- Only SAML version 2.0 can be used with portals.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- Both the `portal_id` and `organization_id` attributes are required. If only one is specified, the user receives an error.
- If both the `portal_id` and `organization_id` attributes are populated in the SAML assertion, the user is directed to that portal login. If neither is populated, the user is directed to the regular SAML Salesforce login.
- More than one portal can be used with a single org.

SSO for Sites Best Practices

- Only SAML version 2.0 can be used with Sites.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- The `portal_id`, `organization_id`, and `siteUrl` attributes are required. If only one is specified, the user receives an error.
- If all the `portal_id`, `organization_id` and `siteUrl` attributes are populated in the SAML assertion, the user is directed to that Sites login. If the `siteUrl` isn't populated and the other two are, the user is directed to the portal login.
- More than one portal can be used with a single org.

[Single Sign-On Implementation Guide](#)

Delegated Authentication Single Sign-On

You can integrate Salesforce with the authentication method of your choice using delegated authentication single sign-on (SSO). You can integrate with your LDAP (Lightweight Directory Access Protocol) server or authenticate with a token instead of a password. You manage delegated authentication at the permission level, not at the org level, giving you more flexibility. With permissions, you can require some to use delegated authentication while others use their Salesforce-managed password.

Here's the process that Salesforce uses to authenticate users with delegated authentication SSO.

1. When a user tries to log in—either online or using the API—Salesforce validates the username and checks the user's permissions and access settings.
2. If the user has the "Is Single Sign-On Enabled" user permission, Salesforce doesn't validate the username and password. Instead, a web services call is made to the user's org asking it to validate the username and password.

 **Note:** Salesforce doesn't store, log, or view the password. It's disposed of immediately after the process completes.

3. The web services call passes the username, password, and sourceIp to your web service. SourceIp is the IP address where the login request originated. You must create and deploy an implementation of the web service that Salesforce servers can access.
4. Your web service implementation validates the passed information and returns either `true` or `false`.
5. If the response is `true`, the login process continues, a new session is generated, and the user proceeds to the app. If `false`, the user gets an error message that the username and password combination is invalid.

 **Note:** With delegated authentication, a user can experience a slight delay when logging in while the user account becomes available in the org.

Configure Salesforce for Delegated Authentication

You manage delegated authentication at the permission level, not at the org level, giving you more flexibility. With permissions, you can require some to use delegated authentication while others use their Salesforce-managed password. You must contact Salesforce to enable the delegated authentication feature before you can configure it in your org.

1. Build your SSO web service.

- a. In Salesforce, download the Web Services Description Language (WSDL) file `AuthenticationService.wsdl`. From Setup, enter `API` in the `Quick Find` box, then select **API**, then select **Download Delegated Authentication WSDL**.

The WSDL file describes the delegated authentication SSO service. Use the WSDL file to generate a server-side stub to which you add your SSO implementation. For example, in the WSDL2Java tool from Apache Axis, use the `--server-side` switch. With the .NET `wsdl.exe` tool, use the `/server` switch.

For a sample request and response, see [Sample SOAP Message for Delegated Authentication](#) on page 909.

- b. Add a link to your corporate intranet or other internal site that takes the authenticated user's credentials and passes them through an HTTP POST to the Salesforce login page.

Because Salesforce doesn't use the password field other than to pass it back to you, don't pass in a password. Instead, pass another authentication token, such as a Kerberos Ticket, so that your corporate passwords aren't passed to or from Salesforce.

You can configure the Salesforce delegated authentication authority to accept only a token or either a token or password. If the authority accepts only a token, Salesforce users can't log in to Salesforce directly because they can't create a valid token. However, many authorities support both tokens and passwords. In this case, users can log in to Salesforce through the login page.

When the Salesforce server passes the credentials back to you in the `Authenticate` message, verify them. Then the user can access the app.

2. In Salesforce, specify your org's SSO gateway URL. From Setup, enter `Single Sign-On` in the `Quick Find` box, select **Single Sign-On Settings**, and then click **Edit**. Enter the URL in the Delegated Gateway URL text box. For security reasons, Salesforce restricts outbound ports to one of the following.

- 80, which accepts only HTTP connections
- 443, which accepts only HTTPS connections
- 1024–66535, which accept HTTP or HTTPS connections

3. Optionally, select **Force Delegated Authentication Callout**.

 **Note:** Select this option if you must record every login attempt. This option forces a callout to the SSO endpoint regardless of login restriction failures. If you don't select this option, a call isn't made to the SSO endpoint if the first login attempt fails due to login restrictions within the Salesforce org.

4. Enable the "Is Single Sign-On Enabled" permission.

 **Important:** If single sign-on (SSO) is enabled for your org, API and desktop client users can log in to Salesforce unless their profile has IP address restrictions set and they try to log in from outside of the range defined. Also the SSO authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However, if the security token is enabled for your org,

Control Individual API Client Access to Your Salesforce Organization

With API Client Whitelisting, restrict all API client applications, such as the Data Loader, to require administrator approval, unless the user's profile or permission set has the "Use Any API Client" permission.

Administrators may grant some users API access through the "API Enabled" permission. After it's given, this permission allows the user API access through any client (such as the Data Loader, Salesforce1, Salesforce for Outlook, or the Force.com Migration Tool). For finer control over which applications the user can use for API access, you can implement API Client Whitelisting. This feature leverages the existing authorization capabilities of connected apps. With API Client Whitelisting, an administrator can approve or block individual client application access for each associated connected app. All client applications that are not configured as connected apps are denied access. If you are not using connected apps, you can relax this restriction for individual users by assigning them a profile or permission set with "Use Any API Client" enabled.

 **Note:** Contact Salesforce to enable API Client Whitelisting. After it's enabled, all client access is restricted until explicitly allowed by the administrator. This restriction might block access to applications that your users are already using. Before you enable this feature, you should configure and approve connected apps for any client applications you want users to continue using, or give the users a profile or permission set with "Use Any API Client" enabled.

To configure API Client Whitelisting, do the following.

1. Contact Salesforce to get the feature enabled for your organization.
2. From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.
3. In the App Access Settings, click **Edit**.
4. Select **Limit API access to installed connected apps with the "Admin approved users are pre-authorized" policy**.

Optionally, select **Allow Visualforce pages to bypass this restriction** so that any Visualforce pages that use the API continue to be authorized to access objects in the organization. If you enable API Client Whitelisting without selecting this option, only approved connected apps are authorized, and Visualforce pages might not behave as expected. Also, if unchecked, client applications that call `getSessionId()` are denied access. Apps that make API calls to Salesforce using a session obtained in a Visualforce context are denied access unless you select this checkbox.

5. Click **Save**.

After you select this feature, all client applications need explicit approval by an administrator to be authorized for the organization, unless the user has a profile or permission set with "Use Any API Client" enabled.

Some components for commonly used apps are automatically installed as connected apps in organizations. These components support apps such as the Data Loader, Salesforce1, Workbench and more. After you select this feature, these components will also require approval, unless the user has a profile or permission set with "Use Any API Client" enabled. See [Managing a Connected App](#) for more information about these components.

Viewing Single Sign-On Login Errors

If your organization is enabled for Single Sign-On using delegated authentication and has built a Single Sign-On solution, you can view the most recent Single Sign-On login errors for your organization.

1. From Setup, enter *Delegated Authentication Error History* in the **Quick Find** box, then select **Delegated Authentication Error History**.
2. For the twenty-one most recent login errors, you can view the user's username, login time, and the error.

 **Note:** Contact Salesforce to learn more about enabling Single Sign-On for your organization.

SEE ALSO:

[Single Sign-On](#)

SAML

Salesforce Identity uses the XML-based Security Assertion Markup Language (SAML) protocol for single sign-on into Salesforce from a corporate portal or identity provider. With SAML, you can transfer user information between services, such as from Salesforce to Microsoft 365.

The identity provider performs most of the work to set up single sign-on (SSO).

1. Establish a SAML identity provider and [gather information](#) about how they connect to Salesforce. The identity provider sends SSO requests to Salesforce.
2. Provide information to your identity provider, such as the [URLs for the start and logout pages](#).
3. Configure Salesforce using the instructions in [Configure SAML Settings for Single Sign-On](#). Only this step takes place in Salesforce.

Your identity provider sends SAML assertions to Salesforce using the SAML Web Single Sign-on Browser POST profile. Salesforce sends SAML responses to the identity provider login URL specified under Setup by entering *Single Sign-On* in the **Quick Find** box, then selecting **Single Sign-On Settings**. Salesforce receives the assertion, verifies it against your Salesforce configuration, and, if the assertion is true, allows SSO.

If you have problems with the SAML assertion after you configure Salesforce for SAML, use the SAML Assertion Validator to [validate the SAML assertion](#). You can obtain a SAML assertion from your identity provider.

If your users can't log in using SAML, [review the SAML login history](#) to determine why. Sharing the login history with your identity provider helps resolve problems quickly.

Click **Download Metadata** to download an XML file of your SAML configuration settings to send to your identity provider. The identity provider can then upload these configuration settings to connect to your Salesforce orgcommunity.

Working With Your Identity Provider

- You must gather the following information from your identity provider before configuring Salesforce for SAML.
 - The version of SAML the identity provider uses (1.1 or 2.0)
 - The entity ID of the identity provider (also known as the issuer)
 - An authentication certificate.
 -  **Tip:** Be sure to store the certificate where you can access it from your browser. This will be uploaded to Salesforce in a later step.
 - The following SAML assertion parameters, as appropriate:
 - The SAML user ID type
 - The SAML user ID location
 - Attribute Name
 - Attribute URI
 - Name ID format
 -  **Note:** Attribute Name, Attribute URI, and Name ID format are only necessary if the [SAML User ID Location](#) is in an Attribute element, and not the name identifier element of a Subject statement.
 -  **Tip:** To set up single sign-on quickly, you can import SAML 2.0 settings from an XML file (or a URL pointing to the file) on the Single Sign-On Settings page. Obtain the XML from your identity provider.

You may also want to share [more information](#) about these values with your identity provider.

 -  **Tip:** Enable Salesforce for SAML and take a screenshot of the page for your identity provider. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**, click **Edit**, then select **SAML Enabled**.
- Work with your identity provider to setup the [start, login, and logout pages](#).

Configure SAML Settings for Single Sign-On

From this page, you can configure your org to use single sign-on. You can also set up just-in-time provisioning. Work with your identity provider to properly configure these settings. For more information about single sign-on, see [Single Sign-On](#). For more information about just-in-time provisioning, see [About Just-In-Time Provisioning](#).

To configure SAML settings for single sign-on from your corporate identity provider to Salesforce:

1. [Gather information from your identity provider.](#)
2. [Provide information to your identity provider.](#)
3. [Set up single sign-on.](#)
4. [Set up an identity provider to encrypt SAML assertions \(optional\).](#)
5. [Enable Just-in-Time user provisioning \(optional\).](#)
6. [Edit the SAML JIT handler](#) if you selected Custom SAML JIT with Apex Handler for Just-in-Time provisioning.
7. [Test the single sign-on connection.](#)

Set up single sign-on

1. In Salesforce, from Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**, and click **Edit**.
2. Select **SAML Enabled**. You must enable SAML to view the SAML single sign-on settings.
3. Specify the SAML version used by your identity provider.
4. Click **Save**.
5. In SAML Single Sign-On Settings, click the appropriate button to create a configuration, as follows.
 - **New** - Specify all settings manually.
 - **New from Metadata File** - Import SAML 2.0 settings from an XML file from your identity provider. This option reads the XML file and uses it to complete as many of the settings as possible.

 **Note:** If your XML file contains information for more than one configuration, the first configuration that occurs in the XML file is used.
 - **New from Metadata URL** - Import SAML 2.0 settings from a public URL. This option reads the XML file at a public URL and uses it to complete as many of the settings as possible. The URL must be added to Remote Site Settings to access it from your Salesforce org.
6. Give this setting a **Name** for reference within your org. Salesforce inserts the corresponding **API Name** value, which you can customize if necessary.

EDITIONS

AND

"Modify All Data"

7. Enter the `Issuer`. Often referred to as the entity ID for the identity provider.
8. If your Salesforce org has [domains](#) deployed, specify whether you want to use the base domain (`https://saml.salesforce.com`) or the custom domain for the **Entity ID**. You must share this information with your identity provider.
 -  **Tip:** Generally, use the custom domain as the entity ID. If you already have single sign-on configured before deploying a domain, the base domain is the entity ID. If you are providing Salesforce to Salesforce services, you must specify the custom domain.
9. For the `Identity Provider Certificate`, use the **Browse** button to locate and upload the authentication certificate issued by your identity provider.
10. For the `Request Signing Certificate`, select the certificate you want from the ones saved in your **Certificate and Key Management** settings.
11. For the `Request Signature Method`, select the hashing algorithm for encrypted requests, either `RSA-SHA1` or `RSA-SHA256`.
12. Optionally, if the identity provider encrypts SAML assertions, select the `Assertion Decryption Certificate` they're using from the ones saved in your **Certificate and Key Management** settings. This field is available only if your org supports multiple single sign-on configurations. For more information, see [Set up an identity provider to encrypt SAML assertions](#).
13. For the `SAML Identity Type`, `SAML Identity Location`, and other fields described in [Identity Provider Values](#), specify the values provided by your identity provider as appropriate.
14. For the `Service Provider Initiated Request Binding`, select the appropriate value based on the information provided by your identity provider.
15. For SAML 2.0, if your identity provider has specific login or logout pages, specify them in **Identity Provider Login URL** and **Identity Provider Logout URL**, respectively.
 -  **Note:** These fields appear in Developer Edition and sandbox organizations by default and in production organizations only if My Domain is enabled. The fields do not appear in trial organizations or sandboxes linked to trial organizations.
16. For the `Custom Error URL`, specify the URL of the page that the users are directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.
17. Optionally, set up Just-in-Time user provisioning. For more information, see [Enable Just-in-Time user provisioning](#) and [About Just-in-Time Provisioning for SAML](#).
18. Click **Save**.

Click **Download Metadata** to download an XML file of your SAML configuration settings to send to your identity provider. The identity provider can then upload these configuration settings to connect to your Salesforce orgcommunity.

Set up an identity provider to encrypt SAML assertions

When Salesforce is the service provider for inbound SAML assertions, you can pick a saved certificate to decrypt inbound assertions from third party identity providers. You need to provide a copy of this certificate to the identity provider.

1. In the Single Sign-On Settings page in Setup, add a new SAML configuration.
2. In the `Assertion Decryption Certificate` field, specify the certificate for encryption from the ones saved in your **Certificate and Key Management** settings.

 **Note:** If you don't see the `Assertion Decryption Certificate` field you need to enable multiple single sign-on for your organization.(Applies to orgs created before the Summer '13 release that aren't using SAML 1.1).To enable multiple

single sign-on configurations, select **Enable Multiple Configs** on the **Single Sign-On Settings** page. If this setting has already been enabled, the field appears, and you won't see the **Enable Multiple Configs** button.

3. Set the `SAML Identity Location` to the element where your identifier is located.
4. When you save the new SAML configuration, your org's SAML settings value for the `Salesforce Login URL` (also known as the "Salesforce ACS URL") changes. Get the new value (from the Single Sign-On Settings page in Setup), and click the name of the new SAML configuration. The value is in the `Salesforce Login URL` field.
5. The identity provider must use the `Salesforce Login URL` value.
6. You also need to provide the identity provider with a copy of the certificate selected in the `Assertion Decryption Certificate` field to use for encrypting assertions.

Enable Just-in-Time user provisioning

1. In SAML Single Sign-On Settings, select `User Provisioning Enabled`.
 - `Standard` - This option allows you to provision users automatically using attributes in the assertion.
 - `Custom SAML JIT with Apex handler` - This option provisions users based on logic in an Apex class.
2. If you selected `Standard`, click **Save** and [test the single sign-on connection](#). If you selected `Custom SAML JIT with Apex handler`, proceed to the next step.
3. In the `SAML JIT Handler` field, select an existing Apex class as the SAML JIT handler class. This class must implement the [SamJitHandler interface](#). If you do not have an Apex class, you can generate one by clicking `Automatically create a SAML JIT handler template`. You must edit this class and modify the default content before using it. For more information, see [Edit the SAML JIT handler](#).
4. In the `Execute Handler As` field, select the user that runs the Apex class. The user must have "Manage Users" permission.
5. Just-in-time provisioning requires a Federation ID in the user type. In `SAML Identity Type`, select `Assertion contains the Federation ID from the User object`. If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.
6. Click **Save**.

Edit the SAML JIT handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the generated Apex SAML JIT handler to map fields between SAML and Salesforce. In addition, you can modify the generated code to support the following:
 - Custom fields
 - Fuzzy profile matching
 - Fuzzy role matching
 - Contact lookup by email
 - Account lookup by account number
 - Standard user provisioning into a community
 - Standard user login into a community
 - Default profile ID usage for portal Just-in-Time provisioning
 - Default portal role usage for portal Just-in-Time provisioning
 - Username generation for portal Just-in-Time provisioning

For example, to support custom fields in the generated handler code, find the “Handle custom fields here” comment in the generated code. After that code comment, insert your custom field code. For more information and examples, see the [SamlJitHandler Interface documentation](#).

 **Note:** If your identity provider sends JIT attributes for the Contact or Account object with the User object in the same assertion, the generated handler might not be able to make updates. For a list of User fields that cannot be updated at the same time as the Contact or Account fields, see [sObjects That Cannot Be Used Together in DML Operations](#).

Test the single sign-on connection

After you have configured and saved your SAML settings, test them by trying to access the identity provider's application. Your identity provider directs the user's browser to POST a form containing SAML assertions to the Salesforce login page. Each assertion is verified, and if successful, single sign-on is allowed.

If you have difficulty signing on using single sign-on after you have configured and saved your SAML settings, use the [SAML Assertion Validator](#). You might have to obtain a SAML assertion from your identity provider first.

If your users are having problems using SAML to log in, you can [review the SAML login history](#) to determine why they were not able to log in and share that information with your identity provider.

If you are using SAML version 2.0, after you've finished configuring SAML, the OAuth 2.0 Token Endpoint field is populated. Use the token with the web single sign-on authentication flow for OAuth 2.0.

View and Edit Single Sign-On Settings

After you've configured your Salesforce org to use SAML, you can manage the SAML configuration from the Single Sign-On Settings page.

From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**.

After the SAML configuration completes, the Single Sign-On Settings page displays the generated URLs and OAuth 2.0 token endpoint.

Field	Description
Salesforce Login URL	For SAML 2.0. The URL associated with the login for the Web SSO OAuth assertion flow. This URL appears if you configured SAML with "Assertion contains the User's Salesforce username" for SAML Identity Type and "Identity is in the NameIdentifier element of the Subject statement" for SAML Identity Location.
Salesforce Logout URL	For SAML 2.0. The Salesforce logout URL that users are directed to after they log off. This URL appears if you didn't specify a value for Identity Provider Logout URL.
OAuth 2.0 Token Endpoint	For SAML 2.0. The ACS URL used when enabling Salesforce as an identity provider in the Web SSO OAuth assertion flow.

From this page you can do any of the following:

- Click **Edit** to change the existing SAML configuration.
- Click **SAML Assertion Validator** to validate the SAML settings for your org using a SAML assertion provided by your identity provider.
- Click **Download Metadata** to download an XML file of your SAML configuration settings to send to your identity provider. The identity provider can then upload these configuration settings to connect to your Salesforce orgcommunity. Enabled only if your identity provider supports metadata and if you are using SAML 2.0.

Identity Provider Values

Before you can configure Salesforce for SAML, you must receive information from your identity provider. This information must be used on the [single sign-on page](#).

The following information might be useful for your identity provider.

Field	Description
SAML Version	The version of SAML your identity provider uses. Salesforce currently supports version 1.1 and 2.0. The SAML specifications for the various versions are linked below: <ul style="list-style-type: none"> • SAML 1.1 • SAML 2.0
Issuer	The Entity ID—a URL that uniquely identifies your SAML identity provider. SAML assertions sent to Salesforce must match this value exactly in the <code><saml:Issuer></code> attribute of SAML assertions.
Entity ID	The issuer in SAML requests generated by Salesforce, and is also the expected audience of any inbound SAML Responses. If you don't have domains deployed, this value is always <code>https://saml.salesforce.com</code> . If you have domains deployed, Salesforce recommends that you use your custom domain name. You can find the value on the Single Sign-On Settings page. From Setup, enter <i>Single Sign-On Settings</i> in the Quick Find box, then select Single Sign-On Settings .
Identity Provider Certificate	The authentication certificate issued by your identity provider.
Request Signing Certificate	The certificate (saved in the Certificate and Key Management page in Setup) used to generate the signature on a SAML request to the identity provider when Salesforce is the service provider for a service provider-initiated SAML login. If a certificate has not been saved in the Certificate and Key Management page in Setup, Salesforce uses the global proxy certificate by default. Using a saved signing certificate provides more control over events, such as certificate expiration, than using the global proxy certificate.
Request Signature Method	The hashing algorithm for encrypted requests, either RSA-SHA1 or RSA-SHA256.
SAML Identity Type	The element in a SAML assertion that contains the string that identifies a Salesforce user. Values are: <p>Assertion contains User's Salesforce username Use this option if your identity provider passes the Salesforce username in SAML assertions.</p>

Field	Description
	<p>Assertion contains the Federation ID from the User object Use this option if your identity provider passes an external user identifier, for example an employee ID, in the SAML assertion to identify the user.</p> <p>Assertion contains the User ID from the User object Use this option if your identity provider passes an internal user identifier, for example a user ID from your Salesforce organization, in the SAML assertion to identify the user.</p>
SAML Identity Location	<p>The location in the assertion where a user should be identified. Values are:</p> <p>Identity is in the NameIdentifier element of the Subject statement The Salesforce Username or FederationIdentifier is located in the <Subject> statement of the assertion.</p> <p>Identity is in an Attribute element The Salesforce Username or FederationIdentifier is specified in an <AttributeValue>, located in the <Attribute> of the assertion.</p>
Attribute Name	If “Identity is in an Attribute element” is selected, this contains the value of the AttributeName that is specified in <Attribute> that contains the User ID.
Attribute URI	If SAML 1.1 is the specified SAML version and “Identity is in an Attribute element” is selected, this contains the value of the AttributeNamespace that is specified in <Attribute>.
Name ID Format	If SAML 2.0 is the specified SAML version and “Identity is in an Attribute element” is selected, this contains the value for the nameid-format. Possible values include unspecified, emailAddress or persistent. All legal values can be found in the “Name Identifier Format Identifiers” section of the Assertions and Protocols SAML 2.0 specification .
Service Provider Initiated Request Binding	<p>If you’re using My Domain, chose the binding mechanism your identity provider requests for your SAML messages. Values are:</p> <p>HTTP POST HTTP POST binding sends SAML messages using base64-encoded HTML forms.</p> <p>HTTP Redirect HTTP Redirect binding sends base64-encoded and URL-encoded SAML messages within URL parameters.</p> <p>No matter what request binding is selected, the SAML Response will always use HTTP POST binding.</p>
Identity Provider Login URL	<p>For SAML 2.0 only: The URL where Salesforce sends a SAML request to start the login sequence.</p> <p>If you have domains deployed and a value specified for this field, login requests are usually sent to the address specified by this field. However, if you need to bypass this value (for example, your identity provider is down) add the login parameter to the query string for the login page. For example: <code>http://mydomain.my.salesforce.com?login</code>.</p> <p> Note: This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.</p>

Field	Description
Identity Provider Logout URL	For SAML 2.0 only: The URL to direct the user to when they click the Logout link in Salesforce. The default is <code>http://www.salesforce.com</code> .  Note: This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.
Salesforce Login URL	The URL associated with logging in for the Web browser single sign-on flow.
OAuth 2.0 Token Endpoint	For SAML 2.0 only: The ACS URL used with the API when enabling Salesforce as an identity provider in the Web single sign-on OAuth assertion flow.
Custom Error URL	The URL of the page users should be directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.

Start, Login, and Logout URL Values

In addition to the information used during the single sign-on, your identity provider can also set the start, login, and logout pages. You can also specify these pages yourself when you [configure single sign-on](#).

The following information might be useful to your identity provider if they are setting these pages.

- The SAML specification supports an HTML form that is used to pass the SAML assertion via HTTPS POST.
- For SAML 1.1, the SAML identity provider can embed name-value pairs in the `TARGET` field to pass this additional information to Salesforce prepended with a specially formatted URL that contains URL-encoded parameters.
- The URL for SAML 1.1 to include in the `TARGET` field is as follows: `https://saml.salesforce.com/?`
- For SAML 2.0, instead of using the `TARGET` field, the identity providers uses the `<AttributeStatement>` in the SAML assertion to specify the additional information.
- Salesforce supports the following parameters:

-  **Note:** For SAML 1.1 these parameters must be URL-encoded. This allows the URLs, passed as values that include their own parameters, to be handled correctly. For SAML 2.0, these parameters are part of the `<AttributeStatement>`.
 - `ssoStartPage` is the page to which the user should be redirected when trying to log in with SAML. The user is directed to this page when requesting a protected resource in Salesforce, without an active session. The `ssoStartPage` should be the SAML identity provider's login page.
 - `startURL` is the URL where you want the user to be directed when sign-on completes successfully. This URL can be absolute, such as `https://yourInstance.salesforce.com/001/o` or it can be relative, such as `/001/o`. This parameter is only used in SAML 1.1. In SAML 2.0, the start URL is the page the user attempted to access before they were authenticated.
 - `logoutURL` is the URL where you want the user to be directed when they click the **Logout** link in Salesforce. The default is `http://www.salesforce.com`.

The following sample `TARGET` field is for SAML 1.1, and includes properly-encoded parameters. It passes a customized start page, as well as start and logout URLs embedded as parameter values in the query string.

```
https://saml.salesforce.com/?ssoStartPage=https%3A%2F%2Fwww.customer.org%2Flogin%2F&startURL=%2F001%2Fo&logoutURL=http%3A%2F%2Fwww.salesforce.com
```

The following is an example of an `<AttributeStatement>` for SAML 2.0 that contains both `ssoStartPage` and `logoutURL`:

```
<saml:AttributeStatement>
  <saml:Attribute Name="ssoStartPage"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:anyType">
    http://www.customer.org
  </saml:AttributeValue>
</saml:Attribute>

  <saml:Attribute Name="logoutURL"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri">
  <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:string">
    https://www.salesforce.com
  </saml:AttributeValue>
</saml:Attribute>
</saml:AttributeStatement>
```

Customize SAML Start, Error, Login, and Logout Pages

You can customize the start, error, login, and logout pages for single sign-on users using SAML 1.1 or 2.0. As part of your configuration, decide the following:

- If your identity provider uses SAML 1.1, the URL to direct the user to when single sign-on successfully completes (known as the start page). This URL can be absolute, such as `https://yourInstance.salesforce.com/001/o` or it can be relative, such as `/001/o`. This URL must be an endpoint that accepts SAML authentication requests.
In SAML 2.0, the start page is the page the user attempted to access before they were authenticated. The SAML 2.0 start page must support Sp-init single sign-on.
If you are using SAML 2.0, you can also use the `RelayState` parameter to control where users get redirected after a successful login.
- The single sign-on start page where Salesforce sends a SAML request to start the login sequence.
We recommend that if you specify a single sign-on start page that you also specify a logout page. When you specify a logout page, when a user clicks logout or if a user's session expires, the user is redirected to that page. If you don't specify a logout page, the user is redirected to the general Salesforce login page.
- The URL to direct the user to when they click the Logout link in Salesforce (known as the logout page). The default is `https://login.salesforce.com`, unless MyDomain is enabled. If My Domain is enabled, the default is `https://customdomain.my.salesforce.com`.

For SAML 2.0, these values can be set either during the single sign-on configuration, or by your identity provider in the login URL or SAML assertion. The order of precedence is:

1. Session cookie—if you've already logged in to Salesforce and a cookie still exists, the login and logout pages specified by the session cookie are used.
2. Values passed in from the identity provider.
3. Values from the single sign-on configuration page.

If you decide not to add these values to the single sign-on configuration, share them with your identity provider. The identity provider must [use these values](#) either in the login URL or the assertion.

You can also decide if you want users to be directed to a custom error page if there's an error during SAML login: It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative. Use this value when you [configure SAML](#).

Example SAML Assertions

Share the example SAML assertions with your identity provider so they can determine the format of the information Salesforce requires for successful single-sign on. The assertion must be signed according to the [XML Signature specification](#), using RSA and either SHA-1 or SHA-256.

In addition to the general single sign-on examples for both SAML 1.1 and SAML 2.0, use the following samples for the specific feature:

- [assertions for portals](#)
- [assertions for Sites](#)
- [SOAP message for delegated authentication](#)
- [assertion for just-in-time provisioning](#)

SAML User ID type is the Salesforce username, and SAML User ID location is the <NameIdentifier> element in the <Subject> element

SAML 1.1:

```
<Subject>
  <NameIdentifier>user101@salesforce.com</NameIdentifier>
</Subject>
```

SAML 2.0:

```
<saml:Subject>
  <saml:NameID
Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified">user101@salesforce.com</saml:NameID>

Sample SAML Assertions for Portals

The following shows the `portal_id` and `organization_id` attributes in a SAML assertion statement:

```

<saml:AttributeStatement>
    <saml:Attribute Name="portal_id">
        <saml:AttributeValue xsi:type="xs:anyType">060D00000000SHZ</saml:AttributeValue>
    </saml:Attribute>

    <saml:Attribute Name="organization_id">
        <saml:AttributeValue xsi:type="xs:anyType">00DD00000000F7P5</saml:AttributeValue>

    </saml:Attribute>
</saml:AttributeStatement>

```

The following is a complete SAML assertion statement that can be used for single sign-on for portals. The organization is using federated sign-on, which is included in an attribute (see the `<saml:AttributeStatement>` in bold text in the assertion), not in the subject.

Sample SAML Assertion for Sites

The following shows the `portal_id`, `organization_id`, and `siteurl` attributes in a SAML assertion statement:

```

<saml:AttributeStatement>
  <saml:Attribute Name="portal_id">
    <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:type="xs:anyType">060900000004cDk
    </saml:AttributeValue>
  </saml:Attribute>
  <saml:Attribute Name="organization_id">
    <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:type="xs:anyType">00D900000008bX0
    </saml:AttributeValue></saml:Attribute>
  <saml:Attribute Name="siteurl">
    <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:type="xs:anyType">https://apl.force.com/mySuffix</saml:AttributeValue>
  </saml:Attribute>
</saml:AttributeStatement>

```

Sample SOAP Message for Delegated Authentication

As part of the delegated authentication single sign-on process, a Salesforce server makes a SOAP 1.1 request to authenticate the user who is passing in the credentials. Here is an example of this type of request. Your single sign-on Web service needs to accept this request, process it, and return a `true` or `false` response.

Sample Request

```

<?xml version="1.0" encoding="UTF-8" ?>
<soapenv:Envelope
  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Body>
    <Authenticate xmlns="urn:authentication.soap.sforce.com">
      <username>sampleuser@sample.org</username>
      <password>myPassword99</password>
      <sourceIp>1.2.3.4</sourceIp>
    </Authenticate>
  </soapenv:Body>
</soapenv:Envelope>

```

```

    </Authenticate>
  </soapenv:Body>
</soapenv:Envelope>

```

Sample Response Message

```

<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope
  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Body>
    <AuthenticateResult xmlns="urn:authentication.soap.sforce.com">
      <Authenticated>false</Authenticated>
    </AuthenticateResult>
  </soapenv:Body>
</soapenv:Envelope>

```

Sample SAML Assertion for Just-In-Time Provisioning

The following is a sample SAML assertion for just in time provisioning.

```

<saml:AttributeStatement>

  <saml:Attribute Name="User.Username"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
    <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org
    </saml:AttributeValue>
  </saml:Attribute>

  <saml:Attribute Name="User.Phone"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
    <saml:AttributeValue xsi:type="xs:anyType">415-123-1234
    </saml:AttributeValue>
  </saml:Attribute>

  <saml:Attribute Name="User.FirstName"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
    <saml:AttributeValue xsi:type="xs:anyType">Testuser
    </saml:AttributeValue>
  </saml:Attribute>

  <saml:Attribute Name="User.LanguageLocaleKey"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
    <saml:AttributeValue xsi:type="xs:anyType">en_US
    </saml:AttributeValue>
  </saml:Attribute>

[SAML](#)

Reviewing the SAML Login History

When a user logs in to Salesforce from another application using single sign-on, SAML assertions are sent to the Salesforce login page. The assertions are checked against assertions in the authentication certificate that are specified on the Single Sign-On Settings page in Setup. If a user fails to log in, a message is written to the login history log that indicates why the login failed. In addition, the [SAML Assertion Validator](#) may be automatically populated with the invalid assertion.

To view the login history, from Setup, enter *Login History* in the *Quick Find* box, then select **Login History**. After viewing the login history, you may want to share the information with your identity provider.

The following are the possible failures:

Assertion Expired

An assertion's [timestamp](#) is more than five minutes old.

Note: Salesforce does make an allowance of three minutes for clock skew. This means, in practice, that an assertion can be as much as eight minutes after the timestamp time, or three minutes before it. This amount of time may be less if the assertion's validity period is less than five minutes.

Assertion Invalid

An assertion is not valid. For example, the `<Subject>` element of an assertion might be missing.

Audience Invalid

The value specified in `<Audience>` must be `https://saml.salesforce.com`.

Configuration Error/Perm Disabled

Something is wrong with the SAML configuration in Salesforce. For example, the uploaded certificate might be corrupted, or the organization preference might have been turned off. To check your configuration, from Setup, enter *Single Sign-On Settings* in the *Quick Find* box, then select **Single Sign-On Settings**. Next, get a sample SAML assertion from your identity provider, and then click [SAML Assertion Validator](#).

Issuer Mismatched

The issuer or entity ID specified in an assertion does not match the issuer specified in your Salesforce configuration.

Recipient Mismatched

The recipient specified in an assertion does not match the recipient specified in your Salesforce configuration.

Replay Detected

The same assertion ID was used more than once. [Assertion IDs](#) must be unique within an organization.

Signature Invalid

The signature in an assertion cannot be validated by the certificate in your Salesforce configuration.

Subject Confirmation Error

The `<Subject>` specified in the assertion does not match the SAML configuration in Salesforce.

Validating SAML Settings for Single Sign-On

If your users have difficulty logging into Salesforce after you [configure Salesforce for single sign-on](#), use the SAML Assertion Validator and the [login history](#) to validate the SAML assertions sent by your identity provider.

1. Obtain a SAML assertion from your identity provider. The assertion can be either in plain XML format or base64 encoded.

If a user tries to log in to Salesforce and fails, the invalid SAML assertion is used to automatically populate the SAML Assertion Validator if possible.
2. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**, then click **SAML Assertion Validator**.
3. Enter the SAML assertion into the text box, and click **Validate**.
4. Share the results of the [validation errors](#) with your identity provider.

SAML Assertion Validation Errors

Salesforce imposes the following validity requirements on assertions:

Authentication Statement

The identity provider must include an `<AuthenticationStatement>` in the assertion.

Conditions Statement

If the assertion contains a `<Conditions>` statement, it must contain a valid timestamp.

Timestamps

The validity period specified in an assertion is honored. In addition, an assertion's timestamp must be less than five minutes old, plus or minus three minutes, regardless of the assertion's validity period setting. This allows for differences between machines. The `NotBefore` and `NotOnOrAfter` constraints must also be defined and valid.

Attribute

If your Salesforce configuration is set to `Identity is in an Attribute` element, the assertion from the identity provider must contain an `<AttributeStatement>`.

If you are using SAML 1.1, both `<AttributeName>` and `<AttributeNamespace>` are required as part of the `<AttributeStatement>`.

If you are using SAML 2.0, only `<AttributeName>` is required.

Format

The `Format` attribute of an `<Issuer>` statement must be set to `"urn:oasis:names:tc:SAML:2.0:nameid-format:entity"` or not set at all.

For example:

```
<saml:Issuer
  Format="urn:oasis:names:tc:SAML:2.0:nameid-format:entity">https://www.salesforce.com</saml:Issuer>
```

The following example is also valid:

```
<saml:Issuer >https://www.salesforce.com</saml:Issuer>
```

Issuer

The issuer specified in an assertion must match the issuer specified in Salesforce.

Subject

The subject of the assertion must be resolved to be either the Salesforce username or the Federation ID of the user.

Audience

The `<Audience>` value is required and must match the `Entity ID` from the single sign-on configuration. The default value is `https://saml.salesforce.com`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Authentication Providers are available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

Recipient

The recipient specified in an assertion must match either the Salesforce login URL specified in the Salesforce configuration or the OAuth 2.0 token endpoint. This is a required portion of the assertion and is always verified.

Signature

A valid signature must be included in the assertion. The signature must be created using the private key associated with the certificate that was provided in the SAML configuration.

Recipient

Verifies that the recipient and organization ID received in the assertion matches the expected recipient and organization ID, as specified in the single sign-on configuration. This is an optional portion of the assertion and is only verified if it's present. For example:

```
Recipient that we found in the assertion: http://aalbert-salesforce.com:8081/
?sam1=02HKiPoin4zeKLPYxfj3twkPsNSJF3fxsh0Jnq4vVeQr3xNkIWmZC_IVk3
Recipient that we expected based on the Single Sign-On Settings page:
http://asmith.salesforce.com:8081/
?sam1=EK03Almz90Cik_ig0L97.0BRme6mT4o6nzi0t_JROL6HLbdR1WVP5aQO5w
Organization Id that we expected: 00Dx0000000BQ1I
Organization Id that we found based on your assertion: 00D000000000062
```

Site URL Attribute

Verifies if a valid Sites URL is provided. Values are:

- Not Provided
- Checked
- Site URL is invalid
- HTTPS is required for Site URL
- The specified Site is inactive or has exceeded its page limit

[SAML](#)

About Just-in-Time Provisioning for SAML

With Just-in-Time provisioning, you can use a SAML assertion to create regular and portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. For example, if you recently added an employee to your organization, you don't need to manually create the user in Salesforce. When they log in with single sign-on, their account is automatically created for them, eliminating the time and effort with on-boarding the account. Just-in-Time provisioning works with your SAML identity provider to pass the correct user information to Salesforce in a SAML 2.0 assertion. You can both create and modify accounts this way. Because Just-in-Time provisioning uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Benefits of Just-in-Time Provisioning

Implementing Just-in-Time provisioning can offer the following advantages to your organization.

- **Reduced Administrative Costs:** Provisioning over SAML allows customers to create accounts on-demand, as part of the single sign-on process. This greatly simplifies the integration work required in scenarios where users need to be dynamically provisioned, by combining the provisioning and single sign-on processes into a single message.

- **Increased User Adoption:** Users only need to memorize a single password to access both their main site and Salesforce. Users are more likely to use your Salesforce application on a regular basis.
- **Increased Security:** Any password policies that you have established for your corporate network are also in effect for Salesforce. In addition, sending an authentication credential that is only valid for a single use can increase security for users who have access to sensitive data.

[Single Sign-On](#)

Just-in-Time Provisioning Requirements and SAML Assertion Fields

Just-in-Time provisioning requires the creation of a SAML assertion. Consider the following when creating your SAML assertion.

- `ProvisionVersion` is supported as an optional attribute. If it isn't specified, the default is 1.0. For example:

```
<saml:Attribute Name="ProvisionVersion" NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">1.0</saml:AttributeValue>
</saml:Attribute>
```

- ProfileIDs change per organization, even for standard profiles. To make it easier to find the profile name, Salesforce allows you to do a profile name lookup by passing the `ProfileName` into the `ProfileId` field.

Field Requirements for the SAML Assertion

To correctly identify which object to create in Salesforce, you must use the `User.` prefix for all fields passed in the SAML assertion. In this example, the `User.` prefix has been added to the `Username` field name.

```
<saml:Attribute
  Name="User.Username"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

The following standard fields are supported. Some fields are required.

Fields	Required	Comments
AboutMe		
Alias		If not present, a default is derived from FirstName and LastName.
CallCenter		
City		
CommunityNickname		If not present, a default is derived from the UserName.
CompanyName		
Country		
DefaultCurrencyIsoCode		Derived from organization settings.
DelegatedApproverId		
Department		
Division		
Email	Y	For example, User.Email=test2@salesforce.com
EmailEncodingKey		If not present, a default is derived from the organization settings.
EmployeeNumber		
Extension		
Fax		
FederationIdentifier (insert only)		If present, it must match the SAML subject, or the SAML subject is taken instead. Can't be updated with SAML.
FirstName		
ForecastEnabled		
IsActive		
LastName	Y	
LanguageLocaleKey		
LocaleSidKey		If not present, a default is derived from the organization settings.
Manager		
MobilePhone		
Phone		
ProfileId	Y	For example, User.ProfileId=Standard User
ReceivesAdminInfoEmails		
ReceivesInfoEmails		
State		

Fields	Required	Comments
Street		
TimeZoneSidKey		If not present, a default is derived from the organization settings.
Title		
Username (insert only)	Y	For example, <code>User.Username=test2@test.com</code> . Can't update using SAML.
UserRoleId		Defaults to "no role" if blank.
Zip		

Other field requirements:

- Only text type custom fields are supported.
- Only the `insert` and `update` functions are supported for custom fields.
- When using the API for user creation, you can pass the new username into the `User.Username` field. You can also specify the `User.FederationIdentifier` if it is present. However, the `Username` and `FederationIdentifier` fields can't be updated with API.

[About Just-in-Time Provisioning for SAML](#)

[Just-in-Time Provisioning and SAML Assertion Fields for Portals](#)

[Just-in-Time Provisioning for Communities](#)

Just-in-Time Provisioning and SAML Assertion Fields for Portals

With Just-in-Time (JIT) provisioning for portals, you can use a SAML assertion to create customer and partner portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. Because JIT uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

-  **Note:** Starting with Summer '13, Customer Portals and partner portals are no longer available for new organizations. Existing organizations continue to have access to these portals. If you don't have a portal, but want to easily share information with your customers or partners, try Communities.

Existing organizations using Customer Portals and partner portals may continue to use their portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Creating Portal Users

The `Portal ID` and `Organization ID` must be specified as part of the SAML assertion. You can find both of these on the company information page for the organization or portal. Because you can also provision regular users, the `Portal ID` is used to distinguish between a regular and portal JIT provisioning request. If no `Portal ID` is specified, then the request is treated as a JIT request for regular platform user. Here are the requirements for a creating a portal user.

- You must specify a `Federation ID`. If the ID belongs to an existing user account, the user account is updated. In case of an inactive user account, the user account is updated, but left inactive unless `User.IsActive` in the JIT assertion is set to true. If there is no user account with that `Federation ID`, the system creates a new user.

- If the portal isn't self-registration enabled and a default new user profile and role aren't specified, the `User.ProfileId` field must contain a valid profile name or ID associated with the portal. In addition, the `User.PortalRole` field must contain a valid portal role name or ID.

 **Note:** The `User.Role` must be null.

Creating and Modifying Accounts

Create or modify an account by specifying a valid `Account` ID or both the `Account.AccountNumber` and `Account.Name`.

- Matching is based on `Account.AccountNumber`. If multiple accounts are found, an error is displayed. Otherwise, the account is updated.
- If no matching account is found, one is created.
- You must specify the `Account.Owner` in the SAML assertion and ensure that the field level security for the `Account.AccountNumber` field is set to visible for this owner's profile.

Creating and Modifying Contacts

Create or modify a contact by specifying the a valid Contact ID in `User.Contact` or both the `Contact.Email` and `Contact.LastName`.

- Matching is based on `Contact.Email`. If multiple contacts are found, an error is displayed. Otherwise, the contact is updated.
- If no matching contact is found, one is created.

Supported Fields for the Portal SAML Assertion

To correctly identify which object to create in Salesforce, you must use a prefix. In the SAML assertion, use the `Account` prefix for all fields in the Account schema (for example `Account.AccountId`) and `Contact` prefix for all fields in the Contact schema. In this example, the `Contact` prefix has been added to the `Email` field name.

```
<saml:Attribute
  Name="Contact.Email"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for accounts. Some fields are required.

Fields	Required	Comments
Billing		Street City State PostalCode Country
AnnualRevenue		
Description		
Fax		
FederationIdentifier (insert only)	Y	If present, it must match the SAML subject or the SAML subject is taken instead. Can't be updated using SAML.
IsCustomerPortal		
IsPartner		

Fields	Required	Comments
NumberOfEmployees		
Ownership		
Phone		
Portal Role	Y	Use Worker for all portal users.
Rating		
Street		
TickerSymbol		
UserRoleId		Defaults to "no role" if blank.
Website		
Zip		

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for contacts.

Fields	Required	Comments

Fields	Required	Comments
Title		

SEE ALSO:

- [About Just-in-Time Provisioning for SAML](#)
- [Just-in-Time Provisioning Requirements and SAML Assertion Fields](#)
- [Just-in-Time Provisioning for Communities](#)

Just-in-Time Provisioning for Communities

With Just-in-Time (JIT) provisioning for Communities, you can use a SAML assertion to create customer and partner community users on the fly the first time they try to log in from an identity provider. This eliminates the need to create user accounts in advance. Because JIT uses SAML to communicate, your organization must have SAML-based single sign-on enabled. Then, you can work with the identity provider to generate the necessary SAML assertions for JIT.

SAML Single Sign-on Settings

Follow the instructions for [Configure SAML Settings for Single Sign-On](#) with `SAML_Enabled`. Set the values for your configuration, as needed, and also include the following values specific to your community for JIT provisioning.

1. Check `User Provisioning Enabled`.

Note:

- Just-in-time provisioning requires a Federation ID in the user type. In `SAML_User_ID_Type`, select `Assertion contains the Federation ID from the User object`.
- If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.

2. The **Entity ID** should be unique across your organization and begin with `https`. You can't have two SAML configurations with the same **Entity ID** in one organization. Specify whether you want to use the base domain (`https://saml.salesforce.com`) or the community URL (such as `https://acme.force.com/customers`) for the **Entity ID**. You must share this information with your identity provider.

Tip: Generally, use the community URL as the entity ID. If you are providing Salesforce to Salesforce services, you must specify the community URL.

3. In `SAML_User_ID_Type`, select `Assertion contains the Federation ID from the User object`. If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.

Creating and Modifying Community Users

The SAML assertion needs the following.

- A `Recipient URL`. This is the Community Login URL from the SAML Single Sign-On Settings detail page in your organization. The URL is in the following form.

```
https://<community_URL>/login?so=<orgID>
```

For example, `Recipient="https://acme.force.com/customers/login?so=00DD0000000JsCM"` where `acme.force.com/customers` is the community home page and `00DD0000000JsCM` is the `Organization ID`.

If an Assertion Decryption Certificate has been uploaded to the organization's SAML Single Sign-On Settings, include the certificate ID in the URL using the `sc` parameter, such as

`Recipient="https://acme.force.com/customers/login?so=00DD0000000JsCM&sc=0LE000000Dp"`
 where `0LE000000Dp` is the certificate ID.

- Salesforce attempts to match the `Federation ID` in the subject of the SAML assertion (or in an attribute element, depending upon how the SAML Identity Location is defined in the SAML Single Sign-On Settings) to the `FederationIdentifier` field of an existing user record.
 1. If a matching user record is found, Salesforce uses the attributes in the SAML assertion to update the specified fields.
 2. If a user with a matching user record isn't found, then Salesforce searches the contacts for a match based on the `Contact ID (User.Contact)` or email (`Contact.Email`). `Contact.Email` and `Contact.LastName` are both required properties when `User.Contact` is not specified, but matching is only based on `Contact.Email` when both properties exist.
 - i. If a matching contact record is found, Salesforce uses the attributes in the SAML assertion to update the specified contact fields, and then inserts a new user record.
 - ii. If a matching contact record isn't found, then Salesforce searches the accounts for a match based on the `Contact.Account` or `Account.AccountNumber` specified in the SAML assertion. `Account.AccountNumber` and `Account.Name` are both required properties when `Contact.Account` is not specified, but matching is only based on `Account.AccountNumber` when both properties exist.
 - i. If a matching account record is found, Salesforce inserts a new user record and updates the account records based the attributes provided in the SAML assertion.
 - ii. If a matching account record isn't found, Salesforce inserts new account, contact, and user records based on the attributes provided in the SAML assertion.

In the case of an inactive user account, the user account is updated, but left inactive unless `User.IsActive` in the JIT assertion is set to true. If there is no user account with that `Federation ID`, the system creates a new user.

- If the community doesn't have self-registration enabled, and a default new user profile and role aren't specified, the `User.ProfileId` field must contain a valid profile name or ID associated with the community.

Salesforce attempts to match the `Federation ID` in the subject of the SAML assertion to the `FederationIdentifier` field of an existing user record.

- 📌 **Note:** Salesforce also supports custom fields on the User object in the SAML assertion. Any attribute in the assertion that starts with `User` is parsed as a custom field. For example, the attribute `User.NumberOfProductsBought__c` in the assertion is placed into the field `NumberOfProductsBought` for the provisioned user. Custom fields are not supported for Accounts or Contacts.

