nulls last. For example: `ORDER BY ActivityDate ASC NULLS LAST, LastModifiedDate DESC`.

## OperatingHours

Represents the hours in which a service territory, service resource, or account is available for field service work. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSOObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name         | Details                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description        | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Create, Nillable, Update</p> <p><b>Description</b><br/>The description of the operating hours. Add any details that aren't included in the name.</p>                                     |
| LastReferencedDate | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>The date when the operating hours record was last modified. Its label in the user interface is <code>Last Modified Date</code>.</p> |
| LastViewedDate     | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>The date when the operating hours record was last viewed.</p>                                                                       |
| Name               | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The name of the operating hours. For example, <i>Summer Hours, Winter Hours, or Peak Season Hours</i>.</p>               |

## Usage

By default, only System Administrators can view, create, and assign operating hours.

Service territory members—which are service resources who can work in the territory—automatically use their service territory’s operating hours. If a resource needs different operating hours than their territory, create separate operating hours for them from the Operating Hours tab. Then, select the desired hours in the `Operating Hours` lookup field on the service territory member detail page.

To view a service resource’s operating hours for a particular territory, navigate to their Service Territories related list and click the Member Number for the territory. This takes you to the service territory member detail page, which lists the member’s operating hours and dates during which they belong to the territory.

## OperatingHoursFeed

Represents a single feed item on an operating hours record detail page. This object is available in API version 38.0 and later.

An operating hours feed shows changes to tracked fields on an operating hours record. It also shows posts and comments about the record. It’s a useful way to stay up to date with changes made to operating hours in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:

- “Modify All Data”
- “Modify All” on the Operating Hours object
- “Moderate Chatter”

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                  |

## OperatingHoursHistory

Represents the history of changes made to tracked fields on an operating hours record. This object is available in API version 38.0 and later.

### Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Special Access Rules

Field Service Lightning must be enabled in your organization, and field tracking for operating hours fields must be configured.

## Fields

| Field Name | Details                                                                                                                                                                                              |

| <code>HasOpportunityLineItem</code> | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Read-only field that indicates whether the opportunity has associated line items. A value of <code>true</code> means that Opportunity line items have been created for the opportunity. An opportunity can have opportunity line items only if the opportunity has a price book. The opportunity line items must correspond to PricebookEntry objects that are listed in the opportunity Pricebook2. However, you can insert opportunity line items on an opportunity that does not have an associated Pricebook2. For the first opportunity line item that you insert on an opportunity without a Pricebook2, the API automatically sets the <code>Pricebook2Id</code> field, if the opportunity line item corresponds to a PricebookEntry in an active Pricebook2 that has a <code>CurrencyIsoCode</code> field that matches the <code>CurrencyIsoCode</code> field of the opportunity. If the Pricebook2 is not active or the <code>CurrencyIsoCode</code> fields do not match, then the API returns an error. You can't update the <code>Pricebook2Id</code> or <code>PricebookId</code> fields if opportunity line items exist on the Opportunity. You must delete the line items before attempting to update the <code>PricebookId</code> field.</p> |

Limit: 255 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OwnerId      | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>ID of the User who has been assigned to work this opportunity.<br/><br/>If you update this field, the previous owner's access becomes Read Only or the access specified in your organization-wide default for opportunities, whichever is greater.<br/><br/>If you have set up opportunity teams in your organization, updating this field has different consequences depending on your version of the API:</p> <ul style="list-style-type: none"> <li>• For API version 12.0 and later, sharing records are kept, as they are for all objects.</li> <li>• For API version before 12.0, sharing records are deleted.</li> <li>• For API version 16.0 and later, users must have the “Transfer Record” permission in order to update (transfer) account ownership using this field.</li> </ul> |
| Pricebook2Id | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>ID of a related Pricebook2 object. The <code>Pricebook2Id</code> field indicates which Pricebook2 applies to this opportunity. The <code>Pricebook2Id</code> field is defined only for those organizations that have products enabled as a feature. You can specify values for only one field (<code>Pricebook2Id</code> or <code>PricebookId</code>)—not both fields. For this reason, both fields are declared nillable.</p>                                                                                                                                                                                                                                                                                                                                                      |
| PricebookId  | <p><b>Type</b><br/>reference</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Field         | Field Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Nillable, Update</p> <p><b>Description</b><br/>Unavailable as of version 3.0. As of version 8.0, the Pricebook object is no longer available. Use the <code>Pricebook2Id</code> field instead, specifying the ID of the Pricebook2 record.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Probability   | <p><b>Type</b><br/>percent</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>Percentage of estimated confidence in closing the opportunity. It is implied, but not directly controlled, by the <code>StageName</code> field. You can override this field to a different value than what is implied by the <code>StageName</code>.</p> <p> <b>Note:</b> If you're changing the <code>Probability</code> field through the API using a partner WSDL call, or an Apex <code>before</code> trigger, and the value may have several decimal places, we recommend rounding the value to a whole number. For example, the following Apex in a <code>before</code> trigger uses the <code>round</code> method to change the field value: <code>o.probability = o.probability.round();</code></p> |
| RecordTypeId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Update</p> <p><b>Description</b><br/>ID of the record type assigned to this object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| StageName     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Required. Current stage of this record. The <code>StageName</code> field controls several other fields on an opportunity. Each of the fields can be directly set or implied by changing the <code>StageName</code> field. In addition, the <code>StageName</code> field is a picklist, so it has additional members in the returned <code>describeSObjectResult</code> to indicate how it affects the other fields. To obtain the stage name values in the picklist, query the <code>OpportunityStage</code> object. If the <code>StageName</code> is updated, then the <code>ForecastCategoryName</code>, <code>IsClosed</code>, <code>IsWon</code>, and <code>Probability</code> are automatically updated based on the stage-category mapping.</p>                                                               |

| Type                     | <b>Type</b><br>picklist<br><br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><br><b>Description</b><br>Type of opportunity. For example, Existing Business or New Business. Label is <b>Opportunity Type</b> .                                                                                         |

**Note:** If you are importing Opportunity data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

## Usage

Use the Opportunity object to manage information about a sale or pending deal. You can also sync this object with a child Quote. To update an Opportunity, your client application needs “Edit” permission on opportunities. You can create, update, delete, and query Attachment records associated with an opportunity via the API. To split credit for an opportunity among multiple opportunity team members, use the OpportunitySplit object.

Client applications can also create or update opportunity objects by converting a Lead with `convertLead()`.

 **Note:** On opportunities and opportunity products, the workflow rules, validation rules, and Apex triggers fire when an update to a child opportunity product or schedule causes an update to the parent record. This means your custom application logic is enforced when there are updates to the parent record, ensuring higher data quality and compliance with your organization's business policies.

## Sample Code—Java

This code starts the sync between an object and a child quote.

```
public void startQuoteSync() {
    Opportunity opp = new Opportunity();
    opp.setId(new ID("006D000000CpOSy"));
    opp.setSyncedQuoteId(new ID("0Q0D000000002Oz"));
    // Invoke the update call and save the results
    try {
        SaveResult[] saveResults = binding.update(new SObject[] {opp});
        // check results and do more processing after the update call ...
    }
    catch (Exception ex) {
        System.out.println("An unexpected error has occurred." + ex.getMessage());
        return;
    }
}
```

This code stops the sync between an object and a child quote.

```
public void stopQuoteSync() {
    Opportunity opp = new Opportunity();
    opp.setId(new ID("006D000000CpOSy"));
    opp.setFieldsToNull(new String[] { "SyncedQuoteId" } );
    // Invoke the update call and save the results
    try {
        SaveResult[] saveResults = binding.update(new SObject[] {opp});
        // check results and do more processing after the update call ...
    }
    catch (Exception ex) {
        System.out.println("An unexpected error has occurred." + ex.getMessage());
        return;
    }
}
```

# OpportunityCompetitor

---

Represents a competitor on an Opportunity.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field          | Details                                                                                                                                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Each Opportunity has only one primary contact. Label is <b>Primary</b>.</p> |
| OpportunityId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort,</p> <p><b>Description</b><br/>Required. ID of an associated Opportunity. This field is non-nullable, and it cannot be updated. You must provide a value for this field when creating new records. You can't change it after it has been created.</p>                    |
| Role          | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Nillable, Update</p> <p><b>Description</b><br/>Name of the role played by the associated Contact on the Opportunity, such as Business User or Decision Maker.</p>                                                                                                        |

## Usage

Records of this object type appear in the user interface on the Opportunity detail page. Like most other objects, records of this object type have their own unique ID that you use when updating or deleting records.

Although allowed, we do not recommend that you create multiple relationships between the same Opportunity and a Contact.

# OpportunityFeed

Represents a single feed item in the feed displayed on the detail page for an opportunity record. This object is available in API version 18.0 and later.

An opportunity feed shows recent changes to an opportunity record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to opportunities.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Opportunity object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Visibility

### Type

picklist

### Properties

Filter, Group, Nillable, Restricted picklist, Sort

### Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

**Visibility** can have the following values:

| Field | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage

Use this object to identify changes to any fields on an Opportunity. The OpportunityHistory object represents the history of a change to the `Amount`, `Probability`, `Stage`, or `Close Date` fields of an Opportunity.

This object respects field level security on the parent object.

SEE ALSO:

[Opportunity](#)

# OpportunityHistory

Represents the stage history of an Opportunity.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Usage

This object represents the history of a change to the `Amount`, `Probability`, `Stage`, or `Close Date` fields of an Opportunity. The `OpportunityFieldHistory` object represents the history of a change to any of the fields of an Opportunity. To obtain information about how a particular opportunity is progressing, query the `OpportunityHistory` records associated with a given Opportunity. Please note that if an opportunity's `Amount`, `Probability`, `Stage`, or `Close Date` fields have not changed, nothing will be returned in the `OpportunityHistory` objects. In this case, query the `OpportunityFieldHistory` records associated with a given Opportunity to get more information about changes to the opportunity.

This object is read-only. The system generates a new record whenever a user or client application changes the value of any of the above fields; the then-current values of all of these major fields are saved in the newly-generated object.

This object respects field-level security on the parent object.

 **Note:** The record is automatically deleted if its parent Opportunity is deleted.

SEE ALSO:  
[Opportunity](#)

# OpportunityLineItem

Represents an opportunity line item, which is a member of the list of Product2 products associated with an Opportunity.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

The user must have the “Edit” permissions on Opportunity records in order to create or update opportunity line items on an opportunity.

## Fields

| Field                | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ConnectionReceivedId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Nillable</p> <p><b>Description</b><br/>ID of the PartnerNetworkConnection that shared this record with your organization. This field is only available if you have enabled Salesforce to Salesforce.</p>                                                                                                                                                                                                                                                                               |
| ConnectionSentId     | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Nillable</p> <p><b>Description</b><br/>ID of the PartnerNetworkConnection that you shared this record with. This field is only available if you have enabled Salesforce to Salesforce. Beginning with API version 15.0, the <code>ConnectionSentId</code> field is no longer supported. The <code>ConnectionSentId</code> field is still visible, but the value is null. You can use the new <code>PartnerNetworkRecordConnection</code> object to forward records to connections.</p> |
| CurrencyIsoCode      | <p><b>Type</b><br/>picklist</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Field               | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| TotalPrice | <p><b>Type</b><br/>currency</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>This field is available only for backward compatibility. It represents the total price of the OpportunityLineItem.<br/><br/>If you do not specify <code>UnitPrice</code>, this field is required. If you specify <code>Discount</code> and <code>Quantity</code>, this field or <code>UnitPrice</code> is required. When updating these records, you can change either this value or the <code>UnitPrice</code>, but not both at the same time.<br/><br/>This field is nillable, but you can't set both <code>TotalPrice</code> and <code>UnitPrice</code> to null in the same update request. To insert the <code>TotalPrice</code> via the API (given only a unit price and the quantity), calculate this field as the unit price multiplied by the quantity. This field is read-only if the opportunity line item has a revenue schedule. If the opportunity line item does not have a schedule or only has quantity schedule, this field can be updated.</p> |
| UnitPrice  | <p><b>Type</b><br/>currency</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>The unit price for the opportunity line item. In the Salesforce user interface, this field's value is calculated by dividing the total price of the opportunity line item by the quantity listed for that line item. Label is <b>Sales Price</b>.<br/><br/>This field or <code>TotalPrice</code> is required. You can't specify both.<br/><br/>If you specify <code>Discount</code> and <code>Quantity</code>, this field or <code>TotalPrice</code> is required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage

An Opportunity can have associated OpportunityLineItem records only if the Opportunity has a Pricebook2. An OpportunityLineItem must correspond to a Product2 that is listed in the opportunity's Pricebook2. For information about inserting OpportunityLineItem for an opportunity that does not have an associated Pricebook2 or any existing line items, see [Effects on Opportunities](#).

This object is defined only for those organizations that have products enabled as a feature. If the organization does not have the products feature, this object does not appear in the `describeGlobal()` call, and you can't use `describeObjects()` or query the OpportunityLineItem object.

For a visual diagram of the relationships between OpportunityLineItem and other objects, see [Product and Schedule Objects](#).

**Note:** If multicurrency option has been enabled, the `CurrencyIsoCode` field is present. It can't be modified, and is always set to the value of the `CurrencyIsoCode` of the parent Opportunity.

## Effects on Opportunities

Opportunities that have associated OpportunityLineItem records are affected in the following ways:

- Creating an OpportunityLineItem increments the Opportunity `Amount` value by the `TotalPrice` of the OpportunityLineItem. Additionally, inserting an OpportunityLineItem increments the `ExpectedRevenue` on the opportunity by the `TotalPrice` times the opportunity `Probability`.
- The Opportunity `Amount` becomes a read-only field when the opportunity has line items. The API ignores any attempt to update this field on an opportunity with line items. Update requests are not rejected, but the updated value is ignored.
- You can't update the `PricebookId` field or the `CurrencyIsoCode` field on the opportunity if line items exist. The API rejects any attempt to update these fields on an opportunity with line items.
- When you create or update an OpportunityLineItem, the API verifies that the line item corresponds to a PricebookEntry in the Pricebook2 that is associated with the opportunity. If the opportunity does not have an associated Pricebook2, the API automatically sets the pricebook on the opportunity if the line item corresponds to a PricebookEntry in an active Pricebook2, and if the PricebookEntry has a `CurrencyIsoCode` field that matches the `CurrencyIsoCode` field of the opportunity. If the Pricebook2 is not active or the `CurrencyIsoCode` fields do not match, an error is returned.
- The Opportunity `HasOpportunityLineItem` field is set to `true` when an OpportunityLineItem is inserted for that Opportunity.

[OpportunityLineItemSchedule](#)

## OpportunityLineItemSchedule

---

Represents information about the quantity, revenue distribution, and delivery dates for a particular OpportunityLineItem.

In API version 38.0 and later, when an OpportunityLineItem record is created for a product with a previously established schedule, an OpportunityLineItemSchedule record is also created.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

| Type         | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Restricted picklist<br><b>Description</b><br>The type of the schedule. Required when inserting an OpportunityLineItemSchedule. Valid values include <code>Quantity</code> , <code>Revenue</code> , or <code>Both</code> . |

## Allowed Type Field Values

The allowed `Type` values for an OpportunityLineItemSchedule depend on the product-level schedule preferences and whether the line item has any existing schedules. The following criteria must be met:

- The Product2 on which the OpportunityLineItem is based must have the appropriate `CanUseRevenueSchedule` or `CanUseQuantitySchedule` fields (or both) set to `true`.
- When you create a schedule for a line item that does not have any existing schedules, you can specify any valid value.
- If you create a schedule for a line item that already has existing schedules, the new schedule must be consistent with the existing schedules. The following matrix outlines the allowable values:

| Value of HasRevenueSchedule on line item | Value of HasQuantitySchedule on line item | Allowable Type Values   |
|------------------------------------------|-------------------------------------------|-------------------------|
| false                                    | false                                     | Revenue, Quantity, both |
| false                                    | true                                      | Quantity                |
| true                                     | false                                     | Revenue                 |

| Value of HasRevenueSchedule on line item | Value of HasQuantitySchedule on line item | Allowable Type Values |
|------------------------------------------|-------------------------------------------|-----------------------|
| true                                     | true                                      | both                  |

## Allowed Quantity and Revenue Field Values

The allowable `Quantity` and `Revenue` field values depend on the value of the `Type` field:

| Type Value | Allowable Quantity Value | Allowable Revenue Value |
|------------|--------------------------|-------------------------|
| Revenue    | Null                     | Non-null                |
| Quantity   | Non-null                 | Null                    |
| both       | Non-null                 | Non-null                |

The `Quantity` and `Revenue` fields have the following restrictions when this object is updated:

- For a schedule of `Type Quantity`, you can't update a null `Revenue` value to non-null. Likewise for a schedule of `Type Revenue`, you can't update a null `Quantity` value to non-null.
- You can't null out the `Quantity` field for a schedule of `Type Quantity`. Likewise you can't null out the `Revenue` field for a schedule of `Type Revenue`.
- You can't null out either the `Revenue` or `Quantity` fields for a schedule of type `Both`.

## Usage

`OpportunityLineItemSchedule` supports two types of schedules:

- `Quantity` schedules
- `Revenue` schedules

The user must have edit access rights on the `Opportunity` in order to create or update line item schedules on that opportunity.

## Products and Schedules Must Be Enabled

The `OpportunityLineItemSchedule` object is defined only for those organizations that have the products and schedules features enabled. If the organization does not have the products and schedules features, the `OpportunityLineItemSchedule` object is not returned in a describe, and you can't describe or query `OpportunityLineItemSchedule` records.

## Effects on Opportunities and Opportunity Line Items

`OpportunityLineItemSchedule` records affect opportunities and opportunity line items in the following ways:

- Inserting an `OpportunityLineItemSchedule` of `Type "Revenue"` or `"Quantity"` increments the `TotalPrice` field on the `OpportunityLineItem` by the `OpportunityLineItemSchedule Revenue` amount. Inserting an `OpportunityLineItemSchedule` of `Type Quantity` or `Both` increments the `Quantity` field on the `OpportunityLineItem` by the `OpportunityLineItemSchedule Quantity` amount.
- Creating an `OpportunityLineItemSchedule` record affects the original opportunity:

1. The Opportunity `Amount` is incremented the by OpportunityLineItemSchedule revenue amount
  2. The Opportunity `ExpectedRevenue` is incremented by the line item schedule amount multiplied by the Opportunity `Probability`
- Deleting an OpportunityLineItemSchedule has a similar effect on the related OpportunityLineItem and Opportunity. Deleting an OpportunityLineItemSchedule decrements the OpportunityLineItem `TotalPrice` by the deleted OpportunityLineItemSchedule `Quantity` or `Revenue` amount. The Opportunity `Amount` is also decremented by the OpportunityLineItemSchedule `Quantity` or `Revenue` amount, and the Opportunity `ExpectedRevenue` is reduced by OpportunityLineItemSchedule `Quantity` or `Revenue` amount multiplied by the Opportunity `Probability`.

## Deleting an Opportunity Line Item Schedule

Deleting the last remaining schedule will set the corresponding `HasQuantitySchedule` or `HasRevenueSchedule` flags (or both) to `false` on the parent line item.

## OpportunityOverride

---

Represents a forecast override of an Opportunity. This read-only object is specific to customizable forecasting. It has a parent-child relationship with LineItemOverride.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Requires the “View All Data” permission.

## Fields

| Field                        | Details                                                                                                                                                                                                        |

 **Important:** You can't use the `<apex:relatedList>` component to add related lists such as OpportunityForecast to Visualforce pages because the `RelationshipName` field of OpportunityOverride is not exposed in the API. Use the `<apex:detail>` component instead.

|                        | <p><b>Description</b></p> <p>A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DeveloperName          | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId                | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>The ID representing the source group. Opportunities owned by users in the source group trigger the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## OpportunityPartner

This read-only object represents a partner relationship between an Account and an Opportunity. This object is automatically created when a Partner object is created for a partner relationship between an account and an opportunity.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

## Creating an Account-Opportunity Partner Relationship

When you create a partner relationship between an account and an opportunity (when you create a Partner object and specify the `OpportunityId` field), the API automatically creates an OpportunityPartner with the corresponding values:

- The value of the Partner field `AccountToId` maps to the value of the OpportunityPartner field `AccountToId`.
- The values of the `OpportunityId`, `Role`, and `IsPrimary` fields in both objects are the same.
- If you set the `IsPrimary` value to 1 (`true`) upon insert of a new OpportunityPartner, any other existing primary partners for that opportunity will automatically have the `IsPrimary` value set to 0 (`false`).

This mapping allows the API to manage the objects and their relationship efficiently.

- [AccountPartner](#)

# OpportunityShare

Represents a sharing entry on an Opportunity.

## Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field                  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Usage

This object allows you to determine which users and groups can view or edit opportunities owned by other users.

If you attempt to create a record that matches an existing record, any modified fields are updated, the system returns the existing record.

If an opportunity is shared in multiple ways with a user, you don't always see multiple sharing records. If a user has access to an opportunity for one or more of the following `RowCause` values, the records in the `OpportunityShare` object are compressed into one record with the highest level of access.

- `Manual`

- Owner

[Object Basics](#)

# OpportunitySplit

OpportunitySplit credits one or more opportunity team members with a portion of the opportunity amount. This object is available in API version 16.0 and later for pilot customers, and version 28.0 and later for others.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

| SplitTypeId     | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Auto-generated, numeric ID for the split type defined by the OpportunitySplitType object. This field is available in API version 28 and later.<br/><br/>If this field is blank, the system automatically specifies the default split type for the opportunity amount, which is validated to 100%.</p> |

## Usage

Use the OpportunitySplit object to manage splits for an opportunity.

If you change the opportunity owner using the API, the old owner remains on the opportunity team with either Read-only access, or the level of access specified in your organization-wide defaults.

## OpportunitySplitType

OpportunitySplitType provides unique labels and behavior for each split type. This object is available in API version 28.0 and later. There are two default split types: revenue splits, which must total 100%, and overlay splits, which can total any percentage.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

## Fields

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Required. The unique name of the object in the API. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

Available in API version 30 and later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# OpportunityStage

---

Represents the stage of an Opportunity in the sales pipeline, such as New Lead, Negotiating, Pending, Closed, and so on.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                   |

| SortOrder | <p><b>Type</b></p> <p>int</p> <p><b>Properties</b></p> <p>Filter, Group, Nillable, Sort</p> <p><b>Description</b></p> <p>Number used to sort this value in the opportunity stage picklist. These numbers are not guaranteed to be sequential, as some previous opportunity stage values might have been deleted.</p> |

## Usage

This object represents a value in the opportunity stage picklist, which provides additional information about the stage of a Opportunity, such as its probability or forecast category. Query this object to retrieve the set of values in the opportunity stage picklist, and then use that information while processing Opportunity records to determine more information about a given opportunity. For example, the application could test whether a given opportunity is won or not based on its `StageName` value and the value of the `IsWon` property in the associated OpportunityStage object.

This object is read-only via the API.

SEE ALSO:

[Object Basics](#)

## OpportunityTag

Associates a word or short phrase with an Opportunity.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter<br><b>Description</b><br>Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.                                                  |
| TagDefinitionId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter<br><b>Description</b><br>ID of the parent TagDefinition object that owns the tag.                                                                                                                                                                                                                                                                    |
| Type            | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Restricted picklist<br><b>Description</b><br>Defines the visibility of a tag.<br>Valid values: <ul style="list-style-type: none"><li>• <b>Public</b>—The tag can be viewed and manipulated by all users in an organization.</li><li>• <b>Personal</b>—The tag can be viewed or manipulated only by a user with a matching OwnerId.</li></ul> |

## Usage

OpportunityTag stores the relationship between its parent TagDefinition and the Opportunity being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## OpportunityTeamMember

Represents a User on the opportunity team of an Opportunity.

See also UserTeamMember, which represents a User who is on the default opportunity team of another user.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field                  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Usage

If you create a record for this object and it matches an existing record, the system updates any modified fields and returns the existing record.

In the user interface, users can set up an opportunity team for the opportunities they own. The opportunity team includes other users that are working on the opportunity with them. This object is available only in organizations that have enabled team selling.

 **Note:** The behavior for changing ownership of opportunities is different using the user interface when the previous owner is on an opportunity team. For example, when you change the owner of an opportunity using the API, the previous owner's access becomes Read Only or the access specified in your organization-wide default for opportunities, whichever is greater. However, performing this same action in the user interface allows you to select the access level for the previous owner when the previous owner is on an opportunity team.

## Usage

The `Status` field specifies the current state of an order. Status strings represent its current state (*Draft* or *Activated*).

When a client application creates an order, the `Status Code` must be *Draft* and the `Status` must be any value that corresponds to a `Status Code` of *Draft*. The application can subsequently activate an order by updating it and setting the value in its `Status` field to an *Activated* state; however, the `Status` field is the only field you can update when activating the order.

After an order is activated, your client application can change the `Status` back to the *Draft* state—but only if the order doesn't have any child reduction order products. Your client application can delete orders when the `Status` is *Draft* but not when its `Status` is *Activated*.

Client applications can use the API to create, update, delete, and query any Attachment associated with an order.

# OrderFeed

---

Represents a single feed item in the feed displayed on an order.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b></p> <p>textarea</p> <p><b>Properties</b></p> <p>Nullable, Sort</p> <p><b>Description</b></p> <p>The content of the OrderFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |
| CommentCount | <p><b>Type</b></p> <p>int</p> <p><b>Properties</b></p> <p>Filter, Group, Sort</p> <p><b>Description</b></p> <p>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> |

| Field Name                      | Details                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code> , go through pagination until end of comments is returned.                                                                                                                                                                    |
| <code>ContentData</code>        | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>                                  |
| <code>ContentDescription</code> | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Create, Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>                                                                                                                                                      |

## Field Name

## Details

- **CreatedRecordEvent**—generated when a user creates a record from the publisher.
- **DashboardComponentAlert**—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- **DashboardComponentSnapshot**—created when a user posts a dashboard snapshot on a feed.
- **LinkPost**—a post with an attached URL.
- **PollPost**—a poll posted on a feed.
- **ProfileSkillPost**—generated when a skill is added to a user's Chatter profile.
- **QuestionPost**—generated when a user posts a question.
- **ReplyPost**—generated when Chatter Answers posts a reply.
- **RypplePost**—generated when a user creates a Thanks badge in Work.com.
- **TextPost**—a direct text entry on a feed.
- **TrackedChange**—a change or group of changes to a tracked field.
- **UserStatus**—automatically generated when a user adds a post. Deprecated.

The following values appear in the **Type** picklist for all feed objects but apply only to [CaseFeed](#):

- **AttachArticleEvent**—generated event when a user attaches an article to a case.
- **CallLogPost**—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- **CaseCommentPost**—generated event when a user adds a case comment for a case object.
- **ChangeStatusPost**—generated event when a user changes the status of a case.
- **ChatTranscriptPost**—generated event when Live Agent transcript is saved to a case.
- **EmailMessageEvent**—generated event when an email related to a case object is sent or received.
- **FacebookPost**—generated when a Facebook post is created from a case. Deprecated.
- **MilestoneEvent**—generated when a case milestone is completed or reaches violation status.
- **SocialPost**—generated when a social post is created from a case.

**Note:** If you set **Type** to **ContentPost**, also specify **ContentData** and **ContentFileName**.

## Usage

Use this object to track changes for an order record.

SEE ALSO:

[Order](#)

## OrderHistory

Represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.

## Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                                                                                           |

## Usage

Order history entries are automatically created each time an order is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field-level security on the parent object.

| OriginalOrderItemId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Required if <code>isReductionOrder</code> on the parent order is <code>true</code>.<br/>ID of the original order product being reduced.</p>                                                                                                                   |
| PricebookEntryId    | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. ID of the associated PricebookEntry. This field must be specified when creating OrderItem records. It can't be changed in an update.</p>                                                                                                                      |
| Quantity            | <p><b>Type</b><br/>double</p> <p><b>Properties</b><br/>Create, Filter, Sort, Update</p> <p><b>Description</b><br/>Number of units of this order product.<br/><br/>If you specify <code>Quantity</code> without specifying <code>UnitPrice</code>, <code>UnitPrice</code> is adjusted to accommodate the new <code>Quantity</code> value while keeping <code>TotalPrice</code> constant.</p> |

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QuoteLineItemId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>ID of the associated quote line item.<br/><br/>If this field is specified, the quote line item's Quoteld must match the Quoteld for the order product's parent order.</p>                                  |
| ServiceDate     | <p><b>Type</b><br/>date</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>Start date for the order product.<br/><br/>Label is <b>Start Date</b>.</p>                                                                                                                                   |
| UnitPrice       | <p><b>Type</b><br/>currency</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>Unit price for the order product. In the Salesforce user interface, this field's value is calculated by dividing the total price of the order product by the quantity listed for that order product.</p> |

## Usage

An order can have associated order product records only if the order has a price book associated with it. An order product must correspond to a product that is listed in the order's price book.

## OrderItemFeed

Represents a single feed item in the feed displayed on the detail page for an order product record.

An order product feed shows changes to an order product for fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to order products in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this object to track changes for an order product record.

SEE ALSO:

[OrderItem](#)

## OrderItemHistory

Represents the history of changes to the values in the fields of an order product.

## Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

## OrderOwnerSharingRule

Represents a rule which determines order sharing access for the order's owners.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

## Usage

Use this object to manage the sharing rules for orders. For example, the following code creates an order owner sharing rule between two public groups, which can also contain portal users.

```
OrderOwnerSharingRule rule = new OrderOwnerSharingRule();  
rule.setName("RuleName"); // Set the sharing rule name
```

```
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx000000000000"); // Set the group of users to share records from
rule.setUserOrGroupId("00Gx000000000001"); // Set the group of users to share records to
rule.setOrderAccessLevel("Edit");
connection.create(rule);
```

## Organization

Represents key configuration information for an organization.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Executing a SOQL SELECT query returns the value of fields in this object, but no value is visible for some of the fields.

## Special Access Rules

Customer Portal users can't access this object.

## Fields

## Usage

Query this object to obtain information about an organization's settings. Only one organization object exists per organization.

SEE ALSO:

[Object Basics](#)

# OrgWideEmailAddress

---

Represents an organization-wide email address for user profiles.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                             |

## Usage

This object represents an email alias for user profiles. You can pass in the ID to an `OrgWideEmailAddress` record when calling `sendEmail()` for a `SingleEmailMessage`.

# OwnedContentDocument

---

Represents a file owned by a user. This object is available in version 30.0 and later.

## Supported Calls

`describeSObjects()`

| Field Name | Details                                                                      |
|------------|------------------------------------------------------------------------------|
|            | <b>Properties</b><br>Create, Filter, Nillable, Sort                          |
|            | <b>Description</b><br>The number of users who have a license to the package. |

## Usage

Use this object to determine the number of licenses allowed and in use for a managed package installed in your organization.

The following example demonstrates the use of the API to manage licenses for a package. The example defines an Apex class that does the following.

- Retrieves the PackageLicense record for the specified package (identified by its namespace prefix).
- Defines a function that returns a list of all users with the specified profile.
- Creates a UserPackageLicense record for each user with that profile, which has the effect of assigning a license for the package to all users with that profile.
- Returns an error message if the number of users exceeds the number of available licenses.

```
public class AssignPackageLicense {

    static String PACKAGE_NAMESPACE_PREFIX = 'acme_101';
    static String PROFILE_ID = '00exx000000jz1SAAQ';
    public static String exceptionText {get; set;}

    public AssignPackageLicense() {
        exceptionText = 'Initialized';
    }

    static List<User> getUsersWithProfile(){
        String userQuery = 'SELECT Id FROM User WHERE ProfileId = :PROFILE_ID';
        List<User> matchingUsers = new List<User>();
        matchingUsers = [SELECT Id FROM User WHERE ProfileId = :PROFILE_ID];
        return matchingUsers;
    }

    public static void assignLicenseByProfile() {
        //find the PackageLicense Id
        PackageLicense pl = [SELECT Id, NamespacePrefix, AllowedLicenses, UsedLicenses,
            ExpirationDate, Status FROM PackageLicense WHERE
            NamespacePrefix = :PACKAGE_NAMESPACE_PREFIX];
        System.assert(pl != null, 'PackageLicense cannot be null.');
```

List<User> usersToAssignLicenses = getUsersWithProfile();  
List<UserPackageLicense> firstUPLs = new List<UserPackageLicense>();

//create a new UserPackageLicense record for each user with the specified profile

```
for (Integer i = 0; i< usersToAssignLicenses.size(); i++){
    UserPackageLicense upl = new UserPackageLicense();
    upl.PackageLicenseId = pl.Id;
```

```
        upl.UserId = usersToAssignLicenses[i].Id;
        firstUPLs.add(upl);
    }

    try {
        //bulk insert
        insert(firstUPLs);
    } catch(DmlException e) {
        for (Integer i = 0; i < e.getNumDml(); i++) {
            // process exception here
            System.debug(e.getDmlMessage(i));
            String status = e.getDmlStatusCode(i);
            System.debug(status + ' ' + e.getDmlMessage(i));
            if(status.equals('LICENSE_LIMIT_EXCEEDED')){
                exceptionText = 'You tried to assign more licenses than available. '
                    + ' You tried to create ' + firstUPLs.size()+' licenses but only have '
                    + (pl.AllowedLicenses - pl.UsedLicenses) + ' licenses free.';
                System.debug(exceptionText);
            }
        }
    }
}
```

# PackagePushError

Represents an error encountered during a push request. The number of PackagePushError records created depends on the number of push jobs in the request that result in an error.

## Supported Calls

describeSObjects(), query(), retrieve()

## Fields

| Field Name   | Details                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------|

| Field Name | Details                                                        |
|------------|----------------------------------------------------------------|
|            | <b>Description</b><br>Required. The parent push job record ID. |

## Usage

Suppose that your push upgrade request wasn't successful due to some of its jobs failing. Let's write some code to find out what those errors were.

This code sample uses the Force.com Web Services Connector (WSC).

```
// Retrieves all PackagePushError objects associated with the PackagePushJob with the given
// ID
final String PACKAGE_PUSH_ERROR_QUERY = "Select ErrorMessage, ErrorDetails, ErrorTitle,"
+ " ErrorSeverity, ErrorType from PackagePushError where PackagePushJobId = '%s'";

// job is a PackagePushJob instance
QueryResult queryResult = conn.query(String.format(PACKAGE_PUSH_ERROR_QUERY, job.getId()));

StringBuilder errorMessages = new StringBuilder();
errorMessages.append("Errors for PackagePushJob [").append(job.getId()).append("]:")
.append("\n");

// There can be multiple PackagePushErrors for a given PackagePushJob
for(SObject r : queryResult.getRecords()) {
    PackagePushError e = (PackagePushError) r;
    errorMessages.append("Title: ").append(e.getErrorTitle()).append("\n");
    errorMessages.append("Severity: ").append(e.getErrorSeverity()).append("\n");
    errorMessages.append("Type: ").append(e.getErrorType()).append("\n");
    errorMessages.append("Message: ").append(e.getErrorMessage()).append("\n");
    errorMessages.append("Details: ").append(e.getErrorDetails()).append("\n");
    errorMessages.append("\n");
}

String errors = errorMessages.toString();
```

## PackagePushJob

Represents an individual push job for upgrading a package in an org from one version to another version. There can be multiple push jobs created for one push request. For example, if you want to upgrade five orgs as part of one push, you have one PackagePushRequest record and five PackagePushJob records.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name                             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>PackagePushRequestId</code>      | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Required. The ID of the parent push request record which must have been created.</p>                                                                                                                                                                                                                                                      |
| <code>Status</code>                    | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The status of the job. The default value of <code>Created</code> is used.</p> |
| <code>SubscriberOrganizationKey</code> | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Required. The organization key of the org where the package is upgraded. This references <code>orgKey</code> in <code>PackageSubscriber</code>.</p>                                                                                                                                                                                          |

## Usage

Suppose that you want to push version 3.4.6 of your package to all orgs. You've already identified the orgs eligible for the upgrade by using `MetadataPackageVersion` and created the push request using `PackagePushRequest`. Now let's write some code to create a push job for each eligible org.

This code sample uses the Force.com Web Services Connector (WSC).

```
PackageSubscriber[] subscribers = new PackageSubscriber[];
```

```
// ... populate eligible and desired subscribers

// Create the PackagePushJob array
PackagePushJob[] jobs = new PackagePushJob[subscribers.length];

for (int i = 0; i < subscribers.length; i++) {
    // create a job for each subscriber...
    PackagePushJob job = new PackagePushJob();
    // ... associate it to the PackagePushRequest ppr...
    job.setPackagePushRequestId(ppr.getId());
    // ... and add the orgKey
    job.setSubscriberOrganizationKey(subscribers[i].getOrgKey());
    jobs[i] = job;
}

// Save the jobs
SaveResult[] saveResults = conn.create(jobs);

// Add the newly generated id's to the PackagePushJob objects
for (int i = 0; i < saveResults.length; i++) {
    if (saveResults[i].isSuccess()) {
        jobs[i].setId(saveResults[i].getId());
    }
}
```

Or, if you're using REST API, submit a POST request to the PackagePushJob sObject endpoint, as in the following example. SOAP API is also supported. This example returns the push job ID (starting with ODX) that is required to query the status of the job.

```
POST
/services/data/v38.0/objects/packagepushjob/
{
    "PackagePushRequestId" : "ODV...",
    "SubscriberOrganizationKey" : "00DR00..."
}
```

### Checking the Status of a Push Job

To check the job status, simply query the Status field. For example:

```
SELECT Id, Status FROM PackagePushJob WHERE PackagePushRequestId ='ODV...'
```

Here's an example in Java.

```
// Finds the status of the PackagePushJob with the given id
String PACKAGE_PUSH_JOB_STATUS_QUERY = "Select status from PackagePushJob where Id = '%s'";

// job is a PackagePushJob instance
QueryResult queryResult = conn.query(String.format(PACKAGE_PUSH_JOB_STATUS_QUERY,
job.getId()));

// extract the status from the QueryResult
String status = ((PackagePushJob) queryResult.getRecords()[0]).getStatus();

// optionally, update the PackagePushJob instance with the latest status
job.setStatus(status);
```

You can also continuously poll the job status until the job is done. The following Java example polls the status every 10 seconds.

```
// The set of states that indicate a PackagePushJob has completed
final Set<String> TERMINAL_STATES = new HashSet<>();
TERMINAL_STATES.add("Succeeded");
TERMINAL_STATES.add("Failed");
TERMINAL_STATES.add("Canceled");

String status = queryJobStatus(job); // this method returns the status as retrieved in the
previous code sample

// If the status is not one of the completed statuses...
while(!TERMINAL_STATES.contains(status)) {
    Thread.sleep(10 * 1000); // ... wait 10 seconds and try again
    status = queryJobStatus(job);
}
```

# PackagePushRequest

Represents the push request for upgrading a package in one or many orgs from one version to another version.

## Supported Calls

create(), describeSObjects(), query(), retrieve(), update(), upsert()

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PackageVersionId   | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b></p> <p>Required. The non-beta, non-deprecated package version that the package is being upgraded to.</p>                                                                                                                                                                                                                                                               |
| ScheduledStartTime | <p><b>Type</b></p> <p>dateTime</p> <p><b>Properties</b></p> <p>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b></p> <p>The date and time (UTC) at which the push request is processed, in ISO 8601 format. Set this value to the earliest time that you want Salesforce to attempt to start the push. As a best practice, schedule pushes at off-peak hours like 1:00 AM Saturday. If you don't specify a value, the push starts when the package push request's Status is set to Pending.</p> |

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The status of the push. Valid values are:</p> <ul style="list-style-type: none"> <li>Cancelled</li> <li>Created (default)</li> <li>Failed</li> <li>In Progress</li> <li>Pending</li> <li>Succeeded</li> </ul> <p>Don't specify this value when you create the push request. The default value of <code>Created</code> is used. Later, you need to change the status to <code>Pending</code> to schedule the push upgrade.</p> |

## Usage

Suppose that you want to push version 3.4.6 of your package to all orgs. You've already identified the orgs eligible for the upgrade by using `MetadataPackageVersion`. Now let's write some code to create a push request, which holds a push job for each eligible org.

This code sample uses the Force.com Web Services Connector (WSC).

```
// Create a new PackagePushRequest for the versionId to upgrade to
// (for example, versionId is the "04t..." id of version
// 3.4.6 of the package
PackagePushRequest ppr = new PackagePushRequest();
ppr.setPackageVersionId(versionId);

// Optionally, set the start time of the PackagePushRequest to schedule it to begin
// automatically; scheduledStartTime is a java.util.Calendar instance
ppr.setScheduledStartTime(scheduledStartTime);

// Save the PackagePushRequest
SaveResult[] saveResults = conn.create(new SObject[] { ppr });
if (saveResults[0].isSuccess()) {
    // Add the newly generated Id to the object
    ppr.setId(saveResults[0].getId());
} else {
    for (Error error : saveResults[0].getErrors()) {
        System.out.println(error.getMessage());
    }
}
```

Or, if you're using REST API, submit a POST request to the `PackagePushRequest sObject` endpoint, as in the following example. SOAP API is also supported.

This example returns the push request ID (starting with ODV) that's required to create push jobs.

```
POST
/services/data/v38.0/subjects/packagepushrequest/
{
  "PackageVersionId" : "04t...",
  "ScheduledStartTime" : "2016-08-24T21:00:00"
}
```

As your next step, create a push job for each eligible subscriber you want to upgrade using `PackagePushJob`.

### Scheduling the Push Upgrade

To signal that the push upgrade is ready to be processed, change the status of the push request to `Pending`. If you didn't set a `ScheduledStartTime`, the push upgrade starts immediately after you change the status.

See the following Java example.

```
// ppr is the PackagePushRequest instance
ppr.setStatus("Pending");
conn.update(new SObject[] { ppr });
```

If you're using REST API, submit a PATCH request to the `PackagePushRequest` sObject endpoint, as in the following example. SOAP API is also supported.

```
PATCH
/services/data/v38.0/subjects/packagepushrequest/ODV...
{
  "Status" : "Pending"
}
```

### Checking the Status of a Push Request

The `PackagePushRequest` status is `Succeeded` if all its associated jobs are successful; it's `Failed` if at least one job failed.

```
// Finds the status of the PackagePushRequest for a given Id
final String PACKAGE_PUSH_REQUEST_STATUS_QUERY = "Select status from PackagePushRequest"
+
  " where Id = '%s'";

// ppr is a PackagePushRequest instance
QueryResult queryResult = conn.query(String.format(PACKAGE_PUSH_REQUEST_STATUS_QUERY,
  ppr.getId()));

// extract the status from the QueryResult
String status = ((PackagePushRequest) queryResult.getRecords()[0]).getStatus();

// optionally, update the PackagePushRequest instance with the latest status
ppr.setStatus(status);
```

You can also check the status of a job by querying the `PackagePushJob`'s `Status` field.

## PackageSubscriber

Represents an installation of a package in an org. This object contains installation information for managed packages developed in the org you're logged in to.

One record is created per installation. For example, if 5 orgs installed 2 packages, 10 records are created.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name               | Details                                                                                                                                                                                               |

## Usage

Here are examples of the types of API queries you can perform.

| Query                                                                                                 | String                                                                                                                       |
|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Get all package subscriber orgs with a specific package ID                                            | <code>SELECT Id, OrgKey, OrgStatus, OrgName, OrgType FROM PackageSubscriber WHERE MetadataPackageVersionId = '04t...'</code> |
| Get all package subscriber orgs that have an installed package created by the org you're logged in to | <code>SELECT Id, OrgKey, OrgStatus, OrgName, OrgType FROM PackageSubscriber WHERE InstalledStatus = 'i'</code>               |

### Filter PackageSubscriber Objects by Instance

If you have packages with many subscribers, querying PackageSubscriber objects can take a while. To improve query performance, add filters to your PackageSubscriber queries, such as an InstanceName filter. InstanceName is a field that represents the instance that the subscriber org is hosted on.

1. Get the org's managed package and the latest released version of the package.

```
/**
 * Get the MetadataPackage object corresponding to this org's managed package
 */
public MetadataPackage getMetadataPackage() throws ConnectionException {
    // retrieve the managed package, which won't have an empty namespace
    QueryResult result = conn.query("select id from MetadataPackage where namespaceprefix
<> ''");

    return (MetadataPackage) result.getRecords()[0];
}

/**
 * Get the latest MetadataPackageVersion object of the given MetadataPackage
 */
public MetadataPackageVersion getLatestMetadataPackageVersion(MetadataPackage
metadataPackage)
throws ConnectionException {
    // get the latest released version of the given package
    String query = "Select id, ReleaseState, MajorVersion, MinorVersion, PatchVersion,
MetadataPackageId"
        + " From MetadataPackageVersion"
        + " Where MetadataPackageId = '%s' and ReleaseState = 'Released'"
        + " Order by majorversion desc, minorversion desc, patchversion desc";

    QueryResult result = conn.query(String.format(query, metadataPackage.getId()));

    return (MetadataPackageVersion) result.getRecords()[0];
}
```

2. Get eligible subscribers. The following query strings and methods are modified to allow querying for PackageSubscribers filtered by an instance.

```
static final String PACKAGE_SUBSCRIBER_ORG_KEY_QUERY = "Select OrgKey from
PackageSubscribers where OrgStatus = 'Active'"
    + " and InstalledStatus = 'I'"
    + " and InstanceName = '%s'"; // placeholder for instance values

static final String METADATA_PACKAGE_VERSION_QUERY = "Select Id, Name, ReleaseState,
(%) from MetadataPackageVersion"
    + " where MetadataPackageId = '%s' AND ReleaseState = 'Released'"
    + " AND (MajorVersion < %s OR (MajorVersion = %s and MinorVersion < %s)"
    + " OR (MajorVersion = %s and MinorVersion = %s and PatchVersion < %s))";

/**
 * Get all PackageSubscribers on the given instance that are eligible to upgrade to the
 * given
 * MetadataPackageVersion
 */
public PackageSubscriber[] getEligibleSubscriberIds(MetadataPackageVersion version,
String instanceName) throws ConnectionException {
    String allPackageId = version.getMetadataPackageId();
    Integer major = version.getMajorVersion();
    Integer minor = version.getMinorVersion();
```

```

Integer patch = version.getPatchVersion();

return getEligibleSubscriberIds(major, minor, patch, allPackageId, instanceName);
}

public PackageSubscriber[] getEligibleSubscriberIds(Integer major, Integer minor, Integer
    patch, String packageId, String instanceName) throws ConnectionException {
    String subscriberQuery = String.format(PACKAGE_SUBSCRIBER_ORG_KEY_QUERY, instanceName);
    QueryResult results = conn.query(String.format(METADATA_PACKAGE_VERSION_QUERY,
        subscriberQuery, packageId, major, major, minor, major, minor, patch));

    return Arrays.stream(results.getRecords()).map(MetadataPackageVersion.class::cast)
        .filter(mpv -> mpv.getPackageSubscribers() != null)
        .flatMap(mpv -> Arrays.stream(mpv.getPackageSubscribers().getRecords()))
        .map(PackageSubscriber.class::cast)
        .toArray(PackageSubscriber[]::new);
}

```

- Put it all together. The following code sample shows how to use the previous methods to modify the workflow to perform package pushes by instance.

```

String[] instances = { "NA4" }; // Here we list the instances we would like to push to
MetadataPackage metadataPackage = api.getMetadataPackage();
MetadataPackageVersion version = api.getLatestMetadataPackageVersion(metadataPackage);

// do pushes by instance to avoid API timeouts retrieving PackageSubscribers
for (String instanceName : instances) {
    PackageSubscriber[] eligibleSubscribers = api.getEligibleSubscriberIds(version,
        instanceName);

    // ... proceed with creating PushRequests and PushJobs as before
}

```

## Partner

---

Represents a partner relationship between two Account records or between an Opportunity and an Account.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- You must have the “View All Data” permission to access this object via the API. All of the Partner fields are accessible in the `describeObjects()` and `query()` calls. You cannot `update()` or `upsert()` partners via the API.
- Customer Portal users can’t access this object.

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AccountFromId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Required if OpportunityId is null. ID of the main Account in a partner relationship between two accounts. Specifying this field when creating a Partner record creates two AccountPartner objects, one for each direction of the relationship. If you specify the OpportunityId field, you can't specify this field as well.</p>                                                                                                             |
| AccountToId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. |       | <b>Description</b><br>UserRole that the account has towards the related opportunity or account, such as consultant or distributor.                                                                                                                                                                                                  |

## Roles

In the Salesforce user interface, system administrators can set up the valid role values and their corresponding reverse role values in the PartnerRole object. Each account in the relationship is assigned a `Role` (such as `Consultant` or `Distributor`) designating that account's role towards the related account or opportunity.

## Creating an Account-Opportunity Partner Relationship

When you create a partner relationship between an account and an opportunity (when you create a Partner object and specify the `OpportunityId` field), the API automatically creates an OpportunityPartner with the corresponding values:

- The value of the Partner field `AccountToId` maps to the value of the OpportunityPartner field `AccountToId`.
- The values of the `OpportunityId`, `Role`, and `IsPrimary` fields in both objects are the same.
- If you set the `IsPrimary` value to 1 (`true`) upon insert of a new OpportunityPartner, any other existing primary partners for that opportunity will automatically have the `IsPrimary` value set to 0 (`false`).

This mapping allows the API to manage the objects and their relationship efficiently.

## Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a Partner object and specify the `AccountFromId`), the API automatically creates two AccountPartner objects, one for the forward relationship and one for the reverse. For example, if you create a Partner object with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`, the API automatically creates two AccountPartner objects:

- The forward relationship AccountPartner with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`.
- The reverse relationship AccountPartner with "Acme Consulting" as the `AccountFromId` and "Acme, Inc." as the `AccountToId`.
- The value of the `Role` field in the reverse relationship AccountPartner is set to the PartnerRole object `ReverseRole` value associated with the value of the `Role` field in the forward relationship AccountPartner.

This mapping allows the API to manage the objects and their relationship efficiently.

## Usage

Represents Salesforce to Salesforce standard and replication connections. This object is referenced by all objects that have been shared with other organizations, enabling you to determine which connections shared a record with you. If the organization does not have Salesforce to Salesforce enabled, the PartnerNetworkConnection object is not available, and you can't access it via the API.

SEE ALSO:

[PartnerNetworkRecordConnection](#)

## PartnerNetworkRecordConnection

Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`

## Usage

When you create a `PartnerNetworkRecordConnection`, you forward a record to a connection.

**Note:** Attempting to forward a record from an object to which the connection is not subscribed results in an `Invalid Partner Network Status` error.

Don't forward a record to the connection that originally shared it. Doing so causes errors when Apex triggers run.

When you delete a `PartnerNetworkRecordConnection`, you stop sharing a record with a connection.

- To share a record, use the following fields: `LocalRecordID` and `ConnectionId`
- To share a child of a parent record, use the following fields: `LocalRecordID`, `ConnectionId`, and `ParentRecordID`
- To share a child of a parent record and its child records, use the following fields: `LocalRecordID`, `ConnectionId`, `ParentRecordID`, and `RelatedRecords`

If the organization does not have Salesforce to Salesforce enabled, the PartnerNetworkRecordConnection object is not available, and you can't access it using the API.

## Sample Code—Apex

The following example shows how to forward a record.

```
List<PartnerNetworkConnection> connMap = new List<PartnerNetworkConnection>(
    [select Id, ConnectionStatus, ConnectionName from PartnerNetworkConnection
     where ConnectionStatus = 'Accepted']
);
for(PartnerNetworkConnection network : connMap) {
    PartnerNetworkRecordConnection newrecord = new PartnerNetworkRecordConnection();

    newrecord.ConnectionId = network.Id;
    newrecord.LocalRecordId = accountId;
    newrecord.RelatedRecords = 'Contact,Opportunity,Orders__c';
    newrecord.SendClosedTasks = true;
    newrecord.SendOpenTasks = true;
    newrecord.SendEmails = true;

    insert newrecord;
}
```

The following example shows how to stop sharing a record.

```
List<PartnerNetworkRecordConnection> recordConns = new List<PartnerNetworkRecordConnection>(
    [select Id, Status, ConnectionId, LocalRecordId from PartnerNetworkRecordConnection
     where LocalRecordId in :accounts]
);

for(PartnerNetworkRecordConnection recordConn : recordConns) {
    if(recordConn.Status.equalsignorecase('Sent')){ //account is connected - outbound

        delete recordConn;
    }
}
```

## PartnerNetworkSyncLog

Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log's twenty most recent entries, and provides a link to the log.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

## Special Access Rules

The Org Sync Log tab can only be added in organizations where Organization Sync has been enabled. To add the tab to the Salesforce user interface, users must also have the “Manage Connections” user permission.

|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | <b>Description</b><br>Uniquely identifies a picklist value so it can be retrieved without using an id or master label.                                                                                                                                                                                                                                                                                                           |
| MasterLabel | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Master label for this partner role value. This display value is the internal label that does not get translated. Limit: 255 characters.                                                                                                                                                                                     |
| ReverseRole | <b>Type</b><br>picklist<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Name of the reverse role that corresponds to this partner role. For example, if the role is "subcontractor," then the reverse role might be "general contractor." In the user interface, assigning a partner role to an account creates a reverse partner relationship so that both accounts list the other as a partner. |
| SortOrder   | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Number used to sort this value in the partner role picklist. These numbers are not guaranteed to be sequential, as some previous partner role values might have been deleted.                                                                                                                                                  |

## Usage

This object represents a value in the partner role picklist. In the user interface, the partner role picklist provides additional information about the role of a Partner, such as their corresponding reverse role. Query this object to retrieve the set of values in the partner role picklist, and then use that information while processing `PartnerRole` records to determine more information about a given partner role. For example, the application could determine the reverse role of a given `Partner Role` value and the value of the `ReverseRole` property in the associated `PartnerRole` object.

# Usage

In API version 36.0 and earlier, querying the Period object yields no results. In API version 37.0 and later, a query returns period records.

[FiscalYearSettings](#)

# PermissionSet

Represents a set of permissions that’s used to grant additional access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

You can use permission sets to grant access, but not to deny access.

# Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Usage

Use the PermissionSet object to query existing permission sets.

For example, to search for all permission sets that contain the “Modify All Data” permission:

```
SELECT Name, PermissionsModifyAllData
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

When combined with the PermissionSetAssignment object, you can create a nested query that returns all users assigned to a particular permission like “Modify All Data”:

```
SELECT Name, (SELECT AssigneeId FROM Assignments)
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

You can also create a permission set, or delete a permission set if it isn't assigned to a user.

## User Licenses

The user license controls the permissions that are available in a permission set.

Every permission set can be associated with a user license or permission set license. If you plan to assign a permission set to multiple users with different user and permission set licenses, leave `LicenseId` empty. If only users with one type of license will use this permission set, set the `LicenseId` to that single user or permission set license. If you want a permission set associated with a permission set license, then set `LicenseId` to the permission set license. To get the `LicenseId`, run this query:

```
SELECT Id, Name
FROM UserLicense
```

Alternatively, to query a user or profile for the `LicenseId`.

```
SELECT Id, Profile.UserLicenseId
FROM User
```

## Child Objects

When using the API, think of each permission set or related set of access controls as an empty container that you fill with permission records.