Supported Fields for the Community SAML Assertion

To correctly identify which object to create in Salesforce, you must use a prefix. In the SAML assertion, use the `Account` prefix for all fields in the Account schema (for example `Account.AccountId`) and `Contact` prefix for all fields in the Contact schema. In this example, the `Contact` prefix has been added to the `Email` field name.

```
<saml:Attribute
  Name="Contact.Email"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for accounts.

Fields	Required	Comments
Billing		Street City State PostalCode Country
AnnualRevenue		
Description		
Fax		
FederationIdentifier (insert only)	Y	If present, it must match the SAML subject or the SAML subject is taken instead. Can't be updated using SAML.

[Just-in-Time Provisioning Requirements and SAML Assertion Fields](#)

Just-in-Time Provisioning Errors

Following are the error codes and descriptions for Just-in-Time provisioning for SAML.

SAML errors are returned in the URL parameter, for example:

```
http://login.salesforce.com/identity/jit/saml-error.jsp?
ErrorCode=5&ErrorDescription=Unable+to+create+user&ErrorDetails=
INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST+TimeZoneSidKey
```

 **Note:** Salesforce redirects the user to a custom error URL if one is specified in your SAML configuration.

Error Messages

Code	Description	Error Details
1	Missing Federation Identifier	MISSING_FEDERATION_ID
2	Mis-matched Federation Identifier	MISMATCH_FEDERATION_ID
3	Invalid organization ID	INVALID_ORG_ID
4	Unable to acquire lock	USER_CREATION_FAILED_ON_UROG
5	Unable to create user	USER_CREATION_API_ERROR
6	Unable to establish admin context	ADMIN_CONTEXT_NOT_ESTABLISHED
8	Unrecognized custom field	UNRECOGNIZED_CUSTOM_FIELD
9	Unrecognized standard field	UNRECOGNIZED_STANDARD_FIELD

Code	Description	Error Details
11	License limit exceeded	LICENSE_LIMIT_EXCEEDED
12	Federation ID and username do not match	MISMATCH_FEDERATION_ID_AND_USERNAME_ATTRS
13	Unsupported provision API version	UNSUPPORTED_VERSION
14	Username change isn't allowed	USER_NAME_CHANGE_NOT_ALLOWED
15	Custom field type isn't supported	UNSUPPORTED_CUSTOM_FIELD_TYPE
16	Unable to map a unique profile ID for the given profile name	PROFILE_NAME_LOOKUP_ERROR
17	Unable to map a unique role ID for the given role name	ROLE_NAME_LOOKUP_ERROR
18	Invalid account	INVALID_ACCOUNT_ID
19	Missing account name	MISSING_ACCOUNT_NAME
20	Missing account number	MISSING_ACCOUNT_NUMBER
22	Unable to create account	ACCOUNT_CREATION_API_ERROR
23	Invalid contact	INVALID_CONTACT
24	Missing contact email	MISSING_CONTACT_EMAIL
25	Missing contact last name	MISSING_CONTACT_LAST_NAME
26	Unable to create contact	CONTACT_CREATION_API_ERROR
27	Multiple matching contacts found	MULTIPLE_CONTACTS_FOUND
28	Multiple matching accounts found	MULTIPLE_ACCOUNTS_FOUND
30	Invalid account owner	INVALID_ACCOUNT_OWNER
31	Invalid portal profile	INVALID_PORTAL_PROFILE
32	Account change is not allowed	ACCOUNT_CHANGE_NOT_ALLOWED
33	Unable to update account	ACCOUNT_UPDATE_FAILED
34	Unable to update contact	CONTACT_UPDATE_FAILED
35	Invalid standard account field value	INVALID_STANDARD_ACCOUNT_FIELD_VALUE
36	Contact change not allowed	CONTACT_CHANGE_NOT_ALLOWED
37	Invalid portal role	INVALID_PORTAL_ROLE
38	Unable to update portal role	CANNOT_UPDATE_PORTAL_ROLE
39	Invalid SAML JIT Handler class	INVALID_JIT_HANDLER
40	Invalid execution user	INVALID_EXECUTION_USER
41	Execution error	APEX_EXECUTION_ERROR

Code	Description	Error Details
42	Updating a contact with Person Account isn't supported	UNSUPPORTED_CONTACT_PERSONACCT_UPDATE

[About Just-in-Time Provisioning for SAML](#)

[Just-in-Time Provisioning and SAML Assertion Fields for Portals](#)

External Authentication Providers

Authentication providers let your users log in to your Salesforce org using their login credentials from an external service provider. Salesforce provides authentication providers for apps that support the OpenID Connect protocol, such as Google, Facebook, Twitter, and LinkedIn. For apps that don't support OpenID Connect, Salesforce provides an Apex `Auth.AuthProviderPluginClass` abstract class to create a custom authentication provider.

You can enable users to log in to your Salesforce org using their login credentials from an external service provider such as Facebook or Janrain.

 **Note:**  [Social Sign-On \(Salesforce Classic\)](#) (11:33 minutes)

Learn how to configure single sign-on (SSO) and OAuth-based API access to Salesforce from other sources of user identity.

Do the following to set up a custom authentication provider for SSO.

- Configure the service provider website.
- Create a registration handler using Apex.
- Define the authentication provider in your org.

When set up is complete, the authentication provider flow is as follows.

1. The user tries to log in to Salesforce using a third-party (external) identity.
2. The login request is redirected to the external authentication provider.
3. The user follows the third-party login process and approves access.
4. The external authentication provider redirects the user to Salesforce with credentials.
5. The user is signed in to Salesforce.

 **Note:** If users have an existing Salesforce session, after authentication with the third party, they're redirected to the page where they can approve the link to their Salesforce account.

Define Your Authentication Provider

Salesforce supports the following authentication providers.

- [Facebook](#)
- [Google](#)
- [LinkedIn](#)
- [Microsoft Access Control Service](#)

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

- [Salesforce](#)
- [Twitter](#)
- [Janrain](#)
- [Any service provider who implements the OpenID Connect protocol](#)
- [Any service provider who supports OAuth but not the OpenID Connect protocol](#)

Add Functionality to Your Authentication Provider

You can add functionality to your authentication provider by using additional request parameters.

- [Scope](#)—Customizes the permissions requested from the third party.
- [Site](#)—Enables the provider to be used with a site.
- [StartURL](#)—Sends the user to a specified location after authentication.
- [Community](#)—Sends the user to a specific community after authentication.
- [Authorization Endpoint](#) on page 959—Sends the user to a specific endpoint for authentication (Salesforce authentication providers, only).

Create an Apex Registration Handler

You must implement a registration handler to use authentication providers for SSO. The Apex `registration handler` class must implement the `Auth.RegistrationHandler` interface, which defines two methods. Salesforce invokes the appropriate method on callback, depending on whether the user has used this provider before or not. When you create the authentication provider, you can automatically create an Apex template class for testing purposes. For more information, see [RegistrationHandler](#) in the *Force.com Apex Code Developer's Guide*.

[Configure a Facebook Authentication Provider](#)

Configure a Facebook authentication provider to let your users log in to your Salesforce org using their Facebook credentials.

[Configure a Google Authentication Provider](#)

Configure Google as an authentication provider to let users log in to your Salesforce org using their Google credentials.

[Configure a Janrain Authentication Provider](#)

Configure Janrain as an authentication provider to let users log in to your Salesforce org using their Janrain credentials.

[Configure a Salesforce Authentication Provider](#)

To configure a Salesforce authentication provider, create a connected app that uses single sign-on (SSO).

[Configure an OpenID Connect Authentication Provider](#)

You can use any third-party web app that implements the server side of the OpenID Connect protocol, such as Amazon, Google, and PayPal, as an authentication provider.

[Configure a Microsoft® Access Control Service Authentication Provider](#)

You can use Microsoft Access Control Service as an authentication provider using the OAuth protocol. Authorization is typically done by a Microsoft Office 365 service like SharePoint® Online.

[Configure a LinkedIn Authentication Provider](#)

Configure LinkedIn as an authentication provider to let users log in to your Salesforce org using their LinkedIn credentials.

[Configure a Twitter Authentication Provider](#)

Configure Twitter as an authentication provider to let users log in to a Salesforce org from their Twitter account.

[Use Salesforce-Managed Values in the Auth. Provider Setup Page](#)

You can choose to let Salesforce create key values when setting up a Facebook, Salesforce, LinkedIn, Twitter, or Google authentication provider. Having Salesforce generate the key values saves you the time and effort of creating your own third-party app.

[Create a Custom External Authentication Provider](#)

Create a custom single sign-on (SSO) authentication provider to let users log in to your Salesforce org using their non-Salesforce credentials. Implement a custom external authentication provider if your OAuth app doesn't support OpenID Connect. If your app supports OpenID Connect, you can use one of the authentication providers that Salesforce provides.

Configure a Facebook Authentication Provider

Configure a Facebook authentication provider to let your users log in to your Salesforce org using their Facebook credentials.

Configuring Facebook as an authentication provider involves these high-level steps.

1. [Set up](#) a Facebook app, making Salesforce the app domain.
2. [Define](#) a Facebook authentication provider in your Salesforce org.
3. [Update](#) your Facebook app to use the Callback URL generated by Salesforce as the Facebook website URL.
4. [Test](#) the connection.

Set Up a Facebook App

Before you can configure Facebook for your Salesforce org, you must set up an app in Facebook.

 **Note:** You can skip this step by allowing Salesforce to use its own default app. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. Go to the [Facebook website](#) and create an app.
2. Modify the app settings and set the Application Domain to Salesforce.
3. Note the app ID and the app secret.

Define a Facebook Provider in Your Salesforce Org

You need the Facebook app ID and app secret to set up a Facebook provider in your Salesforce org.

 **Note:** You can skip this step by allowing Salesforce to manage the values for you. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. From Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select Facebook.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URLs. For example, if the URL suffix of your provider is MyFacebookProvider, your single sign-on (SSO) URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx0000000001/MyFacebookProvider.`
6. Use the Facebook app ID for the *Consumer Key* field.
7. Use the Facebook app secret for the *Consumer Secret* field.

EDITIONS

Available in: **Lightning Experience** and **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Manage Auth. Providers"

8. Optionally, set the following fields.

- a. Enter the base URL from Facebook for the Authorize Endpoint URL. For example, `https://www.facebook.com/v2.2/dialog/oauth`. If you leave this field blank, Salesforce uses the version of the Facebook API that your app uses.
-  **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Facebook for offline access, use `https://accounts.facebook.com/o/oauth2/auth?access_type=offline&approval_prompt=force`. You need the `approval_prompt` parameter to ask the user to accept the refresh action so that Facebook continues to provide refresh tokens after the first one.
- b. Enter the Token Endpoint URL from Facebook. For example, `https://www.facebook.com/v2.2/dialog/oauth`. If you leave this field blank, Salesforce uses the version of the Facebook API that your app uses.
 - c. Enter the User Info Endpoint URL to change the values requested from Facebook's profile API. See https://developers.facebook.com/docs/facebook-login/permissions/v2.0#reference-public_profile for more information on fields. The requested fields must correspond to the requested scopes. If you leave this field blank, Salesforce uses the version of the Facebook API that your app uses.
 - d. `Default Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used (see [Facebook's developer documentation](#) for these defaults).

For more information, see [Use the Scope Parameter](#).

- e. `Custom Error URL` for the provider to use to report any errors.
- f. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the SSO flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
- g. Select an existing Apex class as the `Registration Handler` class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

 **Note:** A `Registration Handler` class is required for Salesforce to generate the SSO initialization URL.

- h. For `Execute Registration As`, select the user that runs the Apex handler class. The user must have the "Manage Users" permission. A user is required regardless of whether you're specifying an existing registration handler class or creating one from the template.
- i. To use a portal with your provider, select the portal from the Portal dropdown list.
- j. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn't appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

Specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Note the generated `Auth.ProviderId` value. You use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider.

- Test-Only Initialization URL—Salesforce admins use this URL to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.

- **Single Sign-On Initialization URL**—Use this URL to perform SSO into Salesforce from a third party using its third-party credentials. The user opens this URL in a browser and logs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.
- **Existing User Linking URL**—Use this URL to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- **OAuth-Only Initialization URL**—Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token. This flow doesn't provide for future SSO functionality.
- **Callback URL**—Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider must redirect to the callback URL with information for each client configuration URL.

Client configuration URLs support additional request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Update Your Facebook App

After defining the Facebook authentication provider in your Salesforce org, go back to Facebook and update your app to use the Callback URL as the Facebook Website Site URL.

Test the SSO Connection

In a browser, open the Test-Only Initialization URL on the Auth. Provider detail page. It redirects you to Facebook and asks you to sign in. You're then asked to authorize your app. After you authorize, you're redirected back to Salesforce.

SEE ALSO:

- [Use Request Parameters with Client Configuration URLs](#)
- [External Authentication Providers](#)

Configure a Google Authentication Provider

Configure Google as an authentication provider to let users log in to your Salesforce org using their Google credentials.

Complete these steps to configure Google as an authentication provider.

1. **Set up** a Google app, making Salesforce the application domain.
2. **Define** a Google authentication provider in your Salesforce org.
3. **Update** your Google app to use the callback URL generated by Salesforce as the Google website site URL.
4. **Test** the connection.

Set Up a Google App

Before you can configure Google for your Salesforce org, you must set up an app in Google.

 **Note:** You can skip this step by allowing Salesforce to use its own default app. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. Go to the [Google website](#) and create a new app.
2. Modify the app settings and set the application domain to Salesforce.
3. Note the app ID and the app secret.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

Define a Google Provider in Your Salesforce Org

You need the Google app ID and app secret to set up a Google provider in your Salesforce org.

 **Note:** You can skip this step by allowing Salesforce to manage the values for you. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. From Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select Google.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URLs. For example, if the URL suffix of your provider is MyGoogleProvider, your SSO URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx00000000001/MyGoogleProvider.`
6. Use the Google app ID for the *Consumer Key* field.
7. Use the Google app secret for the *Consumer Secret* field.
8. Optionally, set the following fields.
 - a. *Authorize Endpoint URL*—Specify the base authorization URL from Google. For example, `https://accounts.google.com/o/oauth2/authorize`. The URL must start with `https://accounts.google.com/o/oauth2`.
 -  **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`. You need the `approval_prompt` parameter to ask the user to accept the refresh action so that Google continues to provide refresh tokens after the first one.
 - b. *Token Endpoint URL*—Specify the OAuth token URL from Google. For example, `https://accounts.google.com/o/oauth2/accessToken`. The URL must start with `https://accounts.google.com/o/oauth2`.
 - c. *User Info Endpoint URL*—Change the values requested from Google's profile API. The URL must start with `https://www.googleapis.com/oauth2/`.
 - d. *Default Scopes*—Send with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used. For the defaults, see [Google's developer documentation](#).
 For more information, see [Use the Scope Parameter](#).
 - e. *Custom Error URL*—Specify a URL for the provider to report errors.
 - f. *Custom Logout URL* to provide a specific destination for users after they log out, if they authenticated using the SSO flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - g. Select an existing Apex class as the *Registration Handler* class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

 **Note:** A *Registration Handler* class is required for Salesforce to generate the SSO initialization URL.

- h.** For `Execute Registration As`, select the user that runs the Apex handler class. The user must have the “Manage Users” permission. A user is required regardless of whether you’re specifying an existing registration handler class or creating one from the template.
- i.** To use a portal with your provider, select the portal from the Portal list.
- j.** Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn’t appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.
Specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Note the generated `Auth. Provider Id` value. You use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider.

- Test-Only Initialization URL—Admins use this URL to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- Single Sign-On Initialization URL—Use this URL to perform single sign-on (SSO) into Salesforce from a third party (using third-party credentials). The user opens this URL in a browser and signs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.
- Existing User Linking URL—Use this URL to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- OAuth-Only Initialization URL—Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token;. This flow doesn’t provide for future SSO functionality.
- Callback URL—Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider redirects to the callback URL with information for each client configuration URL.

Client configuration URLs support other request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from a third party, or go to a location after authenticating.

Update Your Google App

After defining the Google authentication provider in your Salesforce org, go back to Google and update your app to use the callback URL as the Google website site URL.

Test the SSO Connection

In a browser, open the Test-Only Initialization URL on the Auth. Provider Setup page. It redirects you to Google and asks you to sign in. You’re then asked to authorize your app. After you authorize, you’re redirected to Salesforce.

Configure a Janrain Authentication Provider

Configure Janrain as an authentication provider to let users log in to your Salesforce org using their Janrain credentials.

Setting up a Janrain authentication provider is slightly different from setting up other providers. You don't use the single sign-on initialization URL that you obtain after registering your provider with Salesforce to start the flow. Instead, you use Janrain's login widget that's deployed on your site.

To set up your Janrain provider:

1. [Register](#) your app with Janrain and get an `apiKey`.
2. [Define](#) the Janrain authentication provider in your Salesforce org.
3. [Get](#) the login widget code from Janrain.
4. [Set up](#) a site that calls the login widget code in your Salesforce org.

Register Your App

Sign up for a Janrain account from the [Janrain website](#). After you have your Janrain account, you need the `apiKey`.

1. Select **Deployment > Sign-in for Web > Handle Tokens**.
2. Copy the `apiKey`. You need the key later when creating the Janrain provider in your Salesforce org.
3. Add `Salesforce` to the Janrain domain whitelist in your Janrain account at **Deployment > Application Settings > Domain Whitelist**.

Define the Janrain Provider in Your Salesforce Org

You need the Janrain API key to create a Janrain provider in your Salesforce org.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select Janrain.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the callback URL. For example, if the URL suffix of your provider is `MyJanrainProvider`, your callback URL is similar to `https://login.salesforce.com/services/authcallback/00D300000007CvvEAE/MyJanrainProvider`.
6. Use the Janrain `apiKey` value for the `Consumer Secret`.
7. Optionally, enter a custom error URL for the provider to use to report errors.
8. Optionally, enter a custom logout URL to provide a destination for users after they log out if they authenticated using the single sign-on (SSO) flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
9. Select an existing Apex class as the `Registration Handler` class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

 **Note:** A `Registration Handler` class is required for Salesforce to generate the single sign-on initialization URL.

EDITIONS

Available in: **Lightning Experience** and **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Manage Auth. Providers"

10. For `Execute Registration As`, select the user that runs the Apex handler class. The user must have the “Manage Users” permission. A user is required regardless of whether you’re specifying an existing registration handler class or creating one from the template.
11. To use a portal with your provider, select the portal from the Portal dropdown list.
12. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn’t appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.
Specify a path to your own image, or copy the URL for one of our sample icons into the field.
13. Click **Save**.

Note the value of the generated callback URL. You need this URL to complete the Janrain setup.

Several client configuration parameters are available after configuring Janrain as the authentication provider. Use them for the `flowtype` value in the callback URL with your Janrain login widget.

- `test`—Make sure that the third-party provider is set up correctly. The admin configures a Janrain widget to use `flowtype=test`, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `link`—Link existing Salesforce users to a third-party account. The user goes to a page with a Janrain widget configured to use `flowtype=link`, signs in to the third party, signs in to Salesforce, and approves the link.
- `sso`—Perform SSO into Salesforce from a third party (using third-party credentials). The user goes to a page with a Janrain widget configured to use `flowtype=sso`, and signs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.

Client configuration URLs support additional request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Get the Login Widget Code from Janrain

You need to get the login widget code from Janrain for your Salesforce org.

1. From your Janrain account, select **Application > Sign-in for Web > Get the Code**.
2. Enter the callback URL value from your Janrain provider information in your Salesforce org along with the query parameter `flowtype=sso` as the token URL. For example,

```
https://login.salesforce.com/services/authcallback/00DD#####/JanrainApp?flowtype=sso
```

For a domain created with My Domain, replace `login.salesforce.com` with your My Domain name.

For a community, add the `community` parameter and pass it to the login widget as the token URL. For example,

```
janrain.settings.tokenUrl='https://login.salesforce.com/services/authcallback/00DD#####/JanrainApp'+ '?flowtype=sso&community='+encodeURIComponent('https://acme.force.com/customers');
```

Create a Site to Call the Login Widget

1. Enable Sites.
2. Create a page and copy the login widget code to the page.

3. Create a site and specify the page that you created as the home page for the site.

[Use Request Parameters with Client Configuration URLs](#)
[External Authentication Providers](#)

Configure a Salesforce Authentication Provider

To configure a Salesforce authentication provider, create a connected app that uses single sign-on (SSO).

Configuring Facebook as an authentication provider involves these high-level steps.

1. [Create a Connected App](#).
2. [Define the Salesforce authentication provider in your org](#).
3. [Test the connection](#).

Create a Connected App

You can create a connected app from either Lightning Experience or Salesforce Classic.

In Lightning Experience, from Setup, enter `App` in the `Quick Find` box, select **App Manager**, then click **New Connected App**.

In Salesforce Classic, from Setup, enter `Apps` in the `Quick Find` box, select **Apps**. Then, under the Connected Apps section, click **New**.

After you finish creating a connected app, note the values from the `Consumer Key` and `Consumer Secret` fields.

 **Note:** You can skip this step by allowing Salesforce to use its own default app. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

Define the Salesforce Authentication Provider in Your Org

To set up the authentication provider in your org, you need the values from the `Consumer Key` and `Consumer Secret` fields of the connected app definition.

 **Note:** You can skip this step by allowing Salesforce to manage the values for you. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select Salesforce.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URLs. For example, if the URL suffix of your provider is `MySFDCProvider`, your SSO URL is similar to `https://login.salesforce.com/auth/sso/00Dx00000000001/MySFDCProvider`.
6. Paste the consumer key value from the connected app definition into the `Consumer Key` field.
7. Paste the consumer secret value from the connected app definition into the `Consumer Secret` field.
8. Optionally, set the following fields.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Manage Auth. Providers"

- a. `Authorize Endpoint URL` to specify an OAuth authorization URL.

For the `Authorize Endpoint URL`, the host name can include a sandbox or custom domain name (created using My Domain), but the URL must end in `.salesforce.com`, and the path must end in `/services/oauth2/authorize`. For example, `https://login.salesforce.com/services/oauth2/authorize`.

- b. `Token Endpoint URL` to specify an OAuth token URL.

For the `Token Endpoint URL`, the host name can include a sandbox or custom domain name (created using My Domain), but the URL must end in `.salesforce.com`, and the path must end in `/services/oauth2/token`. For example, `https://login.salesforce.com/services/oauth2/token`.

- c. `Default Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded default is used.

For more information, see [Use the Scope Parameter](#).

- d. `Include org ID in third-party account links`. This option appears if the authentication provider was created before the Winter '15 release because user identities didn't include an org ID. As a result, when an existing org had multiple sources, such as sandboxes, because the destination org couldn't differentiate between users with the same user ID. To keep the identities separate in the destination org, select this option. However, if you enable this option, your users must reapprove all their third-party links. The links are listed in the Third-Party Account Links section of a user's detail page. As of Winter '15, user identities contain the org ID, so this option doesn't appear.

- e. `Custom Error URL` for the provider to use to report any errors.

- f. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the SSO flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.

9. Select an existing Apex class as the `Registration Handler` class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

Note: A `Registration Handler` class is required for Salesforce to generate the SSO initialization URL.

10. For `Execute Registration As`, select the user that runs the Apex handler class. The user must have the "Manage Users" permission. A user is required regardless of whether you're specifying an existing registration handler class or creating one from the template.

11. To use a portal with your provider, select the portal from the Portal dropdown list.

12. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn't appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

Specify a path to your own image, or copy the URL for one of our sample icons into the field.

13. Click **Save**.

Note the value of the Client Configuration URLs. You need the callback URL to complete the last step. Use the Test-Only initialization URL to check your configuration. Also note the `Auth. Provider Id` value because you use it with the `Auth.AuthToken` Apex class.

14. Return to the connected app definition that you created earlier from Setup. Paste the callback URL value from the authentication provider into the `Callback URL` field.

Several client configuration URLs are generated after defining the authentication provider.

- **Test-Only Initialization URL**—Salesforce admins use this URL to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- **Single Sign-On Initialization URL**—Use this URL to perform SSO into Salesforce from a third party using its third-party credentials. The user opens this URL in a browser and logs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.
- **Existing User Linking URL**—Use this URL to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- **OAuth-Only Initialization URL**—Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token. This flow doesn't provide for future SSO functionality.
- **Callback URL**—Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider must redirect to the callback URL with information for each client configuration URL.

Client configuration URLs support additional request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Test the SSO Connection

In a browser, open the Test-Only Initialization URL on the Auth. Provider detail page. It redirects you to the authentication provider and asks you to sign in. You're then asked to authorize your app. After you authorize, you're redirected to Salesforce.

[External Authentication Providers](#)

Configure an OpenID Connect Authentication Provider

You can use any third-party web app that implements the server side of the OpenID Connect protocol, such as Amazon, Google, and PayPal, as an authentication provider.

Complete these steps to configure an OpenID authentication provider.

1. [Register](#) your app, making Salesforce the app domain.
2. [Define](#) an OpenID Connect authentication provider in your Salesforce org.
3. [Update](#) your app to use the callback URL generated by Salesforce.
4. [Test](#) the connection.

Register an OpenID Connect App

Before you can configure a web app for your Salesforce org, you must register it with your service provider. The process varies depending on the service provider. For example, to register a Google app, [Create an OAuth 2.0 Client ID](#).

1. Register your app on your service provider's website.
2. Modify the app settings and set the app domain (or Home Page URL) to Salesforce.
3. From the provider's documentation, get the client ID, client secret, authorize endpoint URL, token endpoint URL, and the user info endpoint URL. Here are some common OpenID Connect service providers.

- [PayPal](#)

Define an OpenID Connect Provider in Your Salesforce Org

1. From Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select **OpenID Connect**.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URLs. For example, if the URL suffix of your provider is *MyOpenIDConnectProvider*, your single sign-on URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx0000000001/MyOpenIDConnectProvider`.
6. Use the client ID from your provider for the *Consumer Key* field.
7. Use the client secret from your provider for the *Consumer Secret* field.
8. Enter the base URL from your provider for the *Authorize Endpoint URL*.

Tip: You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use
`https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`.
You need the `approval_prompt` parameter to ask the user to accept the refresh action so that Google continues to provide refresh tokens after the first one.

9. Enter the token endpoint URL from your provider.
10. Optionally, set the following fields.
 - a. *User Info Endpoint URL* from your provider.
 - b. *Token Issuer*. This value identifies the source of the authentication token in the form `https://URL`. If this value is specified, the provider must include an `id_token` value in the response to a token request. The `id_token` value isn't required for a refresh token flow (but will be validated by Salesforce if provided).
 - c. *Default Scopes* to send along with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used. See the [OpenID Connect developer documentation](#) for these defaults.
For more information, see [Use the Scope Parameter](#).
11. Optionally, select **Send access token in header** to have the token sent in a header instead of a query string.
12. Optionally, set the following fields.
 - a. *Custom Error URL* for the provider to use to report any errors.
 - b. *Custom Logout URL* to provide a specific destination for users after they log out, if they authenticated using the SSO flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - c. Select an existing Apex class as the *Registration Handler* class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

Note: A *Registration Handler* class is required for Salesforce to generate the single sign-on initialization URL.

- d. For `Execute Registration As`, select the user that runs the Apex handler class. The user must have the “Manage Users” permission. A user is required regardless of whether you’re specifying an existing registration handler class or creating one from the template.
- e. To use a portal with your provider, select the portal from the Portal dropdown list.
- f. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn’t appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.
Specify a path to your own image, or copy the URL for one of our sample icons into the field.

13. Click **Save**.

Be sure to note the generated `Auth. Provider Id` value. You must use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider.

- Test-Only Initialization URL—Salesforce admins use this URL to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- Single Sign-On Initialization URL—Use this URL to perform SSO into Salesforce from a third party using its third-party credentials. The user opens this URL in a browser and logs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.
- Existing User Linking URL—Use this URL to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- OAuth-Only Initialization URL—Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token. This flow doesn’t provide for future SSO functionality.
- Callback URL—Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider must redirect to the callback URL with information for each client configuration URL.

Client configuration URLs support additional request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Update Your OpenID Connect App

After defining the authentication provider in your Salesforce org, go back to your provider and update your app’s callback URL. For Google apps, the callback URL is called the Authorized Redirect URI. For PayPal, it’s called the Return URL.

Test the SSO Connection

In a browser, open the Test-Only Initialization URL on the `Auth. Provider Setup` page. It redirects you to your provider’s service and asks you to sign in. You’re then asked to authorize your app. After you authorize, you’re redirected back to Salesforce.

Configure a Microsoft® Access Control Service Authentication Provider

You can use Microsoft Access Control Service as an authentication provider using the OAuth protocol. Authorization is typically done by a Microsoft Office 365 service like SharePoint® Online.

Salesforce supports authentication from a Microsoft Access Control Service using only OAuth. Single sign-on (SSO) authentication from a Microsoft authentication provider is not supported.

Complete these steps to configure a Microsoft Access Control Service authentication provider.

1. **Define** a Microsoft Access Control Service authentication provider in your Salesforce org.
2. **Register** your app with Microsoft, making Salesforce the application domain.
3. **Edit** your Microsoft Access Control Service authentication provider details in Salesforce to use the consumer key and consumer secret generated when you registered your app with Microsoft.
4. **Test** the connection.

Define a Microsoft Access Control Service Authentication Provider in Your Salesforce Org

Before you can register an app in SharePoint Online or the Microsoft Seller Dashboard, you need the callback URL that redirects the authorized user to Salesforce.

1. From Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select Microsoft Access Control Service.
4. Enter a name for the provider.

5. Enter the URL suffix, which is used in the client configuration URLs. For example, if the URL suffix of your provider is MyMicrosoftACSPProvider, your callback URL is similar to:

```
https://login.salesforce.com/services/authcallback/00Dx0000000001/MyMicrosoftACSPProvider
```

6. Enter a placeholder value for the consumer key field. You edit this value after your app is registered with Microsoft.
7. Enter a placeholder value for the consumer secret field. You edit this value after your app is registered with Microsoft.
8. Enter the base URL from your provider for the Authorize Endpoint URL. For example, SharePoint Online uses the following form.

```
https://<sharepoint online host name>/_layouts/15/OAuthAuthorize.aspx
```

9. Enter the Token Endpoint URL in the following form.

```
https://accounts.accesscontrol.windows.net/<tenant>/tokens/OAuth/2?resource=<sender ID>/<sharepoint online host name>@<tenant>
```

- <tenant> is the Office 365 tenant name ending with `.onmicrosoft.com` or the corresponding tenant globally unique identifier (GUID).
- <sender ID> is the identifier for the sender of the token. For example, SharePoint uses `00000003-0000-0ff1-ce00-000000000000`

10. Optionally, set the following fields.

- `Default Scopes` to send along with the request to the authorization endpoint. See <http://msdn.microsoft.com/en-us/library/jj687470.aspx#Scope> for more information about scopes for SharePoint Online. Or [Use the Scope Parameter](#) for more information about using scopes with Salesforce.
- `Custom Error URL` for the provider to use to report any errors.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- “View Setup and Configuration”

To edit the settings:

- “Customize Application”
- AND
- “Manage Auth. Providers”

- **Custom Logout URL** to provide a specific destination for users after they log out, if they authenticated using the SSO flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
- To use a portal with your provider, select the portal from the Portal dropdown list. If you have a portal set up for your org, this option can redirect the login request to the portal login page. Otherwise, leave as None.
- Use the **Icon URL** field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn't appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.
Specify a path to your own image, or copy the URL for one of our sample icons into the field.

11. Click **Save**.

Note the generated Auth. Provider Id value. You can use it with the [Auth.AuthToken Apex class](#).

Several client configuration URLs are generated after defining the authentication provider.

- **Test-Only Initialization URL**—Admins use this URL to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- **Oauth-Only Initialization URL**—Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token. This flow doesn't provide for future SSO functionality.
- **Callback URL**—Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the callback URL with information for each client configuration URL.

Client configuration URLs support additional request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Register Your App with Microsoft

Before you can configure an app for your Salesforce org, you must get an app identity using one of the options provided by Microsoft. See [Guidelines for registering apps for SharePoint 2013](#) for details about registering a remote app for SharePoint.

1. Register your app using one of the options provided by Microsoft.
2. Modify the app settings and set the redirect URI to the authentication provider's callback URL.
3. Note the client ID and client secret.
4. Click **Save**.

Edit Your Microsoft Access Control Service Authentication Provider Details

After registering your app with Microsoft, go back to your Microsoft Access Control Service authentication provider details, and update the consumer key and consumer secret with the values provided by Microsoft.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **Edit** next to the name of your Microsoft Access Control Service authentication provider.
3. In the `Consumer Key` field, enter the Microsoft client ID.
4. In the `Consumer Secret` field, enter the Microsoft client secret.

Test the Connection

In a browser, open the Test-Only Initialization URL on the Auth. Provider Setup page. It redirects you to Microsoft and asks you to sign in. You're then asked to authorize your app. After you authorize, you're redirected to Salesforce.

Configure a LinkedIn Authentication Provider

Configure LinkedIn as an authentication provider to let users log in to your Salesforce org using their LinkedIn credentials.

Complete these steps to configure LinkedIn as an authentication provider.

1. [Decide which scopes \(user details\) to get from LinkedIn.](#)
2. [Set up a LinkedIn app.](#)
3. [Define a LinkedIn provider in your Salesforce org](#) and establish a registration handler.
4. [Edit the registration handler.](#)
5. [Update your LinkedIn app](#) to use the callback URL generated by Salesforce as an entry in the LinkedIn OAuth 2.0 Redirect URLs.
6. [Test the single sign-on \(SSO\) connection.](#)

Decide Which Scopes (User Details) to Get from LinkedIn

Scopes determine the information you get from LinkedIn about a user during the authorization process. You can request basic information, such as username and a photo URL, or you can get more specific information, such as an address, phone number, and contact list. The user approves the exchange of information before it's given.

When you set up LinkedIn as an authentication provider, you can set the scopes in three different places: in the LinkedIn app settings, in the Salesforce Auth. Provider settings, or in a query to LinkedIn's user info endpoint using field selectors. Consider the following as you decide where to specify the scopes and the values to use.

- You can leave scope value blank in the LinkedIn and Salesforce settings. The default value is `r_basicprofile`, which provides only the most basic user information as defined by LinkedIn.
- Salesforce requires the email address for users.
- Refer to the [LinkedIn Authentication documentation](#) for a list of supported values and their meaning, or the [LinkedIn Field Selectors page](#) for information about requesting scopes using a URL.
- If you set the default scopes in the Salesforce authentication provider settings, that value overrides the value in the LinkedIn app settings.
- Separate multiple scope values in the LinkedIn app settings or the Salesforce authentication provider settings with a space, for example, `r_basicprofile r_emailaddress`.
- If you use LinkedIn Field Selectors with a URL, separate multiple values with a comma, for example, `https://api.linkedin.com/v1/people/~:(id,formatted-name,first-name,last-name,public-profile-url,email-address)`.

Set Up a LinkedIn App

Before you can configure LinkedIn for your Salesforce org, set up an app in LinkedIn.

 **Note:** You can skip this step by allowing Salesforce to use its own default app. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. Sign in to your developer account for the [LinkedIn website](#).
2. Click the username at the top and select **API Keys**.
3. Click **Add New Application**.
4. Enter the app settings.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

5. Note the API key and secret key. You need them later to create a LinkedIn provider in your Salesforce org.
6. Optionally, enter a LinkedIn supported scope value or several space-separated values.
For more information about using scopes with LinkedIn, see [Decide Which Scopes \(User Details\) to Get from LinkedIn](#).

Define a LinkedIn Provider in Your Salesforce Org

You need the LinkedIn API key and secret key to set up a LinkedIn provider in your Salesforce org.

 **Note:** You can skip this step by allowing Salesforce to manage the values for you. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. From Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select LinkedIn.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URLs. For example, if the URL suffix of your provider is *MyLinkedInProvider*, your SSO URL is similar to:

```
https://login.salesforce.com/services/sso/00Dx0000000001/MyLinkedInProvider
```

6. Use the LinkedIn API key for the *Consumer Key* field.
7. Use the LinkedIn secret key for the *Consumer Secret* field.
8. Optionally, set the following fields.
 - a. *Authorize Endpoint URL* to enter the base authorization URL from LinkedIn. For example, `https://www.linkedin.com/uas/oauth2/authorization/auth`. The URL must start with `https://www.linkedin.com/uas/oauth2/authorization`.

 **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from LinkedIn for offline access, use `https://accounts.linkedin.com/o/oauth2/auth?access_type=offline&approval_prompt=force`. You need the `approval_prompt` parameter to ask the user to accept the refresh action so that LinkedIn continues to provide refresh tokens after the first one.
 - b. *Token Endpoint URL* to enter the OAuth token URL from LinkedIn. For example, `https://www.linkedin.com/uas/oauth2/accessToken/token`. The URL must start with `https://www.linkedin.com/uas/oauth2/accessToken`.
 - c. *User Info Endpoint URL* to change the values requested from LinkedIn's profile API. For more information, see <https://developer.linkedin.com/documents/profile-fields>. The URL must start with `https://api.linkedin.com/v1/people/~,` and the requested fields must correspond to requested scopes.
 - d. *Default Scopes* to enter a supported value or several space-separated values that represent the information you get from LinkedIn. For more information, see [Decide Which Scopes \(User Details\) to Get from LinkedIn](#).
 - e. *Custom Error URL* for the provider to use to report any errors.
 - f. *Custom Logout URL* to provide a specific destination for users after they log out, if they authenticated using the SSO flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.

- g. Select an existing Apex class as the `Registration_Handler` class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

 **Note:** A `Registration_Handler` class is required for Salesforce to generate the single sign-on initialization URL.

- h. For `Execute_Registration_As`, select the user that runs the Apex handler class. The user must have the “Manage Users” permission. A user is required regardless of whether you’re specifying an existing registration handler class or creating one from the template.
- i. To use a portal for LinkedIn users, select the portal from the Portal dropdown list.

9. Use the `Icon_URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn’t appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

Specify a path to your own image, or copy the URL for one of our sample icons into the field.

10. Click **Save**.

Several client configuration URLs are generated after defining the authentication provider.

- Test-Only Initialization URL—Admins use this URL to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- Single Sign-On Initialization URL—Use this URL to perform SSO into Salesforce from a third party (using third-party credentials). The user opens this URL in a browser and signs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.
- Existing User Linking URL—Use this URL to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- OAuth-Only Initialization URL—Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token. This flow does not provide for future SSO functionality.
- Callback URL—Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the callback URL with information for each client configuration URL.

Client configuration URLs support additional request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Edit the Registration Handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the auto-created Apex registration handler (or the existing registration handler if you had one) to map fields between LinkedIn and Salesforce

 **Note:** The default profile query for LinkedIn only retrieves the following fields: first-name, last-name, headline, profile URL. The default registration handler requires email. Either remove the email requirement from the registration handler or change the desired scopes in [Decide Which Scopes \(User Details\) to Get from LinkedIn](#) to include the email address, and any other fields you want in the registration handler.

Here’s an example Apex registration handler specifically for a LinkedIn app as the authentication provider. This registration handler assumes that the requested scopes include `r_basicprofile` and `r_emailaddress`. It also assumes that the users are logging in to a customer portal.

```
//TODO:This auto-generated class includes the basics for a Registration
//Handler class. You will need to customize it to ensure it meets your needs and
```

```

//the data provided by the third party.
global class LinkedInRegHandler implements Auth.RegistrationHandler {
    //Creates a Standard salesforce or a community user
    global User createUser(Id portalId, Auth.UserData data) {
        if (data.attributeMap.containsKey('sfdc_networkid')) {
            //We have a community id, so create a user with community access
            //TODO: Get an actual account
            Account a =[SELECT Id FROM account WHERE name = 'LinkedIn Account'];
            Contact c = new Contact();
            c.accountId = a.Id;
            c.email = data.email;
            c.firstName = data.firstName;
            c.lastName = data.lastName;
            insert(c);
            //TODO: Customize the username and profile. Also check that the username
            //doesn't already exist and possibly ensure there are enough org licenses
            //to create a user. Must be 80 characters or less.
            User u = new User();
            Profile p =[SELECT Id FROM profile WHERE name = 'Customer Portal Manager'];

            u.username = data.firstName + '@sfdc.linkedin.com';
            u.email = data.email;
            u.lastName = data.lastName;
            u.firstName = data.firstName;
            String alias = data.firstName;
            //Alias must be 8 characters or less
            if (alias.length() > 8) {
                alias = alias.substring(0, 8);
            }
            u.alias = alias;
            u.languageLocaleKey = UserInfo.getLocale();
            u.localesidkey = UserInfo.getLocale();
            u.emailEncodingKey = 'UTF-8';
            u.timeZoneSidKey = 'America/Los_Angeles';
            u.profileId = p.Id;
            u.contactId = c.Id;
            return u;
        } else {
            //This is not a community, so create a regular standard user
            User u = new User();
            Profile p =[SELECT Id FROM profile WHERE name = 'Standard User'];
            //TODO: Customize the username. Also check that the username doesn't
            //already exist and possibly ensure there are enough org licenses
            //to create a user. Must be 80 characters or less
            u.username = data.firstName + '@salesforce.com';
            u.email = data.email;
            u.lastName = data.lastName;
            u.firstName = data.firstName;
            String alias = data.firstName;
            //Alias must be 8 characters or less
            if (alias.length() > 8) {
                alias = alias.substring(0, 8);
            }
            u.alias = alias;
        }
    }
}

```

```

        u.languageLocaleKey = UserInfo.getLocale();
        u.localesidkey = UserInfo.getLocale();
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
        u.profileId = p.Id;
        return u;
    }
}
//Updates the user's first and last name
global void updateUser(Id userId, Id portalId, Auth.UserData data) {
    User u = new User(id = userId);
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    update(u);
}
}

```

See the [RegistrationHandler Interface documentation](#) for more information and examples.

Update Your LinkedIn App

After you define the LinkedIn authentication provider in your Salesforce org, go back to LinkedIn. Update your app to use the Salesforce-generated callback URL as the LinkedIn OAuth 2.0 Redirect URLs value.

Test the SSO Connection

In a browser, open the Test-Only Initialization URL on the Auth. Provider Setup page. It redirects you to LinkedIn and asks you to sign in. You're then asked to authorize your app. After you authorize, you're redirected to Salesforce.

Configure a Twitter Authentication Provider

Configure Twitter as an authentication provider to let users log in to a Salesforce org from their Twitter account.

Complete these steps to configure Twitter as an authentication provider.

1. [Set up a Twitter app](#).
2. [Define a Twitter provider in your Salesforce org](#), and establish a registration handler.
3. [Edit the registration handler](#).
4. [Update your Twitter app](#) to use the callback URL generated by Salesforce as an entry in the Twitter app settings.
5. [Test the single sign-on \(SSO\) connection](#).

Set Up a Twitter App

Before you can configure Twitter for your Salesforce org, set up an app in Twitter.

 **Note:** You can skip this step by allowing Salesforce to use its own default app. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. Sign in to your developer account for the [Twitter website](#).
2. Click the user icon at the top and select **My Applications** (or go to [apps.twitter.com](#)).

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

3. Click **Create New App**.
4. Enter the app settings.
5. In the API Keys, note the API key and API secret. You need them later to create a Twitter provider in your Salesforce org.

Define a Twitter Provider in Your Salesforce Org

You need the Twitter API key and API secret from your Twitter app to set up a Twitter provider in your Salesforce org.

 **Note:** You can skip this step by allowing Salesforce to manage the values for you. For more information, see [Use Salesforce-Managed Values in the Auth. Provider Setup Page](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. For provider type, select Twitter.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URLs. For example, if the URL suffix of your provider is `MyTwitterProvider`, your SSO URL is similar to:

```
https://login.salesforce.com/services/sso/00Dx0000000001/MyTwitterProvider
```

6. Use the API key from Twitter for the `Consumer Key` field.
7. Use the API secret from Twitter for the `Consumer Secret` field.
8. Optionally, set the following fields.
 - a. `Custom Error URL` for the provider to use to report any errors.
 - b. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the SSO flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - c. Select an existing Apex class as the `Registration Handler` class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

 **Note:** A `Registration Handler` class is required for Salesforce to generate the SSO initialization URL.

- d. For `Execute Registration As`, select the user that runs the Apex handler class. The user must have the “Manage Users” permission. A user is required regardless of whether you’re specifying an existing registration handler class or creating one from the template.
- e. To use a portal for Twitter users, select the portal from the Portal dropdown list.
- f. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn’t appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

Specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Several client configuration URLs are generated after defining the authentication provider.

- Test-Only Initialization URL—Admins use this URL to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.

- Single Sign-On Initialization URL—Use this URL to perform SSO into Salesforce from a third party (using third-party credentials). The user opens this URL in a browser and signs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.
- Existing User Linking URL—Use this URL to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- Callback URL—Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the Callback URL with information for each client configuration URL.

Client configuration URLs support additional request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Edit the Registration Handler

1. From Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**.
2. Edit the auto-created Apex registration handler (or the existing registration handler if you had one) to map fields between Twitter and Salesforce.

Here's an example Apex registration handler that specifies the Twitter app as the authentication provider.

```
global class MyTwitterRegHandler implements Auth.RegistrationHandler{

global User createUser(Id portalId, Auth.UserData data)
{
    if(data.attributeMap.containsKey('sfdc_networkid'))
    {
        // Create communities user
        Account a = [SELECT Id FROM account WHERE name='Twitter Account']; // Make sure
this account exists

        Contact c = new Contact();
        c.accountId = a.Id;
        c.email = 'temp@CHANGE-ME.com';
        c.firstName = data.fullname.split(' ')[0];
        c.lastName = data.fullname.split(' ')[1];
        insert(c);

        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Customer Portal Manager'];
        u.username = data.username + '@sfdc-portal-twitter.com';
        u.email = 'temp@CHANGE-ME.com';
        u.firstName = data.fullname.split(' ')[0];
        u.lastName = data.fullname.split(' ')[1];
        String alias = data.fullname;

        //Alias must be 8 characters or less
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }

        u.alias = alias;
        u.languageLocaleKey = 'en_US';
        u.localesidkey = 'en_US';
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
    }
}
```

```

        u.profileId = p.Id;
        u.contactId = c.Id;
        return u;
    } else {
        // Create Standard SFDC user
        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
        u.username = data.username + '@sfdc-twitter.com';
        u.email = 'temp@CHANGE-ME.com';
        u.firstName = data.fullname.split(' ')[0];
        u.lastName = data.fullname.split(' ')[1];
        String alias = data.fullname;
        if(alias.length() > 8)
            alias = alias.substring(0, 8);

        u.alias = alias;
        u.languageLocaleKey = 'en_US';
        u.localesidkey = 'en_US';
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
        u.profileId = p.Id;
        return u;
    }
}

global void updateUser(Id userId, Id portalId, Auth.UserData data)
{
    User u = new User(id=userId);
    u.firstName = data.fullname.split(' ')[0];
    u.lastName = data.fullname.split(' ')[1];
    String alias = data.fullname;
    if(alias.length() > 8)
        alias = alias.substring(0, 8);

    u.alias = alias;
    update(u);
}
}

```

See the [RegistrationHandler Interface documentation](#) for more information and examples.

Update Your Twitter App

After you define the Twitter authentication provider in your Salesforce org, go back to Twitter and update your app to use the Salesforce-generated callback URL as the callback URL value in your Twitter app settings.

 **Note:** In your Twitter app, make sure that you select **Allow this app to be used to Sign In with Twitter**.

Test the SSO Connection

In a browser, open the Test-Only Initialization URL on the Auth. Provider detail page. It redirects you to Twitter and asks you to sign in. You're then asked to authorize your app. After you authorize, you're redirected to Salesforce.

Use Salesforce-Managed Values in the Auth. Provider Setup Page

You can choose to let Salesforce create key values when setting up a Facebook, Salesforce, LinkedIn, Twitter, or Google authentication provider. Having Salesforce generate the key values saves you the time and effort of creating your own third-party app.

To use Salesforce-managed values, leave the following fields blank if they show up in your Auth. Provider Setup page.

- Consumer Key
- Consumer Secret
- Authorize Endpoint URL
- Token Endpoint URL
- User Info Endpoint URL
- Default Scopes

 **Note:** Specifying a value for any of the above fields implies that you're using your own connected app. In this case, you must specify values for the consumer key and consumer secret.

 **Example:** Suppose that you want to set up single sign-on (SSO) using a LinkedIn authentication provider to enable login to Salesforce with LinkedIn credentials. You can skip creating a LinkedIn app if you use Salesforce-created values in the Auth. Provider Setup page. Next, you define the LinkedIn authentication provider in your org and test the connection using the procedure in [Configure a LinkedIn Authentication Provider](#).

Create a Custom External Authentication Provider

Create a custom single sign-on (SSO) authentication provider to let users log in to your Salesforce org using their non-Salesforce credentials. Implement a custom external authentication provider if your OAuth app doesn't support OpenID Connect. If your app supports OpenID Connect, you can use one of the authentication providers that Salesforce provides.

1. [Set up](#) an account with your chosen authentication provider.
2. [Create](#) your custom metadata types, and select the custom fields that you want your admins to populate during setup.
3. [Build](#) the matching Apex classes and methods for your chosen metadata types. Then use these classes to implement a custom authentication provider by extending the abstract class `Auth.AuthProviderPluginClass`.
4. [Configure](#) your new metadata on the Auth. Provider Setup page.
5. [Update](#) your app to use the Callback URL generated by Salesforce.
6. [Test](#) the connection.

Set Up Your Account

Before you can configure the external authentication provider plug-in for your Salesforce org, set up an account with your chosen external authentication provider.

1. Go to your authentication provider's site and create an app.
2. Modify the app settings and set the Application Domain to Salesforce.
3. Note the app ID and app secret, if required by your external authentication provider.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Manage Auth. Providers"

EDITIONS

Available in: Available in **Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Your Custom Metadata Types

When you have an account, create the custom metadata types for your Salesforce org required by your external authentication provider.

1. From Setup, enter `metadata` in the `Quick Find` box, then select **Custom Metadata Types**.
2. Click **New Custom Metadata Type**.
3. Enter a label name and plural label name for your custom metadata, and click **Save**.
4. Under the Custom Fields section, click **New** and select the custom fields you that your authentication provider requires. For example, if the authentication provider requires an app ID or app secret, create fields with labels like "Consumer Key" or "Consumer Secret."

 **Note:** You're prompted to enter details for each field type, such as label, description, and Help text. You can choose to make these fields required.

Build Your Apex Classes and Methods

To create a custom authentication provider for SSO, create a class that extends the `Auth.AuthProviderPluginClass` abstract class. This class allows you to store the custom configuration for your authentication provider and handle its authentication protocols. It also creates the name for your external authentication provider and displays this name in the list of available authentication providers.

1. From Setup, enter `apex classes` in the search field, and select **Apex Classes**.
2. Click **New**.
3. In the field provided, create an Apex class and method.
 - a. Extend the `Auth.AuthProviderPluginClass` class.
 - b. For the `return` string on the `getCustomMetadataType` method, enter the API name listed on your newly created custom metadata.

 **Note:** For information about the classes and methods that this plug-in requires, see the [Auth Namespace](#) section of the Force.com [Apex Code Developer's Guide](#).

Configure Your Authentication Provider

You need your authentication provider's app ID and app secret to set up your custom provider in your Salesforce org.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. For the provider type, select your custom authentication provider.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URL. For example, if your provider's URL is `MyAwesomeProvider`, your SSO URL is similar to `https://login.salesforce.com/auth/sso/00Dx0000000001/MyAwesomeProvider`.
6. Enter your information in the custom fields you created.
7. Select an existing Apex class as the `Registration Handler` class. Or click **Automatically create a registration handler template** to create an Apex class template for the registration handler. Edit this class later, and modify the default content before using it.

 **Note:** A `Registration Handler` class is required for Salesforce to generate the SSO initialization URL.

8. For Execute Registration As, select the user that runs the Apex handler class. The user must have the “Manage Users” permission. A user is required regardless of whether you’re specifying an existing registration handler class or creating one from the template. This field is required for all custom authentication providers.
9. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only. It doesn’t appear on the login page for your Salesforce org or domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

Specify a path to your own image, or copy the URL for one of our sample icons into the field.

10. Click `Save`.

Note the generated authentication provider ID. You use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider.

- Test-Only Initialization URL—Use to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- Single Sign-On Initialization URL—Use to initialize SSO into Salesforce from a third party (using third-party credentials). The user opens this URL in a browser and signs in to the third party. The third party either creates a user or updates an existing user. Then the third party signs the user into Salesforce as that user.
- Existing User Linking URL—Use to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- OAuth-Only Initialization URL—Use to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token. This flow doesn’t provide for future SSO functionality.
- Callback URL—Use as the endpoint that the authentication provider calls back to for configuration. The authentication provider redirects to the callback URL with information for each client configuration URL.

Client configuration URLs support other request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from a third party, or go to a location after authenticating.

Update Your External Authentication Provider

After defining your authentication provider in your Salesforce org, go back to your external authentication provider’s site and update your app to use the callback URL as your custom authentication provider’s website URL.

Test the SSO Connection

In a browser, open the Test-Only Initialization URL on the Auth. Provider Setup page. It redirects you to your provider’s site and asks you to sign in. You’re then asked to authorize your app. After you authorize, you’re redirected back to Salesforce.

[Authentication Configuration Endpoint](#)

Using `Frontdoor.jsp` to Log Into Salesforce

You can use `frontdoor.jsp` to give users access to Salesforce from a custom Web interface, such as a remote access Force.com site, using their existing session ID and the server URL.

To authenticate users with `frontdoor.jsp`, you must parse the session ID (not just the 15-character or 18-character ID) and the instance or domain from the `serverUrl` of the `LoginResult` returned from the SOAP API `login()` call. We recommend passing these values to `frontdoor.jsp` through a form that uses a `POST` request.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

For example, the following form posts the current session ID to `frontdoor.jsp`.

```
<form method="POST" action="https://domain_name/secur/frontdoor.jsp">
<input type="hidden" name="sid"
  value="full_sessionID_value"
  />
<input type="submit" name="login" value="Log In" /></form>
```

In this example, `domain_name` is the domain of the serverURL (that is, `yourInstance.salesforce.com` or `myDomain.my.salesforce.com`, depending on whether My Domain is enabled).

You can also send the values as URL parameters, but this approach is not as secure as a POST request because it exposes the session ID in the URL.

```
https://domain_name/secur/frontdoor.jsp?sid=full_sessionID_value
&retURL=optional_relative_url_to_open
```

Full Session ID

You can obtain the full session ID from:

- The `access_token` from an OAuth authentication
 - 💡 **Tip:** One of the scopes specified when you create a connected app must be `web` or `full`.
- The Apex `UserInfo.getSessionId()`

The session ID returned using the Visualforce `{!GETSESSIONID() }` can't be used on `frontdoor.jsp`.

- 🔗 **Note:** Not all session types are supported with `frontdoor.jsp`, such as community API sessions. For these sessions, consider using SAML for single sign-on, instead.

Relative URL to Open

You can optionally include a URL-encoded relative path to redirect users to the Salesforce user interface or a particular record, object, report, or Visualforce page (for example, `/apex/MyVisualForcePage`).

Use Request Parameters with Client Configuration URLs

Add functionality to your authentication provider with request parameters. For example, you can use these parameters to direct users to log in to specific sites, get customized permissions from the third party, or go to a specific location after authenticating.

Add the request parameters to client configuration URLs. These parameters are generated after you defined your authentication provider.

- Test-Only Initialization URL
- Single Sign-On Initialization URL
- Existing User Linking URL
- Callback URL

Append any of these parameters to your URL as needed. For Janrain providers, append them to the appropriate callback URL.

- [Scope](#)—Customizes the permissions requested from the third party.
- [Site](#)—Enables the provider to be used with a site.
- [StartURL](#)—Sends the user to a specified location after authentication.
- [Community](#)—Sends the user to a specific community after authentication.
- [Authorization Endpoint](#) on page 959—Sends the user to a specific endpoint for authentication (Salesforce authentication providers, only).

[Use the Scope Parameter](#)

Customize the permissions requested from a third party, like Facebook or Janrain, so that the returned access token has additional permissions.

[Using the Site Parameter](#)

Use your authentication provider to log into a site or link to a sites user.

[Using the StartURL Parameter](#)

Send your user to a specific location after authenticating or linking.

[Using the Community URL Parameter](#)

Send your user to a specific Community after authenticating.

[Using the Authorization Endpoint Parameter](#)

Send your user to a specific authorization endpoint.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- “View Setup and Configuration”

To edit the settings:

- “Customize Application”

AND

“Manage Auth. Providers”

Use the Scope Parameter

Customize the permissions requested from a third party, like Facebook or Janrain, so that the returned access token has additional permissions.

You can customize requests to a third party to receive access tokens with additional permissions. Then you use `Auth.AuthToken` methods to retrieve the access token that was granted so you can use those permissions with the third party.

The default scopes vary depending on the third party, but usually do not allow access to much more than basic user information. Every provider type (Open ID Connect, Facebook, Salesforce, and others), has a set of default scopes it sends along with the request to the authorization endpoint. For example, Salesforce's default scope is `id`.

You can send scopes in a space-delimited string. The space-delimited string of requested scopes is sent as-is to the third party, and overrides the default permissions requested by authentication providers.

Janrain does not use this parameter; additional permissions must be configured within Janrain.

 **Example:** The following is an example of a `scope` parameter requesting the Salesforce scopes `api` and `web`, added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?scope=id%20api%20web`

Valid scopes vary depending on the third party; refer to your individual third-party documentation. For example, Salesforce scopes are:

Value	Description
<code>api</code>	Allows access to the current, logged-in user's account using APIs, such as REST API and Bulk API. This value also includes <code>chatter_api</code> , which allows access to Chatter REST API resources.
<code>chatter_api</code>	Allows access to Chatter REST API resources only.
<code>custom_permissions</code>	Allows access to the custom permissions in an organization associated with the connected app, and shows whether the current user has each permission enabled.
<code>full</code>	Allows access to all data accessible by the logged-in user, and encompasses all other scopes. <code>full</code> does not return a refresh token. You must explicitly request the <code>refresh_token</code> scope to get a refresh token.
<code>id</code>	Allows access to the identity URL service. You can request <code>profile</code> , <code>email</code> , <code>address</code> , or <code>phone</code> , individually to get the same result as using <code>id</code> ; they are all synonymous.
<code>openid</code>	Allows access to the current, logged in user's unique identifier for OpenID Connect apps. The <code>openid</code> scope can be used in the OAuth 2.0 user-agent flow and the OAuth 2.0 Web server authentication flow to get back a signed ID token conforming to the OpenID Connect specifications in addition to the access token.
<code>refresh_token</code>	Allows a refresh token to be returned if you are eligible to receive one. This lets the app interact with the user's data while the user is offline, and is synonymous with requesting <code>offline_access</code> .
<code>visualforce</code>	Allows access to Visualforce pages.

[Use Request Parameters with Client Configuration URLs](#)

Using the Site Parameter

Use your authentication provider to log into a site or link to a sites user.

To use your provider with a site, you need to do the following:

- Enable the provider to be used with a site
- Ensure the site is configured to use the same portal
- Add the site-specific login URL information to the appropriate client configuration URL, such as the `Single Sign-On Initialization URL`, using the `site` parameter

 **Example:** You create the site login Visualforce page, or specify the default page, when you create the site. An example site login URL is:

```
https%3A%2F%2Fmysite.force.com%2FsiteLogin.
```

The following is an example of a site-login URL added to the `Single Sign-On Initialization URL`, using the `site` parameter, where:

- `orgID` is your Auth. Provider ID
- `URLsuffix` is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/ss/orgID/URLsuffix?site=https%3A%2F%2Fmysite.force.com%2FsiteLogin
```

If you don't specify a `site` parameter, the user proceeds either to a standard portal (if set up for a portal) or the standard application (if not).

Using the StartURL Parameter

Send your user to a specific location after authenticating or linking.

To direct your users to a specific location after authenticating, you need to specify a URL with the `startURL` request parameter. This URL must be a relative URL; passing an absolute URL results in an error. If you don't add `startURL`, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

 **Example:** For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the “Continue to Salesforce” link on the confirmation page leads to this page.

The following is an example of a `startURL` parameter added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/ss/oid/URLsuffix?startURL=%2F05000000001%3Fredirect%3D`

SEE ALSO:

[Use Request Parameters with Client Configuration URLs](#)

Using the Community URL Parameter

Send your user to a specific Community after authenticating.

To direct your users to a specific community after authenticating, you need to specify a URL with the `community` request parameter. If you don't add the parameter, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

 **Example:** For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the “Continue to Salesforce” link on the confirmation page leads to this page.

The following is an example of a `community` parameter added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/ss/oid/URLsuffix?community=https://one.force.com/support`

Using the Authorization Endpoint Parameter

Send your user to a specific authorization endpoint.

You can add a `provAuthorizeEndpointHost` parameter to a Salesforce authentication provider URL to direct users to an authorization endpoint for a provided domain, such as a custom domain created using My Domain. Providing an authorization endpoint lets you take advantage of features like session discovery during authorization. This parameter is only available for Salesforce authentication providers, and cannot be used to send users to an authorization page outside of a Salesforce domain.

To direct your users to a specific Salesforce authorization endpoint, you need to specify a URL with the `provAuthorizeEndpointHost` request parameter and a valid `https` host. Query strings appended to the host URL are ignored. However, you can specify a community path.