In the API, a permission set can contain user, object, and field permissions, as well as setup entity access settings for other settings, such as Apex classes.

- `ObjectPermissions` and `FieldPermissions` objects are available in API version 24.0 and later.
- The `SetupEntityAccess` object is available in API version 25.0 and later.

Only user permissions are managed in the `PermissionSet` API object; all other permission types are managed in child API objects.

In these child objects, access is stored in a record, while the absence of a record indicates no access. To return a record in a SOQL query, a minimum permission or setting is required for each child object.

Because permissions are stored in related objects, it's important to understand what questions to ask when using SOQL. For example, you might want to know which permission sets have "Delete" on an object or have the right to approve a return merchandise authorization (where the approval checkbox is controlled with field permissions). Asking the right questions when using SOQL with permission sets ensures that you get the information you need to make an informed decision, such as whether to migrate permissions or assign a permission set to a user.

For example, the following returns all permission sets where the "Read" permission is enabled for the Merchandise\_\_c object.

```
SELECT SubjectType, ParentId, PermissionsRead
FROM ObjectPermissions
WHERE PermissionsRead = True AND SubjectType = 'Merchandise__c'
```

You can query for all permission sets that have "Read" on an object. However, you can't query for permission sets that have no access on an object, because no records exist for that object. For example, the following returns no records because the object must have at least "Read" to return any records.

```
SELECT SubjectType, ParentId, PermissionsRead
FROM ObjectPermissions
WHERE PermissionsRead = False AND SubjectType = 'Merchandise__c'
```

If you have at least the “Read” permission on an object, you can create a conditional query on other permissions in the same object. For example, the following returns any records where the object has at least the “Read” permission but not the “Edit” permission.

```
SELECT ParentId, PermissionsRead, PermissionsEdit
FROM ObjectPermissions
WHERE PermissionsEdit = False AND SubjectType = 'Merchandise__c'
```

To set an object or field permission to no access, delete the record that contains the permission. For example, to disable all object permissions in the Merchandise\_\_c object for a particular permission set, first query to retrieve the ID of the object permission record.

```
SELECT Id
FROM ObjectPermissions
WHERE SubjectType = 'Merchandise__c'
```

Then delete the IDs returned from the query.

**Note:** If you try to update the object or field permissions by setting all permissions to false, the permission record is automatically deleted; any subsequent queries for the record ID won't return results and you must add a new permission record to grant access.

## View a Permission Set with Nested Queries

You can build on the PermissionSet object using child relationships that show all of the permissions in a single permission set. For example, the following returns all permission sets and displays the “Transfer Leads” permission, as well as any “Read” permissions on any objects and fields.

```
SELECT Label, PermissionsTransferAnyLead,
(SELECT SubjectType, PermissionsRead FROM ObjectPerms),
(SELECT SubjectType, Field, PermissionsRead FROM FieldPerms)
FROM PermissionSet
```

## Associated Profiles

In API version 25.0 and later, every profile is associated with a permission set that stores the profile's user, object, and field permissions, as well as setup entity access settings. You can query permission sets that are owned by profiles but not modify them.

The following example returns all permission sets, including those owned by a profile.

```
SELECT Id, Label, ProfileId, Profile.Name
FROM PermissionSet
```

The following returns all permission sets except those owned by profiles.

```
SELECT Id, Label, ProfileId, Profile.Name, IsOwnedByProfile
FROM PermissionSet
WHERE IsOwnedByProfile = FALSE
```

Because permission sets have child objects in the API, you can query their values on permission sets owned by a profile. For example, the following returns all enabled object permission records for profiles only.

```
SELECT Id, ParentId, PermissionsRead, SubjectType, Parent.ProfileId
FROM ObjectPermissions
WHERE Parent.IsOwnedByProfile = TRUE
```

Once you have the IDs for permission sets that are owned by profiles as well as those not owned by profiles, you can use the [PermissionSetAssignment](#) object to determine whether users can access an object or field via a permission in their profile or any of their

permission sets. For example, the following SOQL query returns all users who have the “Read” permission on the Merchandise\_\_c object and specifies whether the permission is granted through a profile or permission set.

```
SELECT Assignee.Name, PermissionSet.Id, PermissionSet.isOwnedByProfile
FROM PermissionSetAssignment
WHERE PermissionSetId
IN (SELECT ParentId
FROM ObjectPermissions
WHERE SObjectType = 'Merchandise__c' AND PermissionsRead = true)
```

 **Note:** For permission sets that are owned by profiles, don’t use any Name and Label values that are returned in a query, as they can change at any time.

# PermissionSetAssignment

Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AssigneeId      | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>ID of the User to assign the permission set specified in <code>PermissionSetId</code>.</p> |
| PermissionSetId | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>ID of the PermissionSet to assign to the user specified in <code>AssigneeId</code>.</p>    |

## Usage

### Finding Permission Set Assignments

Use the `PermissionSetAssignment` object to query permission set assignments to find out which permission sets are assigned to which users. Because each user may be assigned to many permission sets and each permission set may be assigned to many users, each `PermissionSetAssignment` ID represents the association of a single user and single permission set.

For example, to search for all of the permission sets assigned to a particular user:

```
SELECT Id, PermissionSetId
FROM PermissionSetAssignment
WHERE AssigneeId = '005600000017cKt'
```

To search for all users assigned to a particular permission set:

```
SELECT Id, AssigneeId
FROM PermissionSetAssignment
WHERE PermissionSetId = '0PS30000000000e'
```

You can also create a new permission set assignment, or use delete to remove a permission set that's assigned to a user. To update an assignment, delete an existing assignment and insert a new one.

### User Licenses

When assigning a permission set, if the `PermissionSet` has a `UserLicenseId`, its `UserLicenseId` and the Profile `UserLicenseId` must match. To determine a user's license assignment, query the user's profile and then query the profile's license.

For example, to find a user's profile ID:

```
SELECT Id, ProfileId
FROM User
WHERE Id = '005D00000001GMAT'
```

To find a permission set's `UserLicenseId`:

```
SELECT Id, LicenseId
FROM PermissionSet
WHERE Id = '0PS30000000000e'
```

If the IDs match, the assignment succeeds.

To find all the permission sets with no license that are assigned to any user:

```
SELECT Id, Assignee.Name, PermissionSet.Name
FROM PermissionSetAssignment
WHERE PermissionSet.LicenseId = null
```

SEE ALSO:

[PermissionSet](#)

## PermissionSetLicense

Represents a license that's used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| ExpirationDate | <p><b>Type</b><br/>date</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The date at which the permission set license expires.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| TotalLicenses                                | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The total number of this permission set license that are available to your organization.</p>                                                                                                                                                                                                                                    |

| Field Name   | Details                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UsedLicenses | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The number of this permission set license that are currently assigned to users. |

## Usage

Users with the “View Setup and Configuration” permission can use the PermissionSetLicense object to view the set of currently defined permission set licenses in your organization.

Use the PermissionSetLicense object to query existing permission licenses.

For example, to return a list of all active permission set licenses:

```
SELECT MasterLabel
FROM PermissionSetLicense
WHERE Status = 'Active'
```

When combined with the PermissionSetLicenseAssign object, you can create a nested query that returns all users assigned to a particular permission set license like “Identity Connect”:

```
SELECT MasterLabel, (SELECT AssigneeId FROM PermissionSetLicenseAssignments)
FROM PermissionSetLicense
WHERE MaximumPermissionsIdentityConnect=true
```

[PermissionSetLicenseAssign](#)

## PermissionSetLicenseAssign

Represents the association between a User and a PermissionSetLicense. This object is available in API version 29.0 and later.

**Note:** The relationship name for PermissionSetLicenseAssign is *PermissionSetLicenseAssignments*.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name             | Details                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AssigneeId             | <b>Type</b><br>reference <b>Properties</b><br>Create, Filter, Group, Sort <b>Description</b><br>ID of the User to assign the permission set license specified in <code>PermissionSetLicenseId</code> . |
| PermissionSetLicenseId | <b>Type</b><br>reference <b>Properties</b><br>Create, Filter, Group, Sort <b>Description</b><br>The ID of the permission set license the user is assigned to.                                          |

## Usage

Use the `PermissionSetLicenseAssign` object for querying permission set license assignments to find out which permission set licenses are assigned to which users. Because each user can be assigned to many permission set licenses, each `PermissionSetLicenseAssign` ID represents the association of a single user and single permission set license.

For example, to search for all of the permission sets assigned to a particular user:

```
SELECT Id, PermissionSetLicenseId
FROM PermissionSetLicenseAssign
WHERE AssigneeId = '005D0000001RFek'
```

To search for all users assigned to a particular permission set license:

```
SELECT AssigneeId
FROM PermissionSetLicenseAssign
WHERE PermissionSetLicenseId = '0PLD000000003mwOAA'
```

You can also create a new permission set license assignment, or use delete to remove a permission set license that's been assigned to a user. To update an assignment, delete an existing assignment and insert a new one.

## PlatformAction

`PlatformAction` is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.

## Supported Calls

`query()`

## Fields

## Usage

PlatformAction can be described using describeSObject().

You can directly query for PlatformAction. For example, this query returns all fields for actions associated with each of the records of the listed objects:

```
SELECT ExternalId, ActionTargetType, ActionTargetUrl, ApiName, Category,
       ConfirmationMessage, ExternalId, GroupId, UiTheme, IconUrl, IconContentType,
       IconHeight, IconWidth, PrimaryColor, InvocationStatus, InvokedByUserId,
       IsGroupDefault, Label, LastModifiedDate, Subtype, SourceEntity, Type
FROM PlatformAction
WHERE SourceEntity IN ('001xx000003DGsH', '001xx000003DHBq', 'Task', 'Global') AND
       ActionListContext = 'Record';
```

 **Note:** To query PlatformAction, provide the ActionListContext and SourceEntity. If you query for ActionListContext with a value of RelatedList, and don't specify a RelatedSourceEntity, the query returns the API name of the related list.

This query uses multiple ActionListContext values in its WHERE clause to return all actions in the Lightning Experience user interface (DeviceFormat = 'Desktop') for the specified object:

```
SELECT ActionListContext, Label, Type, Subtype, Section, SourceEntity,
       RelatedSourceEntity, ActionTarget, ActionTargetType, ApiName, Category,
       ConfirmationMessage, DeviceFormat, ExternalId, GroupId, IconContentType,
       IconHeight, IconUrl, IconWidth, Id, InvocationStatus, InvokedByUserId,
       IsGroupDefault, LastModifiedDate, PrimaryColor
FROM PlatformAction
WHERE ActionListContext IN ('Record', 'Chatter', 'RelatedList') AND
       SourceEntity = '001xx000003DlvX' AND
       DeviceFormat = 'Desktop';
```

## PresenceUserConfig

Represents a configuration that determines a presence user's settings. This object is available in API version 32.0 and later.

## Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

## Fields

| Field                      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| DeveloperName              | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| Language                   | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The language of the presence configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Available in API version 36.0 and later. |

## PresenceUserConfigProfile

Represents a configuration that determines the settings that are assigned to presence users who are assigned to a specific profile. User-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field                             | Details                                                                                                                                                                                                                                                           |

# PresenceUserConfigUser

Represents a configuration that determines the settings that are assigned to a presence user. These user-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field                | Details                                                                                                                                                                                                                                                               |

# Pricebook2

Represents a price book that contains the list of products that your org sells.

 **Note:** Price books are represented by Pricebook2 objects. As of API version 8.0, the Pricebook object is no longer available. Requests containing Pricebook are refused, and responses do not contain the Pricebook object.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

This field is read-only for the standard price book. Label is <b>Price Book Name</b>.</p>                                                                                                                                             |

## Usage

A price book is a list of products that your org sells.

- Each org has one standard price book that defines the standard or generic list price for each product or service that it sells.
- An org can have multiple custom price books to use for specialized purposes, such as for discounts, different channels or markets, or select accounts or opportunities. While your client application can create, delete, and update custom price books, your client application can update only the standard price book.
- For some orgs, the standard price book is the only price needed. If you need to set up other price books, you can reference the standard price book when setting up list prices in custom price books.

Use this object to query standard and custom price books that have been configured for your org. A common use of this object is to allow your client application to obtain valid Pricebook2 object IDs for use when configuring PricebookEntry records via the API.

Your client application can perform the following tasks on PricebookEntry objects:

- Query
- Create for the standard pricebook or custom pricebooks.
- Update
- Delete
- Change the `IsActive` field when creating or updating records

## PriceBook2, Product2, and PricebookEntry Relationships

In the API:

- Price books are represented by Pricebook2 objects (as of version 8.0, the Pricebook object is no longer available).
- Products are represented by Product2 objects (as of version 8.0, the Product object is no longer available).
- Each price book contains zero or more entries (represented by PricebookEntry records) that specify the products that are associated with the price book. A price book entry defines the price for which you sell a product at a particular currency.

These objects are defined only for those orgs that have products enabled as a feature. If the org doesn't have the products feature enabled, the Pricebook2 object doesn't appear in the `describeGlobal()` call, and you can't access it via the API.

If you delete a Pricebook2 while a line item references PricebookEntry in the price book, the line item is unaffected, but the Pricebook2 is archived and unavailable from the API.

For a visual diagram of the relationships between Pricebook2 and other objects, see Product and Schedule Objects.

## Price Book Setup

The process of setting up a price book via the API usually means:

1. Initially loading product data from your org into Product2 objects (creating a Product2 record for each product that you want to add).
2. For each Product2 object, creating a PricebookEntry that links the Product2 object to the standard Pricebook2. You need to define a standard price for a product at a given currency (if you have multicurrency enabled), before defining a price for that product in the same currency in a custom price book.
3. Creating a custom Pricebook2.
4. Querying the Pricebook2 object to obtain their IDs.

5. For each Pricebook2 object, creating a PricebookEntry for every Product2 that you want to add, specifying unique properties for each PricebookEntry (such as the UnitPrice and CurrencyIsoCode) as needed.

## Code Sample—Java

```
public void pricebookSample() {
    try {
        //Create a custom pricebook
        Pricebook2 pb = new Pricebook2();
        pb.setName("Custom Pricebok");
        pb.setIsActive(true);
        SaveResult[] saveResults = connection.create(new SObject[]{pb});
        pb.setId(saveResults[0].getId());

        // Create a new product
        Product2 product = new Product2();
        product.setIsActive(true);
        product.setName("Product");
        saveResults = connection.create(new SObject[]{product});
        product.setId(saveResults[0].getId());

        // Add product to standard pricebook
        QueryResult result = connection.query(
            "select Id from Pricebook2 where isStandard=true"
        );
        SObject[] records = result.getRecords();
        String stdPbId = records[0].getId();

        // Create a pricebook entry for standard pricebook
        PricebookEntry pbe = new PricebookEntry();
        pbe.setPricebook2Id(stdPbId);
        pbe.setProduct2Id(product.getId());
        pbe.setIsActive(true);
        pbe.setUnitPrice(100.0);
        saveResults = connection.create(new SObject[]{pbe});

        // Create a pricebook entry for custom pricebook
        pbe = new PricebookEntry();
        pbe.setPricebook2Id(pb.getId());
        pbe.setProduct2Id(product.getId());
        pbe.setIsActive(true);
        pbe.setUnitPrice(100.0);
        saveResults = connection.create(new SObject[]{pbe});
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

## Pricebook2History

---

Represents historical information about changes that have been made to the standard fields of the associated Pricebook2, or to any custom fields with history tracking enabled. This object is available in API version 38.0 and later.

### Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Special Access Rules

This object is always read-only.

### Fields

| Field        | Details                                                                                                                                                                                                                                                                                                 |

| OldValue | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>Previous value of the modified price book field. Maximum of 255 characters. |

## Usage

Price book history entries are indirectly created each time a price book is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

| UnitPrice        | <b>Type</b><br>currency<br><br><b>Properties</b><br>Create, Filter, Sort, Update<br><br><b>Description</b><br>Required. Unit price for this price book entry. You can specify a value only if <code>UseStandardPrice</code> is set to <code>false</code> . Label is <b>List Price</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| UseStandardPrice | <b>Type</b><br>boolean<br><br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Sort, Update<br><br><b>Description</b><br>Indicates whether this price book entry uses the standard price defined in the standard Pricebook2 record ( <code>true</code> ) or not ( <code>false</code> ). If set to <code>true</code> , then the <code>UnitPrice</code> field is read-only, and the value will be the same as the <code>UnitPrice</code> value in the corresponding PricebookEntry in the standard price book (that is, the PricebookEntry record whose <code>Pricebook2Id</code> refers to the standard price book and whose <code>Product2Id</code> and <code>CurrencyIsoCode</code> are the same as this record). For PricebookEntry records associated with the standard Pricebook2 record, this field must be set to <code>true</code> . |

## Usage

Use this object to define the association between your organization's products (Product2) and your organization's standard price book or to other, custom-defined price books ( Pricebook2). Create one PricebookEntry record for each standard or custom price and currency combination for a product in a Pricebook2.

When creating these records, you must specify the IDs of the associated Pricebook2 record and Product2 record. Once created, your client application can't update these IDs.

This object is defined only for those organizations that have products enabled as a feature. If the organization does not have the products feature enabled, then the PricebookEntry object does not appear in the `describeGlobal()` call, and you can't access it.

If you delete a PricebookEntry while a line item references it, the line item is unaffected, but the PricebookEntry will be archived and unavailable from the API.

You must load the standard price for a product before you are permitted to load its custom price(s).

|       | <ul style="list-style-type: none"> <li>Approval Process—Used to control the action taken for a record.</li> <li>State-based Process—Used internally to track various control processes, such as for developing Salesforce Knowledge articles.</li> </ul> |

## Usage

Use this object to read the description of an approval process. The definition is read-only.

## ProcessInstance

Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.

**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

For approval process instances that were completed before the Summer '14 rollout, all Process Instance fields are automatically populated, with one exception: `CompletedDate` is never populated for approval process instances that were completed before January 1, 2013. For approval process instances that were pending during the Summer '14 rollout, all ProcessInstance fields are automatically populated, with two exceptions: `CompletedDate` and `LastActorId` are populated only after the approval process instance is complete.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Portal and Communities users can't access this object.

## Fields

## Usage

Use this object to query or retrieve an approval process.

The following SOQL query returns details for all the ProcessInstanceStep records related to individual ProcessInstance records. The nested query references Steps, which is the child relationshipName for ProcessInstanceStep in the ProcessInstance object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM Steps)
FROM ProcessInstance
```

The following SOQL query returns details for all the ProcessInstanceWorkitem records related to individual ProcessInstance records. The nested query references Workitems, which is the child relationshipName for ProcessInstanceWorkitem in the ProcessInstance object.

```
SELECT Id, (SELECT Id, ActorId, ProcessInstanceId FROM Workitems)
FROM ProcessInstance
```

ProcessInstanceHistory can help provide a unified read-only view of the ProcessInstanceStep and ProcessInstanceWorkitem objects.

## Usage

This object helps you replicate the related list functionality of the Salesforce user interface for approval processes. Use `ProcessInstanceHistory` for a unified read-only view of the `ProcessInstanceStep` and `ProcessInstanceWorkitem` objects. You can't query `ProcessInstanceHistory`. Instead, you can query `ProcessInstanceHistory` by including it in a nested query on the parent `ProcessInstance` object. For example, the following SOQL query returns all the `ProcessInstanceHistory` records related to individual `ProcessInstance` records. The nested query references `StepsAndWorkitems`, which is the child `relationshipName` for `ProcessInstanceHistory` in the `ProcessInstance` object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM StepsAndWorkitems)
FROM ProcessInstance
```

This object respects field-level security on the parent object.

## ProcessInstanceStep

Represents one work item in an approval process (`ProcessInstance`).

**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

`ProcessInstanceStep` fields are never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all `ProcessInstanceStep` fields are populated only after the approval process instance is next acted upon after the Summer '14 rollout.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Portal and Communities users can't access this object.

## Usage

Query or retrieve a new step in an approval process (ProcessInstance).

SEE ALSO:

[ProcessInstance](#)

[ProcessInstanceHistory](#)

[ProcessInstanceWorkitem](#)

## ProcessInstanceNode

---

Represents a step in an instance of an approval process. Compare to ProcessNode, which describes the step in a process definition. Use this object to retrieve approval history.

**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

ProcessInstanceNode fields are never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all ProcessInstanceNode fields are populated only after the approval process instance is next acted upon after the Summer '14 rollout.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Portal and Communities users can't access this object.

## ProcessInstanceWorkitem

Represents a user's pending approval request.

 **Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

ProcessInstanceWorkitem fields are never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all ProcessInstanceWorkitem fields are populated after the approval process instance is next acted upon after the Summer '14 rollout, with three exceptions: `ElapsedTimeInDays`, `ElapsedTimeInDays`, and `ElapsedTimeInMinutes` fields are never populated in ProcessInstanceWorkitem records for which equivalent ProcessInstanceStep records were created before the Summer '14 rollout.

For all other ProcessInstanceWorkitem records, these three fields are populated after the approval process instance is next acted upon after the Summer '14 rollout.

 **Note:** Because ProcessInstanceHistory combines fields from ProcessInstanceStep and ProcessInstanceWorkitem, you may notice incorrect elapsed times of 0 in ProcessInstanceHistory records because the elapsed time fields were never populated in the related ProcessInstanceWorkitem record.

## Supported Calls

`delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

Portal and Communities users can't access this object.

## Fields

| Field                | Details                                                                                                                                                                              |

|                   | <b>Description</b><br>The external name of the node; the name seen by users.                                                                               |
| Name              | <b>Type</b><br>string<br><br><b>Properties</b><br>Filter, Group, Sort<br><br><b>Description</b><br>The unique node name.                                   |
| ProcessDefinition | <b>Type</b><br>reference<br><br><b>Properties</b><br>Filter, Group, Sort<br><br><b>Description</b><br>ID of the object affected by this approval instance. |

## Usage

Use this object to get the description of a process definition.

The following SOQL query returns details for all the ProcessInstanceStep records related to individual ProcessInstance records. The nested query references `Steps`, which is the child `relationshipName` for ProcessInstanceStep in the ProcessInstance object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM Steps)
FROM ProcessInstance
```

The following SOQL query returns details for all the ProcessInstanceWorkitem records related to individual ProcessInstance records. The nested query references `Workitems`, which is the child `relationshipName` for ProcessInstanceWorkitem in the ProcessInstance object.

```
SELECT Id, (SELECT Id, ActorId, ProcessInstanceId FROM Workitems)
FROM ProcessInstance
```

ProcessInstanceHistory can help provide a unified read-only view of the ProcessInstanceStep and ProcessInstanceWorkitem objects.

## Product2

Represents a product that your org sells.

This object has several fields that are used only for quantity and revenue schedules (for example, annuities). Schedules are available only for orgs that have enabled the products and schedules features. If these features aren't enabled, the schedule fields don't appear in the DescribeSObjectResult, and you can't query, create, or update the fields.

**Note:** Products are represented by Product2 objects. As of API version 8.0, the Product object is no longer available. Requests containing Product are refused, and responses do not contain the Product object.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field                               | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>CanUseQuantitySchedule</code> | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether the product can have a quantity schedule (<code>true</code>) or not (<code>false</code>). Label is <b>Quantity Scheduling Enabled</b>.</p>                                                                                                                                                                                                                                                                           |

|-------|---------------------------------------------------------------------------------|
|       | <b>Properties</b><br>Filter, Group, Nillable, Restricted picklist, Sort         |
|       | <b>Description</b><br>The type of the revenue schedule, if the product has one. |

## Schedule Enabled Flags

When enabling the schedules feature, orgs can decide whether to enable quantity schedules, revenue schedules, or both. In addition, you can use the API to control quantity and revenue scheduling at the product level via the `CanUseQuantitySchedule` and `CanUseRevenueSchedule` flags. A value of `true` for either flag indicates that the product and any `OpportunityLineItem`s can have a schedule of that type. These flags can be set when creating or updating `Product2` records.

## Default Schedule Fields

The remaining schedule fields for this object define default schedules. Default schedule values are used to create an `OpportunityLineItemSchedule` when an `OpportunityLineItem` is created for the `Product`.

The default schedule fields support the following valid values (all fields are also nillable).

| Field                                     | Valid Values                              |
|-------------------------------------------|-------------------------------------------|
| <code>RevenueScheduleType</code>          | Divide, Repeat                            |
| <code>RevenueInstallmentPeriod</code>     | Daily, Weekly, Monthly, Quarterly, Yearly |
| <code>NumberOfRevenueInstallments</code>  | Integer between 1 to 150, inclusive.      |
| <code>QuantityScheduleType</code>         | Divide, Repeat                            |
| <code>QuantityInstallmentPeriod</code>    | Daily, Weekly, Monthly, Quarterly, Yearly |
| <code>NumberOfQuantityInstallments</code> | Integer between 1 to 150, inclusive       |

When you attempt to set the schedule fields when creating or updating, the API applies cross-field integrity checks. The integrity requirements are:

- If the schedule type is nil, the installment period and number of installments must be nil.
- If the schedule type is set to any value, then the installment period and number of installments must be non-nil.

Any create or update that fails these integrity checks is rejected with an error.

These default schedule fields, as well as `CanUseQuantitySchedule` and `CanUseRevenueSchedule`, are restricted picklist fields and are available only if the org has the schedules feature enabled.

## Usage

Use this object to define the default product information for your org. This object is associated by reference with `Pricebook2` objects via `PricebookEntry` objects. The same product can be represented in different price books as price book entries. In fact, the same product can be represented multiple times (as separate `PricebookEntry` records) in the same price book with different prices or currencies. A

product can only have one price for a given currency within the same price book. To be used in custom price books, all standard prices must be added as price book entries to the standard price book.

You can query the products that have been configured for your org. For example, you can allow your client application to obtain valid product IDs for use when configuring PricebookEntry records via the API. Your client application can perform the following tasks on PricebookEntry objects:

- Query
- Create for the standard pricebook or custom pricebooks.
- Update
- Delete
- Change the `IsActive` field when creating or updating records

This object is defined only for those orgs that have products enabled as a feature. If the org does not have the products feature, this object does not appear in the `describeGlobal()` call, and you can't describe or query this object.

If you try to delete a product via the API but there is an opportunity that uses that product, the delete fails. The workaround is to delete the product in the user interface, which gives you an option to archive the product.

 **Note:** On opportunities and opportunity products, the workflow rules, validation rules, and Apex triggers fire when an update to a child opportunity product or schedule causes an update to the parent record. This means your custom application logic is enforced when there are updates to the parent record, ensuring higher data quality and compliance with your organization's business policies.

## Product2Feed

---

Represents a single feed item in the feed displayed on the detail page for a product record. This object is available in API version 18.0 and later.

A product feed shows recent changes to a product record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to products in Salesforce.

 **Note:** Products are represented by Product2 objects. As of API version 8.0, the Product object is no longer available. Requests containing Product are refused, and responses do not contain the Product object.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Product2 object
- "Moderate Chatter"

**Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| CommentCount | <p><b>Type</b><br/><code>int</code></p> <p><b>Properties</b><br/><code>Filter</code>, <code>Group</code>, <code>Sort</code></p> <p><b>Description</b><br/>The number of <code>FeedComments</code> associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with “CanApproveFeedPostAndComment” or “ModifyAllData” permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |

## Usage

Use the Profile object to query the set of currently configured user profiles in your organization. Your client application can use Profile objects to obtain valid profile IDs for use when querying or modifying users through the API.

In the user interface, profiles can be used to assign user licenses from specific pools (Force.com Platform user license or Salesforce user license, for example). If a user is assigned to a profile with a different license type, the number of available licenses in the old license type pool increases, one per user changed, and decreases by the same amount in the new license type pool.

[PermissionSet](#)

## ProfileSkill

Represents a profile skill, which describes a user's professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

 **Note:** For information about Live Agent skills, see the [Skill](#) topic.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Usage

Use the ProfileSkill object to look up the attributes of a skill that can be assigned to a user. This is a global object and is not owned by any specific user.

# ProfileSkillEndorsement

---

Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name         | Details                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | <b>Type</b><br>string<br><b>Properties</b><br>Autonumber, Defaulted on create, Filter, idLookup, Sort<br><b>Description</b><br>The name of the profile skill being endorsed. |
| ProfileSkillUserId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the ProfileSkillUser record that is being endorsed.          |
| UserId             | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The user ID of the person giving the endorsement.    |

## Usage

Use the ProfileSkillEndorsement object to query about a single endorsement given to a user about a specific skill. Users can't endorse themselves, they can only be endorsed by others unless they are administrators with the "Modify All Data" permission.

## ProfileSkillEndorsementFeed

---

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillEndorsement record. This object is available in API version 34.0 and later.

### Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                  |

## ProfileSkillEndorsementHistory

Represents the history of changes to the fields of a ProfileSkillEndorsement.

### Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Fields

| Field Name         | Details                 |
|--------------------|-------------------------|
| <code>Field</code> | <b>Type</b><br>picklist |

| Field Name                | Details                                                                                                                                      |

| NewValue                  | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The new value of the profile skill endorsement field. |
| OldValue                  | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The old value of the profile skill endorsement field. |
| ProfileSkillEndorsementId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The ID of the profile skill endorsement.       |

## Usage

Use this read-only object to identify changes to a ProfileSkillEndorsement.

## ProfileSkillFeed

Represents a single feed item in the feed displayed on the detail page for a profile skill.

A ProfileSkill feed shows recent changes to a ProfileSkill record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to solutions.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                  |

## Field Name

## Details

- **ContentPost**—a post with an attached file.
- **CreatedRecordEvent**—generated when a user creates a record from the publisher.
- **DashboardComponentAlert**—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- **DashboardComponentSnapshot**—created when a user posts a dashboard snapshot on a feed.
- **LinkPost**—a post with an attached URL.
- **PollPost**—a poll posted on a feed.
- **ProfileSkillPost**—generated when a skill is added to a user's Chatter profile.
- **QuestionPost**—generated when a user posts a question.
- **ReplyPost**—generated when Chatter Answers posts a reply.
- **RypplePost**—generated when a user creates a Thanks badge in Work.com.
- **TextPost**—a direct text entry on a feed.
- **TrackedChange**—a change or group of changes to a tracked field.
- **UserStatus**—automatically generated when a user adds a post. Deprecated.

The following values appear in the **Type** picklist for all feed objects but apply only to [CaseFeed](#):

- **AttachArticleEvent**—generated event when a user attaches an article to a case.
- **CallLogPost**—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- **CaseCommentPost**—generated event when a user adds a case comment for a case object.
- **ChangeStatusPost**—generated event when a user changes the status of a case.
- **ChatTranscriptPost**—generated event when Live Agent transcript is saved to a case.
- **EmailMessageEvent**—generated event when an email related to a case object is sent or received.
- **FacebookPost**—generated when a Facebook post is created from a case. Deprecated.
- **MilestoneEvent**—generated when a case milestone is completed or reaches violation status.
- **SocialPost**—generated when a social post is created from a case.

**Note:** If you set **Type** to **ContentPost**, also specify **ContentData** and **ContentFileName**.

## Usage

Use this object to track changes for a ProfileSkill record.

## ProfileSkillHistory

---

Represents the history of changes to the fields of a ProfileSkill.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

# Usage

Use this read-only object to identify changes to a ProfileSkill.

# ProfileSkillShare

Represents a sharing entry on a ProfileSkill.

# Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

# Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage

This object is read only. It is visible because of constraints to the ProfileSkill object, but it is ignored and does not control which users and groups can view and edit ProfileSkill records owned by other users.

## ProfileSkillUser

Represents a detail relationship of User. The object connects profile skills with users.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| UserId         | <b>Type</b><br>reference<br><br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><br><b>Description</b><br>The ID of the user. This field can't be changed once it is created. |

## Usage

Use this object to assign specific skills to specific users. ProfileSkillUser appears on the Overview tab on the Chatter profile page. Users can only create a skill mapping for themselves, they can't create skill mappings for others unless they are administrators with the "Modify All Data" permission. Additionally, users can only edit this object if they are the context user and are not editing the `UserId` field.

## ProfileSkillUserFeed

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillUser record. This object is available in API version 34.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this read-only object to identify changes to a ProfileSkillUser.

## PushTopic

Represents a query that is the basis for notifying listeners of changes to records in an organization. This is available from API version 21.0 or later.

## Supported Calls

REST: DELETE, GET, PATCH, POST (query requests are specified in the URI)

SOAP: `create()`, `delete()`, `describe()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

- This object is only available if Streaming API is enabled for your organization.
- Only users with “Create” permission can create this record.

## Fields

| Field               | Field Type | Description                                                                                                                                                                                                                                                                                                                                             |
|---------------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApiVersion          | double     | <p>Required. API version to use for executing the query specified in <code>Query</code>. It must be an API version greater than 20.0. If your query applies to a custom object from a package, this value must match the package's <code>ApiVersion</code>.</p> <p>Example value: 38.0</p> <p><b>Field Properties:</b> Create, Filter, Sort, Update</p> |

| Field                                   | Field Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                         |            | <p><b>Field Properties for API version 29.0 and later:</b> Filter, Sort</p> <p>In API version 29.0 and later, this field is read-only, and will not contain information about delete and undelete events. Use <code>NotifyForOperationCreate</code>, <code>NotifyForOperationDelete</code>, <code>NotifyForOperationUndelete</code> and <code>NotifyForOperationUpdate</code> to specify which record events should generate a notification.</p> <p>A value of <code>Extended</code> means that neither create or update operations are set to generate events.</p> |
| <code>NotifyForOperationCreate</code>   | boolean    | <code>true</code> if a create operation should generate a notification, otherwise, <code>false</code> . Defaults to <code>true</code> . This field is available in API version 29.0 and later.                                                                                                                                                                                                                                                                                                                                                                      |
| <code>NotifyForOperationDelete</code>   | boolean    | <code>true</code> if a delete operation should generate a notification, otherwise, <code>false</code> . Defaults to <code>true</code> . Clients must connect using the <code>cometd/29.0</code> (or later) Streaming API endpoint to receive delete and undelete event notifications. This field is available in API version 29.0 and later.                                                                                                                                                                                                                        |
| <code>NotifyForOperationUndelete</code> | boolean    | <code>true</code> if an undelete operation should generate a notification, otherwise, <code>false</code> . Defaults to <code>true</code> . Clients must connect using the <code>cometd/29.0</code> (or later) Streaming API endpoint to receive delete and undelete event notifications. This field is available in API version 29.0 and later.                                                                                                                                                                                                                     |
| <code>NotifyForOperationUpdate</code>   | boolean    | <code>true</code> if an update operation should generate a notification, otherwise, <code>false</code> . Defaults to <code>true</code> . This field is available in API version 29.0 and later.                                                                                                                                                                                                                                                                                                                                                                     |
| <code>Query</code>                      | string     | <p>Required. The SOQL query statement that determines which record changes trigger events to be sent to the channel.</p> <p>Limit: 1,300 characters</p> <p><b>Field Properties:</b> Create, Filter, Sort, Update</p>                                                                                                                                                                                                                                                                                                                                                |

## PushTopic and Notifications

The PushTopic defines when notifications are generated in the channel. This is specified by configuring the following PushTopic fields:

- PushTopic Queries
- Events
- Notifications

## QuantityForecast

Represents a quantity-based forecast.

The API also provides revenue-based forecasts using RevenueForecast.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Requires the “View All Data” permission.
- Customer Portal users can’t access this object.

## Fields

| Field          | Details                                                                                                                                                                                                                                                                                   |

## Usage

Query this object to support customizable forecasts based on quantities.

You can update one field, `Quota`, which means that you can mass update sales users' quotas instead of updating them one by one in the user interface. Editing `Quota`, which means that you can mass update sales users' quotas instead of updating them one by one in the user interface. Editing `Quota` requires the “Modify All Data” and “Manage Users” permissions.

The rollup fields always reflect opportunity and opportunity product overrides by the forecast owner or one of the forecast owner’s subordinates in the role hierarchy. In addition, the manager rollup fields include overrides by the forecast owner's direct manager in the role hierarchy.

Some of the rollup fields ignore forecast-level (**Adjusted Total**) overrides, but they never ignore opportunity forecast overrides that are visible to the owner or manager.

## Usage

This is a read-only object specific to customizable forecasting.

When a user submits a revenue-based forecast in the user interface, a new record is created. If the same forecast is ever resubmitted, additional records are added. The `CreatedDate` of a record reflects the day on which the forecast was submitted. This object respects field level security on the parent object.

## QueueRoutingConfig

Represents the settings that determine how work items are routed to agents. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CapacityPercentage | <p><b>Type</b><br/>percent</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel.</p> <p>For example, you might give phone calls a capacity percentage of <code>100</code>. If an agent receives a phone call, the agent won't receive new work items until the call ends, because at that point the agent's capacity will have reached 100%.</p> <p>This field is available in API version 33.0 and later.</p>                                            |
| CapacityWeight     | <p><b>Type</b><br/>double</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>The amount of an agent's capacity for work items that's consumed by a work item from this service channel.</p> <p>For example, if an agent has a capacity of <code>6</code>, and cases are assigned a capacity weight of <code>2</code>, an agent can be assigned up to 3 cases before the agent is at capacity and can't receive new work items.</p> <p>This field is available in API version 33.0 and later.</p>                                                                                       |
| DeveloperName      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> |

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |  <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.                                                                   |
| Language        | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The language of the presence status.</p>                                                                                                                                                                    |
| MasterLabel     | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The label of the presence status.</p>                                                                                                                                                                                                                             |
| PushTimeout     | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>The number of seconds set for push timeout. <b>0</b> is returned when push timeout isn't enabled. Available in API version 36.0 and later.</p>                                                                                                             |
| RoutingModel    | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The routing type that determines how work items are routed (pushed) to agents. Possible values are <code>Least Active</code> and <code>Most Available</code>.</p>                                                                          |
| RoutingPriority | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The priority in which work items from the service channels that are related to this routing configuration are routed to agents. Work items from routing configurations that have lower priority values (for example, <code>0</code>) are routed to agents first.</p> |

| Field            | Details                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------|
| ServiceChannelId | <p><b>Type</b></p> reference                                                                       |
|                  | <p><b>Properties</b></p> Create, Filter, Group, Nillable, Sort, Update                             |
|                  | <p><b>Description</b></p> The ID of the service channel that's associated with this configuration. |

## Question

Represents a question in a community that users can view and reply to.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

## Usage

Use this object to track questions in azone.

## QuestionDataCategorySelection

A data category selection represents a data category that classifies a question.

This object can be used to associate a question with a data category from a data category group or to query the categorization for a question.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

To create, read or update data category selection, you must have create, read or update permission on the categorized question. Users who can update question can also delete its category selection. Users who can create questions can only select categories visible to their role.

## Fields

| Field Name            | Details                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataCategoryGroupName | <b>Type</b><br><a href="#">DataCategoryGroupReference</a><br><b>Properties</b><br>Create<br><b>Description</b><br>Unique name of the data category group which has a category associated with the question. |
| DataCategoryName      | <b>Type</b><br><a href="#">DataCategoryGroupReference</a><br><b>Properties</b><br>Create<br><b>Description</b><br>Unique name of the data category associated with the question.                            |
| ParentId              | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter<br><b>Description</b><br>ID of the question associated with the data category selection.                                                    |

## Usage

Every question can be categorized in a data category. You can use the QuestionDataCategorySelection object to query and manage question categorization. Client applications can create categorization for a question. They can also delete, query, and retrieve question categorization.

**Warning:** Even though the API lets you select more than one category for QuestionDataCategorySelection, the Answers tab only supports one data category selection for questions. Selecting multiple categories through QuestionDataCategorySelection may result in unexpected behavior in the Answers tab, such as losing your multiple selections. You should only select one data category when using QuestionDataCategorySelection.

## Sample Code—Java

In the following example, the `selectCategory` method adds a category to a question data category selection. The `retrieveCategorySelections` method returns all the categories from a question data category selection.

```
public void selectCategory(ID parentId, String categoryGroupName, String categoryName) {
    try {
        QuestionDataCategorySelection categorySelection = new
        QuestionDataCategorySelection();

        categorySelection.setParentId(parentId);
        categorySelection.setDataCategoryGroupName(categoryGroupName);
        categorySelection.setDataCategoryName(categoryName);
        binding.create(new SObject[]{categorySelection});
    } catch (RemoteException e) {
        System.out.println("An unexpected error has occurred." + e.getMessage());
    }
}

public String[] retrieveCategorySelections(String parentId) {
    QueryResult qr = null;

    try {
        qr = binding.query("SELECT DataCategoryName FROM QuestionDataCategorySelection
        WHERE Id = '" + parentId + "'");
    } catch (RemoteException e) {
        System.out.println("An unexpected error has occurred." + e.getMessage());
    }

    String[] categoryNames = new String[qr.getRecords().length];
    for (int index = 0; index < qr.getRecords().length; index++) {
        categoryNames[index] =
        ((QuestionDataCategorySelection)qr.getRecords()[index]).getDataCategoryName();
    }

    return categoryNames;
}
```

Salesforce Knowledge uses a similar object for article data category selection. See [Article Type\\_\\_DataCategorySelection](#) for SOQL examples using this object.

## QuestionReportAbuse

---

Represents a user-reported abuse on a Question in a Chatter Answers community. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field      | Details                                                                                                                                                                                                                |

## Usage

Use this object to track user-reported abuse on questions created in a Chatter Answers community.

## QuestionSubscription

Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field               | Details                                                                                                                                                                                                                             |

| SubscriberId        | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Required. ID of the User who is following the Question. This field can't be updated.</p>                |

## Usage

Things to consider when following a Question:

- A user can only follow questions that they have permission to view.
- Administrators and users with the “Modify All Data” permission can configure other users to follow questions that the other user has read access to.
- Administrators and users with the “Modify All Data” permission can configure users to stop following questions.

Queries on QuestionSubscription:

- Users with the “Read” permission on Question can see which questions other users are following.
- A query must include a LIMIT clause and the limit can’t exceed 1,000.
- A query using a WHERE clause can only filter by fields on Question.

## QueueSubject

---

Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object. A queue is a Group whose `Type` is `Queue`. To create a Group, you must have the “Manage Users” permission.

## Fields

| Field                    | Details                                                                                                                                                                                                                                         |

[Object Basics](#)

## QuickText

---

This object stores a snippet of text that allows an agent to send a quick response to a customer in the Live Agent console. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Name           | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter (unavailable in API version 25.0 and later), Group, Sort (unavailable in API version 25.0 and later), Update<br><b>Description</b><br>A descriptive label for the Quick Text record                                            |
| OwnerId        | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Sort, Update<br><b>Description</b><br>ID of the <a href="#">User</a> who owns the Quick Text record                                                                                            |

## Usage

Use this object to create and manage the QuickText messages available to agents in the Live Agent console. You can categorize multiple QuickText records into groups using the Category field. The Category field can also be a parent to multiple custom dependent Picklist fields to create a hierarchical structure of categories.

# QuickTextHistory

Represents changes to field values on a QuickText object. This object is available in API version 24.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name  | Details                                                                                                                                                                             |

## Usage

Use this object to identify changes to a QuickText.

## QuickTextOwnerSharingRule

---

Represents a rule for sharing a QuickText object with users other than the owner.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

## Usage

Use this object to manage the sharing rules for a QuickText object.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

# QuickTextShare

Represents a sharing entry on a QuickText object. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage

This object lets you determine which users and groups can view and edit QuickText records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

## Quote

The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

Quotes can be created from and synced with opportunities, and emailed as PDFs to customers

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field     | Details                                                                                                                                                                       |

## Usage

Use Quote to manage proposed product prices for customers. To update a Quote, your client application needs “Edit” permission.

- Client applications can create, update, delete, and query Attachment records associated with a quote via the API.
- You can sync a quote and its parent Opportunity.

## Usage

Use the QuoteDocument object to store a document that can be used to present the quote information to the customer.

SEE ALSO:

- [Quote](#)
- [QuoteLineItem](#)

## QuoteLineItem

The QuoteLineItem object represents a quote line item, which is a member of the list of Product2 products associated with a Quote, along with other information about those line items on that quote. Available in API version 18.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

The user must have “Edit” permissions on Quote records in order to create or update quote line items on a quote. The user must have “Edit” permissions on Quote records to delete a quote line item.

## Usage

A Quote record can have QuoteLineItem records only if the Quote has a Pricebook2. A QuoteLineItem must correspond to a Product2 that is listed in the quote's Pricebook2.

**Note:** If the multicurrency option has been enabled, the `CurrencyIsoCode` field is present. It can't be modified, it is always set to the value of the `CurrencyIsoCode` of the parent Quote.

## Effects on Quotes

Quotes that have associated QuoteLineItem objects are affected in the following ways:

- Creating a QuoteLineItem increments the Quote value by the `TotalPrice` of the QuoteLineItem.
- When you create or update a QuoteLineItem, the API verifies that the line item corresponds to a PricebookEntry in the Pricebook2 that is associated with the quote.

## RecentlyViewed

Represents records that the current user has recently viewed or referenced (by viewing a related record).

## Supported Calls

`query()`, `update()`

## Special Usage Rules

The RecentlyViewed object does not support the Report, KnowledgeArticle, and Article objects.

## Fields

| Field     | Details                                                                                                                                                                                                                                                                                                                      |

## Usage

This object provides a heterogeneous list of different object types and consists of recently viewed records or records that were recently referenced (a related record was viewed). A record is considered viewed when the user sees the details associated with it, but not when the user sees it in a list with other records. Use this object to programmatically construct a list of recently viewed items specific to the current user, for example, on a custom user interface or for search auto-complete options. You can also retrieve a filtered list of records by object type (`Type`). The RecentlyViewed data is periodically truncated down to 200 records per object.

Use this query in your code to retrieve a list of all the records that were recently viewed. The results are ordered from most to least recent.

```
SELECT Id, Name
FROM RecentlyViewed
WHERE LastViewedDate !=null
ORDER BY LastViewedDate DESC
```

Use this query to retrieve data that was either viewed or referenced, but only for a limited set of objects.

```
SELECT Id, Name
FROM RecentlyViewed
WHERE Type IN ('Account', 'Contact', 'Plan__c')
ORDER BY LastViewedDate DESC
```

This query retrieves a list of all recently viewed contacts with contact-specific fields, such as the contact's account name, and the custom website field. Records are ordered from most to least recent.

```
SELECT Account.Name, Title, Email, Phone, Website__c
FROM Contact
WHERE LastViewedDate != NULL
ORDER BY LastViewedDate DESC
```

## RecordType

Represents a record type.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Record Type Name</b>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| IsActive      | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Indicates whether this record is active (<code>true</code>) or not (<code>false</code>). Only active record types can be applied to records. Label is <b>Active</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IsPersonType  | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter</p> <p><b>Description</b><br/>Indicates whether this record has been designated as a person account (<code>true</code>) or not (<code>false</code>). Visible only if the organization has the person account feature enabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| NamespacePrefix | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Filter, Group, Nillable, Sort</p> <p><b>Description</b></p> <p>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> <p>This field can't be accessed unless the logged-in user has the "Customize Application" permission.</p> |
| ObjectType      | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b></p> <p>Object to which this record type applies, including custom objects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Usage

Use this object to offer different BusinessProcess records and subsets of picklist values to different users based on their Profile. Your client application can describe or query RecordType records.

The following objects have a `RecordTypeId` field:

- Account
- Campaign
- CampaignMember
- Case

- Contact
- Contract
- Lead
- Opportunity
- QuickText
- Solution
- Custom objects

Client applications can create or update values in `RecordTypeId` on these objects, specifying a valid record type ID associated with these objects.

 **Note:** You can't create or update the `RecordTypeId` field on the CampaignMember records. Set the CampaignMember record type using the `CampaignMemberRecordTypeId` field on Campaign.

A client application can retrieve the list of valid record type IDs for a given object by querying the `RecordType`.

## RecordTypeLocalization

---

Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

### Fields

| Field    | Details                                                                                                                                                                                 |

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Nillable</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"><li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li><li>• In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li></ul> |
| ParentId        | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Nillable</p> <p><b>Description</b><br/>The ID of the RecordType associated with the label that is being translated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Usage

Use this object to translate the labels of your record types into other supported languages.

## Reply

Represents a reply that a user has submitted to a question in an answers community.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| ReplyId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the Reply from which the user reported abuse. |

## Usage

Use this object to track user-reported abuse on replies created in a Chatter Answers community.

## Report

Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Supported Query Scopes

Use these scopes to help specify the data your SOQL query returns.

### **allPrivate**

Records saved in all users' private folders.

Requires the user permission "Manage All Private Reports and Dashboards" and [Enhanced Analytics Folder Sharing](#). If your organization was created after the Summer '13 release, you already have Enhanced Analytics Folder Sharing. Available in API version 36.0 and later.

### **created**

Records created by the user running the query.

### **everything**

All records except records saved in other users' private folders.

### **mine**

Records saved in the private folder of the user running the query.

### **organizationOwned**

Records saved in Unfiled Public Reports. In Lightning Experience, the Unfiled Public Reports folder is called Public Reports.

## Usage

Use the report object to get report metadata. Query, search, or retrieve specific metadata on reports. Report object fields are read-only.

## Example: Reports with "Sales" in Their Name

This SOQL query returns reports that contain the name "Sales" and lists their developer names, format, ID, and report name.

```
SELECT DeveloperName,Format,Id,Name FROM Report WHERE Name LIKE '%Sales%'
```

## Example: Reports in an Inactive User’s Private Folder

This SOQL query returns reports saved in a specific user’s private folder.

```
SELECT Id FROM Report USING SCOPE allPrivate WHERE OwnerId = '005A0000000Bc2deFG'
```

SEE ALSO:

- [ReportFeed](#)
- [ReportTag](#)
- [Dashboard](#)

## ReportFeed

Represents a single feed item in the feed displayed on a report. This object is available in API version 20.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:

- “Modify All Data”
- “Moderate Chatter”

 **Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                             |

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <p><b>Description</b></p> <p>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId       | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Filter, Group, Nillable, Sort</p> <p><b>Description</b></p> <p>When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ContentData        | <p><b>Type</b></p> <p>base64</p> <p><b>Properties</b></p> <p>Nillable</p> <p><b>Description</b></p> <p>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage

ReportTag stores the relationship between its parent TagDefinition and the Report being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

# ReputationLevel

---

Represents a reputation level defined for a community. This object is available in API version 32.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization. Only users with permissions to create or manage a community can view the ReputationPointsRule records.

## Fields

| Field Name  | Details                                                                                                                                                                 |

| <code>NamespacePrefix</code> | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><code>namespacePrefix__componentName</code></b> notation. The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> |

# ReputationPointsRule

Represents the reputation point rules for a community. Each rule specifies an action that community members can earn points from and the points associated with those actions in a particular community. This object is available in API version 32.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization. Only users with permissions to create or manage a community can view the ReputationPointsRule records.

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                      |

## ResourceAbsence

Represents a time period in which a service resource is unavailable to work. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

Field Service Lightning must be enabled. To create or update resource absences, you need “Read” access to service resources. To delete resource absences, you need “Edit” access to service resources.

The default value is <i>Vacation</i>. You can add custom values if needed.</p> |

## Usage

The Absences related list on a service resource detail page lets you define periods of time when the resource is unavailable to work. Unless you're using the Field Service Lightning managed packages with the scheduling optimizer, service resources can still be assigned appointments that conflict with their absences.

 **Tip:** Create a trigger that sends an approval request to a supervisor when a service resource creates an absence.

If you're not using the Field Service Lightning managed packages, a calendar view isn't available for individual service resources.

## ResourceAbsenceFeed

---

Represents a single feed item on a resource absence record detail page. This object is available in API version 38.0 and later.

A resource absence feed shows changes to tracked fields on a resource absence record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to resource absences in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Resource Absence object
- "Moderate Chatter"

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                    |

## Usage

Query this object to support customizable forecasts based on revenue. Requires the “View All Data” permission.

You can also update `CurrencyIsoCode` and `Quota`, which means that you can mass update sales users' quotas instead of updating them one by one in the user interface. Editing `Quota` requires “Modify All Data” and “Manage Users” permissions.

The rollup fields always reflect opportunity and opportunity product overrides by the forecast owner or one of the forecast owner’s subordinates in the role hierarchy. In addition, the manager rollup fields include overrides by the forecast owner's direct manager in the role hierarchy.

Some of the rollup fields ignore forecast-level (**Adjusted Total**) overrides, but they never ignore opportunity forecast overrides that are visible to the owner or manager.

# RevenueForecastHistory

---

Represents historical information about revenue-based forecasts that have been submitted (saved) in the user interface.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Requires the “View All Data” permission.
- Customer Portal users can’t access this object.

## Usage

This is a read-only object specific to customizable forecasting.

When a user submits a revenue-based forecast in the user interface, a new record is created. If the same forecast is ever resubmitted, additional records are added. The `CreatedDate` of a record reflects the day on which the forecast was submitted. This object respects field-level security on the parent object.

## RuleTerritory2Association

Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization's sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## SamlSsoConfig

Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

Single sign-on is a process that allows network users to access all authorized network resources without having to log in separately to each resource. Single sign-on allows you to validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Scontrol

A custom s-control, which is custom content that is hosted by the system but executed by the client application.

**Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited. We recommend that you move your s-controls to Visualforce. We continue to support the Scontrol object.

Represents a custom s-control, which is custom content that the system hosts, but client applications execute. An s-control can contain any type of content that you can display or run in a Web browser.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

- Your organization must be using Enterprise, Developer, or Unlimited Edition and be enabled for custom s-controls.
- Customer Portal users can't access this object.

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                          |

|             | <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>S-Control Name</b>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> |
| SupportsCaching | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Indicates whether the s-control supports caching (<code>true</code>) or not (<code>false</code>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Usage

Use custom s-controls to manage custom content that extends application functionality. All users can view custom s-controls, but the "Customize Application" permission is required to create or update custom s-controls.

SEE ALSO:

[Object Basics](#)

## ScontrolLocalization

The translated value of the field label for an s-control.

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

When the Translation Workbench is enabled for your organization, provides the translation of the field label of an s-control.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, or Unlimited Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

| Field             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                         | <p><b>Description</b></p> <p>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><code>namespacePrefix__componentName</code></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> |

## Usage

Use this object to translate your s-controls into a supported language. Users with the Translation Workbench enabled can view s-control translations, but either the "Customize Application" or "Manage Translation" permission is required to create or update s-control translations.

# SearchPromotionRule

---

Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user's search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

A user must have the "Manage Promoted Search Terms" permission.

## Fields

| Field Name       | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The article must be in published status.</p>                                                                                                                                                                                                                                                              |
| Query            | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort, Update</p> <p><b>Description</b></p> <p>The text of the promoted search term. Maximum length: 100 characters.</p> <p>You can associate the same promoted search term with multiple articles. If the user's search matches the promoted term, all associated articles are promoted in search results, ordered by relevancy. For best results, create promoted search terms selectively and limit the number of articles that are promoted per term.</p> |

## Usage

Use this object to optimize article search results in Salesforce Knowledge.