 **Example:** The following is an example of a `provAuthorizeEndpointHost` parameter added to the authentication provider URL:

- `orgID` is your Auth. Provider ID
- `URLsuffix` is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/sso/orgID/  
URLsuffix?provAuthorizeEndpointHost=https%3A%2F%2Fmydomain.my.salesforce.com
```

The following is an example of a `provAuthorizeEndpointHost` directed to a community URL

```
https://login.salesforce.com/services/auth/sso/orgID/  
URLsuffix?provAuthorizeEndpointHost=https%3A%2F%2Fmycommunity.force.com%2Fbilling
```

If an authorization endpoint is not provided, Salesforce uses the default authorization endpoint for the authorization provider. If no default is set for the authorization provider, Salesforce uses the endpoint for `login.salesforce.com`.

The authorization endpoint does not change the token endpoint, which continues to be the configured or default host. For example, if the authorization endpoint is a sandbox instance, and your provider is set to use a production token endpoint, the flow fails, because authorization was granted by the sandbox instance, only.

Identity Providers and Service Providers

An *identity provider* is a trusted provider that lets you use single sign-on to access other websites. A *service provider* is a website that hosts applications. You can enable Salesforce as an identity provider and define one or more service providers. Your users can then access other applications directly from Salesforce using single sign-on. Single sign-on can be a great help to your users: instead of having to remember many passwords, they only have to remember one. Plus, the applications can be added as tabs to your Salesforce organization, which means users don't have to switch between programs.

Before you can enable Salesforce as an identity provider, you have to [set up a domain](#).

Enabling Salesforce as an identity provider requires a [Salesforce certificate and key pair that is signed by an external certificate authority \(CA-signed\) or self-signed](#). If you haven't generated a Salesforce certificate and key pair, one is automatically created for you when you enable Salesforce as an identity provider. You also have the option of picking an already generated certificate, or creating one yourself.

Salesforce uses the SAML 2.0 standard for single sign-on and generates SAML assertions when configured as an identity provider.

Use the [identity provider event log](#) if your users have errors when trying to log in to your service provider's apps.

Using Identity Providers and Service Providers

Salesforce supports the following:

- Identity-provider-initiated login—when Salesforce logs in to a service provider at the initiation of the end user
- Service-provider-initiated login—when the service provider requests Salesforce to authenticate a user, at the initiation of the end user

The following is the general flow when Salesforce as an identity provider logs in to a service provider.

EDITIONS

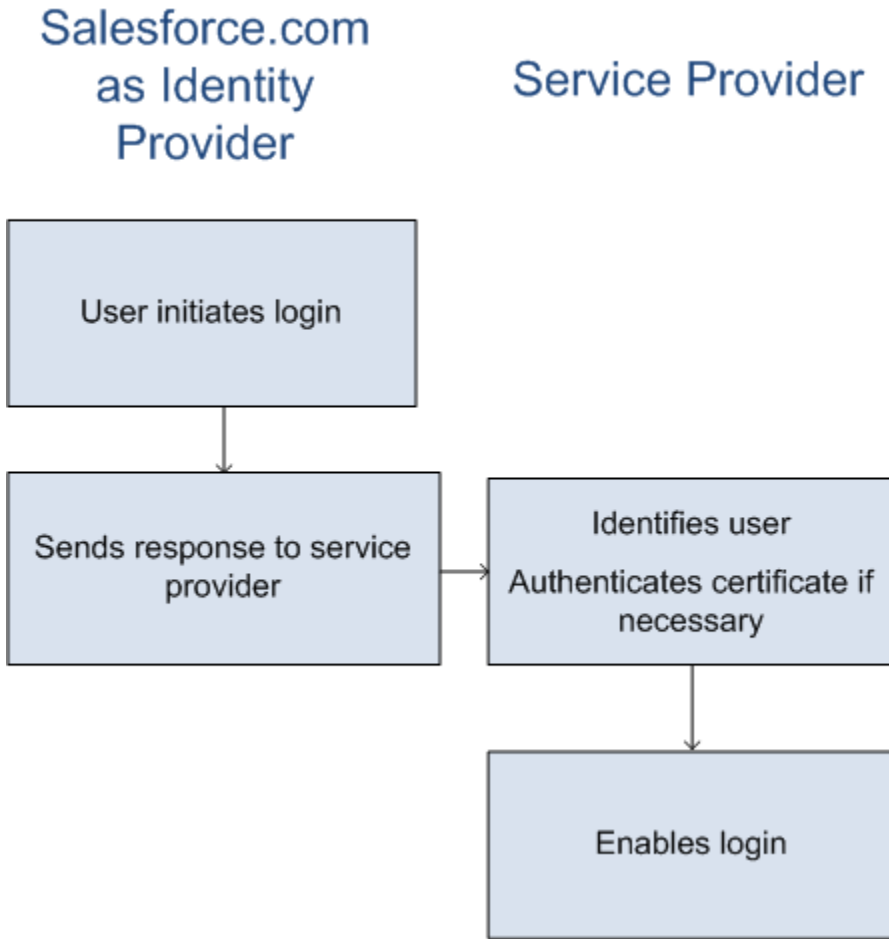

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

Define and modify identity providers and service providers:

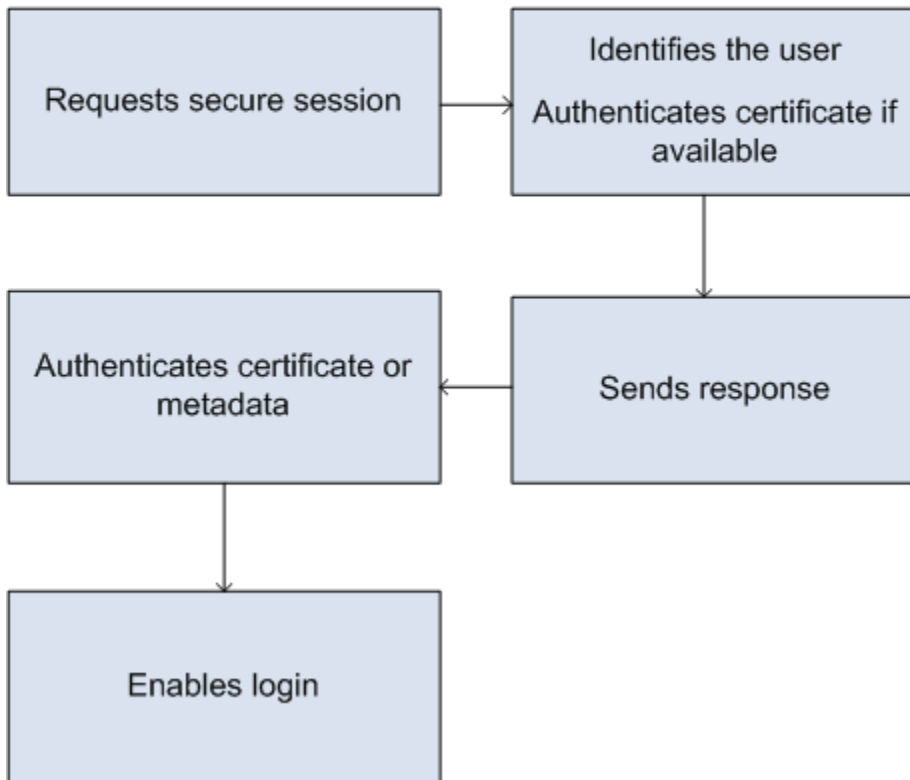

- "Customize Application"

1. The user tries to access a service provider already defined in Salesforce.
2. Salesforce sends a [SAML response](#) to the service provider.
3. The service provider identifies the user and authenticates the certificate.
4. If the user is identified, they are logged in to the service provider.

The following is the general flow when a service provider initiates login and uses Salesforce to identify the user.

Service Provider Salesforce.com as Identity Provider

1. The service provider sends a valid SAML request. The endpoint is automatically generated when the service provider is defined—the SP-Initiated POST Endpoint.
2. Salesforce identifies the user included in the SAML request.

```

<samlp:AuthnRequest ID="bndkmeemcaamihajeloilkagfdliilbhjnjmlmfo" Version="2.0"
  IssueInstant="2010-05-24T22:57:19Z"
  ProtocolBinding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST"
  ProviderName="google.com" IsPassive="false"
  AssertionConsumerServiceURL="https://www.google.com/a/resp.info/acs">
  <saml:Issuer>google.com</saml:Issuer>
  <samlp:NameIDPolicy AllowCreate="true"
    Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified"/>
</samlp:AuthnRequest>
  
```

If a certificate was included as part of the definition, Salesforce authenticates the certificate.

 **Note:** If a certificate is included in the service provider definition, and the SAML request does not contain a certificate, the request fails. The user is not logged in using Salesforce. If the definition does not include a certificate, and the request includes a signature, the request succeeds if the user is identified correctly.

3. If the user isn't already logged in to Salesforce, they are prompted to do so.

4. Salesforce sends a [SAML response](#) to the service provider.
5. The service provider authenticates the SAML response sent by Salesforce. If the user has been authenticated, they are logged in to the service provider. The user is also logged in to Salesforce.

 **Important:** Salesforce doesn't provide any mechanism for automatically logging the user out of Salesforce when they log out of the service provider.

The following is an example of the SAML response from Salesforce. Share this information with your service provider.

```

Enable Salesforce as an Identity Provider

To enable Salesforce as an identity provider:

1. [Set up a domain using My Domain](#), and deploy it to all users.
2. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**, and then click **Enable Identity Provider**.
3. By default, a Salesforce identity provider uses a self-signed certificate generated automatically with the SHA-256 signature algorithm. If you've already created self-signed certificates, select the certificate to use when securely communicating with other services.

If you want to use a CA-signed certificate instead of self-signed certificate, following these steps.

- a. Create and import a new CA-signed certificate. For instructions, see [Certificates and Keys](#).
- b. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**.
- c. Click **Edit**, and then select the CA-signed certificate.
- d. Click **Save**.

After you enable Salesforce as an identity provider, you can define service providers by creating connected apps (From Setup, enter *Apps* in the **Quick Find** box, then select **Apps**).

SEE ALSO:

- [Identity Providers and Service Providers](#)
- [Generate a Self-Signed Certificate](#)
- [Create a Connected App](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer**, **Enterprise**, **Performance**, **Unlimited**, and **Database.com** Editions

USER PERMISSIONS

Define and modify identity providers and service providers:

- "Customize Application"

View Your Identity Provider Details

After you enable an identity provider for your organization, you can view the details from Setup by entering *Identity Provider* in the **Quick Find** box, then selecting **Identity Provider**. You might need to share this information, such as *Issuer*, with your service provider.

From this page you can click:

- **Edit** to change the certificate associated with your identity provider.
 -  **Warning:** Changing the certificate can disable access to external applications. You might need to update all external applications to validate the new certificate information.
- **Disable** to disable your identity provider.
 -  **Warning:** If you disable your identity provider, users can no longer access any external applications.
- **Download Certificate** to download the certificate associated with your identity provider. Your service provider can use this information for connecting to Salesforce.
- **Download Metadata** to download the metadata associated with your identity provider. Your service provider can use this information for connecting to Salesforce.
- In the SAML Metadata Discovery Endpoints section, you can access URLs for the SAML identity provider information for your custom domain and each community. Your service provider can use these URLs to configure single sign-on to connect to Salesforce.
 - Salesforce Identity—URL of identity provider metadata for your custom domain in My Domain.
 - *Community Name* Community Identity—URL of identity provider metadata for the named community.
- In the service providers section, next to the name of an existing service provider, click **Edit** to change its definition, click **Profiles** to add or remove user profiles that have access to this service provider, or click **Del** to delete it.
 -  **Note:** To define a new service provider, from Setup, enter *Apps* in the **Quick Find** box, then select **Apps** and then create a new SAML-enabled connected app.

SEE ALSO:

[Identity Providers and Service Providers](#)

Prerequisites for Defining Service Providers

Before you define a service provider in Salesforce, follow these steps to define an identity provider and exchange configuration information with your provider.

1. [Enable Salesforce as an identity provider.](#)
2. Give your service provider information about your configuration of Salesforce as an identity provider. This information is available as metadata that you can download and give to your service provider. To obtain this metadata, from Setup, enter *Identity Provider* in the **Quick Find** box, select **Identity Provider**, then click **Download Metadata**.

If your service provider doesn't support metadata, but supports certificates instead, you can download the certificate. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**, then click **Download Certificate**.

3. Get the following information from your service provider:
 - Assertion consumer service (ACS) URL
 - Entity ID
 - Subject type—Specifies if the subject for the SAML response from Salesforce (as an identity provider) is a Salesforce user name or a federation ID
 - Security certificate—Only required when the service provider is initiating login to Salesforce and signing their SAML requests

SEE ALSO:

[Identity Providers and Service Providers](#)

Defining Service Providers as SAML-Enabled Connected Apps

1. Complete the [prerequisites](#).
2. From Setup, enter *Apps* in the **Quick Find** box, then select **Apps**.
3. Under Connected Apps, click **New**.
4. Specify the required fields under Basic Information.
5. Under Web App Settings, select **Enable SAML** and then provide the following:

Entity Id

This value comes from the service provider. Each entity ID in an organization must be unique. If you're accessing multiple apps from your service provider, you only need to define the service provider once, and then use the `RelayState` parameter to append the URL values to direct the user to the correct app after signing in.

ACS URL

The ACS, or assertion consumer service, URL comes from the SAML service provider.

Subject Type

Specifies which field defines the user's identity for the app. Options include the user's username, federation ID, user ID, a custom attribute, or an algorithmically calculated persistent ID. A custom attribute can be any custom field added to the User object in the organization, as long as it is one of the following data types: Email, Text, URL, or Formula (with Text Return Type). After you select `Custom Attribute` for the **Subject Type**, Salesforce displays a **Custom Attribute** field with a list of the available User object custom fields in the organization.

USER PERMISSIONS

Define and modify identity providers and service providers:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

Define and modify identity providers and service providers:

- "Customize Application"

Name ID Format

Specifies the format attribute sent in SAML messages. "Unspecified" is selected by default. Depending on your SAML service provider, you may want to set this to email address, persistent, or transient.

Issuer

By default, the standard issuer for your identity provider is used (your organization's My Domain). If your SAML service provider requires a different value, specify it here.

6. Optionally specify the following:

Start URL

Directs users to a specific location when they run the application. The Start URL can be an absolute URL, such as `https://na1.salesforce.com/001/o`, or it can be the link for the application name, such as `https://customer.goodApp.com` for GoodApp. Specifying a Start URL makes the application available in the Force.com app menu and in App Launcher.

Verify Request Signatures

Select `Verify Request Signatures` if the service provider gave you a security certificate. Browse your system for the certificate. This is only necessary if you plan to initiate logging in to Salesforce from the service provider and the service provider signs their SAML requests.

 **Important:** If you upload a certificate, all SAML requests must be signed. If no certificate is uploaded, all SAML requests are accepted.

Encrypt SAML Response

Select `Encrypt SAML Response` to upload a certificate and select an encryption method for encrypting the assertion. Valid encryption algorithm values are `AES-128` (128-bit key), `AES-256` (256-bit key), and `Triple-DES` (Triple Data Encryption Algorithm).

7. Click **Save**.

To authorize users for this SAML application:

1. From Setup, enter *Connected Apps* in the `Quick Find` box, then select the option for managing connected apps.
2. Click the name of the application.
3. Select the profiles and/or permission sets that can access the application.

SEE ALSO:

[Identity Providers and Service Providers](#)

[Custom Fields](#)

Map Salesforce Users to App Users

If the `Subject Type` for the service provider definition is `Federation ID`, you must map the Salesforce user to the username used to sign into the service provider.

To map a Salesforce user to the app user:

1. From Setup, enter `Users` in the `Quick Find` box, then select **Users**, then click **Edit** for every user who needs to be mapped.
2. In `Federation ID`, under Single Sign On Information, enter the username to be used to log into the service provider.
3. Click **Save**.

Tip: Use SOAP API if you have a large number of user profiles or permission sets to update. See the [SOAP API Developer's Guide](#).

SEE ALSO:

[Identity Providers and Service Providers](#)

View Your Service Provider Details

After you define a service provider for your organization by creating a SAML-enabled connected app, you can view the details from Setup by entering `Connected Apps` in the `Quick Find` box, then selecting **Connected Apps**, and then selecting the name of the app. You might need to share this information, such as `SP-Initiated POST Endpoint` or `SP-Initiated Redirect Endpoint`, with your service providers.

From this page you can click:

- **Edit** to change the values of the service provider definition.
- **Delete** to delete a service provider definition.

Warning: If you delete a service provider definition, your users will no longer have access to that service provider.

- **Profile Access** to change which profiles have access to this service provider.

Enabling Identity Providers and Defining Service Providers for Portals and Sites

When enabling identity providers and defining service providers for Force.com Sites, Customer Portals and partner portals, note the following:

- When [defining a service provider](#), if the `Subject Type` is `Username`, the Salesforce organization ID is prepended to the user name in the SAML assertion. For example, if the user is `jDeoint@WFC.com`, the subject for the SAML assertion contains `00DE0000000FFLT@jDeoint@WFC.com`. If the `Subject Type` is `Federation ID`, the exact federation ID is used.
- The attribute `is_portal_user` included in the SAML assertion generated by Salesforce contains values. You might want to share the following example with your service provider.

  </saml:AttributeValue>
</saml:Attribute>
```

SEE ALSO:

[Identity Providers and Service Providers](#)

Using the Identity Provider Event Log

The identity provider event log records both problems and successes with inbound SAML authentication requests from another app provider, and outbound SAML responses when Salesforce is acting as an identity provider. To view the identity provider event log, from Setup, enter *Identity Provider Event Log* in the Quick Find box, then select **Identity Provider Event Log**. You can show successes, failures, or both in the log. You can view the 50 most recent events in the UI; you can view more by creating a report.

Examples Using Identity Providers and Service Providers

This section contains two examples of setting up Salesforce as an identity provider, then setting up two different service providers:

- [Google Apps](#) —shows service-provider initiated login.
- [Salesforce](#)—shows identity-provider initiated login.

Setting up Single Sign-on to Google Apps Example

This example shows how to set up single sign-on from Salesforce to Google Apps. In this example, Google is the service provider, and Google Apps is the app provided by the service provider.

For this example to work:

- You must already have a Premier Edition Google Apps account
- Your Salesforce organization must be set up for single sign-on using SAML 2.0

The general steps are as follows, with more specifics on each step below.

1. [Generate a domain name and enable an identity provider](#) in your Salesforce organization.
2. [Define the service provider in Salesforce](#).
3. [Enable the Salesforce user and profile](#).
4. [Setup Google Apps](#).
5. [Test your implementation](#).

USER PERMISSIONS

Define and modify identity providers and service providers:

- “Customize Application”

Generating a Domain Name and Enabling an Identity Provider

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log in to Salesforce.
2. Generate a domain name for your organization:

- a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**, enter a new subdomain name, and click **Check Availability**.
- b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.

 **Important:** You must deploy your domain name before you can enable Salesforce as an identity provider.

3. Enable Salesforce as an identity provider:
 - a. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**.
 - b. Click **Enable**.
 - c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

Defining a Service Provider

To define the service provider:

1. Log in to Salesforce.
2. From Setup, enter *Apps* in the **Quick Find** box, then select **Apps**.
3. Click **New** in the **Connected Apps** section and for **Connected App Name**, enter *Google Apps*.
4. In the **Web App Settings** area, select **Enable SAML** and then enter the following information:

Field	Value
ACS URL	The URL for your Google App account, such as <code>https://www.google.com/a/respond.info</code>
Entity ID	google.com
Subject Type	Federation ID

5. Click **Save**.
6. To authorize access to this app, enter *Connected Apps* in the **Quick Find** box, select the option for managing connected apps, and then click the name of the application. Then select the current user's profile.
7. Copy the value in the **SP-Initiated Redirect Endpoint** field. You will use this value later.

Mapping the Salesforce user to the Google Apps user

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Click **Edit**.
3. For **Federation ID**, enter the username you use to sign into Google Apps, for example, `JSmith@TGroup.com`.
4. Click **Save**.

Setting up Google Apps

1. Log in to your Google Apps account.

2. Click the **Advanced tools** tab, then the **Set up single sign-on (SSO)** link.
3. Check the `Enable Single Sign-on` checkbox.
4. For `Sign-in page URL`, enter the URL copied from the `SP-Initiated Redirect Endpoint` field, from [defining a service provider](#).
5. For `Sign-out page URL`, specify the URL where you want your users to go after they log out of Google Apps, such as, `http://www.mydomain.salesforce.com`.
6. For `Change password URL`, use the following URL:
`https://mydomain.salesforce.com/_ui/system/security/ChangePassword`, where *mydomain* is the name you specified for your custom domain when you generated your domain.
7. For `Verification certificate`, upload the certificate you downloaded from [enabling an identity provider](#).
8. Click **Save Changes**.

Testing Your Implementation

To verify that your Salesforce organization can use single sign-on to Google Apps:

1. Log out of Google Apps and Salesforce.
2. Try to access a Google app page, such as `http://docs.google.com/a/respond.info/` or `http://mail.google.com/a/respond.info/`.
3. You are redirected to a Salesforce sign-on page. After you login, you are at the specified Google app page.

An alternate test is to add the Google App to a web tab in your Salesforce organization.

1. Log in to Salesforce.
2. From Setup, enter `Tabs` in the `Quick Find` box, then select **Tabs**, then click **New** in the `Web Tabs` section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the `Tab Style` lookup icon to display the `Tab Style Selector`. Select an icon. Keep all other defaults.
7. Click **Next**.
8. In the `Button or Link URL` text box, enter a Google App page, such as `docs.google.com/a/respond.info/` or `mail.google.com/a/respond.info/`, then click **Next**.

 **Note:** This has to be an absolute URL, that is, it must contain either `http://` or `https://`.

9. Click **Next** and **Save**.
10. Click the new tab at the top of your page. You are automatically logged into the specified Google app page.

Setting up Single Sign-on from Salesforce to Salesforce

This example shows how to set up a Salesforce app to initiate single sign-on from one Salesforce organization to another.

The initiating Salesforce organization, that is, the organization that you want to initially log into, acts as the *identity provider*. The Salesforce organization that you want to access using an app acts as the *service provider*. For example, suppose you have two Salesforce organizations: a sales organization and an ideas organization. You can set up single sign-on between the two organizations so your users only have to log into and remember the password for one.

For this example to work, your initiating Salesforce organization must be set up for single sign-on using SAML 2.0. The general steps are as follows, with more specifics on each of these steps.

1. [Generate a domain name and enable an identity provider](#) in the Salesforce organization that is acting as an identity provider.
2. [Set up the Salesforce organization](#) that is acting as a service provider.
3. [Define the service provider app](#) in the Salesforce organization that is acting as an identity provider.
4. [Test your implementation](#).

Generating a Domain Name and Enabling an Identity Provider

All the work in the following steps is done on the Salesforce organization that is acting as the identity provider.

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log in to Salesforce.
2. Generate a domain name for your organization:
 - a. From Setup, enter *My Domain* in the `Quick Find` box, then select **My Domain**, enter a new subdomain name, and click **Check Availability**.
 - b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.

 **Important:** You must deploy your domain name before you can enable Salesforce as an identity provider.
3. Enable Salesforce as an identity provider:
 - a. From Setup, enter *Identity Provider* in the `Quick Find` box, then select **Identity Provider**.
 - b. Click **Enable**.
 - c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

Setting up a Salesforce Organization as Service Provider

To configure a second Salesforce organization as the service provider:

1. Log in to the Salesforce organization that acts as the service provider.
2. Enable and configure SAML:
 - a. From Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**, then click **Edit**.
 - b. Select the `SAML Enabled` check box.
 - c. Use the following settings:

Field	Value
SAML Version	2.0
Issuer	The identity provider issuer URL, created when the identity provider is set up. For example, <code>https://mycustomdomain.salesforce.com</code> .
Identity Provider Certificate	Browse for the certificate you downloaded in enabling an identity provider .

Field	Value
SAML User ID Type	Select Assertion contains the Federation ID from the User object
SAML User ID Location	Select User ID is in the NameIdentifier element of the Subject statement

- d. Click **Save**.
 - e. Copy and save the values from the fields `Salesforce Login URL` and `Entity ID`. You need these values later, when defining the Salesforce service provider.
3. Link your user in the service provider organization to the user in the identity provider organization:
 - a. From your personal settings, enter *Advanced User Detail* in the `Quick Find` box, then select **Advanced User Detail**. No results? Enter *Personal Information* in the `Quick Find` box, then select **Personal Information**.
 - b. Click **Edit**.
 - c. For `Federation ID`, enter the username used to sign into the Salesforce identity provider organization, for example, `IDP_org@TGroup.com`.
 - d. Click **Save**.

Defining the Service Provider in the Identity Provider Organization

To define the service provider, you create a SAML enabled Web App as a connected app:

1. Log in to the Salesforce organization that acts as the identity provider.
2. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**, then in the `Connected Apps` section, click **New**.
3. Specify the following information:

Field	Value
Connected App Name	Salesforce Service Provider
Contact Email	Contact Salesforce should use for contacting you or your support team.
Enable SAML	Select this option to enter service provider details.
Entity Id	Use the Entity ID from setting up the service provider
ACS URL	Use the Salesforce Login URL from setting up the service provider
Subject Type	Select Username

4. Click **Save**.
5. Select the profiles allowed to access this service provider. You must select the current user's profile for this example to work.
6. Click **Save**.
7. Copy down the value of the `IdP-Initiated Login URL` field. You will use this value later, in testing.

Testing Your Implementation

To verify that your Salesforce organizations can use single sign-on to connect, create a web tab:

1. Log in to the Salesforce organization that is acting like a service provider.
2. From Setup, enter *Tabs* in the *Quick Find* box, then select **Tabs**, then click **New** in the *Web Tabs* section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the *Tab Style* lookup icon to display the Tab Style Selector. Select an icon.
7. Click **Next**.
8. In the *Button or Link URL* text box, enter the value of the *IdP-Initiated Login URL* field from [defining the service provider](#), then click **Next**.

 **Note:** This has to be an absolute URL, that is, it must contain either `http://` or `https://`.
9. Click **Next**, then **Save**.
10. Click the new tab at the top of your page. If you have logged out of the Salesforce organization that acts as the identity provider, you are prompted to log in. Once you are logged in, you should see the Salesforce organization that acts as the identity provider in the tab.

[Identity Providers and Service Providers](#)

Configure Remote Site Settings

Before any Visualforce page, Apex callout, or JavaScript code using XMLHttpRequest in an s-control or custom button can call an external site, that site must be registered in the Remote Site Settings page, or the call fails.

 **Note:** To enable corresponding access for Lightning components, create a CSP Trusted Site.

To access the page, from Setup, enter *Remote Site Settings* in the *Quick Find* box, then select **Remote Site Settings**. This page displays a list of any remote sites already registered and provides additional information about each site, including remote site name and URL.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

To register a new site:

1. Click **New Remote Site**.
2. Enter a descriptive term for the *Remote Site Name*.
3. Enter the URL for the remote site.
4. To allow access to the remote site regardless of whether the user's connection is over HTTP or HTTPS, select the *Disable Protocol Security* checkbox. When selected, Salesforce

EDITIONS

USER PERMISSIONS

To configure remote settings:

- “Customize Application” or “Modify All Data”

can pass data from an HTTPS session to an HTTP session, and vice versa. Only select this checkbox if you understand the security implications.

5. Optionally, enter a description of the site.
6. Click **Save** to finish, or click **Save & New** to save your work and begin registering an additional site.

SEE ALSO:

[Create CSP Trusted Sites to Access Third-Party APIs](#)

Named Credentials

A named credential specifies the URL of a callout endpoint and its required authentication parameters in one definition. To simplify the setup of authenticated callouts, specify a named credential as the callout endpoint. If you instead specify a URL as the callout endpoint, you must register that URL in your org's remote site settings and handle the authentication yourself. For example, for an Apex callout, your code would need to handle authentication, which can be less secure and especially complicated for OAuth implementations.

Salesforce manages all authentication for callouts that specify a named credential as the callout endpoint so that you don't have to. You can also skip remote site settings, which are otherwise required for callouts to external sites, for the site defined in the named credential.

Named credentials are supported in these types of callout definitions:

- Apex callouts
- External data sources of these types:
 - Salesforce Connect: OData 2.0
 - Salesforce Connect: OData 4.0
 - Salesforce Connect: Custom (developed with the Apex Connector Framework)

By separating the endpoint URL and authentication from the callout definition, named credentials make callouts easier to maintain. For example, if an endpoint URL changes, you update only the named credential. All callouts that reference the named credential simply continue to work.

If you have multiple orgs, you can create a named credential with the same name but with a different endpoint URL in each org. You can then package and deploy—on all the orgs—one callout definition that references the shared name of those named credentials. For example, the named credential in each org can have a different endpoint URL to accommodate differences in development and production environments. If an Apex callout specifies the shared name of those named credentials, the Apex class that defines the callout can be packaged and deployed on all those orgs without programmatically checking the environment.

Named credentials support basic password authentication and OAuth 2.0. You can set up each named credential to use an org-wide named principal or to use per-user authentication so that users can manage their own credentials.

To reference a named credential from a callout definition, use the named credential URL. A named credential URL contains the scheme `callout:`, the name of the named credential, and an optional path. For example:

```
callout:My_Named_Credential/some_path.
```

You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: `callout:My_Named_Credential/some_path?format=json`.

EDITIONS

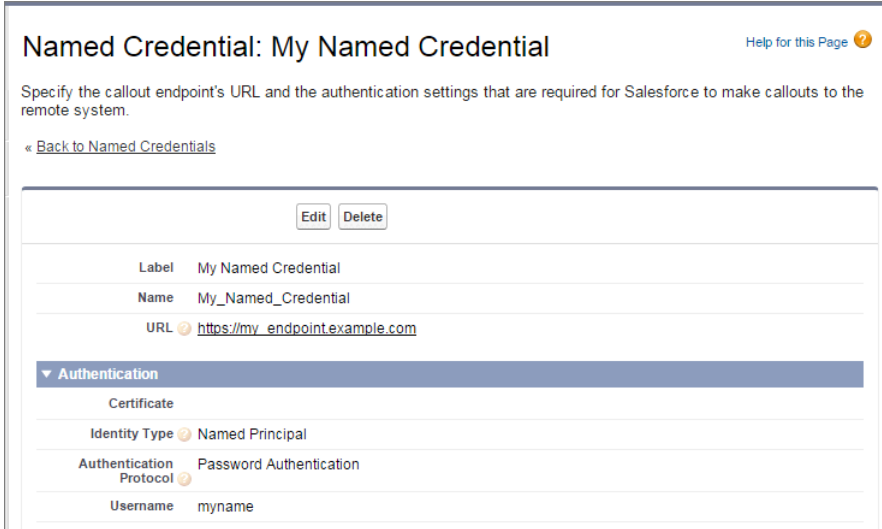

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

 **Example:** In the following Apex code, a named credential and an appended path specify the callout's endpoint.

```
HttpRequest req = new HttpRequest();
req.setEndpoint('callout:My_Named_Credential/some_path');
req.setMethod('GET');
Http http = new Http();
HTTPResponse res = http.send(req);
System.debug(res.getBody());
```

The referenced named credential specifies the endpoint URL and the authentication settings.

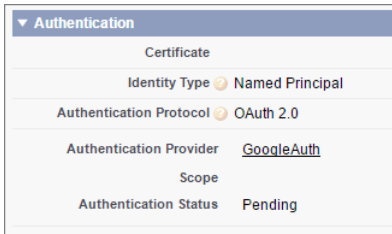

Named Credential: My Named Credential Help for this Page ?

Specify the callout endpoint's URL and the authentication settings that are required for Salesforce to make callouts to the remote system.

[« Back to Named Credentials](#)

Label	My Named Credential
Name	My_Named_Credential
URL	https://my_endpointexample.com
Authentication	
Certificate	
Identity Type	Named Principal
Authentication Protocol	Password Authentication
Username	myname

If you use OAuth instead of password authentication, the Apex code remains the same. The authentication settings differ in the named credential, which references an authentication provider that's defined in the org.

Authentication	
Certificate	
Identity Type	Named Principal
Authentication Protocol	OAuth 2.0
Authentication Provider	GoogleAuth
Scope	
Authentication Status	Pending

In contrast, let's see what the Apex code looks like without a named credential. Notice that the code becomes more complex to handle authentication, even if we stick with basic password authentication. Coding OAuth is even more complex and is an ideal use case for named credentials.

```
HttpRequest req = new HttpRequest();
req.setEndpoint('https://my_endpoint.example.com/some_path');
req.setMethod('GET');

// Because we didn't set the endpoint as a named credential,
// our code has to specify:
// - The required username and password to access the endpoint
// - The header and header information
```

```
String username = 'myname';
String password = 'mypwd';

Blob headerValue = Blob.valueOf(username + ':' + password);
String authorizationHeader = 'BASIC ' +
EncodingUtil.base64Encode(headerValue);
req.setHeader('Authorization', authorizationHeader);

// Create a new http object to send the request object
// A response object is generated as a result of the request

Http http = new Http();
HTTPResponse res = http.send(req);
System.debug(res.getBody());
```

Define a Named Credential

Create a named credential to specify the URL of a callout endpoint and its required authentication parameters in one definition. You can then specify the named credential as a callout endpoint to let Salesforce handle all the authentication. You can also skip remote site settings, which are otherwise required for callouts to external sites, for the site defined in the named credential.

Grant Access to Authentication Settings for Named Credentials

For named credentials that use per-user authentication, grant access to users through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view named credentials:

- “View Setup and Configuration”

To create, edit, or delete named credentials:

- “Customize Applications”

1. From Setup, enter *Named Credentials* in the Quick Find box, then select **Named Credentials**.
2. Click **New Named Credential**, or click **Edit** to modify an existing named credential.
3. Complete the fields.

Field	Description
Label	<p>A user-friendly name for the named credential that's displayed in the Salesforce user interface, such as in list views.</p> <p>If you set <code>Identity Type</code> to <code>Per User</code>, this label appears when your users view or edit their authentication settings for external systems.</p>
Name	<p>A unique identifier that's used to refer to this named credential from callout definitions and through the API.</p> <p>The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
URL	<p>The URL or root URL of the callout endpoint. Must begin with <code>http://</code> or <code>https://</code>. Can include a path but not a query string. Examples:</p> <ul style="list-style-type: none"> • <code>http://my_endpoint.example.com</code> • <code>https://my_endpoint.example.com/secure/payroll</code> <p>You can, however, append a query string and a specific path in the callout definition's reference to the named credential. For example, an Apex callout could reference the named credential "My_Payroll_System" as follows.</p> <pre>HttpRequest req = new HttpRequest(); req.setEndpoint('callout:My_Payroll_System/paystubs?format=json');</pre>
Certificate	<p>If you specify a certificate, your Salesforce org supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your Salesforce org.</p>
Identity Type	<p>Determines whether you're using one set or multiple sets of credentials to access the external system.</p> <ul style="list-style-type: none"> • Anonymous: No identity and therefore no authentication. • Per User: Use separate credentials for each user who accesses the external system via callouts. Select this option if the external system restricts access on a per-user basis. <p>After you grant user access through permission sets or profiles in Salesforce, users can manage their own authentication settings for external systems in their personal settings.</p> • Named Principal: Use the same set of credentials for all users who access the external system from your org. Select this option if you designate one user account on the external system for all your Salesforce org users.

4. Select the authentication protocol.
 - If you select **Password Authentication**, enter the username and password for accessing the external system.

- If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	Choose the provider. See External Authentication Providers on page 927.
Scope	Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Use the Scope Parameter on page 956.  Note: <ul style="list-style-type: none"> The value that you enter replaces the <code>Default Scopes</code> value that's defined in the specified authentication provider. Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	To authenticate to the external system and obtain an OAuth token, select this checkbox. This authentication process is called an OAuth flow. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org. Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.

- If you want to use custom headers or bodies in the callouts, enable the relevant options.

Field	Description
Generate Authorization Header	By default, Salesforce generates an authorization header and applies it to each callout that references the named credential. Deselect this option only if one of the following statements applies. <ul style="list-style-type: none"> The remote endpoint doesn't support authorization headers. The authorization headers are provided by other means. For example, in Apex callouts, the developer can have the code construct a custom authorization header for each callout. This option is required if you reference the named credential from an external data source.
Allow Merge Fields in HTTP Header	In each Apex callout, the code specifies how the HTTP header and request body are constructed. For example, the Apex code can set the value of a cookie in an authorization header. These options enable the Apex code to use merge fields to populate the HTTP header and request body with org data when the callout is made.
Allow Merge Fields in HTTP Body	

Field	Description
	These options aren't available if you reference the named credential from an external data source.

To reference a named credential from a callout definition, use the named credential URL. A named credential URL contains the scheme `callout:`, the name of the named credential, and an optional path. For example:

`callout:My_Named_Credential/some_path.`

You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: `callout:My_Named_Credential/some_path?format=json.`

Grant Access to Authentication Settings for Named Credentials

For named credentials that use per-user authentication, grant access to users through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

1. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** or **Profiles**.
2. Click the name of the permission set or profile that you want to modify.
3. Do one of the following.
 - For a permission set, or for a profile in the enhanced profile user interface, click **Named Credential Access** in the Apps section. Then click **Edit**.
 - For a profile in the original profile user interface, click **Edit** in the Enabled Named Credential Access section.
4. Add the named credentials that you want to enable.
5. Click **Save**.

My Domain

Add a subdomain to your Salesforce org URL with the My Domain Salesforce feature. Having a subdomain lets you highlight your brand and makes your org more secure. A subdomain is convenient and allows you to personalize your login page.

Using My Domain, you define a subdomain that's part of your Salesforce domain. For example, `developer` is a subdomain of the `salesforce.com` domain. With a subdomain, you replace the URL that Salesforce assigned you, like `https://na30.salesforce.com`, with your chosen name, like `https://somethingcool.my.salesforce.com`. A subdomain is also referred to as a custom domain. However, a custom domain has a specific meaning for Salesforce Communities.

A subdomain name helps you better manage login and authentication for your org in several key ways. You can:

- Highlight your business identity with your unique domain URL
- Brand your login screen and customize right-frame content
- Block or redirect page requests that don't use the new domain name
- Work in multiple Salesforce orgs at the same time

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions. **Developer** Edition includes 10 Identity Connect permission set licenses.

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance**, **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

- Set custom login policy to determine how users are authenticated
- Let users log in using a social account, like Google and Facebook, from the login page
- Allow users to log in once to access external services

My Domain is required before you can use these Salesforce features:

- Single sign-on (SSO) with external identity providers
- Social sign-on with authentication providers, such as Google and Facebook
- Lightning components in Lightning component tabs, Lightning Pages, the Lightning App Builder, or standalone apps

 [Watch a Demo](#) (5:11 minutes)

My Domain is also available for sandbox environments.

 **Note:** My Domain is subject to additional [Terms of Use](#).

Your domain name uses standard URL format, including:

- Protocol: https://
- Subdomain prefix: your brand or term
- Domain: my.salesforce.com

Your name can include up to 40 letters, numbers, and hyphens. You can't start the subdomain name with root, status, or a hyphen.

You have the chance to try out names and check availability before you commit to your domain name.

Salesforce is enabled as an identity provider when a domain is created. After your domain is deployed, you can add or change identity providers and increase security for your org by customizing your domain's login policy.

 **Important:** After you deploy your domain, it's activated immediately, and requests with the original URL are redirected to your new domain. Only Salesforce Customer Support can disable or change your domain name after it's deployed.

[Set Up a My Domain Name](#)

Implementing your subdomain name with My Domain is quick and easy.

[Define Your Domain Name](#)

Register your org's custom domain name with My Domain. You can try out names and check availability before registering the name.

[Guidelines and Best Practices for Implementing My Domain](#)

These tips smooth the transition to using the subdomain that you created with My Domain.

[Test and Deploy Your New My Domain Subdomain](#)

After you set up your subdomain with My Domain, test it and then roll it out to your users. Testing gives you the chance to explore your subdomain. It also helps you verify URLs for pages before rolling out the subdomain to your users.

[My Domain URL Changes](#)

When you set up a subdomain name for your org with My Domain, all your application URLs, including Visualforce pages, also change. Make sure that you update all application URLs before you deploy a domain name. For example, the `Email Notification URL` field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it. This table shows you the differences.

[Set the My Domain Login Policy](#)

Manage your user logins by customizing the login policy for your domain. By default, users log in from a generic Salesforce login page, bypassing the login page specific to your domain. If you don't set a login policy, users can make page requests without your domain name, such as when using old bookmarks.

[Customize Your Login Page with Your Brand](#)

Customize the look and feel of your login page by adding a background color, logo, and right-side content. Customizing your login page with your company's branding helps users recognize your page.

[Add Identity Providers on a Login Page](#)

Allow users to authenticate using alternate identity provider options right from your login page. If you've enabled single sign-on and configured SAML, or set up external authentication providers as Auth. Providers in Setup, you can provide links to these identity providers on your domain's login page. Users are sent to the identity provider's login screen to authenticate and then redirected back to Salesforce.

[Get System Performance and Maintenance Information with My Domain](#)

You can get information about system performance and availability from `trust.salesforce.com`. Trust reports status information based on your org instance. If you're using My Domain and don't know your org instance, you can look it up.

[My Domain FAQ](#)

Set Up a My Domain Name

Implementing your subdomain name with My Domain is quick and easy.

1. [Find a domain name that's available and sign up for it.](#)
2. [Customize the logo, background color, and right-frame content on your login page.](#)
3. [Add or change the identity providers available on your login page.](#)
4. [Test your domain name and deploy it to your entire org.](#)
5. [Set the login policy for users accessing your pages.](#)

USER PERMISSIONS

To set up a domain name:

- "Customize Application"

Define Your Domain Name

Register your org's custom domain name with My Domain. You can try out names and check availability before registering the name.

Start setting up your My Domain subdomain by finding a domain name unique to your org and registering it. Choose your name carefully. When you register, Salesforce updates its domain name registries with your domain name. After the name is registered, only Salesforce Customer Support can disable or change your domain name.

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Enter the subdomain name you want to use within the sample URL. For example, if a company called Universal Containers uses the subdomain `universalcontainers`, the company's login URL is `https://universalcontainers.my.salesforce.com/`. Your name can include up to 40 letters, numbers, and hyphens.

You can't use these reserved words for subdomains:

- `www`
- `salesforce`
- `heroku`

You can't start the domain name with:

- `root`
- `status`
- a hyphen (-)

3. Click **Check Availability**. If your name is already taken, choose a different one.
4. Click **Register Domain**.
5. You receive an email when your domain name is ready for testing. It can take a few minutes.

The new subdomain is available to your users after you test and deploy it.

To define a domain name:

- "Customize Application"

Guidelines and Best Practices for Implementing My Domain

These tips smooth the transition to using the subdomain that you created with My Domain.

- Communicate the upcoming change to your users before deploying it.
- Deploy your new subdomain when your org receives minimal traffic, like during a weekend, so you can troubleshoot while traffic is low.
- If you've customized your Salesforce UI with features, such as custom buttons or Visualforce pages, make sure that you test your customizations thoroughly before deploying your domain name. Look for broken links due to hard-coded references (instance-based URLs), and use your subdomain URLs instead. For more information, enter "hard-coded references" in *Salesforce Help*. Test them in a sandbox environment first.
- Make sure that you update all application URLs before you deploy a domain name. For example, the `Email Notification URL` field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it.
- If your domain is registered but has not yet been deployed, URLs contain your subdomain name when you log in from the My Domain login page. However, links that originate from merge fields that are embedded in emails sent asynchronously, such as workflow emails, still use the old URLs. *After* your domain is deployed, those links show the new My Domain URLs.
- Help your users get started using your new subdomain by providing links to pages they use frequently, such as your login page. Let your users know if you changed the login policy, and encourage them to update their bookmarks the first time they're redirected.
- Choose the Redirect Policy option **Redirected with a warning to the same page within the domain** to give users time to update their bookmarks with the new subdomain name. After a few days or weeks, change the policy to **Not redirected**. This option requires users to use your subdomain name when viewing your pages. It provides the greatest level of security.
- Only use **Prevent login from `https://login.salesforce.com`** if you're concerned that users who aren't aware of your subdomain try to use it. Otherwise, leave the option available to your users while they get used to the new domain name.
- Bookmarks don't work when the **Redirect to the same page within the domain** option is selected for partner portals. Manually change the existing bookmarks to point to the new domain URL by replacing the Salesforce instance name with your custom domain name. For example, replace `https://na30.salesforce.com/` with `https://yourDomain.my.salesforce.com/` in the bookmark's URL.
- If you block application page requests that don't use the new Salesforce subdomain URLs, let your users know that they must either update old bookmarks or create new ones for the login page. They must also update tabs or links within the app. If you change your login redirect policy to **Not Redirected**, users must use the new subdomain URLs immediately.
- If you are using My Domain, you can identify which users are logging in with the new login URL and when. From Setup, enter `Login History` in the `Quick Find` box, then select **Login History** and view the Username and Login URL columns.
- On the `login.salesforce.com` page, users can click **Log in to a custom domain** to enter your subdomain name and log in. In this case, they must know the subdomain name. As a safeguard, give them a direct link to your subdomain's login page as well.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer, Professional, and Group** Editions.

If You Have the Following

API integrations into your org

Do the Following

Check to see if the API client is directly referencing the server endpoint. The API client should use the `LoginResult.serverURL` value returned by the login request, instead of using a hard-coded server URL.

After your subdomain is deployed, Salesforce returns the server URL containing your domain. Redirect policy settings have no effect on API calls. That is, old calls to instance URLs continue to work.

If You Have the Following	Do the Following
	However, the best practice is to use the value returned by Salesforce.
Email templates	Replace references to the org's instance URL with your subdomain.
Custom Visualforce pages or custom Force.com apps	Replace references to the org's instance URL with your subdomain. See How to find hard-coded references with the Force.com IDE .
Chatter	Tell your users to update any bookmarks in the left navigation of their Chatter groups.
Zones for Communities (Ideas/Answers/Chatter Answers)	Manually update the email notification URL. To update the URL, clear the existing URL so that the field is blank and save the page. Then the system populates the field with your new My Domain URL.

[My Domain URL Changes](#)[Test and Deploy Your New My Domain Subdomain](#)[My Domain](#)

Test and Deploy Your New My Domain Subdomain

After you set up your subdomain with My Domain, test it and then roll it out to your users. Testing gives you the chance to explore your subdomain. It also helps you verify URLs for pages before rolling out the subdomain to your users.

! **Important:** After you deploy your domain, it's activated immediately, and requests with the original URL are redirected to your new domain. Only Salesforce Customer Support can disable or change your domain name after it's deployed.

1. Test your domain login. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**. Or, log out of your DE org and log in to Salesforce using your new subdomain name. Or, click the login link in the activation email you received.

You can customize your domain login page and add authentication services (like social sign-on) before you deploy the domain to your users. You can also test the domain in a sandbox environment.

2. Test the new domain name by clicking tabs and links. All pages now show your new domain name.

If you've customized your Salesforce UI with features, such as custom buttons or Visualforce pages, make sure that you test your customizations thoroughly before deploying your domain name. Look for broken links due to hard-coded references (instance-based URLs), and use your subdomain URLs instead. For more information, enter "hard-coded references" in *Salesforce Help*.

3. To roll out the new domain name to your org, from Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**. Then click **Deploy to Users** and **OK**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer, Professional, and Group** Editions.

USER PERMISSIONS

To set up a domain name:

- "Customize Application"

When you deploy your domain, it's activated immediately, and all users are redirected to pages with new domain addresses. You can now set login policies in the Domain Settings section that appears after you deploy your domain. For example, you can prevent users from logging in from login.salesforce.com.

SEE ALSO:

- [Set Up a My Domain Name](#)
- [Guidelines and Best Practices for Implementing My Domain](#)
- [Customize Your Login Page with Your Brand](#)
- [Add Identity Providers on a Login Page](#)
- [Set the My Domain Login Policy](#)

My Domain URL Changes

When you set up a subdomain name for your org with My Domain, all your application URLs, including Visualforce pages, also change. Make sure that you update all application URLs before you deploy a domain name. For example, the `Email Notification` URL field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it. This table shows you the differences.

URL Type	Old URL	New URL
Login	https://login.salesforce.com	https://<subdomain>.my.salesforce.com
Application page or tab	https://<instance>.salesforce.com/<pageID>	https://<subdomain>.my.salesforce.com/<pageID>
Visualforce page with no namespace	https://<instance>.visual.force.com/apex/<pagename>	https://<subdomain>--c.<instance>.visual.force.com/apex/<pagename>
Visualforce page <i>with</i> namespace	https://<yournamespace101>.<instance>.visual.force.com/apex/<pagename>	https://<subdomain>--<yournamespace>.<instance>.visual.force.com/apex/

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer, Professional,** and **Group** Editions.

Note: If you implement My Domain in a sandbox environment, the URL format is `https://<subdomain>--<sandboxname>.<instance>.my.salesforce.com`. Because you can't have namespaces in a sandbox environment, the format of all Visualforce page URLs in a sandbox is `https://<subdomain>--<sandboxname>--c.<instance>.visual.force.com/apex/<pagename>`.

SEE ALSO:

Set the My Domain Login Policy

Manage your user logins by customizing the login policy for your domain. By default, users log in from a generic Salesforce login page, bypassing the login page specific to your domain. If you don't set a login policy, users can make page requests without your domain name, such as when using old bookmarks.

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Under My Domain Settings, click **Edit**.
3. To disable authentication for users who don't use your domain-specific login page, set a login policy. Selecting the login policy prevents users from logging in on the generic `https://<instance>.salesforce.com/` login page and then being redirected to your pages after login.
4. Choose a redirect policy.
 - a. To allow users to continue using URLs that don't include your domain name, select **Redirect to the same page within the domain**.
 -  **Note:** Bookmarks don't work when the **Redirect to the same page within the domain** option is selected for partner portals. Manually change the existing bookmarks to point to the new domain URL by replacing the Salesforce instance name with your custom domain name. For example, replace `https://na30.salesforce.com/` with `https://yourDomain.my.salesforce.com/` in the bookmark's URL.
 - b. To remind users to use your domain name, select **Redirected with a warning to the same page within the domain**. After reading the warning, users are redirected to the page. Select this option for a few days or weeks to help users transition to a new domain name.
 - c. To require users to use your domain name when viewing your pages, select **Not redirected**.
5. Click **Save**.

[Guidelines and Best Practices for Implementing My Domain](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer, Professional,** and **Group** Editions.

USER PERMISSIONS

To set login policy for a domain:

- "Customize Application"

Customize Your Login Page with Your Brand

Customize the look and feel of your login page by adding a background color, logo, and right-side content. Customizing your login page with your company's branding helps users recognize your page.

🕒 [Setting Up a My Domain \(Salesforce Classic\)](#) (5:10 minutes. Login page branding starts at 2:43.)

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Under Authentication Configuration, click **Edit**.
3. To customize your logo, upload an image.
Images can be .jpg, .gif, or .png files up to 100 KB. Maximum image size is 250px by 125px.
4. To customize your login page background, click the  or enter a valid hexadecimal color code.
5. To support advanced authentication methods for iOS users, select **Use the native browser for user authentication on iOS**.

This iOS user authentication option is for users of Salesforce1 and Mobile SDK applications on iOS devices. It enables support of authentication methods, such as Kerberos, Windows NT LAN Manager (NTLM), or certificate-based authentication. When you select this option, users on iOS devices are redirected to their native browser when using single sign-on authentication into your custom domain. For other operating systems, Salesforce1 and applications using Mobile SDK version 3.1 or later can support certificate-based authentication when the applications are integrated with Mobile Device Management (MDM) software.

6. Enter the URL of the file to be included in the right-side iFrame on the login page.
The content in the right-side iFrame can resize to fill about 50% of the page. Your content must be hosted at a URL that uses SSL encryption and the https:// prefix. To build your own custom right-side iFrame content page using responsive web design, use the [My Domain Sample](#) template.
Example: <https://c.salesforce.com/login-messages/promos.html>
7. Optionally, select authentication services as identity providers on the login page, such as social sign-on providers like Google and Facebook. Users can then log in with their social account credentials. Configure authentication services as Auth. Providers in Setup.
8. Click **Save**.

Get System Performance and Maintenance Information with My Domain

You can get information about system performance and availability from `trust.salesforce.com`. Trust reports status information based on your org instance. If you're using My Domain and don't know your org instance, you can look it up.

Here's how to get status information using your domain name.

1. Go to trust.salesforce.com.
2. Under System Status, click **Learn More**.
3. Under status.salesforce.com, click **Status**.
The Status & Maintenance page shows the status for each org instance.
4. At the top right of the page, click **My Domain**.
5. Enter your domain name in the search bar to get your org instance.
Don't enter the complete URL. For example, use *yourDomain*, not `https://yourDomain.my.salesforce.com/`.
6. Under Status & Maintenance, select **All**, and look for your instance.

My Domain FAQ

What is My Domain?

Using My Domain, Salesforce admins can define a subdomain within their Salesforce org. The subdomain name appears in all org URLs and replaces the instance name (such as na30). For example, you can brand your URL by naming the subdomain your company name, `https://myCompanyName.my.salesforce.com/`. My Domain is not the same as the custom domain for sites, communities, or portals. The domains are defined separately.

Which Salesforce Editions is My Domain available in?

What are the advantages of My Domain?

Create a subdomain with My Domain to enable users to single sign-on into your org. You can also customize your login page and use Salesforce as an identity provider.

Does My Domain work differently in different Salesforce Editions?

Does My Domain work in sandboxes?

What are the differences between the redirect policy options?

How does My Domain work with single sign-on?

Is My Domain available for the API?

Is the subdomain for My Domain related to the subdomain for Sites or Communities?

How long can the subdomain name be?

After we set up My Domain, will we still be able to log in from `https://login.salesforce.com`?

Will we still be able to log in from a URL that includes a Salesforce instance, like `https://yourInstance.salesforce.com/?`

Can we still use our old Salesforce bookmarks?

Will our Visualforce and content (files) page URLs change?

Can I change or remove my subdomain name?

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer, and Database.com** Editions. Some topics don't apply to **Database.com**.

What is My Domain?

Using My Domain, Salesforce admins can define a subdomain within their Salesforce org. The subdomain name appears in all org URLs and replaces the instance name (such as na30). For example, you can brand your URL by naming the subdomain your company name, `https://myCompanyName.my.salesforce.com/`. My Domain is not the same as the custom domain for sites, communities, or portals. The domains are defined separately.

Which Salesforce Editions is My Domain available in?

Performance, Unlimited, Enterprise, Developer, Professional, and Group editions.

What are the advantages of My Domain?

Create a subdomain with My Domain to enable users to single sign-on into your org. You can also customize your login page and use Salesforce as an identity provider.

My Domain allows you to:

- Customize the login page with your own branding.
- Use Identity features for single sign-on. My Domain is required to:

- Enable users to single sign-on into a Salesforce org
- Use a Salesforce org as an identity provider for single sign-on into third-party applications or other Salesforce orgs
- Preserve deep links (such as `https://yourDomain.my.salesforce.com/001/o`) through any future org splits and migrations.

Does My Domain work differently in different Salesforce Editions?

My Domain works the same in most Salesforce editions except for Developer Edition URLs. Developer Edition URLs end with “-de-ed.my.salesforce.com”, for example, `https://yourDomain.de-ed.my.salesforce.com`. URLs in other editions end with “.my.salesforce.com”, for example, `https://yourDomain.my.salesforce.com`.

Does My Domain work in sandboxes?

Sandboxes and production orgs are different environments and maintain separate domain name registries. So you can use the same My Domain name in sandbox. In fact, during a sandbox refresh, the My Domain name of the production org is copied into sandbox.

For example, if the production org name is `acme.my.salesforce.com`, the sandbox name is `acme--<sandboxName>.csN.my.salesforce.com`.

Test your subdomain in sandbox before deploying it. Look for hard-coded references to instance URLs in Visualforce pages, email templates, and other content.

What are the differences between the redirect policy options?

After you deploy your subdomain with My Domain, you can select a redirect option for users trying to access a page in your org without using your subdomain name.

To see the assigned policy, from Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.

If **Redirected to the same page within the domain** is selected, users are immediately sent to the new URL, without notification.

If **Redirected with a warning to the same page within the domain** is selected, users briefly see a warning message before being redirected to the new URL. The warning gives users a chance to change their bookmarks and get used to using the new subdomain URL. You can't customize the message.

If **Not redirected** is selected, the user gets a “page not found” error. Eventually, you want your users to use only subdomain URLs, but it's a best practice to use **Redirected with a warning to the same page within the domain** for a short time after you deploy your subdomain so that users can get used to the new URLs.

How does My Domain work with single sign-on?

My Domain is required for setting up single sign-on. For inbound single sign-on requests, the subdomain enables deep linking directly to pages in the org. No changes are required for the identity provider. The Salesforce SAML endpoint (`login.salesforce.com`) continues to work for SAML and OAUTH requests, even if your org deploys My Domain and selects **Prevent login from `https://login.salesforce.com`** in the My Domain Settings.

-  **Note:** If you're using external Chatter groups along with single sign-on for employees, users outside your company are redirected to a SAML identity provider that they can't access. To get single sign-on to work, migrate external Chatter groups to communities. Or, from the My Domain settings, do *not* select **Prevent login from `https://login.salesforce.com`**. Doing so allows users to continue to log in through `login.salesforce.com`.

Is My Domain available for the API?

Yes, you can use the Salesforce APIs with your My Domain subdomain.

Is the subdomain for My Domain related to the subdomain for Sites or Communities?

No. The subdomain names you use for Sites and My Domain can be the same or different. We like to refer to Sites and Salesforce Communities as custom domains and My Domain as subdomains.

How long can the subdomain name be?

Your subdomain name can be up to 40 characters. The protocol (`https://`) and the domain (`my.salesforce.com`) are not included in the limit.

After we set up My Domain, will we still be able to log in from `https://login.salesforce.com`?

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Will we still be able to log in from a URL that includes a Salesforce instance, like `https://yourInstance.salesforce.com/?`

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Can we still use our old Salesforce bookmarks?

Yes, if your system administrator allows it. If so, you'll be redirected to the Salesforce page using its new My Domain URL. If your system administrator prevents using old bookmarks, or you see a warning, you should update your bookmarks using the new domain name.

Will our Visualforce and content (files) page URLs change?

URLs for your Visualforce pages contain your new domain name, such as `https://<mydomain>--c.<instance>.visual.force.com`.

URLs for your content (files) also contain your new domain name, such as `https://<mydomain>--c.<instance>.content.force.com`.

Can I change or remove my subdomain name?

You can't change the subdomain name that you create with My Domain. And after your subdomain is deployed, you can't reverse deployment. If you need to change your subdomain name, contact Salesforce Customer Support.

App Launcher

The App Launcher is how users switch between apps. Users are presented with tiles that link to their connected apps, Salesforce apps, and on-premise applications. Salesforce admins can set the default app order for an org and determine which apps are available to which users. They can make the App Launcher the default landing page when users first open Salesforce.

All Lightning Experience users get the App Launcher. Salesforce Classic users need the “Use Identity Features” permission and the App Launcher option in their profile set to **Visible**. Users see only the apps that they are authorized to see according to their profile or permission sets.

In Salesforce Classic, Salesforce admins using the System Administrator profile have access to the App Launcher. Admins using profiles cloned from the System Administrator profile don't.

[Enable the App Launcher with a Profile in Salesforce Classic](#)

Create a profile and assign it to users, so they can access the App Launcher.

[Enable the App Launcher with a Permission Set in Salesforce Classic](#)

Create a permission set and assign it to users, so they can access the App Launcher.

Enable the App Launcher with a Profile in Salesforce Classic

Create a profile and assign it to users, so they can access the App Launcher.

 **Note:** These steps work in Salesforce Classic. If you see the App Launcher icon (☰) on the left side of the navigation bar at the top of your screen, you're in Lightning Experience. If not, you're in Salesforce Classic.

In Salesforce Classic, Salesforce admins using the System Administrator profile have access to the App Launcher. Admins using profiles cloned from the System Administrator profile don't.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click **New Profile**.
3. Select an Existing Profile as a basis for the new profile.
For example, select **Standard User**.
4. Enter the name of the new profile.
For example, *Standard User Identity*.
5. Click **Save**.
6. In the detail page for the new profile, click **Edit**.
7. In Custom App Settings, set the App Launcher to **Visible**, if it isn't already.
Under Tab Settings, verify that the App Launcher tab is set to **Default On**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

8. Under Administrative Permissions, select **Use Identity Features**.
9. Click **Save**.
10. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
11. Click **Edit** next to each user you want to access the App Launcher.
12. In the user's Profile field, select the new profile that has "Use Identity Features" enabled.
For example, you might use the *Standard User Identity* profile.

13. Click **Save**.

When you log in as the selected user, the App Launcher appears in the drop-down app menu.

Enable the App Launcher with a Permission Set in Salesforce Classic

Create a permission set and assign it to users, so they can access the App Launcher.

 **Note:** These steps work in Salesforce Classic. If you see the App Launcher icon (⋮) on the left side of the navigation bar at the top of your screen, you're in Lightning Experience. If not, you're in Salesforce Classic.

1. From Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
2. Click **New**.
3. Enter a Label for the new permission set.
For example, *Identity Features*.
4. Optionally, restrict the use of this permission set to a specific User License.
5. Click **Save**.
6. Click **System Permissions**.
7. Click **Edit**.
8. Select **Use Identity Features**.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

9. Click **Save**.
10. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
11. Click the name of an existing user to whom you want to give access to the App Launcher.
12. In the **Permission Set Assignments** related list, click **Edit Assignments**.
13. Add the new permission set you created for identity features to Enabled Permission Sets.
14. Click **Save**.

When you log in as the selected user, the App Launcher appears in the drop-down app menu.

 **Note:** Still not seeing the App Launcher? In the profile associated with the user, select **Visible** for the App Launcher setting.

[App Launcher](#)

Configure File Upload and Download Security Settings

To provide more security, control the way some file types are handled during upload and download.

To manage file upload and download settings:

1. From Setup, enter *File Upload and Download Security* in the **Quick Find** box, then select **File Upload and Download Security**.
2. Click **Edit**.
3. To prevent users from uploading files that can pose a security risk, select **Don't allow HTML uploads as attachments or document records**.
This setting blocks the upload of these MIME file types: `.html`, `.htt`, `.mht`, `.svg`, `.swf`, `.thtml`, and `.xhtml`.

 **Warning:** Keep the following in mind when selecting this option:

- If your organization uses the partner portal to give your partner users access to Salesforce, we don't recommend enabling this setting. Enabling this setting prevents your organization from customizing the appearance of your partner portal.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To configure file upload and download settings:

- "Customize Application"

- HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.
 - After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.
4. Set download behavior for each file type:
 - a. **Download** (recommended): The file, regardless of file type, is always downloaded.
 - b. **Execute in Browser**: The file, regardless of file type, is displayed and executed automatically when accessed in a browser or through an HTTP request.
 - c. **Hybrid**: Salesforce Files are downloaded. Attachments and documents execute in the browser.
 5. Click **Save**.

Certificates and Keys

Salesforce certificates and key pairs are used for signatures that verify a request is coming from your organization. They are used for authenticated SSL communications with an external web site, or when using your organization as an Identity Provider. You only need to generate a Salesforce certificate and key pair if you're working with an external website that wants verification that a request is coming from a Salesforce organization.

You can export all your certificates and private keys into a keystore for storage or import certificates and keys from a keystore. This allows you to move keys from one organization to another. The exported file is in the Java Keystore (JKS) format, and the imported file must also be in the JKS format. For more information about the JKS format, see [Oracle's Java KeyStore documentation](#).

API Client Certificate

The API client certificate is used by workflow outbound messages, the AJAX proxy, and delegated authentication HTTPS callouts. For security reasons, the API client certificate should be known only to your org.

Choose an API client certificate based on the remote endpoint you connect to. Some endpoint servers require a certificate chain that is trusted by a certificate authority; others are fine with directly trusting a self-signed certificate.

[Generate a Self-Signed Certificate](#)

Generate a certificate signed by Salesforce to show that communications purporting to come from your organization are really coming from there.

[Generate a Certificate Signed by a Certificate Authority](#)

A certificate authority-signed (CA-signed) certificate can be a more authoritative way to prove that your org's data communications are genuine. You can generate this type of certificate and upload it to Salesforce.

[Set Up a Mutual Authentication Certificate](#)

To prevent security from being compromised by simple impersonation, you can require clients and servers to prove their identity to each other with a mutual authentication certificate.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

[Configure Your API Client to Use Mutual Authentication](#)

Enforce SSL/TLS mutual authentication.

[Manage Master Encryption Keys](#)

Encrypted custom fields, such as `Social Security Number` or `Credit Card Number`, are encrypted with a master encryption key. This key is automatically assigned when you select fields to encrypt. You manage your own master key according to your organization's security and regulatory needs.

Generate a Self-Signed Certificate

Generate a certificate signed by Salesforce to show that communications purporting to come from your organization are really coming from there.

1. From Setup, search for *Certificate and Key Management* in the Quick Find box.

2. Select **Create Self-Signed Certificate**.

3. Enter a descriptive label for the Salesforce certificate.

This name is used primarily by administrators when viewing certificates.

4. Enter a unique name. You can use the name that's automatically populated based on the certificate label you enter.

This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the unique name when referring to the certificate using the Force.com web services API or Apex.

5. Select a key size for your generated certificate and keys.

Certificates with 2048-bit keys last one year and are faster than certificates with 4096-bit keys. Certificates with 4096-bit keys last two years.

 **Note:** After you save a Salesforce certificate, you can't change its type or key size.

6. Click **Save**.

Downloaded self-signed certificates have `.cert` extensions.

After you successfully save a Salesforce certificate, the certificate and corresponding keys are automatically generated.

You can have a maximum of 50 certificates.

SEE ALSO:

[Certificates and Keys](#)

[Generate a Certificate Signed by a Certificate Authority](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

Generate a Certificate Signed by a Certificate Authority

A certificate authority-signed (CA-signed) certificate can be a more authoritative way to prove that your org's data communications are genuine. You can generate this type of certificate and upload it to Salesforce.

1. From Setup, enter *Certificate and Key Management* in the **Quick Find** box, then select **Certificate and Key Management**.

2. Select **Create CA-Signed Certificate**.

3. Enter a descriptive label for the Salesforce certificate.

This name is used primarily by administrators when viewing certificates.

4. Enter a unique name. You can accept the name that's populated based on the certificate label you enter.

This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the unique name when referring to the certificate using the Force.com web services API or Apex.

5. Select a key size for your certificate and keys.

We recommend that you use the default key size of 2048 for security reasons. Selecting **2048** generates a certificate using 2048-bit keys. Selecting **4096** generates a certificate using 4096-bit keys.

Note: After you save a Salesforce certificate, you can't change its type or key size.

6. Enter the following information.

These fields are combined to generate a unique certificate.

Field	Description
Common Name	The fully qualified domain name of the company requesting the signed certificate, generally of the form <code>http://www.mycompany.com</code> .
Email Address	The email address associated with this certificate.
Company	Either the legal name of your company or your legal name.
Department	The branch of your company using the certificate, such as marketing or accounting.
City	The city where the company resides.
State	The state where the company resides.
Country Code	A two-letter code indicating the country where the company resides. For the United States, the value is <i>US</i> .

7. Click **Save**.

After you save a Salesforce certificate, the certificate and corresponding keys are automatically generated.

8. Find your new certificate from the certificates list, then click **Download Certificate Signing Request**.

Downloaded certificate signing requests have `.csr` extensions.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

9. Send the certificate request to the certificate authority of your choice.
10. After the certificate authority sends back the signed certificate, go back to *Certificate and Key Management*, click the name of the certificate, then click **Upload Signed Certificate**.
The CA-signed certificate must match the certificate created in Salesforce. If you try to upload a different CA-signed certificate, the upload fails.
11. To complete the upload process, click **Save**.

After you upload the CA-signed certificate, the status of the certificate is changed to Active and you can use it.

 **Tip:** If you need to edit a certificate that you've uploaded, upload it again; Published site domains are republished if they have at least one Force.com site or community. The expiration date of the certificate record is updated to the expiration date of the newly uploaded certificate.

You can have up to 50 certificates.

Set Up a Mutual Authentication Certificate

To prevent security from being compromised by simple impersonation, you can require clients and servers to prove their identity to each other with a mutual authentication certificate.

1. On the Certificate and Key Management page, click **Upload Mutual Authentication Certificate**.

 **Note:** If you don't see this option on the Certificate and Key Management page, contact Salesforce to enable the feature.

2. Give your certificate a label and name and click **Choose File** to locate the certificate.
3. Click **Save** to finish the upload process.
4. Enable the "Enforce SSL/TLS Mutual Authentication" user permission for an "API Only" user.
This "API Only" user configures the API client to connect on port 8443 to present the signed client certificate.

If you are using a certificate chain, the client certificate must include any intermediate certificates in the chain when contacting port 8443.

A certificate chain is a hierarchical order of certificates where one certificate issues and signs another certificate lower in the hierarchy. Upload a certificate chain as a single PEM-encoded CA-signed certificate representing the concatenated chain of certificates. The uploaded certificate chain must include the intermediate certificates in the following order.

- Start with the server or client certificate and then add its signing certificate.
- If more than one intermediate certificate exists between the server or client certificate and the root, add each certificate as the one that signed the previous certificate.
- The root certificate is optional, and generally should not be included.

[Configure Your API Client to Use Mutual Authentication](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Personal, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

Configure Your API Client to Use Mutual Authentication

Enforce SSL/TLS mutual authentication.

1. After you've set up mutual authentication, log in to the Salesforce service using port 8443. Include your credentials and your signed certificate information. For example, your configuration using `cURL` may look something like this, where `@login.txt` contains the login Soap message with your credentials and `fullcert.pem:xxxxxx` is your certificate information:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Personal, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

To Enforce mutual authentication on port 8443 for standard SSL/TLS connections:

(Assign to users with the "Api Only" User permission.)

- "Enforce SSL/TLS Mutual Authentication"

To access Salesforce only through a Salesforce API:

- "Api Only User"