# SecureAgent

Represents a Secure Agent that connects Salesforce to on-premises external data sources like SharePoint 2010 and 2013. This object is available in API version 32.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| Language      | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The language of agent labels in the user interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| SecureAgentsClusterId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The ID of a cluster of agents that contains this individual agent. Clusters provide failover protection if an agent on a particular server becomes inaccessible. To edit them, use the <a href="#">SecureAgentsCluster</a> object.<br/><br/>This field is available in API version 35 and later.</p> |

## SecureAgentsCluster

Represents a cluster consisting of several Secure Agents on different servers. Clusters provide failover protection if an agent on a particular server becomes inaccessible. This object is available in API version 35.0 and later.

Secure Agents connect Salesforce to content in on-premises external data sources, such as SharePoint 2010 and 2013. To edit individual agents that are part of a cluster, use the [SecureAgent](#) object.

## Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| Language      | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The language of cluster labels in the user interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MasterLabel   | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The user-interface name for the cluster.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

# SelfServiceUser

Represents a Contact who has been enabled to use your organization's Self-Service portal, where he or she can obtain online support.

**Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

## Supported Calls

`create()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field     | Details                                                                                                                                                                                                                                                                                                                                         |

| LocaleSidKey      | <p><b>Type</b><br/>picklist</p>                                                                                                                                                                                                                                                                                                                                                           |

| Field          | Details                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>Required. This is a restricted picklist field. The value of this field affects the formatting and parsing of values, especially numeric values, in the Self-Service portal. Values are two-letter codes that indicate language and sometimes language and country. The codes are based on ISO standards.</p> |
| Name           | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>Concatenation of <code>FirstName</code> and <code>LastName</code>. Limited to 121 characters.</p>                                                                                                                                                                                                                   |
| SuperUser      | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether this Self-Service user is a super user with additional access on his or her company's Self-Service portal (<code>true</code>) or not (<code>false</code>).</p>                                                                                                              |
| TimeZoneSidKey | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>Required. This is a restricted picklist field. The time zone of a affects the offset used when displaying or entering times in the Self-Service portal.</p>                                                                                                                  |
| Username       | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Required. This contains the name that a Self-Service user enters to log into the Self-Service portal. Value must be unique in your organization. If you try to create or update a user with a duplicate value, the operation is rejected and an error is returned.</p>                              |

## Usage

For security reasons, you can't query Self-Service user passwords via the API or the user interface. However, the API allows you to set and reset Self-Service user passwords using the `setPassword()` and `resetPassword()` calls.

SelfServiceUser records created from the API don't cause a notification email to be sent. If you want to notify the user, you must send them an email after creating the user.

## ServiceAppointment

---

Represents an appointment to complete field service work for a customer. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Field Service Lightning must be enabled.

## Usage

Service appointments always have a parent record, which can be a work order, work order line item, opportunity, account, or asset. The type of parent record tells you about the nature of the service appointment:

- Service appointments on *work orders* and *work order line items* offer a more detailed view of the work being performed. While work orders and work order line items let you enter general information about a task, service appointments are where you add the details about scheduling and ownership.
- Service appointments on *assets* represent work being performed on the asset.
- Service appointments on *accounts* represent work being performed for the account.
- Service appointments on *opportunities* represent work that is related to the opportunity.

## ServiceAppointmentFeed

---

Represents a single feed item on a service appointment record detail page. This object is available in API version 38.0 and later.

A service appointment feed shows changes to tracked fields on a service appointment record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to service appointments in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Operating Hours object
- "Moderate Chatter"

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                      |

## ServiceAppointmentHistory

Represents the history of changes made to tracked fields on a service appointment. This object is available in API version 38.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name | Details                 |
|------------|-------------------------|
| Field      | <b>Type</b><br>picklist |

| Field Name           | Details                                                                                                                                                                                                         |

| ServiceAppointmentId | <b>Type</b><br>reference<br><br><b>Properties</b><br>Filter, Group, Sort<br><br><b>Description</b><br>ID of the service appointment being tracked. The history is displayed on the detail page for this record. |

## ServiceAppointmentOwnerSharingRule

Represents the rules for sharing a service appointment with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field                         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| DeveloperName                 | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId                       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID representing the source group. A service appointment owned by a User in the source Group triggers the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## ServiceAppointmentShare

Represents a sharing entry on a service appointment. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name  | Details                                                                                                                                                                                                                                                                                  |

## ServiceChannel

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CapacityPercentage | <p><b>Type</b><br/>percent</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel.</p> <p>For example, you might give phone calls a capacity percentage of <code>100</code>. If an agent receives a phone call, the agent won't receive new work items until the call ends, because at that point the agent's capacity will have reached 100%.</p> <p>This field is available in API version 32.0 and earlier. For later API versions, you can set the capacity percentage of work items on the <a href="#">QueueRoutingConfig</a> object.</p>                                                                                                                                                                                                                                                |
| CapacityWeight     | <p><b>Type</b><br/>double</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>The amount of an agent's capacity for work items that's consumed by a work item from this service channel.</p> <p>For example, if an agent has a capacity of <code>6</code>, and cases are assigned a capacity weight of <code>2</code>, an agent can be assigned up to 3 cases before the agent is at capacity and can't receive new work items.</p> <p>This field is available in API version 32.0 and earlier. For later API versions, you can set the capacity weight of work items on the <a href="#">QueueRoutingConfig</a> object.</p>                                                                                                                                                                                                                                                                                               |
| DeveloperName      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

| Field         | Details                                                                                                                                                                                                   |

## Usage

Use this object to query and manage service contracts.

SEE ALSO:

[ServiceContractHistory](#)

[ServiceContractShare](#)

[ServiceContractOwnerSharingRule](#)

## ServiceContractFeed

Represents a single feed item in the feed displayed on the detail page for a service contract record. This object is available in API version 23.0 and later.

A service contract feed shows recent changes to a service contract for any fields that are tracked in feeds, and comments and posts about the record. It's a useful way to stay up-to-date with changes to service contracts.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the ServiceContract object
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CommentCount | <p><b>Type</b></p> <p>int</p> <p><b>Properties</b></p> <p>Filter, Group, Sort</p> <p><b>Description</b></p> <p>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |

## ServiceContractHistory

---

Represents the history of changes to the values in the fields on a `ServiceContract` (customer support agreement). This object is available in API version 18.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field     | Details                                                                                                                                                                                                                                                        |

## Usage

Use this object to identify changes to a service contract.  
This object respects field level security on the parent object.

- [ServiceContractShare](#)
- [ServiceContractOwnerSharingRule](#)

## ServiceContractOwnerSharingRule

Represents the rules for sharing a ServiceContract (customer service agreement) with users other than the owner. This object is available in API version 18.0 and later.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Field Name    | Details                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Description</b><br>The ID representing the source group. Service contracts owned by users in the source group trigger the rule to give access.                                                                                                      |
| Name          | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to <b>Label</b> in the user interface. |
| UserorGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter<br><b>Description</b><br>The ID representing the target user or group. Target users or groups are given access.                                                                        |

## Usage

Use this object to manage the sharing rules for a service contract. General sharing and territory management-related sharing use this object.

## ServiceContractShare

Represents a sharing entry on a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|       | <b>Properties</b><br>Create, Filter                                                              |
|       | <b>Description</b><br>ID of the User or Group that has been given access to the ServiceContract. |

## Usage

This object allows you to determine which users and groups can view and edit ServiceContract records owned by other users.

If you attempt to create a new record that matches an existing record, the create call updates any modified fields and returns the existing record.

|               | <b>Description</b><br>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. |

| Field       | Details                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             |  <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record. |

## ServiceResource

Represents a service technician or dispatcher in field service. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

Field Service Lightning must be enabled.

| ResourceType    | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b></p> <p>Indicates whether a resource is a technician or a dispatcher. Resources who are dispatchers can't be capacity-based or included in scheduling optimization. Only users with the "Field Service Dispatcher" permission set license can be dispatchers.</p> <p> <b>Note:</b> You can't add additional resource types.</p> |

## Usage

View service resources on the Service Resources tab. In addition:

- Service resources that are assigned to a service appointment appear in the Assigned Resources related list on the appointment detail page. You can assign multiple service resources to an appointment.
- Service resources that belong to a service territory appear in the Service Territory Members related list on the territory detail page.

For tracking purposes, service resources can only be deactivated, not deleted. To deactivate a service resource, deselect **Active** on their detail page.

Deactivating a user deactivates the related service resource. You can't create a service resource that is linked to an inactive user.

## ServiceResourceCapacity

Represents the maximum number of scheduled hours or number of service appointments that a capacity-based service resource can complete within a specific time period. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Fields

| TimePeriod        | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>Days, Hours, or Months. For example, if a resource can work 80 hours per month, the capacity's Time Period would be <i>Month</i> and Hours per Time Period would be <i>80</i>.</p> |

## Usage

Service resources who are capacity-based can only work a certain number of hours or complete a certain number of service appointments within a specified time period. Contractors tend to be capacity-based. To indicate that a service resource is capacity-based, select **Capacity-Based** on the service resource detail page, then define their capacity in the Capacities related list:

1. Click **New Resource Capacity**.
2. Enter a start date and an end date to indicate when the capacity is in effect for the resource. For example, if the capacity represents a six-month contract, enter the contract's start and end dates.
3. Specify how much the resource can work:

- Select the `Time Period` that the capacity is based on: hours, days, or months. For example, if the resource can work 80 hours per month, select **Month**.
- If you want the resource’s capacity to be based on the number of hours worked, fill out `Hours per Time Period`. For example, if the resource can work 80 hours per month, enter `80`.
- If you want the resource’s capacity to be based on the number of service appointments they are assigned to, fill out `Work Items per Time Period`. For example, if the resource can complete 20 appointments per month, enter `20`.

 **Note:** If you’re using the Field Service Lightning managed packages and would like to measure capacity both in hours and in number of work items, enter a value for both. The resource is considered to reach their capacity based on whichever term is met first—hours or number of work items.

4. Click **Save**. You can set multiple capacities for a resource as long as their start and end dates do not overlap.

 **Important:** If you aren’t using the Field Service Lightning managed packages, capacity serves more as a suggestion than a rule. Resources can still be as scheduled beyond their capacity, and you aren’t notified when a resource exceeds their capacity.

## ServiceResourceCapacityFeed

Represents a single feed item on a service resource capacity record detail page. This object is available in API version 38.0 and later. A service resource capacity feed shows changes to tracked fields on a service resource capacity record. It also shows posts and comments about the record. It’s a useful way to stay up to date with changes made to service resource capacities in Salesforce.

### Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:

- “Modify All Data”
- “Modify All” on the Operating Hours object
- “Moderate Chatter”

### Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                  |

## ServiceResourceCapacityHistory

Represents the history of changes made to tracked fields on a service resource capacity record. This object is available in API version 38.0 and later.

### Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Special Access Rules

Field Service Lightning must be enabled in your organization, and field tracking for service resource capacity fields must be configured.

## Fields

| Field Name                | Details                                                                                                                                                                                                 |

|------------|----------------------------------------------|
|            | <b>Description</b><br>The type of feed item. |

## ServiceResourceHistory

Represents the history of changes made to tracked fields on a service resource. This object is available in API version 38.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name | Details                                                                                                                                                   |

|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ServiceResourceId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the service resource being tracked. The history is displayed on the detail page for this record. |

## ServiceResourceOwnerSharingRule

Represents the rules for sharing a service resource with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## ServiceResourceSkill

Represents a skill that a service resource possesses. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                  |

| Field Name  | Details                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SkillNumber | <b>Type</b><br>string<br><b>Properties</b><br>Autonumber, Defaulted on create, Filter, Sort<br><b>Description</b><br>An auto-generated number identifying the resource skill assignment. |

## Usage

You can assign skills to all service resources in your org to indicate their certifications and areas of expertise, and specify each resource's skill level from 0 to 99.99. For example, you can assign Maria the "Welding" skill, level 50.

If you intend to use the skills feature, determine which skills you want to track and how skill level should be determined. For example, you may want the skill level to reflect years of experience, certification levels, or license classes.

## ServiceResourceSkillFeed

Represents a single feed item on a service resource skill record detail page. This object is available in API version 38.0 and later.

A service resource skill feed shows changes to tracked fields on a service resource skill record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to service resource skills in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Operating Hours object
- "Moderate Chatter"

## Fields

| Field Name | Details                                                        |
|------------|----------------------------------------------------------------|
| Body       | <b>Type</b><br>textarea<br><b>Properties</b><br>Nillable, Sort |

| Field Name                | Details                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | <b>Description</b><br>The message that appears in the feed. Required when <code>Type</code> is <code>TextPost</code> . Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code> .                                                                                        |
| <code>CommentCount</code> | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The number of comments associated with this feed item.                                                                                                                                                       |
| <code>InsertedById</code> | <b>Type</b><br>reference<br><b>Properties</b><br>Group, Nillable, Sort<br><b>Description</b><br>ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the value is set to the ID of the logged-in user. |
| <code>IsRichText</code>   | <b>Type</b><br>boolean<br><b>Properties</b><br>Defaulted on create, Filter, Group, Sort<br><b>Description</b><br><code>true</code> indicates that the body of the feed contains rich text. <code>false</code> indicates that the post is rendered as plain text.                                     |
| <code>LikeCount</code>    | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The number of feed likes associated with this feed item.                                                                                                                                                     |
| <code>LinkUrl</code>      | <b>Type</b><br>url<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The URL of a link post.                                                                                                                                                                                           |

| Field Name      | Details                                                                                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParentId        | <b>Type</b><br>reference <b>Properties</b><br>Filter, Group, Sort <b>Description</b><br>ID of the service resource skill record tracked in the feed. The feed is displayed on the detail page for this record.                             |
| RelatedRecordId | <b>Type</b><br>reference <b>Properties</b><br>Group, Nillable, Sort <b>Description</b><br>ID of the <code>ContentVersion</code> object associated with a content post. This field is null for all posts, except <code>ContentPost</code> . |
| Title           | <b>Type</b><br>string <b>Properties</b><br>Group, Nillable, Sort <b>Description</b><br>The title of the feed item. When the <code>Type</code> is <code>LinkPost</code> , the Link URL is the URL, and this field is the link name.         |
| Type            | <b>Type</b><br>picklist <b>Properties</b><br>Filter, Group, Nillable, Restricted picklist, Sort <b>Description</b><br>The type of feed item.                                                                                               |

## ServiceResourceSkillHistory

Represents the history of changes made to tracked fields on a service resource skill. This object is available in API version 38.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name             | Details                                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| TopLevelTerritoryId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>(Read only) The top-level territory in a hierarchy of service territories. Depending on where a territory lies in the hierarchy, its top-level territory might be the same as its parent. |

## Usage

View service territories on the Service Territories tab. You can also view a service resource's territories on the Service Territories related list on the resource detail page.

If you want to use service territories, determine which territories you need to create. Depending on how your business works, you may decide to create territories based on cities, counties, or other factors. If you plan to build out a hierarchy of service territories, create the highest-level territories first.

Create service territories from the Service Territories tab in Salesforce. After you create a territory, you can add members to it via the Service Territory Members related list. Service territory members are resources who work within the territory, and associating them with a territory ensures that they're assigned to appointments near their home base.

For example, you can create a hierarchy of territories to represent the areas where your team works in California. Include a top-level territory named *California*, three child territories named *Northern California*, *Central California*, and *Southern California*, and a series of third-level territories corresponding to California counties. Assign service resources to each county territory to indicate who is available to work in that county.

# ServiceTerritoryFeed

---

Represents a single feed item on a service territory record detail page. This object is available in API version 38.0 and later.

A service territory feed shows changes to tracked fields on a service territory record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to service territories in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Operating Hours object
- "Moderate Chatter"

| TerritoryType | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update<br><b>Description</b><br>Primary, Secondary, or Relocation. <ul style="list-style-type: none"> <li>The primary territory is typically the territory where the resource works most often—for example, near their home base. Service resources can only have one primary territory.</li> <li>Secondary territories are territories where the resource can be assigned to appointments if needed. Service resources can have multiple secondary territories.</li> <li>Relocation territories represent temporary moves for service resources. If you're using the Field Service Lightning managed packages with the scheduling optimizer, resources with relocation territories are always assigned to services within their relocation territories during the specified relocation dates; if they don't have a relocation territory, the primary territories are favored over the secondary.</li> </ul> For example, a service resource might have the following territories: <ul style="list-style-type: none"> <li>Primary territory: <i>West Chicago</i></li> <li>Secondary territories:               <ul style="list-style-type: none"> <li><i>East Chicago</i></li> <li><i>South Chicago</i></li> </ul> </li> <li>Relocation territory: <i>Manhattan</i>, for a three-month period</li> </ul> |

## Usage

If you delete a service territory with members, the service resources who were members no longer have any connection to the territory.

# ServiceTerritoryMemberFeed

---

Represents a single feed item on a service territory member record detail page. This object is available in API version 38.0 and later.

A service territory member feed shows changes to tracked fields on a service territory member record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to service territory members in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Operating Hours object
- "Moderate Chatter"

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                            |

## ServiceTerritoryMemberHistory

Represents the history of changes made to tracked fields on a service territory member. This object is available in API version 38.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

## SessionPermSetActivation

The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user's specific session. This object is available in API versions 37.0 and later as part of the Session-Based Permission Sets Developer Preview.

 **Note:** Session-Based Permission Sets is currently available as a Developer Preview.

 **Important:** Managed packages with permission sets that require session activation cannot be installed on customer orgs without this feature.

## Supported Calls

`describeCompactLayouts()`, `describeLayout()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AuthSessionId   | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The session ID related to this permission set assignment for its duration.                 |
| Description     | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The session details, such as device used and browser.                               |
| PermissionSetId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The permission set ID related to this permission set assignment and user for its duration. |
| UserId          | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The user ID of the user to whom this permission set assignment applies for its duration.   |

## Usage

Use SessionPermSetActivation to create a permission set available only for a specified session's duration. For example, create permission sets that provide access to specific applications only during authenticated sessions.

In the following Apex example, an identified session is activated after session information is submitted via a button. Successful activation results in a confirmation message displayed to the user.

```
public class SessionPermSetActivationController {  
    // id of the session permission set to be activated
```

```

private final String sessionPermSetId = 'OPSxx00000004rJ';
private final String sessionId;

public SessionPermSetActivationController() {
    Map<String, String> sessionManagement = Auth.SessionManagement.getCurrentSession();

    sessionId = sessionManagement.get('SessionId');
}

public PageReference activate() {
    // activate the permission set
    SessionPermSetActivation activation = new SessionPermSetActivation();
    activation.AuthSessionId = sessionId;
    activation.PermissionSetId = sessionPermSetId;
    activation.Description = 'created by SessionPermSetActivationController';

    insert activation;
    return null;
}

public boolean getActivated() {
    Integer alreadyActivated = [SELECT count()
                                FROM SessionPermSetActivation
                                WHERE AuthSessionId = :sessionId
                                And PermissionSetId = :sessionPermSetId LIMIT
1];
    return alreadyActivated > 0;
}
}

<apex:page controller="SessionPermSetActivationController">
    <apex:outputPanel rendered="{!Activated}">
        <h3>Activate Session Permission Set</h3>
        <br />
        <apex:form >
            <apex:commandButton action="{!activate}" value="Activate"
id="activateButton"/>
        </apex:form>
    </apex:outputPanel>
    <apex:outputPanel rendered="{!Activated}">
        <h3>Session Permission Set is already active.</h3>
    </apex:outputPanel>
</apex:page>

```

## SetupAuditTrail

Represents changes you or other admins made in your org's Setup area for at least the last 180 days. This object is available in API version 15.0 and later.

**Note:** SetupAuditTrail is not a supported standard controller. Using SetupAuditTrail as a standard controller in a Visualforce page results in an error.

## Supported Calls

`query()`, `retrieve()`

**Note:** Aggregate queries aren't supported on this object. For example, `SELECT count() FROM SetupAuditTrail` works but `SELECT count(Id) FROM SetupAuditTrail` fails.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action       | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Sort</p> <p><b>Description</b><br/>The category of the change made in Setup. For example, a value of <i>PermSetCreate</i> indicates that an administrator created a permission set. The <i>Display</i> field contains more specific information.</p>                       |
| DelegateUser | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>The Login-As user who executed the action in Setup. If a Login-As user didn't perform the action, this field is blank. This field is available in API version 35.0 and later.</p>                                             |
| Display      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The full description of changes made in Setup. For example, if the <i>Action</i> field has a value of <i>PermSetCreate</i>, the <i>Display</i> field has a value like "Created permission set MAD: with user license Salesforce."</p> |
| Section      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The section in the Setup menu where the action occurred. For example, Manage Users or Company Profile.</p>                                                                                                                            |

**Note:** You can use SOQL joins to get the information you need more quickly. For example, running `SELECT CreatedBy.Name FROM SetupAuditTrail LIMIT 10` returns the first and last names of the last 10 people to make changes in Setup.

## SetupEntityAccess

Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

To grant users access to an entity, associate the appropriate SetupEntityAccess record with a PermissionSet that's assigned to a user.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| SetupEntityId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the entity for which access is enabled, such as an Apex class or Visualforce page.</p>                                                                                                                                                                                                                                                                                                                                                    |
| SetupEntityType | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The type of setup entity for which access is enabled. Valid values are:</p> <ul style="list-style-type: none"><li>• <code>ApexClass</code> for Apex classes</li><li>• <code>ApexPage</code> for Visualforce pages</li><li>• In API version 28.0 and later, <code>ConnectedApplication</code> for OAuth connected apps</li><li>• In API version 31.0 and later, <code>CustomPermission</code> for custom permissions</li></ul> |

| Field Name | Details                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <ul style="list-style-type: none"> <li>In API version 28.0 and later, <code>ServiceProvider</code> for service providers</li> <li>In API version 28.0 and later, <code>TabSet</code> for apps</li> </ul> |

## Usage

Because `SetupEntityAccess` is a child of the `PermissionSet` object, the usage is similar to other `PermissionSet` child objects like `FieldPermissions` and `ObjectPermissions`.

For example, the following code returns all permission sets that grant access to any setup entities for which access is enabled:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
```

The following code returns permission sets that grant access only to Apex classes:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE SetupEntityType='ApexClass'
```

The following code returns permission sets that grant access to any setup entities, and are not owned by a profile:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE ParentId
IN (SELECT Id
    FROM PermissionSet
    WHERE isOwnedByProfile = false)
```

You may want to return only those permission sets that have access to a specific setup entity. To do this, query the parent object. For example, this code returns all permission sets that grant access to the `helloWorld` Apex class:

```
SELECT Id, Name,
    (SELECT Id, Parent.Name, Parent.Profile.Name
     FROM SetupEntityAccessItems)
FROM ApexClass
WHERE Name = 'helloWorld'
```

While it's possible to return permission sets that have access to a `ConnectedApplication`, `ServiceProvider`, or `TabSet` by `SetupEntityId`, it's not possible to return permission sets that have access to these `SetupEntityType` fields by any other `AppMenuItem` attribute, such as `Name` or `Description`. For example, to find out if a user has access to the Recruiting app, you'd run two queries. First, query to get the `AppMenuItem` ID:

```
SELECT Id, Name, Label
FROM AppMenuItem
WHERE Name = 'Recruiting'
```

Let's say the previous query returned the `AppMenuItem` ID `02uD0000000GliMIAW`. Using this ID, you can now run a query to find out if a user has access to the Recruiting app:

```
SELECT Id, SetupEntityId, SetupEntityType
FROM SetupEntityAccess
WHERE ParentId
IN
```

```
(SELECT PermissionSetId
FROM PermissionSetAssignment
WHERE AssigneeId = '005D0000001QOzF')
AND (SetupEntityId = '02uD0000000GIiMIAW')
```

## SignupRequest

Represents a request for a new Trialforce sign-up. This object is available in API version 27.0 and later.

**Note:** You are limited to 20 sign-ups per day. If you need to make additional sign-ups, log a case in the Partner Community.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Username         | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The username of the admin user for the trial sign-up. It must follow the address convention specified in RFC822: <a href="http://www.w3.org/Protocols/rfc822/#z10">www.w3.org/Protocols/rfc822/#z10</a></p> |

## Usage

The Java class below uses the REST API to create a SignupRequest object. It authenticates to the Trialforce Management Organization and then posts a request to the SignupRequest object.

Here are the variables you need to specify in this example.

- SERVER — The name of the host server for the Trialforce Management Organization (TMO), for example, *"yourInstance.salesforce.com."*
- USERNAME — The admin username for the TMO.
- PASSWORD — The concatenation of the admin password and the security token for the TMO. To get an email with the security token, from your personal settings in Salesforce select **Reset My Security Token** and click **Reset Security Token**.
- CLIENT\_ID — From Setup in Salesforce, enter *Apps* in the *Quick Find* box, select **Apps**, and click **New** under Connected Apps. Enter values for the required fields (the Callback URL is required but can initially be set to any valid URL as it's not used), grant full access for the OAuth scopes in the "Selected OAuth Scopes" selector, and click **Save**. Then copy the value of "Consumer Key" and use it for this variable.
- CLIENT\_SECRET — On the same page, click **Click to reveal**. Then copy the value of "Consumer Secret" and use it for this variable.