```
curl -k https://login.salesforce.com:8443/services/Soap/u/31.0 -H "Content-Type: text/xml; charset=UTF-8" -H "SOAPAction: login" -d @login.txt -v -E fullcert.pem:xxxxxx
```

2. Once a session ID is returned from your call, you can perform other actions, such as queries. For example:

```
curl -k https://yourInstance.salesforce.com:8443/services/Soap/u/31.0 -H "Content-Type: text/xml; charset=UTF-8" -H "SOAPAction: example" -d @accountQuery.xml -v -E fullcert.pem:xxxxxx
```

where `@accountQuery.xml` is the file name containing the query Soap message with session ID from the login response.

[Certificates and Keys](#)

[Set Up a Mutual Authentication Certificate](#)

Manage Master Encryption Keys

Encrypted custom fields, such as `social_security_number` or `credit_card_number`, are encrypted with a master encryption key. This key is automatically assigned when you select fields to encrypt. You manage your own master key according to your organization's security and regulatory needs.

With master encryption keys, you can:

- Archive the existing key and create a new key.
- Export an existing key after it's been archived.
- Delete an existing key.
- Import an existing key after it's been deleted.

Archiving and Creating New Keys

To archive your current key and create a new key, click **Archive Current Key and Create New Key** on the *Certificate and Key Management* Setup page. A new key is generated, assigned the next sequential number, and activated. All new data is encrypted using the new key.

Existing data continues to use the archived key until the data is modified and saved. Then data is encrypted using the new key.

After you archive a key, you can export or delete it.

Exporting Keys

You can export your keys to a back-up location for safe keeping. It's a good idea to export a copy of any key before deleting it.

Exporting creates a text file with the encrypted key, so you can import the key back into your organization later.

Deleting Keys

Don't delete a key unless you're absolutely certain no data is currently encrypted using the key. After you delete a key, any data encrypted with that key can no longer be accessed.

-  **Important:** Export and delete keys with care. If your key is destroyed, you must reimport it to access your data. You are solely responsible for making sure your data and keys are backed up and stored in a safe place. Salesforce cannot help you with deleted, destroyed or misplaced keys.

Importing Keys

If you have data associated with a deleted key, you can import an exported key back into your organization. Any data that was not accessible becomes accessible again.

Click **Import** next to the key you want to import.

-  **Note:** This page is about Classic Encryption, not Shield Platform Encryption. [What's the difference?](#) on page 807

Monitor Your Organization

Salesforce provides a variety of ways to keep tabs on activity in your Salesforce organization so you can make sure you're moving in the right direction.

[The System Overview Page](#)

The system overview page shows usage data and limits for your organization, and displays messages when you reach 95% of your limit (75% of portal roles).

[Monitor Data and Storage Resources](#)

View your Salesforce org's storage limits and usage from the Storage Usage page in Setup.

[Monitor Login History](#)

Admins can monitor all login attempts for their org and enabled portals or communities. The login history page displays the most recent 20,000 attempts. To see more records, download the information to a CSV or GZIP file.

[Identity Verification History](#)

As an admin, use Identity Verification History to monitor and audit up to 20,000 records of your org users' identity verification attempts from the past six months. For example, suppose that two-factor authentication is enabled when a user logs in. When the user successfully provides a time-based, one-time password as proof of identity, that information is recorded in Identity Verification History.

[Monitor Login Activity with Login Forensics](#)

Login forensics helps administrators better determine which user behavior is legitimate to prevent identity fraud in Salesforce.

[Monitor Training History](#)

As an administrator, you want to know that your team is learning how to use Salesforce effectively. The Training Class History shows you all of the Salesforce training classes your users have taken.

[Monitor Setup Changes](#)

Setup Audit Trail tracks the recent setup changes that you and other admins have made to your org. Audit history is especially useful in orgs with multiple admins.

[Field History Tracking](#)

You can select certain fields to track and display the field history in the History related list of an object. The field history data is retained for up to 18 months.

[Monitor Debug Logs](#)

Set trace flags to trigger logging for users, Apex classes, and Apex triggers in the Developer Console or in Setup. Monitor the resulting logs to diagnose problems in your org.

[Monitoring Scheduled Jobs](#)

The All Scheduled Jobs page lists all reporting snapshots, scheduled Apex jobs, and dashboards scheduled to refresh.

[Monitoring Background Jobs](#)

You can monitor background jobs in your organization, such as when parallel sharing recalculation is running.

The System Overview Page

The system overview page shows usage data and limits for your organization, and displays messages when you reach 95% of your limit (75% of portal roles).

-  **Note:** The system overview page shows only the items enabled for your organization. For example, your system overview page shows workflow rules only if workflow is enabled for your organization.

Click the numbers under each metric to get more details about your usage. If it's available, use Checkout to increase usage limits for your organization. For example, if your organization reaches the limit for custom objects, the system overview page notifies you with a message link. Click the link to clean up any unused objects, or visit Checkout to increase your limit for objects.

To access the system overview page, from Setup, enter *System Overview* in the Quick Find box, then select **System Overview**.

The system overview page displays usage for:

- [Schema](#)
- [API usage](#)
- [Business logic](#)
- [User interface](#)
- [Most used licenses](#)
- [Portal roles](#)

-  **Note:** The object limit percentages are truncated, not rounded. For example, if your org uses 95.55% of the limit for a particular customization, the object limit displays 95%.

[System Overview: Schema](#)

[System Overview: API Usage](#)

[System Overview: Business Logic](#)

[System Overview: User Interface](#)

[System Overview: Most Used Licenses](#)

[System Overview: Portal Roles](#)

System Overview: Schema

The Schema box in the system overview page shows usage information for:

- Custom objects
 -  **Note:** Soft-deleted custom objects and their data count against your limits. We recommend that you hard delete or erase custom objects you no longer need.
- Data storage

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except **Personal** Edition

System Overview: API Usage

The API Usage box in the system overview page shows usage information for API requests in the last 24 hours.

Limits are enforced against the aggregate of all API calls made by the org in a 24 hour period. Limits are not on a per-user basis. When an org exceeds a limit, all users in the org can be temporarily blocked from making additional calls. Calls are blocked until usage for the preceding 24 hours drops below the limit.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

System Overview: Business Logic

The Business Logic box in the system overview page shows usage information for:

- Rules
- Apex triggers
- Apex classes
- Code used: Total number of characters in your Apex triggers and Apex classes (excluding comments, test methods, and @isTest annotated classes).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

System Overview: User Interface

The User Interface box in the system overview page shows usage information for:

- Custom apps
- Site.com sites: We only count published Site.com sites.
- Active Force.com sites
- Flows: We only count active flows.
- Custom tabs
- Visualforce pages

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except **Personal** Database.com

System Overview: Most Used Licenses

The Most Used Licenses box in the system overview page counts only active licenses, and by default shows the top three used licenses for your organization. Any license that reaches 95% usage also appears. Click **Show All** to view all the licenses for your organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except **Personal** Edition

System Overview: Portal Roles

The Portal Roles box in the system overview page shows the usage data and limit for total partner portal, Customer Portal, and Communities roles. The system overview page displays a message when your organization reaches 75% of its allotted portal roles.

-  **Note:** The maximum number of roles used in an org's portals or communities is 5000. This limit includes roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles. You can also delete unused roles. If you require more roles, please contact Salesforce Customer Support.

Monitor Data and Storage Resources

View your Salesforce org's storage limits and usage from the Storage Usage page in Setup.

Items That Require Storage

Storage is divided into two categories. File storage includes files in attachments, Files home, Salesforce CRM Content, Chatter files (including user photos), the Documents tab, the custom File field on Knowledge articles, and Site.com assets. Data storage includes the following:

- Accounts
- Article types (format: "[Article Type Name]")
- Article type translations (format: "[Article Type Name] Version")
- Campaigns
- Campaign Members
- Cases
- Case Teams
- Contacts
- Contracts
- Custom objects
- Email messages
- Events
- Forecast items
- Google docs
- Ideas
- Leads
- Notes
- Opportunities
- Opportunity Splits
- Orders
- Quotes
- Quote Template Rich Text Data
- Solutions

Storage Capacity

Data Storage

For data storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated the greater of 1 GB or a per-user limit. For example, a Professional Edition org with 10 users receives 1 GB, because 10 users multiplied by 20 MB per user is 200 MB, which is less than the 1 GB minimum. A Professional Edition org with 100 users receives more than the 1 GB minimum, because 100 users multiplied by 20 MB per user is 2,000 MB.

File Storage

Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated 10 GB of file storage per org.

Orgs are allocated more file storage based on the number of standard user licenses. In Enterprise, Performance, and Unlimited Editions, orgs are allocated 2 GB of file storage per user license. Contact Manager, Group, Professional Edition orgs are allocated 612 MB per standard user license, which includes 100 MB per user license plus 512 MB per license for the Salesforce CRM Content feature license.

 **Note:** Each Salesforce CRM Content feature license provides an extra 512 MB of file storage, whether Salesforce CRM Content is enabled or not.

The values in the File Storage Allocation Per User License column apply to Salesforce and Salesforce Platform user licenses.

Salesforce Edition	Data Storage Minimum per Org	Data Storage Allocation per User License	File Storage Allocation per Org	File Storage Allocation per User License
Contact Manager				
Group		20 MB		612 MB
Professional	1 GB		10 GB	
Enterprise				
Performance		120 MB		2 GB
Unlimited				
Developer	5 MB			
Personal	20 MB (approximately 10,000 records)	N/A	20 MB	N/A

If your org uses custom user licenses, contact Salesforce to determine if these licenses provide more storage. For a description of user licenses, see [User Licenses](#).

Viewing Storage Usage

To view your org's current storage usage from Setup, enter *Storage Usage* in the **Quick Find** box, then select **Storage Usage**. You can view the available space for data storage and file storage, the amount of storage in use per record type, the top users according to storage utilization, and the largest files in order of size. To view what types of data a particular user is storing, click that user's name.

In all Editions except Personal Edition, administrators can view storage usage on a user-by-user basis.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click the name of any user.
3. Click **View** next to the **Used Data Space** or **Used File Space** fields to view that user's storage usage by record type.

Data storage and file storage are calculated asynchronously and your org's storage usage isn't updated immediately. Keep this in mind if importing or adding many records or files.

Individual users can view their own storage usage in their personal information.

Increasing Storage

When you need more storage, increase your storage limit or reduce your storage usage.

- Purchase more storage space, or add user licenses in Professional, Enterprise, Unlimited, and Performance Editions.
- Delete outdated leads or contacts.
- Remove any unnecessary attachments.
- Delete files in Salesforce CRM Content.

Storage Considerations

When planning your storage needs, keep in mind:

- Person accounts count against both account and contact storage because each person account consists of one account as well as one contact.
- Archived activities count against storage.
- Active or archived products, price books, price book entries, and assets don't count against storage.

Monitor Login History

Admins can monitor all login attempts for their org and enabled portals or communities. The login history page displays the most recent 20,000 attempts. To see more records, download the information to a CSV or GZIP file.

Download Login History

You can download the past six months or the first 20,000 attempts of user logins to your Salesforce org to a CSV or GZIP file.

1. From Setup, enter *Login History* in the **Quick Find** box, then select **Login History**.
2. Select the file format to download.
 - **Excel csv file**—Download a CSV file of all user logins for the past six months or the first 20,000 user login attempts. This report includes logins through the API.
 - **gzipped Excel csv file**—Download a CSV file of all user logins for the past six months or the first 20,000 user login attempts. This report includes logins through the API. Because the file is compressed, it's the preferred option for quickest download time.
3. Select the file contents. The All Logins option includes API access logins.
4. Click **Download Now**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

USER PERMISSIONS

To monitor logins:

- "Manage Users"

 **Note:** Older versions of Microsoft Excel can't open files with more than 65,536 rows. If you can't open a large file in Excel, see the [Microsoft Help and Support article about handling large files](#).

Create List Views

You can create list views sorted by login time and login URL. For example, you can create a view of all logins between a particular time range. Like the default view, a custom view displays the most recent 20,000 logins.

1. On the Login History page, click **Create New View**.
2. Enter the name to appear in the View dropdown list.
3. Specify the filter criteria.
4. Select the fields to display.

You can choose up to 15 fields. You can display only the fields that are available in your page layout. Text area fields display up to 255 characters.

 **Note:** Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary.

View Your Login History

You can view your personal login history.

1. From your personal settings, enter *Login History* in the *Quick Find* box, then select **Login History**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**.
2. To download a CSV file of your login history for the past six months or your past 20,000 attempts, click **Download**.

 **Note:** For security purposes, Salesforce can require users to pass a CAPTCHA user verification test to export data from their org. This simple text-entry test prevents malicious programs from accessing your org's data. To pass the test, users must correctly type the two words displayed in the overlay's text box. The words entered in the text box must be separated by a space.

Single Sign-On with SAML

If your organization uses SAML single sign-on identity provider certificates, single sign-on logins appear in the history.

My Domain

If you are using My Domain, you can identify which users are logging in with the new login URL and when. From Setup, enter *Login History* in the *Quick Find* box, then select **Login History** and view the Username and Login URL columns.

License Manager Users

The login history page sometimes includes internal users with names in the format *033*****2@00d2*****db*. These users are associated with the License Management App (LMA), which manages the number of licenses used by a subscriber org. These internal users can appear in the License Management org (LMO) and in subscriber orgs in which an AppExchange package managed by the LMA is installed.

SEE ALSO:

[Identity Verification History](#)

Identity Verification History

As an admin, use Identity Verification History to monitor and audit up to 20,000 records of your org users' identity verification attempts from the past six months. For example, suppose that two-factor authentication is enabled when a user logs in. When the user successfully provides a time-based, one-time password as proof of identity, that information is recorded in Identity Verification History.

To access Identity Verification History, from Setup, enter *Verification History* in the **Quick Find** box, then select **Identity Verification History**. To view more information, such as the user's approximate geographic location at the time of verification, create a custom view and add the columns you want.

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Identity Verification Fields

The following fields are displayed by default.

Field	Description
Time	The time of the identity verification attempt. The time zone is based on GMT.
Verification Attempt	ID of the verification attempt. Verification can involve several attempts and use different verification methods. For example, in a user's session, a user enters an invalid verification code (first attempt). The user then enters the correct code and successfully verifies identity (second attempt). Both attempts are part of a single verification and, therefore, have the same ID.
Username	The username of the user challenged for identity verification.
Activity Message	<p>The text the user sees on the screen or in Salesforce Authenticator when prompted to verify identity. For example, if identity verification is required for a user's login, the user sees "You're trying to Log In to Salesforce". In this instance, the Activity Message is "Log In to Salesforce". The exception is when the User Activity is "Apex-defined activity." In this instance, the Activity Message can be a custom description passed by the Apex method. If the user is verifying identity using version 2 or later of the Salesforce Authenticator app, the custom description displays in the app as well as in Verification History. If the custom description isn't specified, the name of the Apex method is shown in Verification History.</p> <p> Note: If the user attempted to access a connected app, and the app was renamed or deleted after the verification attempt, this field shows the original connected app name.</p>
Triggered By	<p>The identity verification security policy or setting.</p> <ul style="list-style-type: none"> Apex method—Identity verification made by a verification Apex method.

Field	Description
	<ul style="list-style-type: none"> • Device activation—Identity verification required for users logging in from an unrecognized device or new IP address. This verification is part of Salesforce’s risk-based authentication. • Lightning Login enrollment—Identity verification required for users enrolling in Lightning Login. This verification is triggered when the user attempts to enroll. Users are eligible to enroll if they have the “Lightning Login User” user permission and the org has enabled “Allow Lightning Login” in Session Settings. • High assurance session required—High assurance session required for resource access. This verification is triggered when the user tries to access a resource, such as a connected app, report, or dashboard that requires a high-assurance session level. • Lightning Login login—Identity verification required for users logging in via Lightning Login. This verification is triggered when the enrolled user attempts to log in. Users are eligible to log in if they have the “Lightning Login User” user permission, have successfully enrolled in Lightning Login, and the org has enabled “Allow Lightning Login” in Session Settings. • Profile session level policy—Session security level required at login. This verification is triggered by the “Session security level required at login” setting on the user’s profile. • Two-factor authentication required—Two-factor authentication required at login. This verification is triggered by the “Two-Factor Authentication for User Interface Logins” user permission assigned to a custom profile. Or, the user permission is included in a permission set that is assigned to a user.
Method	<p>The method by which the user attempted to verify identity in the verification event.</p> <ul style="list-style-type: none"> • Email message—Salesforce sent an email with a verification code to the address associated with the user’s account. • Lightning Login enrollment—Salesforce Authenticator sent a notification to the user’s mobile device to enroll in Lightning Login. • One-time password—An authenticator app generated a time-based, one-time password (TOTP) on the user’s mobile device. • Lightning Login login—Salesforce Authenticator sent a notification to the user’s mobile device to approve login via Lightning Login. • Salesforce Authenticator—Salesforce Authenticator sent a notification to the user’s mobile device to verify account activity.

Field	Description
	<ul style="list-style-type: none"> • Temporary verification code—A Salesforce admin or a user with the “Manage Two-Factor Authentication in User Interface” permission generated a temporary verification code for the user. • Text message—Salesforce sent a text message with a verification code to the user’s mobile device. • U2F security key—A U2F security key generated required credentials for the user.
Status	<p>The status of the identity verification attempt.</p> <ul style="list-style-type: none"> • Access denied—The user denied the approval request in the authenticator app, such as Salesforce Authenticator. • Access denied: Flagged by user—The user denied the approval request in the authenticator app, such as Salesforce Authenticator, and also flagged the approval request to report to an administrator. • Failed: General error—An error caused by something other than an invalid verification code, too many verification attempts, or authenticator app connectivity. • Failed: Invalid verification code—The user provided an invalid verification code. • Failed: Recoverable error—Salesforce can’t reach the authenticator app to verify identity, but will retry. • Failed: Too many attempts—The user attempted to verify identity too many times. For example, the user entered an invalid verification code repeatedly. • Succeeded—The user’s identity was verified. • Succeeded: Automated response—Salesforce Authenticator approved the request for access because the request came from a trusted location. After users enable location services in Salesforce Authenticator, they can designate trusted locations. When a user trusts a location for a particular activity, such as logging in from a recognized device, that activity is approved from the trusted location for as long as the location is trusted. • User challenged; waiting for response—Salesforce challenged the user to verify identity and is waiting for the user to respond or for Salesforce Authenticator to send an automated response.
Login Time	Time of the login attempt, in GMT time zone.
Source IP	The IP address of the machine from which the user attempted the action that requires identity verification. For example, the IP address of the machine from where the user tried to log in or access reports. If it’s a non-login action that required verification, the IP address

Field	Description
	can be different from the address from where the user logged in. This address can be an IPv4 or IPv6 address.
Location	The country where the user's IP address is physically located. This value is not localized. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary.

You can display the following fields by creating a custom view. In the description, the IP address is the address of the machine from which the user attempted the action that requires identity verification. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary.

Field	Description
City	The city where the user's IP address is physically located. This value is not localized.
Connected App	The name and link to the connected app the user attempted to access. If the connected app was renamed since the user's verification attempt, it shows the new name. If the connected app was deleted since the user's verification attempt, it shows "Unavailable."
Country	The country where the user's IP address is physically located. This value is not localized.
CountryIso	The ISO 3166 code for the country where the user's IP address is physically located. For more information, see Country Codes - ISO 3166
Latitude	The latitude where the user's IP address is physically located.
Login Type	The type of login, for example, Application, OAuth, or SAML.
Longitude	The longitude where the user's IP address is physically located.
Postal Code	The postal code where the user's IP address is physically located. This value is not localized.
Subdivision	The name of the subdivision where the user's IP address is physically located. In the U.S., this value is usually the state name (for example, Pennsylvania). This value is not localized.
User Activity	The action the user attempted that requires identity verification. <ul style="list-style-type: none"> • Access a connected app—The user attempted to access a connected app. • Access reports—The user attempted to access reports or dashboards. • Apex-defined activity—The user attempted to access a Salesforce resource with a verification Apex method.

Field	Description
	<ul style="list-style-type: none"> Export and print reports—The user attempted to export or print reports or dashboards. Log in to Salesforce—The user attempted to log in.

Monitor Login Activity with Login Forensics

Login forensics helps administrators better determine which user behavior is legitimate to prevent identity fraud in Salesforce.

Companies continue to view identity fraud as a major concern. Given the number of logins to an org on a daily—even hourly—basis, security practitioners can find it challenging to determine if a specific user account is compromised.

Login forensics helps you identify suspicious login activity. It provides you key user access data, including:

- The average number of logins per user per a specified time period
- Who logged in more than the average number of times
- Who logged in during non-business hours
- Who logged in using suspicious IP ranges

There's some basic terminology to master before using this feature.

Event

An event refers to anything that happens in Salesforce, including user clicks, record state changes, and taking measurements of various values. Events are immutable and timestamped.

Login Event

A single instance of a user logging in to an organization. Login events are similar to login history in Salesforce. However, you can add HTTP header information to login events, which makes them extensible.

Login History

The login history that administrators can obtain by downloading the information to .csv or .gzip file and that's available through Setup and the API. This data has indexing and history limitations.

Administrators can track events using the LoginEvent object. There's no user interface for login forensics. Use the Force.com IDE, Workbench, or other development tools to interact with this feature.

 **Note:** Login forensics isn't available on government pods.

[Considerations for Using Login Forensics](#)

Before you get started with Login Forensics, keep in mind some considerations for use.

[Enable Login Forensics](#)

Perform this quick, one time setup to start collecting data about your org's login events.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Considerations for Using Login Forensics

Before you get started with Login Forensics, keep in mind some considerations for use.

- This feature is API only. You can't view events in the user interface.
- Login events are retained for 10 years by default.
- Because login forensics uses an asynchronous queuing technology similar to `@future` calls in Apex, login data might be delayed when querying.

Enable Login Forensics

Perform this quick, one time setup to start collecting data about your org's login events.

You can enable login forensics from the Event Monitoring Setup page in the Setup area.

Monitor Training History

As an administrator, you want to know that your team is learning how to use Salesforce effectively. The Training Class History shows you all of the Salesforce training classes your users have taken.

Administrators can view the Training Class History from Setup by entering *Training History* in the **Quick Find** box, then selecting **Training History**. After taking a live training class, users must submit the online training feedback form to have their training attendance recorded in the training history.

- 📌 **Note:** If you don't see this link under **Manage Users**, your organization has been migrated to a new system. You need to be a Help & Training Admin to access the training reports via My Cases in Help & Training. Contact Salesforce if you do not have this access.

EDITIONS

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Monitor Setup Changes

Setup Audit Trail tracks the recent setup changes that you and other admins have made to your org. Audit history is especially useful in orgs with multiple admins.

To view the audit history, from Setup, enter *View Setup Audit Trail* in the **Quick Find** box, then select **View Setup Audit Trail**. To download your org's full setup history for the past 180 days, click **Download**.

The history shows the 20 most recent setup changes made to your org. It lists the date of the change, who made it, and what the change was. If a delegate (like an admin or customer support representative) makes a setup change on behalf of an end user, the Delegate User column shows the delegate's username. For example, if a user grants login access to an admin and the admin makes a setup change, the admin's username is listed.

Setup Audit Trail tracks these changes.

Setup	Changes Tracked
Administration	<ul style="list-style-type: none"> Company information, default settings like language or locale, and company messages Multiple currency Users, portal users, roles, permission sets, and profiles Email addresses for any user Deleting email attachments sent as links Email footers, including creating, editing, or deleting Record types, including creating or renaming record types and assigning record types to profiles Divisions, including creating, editing, and transferring and changing users' default division Certificates, adding or deleting Domain names Enabling or disabling Salesforce as an identity provider

Field History Tracking

You can select certain fields to track and display the field history in the History related list of an object. The field history data is retained for up to 18 months.

You can track the field history of custom objects and the following standard objects.

- Accounts
- Articles
- Assets
- Cases
- Contacts
- Contracts
- Contract line items
- Entitlements
- Leads
- Opportunities
- Orders
- Order Products
- Products
- Service Contracts
- Solutions

Modifying any of these fields adds an entry to the History related list. All entries include the date, time, nature of the change, and who made the change. Not all field types are available for historical trend reporting. Certain changes, such as case escalations, are always tracked.

 **Note:** Field history increases beyond your current limits require purchasing the Field Audit Trail add-on following the Spring '15 release. When the add-on subscription is enabled, your field history storage is changed to reflect the retention policy associated with the offering. If your org was created prior to June 2011 and your field history limits remain static, Salesforce commits to retain your field history without a limit. If your org was created after June 2011 and you decide not to purchase the add-on, field history is retained for a maximum of 18 months.

Consider the following when working with field history tracking.

- Changes to fields with more than 255 characters are tracked as edited, and their old and new values are not recorded.
- Tracked field values are not automatically translated; they display in the language in which they were made. For example, if a field is changed from *Green* to *Verde*, *Verde* is displayed no matter what a user's language is, unless the field value has been translated into other languages via the Translation Workbench. This also applies to record types and picklist values.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Standard Objects are not available in **Database.com**

- Changes to custom field labels that have been translated via the Translation Workbench are shown in the locale of the user viewing the History related list. For example, if a custom field label is *Red* and translated into Spanish as *Rojo*, then a user with a Spanish locale sees the custom field label as *Rojo*. Otherwise, the user sees the custom field label as *Red*.
- Changes to date fields, number fields, and standard fields are shown in the locale of the user viewing the History related list. For example, a date change to *August 5, 2012* shows as *8/5/2012* for a user with the English (United States) locale, and as *5/8/2012* for a user with the English (United Kingdom) locale.
- If a trigger causes a change on an object the current user doesn't have permission to edit, that change is not tracked because field history honors the permissions of the current user.

[Track Field History for Standard Objects](#)

You can enable field history tracking for standard objects in the object's management settings.

[Track Field History for Custom Objects](#)

You can enable field history tracking for custom objects in the object's management settings.

[Disable Field History Tracking](#)

You can turn off field history tracking from the object's management settings.

[Field Audit Trail](#)

Field Audit Trail lets you define a policy to retain archived field history data up to ten years, independent of field history tracking. This feature helps you comply with industry regulations related to audit capability and data retention.

[Field Audit Trail](#)

[Disable Field History Tracking](#)

Track Field History for Standard Objects

You can enable field history tracking for standard objects in the object's management settings.

If you use both business accounts and person accounts, review the following before enabling account field history tracking:

- Field history tracking for accounts affects both business accounts and person accounts.
- Enabling field history tracking on person accounts does not enable field history tracking on personal contacts.

To set up field history tracking:

1. From the management settings for the object whose field history you want to track, go to the fields area.

2. Click **Set History Tracking**.

Tip: When you enable tracking for an object, customize your page layouts to include the object's history related list.

3. For accounts, contacts, leads, and opportunities, select the `Enable Account History`, `Enable Contact History`, `Enable Lead History`, or `Enable Opportunity History` checkbox.

4. Choose the fields you want tracked.

You can select a combination of up to 20 standard and custom fields per object. This limit includes fields on business accounts and person accounts.

Certain changes, such as case escalations, are always tracked.

You can't track the following fields:

- Formula, roll-up summary, or auto-number fields
- `Created By` and `Last Modified By`
- `Expected Revenue` field on opportunities
- `Master Solution Title` or the `Master Solution Details` fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled.

5. Click **Save**.

Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.

USER PERMISSIONS

To set up which fields are tracked:

- "Customize Application"

Track Field History for Custom Objects

You can enable field history tracking for custom objects in the object's management settings.

1. From the management settings for the custom object, click **Edit**.
2. Select the `Track Field History` checkbox.
 -  **Tip:** When you enable tracking for an object, customize your page layouts to include the object's history related list.
3. Save your changes.
4. Click `Set History Tracking` in the Custom Fields & Relationships section.

This section lets you set a custom object's history for both standard and custom fields.
5. Choose the fields you want tracked.

You can select up to 20 standard and custom fields per object. You can't track:

 - Formula, roll-up summary, or auto-number fields
 - `Created By` and `Last Modified By`
6. Click **Save**.

Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.

SEE ALSO:

[Field History Tracking](#)

[Find Object Management Settings](#)

Disable Field History Tracking

You can turn off field history tracking from the object's management settings.

-  **Note:** You can't disable field history tracking for an object if Apex references one of its a field on the object is referenced in Apex.
1. From the management settings for the object whose field history you want to stop tracking, go to Fields.
 2. Click `Set History Tracking`.
 3. Deselect **Enable History** for the object you are working with—for example, **Enable Account History**, **Enable Contact History**, **Enable Lead History**, or **Enable Opportunity History**.

The History related list is automatically removed from the associated object's page layouts.

If you disable field history tracking on a standard object, you can still report on its history data up to the date and time that you disabled tracking. If you disable field history tracking on a custom object, you cannot report on its field history.

[Find Object Management Settings](#)

Field Audit Trail

Field Audit Trail lets you define a policy to retain archived field history data up to ten years, independent of field history tracking. This feature helps you comply with industry regulations related to audit capability and data retention.

Use Salesforce Metadata API to define a retention policy for your field history. Then use REST API, SOAP API, and Tooling API to work with your archived data. For information about enabling Field Audit Trail, contact your Salesforce representative.

Field history is copied from the History related list into the `FieldHistoryArchive` object and then deleted from the History related list. You define one `HistoryRetentionPolicy` for your related history lists, such as Account History, to specify Field Audit Trail retention policies for the objects that you want to archive. You can then deploy the object by using the Metadata API (Workbench or Force Migration Tool). You can update the retention policy on an object as often as you like.

You can set field history retention policies on the following objects.

- Accounts
- Cases
- Contacts
- Leads
- Opportunities
- Assets
- Entitlements
- Service Contracts
- Contract Line Items
- Solutions
- Products
- Price Books
- Custom objects with field history tracking enabled

 **Note:** The `HistoryRetentionPolicy` is automatically set on the above objects, once Field Audit Trail is enabled. By default, data is archived after 18 months in a production organization, after one month in a sandbox organization, and all archived data is stored for 10 years.

You can include field history retention policies in managed and unmanaged packages.

The following fields can't be tracked.

- Formula, roll-up summary, or auto-number fields
- Created By and Last Modified By
- Expected Revenue field on opportunities

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To specify a field history retention policy:

- "Retain Field History"

- Master Solution Title or the Master Solution Details fields on solutions
- Long text fields
- Multi-select fields

After you define and deploy a Field Audit Trail policy, production data is migrated from related history lists such as Account History into the `FieldHistoryArchive` object. The first copy writes the field history that's defined by your policy to archive storage and sometimes takes a long time. Subsequent copies transfer only the changes since the last copy and are much faster. A bounded set of SOQL is available to query your archived data.

-  **Note:** For some time after the initial GA release, data might not be automatically deleted from the History related list and may reside in both the `FieldHistoryArchive` object and in the History related list. Salesforce reserves the right to delete archived data from the History related list in accordance with the customer-defined policy in future releases.
-  **Note:** If your organization has Field Audit Trail enabled, previously archived data isn't encrypted if you subsequently turn on Platform Encryption. For example, your organization uses Field Audit Trail to define a data history retention policy for an account field, such as the phone number field. After enabling Platform Encryption, you turn on encryption for that field, and phone number data in the account is encrypted. New phone number records are encrypted as they are created, and previous updates to the phone number field that are stored in the Account History related list are also encrypted. However, phone number history data that is already archived in the `FieldHistoryArchive` object continues to be stored without encryption. If your organization needs to encrypt previously archived data, contact Salesforce. We will encrypt and rearchive the stored field history data, then delete the unencrypted archive.

Examples

[ISVforce Guide: Overview of Packages](#)

[Force.com SOQL and SOSL Reference: SOQL with Archived Data](#)

Examples

Set Data Retention Policy for Field History

This example demonstrates how to set a field history data retention policy by using Metadata API. You need to edit the metadata only if you want to override the default policy values (18 months of production storage and 10 years of archive storage). Setting data retention policy involves creating a metadata package and deploying it. The package consists of a `.zip` file that contains an `objects` folder with the XML that defines each object's retention policy, and a project manifest that lists the objects and the API version to use.

-  **Note:** The first copy writes the entire field history that's defined by your policy to archive storage and might take a long time. Subsequent copies transfer only the changes since the last copy, and will be much faster.

1. Define a field history data retention policy for each object. The policy specifies the number of months that you want to maintain field history in Salesforce, and the number of years that you want to retain field history in the archive. The following sample file defines a policy of archiving the object after six months, and keeping the archives for five years.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <historyRetentionPolicy>
    <archiveAfterMonths>6</archiveAfterMonths>
```

```

    <archiveRetentionYears>5</archiveRetentionYears>
    <description>My field history retention</description>
  </historyRetentionPolicy>
  <fields>
    <fullName>AccountSource</fullName>
    ...
  </CustomObject>

```

The file name determines the object to which the policy is applied. For example, to apply the above policy to the Account object, save the file as `Account.object`. For existing custom objects, this works the same way, with the file named after the custom object. For example: `myObject__c.object`.

2. Create the project manifest, which is an XML file that's called `package.xml`. The following sample file lists several objects for which data retention policy is to be applied. With this manifest file, you expect the objects folder to contain five files: `Account.object`, `Case.object`, and so on.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account</members>
    <members>Case</members>
    <members>Contact</members>
    <members>Lead</members>
    <members>Opportunity</members>
  </types>
  <version>32.0</version>
</Package>

```

3. Create the `.zip` file and use the `deploy()` function to deploy your changes to your production environment. For more information, see the [Metadata API Guide](#).

Note: This pilot doesn't support deployment from sandbox to production environments.

That's it! Your field history retention policy will go into effect according to the time periods that you set.

Create a Custom Object and Set Field History Retention Policy at the Same Time

You can use Metadata API to create a custom object and set retention policy at the same time. You must specify the minimum required fields when creating a new custom object. Here's sample XML that creates an object and sets field history retention policy:

```

<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <deploymentStatus>Deployed</deploymentStatus>
  <enableHistory>true</enableHistory>
  <description>just a test object with one field for eclipse ide testing</description>
  <historyRetentionPolicy>
    <archiveAfterMonths>3</archiveAfterMonths>
    <archiveRetentionYears>10</archiveRetentionYears>
    <gracePeriodDays>1</gracePeriodDays>
    <description>Transaction Line History</description>
  </historyRetentionPolicy>
  <fields>
    <fullName>Comments__c</fullName>
    <description>add your comments about this object here</description>

```

```

    <inlineHelpText>This field contains comments made about this object</inlineHelpText>

    <label>Comments</label>
    <length>32000</length>
    <trackHistory>true</trackHistory>
    <type>LongTextArea</type>
    <visibleLines>30</visibleLines>
</fields>
<label>MyFirstObject</label>
<nameField>
  <label>MyFirstObject Name</label>
  <type>Text</type>
</nameField>
<pluralLabel>MyFirstObjects</pluralLabel>
<sharingModel>ReadWrite</sharingModel>
</CustomObject>

```

Set `trackHistory` to `true` on the fields that you want to track and `false` on the other fields.

Update Data Retention Policy for Field History

If a field history data retention policy is already defined on an object, you can update the policy by specifying a new value of `HistoryRetentionPolicy` in the metadata for that object. Once you deploy the metadata changes, the new policy overwrites the old one.

Note: To check the current data retention policy for any object, retrieve its metadata using Metadata API and look up the value of `HistoryRetentionPolicy`.

Query Archived Data

You can retrieve archived data by making SOQL queries on the `FieldHistoryArchive` object. You can filter on the `FieldHistoryType`, `ParentId`, and `CreatedDate` fields, as long as you specify them in that order. For example:

```

SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive
WHERE FieldHistoryType = 'Account' AND ParentId='906F000000

```

Monitor Debug Logs

Set trace flags to trigger logging for users, Apex classes, and Apex triggers in the Developer Console or in Setup. Monitor the resulting logs to diagnose problems in your org.

You can retain and manage debug logs for specific users, including yourself, and for classes and triggers. Setting class and trigger trace flags doesn't cause logs to be generated or saved. Class and trigger trace flags override other logging levels, including logging levels set by user trace flags, but they don't cause logging to occur. If logging is enabled when classes or triggers execute, logs are generated at the time of execution.

Set Up Debug Logging

To activate debug logging for users, Apex classes, and Apex triggers, configure trace flags and debug levels in the Developer Console or in Setup. Each trace flag includes a debug level, start time, end time, and log type. The trace flag's log type specifies the entity you're tracing.

View Debug Logs

The debug log contains information about each transaction, such as whether it was successful and how long it took. Depending on the filters set by your trace flags, the log can contain varying levels of detail about the transaction.

Set Up Debug Logging

To activate debug logging for users, Apex classes, and Apex triggers, configure trace flags and debug levels in the Developer Console or in Setup. Each trace flag includes a debug level, start time, end time, and log type. The trace flag's log type specifies the entity you're tracing.

You can retain and manage debug logs for specific users, including yourself, and for classes and triggers. Setting class and trigger trace flags doesn't cause logs to be generated or saved. Class and trigger trace flags override other logging levels, including logging levels set by user trace flags, but they don't cause logging to occur. If logging is enabled when classes or triggers execute, logs are generated at the time of execution.

The following are the limits for debug logs.

- Each debug log must be 2 MB or smaller. Debug logs that are larger than 2 MB are reduced in size by removing older log lines, such as log lines for earlier `System.debug` statements. The log lines can be removed from any location, not just the start of the debug log.
- Each org can retain up to 50 MB of debug logs. Once your org has reached 50 MB of debug logs, the oldest debug logs start being overwritten.

Configure Trace Flags in the Developer Console

To configure trace flags and debug levels from the Developer Console, click **Debug > Change Log Levels**. Then complete these actions.

- To create a trace flag, click **Add**.
- To edit an existing trace flag's duration, double-click its start or end time.
- To change a trace flag's debug level, click **Add/Change** in the Debug Level Action column. You can then edit your existing debug levels, create or delete a debug level, and assign a debug level to your trace flag. Deleting a debug level deletes all trace flags that use it.

EDITIONS

Available in: Salesforce Classic

Available in **Enterprise, Developer, Performance, Unlimited,** and **Database.com** Editions

The Salesforce user interface and Email Services are not available in **Database.com**.

USER PERMISSIONS

To view, retain, and delete debug logs:

- "Manage Users"

Create Trace Flags in Setup

1. From Setup, enter *Debug Logs* in the *Quick Find* box, then click **Debug Logs**.
2. Click **New**.
3. Select the entity to trace, the time period during which you want to collect logs, and a debug level. A debug level is a set of log levels for debug log categories: Database, Workflow, Validation, and so on. You can reuse debug levels across your trace flags.

New Trace Flag

To specify the type of information that is included in debug logs, add trace flags and debug levels. Each trace flag includes a debug level, a start time, an end time, and a log type.

Trace flags set logging levels (such as for Database, Workflow, and Validation) for a user, Apex class, or Apex trigger for up to 24 hours.

- Select Automated Process from the drop-down to set a trace flag on the automated process user. The automated process user runs background jobs, such as emailing Chatter invitations.
- Select User from the drop-down to specify a user whose debug logs you would like to monitor and retain.
- Select Apex Class or Apex Trigger from the drop-down to specify the log levels that take precedence while executing a specific Apex class or trigger. Setting class and trigger trace flags doesn't cause logs to be generated or saved. Class and trigger trace flags override other logging levels, including logging levels set by user trace flags, but they don't cause logging to occur. If logging is enabled when classes or triggers execute, logs are generated at the time of execution.

A total of 50 MB of debug logs can be retained for your org.

View, Edit, or Delete Trace Flags in Setup

To manage trace flags from Setup, complete these actions.

1. Navigate to the appropriate Setup page.
 - For user-based trace flags, enter *Debug Logs* in the *Quick Find* box, then click **Debug Logs**.
 - For class-based trace flags, enter *Apex Classes* in the *Quick Find* box, click **Apex Classes**, click the name of a class, then click **Trace Flags**.
 - For trigger-based trace flags, enter *Apex Triggers* in the *Quick Find* box, click **Apex Triggers**, click the name of a trigger, then click **Trace Flags**.
2. From the Setup page, click an option in the Action column.
 - To delete a trace flag, click **Delete**.
 - To modify a trace flag, click **Edit**.
 - To modify a trace flag's debug level, click **Filters**.
 - To create a debug level, click **Edit**, and then click **New Debug Level**.

Configure Debug Levels in Setup

To manage your debug levels from Setup, enter *Debug Levels* in the *Quick Find* box, then click **Debug Levels**. To edit or delete a debug level, click an option in the Action column. To create a debug level, click **New**.

Debug Levels

Collect Debug Logs for Guest Users

Your public users generate a large volume of events, which can quickly fill up your debug logs. For this reason, logs are collected for site visitors who are using your Guest User license only when a public user's browser has a special cookie. Logging of public users' asynchronous activity isn't available because asynchronous requests don't include browser cookies.

To enable logging for a guest user's synchronous activity:

1. Ask the user to set a browser cookie with a domain of `.force.com`, a name of `debug_logs`, and any value. (If you use a custom domain, ask your user to set the cookie for your domain rather than for `.force.com`.) Refer to the documentation for your user's browser for information on adding cookies. To add cookies, your user probably needs a browser plug-in or extension for web development.

- To set a cookie for API requests made with Java code, use the `URLConnection` class and set the cookie value as follows.
 - If you use a `.force.com` domain, use this code.

```
URL url = new URL("http://yourSite.force.com/");
URLConnection con = url.openConnection();
con.setDoOutput(true);
con.setRequestProperty("Cookie", "debug_logs=debug_logs,domain=.force.com");
con.setRequestProperty("Content-Type", "text/plain; charset=utf-8");
con.connect();
```

- If you use a custom domain (for example, `yourCustomDomain.com`), use this code.

```
URL url = new URL("http://yourCustomDomain.com/");
URLConnection con = url.openConnection();
con.setDoOutput(true);
con.setRequestProperty("Cookie", "debug_logs=debug_logs,domain=.force.com");
con.setRequestProperty("Content-Type", "text/plain; charset=utf-8");
con.connect();
```

- To set a browser cookie in Google Chrome™:
 - a. Navigate to your site.
 - b. Open the Chrome DevTools Console by pressing Ctrl+Shift+J (Cmd+Opt+J on macOS).
 - c. Execute a command to set the cookie.
 - If you use a `.force.com` domain, use this command.

```
document.cookie="debug_logs=debug_logs;domain=.force.com";
```

- If you use a custom domain (for example, `yourCustomDomain.com`), use this command.

```
document.cookie="debug_logs=debug_logs;domain=yourCustomDomain.com";
```

- To set a browser cookie in other browsers, install a plug-in or extension.
2. Find the name of your site's guest user.
 - a. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
 - b. Select your site from the Site Label column.
 - c. Select **Public Access Settings > View Users**.
 3. Set a user-based trace flag on the guest user.
 - a. From Setup, enter *Debug Logs* in the **Quick Find** box, then click **Debug Logs**.
 - b. Click **New**.
 - c. Set the traced entity type to **User**.
 - d. Open the lookup for the Traced Entity Name field, and then find and select your guest user.
 - e. Assign a debug level to your trace flag.
 - f. Click **Save**.

Tip: Debug logs are for live troubleshooting. To record all site traffic, use event monitoring. For details, see the Sites section of [SOAP API Developer Guide: EventLogFile](#).

Monitoring Scheduled Jobs

The All Scheduled Jobs page lists all reporting snapshots, scheduled Apex jobs, and dashboards scheduled to refresh.

To view this page, from Setup, enter *Scheduled Jobs* in the *Quick Find* box, then select **Scheduled Jobs**. Depending on your permissions, you can perform some or all of the following actions.

- Click **Del** to permanently delete all instances of a scheduled job.
- View the details of a scheduled job, such as the:
 - Name of the scheduled job
 - Name of the user who submitted the scheduled job
 - Date and time at which the scheduled job was originally submitted
 - Date and time at which the scheduled job started
 - Next date and time at which the scheduled job will run
 - Type of scheduled job

Monitoring Background Jobs

You can monitor background jobs in your organization, such as when parallel sharing recalculation is running.

Parallel sharing recalculation helps larger organizations to speed up sharing recalculation of each object. If the number of impacted records from an owner-based sharing rule insert or update is less than 25,000, recalculation runs synchronously and you won't receive an email notification when it's completed. Owner-based sharing rule inserts and updates impacting less than 25,000 records are not available on the Background Jobs page.

To view any background jobs in your organization, from Setup, enter *Background Jobs* in the *Quick Find* box, then select **Background Jobs**.

The Background Jobs page shows the details of background jobs, including a percentage estimate of the recalculation progress. The **Job Type** column shows the background job that's running, such as *Organization-Wide Default Update*. The **Job Sub Type** column shows the affected object, such as *Account* or *Opportunity*.

Enable Your Users to Work on Mobile Devices

Salesforce provides several mobile apps to keep you and your users connected and productive, no matter where you are.

[Put Salesforce1 In Your Users' Hands](#)

The Salesforce1 mobile app enables your users to stay productive on the go.

[Help Users From Anywhere With SalesforceA](#)

SalesforceA is a mobile app for Salesforce administrators. When you're away from your desk, you can use your phone or tablet to perform essential administration tasks like resetting passwords, freeing users, and viewing current system status.

[Support On-the-Go Productivity with Salesforce Mobile Classic](#)

Salesforce Mobile Classic helps your teams succeed by allowing users to access their latest Salesforce data, whenever and wherever they need it, directly from Android™ and iPhone® devices.

[View a Mobile User's Push Registration Information](#)

With the Mobile Push Registrations Page, you can view any user's push registration information for general troubleshooting.

Put Salesforce1 In Your Users' Hands

The Salesforce1 mobile app enables your users to stay productive on the go.

[Salesforce1 Mobile App Setup Options](#)

See the many options for customizing the Salesforce1 mobile app, to make it an effective on-the-go tool for your users' business needs.

[Set Up the Salesforce1 Mobile App with the Salesforce1 Wizard](#)

The Salesforce1 Wizard provides an easy way to complete the essential setup tasks for Salesforce1. After you've set up Salesforce1 with this wizard, your sales reps can use Salesforce1 to run their business from their mobile devices.

[Control Access to the Salesforce1 Mobile App](#)

You can control your organization's access to the Salesforce1 downloadable apps and the Salesforce1 mobile browser app.

[Salesforce1 and Password Manager Apps](#)

Good security practices require long, complex passwords. But typing long, complex passwords on small mobile keyboards is error prone and frustrating. Effectively, your users are penalized for being secure. Well, if your org uses password management, your Salesforce1 for iOS users are free to leave the penalty box. With version 11.0 or later of the Salesforce1 downloadable app for iOS, users can use a password manager app to simplify the login process down to a few taps.

[Salesforce1 Mobile App Navigation Menu](#)

Learn about the items that can appear in the Salesforce1 navigation menu. You can customize most aspects of the navigation menu for your organization.

[Salesforce1 Mobile App Notifications](#)

Notifications let your users know when certain events occur in Salesforce. For example, notifications let users know when they receive approval requests or when someone mentions them in Chatter.

[Work Offline with the Salesforce1 Mobile App](#)

Your mobile users' productivity doesn't have to stop when there's no connectivity. When you enable caching and Offline Edit for Salesforce1, users can keep working, unimpeded by a subway commute, FAA regulations, capricious cellular signals, or bunker-style buildings. Offline access is available for the Salesforce1 downloadable apps. The beta version of Offline Edit requires version 10.0 of the Salesforce1 for Android downloadable app or the Salesforce1 for iOS downloadable app.

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

You can use Visualforce to extend the Salesforce1 app and give your mobile users the functionality that they need while on the go. Before adding a Visualforce page to Salesforce1, make sure the page is enabled for mobile use or it won't be available in the mobile apps.

[Your Org's Branding in the Salesforce1 Mobile App](#)

You can customize the Salesforce1 mobile app to match some aspects of your company's branding, so the app is more recognizable to your mobile users. Custom branding is displayed in all of the Salesforce1 apps.

[Test Current Network Conditions from the Salesforce1 Downloadable App](#)

Do your users ever ask why the Salesforce1 mobile app is snappy in some locations but a little sluggish in others? Obviously the condition of a network can affect how Salesforce1 performs. If a user experiences issues with the Salesforce1 downloadable app for iOS, version 10.0.2 or later, have him test his network so you can rule it out as the source of the problem.

[What's Different or Not Available in the Salesforce1 Mobile App](#)

The Salesforce1 mobile app doesn't include all the functionality that's available in the full Salesforce site, whether your org is using Lightning Experience or Salesforce Classic. Learn about the Salesforce features that aren't available in Salesforce1, that have functional gaps from what you're used to in the full site, or that work differently in Salesforce1.

Salesforce1 Mobile App Setup Options

See the many options for customizing the Salesforce1 mobile app, to make it an effective on-the-go tool for your users' business needs.

All Salesforce1 customization options are available from the Setup menu. For your convenience, you can access many Salesforce1 settings pages more quickly from the Salesforce1 Quick Start setup page. In Salesforce Classic, from Setup, click **Salesforce1 Quick Start** (near the top of the Setup menu). In Lightning Experience, from Setup, enter *Salesforce1 Quick Start* in the `Quick Find` box, then select **Salesforce1 Quick Start**.

 **Note:** We recommend using Google Chrome for the Salesforce1 Quick Start setup page. Microsoft Internet Explorer 9 or later and Mozilla Firefox are also supported.

Here are the Salesforce1 customization options you can consider for your organization.

- Do some basic setup using the Salesforce1 Wizard. From the Salesforce1 Quick Start page, click **Launch Quick Start Wizard**.
 - Define the users who can access Salesforce1.
 - For the downloadable apps, from the Salesforce1 Quick Start page, click **App Security Controls**.
 - For the mobile browser app, from the Salesforce1 Quick Start page, click **Mobile Browser Option**.
 - Customize how data appears in Salesforce1. Unless otherwise specified, you can access these customizations from the management settings for the object whose data you want to customize.
 - Optimize your page layouts so they display well on mobile devices. You can modify existing page layouts or create new, mobile-friendly page layouts. From the appropriate object management settings, go to Page Layouts.
 - Add expanded lookups, components (including the Twitter component), or Visualforce pages to the Mobile Cards section of a page layout to have them display as mobile cards in Salesforce1. From the appropriate object management settings, go to Page Layouts.
 - Make sure that Visualforce pages are enabled for use in Salesforce1, so they'll display in the app. From Setup, enter *Visualforce Pages* in the `Quick Find` box, then select **Visualforce Pages**. Click **Edit** next to the name of a page, and select `Available for Salesforce mobile apps`.
 - Define the fields that show up in an object's record highlight area and in related list preview cards by creating custom compact layouts. From the appropriate object management settings, go to Compact Layouts.
 - Verify that your existing search layouts populate Salesforce1 search results with the desired fields. From the appropriate object management settings, go to Search Layouts.
 - Make it easy and efficient to work in the field by creating actions that are tailored to your specific business activities and use cases.
 - Enable actions in the publisher for your organization. From Setup, enter *Chatter Settings* in the `Quick Find` box, then select **Chatter Settings**. Select the `Enable Actions in the Publisher` checkbox. (This option assumes that your organization has Chatter enabled and that you want the actions you create to display in the Chatter publisher. If your organization doesn't have Chatter enabled, you can still use actions but they only display in Salesforce1 and not in the full Salesforce site.)
-  **Note:** If actions in the publisher aren't enabled, only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear in the Chatter publisher in the full Salesforce site. When Chatter is enabled but actions in the publisher aren't, standard Chatter actions and nonstandard actions appear in the Salesforce1 action bar and in third-party apps that use action lists. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

- Create global actions that allow users to add new object records with no automatic relationship to other records. From Setup, enter `Global Actions` in the `Quick Find` box, then select **Global Actions**. To customize the fields that are used by global actions, click **Layout** on the Global Actions page.

Then add the new actions to the Salesforce1 and Lightning Experience Actions section of the global publisher layout so that they appear in Salesforce1. From Setup, enter `Publisher Layouts` in the `Quick Find` box, then select **Publisher Layouts**.

- Create object-specific actions that allow users to add new records or update data in existing records. From the management settings for the object that you want to add an action to, go to Buttons, Links, and Actions. To customize the fields used by an object-specific action, click **Layout** on the Buttons, Links, and Actions page.

Then add the new actions to the Salesforce1 and Lightning Experience Actions section on the appropriate object page layout.

- Customize the options that are available in the Salesforce1 navigation menu, and the order in which items appear. From the Salesforce1 Quick Start page, click **Navigation Menu**.
- Help keep Salesforce1 users aware of important Salesforce activities by enabling in-app and push notifications. From the Salesforce1 Quick Start page, click **Notification Options**.
- Integrate third-party apps into the Salesforce1 navigation menu by adding Lightning Page tabs for the Lightning Pages deployed to your organization. From Setup, enter `Tabs` in the `Quick Find` box, select **Tabs**, and then click **New** on the Lightning Page Tabs related list.
- Customize Salesforce1 to match the look and feel of your company's branding. From the Salesforce1 Quick Start page, click **Salesforce1 Branding**.
- Allow the Salesforce1 downloadable apps to automatically cache frequently accessed Salesforce data to secure, persistent storage, so users can view data when their devices are offline. (This option is turned on by default.) From the Salesforce1 Quick Start page, click **Offline Cache**.

You can also check out the [Salesforce1 Mobile App Admin Guide](#), which walks you through using the Salesforce1 declarative tools in Setup to get your organization ready for the Salesforce1 mobile experience.

Set Up the Salesforce1 Mobile App with the Salesforce1 Wizard

The Salesforce1 Wizard provides an easy way to complete the essential setup tasks for Salesforce1. After you've set up Salesforce1 with this wizard, your sales reps can use Salesforce1 to run their business from their mobile devices.

 **Note:** We recommend using Google Chrome for the Salesforce1 Wizard and the Salesforce1 Setup page. Microsoft Internet Explorer 9 or later and Mozilla Firefox are also supported.

If you're using Lightning Experience:

1. From Setup, click **Launch Wizard** in the Set Up Salesforce1 tile in the quick access carousel.

If you're using Salesforce Classic:

1. From Setup, click **Salesforce1 Quick Start**.
2. On the Salesforce1 Setup page, click **Launch Quick Start Wizard**.

 **Note:** Although the Salesforce1 Wizard gets you up and running with basic setup tasks, it doesn't include all Salesforce1 setup tasks. For example, although you can rearrange global quick actions via the wizard, the Salesforce1 action bar and action menu can include other types of actions such as object-specific quick actions and standard Chatter actions, depending on the context.

After you've finished the wizard, you'll be directed to the Salesforce1 Quick Start setup page, which provides easy access to Salesforce1 setup pages and documentation. For settings that are configured on a single page, the Quick Start page includes direct links to those pages. In cases where the settings are available on multiple pages in Setup, we've provided links to relevant documentation about the setting.

User Access and Security Policies for the Salesforce1 Downloadable Apps

The Salesforce1 downloadable apps are connected apps. As a result, you can control the users who have access to the apps, as well as other security policies. By default, all users in your organization can log in to the Salesforce1 downloadable apps.

You can control security and access policies for each of the Salesforce1 downloadable apps, using settings components that are installed from the managed Salesforce1 connected apps package. These components need to be installed in Salesforce:

- Salesforce1 for Android
- Salesforce1 for iOS

These components are automatically installed when one of your users installs a Salesforce1 downloadable app from the App Store or Google Play on a mobile device and authenticates with your organization by logging in to the mobile app.

Alternatively, you can manually install the [Salesforce1 and Chatter Apps connected apps package](#) so you can review and modify the default security and access settings before rolling out the Salesforce1 downloadable apps to your users.

When the Salesforce1 connected apps components are installed, they're added to the Connected Apps page. (From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.) Here, you can view and edit the settings for each of the apps, including controlling user access with profiles, permissions, and IP range restrictions. An error message is displayed if a restricted user attempts to log in to a Salesforce1 downloadable app.

Push notifications for the Salesforce1 downloadable apps aren't managed from the Connected Apps page. To manage these settings, from Setup, enter *Notifications* in the *Quick Find* box, then select **Salesforce1 Notifications**.

Offline access is enabled by default when one of the Salesforce1 downloadable apps is installed. To manage these settings, from Setup, enter *Offline* in the *Quick Find* box, then select **Salesforce1 Offline**.

Salesforce1 Connected App Attributes

The following custom attributes are available for the Salesforce1 for Android and iOS downloadable apps, which are also connected apps.

Several of the Salesforce1 custom attributes have a default value that automatically applies when a user logs in to a Salesforce1 downloadable app. If the default values are appropriate for your org, you're all set.

To change a default value, or configure an attribute that doesn't have a default setting, go to Setup in the full Salesforce site. Enter *Connected Apps* in the *Quick Find* box, select **Connected Apps**, then click **Salesforce1 for Android** or **Salesforce1 for iOS**. In the Custom Attributes section on the connected app page, click **New** and enter the attribute name and value.

 **Important:** Remember to wrap attribute values in quotation marks.

Attribute Key	Attribute Value	Platform	Description
CALL_HISTORY	<ul style="list-style-type: none"> DISABLED ADMIN_DEFINED SIMPLE 	Android	<ul style="list-style-type: none"> If set to <code>DISABLED</code>, removes call logging from the navigation menu. If set to <code>ADMIN_DEFINED</code>, enables native Android call logging. If set to <code>SIMPLE</code>, enables Aura call logging.
DISABLE_EXTERNAL_PASTE	<ul style="list-style-type: none"> TRUE FALSE 	Android, iOS	<ul style="list-style-type: none"> If set to <code>TRUE</code>, lets users copy and paste within Salesforce1, but disables copying within and pasting outside of Salesforce1. If set to <code>FALSE</code> (default if attribute value isn't defined), lets users copy and paste within and outside of Salesforce1.
FORCE_EMAIL_CLIENT_TO	The email app's URI scheme. Can differ by platform. For example, here's an Android URI	Android, iOS	If a user taps on an email action in Salesforce1, the user is directed to the

	<p>scheme example for Blue Mail, and an iOS URI scheme example for Gmail.</p> <p>Android:</p> <p><code>https://play.google.com/store/apps/details?id=me.blumail.mail&hl</code></p> <p>iOS:</p> <p><code>googlegmail:///co?to=</code></p>		<p>email app specified in the attribute value.</p> <p>You can specify one email app only.</p> <p>The attribute value you enter depends on the email app and the device platform.</p> <ul style="list-style-type: none"> For Android, use the URI listed in the Google Play Store for the desired email app. For iOS, do an Internet search to locate the URI scheme for the desired email app. For example, search for <i>iOS Mail URI scheme</i>.
SHOW_OPEN_IN	<ul style="list-style-type: none"> TRUE FALSE 	iOS	<ul style="list-style-type: none"> If set to TRUE, lets users share a file from Salesforce1 via a link to the file, or open a Salesforce file in a third-party app. If set to FALSE, disables users from sharing a file from Salesforce1 or opening a Salesforce file in a third-party app.
SHOW_PRINT	<ul style="list-style-type: none"> TRUE FALSE 	iOS	<ul style="list-style-type: none"> If set to TRUE, lets users print from Salesforce1. If set to FALSE, disables printing from Salesforce1.

Tip: Connected app attribute changes take effect when users force quit Salesforce1 or when they log in to a new session. To ensure that new or modified settings take effect for all users, we recommend that you revoke access to Salesforce1 so everyone is required to log in again.

We also recommend that you warn users about the changes you intend to make, especially if you're going to restrict activities that were previously available. Salesforce1 doesn't display messages or indicators that connected app settings have changed.

Enable the Salesforce1 Mobile Browser App

You can control whether users can access the Salesforce1 mobile browser app when they log in to Salesforce from a supported mobile browser. By default, the mobile browser app is turned on for your organization.

Important: Use of the Salesforce Classic full site in a mobile browser isn't supported. While you can disable the Salesforce1 mobile browser app for your organization, and individual users can turn off the mobile browser app for themselves, regular use of the full site in a mobile browser isn't recommended. Your users may experience problems that Salesforce Customer Support won't investigate.

It's not possible to access the Lightning Experience full site from any mobile browser.

1. From Setup, enter *Salesforce1 Settings* in the Quick Find box, then select **Salesforce1 Settings**.
2. Select **Enable the Salesforce1 mobile browser app** to allow all users in your organization to access the app. Deselect this option to turn off access to the app.
3. Click **Save**.

When this option is turned on, users who log in to Salesforce from a supported mobile browser are automatically directed to the Salesforce1 interface. Logging in from an unsupported mobile browser loads the Salesforce Classic full site, even when this option is selected.

In most cases, logging in from an unsupported mobile browser loads the Salesforce Classic full site, even if the **Enable the Salesforce1 mobile browser app** option is enabled. There are two exceptions for iPhone and iPad users, however. Users can access the mobile browser app from Google Chrome for iOS or the Gmail for iOS app's webview, but using Salesforce1 in these environments isn't supported.

Salesforce1 and Password Manager Apps

Good security practices require long, complex passwords. But typing long, complex passwords on small mobile keyboards is error prone and frustrating. Effectively, your users are penalized for being secure. Well, if your org uses password management, your Salesforce1 for iOS users are free to leave the penalty box. With version 11.0 or later of the Salesforce1 downloadable app for iOS, users can use a password manager app to simplify the login process down to a few taps.

Salesforce1 for iOS integrates with 1Password™, LastPass™, or other password manager apps that support the iOS password manager extension. After you set up password management for your org, Salesforce1 users simply tap  on the login page then select a password manager app from the list.

Salesforce1 Mobile App Navigation Menu

Learn about the items that can appear in the Salesforce1 navigation menu. You can customize most aspects of the navigation menu for your organization.

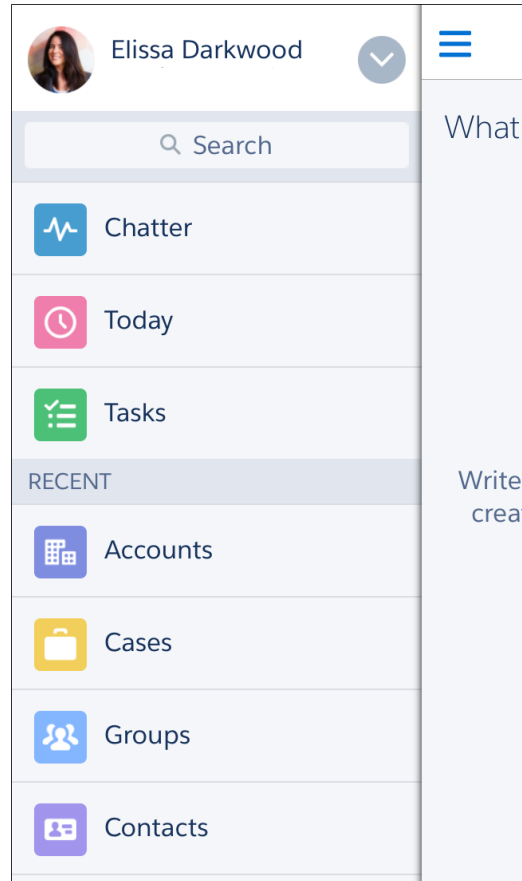

The  icon in the Salesforce1 header opens the navigation menu.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

If the default navigation menu doesn't meet your users' needs, you can easily customize it. From Setup, enter *Navigation* in the **Quick Find** box, then select **Salesforce1 Navigation**.

Depending on your organization's settings, the menu can contain:

Menu Item	Description
Approval Requests	Displays a list of the user's pending approvals. Users can tap an approval item and approve or reject it from within Salesforce1. Available in the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app.
Canvas apps	Appears for organizations that have enabled a canvas app to appear in the Salesforce1 navigation menu.
Chatter	The user's main feed. Appears for organizations that have Chatter enabled.
Dashboards	Availability depends on edition and user permissions. If you don't add this item to the navigation menu, dashboards are automatically included in the set of Smart Search Items instead and the Dashboards item is available from the Recent section.
Events	Lists events owned by the user, that the user created for him- or herself, and that the user or a user's groups are invited to. If you don't add this item to the navigation menu, events are automatically included in the set of Smart Search Items instead and the Events item is available from the Recent section.

Menu Item	Description
Forecasts	<p>Displays the Forecasts app, a helpful tool for every member of a sales team to keep track of forecast data and monitor progress towards quota. Available in the Salesforce1 downloadable app for iOS only.</p> <p> Note: Your org must have Collaborative Forecasts enabled. If your org uses Customizable Forecasts, the Forecasts item isn't available to add to the navigation menu.</p>
Groups	<p>Appears for organizations that have Chatter enabled. If you don't add this item to the navigation menu, groups are automatically included in the set of Smart Search Items instead and the Groups item is available from the Recent section.</p>
Lightning component tabs	<p>Only custom Lightning components that have a Lightning component tab associated with them can appear in the Salesforce1 navigation menu.</p>
Lightning Pages	<p>Custom app pages.</p>
News	<p>Displays the News app, a one-stop place for news and other insights about the user's accounts, contacts, leads, and opportunities.</p>
Notes	<p>Displays the Notes app. If you don't add this item to the navigation menu, notes are automatically included in the set of Smart Search Items instead and the Notes item is available from the Recent section.</p>
Paused Flow Interviews	<p>Displays a list of flow interviews that the user paused. An interview is a running instance of a flow. Users can tap an interview and resume or delete it from within Salesforce1. Available in the Salesforce1 mobile browser app only.</p>
People	<p>Appears for organizations that have Chatter enabled. If you don't add this item to the navigation menu, profiles are automatically included in the set of Smart Search Items instead and the People item is available from the Recent section.</p>
Reports	<p>Availability depends on edition and user permissions. If you don't add this item to the navigation menu, reports are automatically included in the set of Smart Search Items instead and the Reports item is available from the Recent section.</p>
Smart Search Items	<p>Adds standard and custom Salesforce objects to the Recent section in the menu. This item also adds a set of the user's recently accessed objects to the Recent section and adds the More item so users can access all the objects they have permission to use and that are supported in Salesforce1. If you don't include this item in the navigation menu, users can't access any objects on the navigation menu.</p> <p> Note: Smart Search Items is required for users to get search results in the Salesforce1 downloadable app for Android. Users of the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app are able to search for records if this option is omitted from the navigation menu.</p> <p>If your users don't yet have a history of recent objects, they initially see a set of default objects in the Recent section. It can take up to 15 days for the objects that users work with regularly in both Salesforce1 and the full Salesforce site to appear in the Recent section. To make objects appear under Recent sooner, users can pin them from the search results screen in the full site.</p>

Menu Item	Description
Tasks	Lists of a user's open and closed tasks and tasks that have been delegated. If you don't add this item to the navigation menu, tasks are automatically included in the set of Smart Search Items instead and the Tasks item is available from the Recent section.
Today	An app that helps users plan for and manage their day by integrating mobile calendar events with associated Salesforce tasks, accounts, and contacts. The app also allows users to instantly join conference calls, quickly log notes about events, and more. Available in the Salesforce1 downloadable apps only.
Visualforce page tabs	Only Visualforce pages with the <code>Available for Salesforce mobile apps and Lightning Pages</code> checkbox selected will display in Salesforce1.

Things to Keep in Mind

- You can't set different menu configurations for different types of users.
- Anything represented by a tab in Salesforce—such as standard and custom objects, Visualforce pages, the Chatter feed, People, or Groups—is visible for a user in the Salesforce1 menu, based on the user's profile settings. For example, if a user is assigned to a profile that has the Groups tab set to Tab Hidden, the user won't see the Groups menu item in Salesforce1, even though an administrator has included it in the menu.
- The navigation menu in a community isn't controlled via the Navigation Menu settings page. Instead, the tabs that are specified in Tabs & Pages in the community's administration settings determine the contents of the community's navigation menu.

[Customize the Salesforce1 Navigation Menu](#)

[Notes About the Salesforce1 Navigation Menu](#)

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

Customize the Salesforce1 Navigation Menu

Customize your users' mobile Salesforce experience by selecting the menu items, apps, Visualforce pages, or Lightning Pages to display in the Salesforce1 navigation menu.

Note: Before you can include Visualforce pages, Lightning Pages, or Lightning components in the Salesforce1 navigation menu, create tabs for them. From Setup, enter *tabs* in the Quick Find box, then select **Tabs**.

[Walk Through It: Customize the Salesforce1 Navigation Menu](#)

1. From Setup, enter *Navigation* in the Quick Find box, then select **Salesforce1 Navigation**
2. Select items in the Available list and click **Add**.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

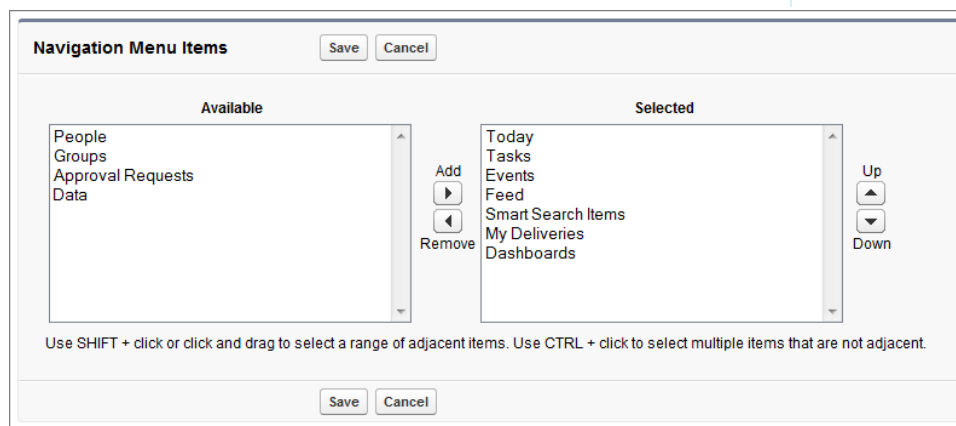

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

USER PERMISSIONS

To customize the Salesforce1 navigation menu:

- "Customize Application"

3. Sort items by selecting them and clicking **Up** or **Down**.

The order you put items in the Selected list is the order that they display in the navigation menu.

Note: The first item in the Selected list becomes your users' Salesforce1 landing page.

4. Click **Save**.

Once saved, the navigation menu items and their order should be reflected in Salesforce1. You may need to refresh to see the changes.

Tip: When organizing the menu items, put the items that users will use most at the top. The Smart Search Items element can expand into a set of eight or more menu items and it might end up pushing other elements below the scroll point if you put it

near the top of the menu. Anything you put below the Smart Search Items element appears in the Apps section of the navigation menu.

SEE ALSO:

[Salesforce1 Mobile App Navigation Menu](#)

[Notes About the Salesforce1 Navigation Menu](#)

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

Notes About the Salesforce1 Navigation Menu

Some objects are excluded from the Recent section in the Salesforce1 navigation menu, even if you accessed them recently.

- People, groups, notes, dashboards, reports, tasks, and events, if these items were added directly to the navigation menu
- List views, which are shown only on object home pages, not in the navigation menu
- Objects that aren't available in Salesforce1, including any objects that don't have a tab in the full Salesforce site

About the Dashboards, Reports, Notes, Tasks, Events, Groups, and People Menu Items

If you opt to add the Dashboards, Reports, Notes, Tasks, Events, Groups, or People items to the Selected list for the Salesforce1 navigation menu, these items appear in the order you specify, just like Today and other individual menu items.

If you don't add these items to the navigation menu, however, they're automatically included in the Smart Search Items set of objects and show up in the Recent section of the navigation menu.

Pin an Object into the Recent Section

Users can customize the objects that appear in the Recent section of the Salesforce1 navigation menu. If they search for an object in the full site, they can hover their mouse over the object name and click  to pin it to the top of the search results. The order of pinned objects in the full site determines the order of the objects that stick to the top of the Recent section of the navigation menu. However, pinning objects in this way causes the unpinned objects remaining in the Recent section to drop into the **More** element.

Smart Search Items and Search Results in Salesforce1

Smart Search Items adds standard and custom Salesforce objects to the Recent section of the navigation menu. Removing Smart Search Items from the navigation menu means Salesforce1 users can't access objects (including object home pages and list views) from the menu.

Removing Smart Search Items also impacts search options in Salesforce1. Because object home pages aren't available, it's not possible to run object-specific searches. The impact on global search depends on the Salesforce1 app.

- With the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app, users can find and access their records from global search results.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

- The Salesforce1 downloadable app for Android requires Smart Search Items for global search to work. If Smart Search Items is omitted from the navigation menu, Android users can't locate records using global search.

Salesforce1 Mobile App Notifications

Notifications let your users know when certain events occur in Salesforce. For example, notifications let users know when they receive approval requests or when someone mentions them in Chatter.

These types of notifications can appear to Salesforce1 users.

- *In-app notifications* keep users aware of relevant activity while they're using Salesforce1. By tapping , a user can view the 20 most recent notifications received within the last 90 days.

If Salesforce Communities is enabled for your organization, users see notifications from all of the communities they're members of. To help users easily identify which community a notification came from, the community name is listed after the time stamp.

- *Push notifications* are alerts that appear on a mobile device when a user has installed the Salesforce1 downloadable app but isn't using it. These alerts can consist of text, icons, and sounds, depending on the device type. If an administrator enables push notifications for your organization, users can choose individually whether to receive push notifications on their devices.

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

Including Full Content in Push Notifications

-  **Note:** Some notifications include text that your users enter in Salesforce. To ensure that sensitive information isn't distributed through a third-party service without proper authorization, push notifications include minimal content (such as a user's name) unless you enable full content in push notifications.

For example, suppose an in-app notification reads: "Allison Wheeler mentioned you: @John Smith, heads-up! New sales strategy for Acme account." By default, the equivalent push notification would be "Allison Wheeler mentioned you." However, if you enabled full content in push notifications, this push notification would include the same (full) content as the in-app notification.

SEE ALSO:

[Enable Salesforce1 Mobile App Notifications](#)

Enable Salesforce1 Mobile App Notifications

Allow all users in your organization to receive mobile notifications about events in Salesforce, for example when they receive approval requests or when someone mentions them in Chatter.

1. From Setup, enter *Salesforce1 Notifications* in the `Quick Find` box, then select **Salesforce1 Notifications**.
2. Select the notifications that you want your Salesforce1 users to receive.
3. If you're authorized to do so for your company, select `Include full content in push notifications`.
4. Click **Save**.

If you selected the option to include full content in push notifications, a pop-up appears displaying terms and conditions. If you click **OK**, you're agreeing to the terms and conditions on behalf of your company.

A user can receive approval requests in Salesforce1 notifications only when the user receives approval requests as email notifications. You or your user can change the `Receive Approval Request Emails` user field to set this preference.

Work Offline with the Salesforce1 Mobile App

Your mobile users' productivity doesn't have to stop when there's no connectivity. When you enable caching and Offline Edit for Salesforce1, users can keep working, unimpeded by a subway commute, FAA regulations, capricious cellular signals, or bunker-style buildings. Offline access is available for the Salesforce1 downloadable apps. The beta version of Offline Edit requires version 10.0 of the Salesforce1 for Android downloadable app or the Salesforce1 for iOS downloadable app.

Manage Salesforce1 caching and Offline Edit from Setup—enter *Salesforce1* in the `Quick Find` box, then select **Salesforce1 Offline**.

[Access Data in Salesforce1 While Offline](#)

With caching in Salesforce1 enabled, your Salesforce1 downloadable app users can see important data when working offline or when the mobile app can't connect to Salesforce. Salesforce1 caches a set of a user's recently accessed records so they're available for viewing without a connection. And much of the data that a user accesses throughout a Salesforce1 session is also added to the cache. Cached data is encrypted and stored in a secure, persistent data store.

[Create, Edit, and Delete Records in Salesforce1 While Online or Offline \(Beta\)](#)

Whether online or offline, Salesforce1 downloadable app users can create, edit and delete records and keep track of all of the changes from the Pending Changes page. Salesforce1 automatically syncs those pending changes to Salesforce and warns the user if there are conflicts that need to be resolved. The beta version of Offline Edit requires version 10.0 of Salesforce1 for Android or Salesforce1 for iOS.

[Data and UI Elements That Are Available When Salesforce1 is Offline](#)

With Salesforce1 caching and Offline Edit, Salesforce1 downloadable app users can work with many of their frequently accessed objects and records while offline. Here's the list of data and Salesforce1 user interface elements that are available offline.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

USER PERMISSIONS

Enable Offline Access and Edit for Salesforce1

With just a few clicks, you can protect your Salesforce1 users against the vagaries of mobile connectivity. You can enable two levels of offline access: caching frequently accessed records, so users can view data while offline, and Offline Edit, so users can create, edit, and delete records while offline. Offline access is available in the Salesforce1 downloadable apps only. The beta version of Offline Edit is available in the Salesforce1 downloadable apps for Android and iOS version 10.0 or later.

SEE ALSO:

[Offline Access: What's Different or Not Available in Salesforce1](#)

Access Data in Salesforce1 While Offline

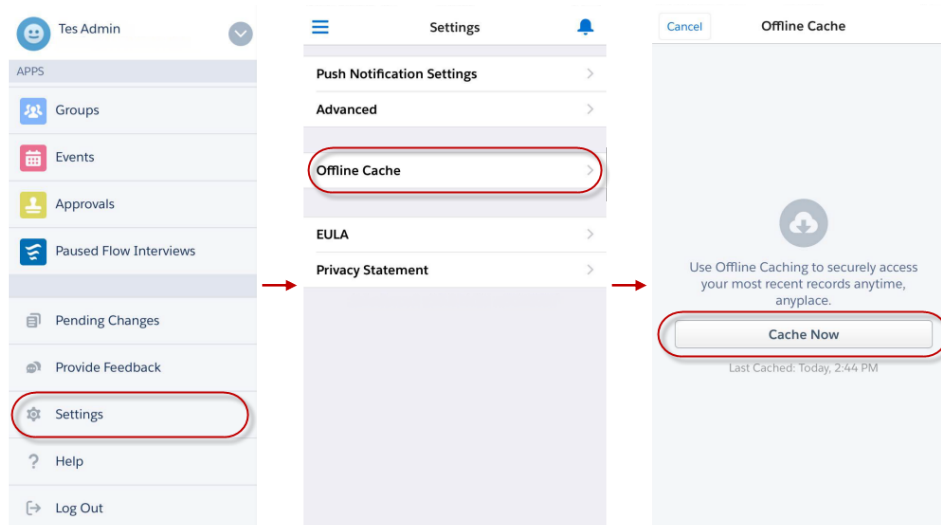

With caching in Salesforce1 enabled, your Salesforce1 downloadable app users can see important data when working offline or when the mobile app can't connect to Salesforce. Salesforce1 caches a set of a user's recently accessed records so they're available for viewing without a connection. And much of the data that a user accesses throughout a Salesforce1 session is also added to the cache. Cached data is encrypted and stored in a secure, persistent data store.

Caching in Salesforce1 is enabled the first time someone in your org installs one of the Salesforce1 downloadable apps.

The contents of a user's cache determines the data that's accessible when the user's mobile device is offline. Let's look at how the cache is initially populated and then updated throughout a Salesforce1 session.

 **Note:** A Salesforce1 session is the time between logging in to and out of the app. Putting the app in the background by switching away to a different app doesn't end a session.

- When a user logs in to Salesforce1, the cache is empty. If the user's device goes offline with an empty cache, no Salesforce data is available.
- Users can quickly populate the cache with a default set of most recently accessed records in two ways. Users can put Salesforce1 in the background by switching away to a different app or navigating to the device home screen to populate their cache. Or users can go to the Salesforce1 navigation menu, select **Settings > Offline Cache > Cache Now**.

 **Tip:** We recommend that your users populate their cache each time they log in to Salesforce1 so they're guaranteed to have a meaningful set of available data when offline.

Depending on the size and complexity of a user's records, caching can take a few seconds to a couple of minutes. If the user goes offline before the cache is fully updated, some of the expected records won't be available.

Populating the cache collects recently accessed records for the first five objects listed in the Recent section of the user's Salesforce1 navigation menu, plus the user's recent tasks and dashboards. For the first five objects listed in the Recent section of the Salesforce1 navigation menu, up to 30 most recently accessed records are cached per object. For tasks and dashboards, the tasks listed under **My Tasks** and the five most recently accessed dashboards are cached. Recently accessed records are determined by a user's activities in both Salesforce1 and the full Salesforce site, including Salesforce Classic and Lightning Experience.

After users initially populate their cache, users can refresh their cache in two ways. If the last cache refresh is more than one hour old, users can put Salesforce1 in the background by switching away to a different app or navigating to the device home screen to refresh the cache. Or users can manually refresh the cache by going to the Salesforce1 navigation menu, select **Settings > Offline Cache > Cache Now**.

- Throughout a Salesforce1 session, many of the other records that the user accesses are also added to the cache. (Not all Salesforce data is available offline—see [Data and UI Elements That Are Available When Salesforce1 is Offline](#).)
- A record remains in the user's cache for 30 days. Each time the same record is accessed, the clock resets. But if the record isn't touched within 30 days, it's automatically removed from the cache and won't be available offline until the user accesses the record again.
- Logging out of Salesforce1 removes all data from the cache. The next time the user logs in, the process of generating the cache starts over.

SEE ALSO:

- [Data and UI Elements That Are Available When Salesforce1 is Offline](#)

- [Create, Edit, and Delete Records in Salesforce1 While Online or Offline \(Beta\)](#)
- [Offline Access: What's Different or Not Available in Salesforce1](#)

Create, Edit, and Delete Records in Salesforce1 While Online or Offline (Beta)

Whether online or offline, Salesforce1 downloadable app users can create, edit and delete records and keep track of all of the changes from the Pending Changes page. Salesforce1 automatically syncs those pending changes to Salesforce and warns the user if there are conflicts that need to be resolved. The beta version of Offline Edit requires version 10.0 of Salesforce1 for Android or Salesforce1 for iOS.

 **Note:** This release contains a beta version of Offline Edit, which means it's a high-quality feature with [known limitations](#). To enable this feature in your org, see [Enable Offline Access and Edit for Salesforce1](#). Offline Edit isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only based on generally available products and features. You can provide feedback and suggestions for Offline Edit in the [IdeaExchange in the Success Community](#).

Keep Track of Updates

Users can keep track of all changes made while online or offline from the Pending Changes page. This page is available from the Salesforce1 navigation menu.

Understanding the Status of Updates

To help users monitor the status of changes made while online or offline, visual indicators display in several places in Salesforce1, including: the Pending Changes page, object home pages, and in the highlights area on updated records.

- : Indicates that there are no conflicts to changes made while online or offline. Records disappear from the Pending Changes page after successfully syncing to Salesforce.
- : Indicates that there are conflicts to changes that must be resolved.
 - If the changes are made while online, the  appears immediately to indicate that there are conflicts.
 - If the changes are made while offline, the  appears when network connectivity is restored to indicate that there are conflicts.

Pending changes may contain conflicts for several reasons:

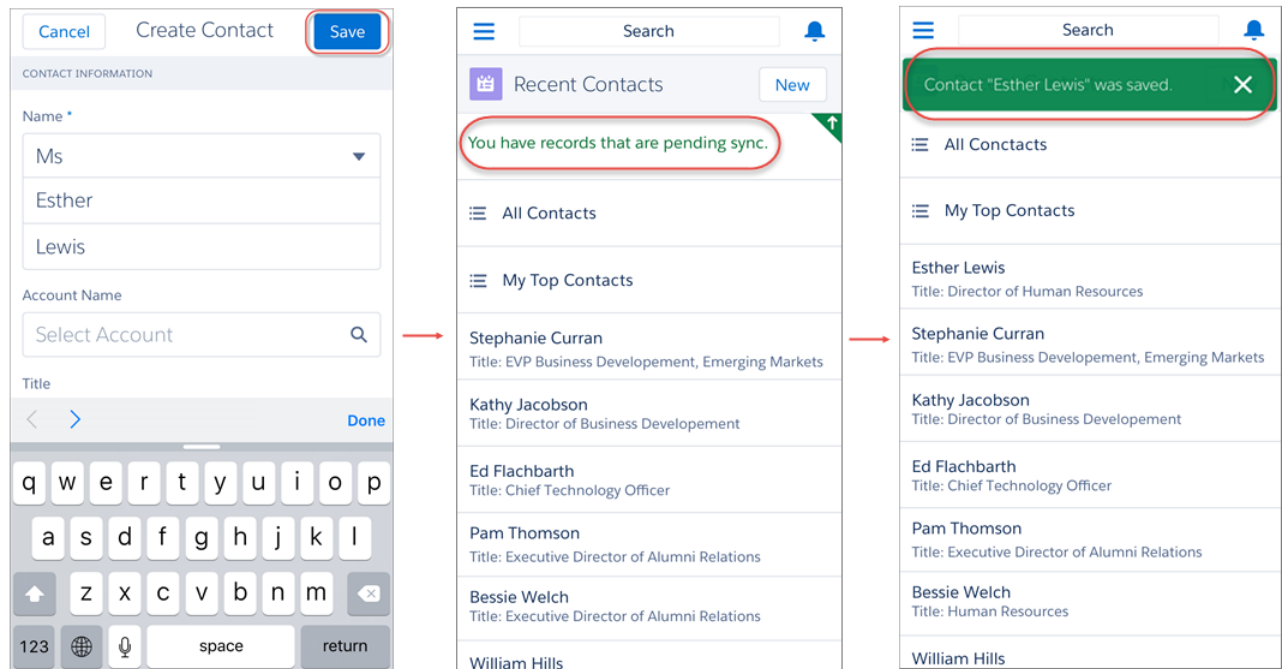

- Validation rule error
- Apex trigger error
- Workflow rule error
- Duplicate rule error

When users tap on a record where  appears, they are taken to a Conflict Resolution page to resolve the issue. After the conflict is resolved, the record disappears from the Pending Changes page after successfully syncing to Salesforce.

- : Indicates that an error has occurred.
 - If the changes are made while online, the  appears immediately to indicate an error.
 - If the changes are made while offline, the  appears when network connectivity is restored to indicate an error.

When users tap on a record where  appears, they are taken to the edit page of that record to fix the error.

While rare in occurrence, sometimes an error is irreconcilable. For example, if an edit is made to a record while offline and someone else deleted that record from Salesforce, the  that appears on that change is irreconcilable. In this scenario, users can only dismiss the irreconcilable change from the Pending Changes page.

See [Data and UI Elements That Are Available When Salesforce1 is Offline](#) for the full list of data that can be updated with Offline Edit.

Data and UI Elements That Are Available When Salesforce1 is Offline

With Salesforce1 caching and Offline Edit, Salesforce1 downloadable app users can work with many of their frequently accessed objects and records while offline. Here's the list of data and Salesforce1 user interface elements that are available offline.

Salesforce Data / Salesforce1 Element	Available for Offline Viewing	Available to Create, Edit, or Delete Offline (Beta)
Navigation Menu	Yes	n/a
Action Bar	Yes	Edit action: Yes Delete action: Yes Other actions: No
Global Search	Previous search results from current session	n/a
List Views	If viewed in current session	No
Records for Recent Objects	Yes, recently accessed records for the first five objects (excluding Files) in the Recent section of the Salesforce1 navigation menu	Yes, recently accessed records for the first five objects (excluding Files) in the Recent section of the Salesforce1 navigation menu
Records for Other Objects	If viewed in current session	If viewed in current session
Related Records	If viewed in current session	If viewed in current session
Salesforce Today	Main page and mobile event records, if viewed in current session	No
Salesforce Events	If viewed in current session	Create: No Edit and Delete: If viewed in current session
Tasks	Most recently accessed tasks from the first page of My Tasks list only	Most recently accessed tasks from the first page of My Tasks list only (The simplified New Task form must be disabled)
Notes	If viewed in current session	Create: Yes Edit: If viewed in current session Delete: No
Files	If viewed in current session	No
Dashboards (Enhanced Charts)	Most recently accessed only	No
Dashboards (Legacy Charts)	No	No
Feeds, Groups, and People	If viewed in current session	No
Notifications	If viewed in current session	n/a
Approvals (submit, approve, or reject)	No	No
Visualforce pages	No	No
Canvas Apps	No	No
Lightning Pages	No	No
Salesforce1 Settings	Yes	n/a

A Salesforce1 session is the time between logging in and logging out of the app. Switching away from Salesforce1 doesn't end the session as long as the user doesn't log out.

SEE ALSO:

[Offline Access: What's Different or Not Available in Salesforce1](#)

Enable Offline Access and Edit for Salesforce1

With just a few clicks, you can protect your Salesforce1 users against the vagaries of mobile connectivity. You can enable two levels of offline access: caching frequently accessed records, so users can view data while offline, and Offline Edit, so users can create, edit, and delete records while offline. Offline access is available in the Salesforce1 downloadable apps only. The beta version of Offline Edit is available in the Salesforce1 downloadable apps for Android and iOS version 10.0 or later.

1. From Setup, enter *Salesforce1* in the **Quick Find** box, then select **Salesforce1 Offline**.
2. To allow viewing data while offline, select **Enable caching in Salesforce1**.
This option is automatically enabled the first time someone in your org installs one of the Salesforce1 downloadable apps.
3. To allow updating records while offline, select **Enable offline create, edit, and delete in Salesforce1 (Beta)**.
This option isn't available if caching in Salesforce1 is disabled.
4. Click **Save**.

 **Tip:** We strongly recommend leaving **Enable caching in Salesforce1** enabled. In addition to making cached data available offline, this setting also enables faster viewing of previously-accessed records and better overall performance. If you disable caching, the Salesforce1 downloadable apps only store the minimum data required to maintain a session. This can impact performance because the app has to refresh record details and feed items every time they're viewed.

Enable Visualforce Pages for the Salesforce1 Mobile App

You can use Visualforce to extend the Salesforce1 app and give your mobile users the functionality that they need while on the go. Before adding a Visualforce page to Salesforce1, make sure the page is enabled for mobile use or it won't be available in the mobile apps.

 **Tip:** Before exposing existing Visualforce pages in Salesforce1, consider how they'll look and function on mobile phones and tablets. Most likely, you'll want to create a new page specifically for mobile form factors.

Visualforce pages must be enabled for mobile use before they can display in these areas of the Salesforce1 user interface:

- The navigation menu, via a Visualforce tab
- The action bar, via a custom action
- Mobile cards on a record's related information page
- Overridden standard buttons, or custom buttons and links
- Embedded in record detail page layouts
- Lightning pages

To enable a Visualforce page for Salesforce1:

1. From Setup, enter *Visualforce Pages* in the Quick Find box, then select **Visualforce Pages**.
2. Click **Edit** for the desired Visualforce page.
3. Select **Available for Salesforce mobile apps and Lightning Pages** then click **Save**.

Consider these notes about Visualforce support in Salesforce1.

- Standard tabs, custom object tabs, and list views that are overridden with a Visualforce page aren't supported in Salesforce1. The Visualforce page is shown for full site users, but Salesforce1 users will see the default Salesforce1 page for the object. This restriction exists to maintain the Salesforce1 experience for objects.
- You can also enable Visualforce pages for Salesforce1 through the metadata API by editing the `isAvailableInTouch` field on the `ApexPage` object.
- The `Salesforce Mobile Classic Ready` checkbox on Visualforce Tab setup pages is for Salesforce Mobile Classic only and has no effect on Visualforce pages in the Salesforce1 apps.

"Author Apex"

Your Org's Branding in the Salesforce1 Mobile App

You can customize the Salesforce1 mobile app to match some aspects of your company's branding, so the app is more recognizable to your mobile users. Custom branding is displayed in all of the Salesforce1 apps.

 **Note:** Images that you upload to customize the Salesforce1 app are stored in a Documents folder named Salesforce1 Branding Resources. For this reason, the Documents object must be enabled for your organization before administrators can view and modify the Salesforce1 Branding page. (The Documents tab doesn't need to be visible, however.)

For users of the Salesforce1 mobile browser app to see custom branding, Documents must be enabled for your organization. For the Salesforce1 downloadable apps, users must also have "Read" user permissions on Documents.

You can customize:

Element	Description
Brand Color	<p>The color for key user interface elements such as the header, buttons, and search bar.</p> <p>Based on the brand color you select, contrasting colors for user interface elements such as borders for the navigation menu, the notifications list, and button text are automatically defined.</p> <p>The headers on overlays, popups, and dialogs—such as edit and create windows or windows that open from actions in the action bar—aren't affected by this setting. These headers are always white, to provide a visual indicator that the user is performing an action as opposed to simply viewing information.</p>
Loading Page Color	The background color on the loading page that appears after a mobile user logs in.
Loading Page Logo	<p>The image on the loading page that appears after a mobile user logs in.</p> <p>We recommend using an image with the largest dimensions allowable for best results. Maximum image size is 460 pixels by 560 pixels.</p>

Consider the following tips when customizing the branding of the Salesforce1 app:

- When creating your logo image, be sure to compress it. In many image editing programs, this process is identified as "use compression," "optimize image," "save for web," or "shrink for the web."
- Verify that your logo appears correctly in Salesforce1, using the same devices as your user base, not just a desktop monitor. Your image can render at different scales or proportions depending on the screen size and pixel density of each device.
- Salesforce1 supports .png, .gif, and .jpg image formats for custom branding elements, but we recommend using .png for the best results.
- These interface elements can't be customized:
 - The Salesforce1 app icon that appears on the mobile device's home screen.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

- The initial loading screen when launching the Salesforce1 downloadable app for iOS. This loading screen appears before the user is prompted by the login page.
- Your mobile users must close the app and then log in again to see any custom branding changes.

You can also customize the branding for the Salesforce1 app login page. My Domain must be enabled to modify the login page. To customize your company's Salesforce1 login page, see [Customize Your Login Page with Your Brand](#) on page 993.

[Customize Branding of the Salesforce1 Mobile App](#)

Customize Branding of the Salesforce1 Mobile App

Change the Salesforce1 mobile app's appearance, including the loading page background color, loading page logo, and header background color, so the app matches your company's branding.

 **Note:** Images that you upload to customize the Salesforce1 app are stored in a Documents folder named Salesforce1 Branding Resources. For this reason, the Documents object must be enabled for your organization before administrators can view and modify the Salesforce1 Branding page. (The Documents tab doesn't need to be visible, however.)

For users of the Salesforce1 mobile browser app to see custom branding, Documents must be enabled for your organization. For the Salesforce1 downloadable apps, users must also have "Read" user permissions on Documents.

1. From Setup, enter *Branding* in the **Quick Find** box, then select **Salesforce1 Branding**, then click **Edit**.
2. To customize brand color for key user interface elements, including the header, click  or enter a valid hexadecimal color code.
3. To customize the background color of the loading page, click  or enter a valid hexadecimal color code.
4. To customize the loading page logo, click **Choose File** to upload an image. Images can be .jpg, .gif, or .png files up to 200 KB in size. The maximum image size is 460 pixels by 560 pixels.
5. Click **Save**.

Test Current Network Conditions from the Salesforce1 Downloadable App

Do your users ever ask why the Salesforce1 mobile app is snappy in some locations but a little sluggish in others? Obviously the condition of a network can affect how Salesforce1 performs. If a user experiences issues with the Salesforce1 downloadable app for iOS, version 10.0.2 or later, have him test his network so you can rule it out as the source of the problem.

To test a network, open the Salesforce1 navigation menu, then select **Settings > Test My Network**. From here, users can test ping, download speed, and upload speed.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

USER PERMISSIONS

To view Salesforce1 branding settings:

- "View Setup and Configuration"

To modify Salesforce1 branding settings:

- "Customize Application"
"Modify All Data"

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

This Test ...	Tells You ...
Ping	How long it takes for the app to send a request to Salesforce and then get a reply. In general, lower ping times are better than higher ones. If there's no result at all, the network may not be connected to the Internet. Results are reported in milliseconds.
Download Speed	How long it takes the app to get data from Salesforce. In general, higher download speeds are better than lower ones. Results are reported in bits per second.
Upload Speed	How long it takes the app to send data to Salesforce. In general, higher upload speeds are better than lower ones. Results are reported in bits per second.

If a test doesn't return a result, or an error is displayed, your user may be experiencing network connectivity issues that are affecting Salesforce1. Ask the user to verify his Internet connection, and then run the test again. If the user continues to experience issues, ask him to try connecting to another network.

What's Different or Not Available in the Salesforce1 Mobile App

The Salesforce1 mobile app doesn't include all the functionality that's available in the full Salesforce site, whether your org is using Lightning Experience or Salesforce Classic. Learn about the Salesforce features that aren't available in Salesforce1, that have functional gaps from what you're used to in the full site, or that work differently in Salesforce1.

Data Access and Views: What's Different or Not Available in Salesforce1

Supported Objects and Data

These objects are available as items in the Salesforce1 navigation menu. You can create, view, and edit records for these objects unless noted otherwise.

- Accounts
- Assets
- Campaigns
- Cases
- Contacts
- Content Libraries (*iOS downloadable app only*)
- Contracts
- D&B Company (*view only, for Data.com Prospector and Data.com Clean customers*)
- Dashboards (*view only*)
- Events
- Files
- Field Service Lightning (Operating Hours, Service Appointments, Service Resources, Service Territories, Work Types) (*mobile browser app only*)
- Forecasts (*iOS downloadable app only*)
- Knowledge Articles (*view only*)
- Leads
- Live Chat Transcripts
- Opportunities
- Orders
- Quotes (*create from opportunities only*)
- Reports (*view only*)
- Social Personas and Social Posts
- Tasks
- Work.com Coaching, Goals, Thanks, Rewards, and Skills (*Skills not available in the iOS downloadable app*)
- Work Orders
- Custom objects that have a tab you can access
- Salesforce Connect external objects that are searchable and have a tab you can access

 **Note:** To be available in Salesforce1, an object must have a tab that you can access. This is true for supported standard objects and your org's custom and external objects.

Salesforce1 doesn't support the User object or provide access to user record detail pages. However, user fields are supported and appear on user profiles, in related lists, and so forth. See "Fields" for some issues with user fields in Salesforce1.

Salesforce1 doesn't support:

- Standard or custom Salesforce apps. (Instead, the navigation menu gives users access to all of the objects that are available to them in the mobile app.)
- Salesforce Console or Agent Console.

- Advanced currency management.

Fields

Unsupported Fields

- division fields
- territory management fields

Combo Boxes

- Combo boxes, which combine a picklist with a text field, aren't available. Typically the text field is available but the picklist is not.

Lookup Fields

- Administrator-defined dependent lookup filters aren't supported.
- User-defined lookup filter fields aren't supported.
- You can't create a record from a lookup field like you can in Lightning Experience.
- Lookup fields in Salesforce Classic show record names regardless of sharing permissions, so it's possible for users to see the names of records that they can't access. In Lightning Experience and the Salesforce1 mobile app, lookup fields respect sharing permissions and only show the name of records that the user can access. The one exception is owner lookup fields, which always display the name of the record's owner, regardless of sharing permissions.

Picklist Fields

- Controlling and dependent picklists are supported, but Salesforce1 doesn't display indicators on create and edit pages for these fields. To determine if a picklist field is dependent, and which picklist field controls it, switch to the full site.
- Disabled picklists aren't grayed out like they are in the full site.

Phone Number Fields

- The keypad that displays in phone number fields doesn't include parentheses, hyphens, or periods, and Salesforce1 doesn't apply any phone number formatting when you save the record. To apply a specific phone number format, edit the record in the full site.

Rich Text Area Fields

Support for rich text area fields varies by the version of Salesforce1 and the type of device.

Device	Salesforce1 Version	View Rich Text Area Fields	Edit Rich Text Area Fields
Android	Downloadable App Mobile Browser App	Yes	Yes The rich text editor isn't available. But you can manually add HTML tags.
iOS	Downloadable App	Yes	No
iOS	Mobile Browser App	Yes	Yes The rich text editor is available.
Windows	Mobile Browser App	No	No

User Fields

- While user detail pages aren't available in the Salesforce1 mobile app, user fields are supported and appear on user profiles, in related lists, and so forth.
- There are some issues when these user fields appear in related lists or mobile cards.
 - The `Company Name` field is blank if an internal user is viewing a mobile card or related list entry related to another internal user. If the referenced user is an external user, the company name appears correctly.