```
public class IsvSignupDriver {
    private static final String SERVER = server_name:port;
    private static final String USERNAME = tmo_username;
    private static final String PASSWORD = tmo_passwordsecurity_token;
    private static final String CLIENT_ID = consumer_key;
    private static final String CLIENT_SECRET = consumer_secret;

    private static SignupRequestInfo signupRequest = null;

    public static String createSignupRequest (SignupRequestInfo sr)
        throws JSONException, IOException {
        JSONObject createResponse = null;
```

```

        signupRequest = sr;
        JSONObject loginResponse = login(SERVER, USERNAME, PASSWORD);
        String instanceUrl = loginResponse.getString("instance_url");
        String accessToken = loginResponse.getString("access_token");
        createResponse = create(instanceUrl, accessToken);
        System.out.println("Created SignupRequest object: " + createResponse + "\n");
        return createResponse.toString();
    }

    /* Authenticates to the TMO using the required credentials */

    private static JSONObject login(String server, String username, String password)
        throws ClientProtocolException, IOException, JSONException {
        String authEndPoint = server + "/services/oauth2/token";
        HttpClient httpClient = new DefaultHttpClient();
        try {
            HttpPost post = new HttpPost(authEndPoint);

            List<NameValuePair> params = new ArrayList<NameValuePair>();
            params.add(new BasicNameValuePair("grant_type", "password"));
            params.add(new BasicNameValuePair("client_id", CLIENT_ID));
            params.add(new BasicNameValuePair("client_secret", CLIENT_SECRET));
            params.add(new BasicNameValuePair("username", username));
            params.add(new BasicNameValuePair("password", password));
            post.setEntity(new UrlEncodedFormEntity(params, Consts.UTF_8));

            BasicResponseHandler handler = new BasicResponseHandler();
            String response = httpClient.execute(post, handler);
            return new JSONObject(response);
        } finally {
            httpClient.getConnectionManager().shutdown();
        }
    }

    /* Posts a request to the SignupRequest object */

    private static JSONObject create(String instanceUrl, String accessToken)
        throws ClientProtocolException, IOException, JSONException {
        HttpClient httpClient = new DefaultHttpClient();
        try {
            HttpPost post = new HttpPost(instanceUrl +
                "/services/data/v27.0/objects/SignupRequest/");
            post.setHeader("Authorization", "Bearer " + accessToken);
            post.setHeader("Content-Type", "application/json");

            JSONObject requestBody = new JSONObject();
            requestBody.put("TemplateId", signupRequest.getTemplateID());
            requestBody.put("SignupEmail", signupRequest.getEmail());
            requestBody.put("username", signupRequest.getUsername());
            requestBody.put("Country", "US");
            requestBody.put("Company", signupRequest.getCompanyName());
            requestBody.put("lastName", signupRequest.getLastName());

            StringEntity entity = new StringEntity(requestBody.toString());
            post.setEntity(entity);
        }
    }

```

```

        BasicResponseHandler handler = new BasicResponseHandler();
        String response = httpClient.execute(post, handler);
        return new JSONObject(response);
    } finally {
        httpClient.getConnectionManager().shutdown();
    }
}
}

```

## Error Codes

If the sign-up fails, the system generates an error code that can help you identify the cause. This table shows the most important error codes.

| Error Code | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C-1007     | Duplicate username.                                                                                                                                                                 |
| C-1015     | Error while establishing the new organization's My Domain settings. Contact Salesforce support for assistance.                                                                      |
| C-1016     | Error while configuring the OAuth connected app for Proxy Signup. Verify that your connected app has a valid consumer key, callback URL, and unexpired certificate (if applicable). |
| C-1018     | Invalid subdomain value provided during sign-up.                                                                                                                                    |
| C-1019     | Subdomain in use. Please choose a new subdomain value.                                                                                                                              |
| C-9999     | Generic "fatal error." Contact Salesforce support for assistance.                                                                                                                   |
| S-1006     | Invalid email address (not in a proper email address format).                                                                                                                       |
| S-2006     | Invalid country code.                                                                                                                                                               |
| T-0001     | Template ID not valid (not in the format OTTxxxxxxxxxx).                                                                                                                            |
| T-0002     | Template not found. Either the template doesn't exist (it may have been deleted), or it doesn't exist at the appropriate version.                                                   |
| T-0003     | Template not approved for use by Salesforce.                                                                                                                                        |

## Site

Represents a public website that is integrated with an Organization. This object is generally available in API version 16.0 and later.

To access this object, Force.com Sites or Site.com must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.

## Fields

| Field                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage

Use this read-only object to query or retrieve information on your Force.com site.

## SiteDomain

SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the [Domain](#) and [DomainSite](#) objects instead.

To access this object, Force.com Sites or Site.com must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.

## Fields

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                |

|       | <b>Properties</b><br>Filter, Group, Sort, Nillable                                                                                                                                                           |
|       | <b>Description</b><br>The global namespace that this custom Web address belongs to. This value is set to DNS for custom Web addresses in the global DNS. This field is available in version 24.0 of the API. |

## Usage

Use this read-only object to query the custom Web addresses that are associated with each website in your organization.

## SiteHistory

Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later.

To access this object, Force.com Sites must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

|                | <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| Language       | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The language of the skill.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Usage

### Live Agent

Use this object to assign Live Agent users to groups based on their abilities. The skills associated with a LiveChatButton determine which agents receive chat requests that come in through that button.

Field Service Lightning

Use this object to track certifications and areas of expertise in your workforce. After you create a skill, you can:

- Assign it to a service resource via the Skills related list on the resource’s detail page. When you assign a skill to a service resource, you can specify their skill level and the duration of the skill.
- Add it as a required skill via the Skill Requirements related list on any work type, work order, or work order line item. When you add a required skill to a work record, you can specify the skill level.

# SkillProfile

Represents a join between Skill and Profile. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name | Details                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ProfileId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The ID of the profile.</p> |
| SkillId    | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the skill.</p>             |

## Usage

Use this object to assign specific skills to specific profiles.

# SkillRequirement

Represents a skill that is required to complete a particular task. Skill requirements can be added to work types, work orders, and work order line items. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Fields

| Field Name                      | Details                                                                                                                                                                                                                                                                                                 |

|             | <b>Description</b><br>An auto-generated number identifying the skill requirement.                                                                                                                                                          |

## Usage

If a work order or work order line item can only be completed by a service resource with a particular set of skills, add *required skills* to the record via the Skill Requirements related list. Required skills help dispatchers assign the record to a service resource with the proper expertise. You can still assign a work order, work order line item, or related service appointment to a service resource that does *not* possess the required skills, so required skills serve more as a suggestion than a rule.

**Note:** If you're using the Field Service Lightning managed packages, you can use matching rules to ensure that appointments are only assigned to service resources who possess the required skills listed on the parent work order.

If many of your work orders require the same skills, we recommend adding required skills to *work types* to save yourself some time and keep your processes consistent. When you add a required skill to a work type, work orders and work order line items that use that type automatically inherit the required skill. For example, if you know that all annual maintenance visits for your Classic Refrigerator product require a Refrigerator Maintenance skill level of at least 50, you can add that required skill to the Annual Maintenance Visit work type. When it's time to create a work order for a customer's annual fridge maintenance, adding that work type to the work order adds the required skill as well.

## SkillRequirementFeed

Represents a single feed item on a skill requirement record detail page. This object is available in API version 38.0 and later.

A skill requirement feed shows changes to tracked fields on a skill requirement record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to skill requirements in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Operating Hours object
- "Moderate Chatter"

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The message that appears in the feed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>.</p>                        |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of comments associated with this feed item.</p>                                                                                                                                                       |
| InsertedById | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the value is set to the ID of the logged-in user.</p> |
| IsRichText   | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/><code>true</code> indicates that the body of the feed contains rich text. <code>false</code> indicates that the post is rendered as plain text.</p>                                     |

| Field Name      | Details                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Field Name | Details                                      |
|------------|----------------------------------------------|
|            | <b>Description</b><br>The type of feed item. |

## SkillRequirementHistory

Represents the history of changes made to tracked fields on a skill requirement. This object is available in API version 38.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| OldValue   | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The value of the field before it was changed.                      |

| Field Name         | Details                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SkillRequirementId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the skill requirement being tracked. The history is displayed on the detail page for this record. |

## SkillUser

Represents a join between Skill and User. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name | Details                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------|
| SkillId    | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the skill.          |
| UserId     | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort<br><b>Description</b><br>The ID of the user. |

## Usage

Use this object to assign specific skills to specific users.

# SlaProcess

---

Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

An entitlement process is a timeline that includes all the steps (MilestoneType records) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

All users, even those without the "View Setup and Configuration" user permission, can view entitlement processes via the API.

## Fields

| Field            | Details                                                                                                                                                                                                               |

## Solution

---

Represents a detailed description of a customer issue and the resolution of that issue.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field                    | Details                                                                                                                                                                                                                                                        |

## Usage

Use this object to manage your organization's solutions. Client applications can create, update, delete, and query Attachment records associated with a solution.

## SolutionFeed

---

Represents a single feed item in the feed displayed on the detail page for a solution record. This object is available in API version 18.0 and later.

A solution feed shows recent changes to a solution record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to solutions.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Solution object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p> |

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CommentCount       | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ContentData        | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## SolutionHistory

Represents the history of changes to the values in the fields of a solution.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field      | Details                                                                                                                                                                                                                                                        |

# Usage

Use this read-only object to identify changes to a solution.  
This object respects field-level security on the parent object.

SEE ALSO:  
[SolutionStatus](#)

# SolutionStatus

Represents the status of a Solution, such as Draft, Reviewed, and so on.

# Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

# Fields

These numbers are not guaranteed to be sequential, as some previous solution status values might have been deleted.</p> |

## Usage

This object represents a value in the solution status picklist. The solution status picklist provides additional information about the status of a Solution, such as whether a given status value represents a reviewed or unreviewed solution. Your client application can query this object to retrieve the set of values in the solution status picklist, and then use that information while processing Solution objects to determine more information about a given solution. For example, the application could test whether a given case has been reviewed or not based on its `Status` value and the value of the `IsReviewed` property in the associated `SolutionStatus` record.

SEE ALSO:

[Solution](#)

## SolutionTag

Associates a word or short phrase with a Solution.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

## Fields

| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Restricted picklist</p> <p><b>Description</b><br/>Defines the visibility of a tag.<br/><br/>Valid values:</p> <ul style="list-style-type: none"><li>• <b>Public</b>—The tag can be viewed and manipulated by all users in an organization.</li><li>• <b>Personal</b>—The tag can be viewed or manipulated only by a user with a matching <b>OwnerId</b>.</li></ul> |

## Usage

SolutionTag stores the relationship between its parent TagDefinition and the Solution being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## SOSDeployment

Represents the general settings for deploying SOS video call capability in a native mobile application. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| Language      | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The language of the deployment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage

Use this object to query and manage SOS deployments.

# SOSSession

This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name   | Details                                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WaitDuration | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The amount of time the customer waited before an agent accepted the SOS session and the call began. |

## Usage

Use this object to query and manage SOS session records.

## SOSSessionActivity

Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name   | Details                                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|

| Field Name | Details                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the SOS session that's associated with the event.                         |
| Type       | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort<br><b>Description</b><br>The kind of activity that occurred. |

## Usage

Use this object to query and manage SOS session activities.

## SOSSessionHistory

This object is automatically created for each SOS session and stores information about changes made to the session. This object is available in API versions 34.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                                       |

| SOSSessionId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the session record that was changed. |

## Usage

Use this object to identify changes to SOS session records.

## SOSSessionOwnerSharingRule

Represents the rules for sharing an SOS session record with users other than the record owner. This object is available in API version 34.0 and later.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name  | Details                                                                                                  |

| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID that represents the User or Group that you are granting access to. |

## Usage

Use this object to manage the sharing rules for SOS session records.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

## SOSSessionShare

Represents a sharing entry on an SOS session. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                         |

## Usage

This object lets you determine which users and groups can view and edit SOSSession records that are owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

# StaticResource

---

Represents a static resource that can be used in Visualforce markup.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <b>NamespacePrefix</b> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> <p>This field can't be accessed unless the logged-in user has the "Customize Application" permission.</p> |

## Usage

Use static resources to upload content that you can reference in Visualforce markup, including archives (such as .zip and .jar files), images, stylesheets, JavaScript, and other files. Using a static resource is preferable to uploading a file to the Documents tab because:

- You can package a collection of related files into a directory hierarchy and upload that hierarchy as a .zip or .jar archive.
- You can reference a static resource in page markup by name using the `$Resource` global variable instead of hard-coding document IDs.

## Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

## Maximum Static Resource Size

You can create or update static resources to a maximum size of 5 MB. An organization can have up to 250 MB of static resources, total.

## StreamingChannel

---

Represents a channel that is the basis for notifying listeners of generic Streaming API events. Available from API version 29.0 or later.

## Supported Calls

REST: DELETE, GET, PATCH, POST (query requests are specified in the URI)

SOAP: `create()`, `delete()`, `describe()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

## Special Access Rules

- This object is available only if Streaming API is enabled for your organization.
- Only users with “Create” permission can create this record.
- You can create a permission set and grant users read and create access to all streaming channels in the org. This access isn’t for a specific channel, like with user sharing.
- You can apply user sharing to StreamingChannel. You can restrict access to receiving or sending events on a channel by sharing channels with specific users or groups. Channels shared with public read-only or read-write access send events only to clients subscribed to the channel that also are using a user session associated with the set of shared users or groups. Only users with read-write access to a shared channel can generate events on the channel, or modify the actual StreamingChannel record.

## Dynamic Streaming Channel

Generic Streaming also supports dynamic streaming channel creation, which creates a StreamingChannel when a client first subscribes to the channel. To enable dynamic streaming channels in your org, from Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface** and enable **Enable Dynamic Streaming Channel Creation**.

| OwnerId            | reference  | The ID of the owner of the StreamingChannel.<br><b>Field Properties:</b> Create, Default on create, Filter, Group, Sort, Update<br><b>Label:</b> Owner Name                                                                                                                                                         |

# TagDefinition

---

Defines the attributes of child Tag objects.

## Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

## Fields

| Field | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name  | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Filter, Nillable, Update</p> <p><b>Description</b></p> <p>Identifies the tag word or phrase.</p>                                                                                                                                                                                                                                                                                                    |
| Type  | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Filter, Nillable, Restricted picklist</p> <p><b>Description</b></p> <p>Defines the visibility of a tag. Possible value are:</p> <ul style="list-style-type: none"><li>• <b>Public:</b> The tag can be viewed and manipulated between all users in an organization.</li><li>• <b>Personal:</b> The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.</li></ul> |

## Usage

When you create a tag for a record, an association is created with to a corresponding TagDefinition:

- If the value in the tag's `Name` field is new, a new TagDefinition record is automatically created and becomes the parent of the tag.
- If the value in the tag's `Name` field already exists in a TagDefinition, that TagDefinition automatically becomes the parent of the tag.

Each TagDefinition record has a one-to-many relationship with its child tag records.

The following standard objects represent tags for records:

- AccountTag
- AssetTag
- CampaignTag
- CaseTag
- ContactTag

- ContractTag
- DocumentTag
- EventTag
- LeadTag
- NoteTag
- OpportunityTag
- SolutionTag
- TaskTag

Custom objects may also be tagged. Tags for custom objects are identified by a suffix of two underscores immediately followed by the word `tag`. For example, a custom object named `Meeting` has a corresponding tag named `Meeting__tag` in that organization's WSDL. `Meeting__tag` is only valid for `Meeting` objects.

`TagDefinition` is useful for mass operations on any tag record. For instance, if you want to rename existing tags, you can search for the appropriate `TagDefinition` object, update it, and the child tag's `Name` values are also changed. The following Java example replaces all `WC` tags with the phrase `West Coast`:

```
public void tagDefinitionSample() {
    String soqlQuery = "SELECT Id, Name FROM TagDefinition " +
        "WHERE Name = 'WC'";
    QueryResult qResult = null;
    try {
        qResult = connection.query(soqlQuery);
        TagDefinition tagDef = (TagDefinition) qResult.getRecords()[0];
        tagDef.setName("West Coast");
        connection.update(new SObject[]{tagDef});
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

When a tag is deleted, its parent `TagDefinition` will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a `TagDefinition` sends it to the Recycle Bin, along with any associated tag entries.

## Task

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

**Note:** Task fields related to calls are exclusive to Salesforce CRM Call Center. Additionally, `query()`, `delete()`, and `update()` aren't allowed with tasks related to more than one contact in API versions 23.0 and earlier.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field           | Field Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AccountId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Group, Sort, Filter, Nillable</p> <p><b>Description</b><br/>Represents the ID of the related Account. The <code>AccountId</code> is determined as follows.</p> <p>If the value of <code>whatId</code> is any of the following objects, then Salesforce uses that object's <code>AccountId</code>.</p> <ul style="list-style-type: none"> <li>• Account</li> <li>• Opportunity</li> <li>• Contract</li> <li>• Custom object that is a child of Account</li> </ul> <p>If the value of the <code>whatId</code> field is any other object, and the value of the <code>whoId</code> field is a Contact object, then Salesforce uses that contact's <code>AccountId</code>. (If your organization uses Shared Activities, then Salesforce uses the <code>AccountId</code> of the primary contact.)</p> <p>Otherwise, Salesforce sets the value of the <code>AccountId</code> field to <code>null</code>.</p> <p>For information on IDs, see <a href="#">ID Field Type</a>.</p> |
| ActivityDate    | <p><b>Type</b><br/>date</p> <p><b>Properties</b><br/>Group, Sort, Create, Filter, Nillable, Update</p> <p><b>Description</b><br/>Represents the due date of the task. This field has a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. The timestamp is not relevant; do not attempt to alter it in order to accommodate time zone differences. Label is <b>Due Date</b>.</p> <p> <b>Note:</b> This field can't be set or updated for a recurring task (<code>IsRecurrence</code> is <code>true</code>).</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| CallDisposition | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Represents the result of a given call, for example, "we'll call back," or "call unsuccessful." |          | <b>Description</b><br><p>The <code>Whold</code> represents a human such as a lead or a contact. <code>Wholds</code> are polymorphic. Polymorphic means a <code>Whold</code> is equivalent to a contact's ID or a lead's ID. The label is <code>Name ID</code>.</p> <p>If <code>Shared Activities</code> is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the <code>Whold</code> field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is <code>Name ID</code>.</p> |

## Usage

### Recurring Tasks

- Recurring tasks are available in API version 16.0 and later.
- After a task is created, it can't be changed from recurring to nonrecurring or vice versa.
- When you delete a recurring task series through the API, all open and closed task occurrences in the series are removed. However, when you delete a recurring task series through the user interface, only open tasks occurrences (`IsClosed` is `false`) in the series are removed.
- If `IsRecurrence` is `true`, then `RecurrenceStartDateOnly`, `RecurrenceEndDateOnly`, `RecurrenceType`, and any properties associated with the given recurrence type (see the following table) must be populated.
- When you change the `RecurrenceStartDateOnly` field or the recurrence pattern, all open tasks occurrences in the series are deleted and new open task occurrences are created based on the new recurrence pattern. The recurrence pattern is determined by the following fields: `RecurrenceType`, `RecurrenceTimeZoneSidKey`, `RecurrenceInterval`,

RecurrenceDayOfWeekMask, RecurrenceDayOfMonth, RecurrenceInstance, and RecurrenceMonthOfYear.

- When you change the value of `RecurrenceEndDateOnly` to an earlier date (for example, from January 20th to January 10th), all open task occurrences in the series with the `ActivityDate` value greater than the new end date value are deleted. Other open and closed task occurrences in the series are not affected.
- When you change the value of `RecurrenceEndDateOnly` to a later date (for example, from January 10th to January 20th), new task occurrences are created up to the new end date. Existing open and closed tasks in the series are not affected.

The following table describes the usage of recurrence fields. Each recurrence type must have all of its properties set. All unused properties must be set to null.

| RecurrenceType Value | Properties                                                          | Example Pattern                                     |
|----------------------|---------------------------------------------------------------------|-----------------------------------------------------|
| RecursDaily          | RecurrenceInterval                                                  | Every second day                                    |
| RecursEveryWeekday   | RecurrenceDayOfWeekMask                                             | Every weekday - can't be Saturday or Sunday         |
| RecursMonthly        | RecurrenceDayOfMonth<br>RecurrenceInterval                          | Every second month, on the third day of the month   |
| RecursMonthlyNth     | RecurrenceInterval RecurrenceInstance<br>RecurrenceDayOfWeekMask    | Every second month, on the last Friday of the month |
| RecursWeekly         | RecurrenceInterval<br>RecurrenceDayOfWeekMask                       | Every three weeks on Wednesday and Friday           |
| RecursYearly         | RecurrenceDayOfMonth<br>RecurrenceMonthOfYear                       | Every March on the twenty-sixth day of the month    |
| RecursYearlyNth      | RecurrenceDayOfWeekMask<br>RecurrenceInstance RecurrenceMonthOfYear | The first Saturday in every October                 |

### JunctionIdList

The `JunctionIdList` field is now implemented in the Event and Task objects. With a single API call, it's easy to create many-to-many relationships between the Event or Task object with contacts, leads, or users.

To create a Task with related Contacts without `JunctionIdList`, you first have to create the task, then use the returned task ID to create the `TaskRelation` records. If the `TaskRelation` save call fails, error handling is your responsibility because the task has already been committed to the database.

```
public void createTasksOld(Contact[] contacts) {
    Task task = new Task();
    task.setSubject("New Task");
    SaveResult[] results = null;
    try {
        results = connection.create(new Task[] {
            task
        });
    }
    if (results[0].isSuccess()) {
        TaskRelation[] relations = new TaskRelation[contacts.size()];
        for (int i = 0; i < contacts.length; i++) {
            relations[i] = new TaskRelation();
            relations[i].setTaskId(results[0].getID());
        }
    }
}
```

```

        relations[i].setRelationId(contacts[i].getID());
    }
    results = connection.create(relations);
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}

```

To create a task using `JunctionIdList`, IDs are pulled from the related contacts and both the task and the `TaskRelation` records are created in one API call. If the `TaskRelation` fails, the task is rolled back because it's all done in a single API call.

```

public void createTaskNew(Contact[] contacts) {
    String[] contactIds = new String[contacts.size()];
    for (int i = 0; i < contacts.size(); i++) {

## TaskFeed

---

Represents a single feed item in the feed on a Task. This object is available in API version 20.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of TaskFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ContentData  | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this object to track changes for a task record.

# TaskPriority

Represents the importance or urgency of a Task, such as High, Normal, or Low.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| SortOrder | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Nillable, Group, Sort<br><b>Description</b><br>Number used to sort this value in the task priority picklist. These numbers are not guaranteed to be sequential, as some previous task priority values might have been deleted. |

## Usage

This object represents a value in the task priority picklist. The task priority picklist provides additional information about the importance of a Task, such as whether a given priority value represents a high priority. Your client application can query on this object to retrieve the set of values in the task priority picklist, and then use that information while processing Task objects to determine more information about a given task. For example, the application could test whether a given Task is high priority based on its `Priority` value and the value of the `IsHighPriority` in the associated TaskPriority object.

[Object Basics](#)

## TaskRelation

Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

TaskRelation is only available if you've enabled Shared Activities in your organization.

TaskRelation allows the following relationships:

- A task can be related to one lead or up to 50 contacts.
- A task can also be related to one account, asset, campaign, case, contract, opportunity, product, solution, or custom object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `queryAll()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AccountId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Indicates the Account ID of the relation.<br/><br/>For information on IDs, see <a href="#">ID Field Type</a>.</p>                                                                                                                                                                                                                                                                                                                                                        |
| IsDeleted  | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether a task has been deleted; label is <b>Deleted</b>. When a TaskRelation record is deleted, it isn't moved to the Recycle Bin and can't be undeleted, unless the record was cascade-deleted when the parent object was deleted. Don't use the <code>IsDeleted</code> field to detect deleted records in SOQL queries or <code>queryAll()</code> calls on directly deleted relation records. Instead, use the call <code>getDeleted()</code>.</p> |
| IsWhat     | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether the relation is an Account, Opportunity, Campaign, Case, other standard object, or a custom object. | TaskId     | <p><b>Type</b><br/>reference</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Field Name | Details                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Properties</b><br>Create, Filter, Group, Sort                                                                               |
|            | <b>Description</b><br>Represents the ID of the associated Task.<br>For information on IDs, see <a href="#">ID Field Type</a> . |

## Usage

### See contacts associated with a task

```
public void queryWhosOfTaskSample() {
    String soqlQuery = "SELECT Id, Subject, (SELECT RelationId, Relation.Name, IsWhat
from TaskRelations WHERE isWhat = false) FROM Task WHERE Id = '00T x0000005OKEN'";
    QueryResult qResult = null;
    try {
        qResult = connection.query(soqlQuery);
        TaskRelation relation1 =
(TaskRelation)qResult.getRecords()[0].getTaskRelations().getRecords()[0];
    }catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

| MasterLabel | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Master label for this task status value. This display value is the internal label that does not get translated. Limit: 255 characters.</p>                                                  |
| SortOrder   | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Number used to sort this value in the task status picklist. These numbers are not guaranteed to be sequential, as some previous task status values might have been deleted.</p>                |

## Usage

This object represents a value in the task status picklist. The task status picklist provides additional information about the status of a Task, such as whether a given status value represents an open or closed task. Your client application can query this object to retrieve the set of values in the task status picklist, and then use that information while processing Task records to determine more information about a given task. For example, the application could test whether a given task is open or closed based on the Task `Status` value and the value of the `IsClosed` property in the associated TaskStatus record.

## Usage

TaskTag stores the relationship between its parent TagDefinition and the Task being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## TaskWhoRelation

Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

This derived object is a filtered version of the [TaskRelation](#) on page 1717 object; that is, `IsParent` is `true` and `IsWhat` is `false`. It doesn't represent relationships to accounts, opportunities, or other objects.

TaskWhoRelation allows a variable number of relationships: one lead or up to 50 contacts. Available only if you've enabled Shared Activities for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                  |
|------------|--------------------------|
| RelationId | <b>Type</b><br>reference |

| Field Name | Details                                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Indicates the ID of the contacts or lead related to the task.                                   |
| TaskId     | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Indicates the ID of the task.                                       |
| Type       | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Indicates whether the person related to the task is a lead or contact. |

## Usage

### Apex example that queries contacts associated with a task

```
public void queryWhosOfTaskSample() {  
    String soqlQuery = "SELECT Id, Subject, (SELECT RelationId, Relation.Name, IsWhat  
from TaskWhoRelations) FROM Task WHERE Id = '00Tx0000005OKEN'";  
    QueryResult qResult = null;  
    try {  
        qResult = connection.query(soqlQuery);  
        TaskWhoRelation relation1 =  
(TaskWhoRelation)qResult.getRecords()[0].getTaskWhoRelations().getRecords()[0];  
    } catch (ConnectionException ce) {  
        ce.printStackTrace();  
    }  
}
```

# TenantSecret

This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

You can rotate the tenant secret once every four hours in a sandbox organization or every 24 hours in production organizations.

 **Note:** This information is about Shield Platform Encryption and not Classic Encryption.

## Supported Calls

`create()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage

Use this object to create or update your organization-specific tenant secret. For example, you can build an automated tenant secret creation and activation solution similar to the following.

1. Start by creating an Apex class to create the new tenant secret.

```
global class CreateNewSecret implements Schedulable {
    global void execute(SchedulableContext SC) {
        TenantSecret k = new TenantSecret ();
        k.description = 'Created new secret from scheduled job';
        insert k;
    }
}
```

2. Schedule the Apex class to run at the specified interval.

This Apex code only needs to be run a single time to schedule the job. This code runs the job every 90 days.

```
CreateNewSecret secret = new CreateNewSecret();
String schedule = '0 0 0 1 JAN,APR,JUL,OCT ?';
String jobId = system.schedule('Automated secret creation and activation', schedule,
secret);
```

3. Validate that the job is scheduled.
4. Validate that tenant secrets are created after the job is run.

Here is an example of destroying a tenant secret.

**Warning:** Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce.

```
TenantSecret secret = [SELECT Id FROM TenantSecret WHERE Version = 2];
secret.SecretValue = NULL;
update secret;
```

# Territory

Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| DeveloperName           | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Territory Name</b> in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |

Label is <b>Confine Opportunity Assignment</b> . |

## Usage

Use the Territory object to query your organization's territory hierarchy. Use it to obtain valid territory IDs when querying or modifying records associated with territories.

### SEE ALSO:

[AccountTerritoryAssignmentRule](#)  
[AccountTerritoryAssignmentRuleItem](#)  
[UserTerritory](#)

## Territory2

---

Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.

### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization's sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

### Fields

## Territory2Model

Represents a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization's sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

## Fields

## Territory2ModelHistory

Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name        | Details                                                                                                                                                          |

## Usage

This object is automatically generated whenever any field value changes on a territory model record. Use this object to identify those changes.

## Territory2Type

Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

All users (including standard users) have access to this object in the user interface

## Fields

|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>Required The user interface label for the territory type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Priority   | <b>Type</b><br>int<br><b>Properties</b><br>Create, Filter, Group, SortUpdate<br><b>Description</b><br>Required. Used for Filter-Based Opportunity Territory Assignment (Pilot in Spring '15 / API version 33). Lets you specify a priority for a territory type. For opportunity assignments, the filter examines all territories assigned to the account that the opportunity is assigned to. The account-assigned territory whose territory type priority is highest is then assigned to the opportunity. The <code>priority</code> field value on each territory type must be unique. Further, if there are multiple territories with the same territory type (and therefore the same priority) assigned to the account, no territory is not assigned to the opportunity. |

## TestSuiteMembership

Associates an Apex class with an ApexTestSuite. This object is available in API version 36.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name      | Description                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApexClassId     | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The Apex class whose tests are to be executed. |
| ApexTestSuiteId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort                                                                         |

| Field Name | Description                                                               |
|------------|---------------------------------------------------------------------------|
|            | <b>Description</b><br>The test suite to which the Apex class is assigned. |

## Usage

Insert a TestSuiteMembership object using an API call to associate an Apex class with an ApexTestSuite object. (ApexTestSuite and TestSuiteMembership aren't editable through Apex DML.) To remove the class from the test suite, delete the TestSuiteMembership object. If you delete an Apex test class or test suite, all TestSuiteMembership objects that contain that class or suite are deleted.