 - The `Active` field is blank unless the user is inactive.

List Views

- You can create new list views in Salesforce1 but you can't edit existing list views.
- Editing a record's field in a list view isn't available. Instead, users can open the record then tap the **Edit** action.
- Selecting multiple records in list views isn't supported in Salesforce1.
- Mass actions, which allow you to apply an action to multiple records at the same time, aren't available.

Record View and Record Highlights

- Customizations made to record highlights with Lightning App Builder, such as hiding fields or actions or displaying the highlights area vertically instead of horizontally, don't apply to Salesforce1.
- Sections on the record detail page aren't collapsible.

Related Lists

- Related lists in Salesforce1 display the first four fields that are defined in the Related List section on an object's page layout. The number of fields shown can't be increased.
- Some related lists aren't available in the mobile app, including:
 - Content Deliveries
 - External Sharing
 - Related Content

And see [Sales Features in Salesforce1](#), [Productivity Features in Salesforce1](#), and [Customer Service Features in Salesforce1](#) for related lists that aren't available for specific objects.

- The Notes and Attachments related list isn't fully supported in Salesforce1. There are several issues, including:
 - Attachments added in the full Salesforce site aren't guaranteed to open in Salesforce1, even if they appear in the related list. We recommend using Files instead. Documents that are uploaded to the Files tab in the full site are then viewable in Salesforce1.
 - You can't add or delete notes or attachments from the related list. (But you can create a note and relate it to a record, using the **Note** (📝) action in the Salesforce1 action bar. Depending on how your administrator has configured Notes in Salesforce1, this action may not be available for all objects.)
 - Notes and attachments on child records don't display on the parent record's related list.
- If a related list is sorted by a text area field, it doesn't display any records.

Sales Features: What's Different or Not Available in Salesforce1

Accounts

- Automated Account Fields isn't available, so when creating a new account, you won't see suggested companies in the **Account Name** field.
- Social Accounts:
 - You can't access social accounts features for Facebook, Klout, or YouTube in Salesforce1.
 - If an account has been linked to a social network profile, the profile image selected for the account may display when viewing the account in Salesforce1 even when you aren't logged in to the social network. Profile images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your account share on Twitter. You can't view common connections in the full Salesforce site.
 - To view the Twitter card on accounts in Salesforce1, you must add Twitter to the page layout. Access the full Salesforce site to edit page layouts. If your organization uses person accounts, the card must be added separately for business account layouts and person account layouts.
- The **Manage External Account** button isn't available.
- You can't view the account hierarchy.
- You can't merge accounts.
- You can view partners, notes, and attachments, but you can't edit them.
- Accounts Home reports and tools aren't available.
- Records in the Contact Roles related list are read only. The Roles field on the Contact Roles related list isn't available.
- The Account History related list isn't available.
- You can't clean account records with Data.com Clean.
- When navigating to a person account from a contact field in a related list or a record detail page (such as the Name field on an activity), you're taken to the Contact page layout, not the Person Account layout. Therefore, you might not see all the fields, related lists, and actions you expect. To navigate to the Person Account layout, tap the account name.
- Person accounts can't be edited or deleted from contact list views or contact related lists. Navigate to the person account record to edit or delete it.

Account Teams

- You can add, edit, or delete only one account team member at a time.
- When the account owner is changed, the account team is retained.
- Any user with edit access to an account can edit the account's team members, but only changes to the Team Role field are saved.
- The **Display Access** button isn't available.

Campaigns

- The **Manage Members** and **Advanced Setup** buttons aren't available.

- Campaign Hierarchy is available only as a related list. The option to **View Hierarchy** from a link on the campaign detail page isn't available. When viewing a parent campaign, the Campaign Hierarchy related list shows only the child campaigns, while the full site displays both the parent and child campaigns.
- When viewing the Campaign Members related list, only the members' Status appears. You can, however, tap members to see more details about them.

Contacts

- Contacts to Multiple Accounts:
 - Only the list item actions that are specific to the Account Contact Relationship object are available on the Related Accounts and Related Contacts related lists. Therefore, you see actions to view or remove the account-contact relationship, but not to edit or delete the contact or account record as you do in Salesforce Classic.
 - From the Related Contacts related list, you can navigate to a contact record, but not an account record.
 - When navigating to a person account from the Related Contacts related list, you're taken to the Contact page layout, not the Person Account layout. Therefore, you might not see all the fields, related lists, and actions you expect. To navigate to the Person Account layout, tap the account name.
- Social Contacts:
 - You can't access social contacts features for Facebook, Klout, or YouTube in Salesforce1.
 - If a contact has been linked to a social network profile, the profile image selected for the contact may display when viewing the contact in Salesforce1 even when you aren't logged in to the social network. Profile images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your contact share on Twitter. You can't view common connections in the full Salesforce site.
 - To view the Twitter card on a contact in Salesforce1, you must add Twitter to the page layout for contacts. Access the full Salesforce site to edit page layouts.
- Activity logs aren't created when you use the  icon to send emails from the Salesforce1 app.
- The **Request Update**, **Manage External User**, and **Enable Customer User** buttons aren't available.
- You can't add opportunities or account users on a contact, and you can't add a contact to a campaign.
- You can't merge contacts.
- You can't add contacts from Data.com or clean contact records with Data.com Clean.

Contracts

- The Deactivate button isn't available.
- These contracts related lists aren't available.
 - Contract History
 - Items to Approve
- Creating contact roles on contracts isn't available.
- When creating a new task or event or logging a call from a contract in Salesforce1, the **Related To** field isn't pre-populated with the contract number.

- When creating an order from the Orders related list on a contract, the `Contract Number` field isn't pre-populated with the default contract number.

Data.com and Data Integration

- Data.com Clean:
 - You can see fields updated by Clean jobs, but the option to manually clean records isn't available.
- Data.com Prospector:
 - Data.com Prospector isn't supported in Salesforce1.
You can't search for or add accounts, contacts, or leads. Nor can you see Prospecting Insights or Company Hierarchy.
- Data Integration:
 - You can see fields that were updated by data integration rules, but you can't use Data Integration to manually update records.

Einstein

- With the exception of lead scores appearing in lead list views in Salesforce1, all other Sales Cloud Einstein features are unavailable in the mobile app.

Forecasts

- The Forecasts app is available in the Salesforce1 downloadable app for iOS, version 11.0 or later only.
- The Forecasts app requires Collaborative Forecasts. The app isn't available for orgs using Customizable Forecasts.
- Forecast data in Salesforce1 is read-only.
- Only Opportunities - Revenue forecasts are available. These forecast types are not supported:
 - Opportunities - Quantity
 - Product Families - Revenue
 - Product Families - Quantity
 - Opportunity Splits - Revenue
 - Overlay Splits - Revenue
 - Custom Opportunity Currency Field - Revenue
 - Expected Revenue - Revenue
- Users can't change the forecasting currency.
- Showing and hiding quota information isn't supported.

Leads

- Social leads:
 - You can't access social leads features for Facebook, Klout, or YouTube in Salesforce1.
 - If a lead has been linked to a social network profile, the profile image selected for the lead may display when viewing the lead in Salesforce1 even when you aren't logged in to the social network. Profile images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.

- You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
- Salesforce1 lists common connections you and your lead share on Twitter. You can't view common connections in the full Salesforce site.
- To view the Twitter card on a lead in Salesforce1, you must add Twitter to the page layout for leads. Access the full Salesforce site to edit page layouts.
- Lead conversion:
 - You can select accounts but can't create them.
 - You can create opportunities but can't select existing ones.
 - You can't select lead sources across duplicate records. The lead source defaults to the duplicate contact.
 - You can't create related tasks during the conversion, but you can create tasks from the contact record.
 - You can't automatically notify owners of converted leads.
- The **Find Duplicates** and **Unlock Record** buttons aren't available.
- You can't merge leads.
- The Lead History related list isn't available.
- When adding a new lead, the `Campaign` field and the `Assign using active assignment rule` checkbox aren't available. You can add values to these fields in the full Salesforce site.

News

- When accessing news from Salesforce1 running on a smartphone, only one news item is displayed at a time.
- When accessing news from Salesforce1 running on a tablet, you can't scroll through the available news items. Instead, the device's screen size determines the number of news items that are displayed.
- When navigating to other records, more news items can become available. It takes longer for those news items to appear in the News app.
- On account records, we don't include news cards for executives, which let you see a list of news items related to a single person. Instead, each news item that's related to an executive is shown on a separate news card.

Opportunities

- The **Competitors** button isn't available.
- These fields aren't available: `Opportunity Splits` amount field, `Products` subtotal field, and `Stage History` connection field.
- Records in the Contact Roles related list are read only.
The `Roles` field on the Contact Roles related list isn't available.
- The Campaign Influence and Similar Opportunities related lists aren't available.
- These related lists are available but the lists display record preview cards only; you can't tap to open any of the list records.
 - Competitors
 - Opportunity Splits
 - Stage History

- The opportunity owner can't edit the `Forecast Category` field. `Forecast Category` is automatically populated based on the value of the `Stage Opportunities` field when you save the record. The opportunity owner can manually edit the value for `Forecast Category` in Salesforce Classic (but not from Lightning Experience).
- You can associate a price book with an opportunity that doesn't already have one, but you have to switch back to the full Salesforce site to change the association.
- You can't view product details, even for products that appear on the opportunity.
- You can add products with quantity or revenue schedules to an opportunity, but you can only edit product schedule in Salesforce Classic.

Opportunity Teams

- You can add, edit, or delete only one opportunity team member at a time.
- When the opportunity owner is changed, the opportunity team is retained.
- The **Clone** and **Display Access** buttons aren't available.

Orders

- The **Create** and **Reduce Order** buttons aren't available.
- The Order History and Order Product History related lists aren't available.
- When creating a new task or event or logging a call from an order in Salesforce1, the `Related To` field isn't pre-populated with the order number.
- When creating an order from the Orders related list on a contract, the `Contract Number` field isn't pre-populated with the default contract number.

Quotes

- Quote PDFs appear in the related list but aren't viewable.
- You can't add or edit multiple quote line items at the same time.
- You can't perform these actions.
 - Email quotes
 - Create or delete PDFs
 - Start sync or stop sync
 - Create quotes from the Quotes home page. You create quotes from opportunities.

Productivity Features: What's Different or Not Available in Salesforce1

Salesforce Today

The Salesforce Today app is available in the Salesforce1 downloadable apps for Android phones and iPhone and iPad devices. It's not available in the Salesforce1 mobile browser app, nor in the full Salesforce site.

There are some issues when using Today.

- You see local events from selected calendars on your mobile device but Salesforce events aren't available in this release of Today.
- If some or all of your calendar servers don't automatically push data to your device, you need to update your calendars before you can see the most current information in Today.

- The 24-hour time format isn't supported.
- When viewing a multiday event, only the ending date and time are displayed in the highlights area.
- The wrong date and time may display for recurring multiday events.
- If your calendar doesn't display invitee names because the list is too long, Today shows a count of "1 invitee" in the Current Event and Agenda cards on the main view and doesn't show any invitees when you open the event.
- Today is unable to find a matching Salesforce record for a meeting organizer of an iCloud event because the iCloud API doesn't return an email address.
- Today uses the mobile device's time zone setting, while Salesforce events respect the user's Salesforce time zone setting. If there's a difference between these settings when a user logs a local event from Today, the `Time` field in the new Salesforce event record reflects the user's Salesforce time zone and doesn't match the time of the local event.
- On Android devices, a meeting organizer's name may not display correctly if there isn't a matching Salesforce record for the person.
- If another user makes updates to a mobile calendar event record while you're viewing the record in Today on an Android device, you don't automatically see the changes. The record is refreshed the next time you select it from the Today main view.
- Because of the way that the Android OS identifies local events, if a user accesses Today on an Android device to log a local event in Salesforce, then views the same event in Today on a different Android device or an iOS device, it may look like the event wasn't logged and it isn't possible to access the corresponding Salesforce event from Today. The logged event status and link is correct on the original Android device, however.
- Chatter Free and Chatter External users aren't able to access Today because these user license types don't have access to contacts or person accounts.

Activities (Events and Tasks)

- The activity timeline from Lightning Experience isn't available.
- The `subject` field doesn't include a picklist of previously defined subjects.
- Activities can't be archived.
- You can't use Shared Activities to relate multiple contacts to an event or a task.
- Activity reminders aren't available.
- When an activity is related to a person account using only the `Name` field, the activity doesn't appear on the person account record.

Events and Calendars

- You can't see a full calendar like you can in the full site. Nor can you create a calendar from standard or custom objects.
- You can't accept or decline an event you've been invited to.
- You can't add events to Microsoft® Outlook®.
- You can't add invitees to events or remove them from events.
- Recurring events aren't available.
- Invitee related lists display slightly different content. In Salesforce1, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner. To reproduce the full site functionality in Salesforce1, use an API query; see [EventRelation](#).
- Events reflect your Salesforce time zone and locale settings, not the time zone setting on your mobile device.
- The date bar on the Events home page always begins on Sunday and ends on Saturday, regardless of your device and Salesforce locale settings.
- If you view the event list while the time advances from 11:59 PM to midnight, the list isn't automatically updated to display the next day's date and time.

Tasks

- Only the **My Tasks**, **Completed Within Last 7 Days**, **Delegated**, and **Today** lists are available in Salesforce1. No other task lists, such as **Overdue**, **This Month**, or **All Open**, are available in Salesforce1.
- In task lists, the order of the fields in the priority picklist determines the order in which tasks are sorted.
- The more tasks that you have, and the more relationships that your tasks have to other records, the longer it can take to view tasks or use other features in the Salesforce1 app.
- When more than 1,000 overdue tasks exist, task lists in Salesforce1 don't display any overdue tasks at all. Use reports to view your overdue tasks and close them, postpone them, or delete their due dates.
- Group (multiuser) tasks aren't available.
- The `Create Recurring Series of Tasks` field isn't supported on quick action layouts. Only a portion of the recurring task interface appears in new task quick actions, making it impossible for users to save any recurring tasks they attempt to create.
- You can't create recurring tasks with a frequency of every weekday in Salesforce1. And we don't recommend editing tasks with this frequency in Salesforce1 because the edit page doesn't show the task's recurrence settings. To create or edit tasks that repeat every weekday, use Salesforce Classic.
- If a task doesn't include a subject, it appears in feeds in Salesforce1 as [No Subject].
- Task layouts contain a few unique elements that make tasks easier to work with. These elements don't appear in a compact layout because you can't change them, but users always see them:
 - The and icons represent the status of the `IsClosed` field to users with the Edit Task permission.
 - The  icon represents a task marked high priority (including custom high priority).
 - If the due date exists and a user has permission to view it, all tasks show the due date.
 - Tasks include the primary contact and the related account or other record, when they exist.

The fields in each list can vary depending on the settings in your Salesforce org.

You control the layout of task records and tasks in the task list using compact layouts. You control related lists, as always, using the page layout editor. Adding the due date field to either layout doesn't change the appearance of tasks—that field never appears twice.

Below the built-in task elements, Salesforce1 displays up to three other fields.

- The default compact layout for tasks includes two fields: the name of a lead or contact, and an opportunity, account, or other record the task is related to.
- In an Activities related list, a task's fields depend on what record you're viewing and how you've defined the layout for that object.

For more information, see [Compact Layouts](#).

Notes

- When using Salesforce1, you can access all of your notes from the **Notes** item in the Salesforce1 navigation menu. The Salesforce Classic version of the full site doesn't include a Notes tab. Instead, Salesforce Classic users access notes from the **Files** tab.
- You can't share notes with other users or groups.
- In the Salesforce1 downloadable app for Android and the Salesforce1 mobile browser app, you can't add images to notes, but you can view images that were added from the full site. You can, however, add images to notes using the Salesforce1 downloadable app for iOS, version 10.0 or later.
- Some rich text options that are available in the full site, such as applying a bold or italic font or indenting a paragraph, aren't available in Salesforce1. But you can view formatting that was added from the full site.
- You can't revert to previous versions of notes, but you can view previous versions.

- Spelling errors aren't highlighted while creating or editing notes.

Email

- Salesforce1 doesn't display emails in the improved layout that's available in Lightning Experience.
- Inbox isn't available in Salesforce1.

Voice

- The telephony features in Lightning Experience aren't available in Salesforce1.
- Skype for Salesforce isn't available.

Work.com

When using Work.com features in Salesforce1, you can't:

- Share goals and metrics
- Link metrics to reports
- Refresh metrics that are linked to reports
- Link parent goals and subgoals
- Add goal images
- Create custom badges
- Offer or request feedback
- View custom metric fields
- Create, fill out, or dismiss performance summaries
- Manage performance summary cycles

Customer Service Features: What's Different or Not Available in Salesforce1

Cases and Case Feed

- For organizations that have the legacy "Page Layouts for Case Feed Users" enabled, users who are assigned the "Use Case Feed" permission see the standard case layout in Salesforce1.
- Standard actions on Case Feed aren't available in Salesforce1. But several actions that duplicate this functionality are available for Salesforce1. Salesforce admins can add these actions to the Salesforce1 & Lightning Actions section on case page layout so they're available from the Salesforce1 action bar when working with cases.

Standard Action Available in Salesforce Classic	Equivalent Action for Salesforce1
Email	Send Email
Change Case Status	Update Case
Log a Call	Log a Call

The **Portal** action isn't available.

- There are some differences in behavior when using case Send Email actions in Salesforce1.

- The `CC` and `BCC` fields on the Send Email publisher aren't collapsible.
- HTML isn't supported in Send Email actions on cases in Salesforce1. If a Send Email action includes an `HTML Body` field, html markup tags don't appear in the Send Email publisher or in emails created from the action.
- It's not possible to include email attachments when using a case Send Email action in Salesforce1.
- If a default email template is assigned to a case Send Email action, any attachments included in the template are ignored in Salesforce1. The attachments don't appear in the Send Email publisher and aren't included in emails created from the action.
- You can't create, edit, or delete case comments from Salesforce1. Also, the Case Comments related list doesn't display the full text of comments that were added in the full site.
- These case related lists aren't available:
 - Business Hours on Holiday List
 - Case Contact Role
 - Milestone List
 - Solution List
 - Team Member List
 - Team Member on Team List
 - Team Template Member List

Field Service Lightning

- When you create a record from a field service related list, the field that lists the parent record doesn't populate until you save the record. This issue applies to all versions of Salesforce1. For example, when you create a service appointment from the Service Appointments related list on a work order, the `Parent Record` field is blank until you tap **Save**. Once the record is created, the parent record field lists the parent work order as expected.
- The dispatcher console, which is part of the Field Service Lightning managed packages and includes the service list, scheduling policy picker, Gantt view, and map, isn't available in Salesforce1.

Salesforce Knowledge Articles

Articles are supported in the Salesforce1 downloadable app for iOS, version 10.0 or later, the Salesforce1 downloadable app for Android, version 8.0 or later, and in the Salesforce1 mobile browser app, with these limitations:

Issue	Android Downloadable App, v8.0 or later	iOS Downloadable App, v10.0 or later	Mobile Browser App
Only published articles are available—not draft or archived articles.	■	■	■
Articles can't be created, edited, translated, or archived.	■	■	■
Articles can't be linked to cases. (But links that are set up from the full site can be viewed in Salesforce1 on the Related tab.)	■	■	■
Smart links aren't supported.	■	■	■
Article ratings aren't supported.	■	■	■

Issue	Android Downloadable App, v8.0 or later	iOS Downloadable App, v10.0 or later	Mobile Browser App
Tables are sometimes cut off on the right side when included in article rich text fields.	■		■
Compact layouts display the article type API name instead of the article type name. So users see the article type API name in the highlights area when viewing an article.	■	■	
When searching from the Articles home page, only articles in the user's language are returned and only if that language is an active Knowledge language (from Setup, Customize > Knowledge > Knowledge Settings). To see articles in another language, users can change to an active Knowledge language. From My Settings , use the Quick Find search box to locate the Language & Time Zone page.	■	■	
In global search, search results show articles in the language specified for the device, regardless of the active Knowledge language.	■		
Filtering search results by data categories, article type, validation status, or language isn't available.	■	■	■
In global search, articles don't appear in the list of recent records.	■	■	
In global search results, search highlights and snippets don't appear. These features are available in all versions of Salesforce1 when searching from the Articles home page.	■	■	
Knowledge articles aren't available when accessing communities via the Salesforce1 mobile app.	■	■	

Social Customer Service

- To reply to social posts, you must use Salesforce Classic.
- Moderation and authorization pages aren't available in Salesforce1.

Work Order Milestones

- The milestone tracker isn't available.
- Entitlement processes and milestones must be managed from the full Salesforce site.

Work Orders and Linked Articles

- Linked articles are view-only. You can search the Knowledge base and read attached articles, but you can't attach or detach articles. To manage linked article settings and attach or detach articles, use the full site.
- The Linked Work Orders and Linked Work Order Line Items related lists on articles aren't available.
- Linked articles can't be accessed from feed items.

Reports and Dashboards: What's Different or Not Available in Salesforce1

Reports

Considerations When Using Reports in Salesforce1

Feature	Notes about Salesforce1 Availability
Number of Rows Displayed	Reports display a maximum of 2,000 rows, same as on the full Salesforce site.
Groupings	When you view a report with groupings, the groupings are displayed as columns at the end of the report.
Report Formats	Summary reports, matrix reports, and tabular reports are available in Salesforce1, but matrix and summary reports are shown in tabular format. Joined reports aren't available.
Conditional Highlighting	You can't view reports that show conditional highlighting in Salesforce1.
Filters	<p>When you open a report from the Reports tab, you can't filter the report.</p> <p>When you tap a dashboard component to open the source report, you can filter the report by tapping a value on the chart. If the source report is a tabular or joined report, then you can't filter it.</p>

Report Features Not Available in Salesforce1

- Create, edit, or delete reports
- Export
- Print
- Feed
- Schedule report refreshes
- Subscribe
- Joined reports
- Historical trend reports
- Add to campaign
- Role hierarchy
- Custom summary formula fields
- Folders
- Hide details
- Summary information (grand totals, subtotals, summarized fields, record counts, etc.)

Other Notes about Using Reports in Salesforce1

- You can't drill into reports that have more than three checkbox fields.

- When you view a report with more than 16 summary fields in Salesforce1, you receive an error message.
- Salesforce1 can't render reports via URLs that use dynamic parameter values. If you modify a URL to pass parameters into reports, Salesforce1 shows a blank screen (a report record with no returned results).

Dashboards

Considerations When Using Dashboards in Salesforce1

Feature	Notes about Salesforce1 Availability
Edit a Dashboard	You can't edit dashboards in Salesforce1. Dashboards are read-only.
View As	In Salesforce1, as in the full Salesforce site, you can only run dashboards as a user in your role hierarchy. However, in Salesforce1 you can choose from all users in your organization. If you select a user outside your role hierarchy, you get an error.
Dashboard Layout	With Enhanced Charts, dashboards display in a single-column layout on phones, and up to a two-column layout on tablets. With Classic Charts, Lightning Experience dashboards that have more than three columns display in a three-column layout on phones and tablets.

Dashboards Features Not Available in Salesforce1

- Create, edit, or delete dashboards
- Feed
- Schedule
- Link from a dashboard component to a website or email address
- Visualforce components on dashboards
- Folders

Other Notes about Using Dashboards in Salesforce1

In some situations, data displayed in a dashboard component can get out of sync with data in the report that's displayed on the same page. When a dashboard component's data doesn't match the report, one of these things is happening:

- The dashboard is being refreshed as the configured user or the running user, while a report is always run as the current user.
- The report was refreshed more recently than the dashboard. A report is refreshed every time you look at it (assuming you aren't working offline). But a dashboard component is refreshed only when the dashboard it belongs to is refreshed.

The same temporary mismatch can occur in the full site, but there you see reports and dashboard charts on separate pages. In Salesforce1, you see the report and the dashboard chart on the same page.

Charts

Other Notes about Using Charts in Salesforce1

- Unless you turn on **Enable Enhanced Charts in Salesforce1**, legacy Salesforce Classic Charts display instead of the new Lightning Experience Charts. After turning on **Enable Enhanced Charts in Salesforce1**, all users see Enhanced Charts regardless of whether they switch to Lightning Experience on the full Salesforce site.

Enhanced Charts are similar to Legacy Charts, but there are a few differences:

- Enhanced Charts show only the first 200 groupings.
- On tablets, dashboards always have two columns. On phones, dashboards always have one column.
- On mobile dashboards, Enhanced Chart components don't show footers, but titles and subtitles still display. If there is important information in a component footer, consider moving it to the title or subtitle.

 **Note:** If your org was created during or after the Summer '16 release, then Enhanced Charts are turned on by default and Legacy Charts aren't available. In Summer '17, in all orgs, Salesforce1 will feature Enhanced Charts only.

- Report Charts are only available after drilling into a dashboard component's report. Report charts aren't available from the Reports tab.

Salesforce Files: What's Different or Not Available in Salesforce1

When using Salesforce Files in the Salesforce1 mobile app, you can't:

- Add more than one file to feed items in Chatter
- See multiple files attached to a feed item in the main Chatter feed—only the first attachment is displayed (*downloadable apps only*)
- View file types other than these: `.doc`, `.docx`, `.pdf`, `.ppt`, `.pptx`, `.xls`, `.xlsx`, and all image files, including `.gif`, `.jpg`, and `.png` formats
- Create, rename, or delete library folders
- Move files in libraries into folders
- Access Files from the Salesforce1 navigation menu if you're a high-volume portal user
- Upload files using the Good Access secure mobile browser
- Assign topics to files in the main Chatter feed (*downloadable apps only*)

Content Libraries and Files

The support for Salesforce CRM Content in the Salesforce1 downloadable app for iOS is geared towards letting users view and share content. Other activities, such as managing or contributing to libraries, aren't available in Salesforce1. Here's how working with content libraries in Salesforce1 is different from what users can do in the full site.

- The Private Library folder isn't available. Instead, a user can access the files in their private library by selecting the Owned by Me filter in the Files list on Files home.
- When viewing libraries, the top content, popular tags, recent activity, and most active contributors sections aren't available.
- Users can't:
 - See content detail pages
 - Upload and publish new or revised files to libraries
 - Publish web links in libraries
 - Edit content details
 - Add, edit, or delete comments
 - Move files to different libraries
 - Use tags to classify or filter content
 - Subscribe to libraries, files, authors, or tags
 - Provide feedback on content, or review feedback on content
 - Delete, archive, or restore content

- Content search options like filtering by file type, author, or library name aren't available. But users can use global search to find files in libraries.
- Interacting with content packs in Salesforce1 is limited. Users can see the content packs that exist and share them with Salesforce colleagues or groups. But it's not possible to preview or download the files included in a content pack. Nor can mobile users create or modify content packs.
- Creating or managing content deliveries isn't available. This includes generating an encrypted URL for sharing files and content packs with customers.

Chatter: What's Different or Not Available in Salesforce1

Feeds

When viewing feed items in the Salesforce1 mobile app, you can't see:

- Live feed or live comment updates.
- Rich text formatting or code snippets in the main feed. (*downloadable apps only*)
- Inline images in the main feed—you see a placeholder with the name of the image instead. (*downloadable apps only*)
- Multiple attachments on an item in the main feed—only the first attachment is displayed. (*downloadable apps only*)
- Previews of links in the main feed. (*downloadable apps only*)
- The list of people who liked a post. (*mobile browser app only*)
- Bundled posts in the What I Follow feed. (*downloadable apps only*)
- Social feed posts. (*downloadable apps only*)
- The full content of posts shared from Lightning Experience when viewed in the main Chatter feed (*downloadable apps only*) or in feeds on profiles (*Salesforce1 for iOS downloadable app only*). Tap the **View Post** link in the shared feed item to see the shared content.

When posting, commenting, or doing other work in feeds from Salesforce1, you can't:

- Apply rich text formatting or include code snippets in feed items.
- Use Chatter emoticons (but you can use iOS and Android emoji keyboards to add emoticons to feeds).
- Add inline images to feed items.
- Add more than one attachment to feed items.
- Edit feed posts or comments.
- Mute a feed item. (*downloadable apps only*)
- Use action links in the main feed. (*downloadable apps only*)
- Share posts. (*mobile browser app only*)
- Search in feeds on user profiles and records.

There are some other features that aren't available from the Chatter item in Salesforce1. You can't:

- Switch the main feed to show only muted posts.
- Filter the main feed to show all updates, fewer updates, questions, or only posts related to a specific object.
- Send or view Chatter messages.
- See recommendations.
- Add or view Chatter favorites.
- See Chatter activity statistics or Chatter influence status.
- Invite coworkers to sign up for Chatter.

Topics

Topics are available in the Salesforce1 mobile browser app only. In the mobile browser app, you can't:

- See trending topics.
- Edit topic details (name and description).
- Tag favorite topics.
- Assign topics to records.
- View records assigned to a topic.
- See these related lists: Related Topics, Related Groups, Knowledgeable on Topics, Recent Files.
- See topics in auto-complete options when searching.
- Delete topics.

Chatter Questions

When using Chatter Questions in Salesforce1, you can't:

- See similar questions and knowledge articles when you ask questions.
- Select best answers.

 **Note:** Chatter Questions isn't fully supported in the Salesforce1 downloadable apps. When coworkers ask questions, you can see who posted but the text of the question isn't displayed. You can see any answers to the question, however.

Groups

When using groups in Salesforce1, you can't:

- See live feed updates.
- Use the group creation wizard to set up a new group.
- See recommendations of groups to join.
- Invite customers to join private customer groups.
- Add records to Chatter groups with customers using the **Add Record** action.
- Withdraw requests to join private groups.
- Change email and in-app notification settings for groups in communities.
- See or customize group member engagement data.

Group owners and managers can't remove files from the group files list.

People and Profiles

When using People to view profiles in Salesforce1, you can't:

- Edit profile information in the Salesforce1 for iOS downloadable app.
- Upload a profile photo using the Good Access™ secure mobile browser.
- Hover on user profile photos to quickly see user information.
- Use custom profiles.
- Filter the Following related list on your profile.

Chatter Messenger

Chatter Messenger isn't available in Salesforce1.

Salesforce Communities: What's Different or Not Available in Salesforce1

Salesforce Communities in Salesforce1 is similar to the full site, with these differences:

- The Salesforce1 navigation menu for a community doesn't include all the items that are available to your internal organization:
 - The navigation menu shows only the tabs that the admin has included in that community via Tabs & Pages in the community's administration settings.
 - The Chatter tab that's available in Salesforce Classic is divided into three menu options in Salesforce1 (and Lightning Experience). If your community includes the Chatter tab in Salesforce Classic, you see Feed, People, and Groups in Salesforce1.
 - The Events and Today items aren't available and don't appear in the navigation menu.
 - Tasks are available only to users with the Edit Tasks permission.
 - The Reports item isn't available and doesn't appear in the navigation menu.
 - Salesforce Knowledge articles aren't supported in communities when using the Salesforce1 downloadable apps. The Articles item doesn't display in the navigation menu. (But articles are available if using the Salesforce1 mobile browser app.)
- There is no All Company nor Company Highlights feed.
- Adding inline images to a post isn't available.
- Community Management and Community Workspaces aren't available in Salesforce1.
- Communities that use a Community Builder template, such as Koa, Kokua, or Customer Service (Napili), contain rich styling that doesn't display in Salesforce1. These communities are responsive and it's best to access them directly from a mobile browser using community URLs. (Communities that use a Salesforce Tabs + Visualforce template *are* supported in all the Salesforce1 apps.)
- Site.com branding is not supported.
- Community members can't flag private messages as inappropriate.
- Reputation isn't supported in Salesforce1. However, if reputation is enabled and set up in the full site, users do accrue points when using Salesforce1. Users can view their points in the full site only though.
- Search is scoped to the community and returns only items from the current community. The only exception is records, since they are shared across communities and the internal organization.
- Role-based external users can approve and reject approval requests from the Approval History related list on records, but they can't submit requests for approval.
- A user's list of notifications includes notifications from all communities the user is a member of. The name of the community in which the notification originated appears after the time stamp.
- External users accessing communities don't see a help link.
- In the Salesforce1 mobile browser app, external users' photos don't include any visual indication that the user is an external user. In the full Salesforce site and the Salesforce1 downloadable apps, the upper left corner of an external user's photo is orange.
- In the Salesforce1 mobile browser app, the People list shows the default photo (👤) next to each user's name. Tap a user to go to their profile page where you can see their uploaded photo. In the Salesforce1 downloadable apps, photos appear next to users' names in the People list.
- The community template and your user licenses determine how you can access communities using Salesforce1. For more information, see *Access Communities in Salesforce1* in the Salesforce Help.
- Group members in communities can't edit their email and in-app notification settings in Salesforce1. As a workaround, users can set their group email notification preference to **Every Post** in the community from the full site. Selecting this option automatically enables both email notifications and in-app notifications in Salesforce1 for that group.

- Communities aren't available from Salesforce1 when the mobile device is offline.

[Access Communities in Salesforce1](#)

Navigation and Actions: What's Different or Not Available in Salesforce1

Navigation

- On most devices, the Salesforce1 mobile app is supported on portrait orientation only. The one exception is when using the Salesforce1 downloadable app on iPad tablets, where both portrait and landscape orientation are supported.
The mobile browser app interface does rotate into landscape orientation but isn't guaranteed to work in this orientation.
- The App Launcher isn't available. You can't switch between standard or custom apps in Salesforce1. The navigation menu gives you access to all of the objects and apps that are available to you in the mobile app.
- The Lightning Experience utility bar isn't available in Salesforce1.
- The top-down tab-key order, which allows users viewing a record detail page to move through a column of fields from top to bottom before moving focus to the top of the next column of fields, isn't supported in Salesforce1. Even if a page layout is configured for a top-down tab-key order, Salesforce1 moves from left-to-right through field columns.

Actions

- Most actions, including quick actions, productivity actions, and standard and custom buttons, are displayed in the action bar or list item actions in Salesforce1.
- The **Save & New** button isn't available in Salesforce1.
- If you use URL custom buttons to pass parameters to standard pages in Salesforce Classic—such as pre-populating fields when creating a record—this behavior doesn't work in Salesforce1.
- There are a few differences between the Send Email quick action in Salesforce and the standard Email action in Case Feed:
 - Users can't switch between the rich text editor and the plain text editor in a Send Email action.
 - Templates aren't supported in the Send Email action.
 - Quick Text isn't available in the Send Email action.
 - The Send Email action doesn't support attachments.
 - Users can't save messages as drafts when using the Send Email action.
 - Users can't edit or view the From field in the Send Email action.

Search: What's Different or Not Available in Salesforce1

Search Behavior

- Salesforce objects are available in Salesforce1 when the Smart Search Items option is included in the Salesforce1 navigation menu. Smart Search Items is required to get search results for standard and custom objects.
- When doing a global search in Salesforce1, you can find records for the objects that appear in the Recent section of the navigation menu only.

If you're new to Salesforce and don't yet have a history of recent objects, you're able to search this default set of objects: Accounts, Cases, Contacts, Files, Leads, Opportunities. You can also search Groups and People if these items appear in your Recent section. If they appear in other areas of the navigation menu, they aren't searchable.

As you spend time working in Salesforce1 and the full Salesforce site (Salesforce Classic and Lightning Experience), the objects that you use the most eventually replace the default ones in the Recent section and become the objects that are available for global searches in Salesforce1.

- In the Salesforce1 mobile browser app, use the search scope bar beneath the global search box to see results for the selected object.

The objects available in the search scope bar are the same as the items that appear in the Recent section of the Salesforce1 navigation menu. The search scope bar displays objects in the same order as in the navigation menu.

The Salesforce1 downloadable apps for Android and iOS don't have a search scope bar. These apps display search results on a single page, grouped by object.

- To find records for an object that doesn't appear in global search results (that is, any of the objects you see when you tap **More** to expand the Recent section in the navigation menu), use the search box on the object's home page.
- You can't pin frequently used items.
- You can't search by divisions.

Instant Results

 **Note:** Instant results are shown as a drop-down in the search box and include recent items or auto-suggested records, which are shown after you type at least three characters. If you don't see a record in instant results, perform a full search.

- The Salesforce1 mobile browser app shows more recent items and auto-suggested records than in Lightning Experience.
- In the Salesforce1 mobile browser app, instant results are displayed for the selected object only, not for multiple objects.

Search Results

- Top Results, which lists search results for the objects you use most frequently, isn't available.
- List views aren't included in full search results. To find list views in instant results, open the record search page for an object and type your search terms. As you type, the list of matching items expands to show the list views you've most recently accessed in the full Salesforce site.
- You can't filter search results.
- In the Salesforce1 downloadable apps for Android and iOS, global search returns up to 50 of the most relevant records. There's no limit in the Salesforce1 mobile browser app.

Lookup Searches

- Instant results are based on recent items only instead of all records that match the search term.
- A wildcard is automatically appended to all lookup searches.
- Lookup search returns up to 25 of the most relevant records in the results.
- There's no secondary field displayed under the primary record name to provide more contextual information.
- To add records for multiple types of objects within a single lookup, use the drop-down above the search results.

Entering Data: What's Different or Not Available in Salesforce1

There are some differences between the full Salesforce site and the Salesforce1 app when you're adding new records or updating existing data.

Category	Issue	Creating Records	Editing Records
Any Record	Third-party keyboards aren't supported.	✓	✓

Category	Issue	Creating Records	Editing Records
	Inline editing isn't available.	✓	✓
	Changing a record's owner is available for accounts, campaigns, cases, contacts, leads, opportunities, work orders, and custom objects only.		✓
	Combo boxes, which combine a picklist with a text field, aren't available. Typically the text field is available but the picklist is not.	✓	✓
	If territory management is enabled, you can't assign or modify a record's territory rules.	✓	✓
Accounts and Contacts	The Copy Billing Address to Shipping Address and Copy Mailing Address to Other Address links aren't available.	✓	✓
	If territory management is enabled, the Evaluate this account against territory rules on save option isn't available when editing account records.		✓
Events	An event owner can't change, add, or remove an event's invitees. If two or more contacts are related to an event, the owner can't edit them; if the event has just one related lead or contact, the owner can edit it but not add more.		✓
	Events that aren't related to a contact or object aren't displayed.	✓	✓
	You can't accept or decline an event you've been invited to.		✓
	You can't use Shared Activities to relate multiple contacts to an event.	✓	✓
	Proposed Events (the New Meeting Request button) aren't supported.	✓	✓
	The <code>Related To</code> field remains editable when the <code>Name</code> field is set to <code>Lead</code> , but you'll receive an error if the <code>Related To</code> field contains data when you save the record.	✓	✓
	You can't create recurring events or change the details of a recurring event series. (You can change the details of individual occurrences in an event series.)	✓	✓
	The <code>Subject</code> field doesn't include a picklist of previously defined subjects.	✓	✓
	The <code>Email</code> and <code>Phone</code> fields for an associated contact aren't displayed.	✓	✓
	You can't add attachments.	✓	✓
	You can't send notification emails.	✓	✓
	You can't set event reminders.	✓	✓
Leads	When you add a new lead, the <code>Campaign</code> field and the <code>Assign using active assignment rule</code> checkbox aren't available. You can add values to these fields in the full site.	✓	
Opportunities	You can't edit the <code>Forecast Category</code> field. The field is automatically populated, based on the value of the <code>Stage Opportunities</code> field, when you save the record. You can manually edit the value of this field in Salesforce Classic (but not from Lightning Experience).	✓	✓
Tasks	The <code>Subject</code> field doesn't include a picklist of previously defined subjects.	✓	✓

Category	Issue	Creating Records	Editing Records
	The <code>Related To</code> field remains editable when the <code>Name</code> field is set to <code>Lead</code> , but you'll receive an error if the <code>Related To</code> field contains data when you save the record.	✓	✓
	The <code>Email</code> and <code>Phone</code> fields for an associated contact aren't displayed.	✓	✓
	You can't use Shared Activities to relate multiple contacts to a task.	✓	✓
	You can't create recurring tasks using a New Task quick action, but you can via the New Task button on task lists. You can't edit the recurrence details of a recurring task series.	✓	✓
	You can't add attachments.	✓	✓
	You can't send notification emails.	✓	✓
	You can't set task reminders.	✓	✓
Phone Number Fields	The keypad that displays in phone number fields doesn't include parentheses, hyphens, or periods, and Salesforce1 doesn't apply any phone number formatting when you save the record. To apply a specific phone number format, edit the record in the full site.	✓	✓
Success Message	After creating a record from a related list in Salesforce1, the resulting success message doesn't include a link to the new record (like in Lightning Experience).	✓	

Duplicate Management: What's Different or Not Available in Salesforce1

Duplicate management in the Salesforce1 app is similar to the full site, with these differences.

- Each possible duplicate is shown on a "duplicate card." Salesforce1 shows a maximum of 30 duplicates (10 per object), even if there are more.
- A duplicate card displays three fields, which are derived from the search results format defined for your org, not from the associated matching rule.
- If you tap a duplicate card that appears while you're editing or creating a record, any information you've entered is lost.
- By default, duplicate rules run when you complete fields on a record. In Salesforce Classic, duplicate rules run when you save a record.
- Merging accounts, contacts, and leads isn't supported.

Approvals: What's Different or Not Available in Salesforce1

Approval Responses

These approval-related options aren't available in the Salesforce1 mobile app.

- Recalling approval requests
- Reassigning approval requests
- Unlocking a record that's locked for approval

Salesforce1 Notifications for Approval Requests

- Notifications for approval requests aren't sent to queues or delegates. For each approval step involving a queue, add individual users as assigned approvers, so at least those individuals can receive the approval request notifications in the mobile app. To

have both queues and individual users as assigned approvers, select **Automatically assign to approver(s)** instead of **Automatically assign to queue** in the approval step.

- Notifications for approval requests are sent only to users who have access to the record being approved. Assigned approvers who don't have record access can still receive email approval notifications, but they can't complete the approval request until someone grants record access.

Approval Comments

- Salesforce1 prompts you for comments after you tap Approve or Reject.
- The approval detail page doesn't display comments. The Approval History related list displays truncated comments. To see all approval comments for a record, use the full Salesforce site.

Approval History Related List

- The Approval History related list doesn't include the Submit for Approval button.
- When working with approvals in communities, role-based external users can see and take action from the Approval History related list, but they can't submit requests for approval.

Offline Access: What's Different or Not Available in Salesforce1

Access Data While Offline

When caching in Salesforce1 is enabled, downloadable app users can access cached data while working offline. The default data that's cached includes recently accessed records for the first five objects in the Recent section of the user's Salesforce1 navigation menu, plus the user's recent tasks and dashboards. Recently accessed records are determined by a user's activities in both Salesforce1 and the full Salesforce site, including Salesforce Classic and Lightning Experience. In addition, much of the data that a user accesses throughout a Salesforce1 session is added to the cache.

Some data isn't available when a user's mobile device is offline. See [Data and UI Elements That Are Available When Salesforce1 is Offline](#) for the full rundown on what's supported.

Update Data While Offline (Beta)

Create, Edit, and Delete Actions

- Create records using the **New** button on recently accessed object home pages. New record actions in an action bar (such as **New Task**, **New Contact**, or **New** on related lists) aren't supported offline.
- **Edit** and **Delete** actions in the action bar are available for cached records only.

All Other Quick Actions

- All other action bar icons, such as **Log a Call**, **Post**, or **Change Owner**, aren't supported offline.

Record Types for Recent Objects

- Salesforce1 caches up to 15 of a user's most recently accessed record types per object. If your org has defined more than 15 record types for any of a user's recent objects (that is, the first five objects listed in the Recent section of the user's Salesforce1 navigation menu), only the cached record types are available when creating a record offline. And only records matching the cached record types are editable while offline.

Lookups and Picklists

- Dependent lookups and picklists for a cached record aren't supported when offline, unless the user interacted with these elements before the record was cached.
- Lookup filters aren't supported when offline. Users can enter the name of the related lookup record when editing data offline but the app doesn't search for related looked records until the user's mobile device is back online.

- Complex page layouts, with a very large number of fields or many picklists, can result in records that are too large for Salesforce1 to cache. If a user doesn't see expected recently accessed records when offline, this may be the reason why. If this becomes a problem for your users, we recommend re-evaluating the affected object's page layout to see if you can optimize it for mobile use.

Notes

- Notes that include images aren't available offline.
- Images can't be added to notes when working offline.
- Users can't relate notes to records when working offline.

Tasks

- Users can only create tasks offline if the simplified New Task form for Salesforce1 is disabled.
 1. From Setup, enter *Activity Settings* in the **Quick Find** box, then select **Activity Settings**.
 2. Deselect **Show simpler New Task form in Salesforce1**.
 3. Click **Submit**.
- Selecting or deselecting checkboxes on tasks isn't supported when offline.

Communities

- Salesforce Communities aren't supported when offline.

Salesforce Customization: What's Different or Not Available in Salesforce1

Custom Home Pages

- Salesforce1 doesn't support login redirection to Salesforce apps or custom home tabs like the full Salesforce site does. If you prefer to retain this redirection for users who log in to Salesforce from a mobile browser, turn off the Salesforce1 mobile browser app. This can be done on a user-by-user basis or for your entire organization.

Custom Actions and Buttons

- Custom buttons that are added to the Button section of a page layout and that define the content source as *URL* or *Visualforce* are supported in Salesforce1. Remember that Visualforce pages must be enabled for use in Salesforce1.
Custom links, custom buttons that are added to list views, and custom buttons that define the content source as *OnClick JavaScript* aren't available in Salesforce1.
- Using URL custom buttons to pass parameters to standard pages in Salesforce Classic—such as pre-populating fields when creating a record—doesn't work in Salesforce1 or Lightning Experience.
- Custom images used for action icons must be less than 1 MB in size.

Lightning Pages

- You can't add more than 25 components to a Lightning Page region.

Visualforce Pages

- Standard tabs, custom object tabs, and list views that are overridden with a Visualforce page aren't supported in Salesforce1. The Visualforce page is shown for full site users but Salesforce1 users will see the default Salesforce1 page for the object instead. This restriction exists to maintain the Salesforce1 experience for objects.
- Salesforce1 imposes additional restrictions and constraints on Visualforce pages. See [Visualforce Guidelines and Best Practices](#) in the [Salesforce1 Mobile App Developer guide](#) for details.

Programmatic Customizations

- These programmatic customizations to the UI aren't supported: Web tabs and S-controls.

Help Users From Anywhere With SalesforceA

SalesforceA is a mobile app for Salesforce administrators. When you're away from your desk, you can use your phone or tablet to perform essential administration tasks like resetting passwords, freezing users, and viewing current system status.

SalesforceA is free. Download it from the Google Play Store for Android phones and tablets, and from the Apple App Store for Apple iPhone, iPod Touch, and iPad.

[SalesforceA Options](#)

Manage users and view information for Salesforce organizations from your mobile device.

[Log In to SalesforceA](#)

Log in to the SalesforceA mobile app to perform essential administrative tasks for your Salesforce organization.

[Log In to Multiple Organizations with SalesforceA](#)

Use SalesforceA on your mobile device to log in to multiple Salesforce organizations that you administer. Once logged in, you can switch between organizations without going through the login process again.

[Create a New User with SalesforceA](#)

Use SalesforceA on your mobile device to create a new user. Creating a new user is available in SalesforceA for iOS version 3.3 or later.

[Reassign a User License with SalesforceA](#)

When you create a new user with SalesforceA, there may be instances when your org doesn't have enough user licenses to assign to the newly created user. No need to worry if this happens, because SalesforceA saves the newly created user as inactive. To change the newly created user from inactive to active, you can reassign a user license from an existing user to the newly created user. Reassigning a user license is available in SalesforceA for iOS version 3.3 or later.

SalesforceA Options

Manage users and view information for Salesforce organizations from your mobile device.

Overview of Your Organization

The Overview screen shows:

- Number of frozen and locked out users
- Trust status
- Recently viewed users

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

EDITIONS

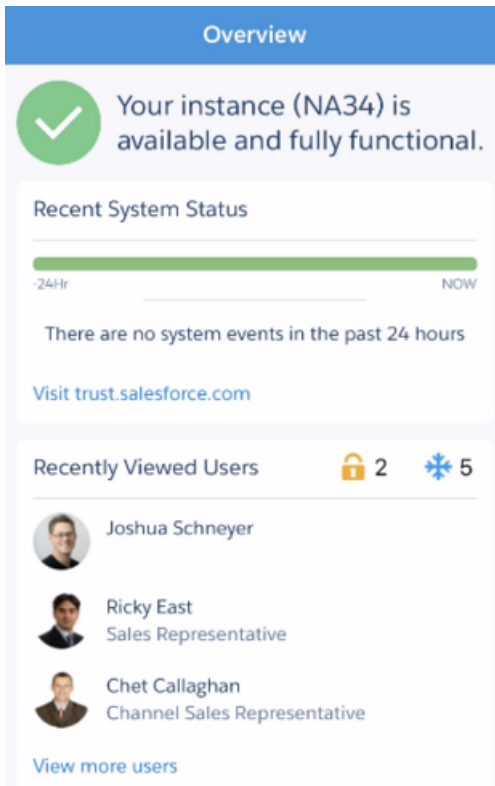

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

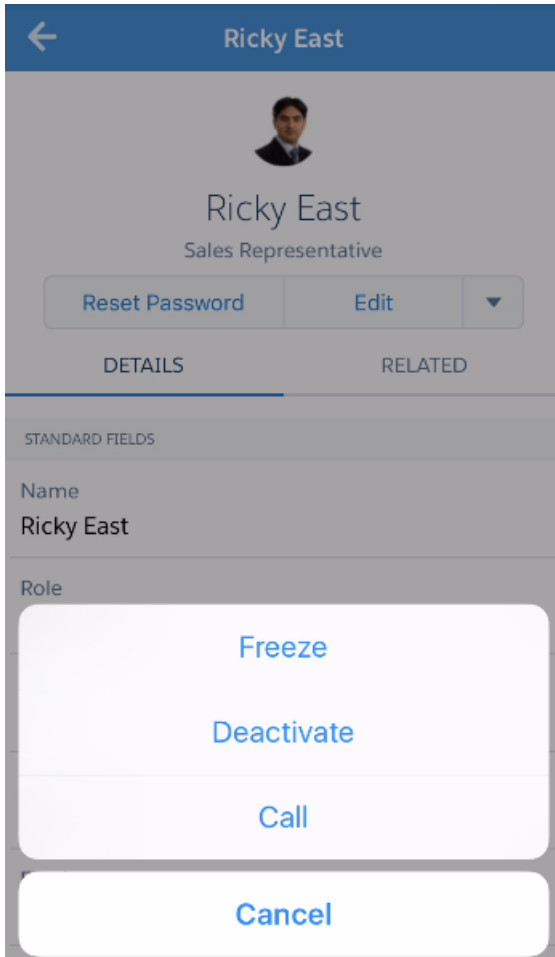

For Android users, the navigation icon is in the top left. Tap it to go to the navigation menu.

For iOS users, navigation is done through the action bar at the bottom of the screen.

User Management

From the navigation menu, tap **Users** to see a list of users or search for a user. Tap a name to:

- View or edit user details
- Freeze, deactivate, or reactivate the user
- Reset a user password
- Assign permission sets (iOS only)
- Create a new user (iOS only)

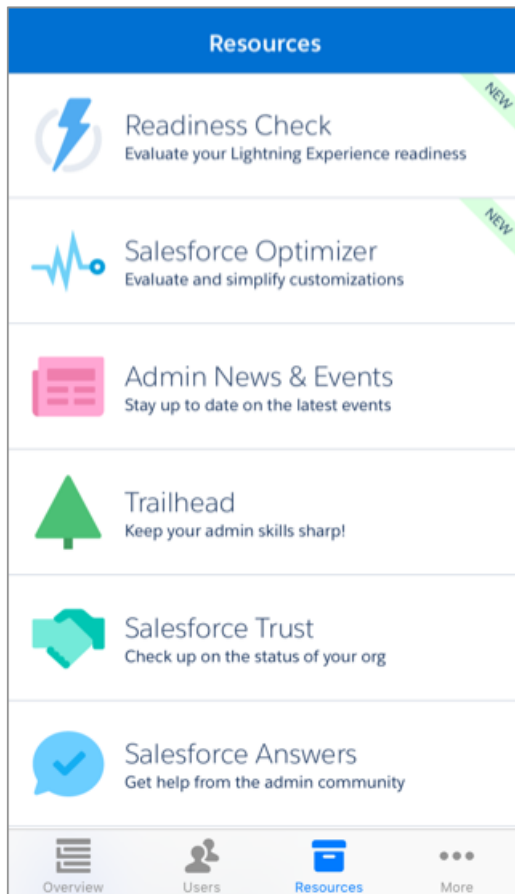

Swipe to the Related page to see:

- The user's current permission sets
- The user's login history

Additional Information

The Resources page gives you quick access to:

- Lightning Readiness Check
- Optimizer
- Admin News and Events
- Trailhead
- Salesforce Trust
- Salesforce Answers
- Salesforce Release Notes

Log In to SalesforceA

Log in to the SalesforceA mobile app to perform essential administrative tasks for your Salesforce organization.

As a Salesforce administrator, you can use SalesforceA to log in to your production organization (default), sandbox environment, or a custom host. Choose the environment or host with the host menu.

- For iOS users: open the host menu from the gear icon in the upper right corner of the login screen.
- For Android users: open the host menu from the action overflow button in the upper right corner of the login screen.

If prompted, enter a passcode as an extra layer of security for your mobile device. Manage this security setting in the Salesforce desktop browser application from **Setup** in the **Connected Apps** entry for **SalesforceA**.

Once you log in, you see the Overview screen.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

SEE ALSO:

[Log In to Multiple Organizations with SalesforceA](#)

Log In to Multiple Organizations with SalesforceA

Use SalesforceA on your mobile device to log in to multiple Salesforce organizations that you administer. Once logged in, you can switch between organizations without going through the login process again.

1. Tap the navigation icon to go to the menu. For iOS users, tap **More**.
2. Tap the down arrow next to your username. A list of your accounts appears.
3. Select a previously saved username or tap **+ Add account** to add an account.
4. To choose a sandbox or custom host, tap the gear icon in the upper right (iOS users) or the action overflow button in the upper right (Android users), and switch to your desired host.

From the list of your accounts, you can:

- Switch between organizations
- See whether each organization is production or sandbox (iOS only)
- See each organization's edition (iOS only)

Tap the up arrow to close the account selector.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

Create a New User with SalesforceA

Use SalesforceA on your mobile device to create a new user. Creating a new user is available in SalesforceA for iOS version 3.3 or later.

1. From the **Users** page, tap **+**.
2. Enter the user's name and email address and a unique username in the form of an email address. By default, the username is the same as the email address.