The following SOQL query returns the membership object that relates this Apex class to this test suite.

```
SELECT Id FROM TestSuiteMembership WHERE ApexClassId = '01pD0000000Fhy9IAC'
      AND ApexTestSuiteId = '05FD00000004CDBMA2'
```

[ApexTestSuite](#)

## ThirdPartyAccountLink

Represents the list of external users who authenticated using an Auth. Provider. This object is available in API version 32.0 and later.

A list of third-party account links is generated when users of an organization authenticate using an external Auth. Provider. Use this object to list and revoke a given user's social sign-on connections (such as Facebook®).

## Supported Calls

`describeSObjects()`, `query()`

## Fields

## Usage

Use this object makes to build custom screens to manage a user's third-party account links.

Administrators (with the "Manage Users" permission) querying this object can see all the links for all users in the organization. Without the "Manage Users" permission, users can only retrieve thier own links. A user may not have access to the `SsoProvider` value (the foreign key). In this case, use the `SsoProviderName` to render the name of the provider for the associated link.

Use the Apex method `Auth.AuthToken.revokeAccess()` to revoke a link.

In API version 34.0 and later, this object was enhanced to help manage high instance counts. A `query()` call returns up to 500 rows. A `queryMore()` call returns 500 more, up to 2500 total. No more records are returned after 2500. To make sure you don't miss any records, issue a `COUNT()` query in a `SELECT` clause for `ThirdPartyAccountLink`. This gives you the total number of records. If there are more than 2500 records, divide your query by filtering on fields, like `UserId`, to return subsets of less than 2500 records.

## TimeSlot

Represents a period of time on a specified day of the week during which field service work can be performed. Operating hours consist of one or more time slots. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                 |

| StartTime      | <p><b>Type</b><br/>time</p> <p><b>Properties</b><br/>Create, Filter, Sort, Update</p> <p><b>Description</b><br/>The time when the time slot starts.</p>                                                                                                                                                                    |
| TimeSlotNumber | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p><b>Description</b><br/>The name of the time slot. The name is auto-populated to a day and time format—for example, <i>Monday 9:00 AM - 10:00 PM</i>—but you can manually update it if you wish.</p>  |
| Type           | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The type of time slot. Possible values are <i>Normal</i> and <i>Extended</i>. You may choose to use <i>Extended</i> to represent overtime shifts.</p> |

## Usage

Operating hours are comprised of time slots, which indicate the hours of operation for a particular day. After you create operating hours, create time slots for each day in the Time Slots related list. For example, if the operating hours should be 8 AM to 5 PM Monday through Friday, create five time slots, one per day. To reflect breaks such as lunch hours, create multiple time slots in a day: for example, *Monday 8:00 AM - 12:00 PM* and *Monday 1:00 PM - 5:00 PM*.

**Tip:** Time slots don't come with any built-in rules, but you can create Apex triggers that limit time slot settings in your org. For example, you may want to restrict the start and end times on time slots to half-hour increments, or to prohibit end times later than 8 PM.

## TimeSlotHistory

Represents the history of changes made to tracked fields on a time slot. This object is available in API version 38.0 and later.

## Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

# Special Access Rules

Field Service Lightning must be enabled in your organization, and field tracking for time slot fields must be configured.

## Fields

| Field Name | Details                                                                                                                                                                                                                           |

## Topic

Represents a topic on a Chatter post or record. This object is available in API version 28.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Name         | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, idLookup, Sort, Update</p> <p> <b>Note:</b> You can change only the spacing and capitalization of a topic name with the update property.</p> <p><b>Description</b><br/>Name of the topic.</p> |
| NetworkId    | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Identifier of the <a href="#">community</a> to which the Topic belongs. This field is available only if Salesforce Communities is enabled in your organization.</p>                                                            |
| TalkingAbout | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>Number of people talking about the topic over the last two months, based on factors such as topic additions and comments on posts with the topic.</p>                                                                                                  |

## Usage

Use this object to query a specific topic or to get a list of all topics, even those used solely in private groups and on records, and the number of people talking about them.

Use this object to create, edit, or delete topics. To create a topic, you must have the "Create Topics" permission. To edit a topic, you must have the "Edit Topics" permission. To delete a topic, you must have the "Delete Topics" or "Modify All Data" permission.

## TopicAssignment

---

Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

Administrators must enable topics for objects before users can add topics to records of that object type. Topics for most objects are available in API version 30.0 and later. Topics for ContentDocument are available in API version 37.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name                   | Details                                                                                                                                                                                                                                                                                                                                                                            |

| TopicId    | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>Identifier of the topic.</p>                                                                                                                                                                                                                                                                                                                             |

## Usage

Use this object to query the assignments of topics to feed items, records, or files. To assign or remove topics, you must have the “Assign Topics” permission.

In SOQL `SELECT` syntax, this object supports nested semi-joins, allowing queries on Knowledge articles assigned to specific topics. For example:

```
SELECT parentId FROM KnowledgeArticleViewStat
  WHERE parentId in (SELECT KnowledgeArticleId FROM KnowledgeArticleVersion
    WHERE publishStatus = 'Online' AND language = 'en_US'
    AND Id in (select EntityId from TopicAssignment where TopicId ='0T0xx0000000xxx'))
```

No SOQL limit if logged-in user has “View All Data” permission. If not, do one of the following:

- Specify a `LIMIT` clause of 1,100 records or fewer.
- Filter on `Id` or `Entity` when using a `WHERE` clause with `=`.

SEE ALSO:

[Topic](#)  
[FeedItem](#)

# TopicFeed

Represents a single feed item on a topic page. This object is available in API version 29.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                    |

## TopicLocalization—Beta

Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in communities. This object is available in API version 33.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

Users with the Translation Workbench enabled can view topic translations, but the “Customize Application,” “Manage Translation,” or “Manage Categories” permission is required to create or update them.

## Fields

## TwoFactorInfo

Stores a user's secret for two-factor operations. Use this object when customizing two-factor authentication in your organization. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

You need the "Manage Two-Factor Authentication in API" permission to create or update this object.

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage

### Query invitees who have not responded to an invitation to an event

```
SELECT eventId, type, response FROM UndecidedEventRelation WHERE  
eventId='00UTD000000ZH5LA'
```

## User

Represents a user in your organization.

## Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

- To create or update a User record, you must have the “Manage Internal Users” permission. Additionally, if the user is a Customer Portal user, you must have the “Edit Self-Service Users” permission, and if the user is a partner portal user, you must have the “Manage External Users” permission.
- If [Communities](#) is enabled in your organization, to create or update external users for Customer Portal, partner portal, or Communities, you must also have the “Manage External Users” permission.
- Information in hidden fields in a user’s profile is not searchable by external users (with a portal profile) in a community. For example, if a user in a community has a hidden email address and an external user searches for it, the user record is not returned in the search results. Hidden field values are also not returned when external users perform searches on non-hidden fields. So if an external user searches for a user’s name (cannot be hidden), any hidden field values associated with the user record (for example, a hidden email address) are not returned in the search results.

Internal users from your organization who belong to the same community, however, can both search for and view hidden field values in search results.

- When requested by portal users, queries that look up to the User object, such as `owner.name` or `owner.email` might not return values when the portal user making the request doesn’t have Read access to the User record being queried.

The behavior depends on the number of domains associated with the lookup field. If the object can look up to more than one domain, `owner.name` returns a value, but other detail fields don’t. For example, Case owner can look up to the User or Queue objects. In this case, portal users can see only the value of `owner.name`. Other User detail fields, such as `owner.email` or `owner.phone` don’t return a value.

If the object can look up to only a single domain, such as Account owner, then no detail fields return values, including `owner.name`.

- Changing ownership of a record by updating its `OwnerId` field requires the user making the change to have both the “Transfer Record” permission and Read access to the User record of the new record owner.

## Fields

| Field     | Details                                                                                                                                                                                                                                                 |

|                                    | <b>Description</b><br>The user's name suffix. Maximum size is 40 characters. Contact Salesforce Customer Support to enable this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TimeZoneSidKey                     | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort, Update<br><b>Description</b><br>Required. This field is a restricted picklist field. A User time zone affects the offset used when displaying or entering times in the user interface. However, the API does not use a User time zone when querying or setting values.<br><br>Values for this field are named using region and key city, according to ISO standards. It can often be more convenient to manually set one User time zone in the user interface, and then use that value for creating or updating other User records via the API.             |
| Title                              | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The user's business title, such as "Vice President."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Username                           | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, idLookup, Sort, Update<br><b>Description</b><br>Required. Contains the name that a user enters to log into the API or the user interface. The value for this field must be in the form of an email address. It must also be unique across all organizations. If you try to create or update a User with a duplicate value for this field, the operation is rejected.<br><br>Each inserted User also counts as a license. Every organization has a maximum number of licenses. If you attempt to exceed the maximum number of licenses by inserting User records, the create is rejected. |

If you are a Professional Edition customer and purchased Wireless Edition prior to November 7, 2005 or are an Enterprise Edition customer who has signed or renewed your Salesforce contract prior to November 7, 2005, you may continue using Wireless Edition through the end of your existing contract term.</p>                                                                                                                                                                                                                |

## Usage

Use this object to query information about users and to provision and modify users in your organization. Unlike other objects, the records in the User table represent actual users—not data owned by users. Any user can query or describe User records.

For example, the following SOQL code finds users with a particular user role.

```
SELECT Id, Username
FROM User
WHERE UserRoleId='00ED0000000xicT'
```

Each portal user is associated with a portal account. A portal account can have a maximum of three portal roles (Executive, Manager, and User). You can select the default number of roles to be created from the user interface. The role hierarchy is maintained when you

insert and delete portal roles, and roles are created bottom-up. Deleting the User role causes the Manager role to be renamed to User role. Deleting both the Executive and User roles causes the Manager role to be renamed to User role. Before deleting a role, you must assign users under that role to another role.

## Deactivate Users

You can't delete a user in the user interface or the API. You can deactivate a user in the user interface; and you can deactivate or disable a Customer Portal or partner portal user in the user interface or the API. Because users can never be deleted, we recommend that you exercise caution when creating them.

If you deactivate a user, any EntitySubscription where the user is associated with the ParentId or SubscriberId field, meaning all subscriptions both to and from the user, are soft deleted. If the user is reactivated, the subscriptions are restored. However, if you deactivate multiple users at once and these users follow each other, their subscriptions are hard deleted. In this case, the user-to-user EntitySubscription is deleted twice (double deleted). Such subscriptions can't be restored upon user reactivation.

## Passwords

For security reasons, you can't query User passwords via the API or the user interface. However, the API allows you to set and "reset" User passwords using the setPassword() and resetPassword() calls. The password lockout status and the ability to reset the User locked-out status is not available via the API. You must check and reset the User password lockout status using the user interface.

SEE ALSO:

- UserRole
- UserLicense

## UserAccountTeamMember

Represents a User on the default account team of another User.

See also OpportunityTeamMember, which represents a User on the opportunity team of an Opportunity

## Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

## Special Access Rules

Customer Portal users can't access this object.

## Usage

This object is available only in organizations that have enabled the account teams functionality, which can be done using the user interface.

If you attempt to create a record that matches an existing record, the create call updates any modified fields and returns the existing record.

You can set up a User record so the default account team includes the others who typically work with them on accounts.

## UserAppInfo

---

Stores the last Lightning app logged in to. This object is available in API version 38.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`,  
`query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

### Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## UserAppMenuCustomization

---

Represents an individual user's settings for items in the Force.com app menu or App Launcher. This object is available in API version 35.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApplicationId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The 15-character ID for the application associated with the menu item.                                                                                                          |
| OwnerId       | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Sort, Update<br><b>Description</b><br>The ID of the user for these specific settings.                                                                                                                      |
| SortOrder     | <b>Type</b><br>int<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The index value that controls where this item appears in the menu. For example, a menu item with a sort order value of 5 will appear between items with sort order values of 3 and 9. |

## Usage

See the AppMenuItem object for the organization-wide default settings. This object contains the fields representing any changes the user made to the menu.

## UserAppMenuCustomizationShare

Represents a sharing entry on a UserAppMenuCustomization record. This object is available in API version 35.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Field Name | Details                                                                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>The location mobile users are directed to after they've authenticated. This is only used with connected apps.                                                                                                                                                                            |
| Name       | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The API name of the item.                                                                                                                                                                                 |
| SortOrder  | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The index value that controls where this item appears in the menu. For example, a menu item with a sort order value of 5 will appear between items with sort order values of 3 and 9.                        |
| StartUrl   | <b>Type</b><br>url<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The location users are directed to after they've authenticated. For a connected app, this is the location specified by the <code>StartUrl</code> . Otherwise it's the application's default start page.      |
| Type       | <b>Type</b><br>picklist<br><b>Properties</b><br>Filter, Group, Nillable, Restricted picklist, Sort<br><b>Description</b><br>The type of application represented by this item. The types are: <ul style="list-style-type: none"><li>• ConnectedApplication</li><li>• ServiceProvider</li><li>• TabSet</li></ul> |

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UserSortOrder | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 will appear between items with sort order values of 3 and 9.</p> <p>This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use:</p> <pre>SELECT ApplicationId,SortOrder,UserSortOrder FROM AppMenuItem order by userSortOrder NULLS LAST, sortOrder NULLS LAST</pre> |

## Usage

See the AppMenuItem object for the organization-wide default settings This object contains the fields the requesting user has permission to see.

## UserConfigTransferButton

Represents the association between a Live Agent configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name       | Details                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LiveChatButtonId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The ID of the live chat button that agents can transfer chats to.</p> |

| Field Name           | Details                                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LiveChatUserConfigId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the Live Agent configuration; agents associated with this configuration can transfer chats to the chat button indicated by the <code>LiveChatButtonId</code> . |

## UserConfigTransferSkill

Represents the association between a Live Agent configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name           | Details                                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## UserFeed

Represents a single feed item in the feed displayed on a Chatter user profile feed. A user profile feed shows changes to a user record for fields that are tracked in feeds, and posts and comments about the record. This object is available in API version 18.0 and later.

A user feed shows recent changes to a user record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to users in the organization.

## Supported Calls

`delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

If you use the `FeedComment` object to comment on a user record, the user can delete the comment. For example, if John Smith makes a comment about Sasha Jones, Sasha can delete the comment.

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the User object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage

Users with the “View Setup and Configuration” permission can use the UserLicense object to view the set of currently defined user licenses in your organization.

The UserLicense object is currently used by bulk user creation to determine the user license to which each profile and permission set belongs. For example, if you use the API to create portal users and you want to know which profile belongs to each portal user license, you can query this object for each profile and check the `LicenseDefinitionKey` to identify the associated user license.

[Profile](#)

## UserLogin

Represents the settings that affect a user's ability to log into an organization. To access this object, you need the `UserPermissions.ManageUsers` permission. This object is available in API version 29.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name                    | Details                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>IsFrozen</code>         | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>If <code>true</code>, the user account associated with this object is frozen.</p>                                                                                                                          |
| <code>IsPasswordLocked</code> | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>If <code>true</code>, the user account associated with this object is locked because of too many login failures. From the API, you can set this field to <code>false</code>, but not <code>true</code></p> |
| <code>UserId</code>           | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the associated user account. This field can't be updated.</p>                                                                                                                                                         |

## Usage

To query for all frozen users in your organization:

```
SELECT Id, UserId
FROM UserLogin
WHERE IsFrozen = true
```

# UserMembershipSharingRule

Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Fields

| DeveloperName | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>The ID representing the source group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| UserOrGroupId   | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>The ID representing the target group being given access.</p>                                                                                                                              |

## Usage

Use this object to manage sharing rules for user records. Source and target groups can include internal users, portal users, Chatter or Chatter External users.

## UserPackageLicense

Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name       | Details                                                                                                                                                                      |

| UserId           | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The User ID of the user licensed to use this package                           |

## Usage

Use this object, in conjunction with PackageLicense, to provide users access to a managed package installed in your organization.

## UserPreference

Represents a functional preference for a specific user in your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

| Value  | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Filter, Nillable, Sort</p> <p><b>Description</b></p> <p>The value of the user preference. For Event Reminder Default Lead Time, the values are increasing intervals of time from 0 minutes to 2 days. For Task Reminder Default Time, the values are half-hours from 12:00 AM to 11:30 PM. To view the respective sets of values, access the Reminders in your personal settings in the online application.</p>                                                                                            |

## Usage

Use this object to query the set of currently configured user preferences in your organization. In your client application, you can query the User object to obtain valid User IDs in order to access the UserPreference object.

All users can invoke `query()` or `describeSObjects()` with this object.

## UserProfile

Represents a Chatter user profile.

**Note:** This object has been deprecated as of API version 32.0. Use the [User](#) object to query information about a user in API version 32.0 and later.

## Supported Calls

`describeLayout()`, `query()`, `retrieve()`

## Special Access Rules

- Information in hidden fields in a user's profile is not searchable by external users (with a portal profile) in a community. For example, if a user in a community has a hidden email address and an external user searches for it, the user record is not returned in the search results. Hidden field values are also not returned when external users perform searches on non-hidden fields. So if an external user searches for a user's name (cannot be hidden), any hidden field values associated with the user record (for example, a hidden email address) are not returned in the search results.

Internal users from your organization who belong to the same community, however, can both search for and view hidden field values in search results.

- Any fields that have been restricted in visibility will be returned empty, whether or not they are, and will not be removed from the field listing.

## Fields

This field is related to UserPreference and customizing activity reminders.</p>                                                                                                                                                                                                                                                                                     |

## Usage

Use this object to query Chatter—related information about the user. While the User object contains all the information about a user and is historically tied to user management, UserProfile is a read-only entity that contains the information that is relevant in a Chatter context.

## UserProfileFeed

Represents a user profile feed, which tracks all actions by a user on records that can be tracked in a feed. This feed is displayed on the user profile page.

UserProfileFeed is available in API version 18.0 through API 26.0. In API version 27.0 and later, UserProfileFeed is no longer available in the SOAP API. Use the Chatter REST API to access UserProfileFeed.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

- "Manage Unlisted Groups"

Only users with this permission can delete items in unlisted groups.

## Fields

| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of <code>FeedComments</code> associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ContentData  | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Usage

Use this object to query and retrieve record changes tracked in a user profile feed. Note the following when working with user profile feeds:

- This object is read only in the API.
- Queries retrieve feed items that include mentions from other users.
- Use this object to query and retrieve lead feed items that were associated with a converted lead record.
- Include a `WITH` clause and specify the `UserId` of the user whose profile you want to query. The `WITH` clause must come after a `WHERE` clause.

Users that do not have the “View All Data” permission have the following limitations when querying records:

- Must specify a `LIMIT` clause and the limit must be less than or equal to 1000.
- Can include a `WHERE` clause that references `UserProfileFeed` fields, but cannot include references to fields in related objects. For example, you can filter by `CreatedDate` or `ParentId`, but not by `Parent.Name`.
- Can include an `ORDER BY` clause that references `UserProfileFeed` fields, but cannot include references to fields in related objects. For example, you can `ORDER BY CreatedDate` or `ParentId`, but not by `Parent.Name`.

 **Tip:** To query for the most recent feed items, you should `ORDER BY CreatedDate DESC, Id DESC`.

Note the following SOQL restrictions.

- No SOQL limit if logged-in user has “View All Data” permission. If not, specify a `LIMIT` clause of 1,000 records or fewer.
- SOQL `ORDER BY` on fields using relationships is not available. Use `ORDER BY` on fields on the root object in the SOQL query.

## UserProvAccount

Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

| IsKnownLink      | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Setting the <code>IsKnownLink</code> value to <code>true</code> implies the administrator or another user is managing the relationship between the Salesforce user account and the third-party user account, manually. This field helps Salesforce coordinate updates between the <code>UserProvAccountStaging</code> object and the <code>UserProvAccount</code> object while committing staged accounts. Typically, for a matching user account (the same <code>ExternalUserId</code> for both objects), Salesforce copies the values from the <code>UserProvAccountStaging</code> object to the <code>UserProvAccount</code> object.</p> <p>However, if Salesforce encounters a <code>UserProvAccountStaging</code> object with a matching <code>ExternalUserId</code> but different <code>LinkState</code> and <code>SalesforceUserId</code> values during this process, Salesforce checks the <code>UserProvAccount</code> <code>IsKnownLink</code> value. If the <code>IsKnownLink</code> value is <code>true</code>, Salesforce doesn't copy the <code>LinkState</code> and <code>SalesforceUserId</code> values from the <code>UserProvAccountStaging</code> object to the <code>UserProvAccount</code> object (all other values are copied).</p> <p>The default is <code>false</code>, meaning Salesforce manages the account relationship.</p> |
| LinkState        | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The state of the current connection between the user account in the Salesforce organization and the associated user account in the target system. The valid values are:</p> <ul style="list-style-type: none"> <li>• <code>linked</code>— changes to the account in the Salesforce organization are queued to be updated for the associated user account in the target system.</li> <li>• <code>duplicate</code>— an associated account in the target system exists.</li> <li>• <code>orphaned</code>—no associated account exists in the target system.</li> <li>• <code>ignored</code>— changes to the account in the Salesforce organization have no effect on the associated user account in the target system.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## UserProvAccountStaging

Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the UserProvAccount object when you click the button to collect and analyze accounts on the target system.

User provisioning links a Salesforce user account with an account in a third-party (target) system. To configure user provisioning, you use a User Provisioning Wizard that guides you through the setup process. As you enter values about account details in the wizard, these values are stored in this object until you click the button to collect and analyze accounts on the target system. The general user provisioning configuration details are stored in the UserProvisioningConfig object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Usage

When committing fields from a `UserProvAccountStaging` to a `UserProvAccount` object, Salesforce looks up the `UserProvAccount` record where `UserProvAccountStaging.ExternalUserId = UserProvAccount.ExternalUserId`.

- If an `ExternalUserId` doesn't match an existing account, Salesforce creates a `UserProvAccount` record based on the `UserProvAccountStaging` record.
- If an `ExternalUserId` matches, then Salesforce checks the `UserProvAccount.isKnownLink` value, and does the following.
  - If `UserProvAccount.IsKnownLink = true`, Salesforce copies the `UserProvAccountStaging` values to the `UserProvAccount` object, except for the `ExternalUserId` and `LinkState` values.
  - If `UserProvAccount.IsKnownLink = false`, Salesforce copies all of the `UserProvAccountStaging` values to the `UserProvAccount` object.

## UserProvMockTarget

Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

During the user provisioning process, user account information is sent to a third-party system to create, update or delete a user account on that system. While configuring user provisioning for your organization using a flow or Apex plugin, you can use this object to confirm the associated flow or plugin is sending the desired data. After confirming the correct fields and values, you can update the flow or Apex plugin to send the data to the target system.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## UserProvisioningConfig

Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

# UserProvisioningLog

Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

Some messages for this object are generated automatically by Salesforce, and others are created by the developers of the user provisioning plugin. Developers can use this object to log messages from the flow associated with the user provisioning process or the Apex plugin that calls the target system. Administrators can use this object as a log of all user provisioning activity and as a troubleshooting tool if desired behavior is missing. This object is available as a custom report type.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## UserProvisioningRequest

Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

A UserProvisioningRequest (UPR) record is created for each provisioning action for each user, and for each connected app available to the user. For example, if a user has two connected apps, and a provisioning request is sent to two different services to create an account for the user, Salesforce creates two UPR objects. Provisioning actions include creating, updating, or deleting a user account.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

## Usage

The `State` value changes during a reconciliation process (`Operation = Reconcile`) to gather and compare users on the third-party system to Salesforce users. Typically, when a UPR entry is first created, it has a `State` value of `New`. When a collection process is triggered, the `State` transitions to `Collecting` until that process is finished and the `State` is `Collected`. When an analyze process is triggered, the `State` transitions to `Analyzing` until that process is finished and the `State` is `Analyzed`. If a process commits the request, the `State` then transitions to `Committing`, and the properties move from the

UserProvAccountStaging object to the UserProvAccount object. When those properties are saved in the UserProvAccount object, the `State` transitions to `Completed`.

However, the `State` does not necessarily start at `New`. For example, UserProvAccountStaging entries can be inserted programmatically. If a process is initiated that triggers linking these rows to accounts on the third-party service, a UPR entry could start with the `Analyzing` `State`.

Also, the `State` cannot go backwards from an active task. For example, a successful `Analyzing` `State` must progress to `Analyzed`; unless the active process fails, and then the `State` must change to `Failed`. Certain `State` transitions cannot be made programmatically and must be triggered by Salesforce.

The following table shows the `State` transitions that can occur for each `State` value. Each row corresponds to a current `State` value and each column corresponds to a new `State` after a potential transition.

-  — the transition to this value is not allowed.
-  — the transition to this value is allowed.
-  — only Salesforce can transition the `State` to this value.

## State Values for Managing Provisioning Failures

The `state` value changes to `Failed` for several reasons, such as network outages, session timeouts, permissions issues, and record locks. The `Failed` state can transition to either `Retried` or `Manually Completed` to indicate what action was taken to address the failure. Actions can include correcting the root cause of the failure and requesting that the provisioning engine retry the UPR. Or, it can be completing the action against the target manually. Each UPR is an independent transaction and it's possible the retry causes a failure with a different root cause. So it's hard to distinguish failed events that you addressed from the ones that require more action.

If you tried to correct the cause of the failure and requested the provisioning engine to retry the UPR, you can mark the failed UPR `Retried`. Or, if the action against the target was completed manually, you can mark it `Manually Completed`.

When a retry event is created, the failed UPR is cloned, and resubmitted. The `ParentID` field contains a lookup to the failed UPR to use to clone the new UPR. The `Retry Count` field contains the number of retry attempts that were performed on a UPR. With the `Retry Count` field, you can add custom business logic like "Retry 5 times then stop and notify your admin."

# UserProvisioningRequestOwnerSharingRule

Represents a rule for sharing a UserProvisioningRequest object with users other than the owner. This object is available in API version 34.0 and later.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## UserProvisioningRequestShare

Represents a sharing entry on a UserProvisioningRequest record. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name                 | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|            | <b>Description</b><br>ID of the User or Group that has been given access to the UserProvisioningRequest record. |

## UserRecordAccess

Represents a user's access to a set of records. This object is read only and is available in API version 24.0 and later.

## Supported Calls

`describeObjects()`, `query()`

## Fields

| Field           | Details                                                                                                                                                                                                                        |

| UserId            | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group</p>                                                                                                                                                                                                                                                                                |

| Field | Details                               |
|-------|---------------------------------------|
|       | <b>Description</b><br>ID of the user. |

## Usage

Use this object to query a user's access to records. You can't create, delete, or update any records using this object.

Up to 200 record IDs can be queried. You can include an `ORDER BY` clause for any field that is being selected in the query.

The following sample query returns the records, whether the queried user has read and transfer access to each record, and the user's maximum access level to each record.

```
SELECT RecordId, HasReadAccess, HasTransferAccess, MaxAccessLevel
  FROM UserRecordAccess
 WHERE UserId = [single ID]
    AND RecordId = [single ID]           //or Record IN [list of IDs]
```

The following query returns the records to which a queried user has read access.

```
SELECT RecordId
  FROM UserRecordAccess
 WHERE UserId = [single ID]
    AND RecordId = [single ID]           //or Record IN [list of IDs]
    AND HasReadAccess = true
```

Using API version 30.0 and later, `UserRecordAccess` is a foreign key on the records. You can't filter by or provide the `UserId` or `RecordId` fields when using this object as a lookup or foreign key. The previous sample queries can be run as:

```
SELECT Id, Name, UserRecordAccess.HasReadAccess, UserRecordAccess.HasTransferAccess,
       UserRecordAccess.MaxAccessLevel
  FROM Account
```

```
SELECT Id, Name, UserRecordAccess.HasReadAccess
  FROM Account
```

SOQL restrictions for API version 29.0 and earlier:

- When the running user is querying a user's access to a set of records, records that the running user does not have read access to are filtered out of the results.
- When filtering by `UserId` and `RecordId` only, you must use `SELECT RecordId` and optionally one or more of the access level fields: `HasReadAccess`, `HasEditAccess`, `HasDeleteAccess`, `HasTransferAccess`, and `HasAllAccess`. You may include `MaxAccessLevel`.
- When filtering by `UserId`, `RecordId`, and an access level field, you must use `SELECT RecordId` only.

## UserRole

Represents a user role in your organization.

**Note:** This object was called "Role" in previous versions of the API documentation.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                                     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage

Use this object to query the set of currently configured user roles in your organization. Use it in your client application to obtain valid UserRole IDs to use when querying or modifying a User record.

All users have access to invoke query or describe this object. If your client application logs in with the “Manage Users” permission, it can query, create, update, or delete UserRole records.

 **Note:** You can’t update any field for a portal role.

For example, the following code finds all roles that are not assigned to any users.

```
SELECT Id, Name, DeveloperName,
FROM UserRole
WHERE Id NOT IN (SELECT UserRoleId
                  FROM User
                  WHERE UserRoleId != '0000000000000000')
```

## UserServicePresence

Represents a presence user’s real-time presence status. This object is available in API version 32.0 and later.

## Supported Calls

query(), getDeleted(), getUpdated(), retrieve()

## Fields

| Field              | Details                                                                                                                                                                          |

## UserShare

Represents a sharing entry on a user record. This object is available in API version 26.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>ID of the User or Group that has been given access to the User. This field can't be updated. |

## Usage

This object allows you to determine which users and groups can view or edit User records owned by other users.

## UserTeamMember

Represents a single User on the default opportunity team of another User.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- This object is available only in organizations that have enabled the team selling functionality.
- Customer Portal users can't access this object.

## Usage

If you attempt to create a record that matches an existing record, the create request updates any modified fields and returns the existing record.

Users can set up their default opportunity team to include other users that typically work with them on opportunities.

# UserTerritory

Represents a User who has been assigned to a Territory.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Only available if territory management has been enabled for your organization.
- Customer Portal users can't access this object.

## Usage

If a user is inactive in a territory, and the opportunities they own that are associated with the territory are all closed, then the user is not returned.

SEE ALSO:

[Territory](#)

[AccountTerritoryAssignmentRule](#)

[AccountTerritoryAssignmentRuleItem](#)

## UserTerritory2Association

Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization's sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

## VerificationHistory

Represents the past six months of your org users' attempts to verify their identity. This object is available in API version 36.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Only users with “Manage Users” permission can access this object.

## Fields

| EventGroup | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the verification attempt. Verification can involve several attempts and use different verification methods. For example, in a user’s session, a user enters an invalid verification code (first attempt). The user then enters the correct code and successfully verifies identity (second attempt). Both attempts are part of a single verification and, therefore, have the same ID. The label is Verification Attempt.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|            | Logins" user permission assigned to a custom profile. Or, the user permission is included in a permission set that is assigned to a user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Remarks    | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The text the user sees on the screen or in Salesforce Authenticator when prompted to verify identity. For example, if identity verification is required for a user's login, the user sees "You're trying to Log In to Salesforce". In this instance, the <code>Remarks</code> value is "Log In to Salesforce". The exception is when the <code>Activity</code> value is Apex. In this instance, the <code>Remarks</code> value is a custom description passed by the Apex method. If the user is verifying identity using the Salesforce Authenticator app, the custom description displays in the app as well. If the custom description isn't specified, the default value is the name of the Apex method. The label is Activity Message.</p> |
| ResourceId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>If the <code>Activity</code> value is ConnectedApp, the <code>ResourceId</code> value is the ID of the connected app. The label is Connected App ID.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SourceIp   | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The IP address of the machine from which the user attempted the action that requires identity verification. For example, the IP address of the machine from where the user tried to log in or access reports. If it's a non-login action that required verification, the IP address can be different from the address from where the user logged in. This address can be an IPv4 or IPv6 address.</p>                                                                                                                                                                                                                                                                                                                                                     |

| VerificationTime | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Filter, Sort</p> <p><b>Description</b><br/>The time of the identity verification attempt. The time zone is based on GMT. The label is Time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage

Here are two examples of the types of API queries you can perform.

| Query                                                                          | String                                                                                                                                                                       |
|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show verification history for a user’s login record                            | <pre>SELECT Activity, EventGroup, Policy, Remarks, Status, UserId, VerificationMethod, VerificationTime FROM VerificationHistory WHERE LoginHistoryId = '0Yad000#####'</pre> |
| Get detailed geographic location information for a user’s verification attempt | <pre>SELECT City, CountryIso, Latitude, Longitude, PostalCode FROM LoginGeo WHERE LoginGeoId = '0LE#####'</pre>                                                              |

## Vote

---

Represents a vote that a user has made on an Idea or a Reply.

**Note:** In API version 16.0 and earlier, SOQL queries on the Vote object only return votes for the Idea object. Starting in API version 17.0, SOQL queries return votes for both Idea and Reply.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field     | Details                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IsDeleted | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter</p> <p><b>Description</b><br/>Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is <b>Deleted</b>.</p>                                                                                                                                                                                            |
| ParentId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Group, Sort, Create, Filter</p> <p><b>Description</b><br/>ID of the Idea or Reply associated with this vote.</p>                                                                                                                                                                                                                                                      |
| Type      | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Group, Sort, Create, Filter, Restricted picklist</p> <p><b>Description</b><br/>Picklist that indicates the type of vote. The value <code>Up</code> indicates that the vote is a user's positive endorsement of the associated idea or reply. The value <code>Down</code> indicates that the vote is a user's negative endorsement of the associated idea or reply.</p> |

**Note:** If you are importing Vote data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

## Usage

In version 12.0 and later, use this object to track the votes that users made on ideas. For more information on ideas, see “Ideas Overview” in the Salesforce online help.

In version 17.0 and later, use this object to track the votes users made on replies. For more information, see “Answers Overview” in the Salesforce online help.

In version 17.0 and later, you must filter using the following syntax when querying this object in a SOQL query: `ParentId = single ID`, `Parent.Type = single Type`, `Id = single ID`, or `Id IN (list of IDs)`. See Comparison Operators in the [Salesforce SOQL and SOSL Reference Guide](#) for a sample query.

A SOQL query must filter using one of the following Parent or Id clauses.

- `ParentId = [single ID]`
- `Parent.Type = [single type]`
- `Id = [single ID]`
- `Id IN = [list of IDs]`

## WebLink

---

Represents a custom link to a URL or Scontrol.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

- To create a custom link, the client application must be logged in with the “Customize Application” permission.
- Customer Portal users can’t access this object.

## Usage

Use this object to programmatically manage custom links, which allow client applications to integrate data with external URLs, an organization's intranet, or other back-end office systems. A custom link can point to:

- An external URL, such as `www.google.com` or your company's intranet.
- A custom s-control, such as a Java applet or Active-X control.

Custom links can include fields as tokens within the URL or custom s-control.

SEE ALSO:

[Scontrol](#)

## WebLinkLocalization

Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

## Usage

Use this object to translate your custom links to URLs or s-controls into the different languages supported by Salesforce. Users with the Translation Workbench enabled can view custom link translations, but either the “Customize Application” or “Manage Translation” permission is required to create or update custom link translations.

## WorkAccess

Used to grant or restrict user access to give badge definitions. Each badge definition record must have one WorkAccess record.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

WorkAccess is not available through Schema Builder and is not customizable. A WorkAccess record is **required** for users to **Give** BadgeDefinitions. If a WorkAccess record is not created, BadgeDefinitions will not be available to users.

The sharing of WorkAccess records is through [WorkAccessShare](#) on page 1910. For each WorkBadgeDefinition record, you must create both a WorkAccess record (per WorkBadgeDefinition) and WorkAccessShare records for sharing to users or groups.

## Fields

| Field Name | Details                                                                                                                                                                                           |

| OwnerId    | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Sort, Update<br><b>Description</b><br>Salesforce unique ID for owner of Access record.               |
| ParentId   | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Salesforce unique ID for BadgeDefinition record associated with this Access record. |

## WorkAccessShare

Used to control Givers of WorkBadgeDefinition records.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

Related to [WorkAccess Object](#). WorkAccess is the parent of WorkAccessShare.

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name    | Details                                                                                                                                                                                                                                                                     |

## WorkBadge

Represents information about who the badge was given to and which badge was given. A WorkBadge record is created for each recipient of a WorkBadgeDefinition.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

WorkBadge is a lookup to WorkThanks. Each WorkBadge record must derive a SourceId from WorkThanks. There can be multiple WorkBadge records tied to a single WorkThanks record.

## WorkBadgeDefinition

Represents the attributes of a badge including the badge name, description, and image. Each WorkBadge record must have a lookup to a WorkBadgeDefinition since badge attributes (like badge name) are derived from the WorkBadgeDefinition object.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

WorkBadgeDefinition has a field called `ImageUrl` that references a DocumentID. This is a required field for creating a Badge.

To grant “giver” access to a WorkBadgeDefinition, you must also create the [WorkAccess](#) (and the related [WorkAccessShare](#)) records.

Each WorkBadgeDefinition has an `ImageUrl` field that must be populated with a DocumentID of the Document record containing the badge image.

## Fields

| Field Name      | Details                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------|
| Description     | <b>Type</b><br>textarea                                                                                                       |
|                 | <b>Properties</b><br>Create, Update                                                                                           |
|                 | <b>Description</b><br>Required. Limit: 4000 characters. The description of the badge and what it means to receive this badge. |
| GivenBadgeCount | <b>Type</b><br>int                                                                                                            |

| Field Name     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## WorkBadgeDefinitionShare

Represents a sharing entry on a WorkBadgeDefinition object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## WorkCoaching

Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. WorkCoaching is feed-enabled so there is a private feed available to the coach and coachee.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name | Details                                                                                                                                                                            |

## WorkCoachingFeed

Represents a single feed item in the feed on the detail page for a coaching record.

A coaching feed shows recent changes to a lead record for any fields that are tracked in feeds, and posts and comments about the record. It's a useful way to stay up-to-date with changes made to coaching in Salesforce.

## Supported Calls

`delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items that you created. To delete feed items that you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the WorkCoachingFeed object
- "Moderate Chatter"

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                              |

|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p><b>Description</b></p> <p>Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via the SOAP API. Otherwise, the post is rendered as plain text.</p> <p>Rich text supports the following HTML tags:</p> <ul style="list-style-type: none"> <li>• <code>&lt;p&gt;</code></li> </ul> <p> <b>Tip:</b> Though the <code>&lt;br&gt;</code> tag isn't supported, you can use <code>&lt;p&gt;&amp;nbsp;&lt;/p&gt;</code> to create lines.</p> <ul style="list-style-type: none"> <li>• <code>&lt;b&gt;</code></li> <li>• <code>&lt;code&gt;</code></li> <li>• <code>&lt;i&gt;</code></li> <li>• <code>&lt;u&gt;</code></li> <li>• <code>&lt;s&gt;</code></li> <li>• <code>&lt;ul&gt;</code></li> <li>• <code>&lt;ol&gt;</code></li> <li>• <code>&lt;li&gt;</code></li> <li>• <code>&lt;img&gt;</code></li> </ul> <p>The <code>&lt;img&gt;</code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code>&lt;img src="sfdc://069B0000000omjh"&gt;&lt;/img&gt;</code></p> <p> <b>Note:</b> In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p> |

## WorkCoachingShare

Represents a sharing entry on a WorkCoaching object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Field Name    | Details                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UserOrGroupId | <b>Type</b><br>reference <b>Properties</b><br>Create, Filter, Group, Sort <b>Description</b><br>ID of the user or group that was given access to the coaching relationship. This field can't be updated. |

## WorkFeedback

Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

- Ownership is transferred to the requester on submit for certain types (ad-hoc feedback).
- The record is read-only after the request that it's linked to is set to Submitted.
- You can't link a feedback object to a request unless you are the recipient.
- The question that the feedback is linked to must be part of the same question set that the request is linked to.

## Fields

| Field Name | Details                                                                                                                                                                                                |

# WorkFeedbackQuestionSet

---

Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

In the Work.com performance application, a question set defines the type of summaries and their due dates that will accompany the deployment of a specific performance summary cycle.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                        |

## WorkFeedbackQuestionSetShare

Represents a sharing entry on a WorkFeedbackQuestionSet.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                 |

## WorkFeedbackQuestionShare

Represents a sharing entry on a WorkFeedbackQuestion.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name               | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| UserOrGroupId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the user or group that was given access to the feedback question. This field can't be updated.</p> |

## WorkFeedbackRequest

Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, WorkFeedbackRequest represents feedback that is offered about a subject. In the performance application, WorkFeedbackRequest represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

- After a request's state is changed to Submitted, fields can't be changed, except for LastSharedDate and IsUnreadByOwner.
- If LastRemindDate is updated, a reminder notification will be sent to the request's recipient (only possible when request is in Draft state).
- When a new request is created, a notification is sent to the recipient.
- When a recipient of a request submits their feedback (Draft->Submitted), a notification will be sent to requester (except for offered feedback).
- Requester cannot modify the subject of the question set after a request is created.
- For offered feedback (to user, to manager, or both), the person who is offering feedback is both the creator of WorkFeedbackRequest as well as the recipient.

## WorkFeedbackRequestFeed

Represents a single feed item in the feed displayed on the feedback request detail page.

The feedback request feed shows changes to a request for fields that are tracked in feeds, posts, and comments about the request.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The sum of the weights should equal 100%.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## WorkGoalCollaborator

Represents collaborators on a WorkGoal object. This doesn't include WorkGoal followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the [Goal](#) object to query information about Work.com goals.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## WorkGoalCollaboratorHistory

Represents the history of changes to the values in the fields in a WorkGoalCollaborator object. Access is read-only.

**Note:** This object has been deprecated as of API version 35.0. Use the [Goal](#) object to query information about Work.com goals in API version 35.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

# WorkGoalFeed

Represents a single feed item in the feed displayed on the goal page for a Goal record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal, and updates on metrics. This object has been deprecated as of API version 35.0. Use the [GoalFeed](#) object to query information about feed items for Work.com goals.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                            |

# WorkGoalHistory

---

Represents the history of changes to the values in the fields of a WorkGoal. Access is read-only. This object has been deprecated as of API version 35.0. Use the [GoalHistory](#) object to query historical information for Work.com goals.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                   |

## WorkGoalShare

Represents a sharing entry on a WorkGoal object. This object has been deprecated as of API version 35.0. Use the [GoalShare](#) object to query information about sharing for Work.com goals.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                 | <b>Properties</b><br>Create, Filter, Nillable, Sort, Update<br><br><b>Description</b><br>The total tax on the work order. You can enter a number with or without the currency symbol and use up to two decimal places. For example, in a work order whose total price is \$100, enter \$10 to apply a 10% tax.                              |
| TotalPrice      | <b>Type</b><br>currency<br><br><b>Properties</b><br>Filter, Nillable, Sort<br><br><b>Description</b><br>Read only. The total of the work order line items' prices. This value has discounts applied but not tax.                                                                                                                            |
| WorkOrderNumber | <b>Type</b><br>string<br><br><b>Properties</b><br>Autonumber, Defaulted on create, Filter, idLookup, Sort<br><br><b>Description</b><br>An eight-digit, auto-generated number that identifies the work order.                                                                                                                                |
| WorkTypeId      | <b>Type</b><br>reference<br><br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><br><b>Description</b><br>The work type associated with the work order. When a work type is selected, the work order automatically inherits the work type's <code>Duration</code> , <code>Duration Type</code> , and required skills. |

## Usage

A work order can be a child record of accounts, assets, cases, contacts, entitlements, service contracts, and other work orders. We recommend adding work order line items to the work order to break the main task into smaller subtasks.

## WorkOrderFeed

Represents a single feed item on a work order record detail page. This object is available in API version 36.0 and later.

A work order feed shows changes to tracked fields on a work order record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to work orders in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Work orders or Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Work Order object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                              |

## WorkOrderHistory

Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Work orders or Field Service Lightning must be enabled in your organization, and field tracking for work order fields must be configured.

## Fields

| Field Name | Details                 |
|------------|-------------------------|
| Field      | <b>Type</b><br>picklist |

| Field Name  | Details                                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | <b>Properties</b><br>Filter, Group, Restricted picklist, Sort<br><b>Description</b><br>The name of the field that was changed.                                                                 |
| NewValue    | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The new value of the field that was changed.                                                            |
| OldValue    | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The value of the field before it was changed.                                                           |
| WorkOrderId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the work order being tracked. The history is displayed on the detail page for this record. |

## WorkOrderLineItem

Represents a subtask on a work order, typically in field service. This object is available in API version 36.0 and later.

### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WorkOrderId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The line item's parent work order. Because work order line items must be associated with a work order, this is a required field.</p>                                                                                          |
| WorkTypeId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>The work type associated with the line item. When a work type is selected, the line item automatically inherits the work type's <code>Duration</code>, <code>Duration Type</code>, and required skills.</p> |

## Usage

A work order line item is a child record of a work order. It represents a specific subtask on a work order.

For example, suppose a customer purchased a truck from you. The truck is represented as an asset in your Salesforce org. After some time, the truck needs both headlight bulbs replaced. Here's one way that you can use work orders and work order line items to track the repair.

1. Create a work order named "Replace Headlight Bulbs" from the asset record detail page.
2. Add three work order line items to the work order: "Replace Left Headlight Bulb," "Replace Right Headlight Bulb," and "Test Headlights."
3. Assign the work order to a technician via a queue.
4. As the technician completes each line item, he or she marks the item as `Completed`.
5. When all the line items are complete, the technician marks the work order as `Completed`.

## WorkOrderLineItemFeed

Represents a single feed item on a work order line item record detail page. This object is available in API version 36.0 and later.

A work order line item feed shows changes to tracked fields on a work order line item record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to work order line items in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Work orders or Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Work Order Line Item object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## WorkOrderLineItemHistory

Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Work orders or Field Service Lightning must be enabled in your organization, and field tracking for work order line item fields must be configured.

## Fields

| Field Name | Details                                                                                                                                             |

## WorkOrderShare

Represents a sharing entry on a work order. This object is available in API version 36.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Work orders or Field Service Lightning must be enabled in your organization. Community users can't access this object.

| State          | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort, Update<br><b>Description</b><br>The state that the performance summary cycle is in. Available pick list values: <ul style="list-style-type: none"><li>• Setup: The summary is in draft.</li><li>• In Progress: The summary is deployed and people are answering the questions that were created.</li><li>• Finished: The summary is no longer in progress.</li><li>• Error: The summary encountered an error.</li></ul> |

# WorkPerformanceCycleFeed

---

Represents a single feed item in the feed that is displayed on a Work.com Performance detail page.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body               | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of the FeedItem. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>               |
| CommentCount       | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p>                                                                                                                                                                                     |
| ContentData        | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p> |
| ContentDescription | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>                                                                                                                             |

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ContentFileName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p> |
| ContentSize     | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Read only. Automatically determined during insert. The size of the file (in bytes) uploaded to the feed.</p>                                                                                                                      |
| ContentType     | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Read only. Automatically determined during insert. The MIME type of the file uploaded to the feed.</p>                                                                                                                         |
| InsertedById    | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the user who added this object to the feed. For example, if a client application migrates multiple posts and comments from another application into a feed, then <code>InsertedById</code> is set to the ID of the logged-in user.</p>                                |
| IsRichText      | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via the SOAP API. Otherwise, the post is rendered as plain text.</p>                              |

## WorkPerformanceCycleHistory

Represents the history of changes to the values in the fields of a `WorkPerformanceCycle` object.

### Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name             | Details                                                                                                                                                   |

## WorkPerformanceCycleShare

Represents a sharing entry on a WorkPerformanceCycle object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## WorkReward

Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

You must have the Reward permission enabled in order to use the Rewards feature, including WorkRewardFund and WorkReward.

## Additional Considerations and Related Objects

WorkReward is a lookup to WorkRewardFund. WorkRewardFund must have at least one WorkReward record to be available for use. Each WorkBadge record with a `RewardId` indicates a reward badge given to a Recipient.

## Fields

| Field Name | Details                                                                                                                                                            |

|            | <b>Properties</b><br>Filter, Nillable, Sort                                                          |
|            | <b>Description</b><br>The value of the WorkReward.                                                   |

## WorkRewardFund

Represents a Reward Fund and describes the Reward Fund attributes.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

To use the Rewards feature, including WorkRewardFund and WorkReward, you must have the Reward permission enabled. To create Rewards, the user must have Create on WorkRewardFund, which is not a standard permission.

## Additional Considerations and Related Objects

WorkReward is a lookup to WorkRewardFund. WorkRewardFund must have at least one WorkReward record available. Each WorkBadgeDefinition with a RewardFundId is a "Reward Badge."

## Fields

# WorkThanks

---

Represents the source and message of a thanks post.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

WorkBadge is a lookup to WorkThanks. Each WorkBadge record must derive a SourceId from WorkThanks.

## Fields

| Field Name | Details                                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FeedItemId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>ID of the FeedItem related to the thanks badge.      |
| GiverId    | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>Salesforce user ID for the giver of the Thanks record. |
| Message    | <b>Type</b><br>textarea<br><b>Properties</b><br>Create<br><b>Description</b><br>Required. Message associated with the Thanks record.                         |

| Field Name | Details                                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>The ID of the <a href="#">community</a> that this WorkThanks is associated with. This field is available only if Salesforce Communities is enabled in your organization.                                                |
| OwnerId    | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Sort, Update<br><b>Description</b><br>Salesforce user ID for the owner of the badge record (typically the same user as the giver of the record). |

## WorkThanksShare

Share records for WorkThanks object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                              |

| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>User or Group ID for WorkThanks record.                                                                                                                           |

## WorkType

Represents a type of work to be performed. Work types are templates that can be applied to work order or work order line items. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name  | Details                                                                                                                                                                                                        |

Try to use a name that helps users quickly understand the type of work orders that can be created from the work type. For example, "Annual Refrigerator Maintenance" or "Valve Replacement."</p> |
| ShouldAutoCreateSvcAppt | <p><b>Type</b><br/>boolean</p>                                                                                                                                                                                                                                                                                                                       |

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p><b>Properties</b></p> <p>Create, Filter, Group, Defaulted on create, Sort, Update</p> <p><b>Description</b></p> <p>Select this option to have a service appointment automatically created on work orders and work order line items that use the work type.</p> <p> <b>Note:</b> By default, the Due Date on auto-created service appointments is seven days after the created date. Admins can adjust this offset from the Field Service Settings page in Setup.</p> |

## Usage

To apply a work type to a work order or work order line item, select the work type in the `Work Type` lookup field on the record. When you add a work type, the work order or work order line item inherits the work type's duration values and required skills.

### Note:

- If needed, you can update the duration values and required skills on a work order or work order line item after they're inherited from the work type.
- If a work order or work order line item already has required skills, associating it with a work type doesn't cause it to inherit the work type's required skills.
- Customizations to required skills, such as validation rules or Apex triggers, are not carried over from work types to work orders and work order line items.

## WorkTypeFeed

Represents a single feed item on a work type record detail page. This object is available in API version 38.0 and later.

A work type feed shows changes to tracked fields on a work type record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to work types in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Operating Hours object
- "Moderate Chatter"

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The message that appears in the feed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>.</p>                        |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of comments associated with this feed item.</p>                                                                                                                                                       |
| InsertedById | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the value is set to the ID of the logged-in user.</p> |
| IsRichText   | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/><code>true</code> indicates that the body of the feed contains rich text. <code>false</code> indicates that the post is rendered as plain text.</p>                                     |
| LikeCount    | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of feed likes associated with this feed item.</p>                                                                                                                                                     |

| Field Name      | Details                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LinkUrl         | <p><b>Type</b><br/>url</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The URL of a link post.</p>                                                                                                                                      |
| ParentId        | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the work type record tracked in the feed. The feed is displayed on the detail page for this record.</p>                                         |
| RelatedRecordId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the <code>ContentVersion</code> object associated with a content post. This field is null for all posts, except <code>ContentPost</code>.</p> |
| Title           | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the Link URL is the URL, and this field is the link name.</p>         |
| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The type of feed item.</p>                                                                                              |

# WorkTypeHistory

Represents the history of changes made to tracked fields on a work type. This object is available in API version 38.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Field Service Lightning must be enabled.

## Reusable Terms for API Objects

### API Version Availability.

- This object is available in API version 38.0 and later.
- This object is available in API version 37.0 and later.
- This object is available in API version 27.0 and later.
- This object is available in API version 21.0 and later.
- This object is available in API version 20.0 and later.
- This object is available in API version 18.0 and later.

### API Reusables

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## CHAPTER 3 Data Model

The entity relationship diagrams (ERDs) for standard Salesforce objects in this section illustrate important relationships between objects. Salesforce ERDs use crow's foot notation. The following ERDs are available.

- [Sales Objects](#)—includes accounts, contacts, opportunities, leads, campaigns, and other related objects
- [Task and Event Objects](#)—includes tasks and events and their related objects
- [Support Objects](#)—includes cases and solutions and their related objects
- [Salesforce Knowledge Objects](#)—includes view and vote statistics, article versions, and other related objects
- [Document, Note, and Attachment Objects](#)—includes documents, notes, and attachments and their related objects
- [User, Sharing, and Permission Objects](#)—includes users, profiles, and roles
- [Profile and Permission Objects](#)—includes users, profiles, permission sets, and related permission objects
- [Record Type Objects](#)—includes record types and business processes and their related objects
- [Product and Schedule Objects](#)—includes opportunities, products, and schedules
- [Sharing and Team Selling Objects](#)—includes account teams, opportunity teams, and sharing objects
- [Customizable Forecasting Objects](#)—includes forecasts and related objects
- [Forecasts Objects](#)—includes objects for Collaborative Forecasts.
- [Territory Management 2.0 Objects](#)—includes territories and related objects associated with Territory Management 2.0
- [Territory Management](#)—includes territories and related objects
- [Process Objects](#)—includes approval processes and related objects
- [Content Objects](#)—includes content and libraries and their related objects
- [Chatter Feed Objects](#)—includes objects related to feeds
- [Work.com Badge and Reward Objects](#)—includes badge and reward objects
- [Work.com Feedback and Performance Cycle Objects](#)—includes feedback and performance cycle objects

Each ERD includes links to the topics that describe the fields in objects related to the diagram. The data model for your custom objects depends on what you create.

## Chatter Objects

Diagram showing the relationships between the Chatter objects

The following diagram shows the relationships between the major Chatter objects.

- A feed item is an entry in the feed, such as a change to a record that's being followed, an updated post, or a user status change.
- All feed items have a `ParentId`, which is either:
  - a record
  - a user
  - a group