3. Select a **User License**. The user license determines which profiles are available for the user.
4. Select a profile, which specifies the user's minimum permissions and access settings.
5. In Professional, Enterprise, Unlimited, Performance, and Developer Editions, select a **Role**.
6. Select **Generate new password and notify user immediately** to have the user's login name and a temporary password emailed to the new user.
7. Tap **Save**.

 **Note:** Your *username* must be unique across all Salesforce orgs. The username must be in the format of an email address, for example, jane@salesforce.com. This email username doesn't have to work. You *can* have the same functioning email address associated with your account across orgs—only the *username in the form of an email address* must remain unique.

EDITIONS

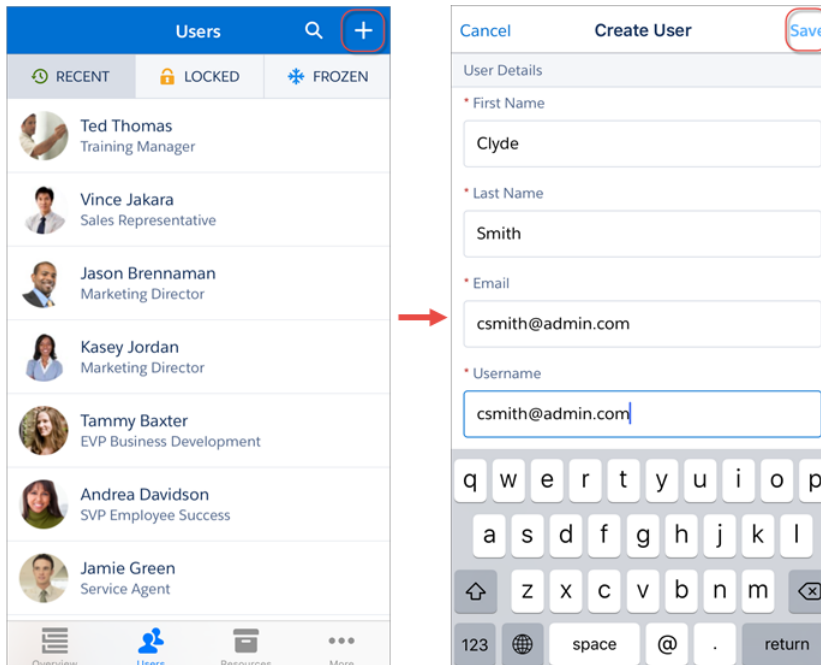

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

You can create a new user even if you don't have enough user licenses to accommodate one. SalesforceA saves all the fields of your new user, but the user is in an inactive state. To change the state of an inactive user to active, you need to reassign a license from an existing user to your newly created user. For guidelines about creating a new user, see [Guidelines for Adding Users](#) in the Salesforce Help for more information.

Reassign a User License with SalesforceA

When you create a new user with SalesforceA, there may be instances when your org doesn't have enough user licenses to assign to the newly created user. No need to worry if this happens, because SalesforceA saves the newly created user as inactive. To change the newly created user from inactive to active, you can reassign a user license from an existing user to the newly created user. Reassigning a user license is available in SalesforceA for iOS version 3.3 or later.

1. From the inactive user's page, tap **Reassign a License**.
2. Either scroll or use the **Find User** search bar to find an existing user you want to reassign a user license from.
3. When you've found that existing user, tap **Reassign This License**.
4. Confirm the changes, and tap **OK**.

EDITIONS

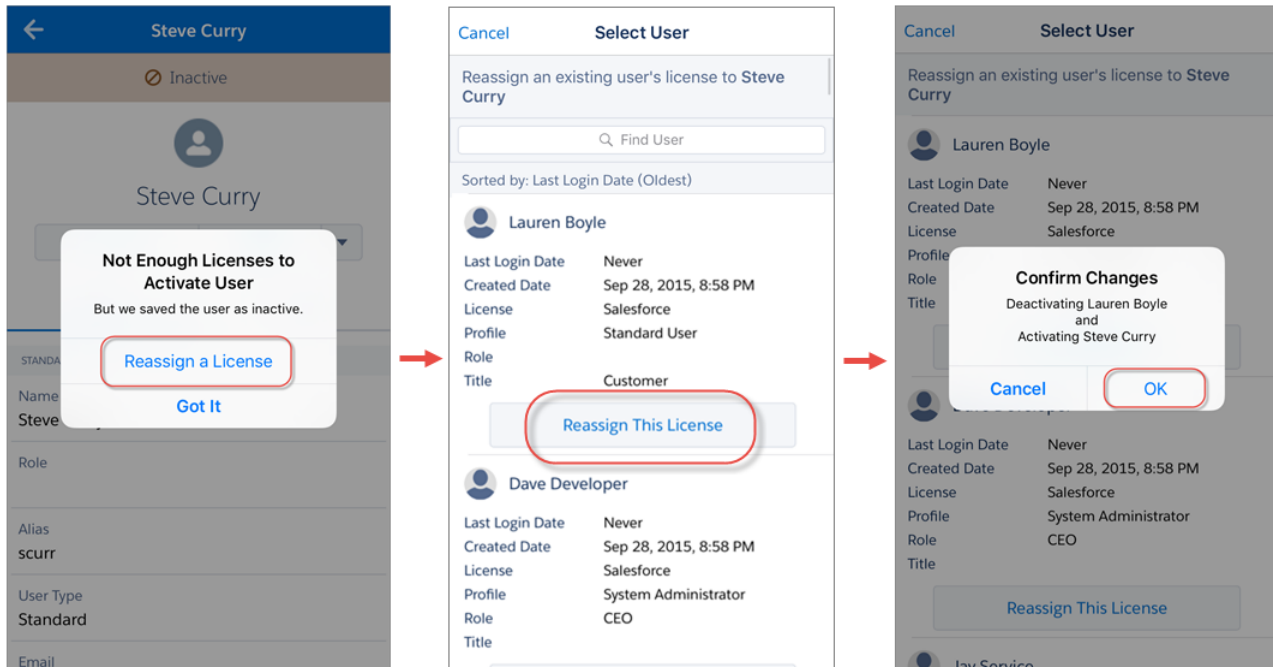

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions.

Support On-the-Go Productivity with Salesforce Mobile Classic

Salesforce Mobile Classic helps your teams succeed by allowing users to access their latest Salesforce data, whenever and wherever they need it, directly from Android™ and iPhone® devices.

The Salesforce Mobile Classic app exchanges data with Salesforce over mobile or wireless networks, and stores a local copy of the user's data in its own database on the mobile device. Users can edit local copies of their Salesforce records when a data connection isn't available, and transmit those changes to Salesforce when a connection is available again. The app also promotes near real-time logging of critical information by prompting users to enter updates directly in Salesforce or Force.com AppExchange apps after important customer calls, emails, or appointments.

A Salesforce Mobile Classic license is required for each user to use Salesforce Mobile Classic. For organizations using Unlimited, Performance, and Developer Editions, Salesforce provides one mobile license for each Salesforce license. Organizations using Professional or Enterprise Editions purchased mobile licenses separately.

Note: The Android and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact Salesforce to turn on Salesforce Mobile Classic for your organization.

About the Salesforce Mobile Classic Default Configuration

Mobile configurations for the Salesforce Mobile Classic app are sets of parameters that determine what data Salesforce transmits to users' mobile devices and which users receive the data on their mobile devices. A default mobile configuration is provided for Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations. Administrators can't view or edit the default mobile configuration.

Users are automatically assigned to the default mobile configuration when they activate their Salesforce account from a supported mobile device using the Salesforce Mobile Classic app.

The default mobile configuration:

- Allows users with an assigned mobile license to install and activate Salesforce Mobile Classic, even if you haven't yet assigned them to a mobile configuration.

You can [disable Salesforce Mobile Classic](#) to prevent users from activating the Salesforce Mobile Classic app.

The default configuration can mobilize the following objects:

- Accounts
- Assets
- Cases
- Contacts
- Dashboards
- Events
- Leads
- Opportunities
- Reports
- Solutions
- Tasks

Note:

- Not all objects available in the Salesforce Mobile Classic app are mobilized with the default configuration.
- Assets aren't available as a tab in the Salesforce Mobile Classic app but display as a related list for accounts, cases, and contacts.

The default configuration automatically synchronizes records the user recently accessed in Salesforce on the Salesforce Mobile Classic app. Users can search for records that aren't automatically synchronized; once the user downloads a record, the record becomes a permanent part of the data set. In addition to recently accessed records, the default configuration synchronizes activities closed in the past five days and open activities due in the next 30 days.

Salesforce Mobile Classic Implementation Tips and Best Practices

Set up the Salesforce Mobile Classic app using these tips and best practices.

Building Lean Data Sets

- Keep the data sets in your mobile configurations as small as possible. Not only do lean data sets greatly improve the Salesforce Mobile Classic app's performance, but they also make the app easier to use. Pushing massive amounts of data to the device might seem like a good idea, but the important records tend to get lost among the ones that aren't relevant to users' day-to-day activities. Small data sets are powerful because the Salesforce Mobile Classic app synchronizes with Salesforce every 20 minutes, so the data is constantly refreshed with new and updated records. Even if your mobile configurations don't account for every possible record your users might need, they can search for records that aren't automatically synchronized to their devices.

To build small data sets:

- Nest the objects in the data set tree. For example, add contacts as a child data set of the account object so that the data set includes contacts related to the mobilized accounts instead of all the user's contacts.
 - Avoid setting the record ownership filter to All Records unless your organization uses a private sharing model. It's unlikely that users need to see all of an object's records on their devices. Instead of mobilizing all opportunity records, for example, mobilize just the opportunities owned by the user or the user's opportunity team.
 - Use filters that synchronize the most relevant records. For example, even if you limit the opportunities on the device to records owned by the user, you could further prune the data set by mobilizing only opportunities closing this month.
 - Set a record limit to prevent the data set from getting too large. Generally, a single data set should generate no more than 2,500 records.
- Another way to build lean data sets is to [mobilize the Salesforce recent items list](#), add the data sets, and set the record ownership filters in your data sets to None (Search Only). The user's data set is populated with records recently accessed in Salesforce, and those records in turn synchronize additional data based on the data set hierarchy. For example, let's say you create a data set with the account object at the root level and add the contact, task, and event objects as child data sets. When the Salesforce Mobile Classic app synchronizes an account from the Salesforce recent items list, it also synchronizes the contacts, tasks, and events related to that account.
 - If you're not sure which fields to use as filters for your data sets or mobile views, consider using the Last Activity Date field. For example, set up a filter that synchronizes contacts with an activity logged this week or this month. The Last Activity Date field is a better indicator of a record's relevance than the Last Modified Date field—often the main detail of a record remains unchanged even though users frequently log related tasks and events.

Mobilizing Records Users Need

- Before mobilizing a custom object, make sure the object's functionality is compatible with the Salesforce Mobile Classic app. Salesforce Mobile Classic doesn't support S-controls, mashups, merge fields, image fields, or custom links.
- To obtain a relevant set of activities, mobilize the task and event objects at the root level of the data set hierarchy and nest them under parent objects, like contacts, accounts, and opportunities. Adding tasks and events at multiple levels ensures that users will see their personal activities and activities related to the records on their devices. Avoid mobilizing too much activity history or too

- "Manage Mobile Configurations"

many tasks and events not owned by the user. Generally, there are more task and event records in an organization than any other type of record, so it's easy to bloat data sets with too many activities.

- If your sales representatives frequently take orders in the field and need a comprehensive inventory list, add the product object at the root level of the data set hierarchy. Nesting the opportunity product object below the opportunity object won't mobilize all products.
- If your users need to assign tasks to other users or change the record owner, mobilize the user object so that the names of other users will be available on the device. Avoid mobilizing all user records—instead, set up filters based on the role or profile.
- Be sure that users assigned to a mobile configuration have field-level access to all the fields used in the configuration's filter criteria. If a user doesn't have access to a field in a data set's filter criteria, the Salesforce Mobile Classic app won't synchronize the records for that data set or its child data sets.
- You can sometimes use cross-object formula fields to work around limitations of the Salesforce Mobile Classic app. For example, Salesforce Mobile Classic doesn't support campaigns, so you can't add the campaign object as a data set and add the opportunity object as its child data set to get the related records. However, you can create a text formula field on the opportunity object equal to the name of the parent campaign. The field needs to be visible, but it doesn't need to be included on your page layouts. Then add the opportunity object to the data set and use the new formula field to filter opportunities related to a specific campaign.
- Although a mobile configuration might include an object at multiple levels in the data set hierarchy, users won't see duplicate tabs in the Salesforce Mobile Classic app. Only one Task tab appears on the device even if you mobilize the task object at the root level and as a child data set of three objects.

Customizing Mobile Configurations

- Clean up your mobile page layouts by excluding fields from the objects in the mobile configuration. Less data is sent to the device, and mobile users don't have to scroll through unnecessary fields.
- If you mobilize the Dashboards tab, be sure to select any other tabs that should appear in the Salesforce Mobile Classic app. Customizing the tabs for a mobile configuration overrides the default tab set—if you only mobilize the Dashboard tab, it will be the only tab sent to the device.
- Due to the small size of mobile device screens, you can only select two display columns for mobile views. If you need three columns of data, create a text formula field on the object that concatenates the three fields, then use the formula field in the mobile view criteria.
- When creating mobile views, you can filter based on the current user with the `$User.ID` global variable, but you can't enter a user's name as a value in the filter criteria. To build a view based on users, create a text formula field on the appropriate object, then use the formula field in the mobile view criteria. For example, to create a view that displays opportunities owned by an opportunity team, create a text formula field on the opportunity object that contains the opportunity owner's user ID or role, then create a view that filters on values in that field.

Testing and Deploying the Mobile Product

- It's important to test mobile configurations to make sure they're synchronizing an acceptable amount of data. Test configurations against active users who own a very large number of records. Typically, most data sets generate between 500 KB and 4 MB of data. If the data sets are over 4 MB, refine the filter criteria to limit the amount of data sent to the device.
- You can use the Salesforce Mobile Classic app in the sandbox before deploying to your organization.
- Use of the Salesforce Mobile Classic app requires a data plan. The wireless data volume for the Salesforce Mobile Classic app varies greatly between customers and even users in the same organization. It's impossible to predict your organization's data usage, but we can offer some guidelines:
 - The initial data download consists of records that match the criteria specified in the user's mobile configuration and the metadata needed to support these records when disconnected. On average, the data sizes range from 500 KB–4 MB.

- After the initial download of data, incremental update requests are initiated by the client app every 20 minutes. Each of these requests and the corresponding server response are approximately 200 bytes.
- If any new data is downloaded to the client app as a result of the update request, only the new or changed values are sent. For example, the Salesforce Mobile Classic app only downloads the new phone number in a contact record, not the entire contact record. The amount of data transmitted differs for every organization and every user.

Generally, the volume of data transmitted by the Salesforce Mobile Classic app is low compared to moderate email usage.

Best Practices

- Use the zero-administration deployment option to experiment with the Salesforce Mobile Classic app before you set up mobile configurations. You'll create better blueprints for your mobile configurations if you've tried using the Salesforce Mobile Classic app.
- Talk to users about their favorite reports, views, and dashboards to get ideas for what filter criteria to use in mobile configurations.
- After setting up mobile configurations, deploy the Salesforce Mobile Classic app on a limited basis with a select group of users. Adjust the mobile setup based on their feedback, then deploy to all of your users.

Setting Up Salesforce Mobile Classic

To deploy the Salesforce Mobile Classic app to your organization:

1. [Review the mobile implementation tips and best practices](#)
2. [Enable mobile users](#)
3. [Create one or more mobile configurations](#)
4. [Define the data sets for your mobile configurations](#)
5. [Test the mobile configurations](#)
6. [Customize mobile page layouts and adjust mobile user permissions](#) (optional)
7. [Customize mobile tabs](#) (optional)
8. [Create custom mobile views](#) (optional)
9. [Set up mobile reports](#) (optional)
10. [Set up Salesforce CRM Content](#) (optional)
11. [Configure access for partner users](#) (optional)
12. [Create links to Web and Visualforce Mobile pages](#) (optional)
13. [Notify users that Salesforce Mobile Classic is available for download](#)

When users download the Salesforce Mobile Classic app and activate their accounts, you can [manage their devices](#) in the Salesforce Mobile Classic Administration Console.

Enabling Salesforce Mobile Classic Users

To enable users to access Salesforce Mobile Classic:

1. Allocate mobile licenses to users by selecting the `Salesforce Mobile Classic User` checkbox on the user record.
2. Edit each custom profile to which Salesforce Mobile Classic users are assigned to include the "API Enabled" permission. Salesforce Mobile Classic users need access to the API so their mobile devices can communicate with Salesforce. The "API Enabled" permission is enabled by default on standard profiles.

 **Note:** The Android and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact Salesforce to turn on Salesforce Mobile Classic for your organization.

To prevent users from activating Salesforce Mobile Classic on their mobile devices before you're ready to deploy the app, disable the `Salesforce Mobile Classic User` checkbox for all your users.

 **Note:** If you deselect this checkbox for a user who is already assigned to a mobile configuration, Salesforce removes that user from the mobile configuration and assigns the user to the default mobile configuration.

The free version of Salesforce Mobile Classic is available only for orgs that enabled this option before Summer '16. With Summer '16, all other orgs (new and existing) don't see this option.

Create Salesforce Mobile Classic Configurations

Mobile configurations are sets of parameters that determine the data Salesforce transmits to users' mobile devices, and which users receive that data on their mobile devices. Organizations can create multiple mobile configurations to simultaneously suit the needs of different types of mobile users. For example, one mobile configuration might send leads and opportunities to the sales division, while another mobile configuration sends cases to customer support representatives.

Before creating your mobile configurations, plan which profiles and users you want to assign to each configuration. Each mobile configuration only affects the mobile devices of users assigned to the configuration.

To create a mobile configuration:

1. [Enter Basic Information](#)
2. [Assign Users and Profiles](#)
3. [Set Total Data Size Limit](#)
4. [Complete Your Mobile Configuration](#)

 **Note:** A [default mobile configuration](#) is provided for Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations. You can't view or edit the default configuration.

Enter Basic Information

1. From Setup, enter *Salesforce Classic Configurations* in the **Quick Find** box, then select **Salesforce Classic Configurations** to access the mobile configurations list page.
2. Click **New Mobile Configuration**.
3. Enter a name for the mobile configuration.
4. Select the **Active** checkbox if you want to activate the mobile configuration immediately after creating it. The mobile configuration does not work until you select this checkbox.

If you deactivate an active mobile configuration, Salesforce saves all requests from devices of the users assigned to the mobile configuration for up to one week. If you reactivate the mobile configuration, Salesforce executes those requests in the order received.

5. Optionally, enter a description for the mobile configuration.
6. Optionally, select the **Mobilize Recent Items** checkbox to mark recently used records in Salesforce for device synchronization. Selecting this option ensures that mobile users assigned to the configuration will not have to search for and download items they recently accessed on Salesforce, even if those records do not meet the configuration's filter criteria. Only records belonging to mobilized objects can be marked for device synchronization; for example, if you do not mobilize the account object in a configuration, users assigned to that configuration cannot automatically receive recent accounts on their devices.
7. If you select the **Mobilize Recent Items** checkbox, select a value from the **Maximum Number of Recent Items** drop-down list. Set a low number if your users have minimal free space on their mobile devices.
8. Optionally, select the **Mobilize Followed Records** checkbox to automatically synchronize records users are following in Chatter to their mobile device. The device only synchronizes followed records for objects included in the mobile configuration's data set.

The **Mobilize Followed Records** checkbox is only available if Chatter is enabled for your organization.

USER PERMISSIONS

To view Salesforce Mobile Classic configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Mobile Classic configurations:

- "Manage Mobile Configurations"

Assign Users and Profiles

You can assign individual users and profiles to each mobile configuration. If you assign a profile to a mobile configuration, the mobile configuration applies to all Salesforce Mobile Classic users with that profile unless a specific user is assigned to another mobile configuration.

 **Tip:** For ease of administration, we recommend that you assign mobile configurations to profiles; however, you may have situations in which you need to assign a configuration directly to individual users.

To assign users and profiles to a mobile configuration:

1. In the Search drop-down list, select the type of member to add: users or profiles. This drop-down list is not available if you have not enabled the `Mobile User` checkbox on any user records, or if all users are already assigned to a mobile configuration; in that case, you can only assign profiles to this mobile configuration.
2. If you do not immediately see the member you want to add, enter keywords in the search box and click **Find**.
3. Select users and profiles from the `Available Members` box, and click the **Add** arrow to add them to the mobile configuration. You can assign each user and profile to only one mobile configuration.

The `Available Members` box only displays users who have the `Mobile User` checkbox enabled.

4. If there are users or profiles in the `Assigned Members` box you do not want to assign to this mobile configuration, select those users and click the **Remove** arrow.

 **Warning:** Removing a user from an active mobile configuration deletes the Salesforce-related data on the user's mobile device but does not delete the client application.

Set Total Data Size Limit

Different types of mobile devices offer different memory capacities, and some devices experience serious problems if all of the flash memory is used. To avoid overloading mobile devices, optionally specify a total data size limit for each mobile configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration.

To set the total data size limit, use the `Don't sync if data size exceeds` drop-down list to specify the amount of memory that is consistently available on the mobile devices of users who are assigned to this mobile configuration. If the combined size of all the data sets exceeds this limit, users assigned to this profile receive an error message on their mobile devices, and Salesforce will not synchronize any data sets in this mobile configuration. [Test your mobile configuration](#) to make sure the data sets do not exceed the total data size limit.

 **Tip:** To reduce the size of your data, do one or more of the following:

- Delete a data set.
- Reduce the scope of your data sets.
- Refine the filter criteria of your data sets.

Complete Your Mobile Configuration

Click **Save**. Note that your mobile configuration is not active until you select the `Active` checkbox.

SEE ALSO:

[Manage Salesforce Mobile Classic Configurations](#)

[Define Data Sets](#)

[Setting Up Salesforce Mobile Classic](#)

Define Data Sets

Accessing Salesforce from a mobile device is very different than accessing it from your computer. This is because mobile devices generally have less memory and screen size than computers, and they do not maintain a constant network connection. To work with these limitations, each mobile configuration only transfers data sets, which are subsets of the records users access in the Salesforce online user interface. Mobile devices store data sets in on-board databases, allowing users to access their most important records and work offline when no network connection is available. Salesforce automatically synchronizes the on-board databases when the mobile device reestablishes a network connection.

Each data set can contain records related to a single object and is classified by the name of that object. For example, the Accounts data set only includes account records.

Data sets can have child data sets, which are data sets that contain records associated with a top-level (parent) data set. For example, if the first level of your hierarchy has an Accounts data set, you can add a Contacts child data set that includes all contact records related to the account records. Child data sets appear as related lists on mobile devices.

A single mobile configuration can have multiple data sets for the same object and at different levels. For example, you can have an Events parent data set and an Events child data set under Leads.

 **Tip:** Review the [sample data sets](#) to see how you might define data sets for common groups of Salesforce users.

After [creating a mobile configuration](#), you must define its data sets. To access the data sets for a mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of the mobile configuration that you want to modify.
2. In the Data Sets related list, click **Edit**.
3. From the Data Sets page, you can:
 - [Add a data set](#).
 - Remove a data set by selecting the data set you want to remove and clicking **Remove**.
 - Edit a data set by selecting the data set you want to edit in the hierarchy. The right pane displays the filters for that data set.
 - [Test your mobile configuration](#).

As you define and modify the data sets, Salesforce automatically saves your changes.

4. Click **Done** when you are finished.

Adding Data Sets

To add a data set:

1. In the hierarchy, select **Data Sets** to create a parent data set, or select an existing data set to create a child data set.
2. Click **Add...**
3. In the popup window, select the object for the records you want the data set to include. Salesforce lets you create parent data sets for all custom objects and the following standard objects:
 - Accounts

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited, and Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional and Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To view mobile data sets:

- "View Setup and Configuration"

To create, change, or delete mobile data sets:

- "Manage Mobile Configurations"

- Assets
- Attachments
- Cases
- Contacts
- Content
- Events
- Leads
- Notes
- Opportunities
- Price Books
- Products
- Solutions
- Tasks
- Users

**Note:**

- Although attachments are available as a data set, they're only supported in Salesforce Mobile Classic for Android.
- Salesforce Mobile Classic supports default field values only for picklists and multiselect picklists. Default field values for other types of fields, such as checkboxes and numeric fields, do not appear in Salesforce Mobile Classic.

When adding to an existing data set, the popup window displays any object with a relationship to the selected object. This includes child objects, and also parent objects with a master-detail or lookup relationship to the selected object.

For example, assume you created an account field called Primary Contact with a lookup relationship to the contact object. If you add Account as a top-level data set in a mobile configuration, you see two sets of contacts when you add Contact below Account:

- **Contact:** Represents the standard relationship between the account and contact objects.
- **Contact (Referenced by Account):** Represents any object that is the parent in a lookup or master-detail relationship for the selected object. In this case, the contact object is referenced by the Primary Contact field on the account object.

Because Salesforce distinguishes between these two types of relationships, you could, for example, mobilize just the contacts referenced by a custom account field without sending any child contact records to the device.

4. Click **OK**. The data set you created appears in the hierarchy.
5. Optionally, use filters to restrict the records that a parent or child data set includes:
 - a. Use the Filter by Record Ownership options to configure Salesforce to automatically synchronize records based on the owner of the record. The possible options are:
 - **All Records:** Salesforce automatically synchronizes all records the user can access. The **All Records** option is not available for tasks and events when they are parent data sets in a mobile configuration. This helps prevent failed data synchronization due to activity filter queries that take too long to run.
 - **User's Records:** Salesforce automatically synchronizes all records the user owns.
 - **User's Team's Records:** Salesforce automatically synchronizes all records owned by the user and the user's subordinates in the role hierarchy.
 - **User's Account Team's Records:** Salesforce automatically synchronizes accounts for which the user is an account team member, but does not include accounts owned by the user.

- **User's Opportunity Team's Records:** Salesforce automatically synchronizes opportunities for which the user is an opportunity team member, but does not include opportunities owned by the user.
- **None (Search Only):** Salesforce does not automatically synchronize any records for this data set; however, users can use their mobile devices to search all of the records they can access.

Salesforce only displays options that relate to the selected data set. For example, selecting an account data set displays the **User's Account Team's Records** option, while selecting an opportunity data set displays the **User's Opportunity Team's Records** option.

If your mobile needs for an object require a combination of the available record ownership filters, you can add the same object data set up to four times on the same hierarchy level. For example, a sales manager might want to synchronize his opportunities, opportunities owned by his subordinates, and opportunities for which he is an opportunity team member. In this case, you would add an opportunity data set and select **User's Team's Records**, then add a second opportunity data set at the same level in the hierarchy and select **User's Opportunity Team's Records**. Note that objects with only one ownership filter option, such as Case Comment, cannot be added multiple times at the same level of the hierarchy.

- Set the filter criteria to automatically synchronize only records that meet specific criteria in addition to the Filter by Record Ownership option you selected. For example, you can set the filter to only include opportunity records with amounts greater than \$50,000, or contact records with the title "Buyer."
- To prevent a single data set from consuming all the memory on a mobile device, select the second radio button under Set Max Record Limit and enter the maximum number of records this data set can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the [data size limit](#) is exceeded.

If the limit is reached, Salesforce updates the records currently on the mobile device approximately every 20 minutes, and replaces the records approximately every 24 hours in accordance with the Order By and Sort settings. For example, if the settings are Last Modified Date and Descending, Salesforce transfers the most recently modified records to mobile devices and removes the same number of records that were least recently modified.

If you selected the **None (Search Only)** Filter by Record Ownership option, the limit you set does not apply because no records are automatically synchronized.

 **Tip:** Do not use Set Max Record Limit in place of filters. Only use Set Max Record Limit as a safety mechanism, and use filters as the primary means of limiting the number of records on a mobile device. This ensures that your mobile users receive the correct records on their devices.

Because of the memory restrictions of mobile devices, Salesforce prevents a single query from returning more than 2,500 records.

- Be sure to [test your mobile configuration](#) to make sure the data does not exceed the total data size limit.
- Click **Done**.

[Setting Up Salesforce Mobile Classic](#)

Merge Fields for Mobile Filter Criteria

Some of the \$User merge fields are available when defining filters for mobile configurations and mobile custom views. In mobile configurations, you can use these merge fields to synchronize records where the user is linked to a record but is not the record owner. For example, you can send cases created by the current user to the mobile device, or you can send records to the device where the current user is referenced in a custom field. In mobile views, you can use the merge fields to define view based on the record owner; for example, you might create a view that displays the current user's accounts with a rating of "Hot".

The following table describes the available user merge fields:

Merge Field	Description
<code>\$User.ID</code>	References the ID of the current user. This merge field can be applied to fields that contain a user lookup. The valid operators for this merge field are Equals and Not Equal To. When creating mobile view filters that reference an owner field, you can only use the <code>\$User.ID</code> merge field.
<code>\$User.Username</code>	References the username of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Firstname</code>	References the first name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Lastname</code>	References the last name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Fullname</code>	References the first and last name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or

[Define Data Sets](#)

Sample Data Sets

Many administrators create mobile configurations based on the functional groups in their organization because users in the same group usually have similar mobile requirements for data. Below are sample data sets for common Salesforce groups. Your mobile users have unique needs, but you can use the examples as a reference to help you get started with mobile configurations.

Sales Manager

Sales managers usually need to see records they own and also the records of their subordinates. They also tend to closely monitor large deals in the pipeline.

This mobile configuration allows sales managers to see:

- The opportunities they own.
- The opportunities owned by users who report to them in the role hierarchy.
- All opportunities scheduled to close in the current quarter with an amount greater than \$100,000.
- All accounts related to the opportunities.
- A subset of their contact and activity records.

Sample Mobile Configuration for Sales Managers

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Team's Records	(Close Date equals THIS QUARTER) AND (Amount greater than "100,000")	No Limit	
Account	All Records		No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Sales Engineer

The sales engineer mobile configuration retrieves opportunities owned by the other members of the user's opportunity team, but does not include the user's records. The configuration is opportunity-based because all accounts and contacts sent to the device are related to the opportunities. The sales engineers would see activity history related to the opportunities on the device and also their own activities.

Sample Mobile Configuration for Sales Engineers

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Sales Team's Records	Closed equals False	No Limit	
↳ Account	All Records		No Limit	
↳ Contact	All Records		No Limit	
↳ Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
↳ Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Account Executive

This account executive mobile configuration is account-based, which means the device pulls down the user's accounts and opportunities related to those accounts. The opportunities are filtered so that only open opportunities scheduled to close in the current quarter appear on the device. The Task and Event child data sets retrieve all activities related to those opportunities, not just the user's activities. Only open tasks and events from a two-month window are sent to the device. The Task and Event parent data sets pull down just the user's activities and restrict the activities to open tasks and events scheduled for the next 30 days. The Contact data set delivers the user's contact records, but limits the record count to the 500 most recently active contacts.

Sample Mobile Configuration for Account Executives

Object	Ownership Filter	Field Filter	Max Records	Order By
Account	User's Records		No Limit	
↳ Opportunity	User's Records	(Closed equals False) AND (Close Date equals THIS QUARTER)	No Limit	
↳ Event	All Records	(Date equals LAST 30 DAYS) AND (Date equals NEXT 30 DAYS)	No Limit	
↳ Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Customer Support Representative

Customer support representatives are focused primarily on cases and solutions. This mobile configuration delivers all open cases to the user's device, along with related accounts, contacts, case comments, case history, tasks, and events. The Case Solution child data set sends all solutions related to the cases, and the Solution data set lets the user search for solutions from the Solutions tab on the device. The support representatives also have access to a subset of their activity records.

Sample Mobile Configuration for Customer Support Representatives

Object	Ownership Filter	Field Filter	Max Records	Order By
Task	All Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	
Case	User's Records	Closed equals False	No Limit	
Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Case Comment	All Records		No Limit	
Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
Account	All Records		No Limit	
Contact	All Records		No Limit	
Case History	All Records		No Limit	
Case Solution	All Records		No Limit	
Solution	None (Search Only)		No Limit

[Manage Salesforce Mobile Classic Configurations](#)

[Define Data Sets](#)

Test Salesforce Mobile Classic Configurations

When you [create a Salesforce Mobile Classic configuration](#), you specify a total data size limit for the configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration. After [defining the data sets](#), it's important to test the mobile configuration to make sure the total data size limit isn't exceeded.

To estimate the size of the data set that the mobile configuration will deliver to a user's device:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of the mobile configuration that you want to test.
2. In the Data Sets related list, click **Edit**.
3. In the Test Data Size section, click the lookup icon next to the `Select a user` field to choose the user you want to test. While users must be mobile-enabled in order to assign them to mobile configurations, you can test the configuration's data size against any user account.

The `Select a user` field defaults to the name of the user currently logged in; however, it is important to test a mobile configuration with the accounts of users who will actually be assigned to the configuration, particularly users who own a large number of records.

4. Select the **Include metadata** checkbox to include metadata in the estimate. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.

Warning: It might take a while for Salesforce to calculate the metadata size in addition to the data size. Even if you choose to hide the metadata in your test results, the metadata is still factored into the total data size when the mobile device synchronizes with Salesforce.

5. Click **Estimate Data Size**.

The size of each data set is calculated. Results display in the hierarchy tree, which is the left pane of the data set region at the top of the page. Additional results appear in the Test Data Size section below the hierarchy.

- In the hierarchy tree, two numbers appear next to each data set. The first represents the number of records generated by the data set, and the second represents the total size of the data set in bytes or kilobytes. This breakdown is useful for identifying which data sets might require additional filtering criteria to reduce the size.
- The Test Data Size section provides an estimate of the data that the current mobile configuration would deliver to the selected user's device, including:
 - The size and number of records in each object's data set.
 - The total size and number of records, which includes records in the data set and marked records. A marked record is a record that is not part of a user's mobile configuration. There are two ways marked records can become part of the data set:
 - The user downloads records to his or her device through online searches, and the records are flagged so that they get sent to the user's device every time the device synchronizes with Salesforce.
 - Records in the user's data set contain lookup fields to records that do not match the mobile configuration's filter criteria. Salesforce synchronizes the records referenced in the lookup fields so that users do not encounter broken links in the mobile app.

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional** and **Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To view Salesforce Mobile Classic data sets:

- "View Setup and Configuration"

To test Salesforce Mobile Classic configurations:

- "Manage Mobile Configurations"

 **Tip:** For an accurate count of the marked records, synchronize the data in the mobile app before estimating the data size. To synchronize the data:

- On an Android device, tap **Application Info** > **Sync Now** > **Refresh All Data**.
- On an iPhone device, tap **More**, then tap **App Info**. Tap **Sync Now**, then tap **Refresh All Data**.

- The size of the metadata that would be sent to the device for the user, if you selected the **Include metadata** checkbox.
- The total mobilized data set, which is the sum of all the records.

- Reports are not included in the data size estimate.

6. Compare the test results to the total data size limit that was set for the configuration; the limit is located in the top of the Test Data Size section. Click the size limit to increase or decrease the value on the Edit Mobile Configuration page.

- If the total data size is below the limit, the selected user can safely be assigned to the mobile configuration. However, keep in mind that the test results are an estimate because different devices have different storage algorithms.
- If the total data size exceeds the limit, reduce the size of the data by reducing the scope of your [data set](#), refining the filter criteria of your data sets, deleting a data set, or [removing fields from the mobile page layout](#). Repeat the testing process until the data is below the total limit.

 **Note:** The data size estimate in the Test Data Size section does not automatically refresh if you edit the data sets. Click **Refresh Data Size** to update the test results.

[Manage Salesforce Mobile Classic Devices](#)

[Setting Up Salesforce Mobile Classic](#)

Edit Object Properties for Salesforce Mobile Classic

You can change the properties of standard and custom objects in the Salesforce Mobile Classic app. For example, you can restrict the permissions of Salesforce Mobile Classic users, or you can exclude unnecessary fields from the object's mobile page layout.

Salesforce Mobile Classic object properties are customized per mobile configuration. To edit mobile object properties:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**.
2. Click the name of the mobile configuration you want to modify.
3. In the Mobile Object Properties related list, click **Edit** next to an object name.

Only objects you mobilized in the configuration's data set appear in the related list. You can't change the properties of the user object.

4. From the Edit Mobile Configuration page, you can:
 - [Remove Mobile Permissions](#)
 - [Customize Salesforce Mobile Classic Page Layouts](#)
5. Click **Save**.

Remove Mobile Permissions

The Salesforce Mobile Classic app inherits the user's permissions from Salesforce. Some administrators want to further restrict the permissions of users when they access Salesforce data in Salesforce Mobile Classic, usually due to limitations of the app or the possibility of user error. For example, users can inadvertently delete a record because they don't realize that deleting a record in Salesforce Mobile Classic also deletes the record in Salesforce. If this is a concern, administrators can prevent users from deleting records in the mobile application, regardless of their standard and custom object permissions in Salesforce. Also, Salesforce Mobile Classic doesn't support all Salesforce features, such as S-controls and Apex. If your business process for an object is unsupported by Salesforce Mobile Classic, you might choose to prevent mobile users from updating those records in the app.

In the Permissions section, select which permissions to remove from mobile users for this object. Use the **Deny Create**, **Deny Edit**, or **Deny Delete** checkboxes to prevent users from creating, editing, or deleting records in Salesforce Mobile Classic.

 **Note:** Currently, you can't block mobile permissions for the content object.

Customize Salesforce Mobile Classic Page Layouts

The Salesforce Mobile Classic app inherits the user's page layouts from Salesforce. Administrators may want to exclude some fields from each object's mobile page layout because unnecessary fields consume memory and make it harder for users to scroll through pages on the mobile device.

In the Excluded Fields section, select which fields to display on the mobile device for this object. To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.

- Administrators can view all available fields per object, regardless of field-level security.

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional** and **Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To view Salesforce Mobile Classic configurations:

- "View Setup and Configuration"

To edit Salesforce Mobile Classic object properties:

- "Manage Mobile Configurations"

- Certain fields are required in order for Salesforce Mobile Classic to communicate with Salesforce. Those fields don't display in the Available Fields box because they are mandatory and can't be excluded from mobile page layouts.
- Fields used in custom mobile views can't be excluded from mobile page layouts.
- If you mobilize the content object, all of the content object's fields display in the Available Fields box; however, the layout of the content detail page in the Salesforce Mobile Classic app is hard-coded to show only a few fields. Excluding fields for the content object doesn't affect the page layout in the app.

SEE ALSO:

- [Support On-the-Go Productivity with Salesforce Mobile Classic](#)
- [Manage Salesforce Mobile Classic Configurations](#)
- [Manage Salesforce Mobile Classic Tabs](#)
- [Create Links to Web and Visualforce Mobile Pages for Salesforce Mobile Classic](#)
- [Setting Up Salesforce Mobile Classic](#)

Assign Tabs to a Salesforce Mobile Classic Configuration

For each mobile configuration, you can select the tabs that appear in the Salesforce Mobile Classic app and define the order of the tabs. The available tabs for a mobile configuration include:

- Standard object tabs
- Custom object tabs
- Visualforce and web tabs that have been enabled for Salesforce Mobile Classic

Warning: Not all websites and Visualforce features are supported on mobile devices. Carefully review the [best practices](#) for creating mobile-friendly pages before enabling Visualforce or web tabs for the Salesforce Mobile Classic app.

By default, tabs work the same in the Salesforce Mobile Classic app as in the full Salesforce site—if an object's tab is hidden in Salesforce, it's hidden in Salesforce Mobile Classic as well.

Note: If you customize mobile tabs, the tabs you select for the mobile configuration are sent to users' mobile devices even if the tabs have not been added to a configuration. Although the tabs are sent to the device, they only display in the Salesforce Mobile Classic app if users have permission to view the tab.

There are several reasons you might want to hide an object's tab in Salesforce Mobile Classic even though the object records are sent to the device. The Salesforce Mobile Classic app has much less screen space to display a row of tabs, so occasionally you might choose to reduce the number of tabs on the device. Also, sometimes a custom object has a relationship to a standard object, and users access the custom object record from the parent object record. In that case, you could mobilize the custom object but hide the tab.

To assign tabs to a mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration.
2. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you have already set up the mobile tabs, click **Edit**.

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited, and Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional and Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To view Salesforce Mobile Classic configurations:

- "View Setup and Configuration"

To customize Salesforce Mobile Classic tabs:

- "Manage Mobile Configurations"

3. Select tabs from the `Available Tabs` list, and click the **Add** arrow to add them to the mobile configuration.
4. In the `Selected Tabs` list, choose tabs and click the **Up** and **Down** arrows to arrange the tabs in the order they should appear in the Salesforce Mobile Classic app.
5. Click **Save**.

Note: iPhone users can customize the order of their tabs in the Salesforce Mobile Classic app. If the user customizes their tab order, any administrator changes to the tab order in the mobile configuration are ignored by the app, and any newly mobilized tabs are added below the user's existing tabs.

[Manage Salesforce Mobile Classic Tabs](#)

[Enabling Web and Visualforce Tabs for Salesforce Mobile Classic](#)

[Support On-the-Go Productivity with Salesforce Mobile Classic](#)

[Manage Salesforce Mobile Classic Configurations](#)

Enabling Web and Visualforce Tabs for Salesforce Mobile Classic

You can make web and Visualforce tabs available in the Salesforce Mobile Classic app. When you build the web tab or Visualforce tab, edit the tab properties and select the `Salesforce Mobile Classic Ready` checkbox to ensure that the web page or Visualforce page displays and functions properly on a mobile device. Selecting the checkbox adds the tab to the list of available tabs for your Salesforce Mobile Classic mobile configurations.

It is important to note that most mobile browsers have technical limitations concerning display size, scripts, processor speed, and network latency. Review the following considerations before mobilizing your web and Visualforce pages to ensure that they are compatible with mobile browsers.

Mobile Web Tab Considerations

Consider the following when defining a web tab that will be used in the Salesforce Mobile Classic app:

- The ability to mobilize web tabs is only available for iPhone devices. If you mobilize a web tab, keep in mind that Android users can't view the tab in Salesforce Mobile Classic.
- The tab type must be URL. The mobile application can't run S-controls.
- Some web pages contain JavaScript and Flash, but not all mobile browsers support them:
 - Apple's Safari browser supports JavaScript, but not Flash.
- Before mobilizing a web tab, navigate to the target URL on one of your organization's mobile devices to verify that it works as expected in a mobile browser. In the event that your organization's device inventory includes phones with different operating systems—for example, iPhone devices—be sure to test on each type of device. If users can't accomplish the necessary tasks on the web page from a mobile browser, do not mobilize the web tab.

Visualforce Mobile Tab Considerations

Consider the following when defining a mobile Visualforce tab:

- Visualforce Mobile is only available for iPhone. If you mobilize a Visualforce tab, keep in mind that Android users can't view the tab in Salesforce Mobile Classic.

EDITIONS

Salesforce Mobile Classic setup available in: both **Salesforce Classic** and **Lightning Experience**

Mobile app available in: **Performance, Unlimited, and Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional** and **Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

- Because the display size is limited on mobile browsers, we recommend redesigning the Visualforce page to optimize it for mobile users:
 - Set the `sidebar` and `showHeader` attributes on the `<apex:page>` tag to `false`. Phones have small screens and limited processing power, so it is essential that the page suppresses the tab header and sidebar.
 - Set the `standardStylesheets` attribute on the `<apex:page>` tag to `false`. The standard Salesforce style sheet causes pages to load slowly on the device. The best approach to adding a style sheet to your page is to include a `<style>` section just below the `<apex:page>` component.
 - Set the `columns` attribute on the `<apex:pageBlockSection>` component to `1`. There is not enough room on a mobile device's screen to display two columns, so specifying a one-column layout prevents fields from wrapping awkwardly on the page.
- Splash pages don't display in the Salesforce Mobile Classic app.
- In the Salesforce Mobile Classic app, the Visualforce page is embedded in a tab, so you should avoid using tabs for navigation in mobile Visualforce pages.
- Even if you know that the mobile browser supports the JavaScript in your Visualforce page, keep your use of JavaScript to a minimum. Mobile devices generally have slow network connections, and too many scripts running on a page creates a poor user experience. To minimize the amount of JavaScript on your mobile Visualforce pages, try to build them using mostly HTML.
- All Visualforce pages contain JavaScript, even if you don't create pages that use JavaScript code.
- User agent inspection can be executed in a custom controller to support multiple devices. You can do this by inspecting the appropriate result of the `getHeaders()` method on the current page reference.

[Manage Salesforce Mobile Classic Tabs](#)

[Manage Salesforce Mobile Classic Configurations](#)

[Create Links to Web and Visualforce Mobile Pages for Salesforce Mobile Classic](#)

[Assign Tabs to a Salesforce Mobile Classic Configuration](#)

Create List Views for Salesforce Mobile Classic

You can create custom list views for Salesforce Mobile Classic users. Custom list views for Salesforce Mobile Classic, also called mobile views, are different from Salesforce custom views in these ways:

- Administrators set up mobile views for each mobile configuration. The views are available to all users assigned to the configuration, and administrators can't restrict visibility to certain groups of users within the configuration. Each mobilized object in a mobile configuration can have up to 10 custom views.
- Users can't filter mobile views by All Records or My Records. The views apply to all records stored locally on the device regardless of ownership; however, ownership filters can be applied using the additional fields in the search criteria.
- Mobile views don't support filter logic.
- Mobile views are limited to a two-column display.
- Users can sort mobile views in ascending or descending order by up to two fields.

For each mobile configuration, you can define up to 10 custom views per object. These views are then pushed to the devices of users assigned to the affected configurations. To create a custom view for Salesforce Mobile Classic:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration. You might need to [create a mobile configuration](#) if you haven't already.
2. Scroll down to the Mobile Views related list.
3. Choose an object type from the Select an object drop-down list, and then click **New Mobile View**. Only objects included in the mobile configuration's data set appear in the drop-down list. You can't create mobile views for the user object.
4. Enter the view name.

Because display space on mobile devices is limited, the maximum length of a mobile view name is 30 characters.

5. In the Specify Filter Criteria section, enter conditions that the selected items must match; for example, *Amount is greater than \$100,000*.
 - a. Choose a field from the first drop-down list.

 **Note:** You can't create views based on fields you [excluded from mobile page layouts](#) or fields that are [hidden for all profiles and permission sets](#).

- b. Choose a filter operator.
- c. In the third field, enter the value to match.

 **Warning:** Note the following about filter criteria values for mobile views:

- You can use the `$User.ID merge field` as a value in your filter criteria to reference the current user. You can't enter user names in your filter criteria.
- You can only enter special date values in your filter criteria, not actual dates.
- You can't use FISCAL special date values in the filter criteria.

- d. Select **Match All** if items in the mobile view should match all the criteria you entered. Select **Match Any** if items in the mobile view should match any of the criteria you entered. Mobile custom views do not support advanced filtering options.

Enable Reports in Salesforce Mobile Classic

To enable reports in the Salesforce Mobile Classic app:

1. Create a Mobile Reports folder in Salesforce. From the reports home page in the full site, click **Create New Folder**.

2. In the `Report Folder` field, enter: `Mobile Reports`.

The server won't load reports on mobile devices unless this folder is named `Mobile Reports`. Be sure to check for any typos in the name before saving the folder. Additionally, Salesforce doesn't require folder names to be unique. Salesforce Mobile Classic users can see any report stored in all folders named `Mobile Reports` unless you restrict access with the folder visibility option.

3. Choose a `Public Folder Access` option. This option doesn't affect the ability of mobile users to run reports.
4. Optionally, select any unfiled reports and click **Add** to store them in the `Mobile Reports` folder. You can also add reports to the folder after saving the folder.
5. Choose a folder visibility option.

- `This folder is accessible by all users` gives every user in your organization the ability to see the list of mobile reports from their devices.
- `This folder is accessible only by the following users` lets you grant access to a desired set of users.

Don't make the `Mobile Reports` folder private unless you want to hide mobile reports from all users, including yourself.

6. Click **Save**.
 7. Add reports to the `Mobile Reports` folder. Click the report name on the reports home page, then click **Save As** and save the report in the `Mobile Reports` folder.
- After saving the report, you can edit the options to make the report easier to view on a mobile device. For example, you might reduce the number of columns or enter additional filtering criteria.

8. Add the Reports tab to your mobile configurations. From Setup, enter `Salesforce Classic Configurations` in the `Quick Find` box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration.
9. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you've already set up the mobile tabs, click **Edit**.
10. Select **Reports** from the Available Tabs list, then click the **Add** arrow to add it to the mobile configuration. The Available Tabs list includes standard object tabs and custom object tabs. It can also include web and Visualforce tabs.

 **Warning:** If you have not yet customized tabs in the mobile configuration, you must select all the tabs that should appear in the Salesforce Mobile Classic, not just the Reports tab.

11. In the Selected Tabs list, choose the Reports tab and click the **Up** and **Down** arrows to define where the Reports tab should appear in the Salesforce Mobile Classic app.
12. Click **Save**.

EDITIONS

[Setting Up Salesforce Mobile Classic](#)

Set Up Salesforce CRM Content for Salesforce Mobile Classic

Note the following about how Salesforce CRM Content is implemented in Salesforce Mobile Classic:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Mobile Classic is only supported on iPhone devices.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Mobile Classic is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Mobile Classic configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.
3. Click **Add...**
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

Because users can't search for content in the Salesforce Mobile Classic app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

- **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like LAST 90 DAYS or LAST 180 DAYS to ensure that recently updated content records are synchronized.
- **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
- **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To view Salesforce Mobile Classic configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Mobile Classic data sets:

- "Manage Mobile Configurations"

- **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals `Sales`.
6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.
 7. Click **Done**.

Configuring Salesforce Mobile Classic Access for Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can allow partner users to access partner portal data on mobile devices using the Salesforce Mobile Classic app.

Tips for setting up Salesforce Mobile Classic access for partner users:

- Before setting up Salesforce Mobile Classic for partner users, you must configure partner user accounts and purchase mobile licenses for each partner portal user that will be using Salesforce Mobile Classic. Partner user profiles must be assigned to at least one active partner portal before partner users can use Salesforce Mobile Classic. If a user profile is assigned to multiple partner portals, only the first assigned partner portal will be accessible using Salesforce Mobile Classic.
- Custom mobile list views don't affect list views in the partner portal.
- If you make User data sets available in the Salesforce Mobile Classic app, partners can assign objects to their partner account users and all internal users. If you don't make User data sets available, partners can only assign objects to internal or partner account users who are associated with records that you've made available on the mobile device.

- "Manage Mobile Configurations"

Create Links to Web and Visualforce Mobile Pages for Salesforce Mobile Classic

To improve the integration between the Salesforce Mobile Classic app, Visualforce Mobile, and external websites, you can optionally create links from native Salesforce records to Visualforce Mobile pages or external websites. To create the links, build text formula fields on a standard or custom object. The field must be visible on the page layout to appear in the Salesforce Mobile Classic app. The best practice is to include all embedded links in a separate section labeled "Mobile Links" at the bottom of the page layout. There is currently no way to hide these links in Salesforce, but users can collapse the section to keep the links out of the way.

1. Navigate to the fields area of the appropriate object.
2. Click **New** in the fields section of the page.
3. Select **Formula**, and then click **Next**.
4. Enter the field label.

The field name is automatically populated based on the field label you enter.

5. Select **Text**, then click **Next**.
6. In the formula editor, create the link to the custom Visualforce page or external website:
 - To create a Visualforce link, type `"visualforce:///apex/PageName"`, and replace `PageName` with the name of your Visualforce page. You can append parameters to the string, such as `?contactid=" & Id"`, in order to pass information from the record in the client application to the Visualforce page.
 - To create a Web link, type `"weblink:"`, followed by the URL to which you want the link to point, such as `"weblink:http://www.salesforce.com"`. You can append parameters to the string in order to pass information from the record in the client application to the Web page. For example, the following Web link launches a social networking site from a contact record and performs a search for the contact:

```
"weblink:http://m.linkedin.com/members?search_term=" &FirstName& "+" &LastName&
"&filter=name&commit=Search"
```

 **Note:** The client application passes the Visualforce or Web link with all parameters to the embedded browser. It is up to the website or Visualforce Mobile page to interpret any parameters. Be sure to construct your Visualforce Mobile page to consume any parameters passed in the link.

7. Click **Next**.
8. Set the field-level security to determine whether the field should be visible or read only for specific profiles, and click **Next**.
9. Choose the page layouts that should display the field. In the next step, you will customize the layout to change the location of the field on the page.
10. Save your changes.
11. Edit the object's page layout. From the management settings for the object whose page layout you want to change, go to Page Layouts.
12. Drag a Section element from the palette to the page layout and drop it below the existing sections.
13. In the **Section Name** field, type *Mobile Links*.
14. Deselect the **Edit Page** option.

Notifying Users about Salesforce Mobile Classic Availability

When you're ready to deploy the Salesforce Mobile Classic app to your users, send them an email to notify them about the availability of the app and provide installation instructions. You can send the email using your corporate email application, like Outlook, or you can send mass email from Salesforce. Either way, include the URL that launches the download.

- For Android users, the download URL is `mobile.salesforce.com`. The link is the same for the initial download and for subsequent upgrades.
- You can obtain the iPhone download URL from iTunes. Open iTunes, click **iTunes Store**, then search for Salesforce Mobile Classic. Click the app icon to view details about the app. At the top of the iTunes window is a bread crumb path representing the application's location in the App Store: **App Store > Business > Salesforce Mobile Classic**. Drag-and-drop the path into a text editor or word processing program to display the app's download URL.

To send mass email to Salesforce Mobile Classic users from Salesforce:

1. Create an email template that informs users about the availability of Salesforce Mobile Classic. From your personal settings, enter *Templates* in the *Quick Find* box, and select either **My Templates** or **Email Templates**—whichever one appears. Optionally, you can also create a separate email template for upgrade notifications. Include the download link in the templates.
2. Create a custom view on the Mass Email page that shows your Salesforce Mobile Classic users only.
3. Send mass email to your Salesforce Mobile Classic users, using the custom view that you created. From Setup, enter *Mass Email Users* in the *Quick Find* box, then select **Mass Email Users**.

Salesforce Mobile Classic FAQ for Administrators

- [Is the Salesforce Mobile Classic app secure?](#)

Is the Salesforce Mobile Classic app secure?

All data transmitted between Salesforce and Salesforce Mobile Classic is fully encrypted and secured over the air.

The mobile application has multiple layers of security at the device level. Device vendors provide the ability to set password or passcode access restrictions. Users must be required to use the device protection in accordance with your organization's security policy. If the device is locked by password, it is difficult for unauthorized persons to obtain sensitive data.

Additionally, a user must have valid Salesforce credentials to activate the mobile application on the device. When a user registers a new wireless device, the Salesforce data on their old wireless device is automatically erased—users can only activate one mobile device at a time. Users are also warned when a new device is activated using their Salesforce account. If a logged in user exceeds the administrator-configured inactivity period on the mobile device, the mobile session is terminated and the password or passcode is required to reestablish the session.

Administrators can also remotely [delete data](#) from any lost or stolen devices.

Salesforce Mobile Classic Permissions

A mobile license is required for each user who will access the Salesforce Mobile Classic app. You allocate mobile licenses using the `Mobile User` checkbox on the user record.

For organizations using Unlimited, Performance, and Developer Editions, Salesforce provides a mobile license for each Salesforce license and the `Mobile User` checkbox is enabled by default for all users. Organizations using Professional or Enterprise Editions must purchase mobile licenses separately and allocate them manually.

 **Note:** The `Mobile User` checkbox is disabled by default for new Performance Edition users.

To prevent users from activating Salesforce Mobile Classic on their mobile devices before you're ready to deploy the app, disable the `Mobile User` checkbox for all your users.

Salesforce Mobile Classic Usage Data in Custom Report Types

You can create custom report types with data that shows how your organization uses Salesforce Mobile Classic. For example, the reports can show how often users access Salesforce Mobile Classic, which mobile device models they use, and so forth.

To create a custom report type with Salesforce Mobile Classic usage data, select the Mobile Session `Primary Object` when defining a custom report type. When you select the fields for the custom report type, choose from the following Salesforce Mobile Classic-specific fields.

Mobile Usage Data Point	Definition
Brand	Wireless carrier
Data Size (Bytes)	Total size of records on device
Device Address	Unique physical address of device (UDID for iOS)
Device Application Version	Installed version of Salesforce Mobile Classic
Device Model	Model of device
Device Operating System Version	Version of operating system installed on device
Duration	Duration of the mobile session in seconds
Last Registration Date	Date of last registration or activation
Last Status Date	Date of last communication received from device
Manufacturer	Manufacturer of device
Metadata Size (Bytes)	Size of metadata (page layouts, picklist values, and so forth) on the device
Owner: Full Name	Name of the device user
Session Start Date	Date the mobile session started
Status	Indicator that the user's data set exceeds the maximum allowed size by the mobile configuration

EDITIONS

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

Note:

- Mobile sessions are similar to Web-based sessions in login history reports; however, mobile sessions have a fixed timeout value of 20 minutes. Salesforce creates a new Mobile Session when a user logs into or launches Salesforce Mobile Classic after 20 minutes of inactivity in the app or on the device in general.
- Mobile session reports only have usage data for the Salesforce Mobile Classic app and not other Salesforce mobile apps, such as the Salesforce1 apps.
- Some devices do not provide every physical attribute. For example, Apple devices do not provide brand.

Manage Salesforce Mobile Classic Devices

After a user installs the Salesforce Mobile Classic app on a mobile device and logs in for the first time, Salesforce collects information about the device and associates it with the user's record. The device information is read only.

Although the device entry is created automatically, you can still view and manage all the mobile users and devices in your organization from Setup by entering *Users and Devices* in the **Quick Find** box, then selecting **Users and Devices**.

From the All Mobile Users and Devices page, you can:

- View the list of users in your organization who have been enabled to use Salesforce Mobile Classic.
 - Create custom list views to see different subsets of your mobile users. For example, create a view that shows the users who have never logged in to Salesforce from the Salesforce Mobile Classic app to evaluate the effectiveness of your organization's Salesforce Mobile Classic deployment efforts.
 - [View details about a mobile device](#) by clicking the device address.
 - View details about a specific user by clicking the username.
 - View details about a mobile configuration by clicking the mobile configuration name.
 - Perform these actions on multiple users at the same time:
 - [Adjust the mobile session timeout value](#)
 - [Erase the Salesforce data from a user's mobile device](#)
 - [Delete a mobile device from a user's record](#)
 - Find out why a user's device isn't synchronizing by hovering your mouse over the red error icon in the Status column. Additional information about the synchronization errors appears on the device's detail page.
-  **Note:** You can also manage mobile users from the Assigned Mobile Devices related list on the user detail page.

Permanently Link Salesforce Mobile Classic Users to a Mobile Device

You can prevent mobile users from registering any mobile device other than the one they used for their initial Salesforce Mobile Classic activation.

By default, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so administrators don't need to update the device record to assign the device to another user. While this behavior makes it easy to switch devices between users in your organization, some administrators prefer that users are permanently linked to the devices they were originally assigned. This helps administrators of organizations with highly sensitive data ensure that their users do not access corporate data from personal devices.

To permanently link a user to a mobile device:

1. From Setup, enter *Salesforce Classic Settings* in the **Quick Find** box, then select **Salesforce Classic Settings**.
2. Click **Edit**.
3. Select **Permanently Link User to Mobile Device**.
4. Click **Save**.

 **Warning:** Enabling the **Permanently Link User to Mobile Device** setting requires administrative action when users need to switch devices. You must manually [delete the existing device](#) from a user's record in order for the user to register a different device. If you don't delete the device, the user won't be able to access the Salesforce Mobile Classic app.

Viewing Salesforce Mobile Classic Device Information

Salesforce collects information about a mobile user's device the first time the user logs in to the Salesforce Mobile Classic app. There are two ways to access the device details.

- From Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. Then click a device address in the list view.
- From Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click **Edit** next to a user's name, and then click the device address in the Assigned Mobile Devices related list.

From the Mobile Device page, you can:

- Review device information
- [Adjust the mobile session timeout value](#)
- [Erase the Salesforce data from a user's device](#)
- [Delete a device from a user's record](#)

Below is a description of the fields in alphabetical order that are stored for each mobile device in your organization.

Field	Description
Brand	The brand of the mobile device, if available.
Carrier	The name of the carrier providing service for the mobile device, if available.
Connected Since	The date and time the device established a connection to the mobile server. The device loses a connection when the battery dies or when the session is closed because the server has not received data from the device for a long period of time.
Connection Status	The state of the device connection. Possible values for this field are Connected, Not Connected, and Not Available.
Created By	The name of the first user who registered the mobile device and the time and date the registration occurred.
Data Size	The size of the Salesforce data currently stored on the user's mobile device. The mobile device periodically sends this information to Salesforce, which is helpful when troubleshooting synchronization errors resulting from an exceeded data limit .
Device Address	The unique identifier of the user's mobile device.
Device Model	The model of the mobile device.
Is Simulator?	A flag indicating whether the device is a simulator or a mobile device. A simulator is a

Field	Description
	software application that emulates the behavior of a mobile device.
Last Activated	The last time a full data set was downloaded to the mobile device. If a user's data set exceeds the limit defined in the assigned mobile configuration, the device can be registered but not activated.
Last Data Received	The last time data was received from the device. This information is helpful for troubleshooting connection issues.
Last Registration	The last time a user registered the mobile device. The registration process creates the device record in Salesforce and associates it with the user who registered it.
Last Status Date	The last time the mobile device notified Salesforce that the device is no longer synchronizing data due to an error. The Last Status Date field is only visible when an error is present.
Manufacturer	The manufacturer of the mobile device.
Metadata Size	The size of the Salesforce metadata currently stored on the user's mobile device. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.
Modified By	The name of the last user who registered the mobile device and the time and date the registration occurred.
Number of Pending Outgoing Messages	The number of messages queued on the mobile server waiting to be sent to the device.
Operating System	The type of operating system installed on the mobile device: Android or iPhone.
Operating System Version	The version number of the operating system installed on the mobile device.
Phone Number	The phone number associated with the mobile device.
Salesforce Mobile Classic Version	The version number and build number of the mobile client application installed on the device.
Size of Pending Outgoing Messages (Bytes)	The total data size of the messages queued on the device waiting to be sent to the mobile server. Because the server processes messages almost instantaneously, this value is usually 0.
Size of Outgoing Messages (Bytes)	The total data size of the outbound message queue on the mobile server.
Status	Indicates whether any synchronization errors exist between the device and Salesforce. The Status field is only visible when an error is present. The two error statuses are Data Limit Exceeded and Unknown Error.

Field	Description
Username	The Salesforce username of the user who is associated with the mobile device.

 **Note:** If Salesforce detects the selected device was registered by a user in another organization, an error displays on the device detail page. This can happen when a device was registered to a user in your sandbox organization and then later activated by a user in your production organization. To remove the old device record from your organization, simply [delete the device](#).

Set Salesforce Mobile Classic Session Timeout Values

For security reasons, the Salesforce Mobile Classic app is set to lock out users after 10 minutes of inactivity. Administrators can adjust or disable this setting on a device-by-device basis. For example, you might disable the Salesforce Mobile Classic timeout setting if a mobile device's operating system has its own locking mechanism.

To change the Salesforce Mobile Classic session timeout value:

- Navigate to one of these pages.
 - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
 - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
- Click **Set Mobile Session Timeout**.
- Choose the new timeout value in minutes. You can also choose **Never Expire** if users shouldn't be locked out of the app.
- Click **Save**.
Salesforce attempts to send a message containing the new session timeout setting to the selected mobile devices.
- A confirmation page [summarizes the results](#) for each mobile device you selected.

Mobile Session Timeout Results

After Salesforce sends the new session timeout session to the selected mobile devices, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Mobile Classic server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Mobile Classic

EDITIONS

Salesforce Mobile Classic setup available in: both **Salesforce Classic** and **Lightning Experience**

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional** and **Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To set Salesforce Mobile Classic session timeout values:

- "Manage Mobile Configurations"

Result	Description
	server prevented the message from being sent. Try again later.
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

Erasing Data in Salesforce Mobile Classic

When a user accesses the Salesforce Mobile Classic app, the user's mobile device contains both the mobile app and a set of the user's Salesforce data. An administrator can remove the data from a device without uninstalling the mobile app. This is an effective security tool when a user misplaces his or her device. You also must erase a device's data if you plan to give it to another user.

To erase the Salesforce data on one or more mobile devices:

- Navigate to one of these pages.
 - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
 - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
- Click **Erase Data**, then click **OK**.
Salesforce attempts to send a message to the mobile devices to erase the data.

Erase Data Results

After Salesforce sends the message to the mobile devices to erase data, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Mobile Classic server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Mobile Classic server prevented the message from being sent. Try again later.

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional** and **Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To delete the Salesforce data on a device running Salesforce Mobile Classic:

- "Manage Mobile Configurations"

Result	Description
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

SEE ALSO:

[Manage Salesforce Mobile Classic Devices](#)

[Deleting Mobile Devices](#)

Deleting Mobile Devices

There are two instances when you would delete a mobile device from a user's record:

- Your organization's mobile settings permanently link mobile users to their devices, and you need to assign a device to a different user. If you did not enable this setting, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so it is unnecessary to delete a device to assign it to another user.
- You want to move a device from your sandbox organization to your production organization.

To delete a mobile device:

1. Navigate to one of these pages.
 - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
 - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
2. On the Mobile Devices and Users page, select one or more devices, then click **Delete Device**. On the Mobile Device page, click **Delete**.
3. Click **OK**.
Salesforce attempts to delete the selected device(s).
4. A confirmation page [summarizes the results](#) for each mobile device you selected.

Delete Device Results

After Salesforce sends the message to the mobile server to delete the devices, a results page provides information about the status of each device. The table below describes the three possible outcomes:

Result	Description
Device deleted.	Salesforce removed the device record from your organization.
Device cannot be deleted at this time. Please try again later.	A temporary communication problem between Salesforce and the mobile server prevented the device from being deleted. Try again later.

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited, and Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional and Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To view mobile devices and users:

- "View Setup and Configuration"

To delete mobile devices:

- "Manage Mobile Configurations"

Result	Description
User has no mobile device.	The selected mobile user never registered a device, so therefore the message could not be sent.

Salesforce Mobile Classic App Limits

Mobile Device Limits

Apple iPhone and iPod Touch devices

- Third parties (including, but not limited to, Apple Inc. and your network connectivity provider) may at any time restrict, interrupt or prevent use of Salesforce Mobile Classic for the iPhone and iPod touch devices, or delete the Salesforce Mobile Classic app from iPhone or iPod touch devices, or require Salesforce to do any of the foregoing, without entitling the customer to any refund, credit or other compensation from such third-party or Salesforce.
- Service level agreements don't apply to the Salesforce Mobile Classic for iPhone product. Additional limitations are described in the Order Form Supplement for Salesforce Mobile Classic for iPhone, which users are required to accept upon download or installation of the Salesforce Mobile Classic for iPhone product.

Dashboards Limits

When working with dashboards in Salesforce Mobile Classic, these limitations exist:

- You can't create or edit dashboards.
- Links to custom report details are disabled.

View a Mobile User's Push Registration Information

With the Mobile Push Registrations Page, you can view any user's push registration information for general troubleshooting.

To view a user's device push registration information:

1. From Setup, enter `Users` in the `Quick Find` box, then select **Users**.
2. Select a user.
3. On the user detail page next to `Mobile Push Registrations`, click **View**.

EDITIONS

Available in: Salesforce Classic

Available in: All editions

USER PERMISSIONS

To view mobile push registration information:

- "View Setup and Configuration"

Installed Packages

You can install packages into your Salesforce organization, and then configure and manage them. To view the packages you've installed, from Setup, enter "Installed" in the Quick Find box, and then select **Installed Packages**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Install a Package

Install a managed or unmanaged package in your Salesforce org to add new functionality to your org. Choose a custom installation to modify the default package settings, including limiting access to the package. Before you install a package, verify on the AppExchange listing that the offering is compatible with your Salesforce edition.

Pre-Installation Steps

1. In a browser, go to the installation URL provided by the package developer, or, if you're installing a package from the AppExchange, click **Get It Now** from the application information page.

 **Note:** If you're installing into a sandbox, replace the `www.salesforce.com` portion of the installation link with `test.salesforce.com`. The package is removed from your sandbox organization whenever you create a new sandbox copy.

2. Enter your username and password for the Salesforce organization in which you want to install the package, and then click the login button.
3. If the package is password-protected, enter the password you received from the publisher.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

- Optionally, if you're installing an unmanaged package, select **Rename conflicting components in package**. When you select this option, Salesforce changes the name of a component in the package if its name conflicts with an existing component name.

Default Installation

Click **Install**. You'll see a message that describes the progress and a confirmation message after the installation is complete.

Custom Installation

Follow these steps if you need to modify the default settings as an administrator.

- Choose one or more of these options, as appropriate.
 - Click **View Components**. You'll see an overlay with a list of components in the package. For managed packages, the screen also contains a list of connected apps (trusted applications that are granted access to a user's Salesforce data after the user and the application are verified). Review the list to confirm that the components and any connected apps shown are acceptable, and then close the overlay.
 -  **Note:** Some package items, such as validation rules, record types, or custom settings might not appear in the Package Components list but are included in the package and installed with the other items. If there are no items in the Package Components list, the package might contain only minor changes.
 - If the package contains a remote site setting, you must approve access to websites outside of Salesforce. The dialog box lists all the websites that the package communicates with. We recommend that a website uses SSL (secure sockets layer) for transmitting data. After you verify that the websites are safe, select **Yes, grant access to these third-party websites** and click **Continue**, or click **Cancel** to cancel the installation of the package.
 -  **Warning:** By installing remote site settings, you're allowing the package to transmit data to and from a third-party website. Before using the package, contact the publisher to understand what data is transmitted and how it's used. If you have an internal security contact, ask the contact to review the application so that you understand its impact before use.
 - Click **API Access**. You'll see an overlay with a list of the API access settings that package components have been granted. Review the settings to verify they're acceptable, and then close the overlay to return to the installer screen.
 - In Enterprise, Performance, Unlimited, and Developer Editions, choose one of the following security options.
 -  **Note:** Depending on the type of installation, you might not see this option. For example, in Group and Professional Editions, or if the package doesn't contain a custom object, Salesforce skips this option, which gives all users full access.

Install for Admins Only

Specifies the following settings on the installing administrator's profile and any profile with the "Customize Application" permission.

- Object permissions—"Read," "Create," "Edit," "Delete," "View All," and "Modify All" enabled
- Field-level security—set to visible and editable for all fields
- Apex classes—enabled
- Visualforce pages—enabled
- App settings—enabled
- Tab settings—determined by the package creator
- Page layout settings—determined by the package creator
- Record Type settings—determined by the package creator

After installation, if you have Enterprise, Performance, Unlimited, or Developer Edition, set the appropriate user and object permissions on custom profiles as needed.

Install for All Users

Specifies the following settings on all internal custom profiles.

- Object permissions—“Read,” “Create,” “Edit,” and “Delete” enabled
- Field-level security—set to visible and editable for all fields
- Apex classes—enabled
- Visualforce pages—enabled
- App settings—enabled
- Tab settings—determined by the package creator
- Page layout settings—determined by the package creator
- Record Type settings—determined by the package creator

Note: The Customer Portal User, Customer Portal Manager, High Volume Customer Portal, Authenticated Website, Partner User, and standard profiles receive no access.

Install for Specific Profiles...

Enables you to choose the usage access for all custom profiles in your organization. You can set each profile to have full access or no access for the new package and all its components.

- Full Access—Specifies the following settings for each profile.
 - Object permissions—“Read,” “Create,” “Edit,” “Delete,” “View All,” and “Modify All” enabled
 - Field-level security—set to visible and editable for all fields
 - Apex classes—enabled
 - Visualforce pages—enabled
 - App settings—enabled
 - Tab settings—determined by the package creator
 - Page layout settings—determined by the package creator
 - Record Type settings—determined by the package creator
- No Access—Specifies the same settings as Full Access, *except* all object permissions are disabled.

You might see other options if the publisher has included settings for custom profiles. You can incorporate the settings of the publisher’s custom profiles into your profiles without affecting your settings. Choose the name of the profile settings in the drop-down list next to the profile that you need to apply them to. The current settings in that profile remain intact.

Alternatively, click **Set All** next to an access level to give this setting to all user profiles.

2. Click **Install**. You’ll see a message that describes the progress and a confirmation message after the installation is complete.
 - During installation, Salesforce checks and verifies dependencies. An installer’s organization must meet all dependency requirements listed on the Show Dependencies page or else the installation will fail. For example, the installer’s organization must have divisions enabled to install a package that references divisions.
 - When you install a component that contains Apex, all unit tests for your organization are run, including the unit tests contained in the new package. If a unit test relies on a component that is initially installed as inactive, such as a workflow rule, this unit test might fail. You can select to install regardless of unit test failures.
 - If your installation fails, see [Why did my installation or upgrade fail?](#) on page 1157.

Post-Installation Steps

If the package includes post-installation instructions, they're displayed after the installation is completed. Review and follow the instructions provided. In addition, before you deploy the package to your users, make any necessary changes for your implementation. Depending on the contents of the package, you might need to perform some of the following customization steps.

- If the package includes permission sets, assign the included permission sets to your users who need them. In managed packages, you can't make changes to permission sets that are included in the package, but subsequent upgrades happen automatically. If you clone a permission set that comes with a managed package or create your own, you can make changes to the permission set, but subsequent upgrades won't affect it.
- If you're re-installing a package and need to re-import the package data by using the export file that you received after uninstalling, see [Importing Package Data](#) on page 1150.
- If you installed a managed package, click **Manage Licenses** to assign licenses to users.
 - 📌 **Note:** You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.
- Configure components in the package as required. For more information, see [Configuring Installed Packages](#) on page 1142.

SEE ALSO:

[Upgrading Packages](#)

[Installation Guide: Installing Apps from Force.com AppExchange](#)

[Installed Packages](#)

Configuring Installed Packages

Many components have an **Is Deployed** attribute that controls whether they are available for end users. After installation, all components are immediately available if they were available in the developer's organization. Before making the package available to your users, make any necessary changes for your implementation. Depending on the contents of the package, you might need to customize the following items:

Configure Option

If the publisher included a link to an external website with information about configuration, AppExchange Downloads page displays a **Configure** option next to the package in Setup when you click **Installed Packages**. Click **Configure** to view the publisher's suggested configurations.

Custom Fields and Custom Links

Add any necessary custom fields or links to the new custom objects.

Custom Object

Enable tracking on objects that aren't in this package, but that have fields that are tracked in Chatter. For example, if you want to track a custom field on Account, you must make sure the Account standard object is enabled for tracking.

Custom Report Types

If the `Report Type Name` of a custom report type matches one used within your organization, change the `Report Type Name` after you install the package to avoid any confusion between the two report types.

Dashboard Running User

The `Running User` for any dashboards are set to the user installing the package. You can edit the properties of the dashboard and change the `Running User` to a user that has the security settings you want applied to the dashboard.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

To configure installed packages:

- "Customize Application"

Folders

When apps contain documents, email templates, reports, or dashboards, Salesforce creates new folders in the installer's organization using the publisher's folder names. Make sure these folder names are unique in your organization.

All users can see new folders. Configure folder settings before you deploy if you want them to have limited visibility.

Home Page Layouts

Custom home page layouts included in the package are not assigned to any users. To make them available to your users, assign them to the appropriate profiles.

List Views

List views included in apps are visible to all users. Change the visibility of these list views if necessary.

Page Layouts

All users are assigned the default page layout for any custom objects included in the package. Administrators of Enterprise, Unlimited, Performance, and Developer Edition organizations can configure the page layout for the appropriate users.

If a custom object in the package includes any relationships to standard objects, add them as related lists on the appropriate page layouts.

If the package includes any custom links, add them to the appropriate page layouts.

If your organization has advanced currency management enabled, currency roll-up summary fields are invalid if they are on accounts and summarizing opportunity values, or on opportunities and summarizing custom object values. Remove these fields from any page layouts.

Permission Sets

Assign permission sets included in a package to the users who need access to the package.

You can't edit permission sets that are included in a managed package. If you clone a permission set that comes with the package or create your own, you can make changes to the permission set, but subsequent upgrades won't affect it.

Translation Workbench

Translated values for installed package components are also installed for any language that the developer has included. Any package components the developer has customized within setup, such as a custom field or record type, display in the installer's setup pages in the developer's language (the language used when defining these components). Users in the installer's organization automatically see translated values if their personal language is included in the package. Additionally, installers can activate additional languages as long as the Translation Workbench is enabled.

Workflow Alerts

If the recipient of a workflow alert is a user, Salesforce replaces that user with the user installing the package. You can change the recipients of any installed workflow alerts.

Workflow Field Updates

If a field update is designed to change a record owner field to a specific user, Salesforce replaces that user with the user installing the package. You can change the field value of any installed field updates.

Workflow Outbound Messages

Salesforce replaces the user in the `User to send as` field of an outbound message with the user installing the package. You can change this value after installation.

Workflow Rules

Workflow rules are installed without any time-based triggers that the developer might have created. Set up time-based triggers as necessary.

Workflow Tasks

Salesforce replaces the user in the `Assigned To` field with the user installing the package. You can change this value after installation.

Make any more customizations that are necessary for your implementation.

 **Note:** Anything you add to a custom app after installation will be removed with the custom app if you ever uninstall it.

SEE ALSO:

[Installed Packages](#)

[Tradeoffs and Limitations of Shield Platform Encryption](#)

Uninstalling a Package

You can remove any installed package, including all of its components and all data in the package. Additionally, any custom fields, links, or anything else you added to the custom app after installation are also removed.

To remove a package:

1. From Setup, enter *Installed* in the **Quick Find** box, then select **Installed Packages**.
2. Click **Uninstall** next to the package that you want to remove.
3. Select *Yes, I want to uninstall...* and click **Uninstall**.
4. After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it's only available for a limited period of time after the uninstall completes.

 **Tip:** If you reinstall the package later and want to reimport the package data, see [Importing Package Data](#) on page 1150.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

Notes on Uninstalling Packages

- If you're uninstalling a package that includes a custom object, all components on that custom object are also deleted. This includes custom fields, validation rules, s-controls, custom buttons and links, as well as workflow rules and approval processes.
- You can't uninstall a package whenever any component in the package is referenced by a component that will not get included in the uninstall. For example:
 - When an installed package includes any component on a standard object that another component references, Salesforce prevents you from uninstalling the package. This means that you can install a package that includes a custom user field and build a workflow rule that gets triggered when the value of that field is a specific value. Uninstalling the package would prevent your workflow from working.
 - When you have installed two unrelated packages that each include a custom object and one custom object component references a component in the other, Salesforce prevents you from uninstalling the package. This means that you can install an expense report app that includes a custom user field and create a validation rule on another installed custom object that references that custom user field. However, uninstalling the expense report app prevents the validation rule from working.
 - When an installed folder contains components you added after installation, Salesforce prevents you from uninstalling the package.
 - When an installed letterhead is used for an email template you added after installation, Salesforce prevents you from uninstalling the package.

- You can't uninstall a package if a field added by the package is being updated by a background job, such as an update to a roll-up summary field. Wait until the background job finishes, and try again.
- Uninstall export files contain custom app data for your package, excluding some components, such as documents and formula field values.

Manage Installed Packages

Manage packages installed in your Salesforce org, including assigning licenses to users, uninstalling packages, and exporting package data.

- **Note:** Salesforce only lists license information for managed packages. For unmanaged packages, the license-related fields, such as **Allowed Licenses**, **Used Licenses**, and **Expiration Date**, displays the value "N/A."

Using this list, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
- Click **Manage Licenses** to assign available licenses to users in your organization. You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.
- **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.
- Click **Configure** if the publisher has included a link to an external website with information about configuring the package.
- Click the package name to view details about this package.
- View the publisher of the package.
- View the status of the licenses for this package. Available values include:
 - Trial
 - Active
 - Suspended
 - Expired
 - Free

This field is only displayed if the package is managed and licensed.

- Track the number of licenses available (**Allowed Licenses**) and the number of licenses that are assigned to users (**Used Licenses**).
- View the date your licenses for this package are scheduled to expire.
- View the date your licenses were installed.
- View the number of custom apps, tabs, and objects this package contains.
- See whether the custom apps, tabs, and objects count toward your organization's limits. If they do, the box in the **Limits** column is checked.
- **Note:** If you have not installed a licensed managed package, the **Publisher**, **Status**, **Allowed Licenses**, **Used Licenses**, and **Expiration Date** fields do not appear.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

To assign licenses for a managed package:

- "Manage Package Licenses"

To download or delete the export file for an uninstalled package:

- "Download AppExchange Packages"

After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it's only available for a limited period of time after the uninstall completes. Using this list, you can:

- Click **Download** to open or store the export file.
- Click **Del** to delete the export file.

Expired Managed Packages and Sharing Rules

If a criteria-based sharing rule references a field from a licensed managed package whose license has expired, (`expired`) is appended to the label of the field. The field label is displayed in the field drop-down list on the rule's definition page in Setup. Criteria-based sharing rules that reference expired fields aren't recalculated, and new records aren't shared based on those rules. However, the sharing of existing records prior to the package's expiration is preserved.

[View Installed Package Details](#)

[Importing Package Data](#)

View Installed Package Details

View key details about a package installed from the AppExchange, such as the number of custom apps, tabs, and objects it uses. You can also assign licenses to users, uninstall the package, and purchase the package.

To access the package detail page, from Setup, enter *Installed Packages* in the **Quick Find** box, select **Installed Packages**, and then click the name of the package that you want to view.

From this page, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
- Click **Manage Licenses** to assign available licenses to users in your organization. You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.

 **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.

- Optionally, click **View Dependencies** and review a list of components that rely on other components, permissions, or preferences within the package.

Viewing Installed Packages

The installed package page lists the following package attributes (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Uninstall • Manage Licenses

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

To manage user licenses for an AppExchange package:

- "Manage Package Licenses"

Attribute	Description
Allowed Licenses	The total number of licenses you purchased for this package. The value is "Unlimited" if you have a site license for this package. This field is only displayed if the package is managed and licensed.
Apps	The number of custom apps in the package.
Connected Apps	A list of the connected apps that can have access to a user's Salesforce data after the user and the application have been verified.
Description	A detailed description of the package.
Expiration Date	The date that this license expires, based on your terms and conditions. The expiration date is "Does Not Expire" if the package never expires. This field is only displayed if the package is managed and licensed.
Installed Date	The date of the package installation.
Limits	If checked, the package's custom apps, tabs, and objects count toward your organization's limits.
Namespace	The 1- to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
Objects	The number of custom objects in the package.
Package Name	The name of the package, given by the publisher.
Publisher	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
Status	<p>The state of a package. Available values include:</p> <ul style="list-style-type: none"> • Trial • Active • Suspended • Expired • Free <p>This field is only displayed if the package is managed and licensed.</p>
Tabs	The number of custom tabs in the package.
Used Licenses	The total number of licenses that are already assigned to users. This field is only displayed if the package is managed and licensed.
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the <code>Version Number</code> .

Viewing Installed Package Details

The installed package detail page lists the following package attributes (in alphabetical order):

Attribute	Description
Apps	The number of custom apps in the package.
Description	A detailed description of the package.
First Installed Version Number	The first installed version of the package in your organization. This field is only displayed for managed packages. You can reference this version and any subsequent package versions that you have installed. If you ever report an issue with a managed package, include the version number in this field when communicating with the publisher.
Installed By	The name of the user that installed this package in your organization.
Limits	If checked, the package's custom apps, tabs, and objects count toward your organization's limits.
Modified By	The name of the last user to modify this package, including the date and time.
Namespace	The 1- to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
Objects	The number of custom objects in the package.
Package Name	The name of the package, given by the publisher.
Package Type	Indicates whether the package is managed or unmanaged.
Post Install Instructions	A link to information on configuring the package after it's installed. As a best practice, the link points to an external URL, so you can update the information independently of the package.
Publisher	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
Release Notes	A link to release notes for the package. As a best practice, link to an external URL, so you can make the information available before the release and update it independently of the package.
Tabs	The number of custom tabs in the package.
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the <code>Version Number</code> .
Version Number	The version number for the latest installed package version. The format is <code>majorNumber.minorNumber.patchNumber</code> ,

Attribute	Description
	such as 2.1.3. The version number represents a release of a package. The <code>versionName</code> is a more descriptive name for the release. The <code>patchNumber</code> is generated only when you create a patch. If there is no <code>patchNumber</code> , it is assumed to be zero (0).

Unused Components

You can see a list of components deleted by the developer in the current version of the package. If this field is part of a managed package, it's no longer in use and is safe to delete unless you've used it in custom integrations. Before deleting a custom field, you can keep a record of the data from Setup by entering *Data Export* in the *Quick Find* box, then selecting **Data Export**. After you've deleted an unused component, it appears in this list for 15 days. During that time, you can either undelete it to restore the field and all data stored in it, or delete the field permanently. When you undelete a field, some properties on the field are lost or changed. After 15 days, the field and its data are permanently deleted.

The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Undelete • Delete
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Package Components

You can see a list of the components included in the installed package. The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Undelete • Delete
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.

Attribute	Description
Type	Displays the type of the component.

Importing Package Data

When you uninstall an AppExchange package, Salesforce automatically creates an export file containing the package data as well as any associated notes and attachments. If you choose to install the package again, you can import this data.

To import your AppExchange package data, use one of the following tools that is available for your Edition:

- For Group Edition, use the appropriate import wizard.
- For Professional Edition, use the appropriate import wizard or any compatible Salesforce ISV Partner integration tool.
- For Enterprise, Developer, Performance, and Unlimited Edition, use the Data Loader.

Notes on Importing AppExchange Package Data

- Salesforce converts date fields into date/time fields upon export. Convert the appropriate fields into date fields before you import.
- Salesforce exports all date/time fields in Greenwich Mean Time (GMT). Before importing these fields, convert them to the appropriate time zone.
- The value of auto number fields may be different when you import. To retain the old values, create a new custom auto number field on a custom object before importing the data.
- Salesforce updates system fields such as `Created Date` and `Last Modified Date` when you import. To retain the old values for these fields, contact Salesforce support.
- Relationships are not included in the export file. Recreate any master-detail or lookup relationships after importing your data.
- Record type IDs are exported but not the record type name.
- Field history is not exported.
- Recreate any customizations that you made to the package after installation.

USER PERMISSIONS

To import Force.com AppExchange package data:

- The permissions required to use the import tool you choose, such as the import wizard or Data Loader.

Managing Licenses for Installed Packages

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

 **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.

1. From Setup, enter *Installed Packages* in the Quick Find box, then select **Installed Packages**.
2. Click **Manage Licenses** next to the package.

 **Note:** To assign licenses for a package, you must have access to the package and at least one available license.

- To assign licenses to more users, click **Add Users**.
- To remove a license from a user, click **Remove** next to the user's name. To remove licenses from multiple users, click **Remove Multiple Users**.
- Click any column heading to sort the users in ascending order using the data in that column. Click the heading again to sort in descending order.
- If available, select **fewer** or **more** to view a shorter or longer display list.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To manage licenses for a AppExchange package:

- "Manage Package Licenses"

Assign Licenses for Managed Packages

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

The Managed Packages related list on the user detail page lists all managed packages that user is assigned. Assigning a license for a managed package makes the package available to the user within Salesforce. Unmanaged packages don't appear on this list because you can't assign licenses for them.

 **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.

To assign a user to a license for one of the available managed packages:

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click **Assign Licenses** from the Managed Packages list.
3. Select the package you want to assign to the user. All available managed packages are listed in the Unassigned Packages list. After selecting a package, Salesforce automatically moves it to the Selected Packages list.

The Unassigned Packages list displays all packages that this user could access if assigned a license. Packages don't appear on this list if they are unmanaged, uninstalled, in use, or not available.

- Click a letter to view the packages that begin with that letter or click **All** to display all available managed packages.
- Click **select shown** to select all packages displayed in the Unassigned Packages list on the current page, adding them to the Selected Packages list below.
- Click **deselect shown** or **deselect all** to move packages from the Selected Packages area to the Unassigned Packages area.

4. Click **Add**.

To revoke a license from this user, click the **Remove** link next to the appropriate package name.

[Managing Licenses for Installed Packages](#)

Removing Licenses for Installed Packages

To remove licenses for an AppExchange package from multiple users:

1. From Setup, enter *Installed Packages* in the **Quick Find** box, then select **Installed Packages**.
2. Click **Manage Licenses** next to the package name.
3. Click **Remove Multiple Users**.
4. To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views.
5. Click a letter to filter the users with a last name that corresponds with that letter or click **All** to display all users who match the criteria of the current view.
6. Select users.
 - To select individual users, use the checkboxes. Selected users appear in the Selected for Removal list. When the list includes all users for which you want to remove licenses, click **Remove**.
 - To select all users in the current view, click **Remove All Users**, then click **OK**.

You can also remove licenses for an AppExchange package from a single user using the following options:

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users** and click **Remove** next to the package in the managed packages list.

Responding to License Manager Requests

A license manager is a Salesforce organization that tracks all Salesforce subscribers installing a particular AppExchange package. Salesforce administrators can choose to designate another organization as the license manager for one of their packages. The license manager does not need to be the same organization as the one from which the package is managed. To choose another organization as the license manager, all you need is an email address (not a Salesforce username). If a Salesforce administrator selects to have a third-party license manager and enters your email address, you will receive a license management request in email.

To respond to a registration request:

- Click the link in the license management request email. This displays the registration request in the requestor's Developer Edition organization.
- Click **Accept** to complete the registration process. Alternatively, click **Reject** to decline the request and close the browser; this prevents you from using the link again.

 **Note:** If you accept this request, you authorize Salesforce to automatically create records in your Salesforce organization to track information about this package. Choosing a license manager organization is permanent and cannot be changed.

- Enter the username and password for the Salesforce organization you want to use to manage licenses for this package. A license manager can be any Salesforce organization that has installed the free License Management Application (LMA) from Force.com AppExchange.
- Click **Confirm**.

- “Customize Application”

Assigning Licenses Using the API

Administrators can use the API to assign or revoke licenses for any managed package installed in their organization. License information for a package is stored in two objects, PackageLicense and UserPackageLicense, which were previously accessible only from the Manage Licenses page under Setup. These are now accessible as standard objects, so an administrator can assign licenses to specific users via API calls. This makes managing package licenses in a subscriber organization faster and easier, especially for large-scale deployments.

For example, suppose an administrator installs an app for use by all 200 salespeople in the company. Assigning a license to each salesperson from the UI is inefficient and time-consuming. Using the API, the administrator can assign licenses to all salespeople, based on their profile, in one step.

Here are some common licensing tasks that administrators can use the API to do.

- Determine the number of package licenses in use and available.
- Verify if a specific user has a license for the package.
- Get a list of all users who have a license for the package.
- Assign a package license to a user or group of users.
- Revoke a package license that was previously assigned to a user.

For details of the PackageLicense and UserPackageLicense objects and a code sample, see the [Object Reference for Salesforce and Force.com](#).

Upgrading Packages

Salesforce supports upgrades for managed packages only. Publishers can publish an upgrade for a managed package and notify installers that the new version is available. Installers of a managed package can then install the upgrade as follows:

1. Before you install an upgrade, determine if the app you installed was from a managed package. Look for the  Managed - Installed icon on the detail pages for each component and on the list of packages installed.
If the app you installed is not from a managed package, upgrades for it are not available.
2. Then, install the upgrade in the same way you would install any other package from the AppExchange. If the publisher provided a link to the new version, follow the link to the package posting and install it in your organization. The first page of the install wizard lists the current version you have installed, the version you're about to install, and a list of additional components included in the new version.

Notes on Upgrading Managed Packages

Consider the following when upgrading a managed package:

- All existing custom objects that were previously deployed will still be deployed. Salesforce prompts you to deploy any new custom objects or previously undeployed custom objects.
- Profile settings for components in a package are editable by the customer but not upgradeable by the package developer. If the developer makes changes to any profile settings after releasing the package, those changes won't be included in an upgrade. Customers will need to manually update the profile settings after upgrading the package. In contrast, permission sets in a package are upgradeable by the developer, so any changes the developer makes will be reflected in the customer organization after upgrading the package.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To manage licenses for an AppExchange app:

- "Manage Package Licenses"

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To upload packages:

- "Upload AppExchange Packages"

To install and uninstall packages:

- "Download AppExchange Packages"

- If the developer chooses to add universally required custom fields, the fields will have default values.
- Translation Workbench values for components that are “editable but not upgradeable” are excluded from upgrades.
- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

- [Can I reinstall an AppExchange package after uninstalling it?](#)
- [When I install a package that’s listed on the AppExchange, do custom objects, tabs, and apps in that package count against the limits of my Salesforce Edition?](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Can I uninstall packages that I installed from AppExchange?

Yes. All your installed packages are listed in the Installed Packages page. You can remove any package by clicking the **Uninstall** link next to the package name.

SEE ALSO:

[Uninstalling a Package](#)

[Importing Package Data](#)

Who can use AppExchange?

Anyone can browse and test drive AppExchange listings. Salesforce administrators and users with the “Download AppExchange packages” permission can install AppExchange apps. To publish an app on the AppExchange, a user must have both “Create AppExchange packages” and “Upload AppExchange packages” permissions.

Why did my installation or upgrade fail?

An installation can fail for several reasons:

- The package includes custom objects that will cause your organization to exceed its limit of custom objects.
- The package includes custom tabs that will cause your organization to exceed its limit of custom tabs.
- The developer of the package has uploaded a more recent version of the package and has deprecated the version associated with this installation URL. Contact the publisher of the package to get the most recent installation URL.
- You're trying to install an extension to a package, and you don't have the base package installed.
- The package requires that certain components are enabled in your organization, or that required features are enabled in your edition.
- The package contains Apex code and you are not authorized to run Apex in your organization.
- The package you're installing has a failing Apex test.

Can I customize AppExchange packages?

Yes, all packages are customizable. However, to ensure compatibility with future versions, some aspects of managed packages can't be changed.

For a list of components that are editable in a managed package, see [ISVforce Guide](#).

Who can use AppExchange packages?

If you use an Enterprise, Unlimited, Performance, or Developer Edition organization, you can choose which user profiles have access to the package as part of the installation process. Packages installed in Professional and Group Edition organizations are installed with "Full Access" to all user profiles. However, regardless of Edition, all custom objects are installed in "In Development" mode which hides them from all standard users. Users must have the "Customize Application" permission to view custom objects in "In Development" mode. When you are ready to roll out the package to other users, change the custom object status to "Deployed."

How can I upgrade an installed package?

Managed packages are completely upgradeable. Before installing a package, contact the publisher to determine if it's managed.

How secure are the components I install?

Salesforce performs periodic security reviews of all publicly listed applications on AppExchange. When installing third party applications with access to data, these applications may have access to other data within the organization where the package was installed. Private listings do not go through a security review and administrators should inspect the application carefully before determining whether it should be installed within their organization.

What happens to my namespace prefix when I install a package?

A namespace prefix is a globally unique identifier that you can request if you plan to create a managed package. All the components from a managed package that you install from another developer contain the developer's namespace prefix in your organization. Unmanaged packages can have a namespace prefix while they're developed in an org that contains a managed package. This namespace isn't used outside of the development (publisher) org. If an unmanaged package is installed in an org that has no namespace, then the unmanaged components have no namespace in the subscriber org. If an unmanaged package is installed in an org that has a namespace, then the components get the namespace of the subscriber org.

Can I reinstall an AppExchange package after uninstalling it?

Yes. You can reinstall a package in the same manner that you installed it.

SEE ALSO:

[Install a Package](#)

[Importing Package Data](#)

When I install a package that's listed on the AppExchange, do custom objects, tabs, and apps in that package count against the limits of my Salesforce Edition?

No. If you install a package from the AppExchange, its custom objects, tabs, and apps don't count against the limits of your Salesforce edition. However, if the package uses other types of custom components, such as custom fields, they count against the relevant limits of your Salesforce edition.

 **Note:** These rules apply only to managed packages that are listed on the AppExchange. If you install an unmanaged package or a managed package that's not publicly listed on the AppExchange, its custom objects, tabs, and apps count against the limits of your Salesforce edition.

IMPROVE YOUR SALESFORCE IMPLEMENTATION WITH OPTIMIZER

Welcome to Salesforce Optimizer! Optimizer evaluates your implementation to determine how your company uses certain Salesforce features, then identifies ways that you can improve your implementation for your company.

Salesforce is an incredibly powerful tool, but as veteran administrators know, maintaining a suite of features across your org can be cumbersome. Optimizer takes the guesswork out of how to best maintain features, so they can be optimized to help your users get work done. You can run Optimizer in sandbox or production environments to receive recommendations to improve features, clean up customizations, reduce complexity, and drive feature adoption.

To start your evaluation, kick off Optimizer. After our analysis is complete, we email you a personalized Optimizer report with advice and recommendations about how to improve your implementation.

But before you kick off your evaluation, learn about which features and customizations that Optimizer evaluates. That way, you know which features and customizations you've got covered, and which you still need to evaluate yourself.

After we email you your Optimizer report, use the recommendations in your report to tweak features and settings to improve your implementation.

Keep in mind that Salesforce Optimizer and its report:

- Are available in English only.
- Evaluates some, not all, of your features and customizations.

Availability of Optimizer

Make sure that your environment is supported before you run Optimizer for your implementation.

Which Features Does Optimizer Evaluate?

Optimizer is a powerful tool that provides recommendations for how to improve features in your Salesforce implementation. However, Optimizer only analyzes a subset of features across Salesforce.

Kick Off Optimizer

Kick off Optimizer to evaluate how you can improve certain features for your users. After you kick off your evaluation, we email you a personalized Optimizer report with advice and recommendations about how you can streamline your implementation.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Optimizer is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To kick off Optimizer:

- "Customize Application" and "Modify All Data"

To receive the email that contains your Optimizer report:

- In Setup, Email Delivery set to the access level "All Email"

Availability of Optimizer

Make sure that your environment is supported before you run Optimizer for your implementation.

Salesforce Optimizer is available in sandbox and production environments.

The feature is also available for customers with certain IP address restrictions. Whitelist the following IP addresses for users who run Optimizer in your organization:

- 52.2.2.209
- 52.203.195.34
- 52.200.207.131
- 52.72.119.132

For Enterprise, Performance, Unlimited, and Developer Editions, [whitelist these IP addresses on those users' profiles](#). Users who aren't assigned to those profiles can't access Optimizer.

For Professional Edition, set the Login IP Range. From Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Optimizer is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Which Features Does Optimizer Evaluate?

Optimizer is a powerful tool that provides recommendations for how to improve features in your Salesforce implementation. However, Optimizer only analyzes a subset of features across Salesforce.

Salesforce Optimizer evaluates the following features:

- Fields
- Apex triggers
- Hard-coded URLs
- Page layouts
- Record types
- Validation rules
- Sharing rules
- Workflow rules
- Administrator permissions
- Users' login activity
- Profiles
- Permission sets

 **Note:** Optimizer has access only to your implementation's metadata.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Optimizer is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Kick Off Optimizer

Kick off Optimizer to evaluate how you can improve certain features for your users. After you kick off your evaluation, we email you a personalized Optimizer report with advice and recommendations about how you can streamline your implementation.

1. From Setup, enter “Optimizer” in the Quick Find box, then select Optimizer.
2. Determine whether you want to run Salesforce Optimizer on a sandbox or production environment.
 - a. To receive recommendations for how to improve sandbox, click **Sandbox**.
 - b. To receive recommendations for how to improve production, click **Production**.
3. Sit tight while Salesforce produces your Optimizer report.

After you kick off Optimizer, Salesforce generates a PDF report and emails it to you. Salesforce also saves the report to Salesforce Files. After you receive the report, follow its recommendations to make improvements to features across your implementation.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Optimizer is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To kick off Optimizer:

- “Customize Application” and “Modify All Data”

To receive the email that contains your Optimizer report:

- In Setup, Email Delivery set to the access level “All Email”

Managing the People and Organizations You Sell To

Establishing Your Customers, Competitors, and Partners

Accounts

Use Salesforce accounts to store information about your customers or the entities you are working with, such as companies, schools, government agencies, or individuals.

Think of an account as a file folder in which you store every bit of information you know about a customer. For example, if you're storing information about a company, you include its name, location, a contact person, past or current orders, and other related information. You could also keep a log of phone calls or service requests.

In Salesforce, information about the company itself—its name, location, website, and so on—is stored as an *account record*. Information related to the account, such as a contact person, notes, and orders, is stored in other types of records. Salesforce makes it easy to find all the records related to each account by listing them on the account record's home page. You can locate, create, delete, sort, and filter your accounts from the Accounts tab. Select an account to view its record home page, to edit the account, and access other records related to that account.

There are a few things to know about accounts.

Salesforce Offers Two Types of Accounts

Salesforce accounts are *business accounts* by default. Business accounts are used to store information about companies or other entities. Salesforce administrators can also choose to set up *person accounts*, which are used to store information about individual people. For example, person accounts fit your customers best if they are online shoppers, gym members, vacation travelers, or other individual consumers. Depending on who your company sells to, you might have just one type of account available, or both.

Note: In the Salesforce Help and other documentation, the word *account* by itself always refers to both business accounts and person accounts. We use the terms *business accounts* and *person accounts* when there are differences between the two types of accounts.

The Accounts Feature Can Be Renamed

Your Salesforce administrator can change the name of accounts to something that works better for your business, such as *Clients* or *Patients*. However, we will always refer to them as *accounts* in the Salesforce Help.

Users Can Access Accounts on Mobile Devices

Your accounts are accessible to you from the full Salesforce site or the Salesforce1 mobile application, if your Salesforce administrator has turned on Salesforce1 access.

EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions**

Person accounts available in: Both Salesforce Classic and Lightning Experience

Person accounts available in **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Accounts Can Be Linked to Social Networks and News

Additional information and updates about your accounts are available if your company uses the Social Accounts, Contacts, and Leads; the News component (Lightning Experience only); or Data.com Clean features.

What Is a Person Account?

Person accounts store information about individual consumers.

Salesforce accounts are *business accounts* by default. Business accounts are used to store information about companies or other entities. Salesforce administrators can also choose to set up *person accounts*, which are used to store information about individual people. For example, person accounts fit your customers best if they are online shoppers, gym members, vacation travelers, or other individual consumers. Depending on who your company sells to, you might have just one type of account available, or both.

Person accounts work differently than business accounts. For example, person accounts can't have contacts. Instead, the person account record stores the information you'd typically save for business contacts, such as first name and last name. You can usually treat a person account like a contact. For example, you can invite a person account to a meeting or associate it with a campaign. For differences between person accounts and business accounts, see [Person Account Behaviors](#).

 **Note:** In the Salesforce Help and other documentation, the word *account* by itself always refers to both business accounts and person accounts. We use the terms *business accounts* and *person accounts* when there are differences between the two types of accounts.

Considerations for Using Merge Fields for Person Accounts

A merge field is a field you can put in an email, an email template, a mail merge template, a custom link, or a formula to incorporate values from a record. You can use merge fields in the subject and body of custom HTML templates. When using merge fields, it's a good idea to understand how they work and what to expect in your merged documents and emails.

- If your organization uses person accounts, business account and person account fields are available as account merge fields. Account fields exclusive to person accounts, such as `Birthdate`, `Email`, and `Title` have "Account.Person" in their merge field names. For example, `{!Account.PersonBirthdate}`.
- You can use the merge field `{!Account.IsPersonAccount}` to determine whether you are working with a person account or a business account.
- Account fields that previously had unique names and labels may no longer be unique because some contact fields are displayed as part of the account object. These fields on the accounts page are identified by the person account icon (). Ensure that all custom account fields have field names and labels unique to your organization so that the merge field references the correct field. For more information, see [What Is a Person Account?](#) on page 1170.

Important:

- If two or more custom objects have matching names or labels, only one of the objects appears when you select from available merge fields. Make sure that all custom objects have unique names and labels so that you can select merge fields from any of the objects.

SEE ALSO:

[Accounts](#)

[Validation Rules for Person Accounts](#)

Validation Rules for Person Accounts

 **Important:** Once person accounts have been enabled, they can't be turned off. Therefore, we recommend existing customers [create a sandbox](#) to preview how person accounts will affect their organization.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. The list of available merge fields depends on the type of data that you're working with. This topic lists considerations for working with merge fields in validation rules with person accounts.

Tips

- To define a validation rule that applies only to person accounts, use the `IsPersonAccount` merge field. For example, `Account.City = "San Francisco"` verifies that a business or person account's city is San Francisco, while `IsPersonAccount (Account.City = "San Francisco")` verifies that a person account's city is San Francisco.
- You must handle person account and business account names separately in account validation rules.
 - For business accounts, use the `Name` merge field.

- For person accounts, use the `FirstName` and `LastName` merge fields.
- `Birthdate`, `Email`, and other fields that are only supported for person accounts are available as merge fields in account validation rules. When you use one of those merge fields, note that business account records will be processed as if those fields have blank values. For business account and person account fields, see [Account Fields](#) on page 1181.

SEE ALSO:

- [Accounts](#)
- [Considerations for Using Merge Fields for Person Accounts](#)

What is a business account and how does it differ from a person account?

A business account is a company, corporation, firm, or other business entity to which you can associate multiple contacts. Business accounts are available in all Editions and have a folder icon (📁).

In Enterprise, Unlimited, Performance, and Developer Editions, your Salesforce organization can be enabled to use person accounts (👤), which are individual consumers who function simultaneously as accounts and contacts.

SEE ALSO:

- [Accounts](#)

Person Account Behaviors

Person accounts are accounts that can also be used as contacts in many situations. However, there are key areas in which person accounts differ from business accounts and contacts, or have unique considerations.

Salesforce Functionality	Person Account Behavior
Account Merge	Person accounts can be merged only with other person accounts, and only using Salesforce Classic. See Merge Duplicate Accounts on page 1195.
Account Quick Create	On the accounts home page, the fields in the Quick Create area are based on whether the default account record type set on your profile is a person account record type or a business account record type.
Accounts	<p>Person accounts can't be included in account hierarchies.</p> <p>Person accounts can't have direct relationships with other accounts or contacts. You can, however, use <code>Contacts to Multiple Accounts</code> to create indirect relationships between a person account and another person account, business account, or contact.</p>
Activities	<p>Person accounts can be associated with events or tasks using either the <code>Name</code> or <code>Related To</code> fields.</p> <p>As with contacts, person accounts can be invited to events.</p>

EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions**

Person accounts available in: Both Salesforce Classic and Lightning Experience

Person accounts available in **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Salesforce Functionality	Person Account Behavior
	For users to request a meeting with a person account, the <code>Email</code> field must be added to the Person Accounts page layout.
Campaigns	As with contacts, person accounts can be added to campaigns and have a Campaign History related list.
Cases	On cases, person accounts can be entered in the <code>Account Name</code> field, the <code>Contact Name</code> field, or both.
Chatter Feed Tracking	When you follow person accounts, you follow the account fields, but not the contact fields.
Communities and Portals	As with contacts, person accounts can be enabled as users for customer communities and portals. Person Accounts can't be enabled as users for partner communities and portals.
Contact Roles	As with contacts, you can associate person accounts to accounts, cases, contracts, and opportunities using the Contact Roles related list. Similarly, you can associate contacts to person accounts using the Contact Roles related list.
Contacts	Unlike business accounts, person accounts can't have direct relationships with contacts. You can, however, use Contacts to Multiple Accounts to create indirect relationships between a person account and a contact.
Contacts to Multiple Accounts	Contacts to Multiple Accounts works with person accounts. That means a person account can be either a related contact on a business account or a related account on a contact. A person account can also be related to another person account as either a related contact or related account. Person accounts are always indirectly related to other accounts or contacts.
Custom Objects	Custom objects with relationships to either accounts or contacts can be added as related lists on person accounts.
Data.com	Person accounts aren't supported in Data.com products and features, including Prospector, Clean, and Data Integration.
Desktop Integration	Person accounts are supported in the following Salesforce integration features. <ul style="list-style-type: none"> • Lightning for Outlook • Salesforce for Outlook • Connect Offline Person accounts aren't supported in Lightning Sync.
Duplicate Management	Duplicate rules support person accounts. Merging of duplicate person accounts is supported in Salesforce Classic only.
Email	As with contacts, you can send individual emails and mass emails to person accounts.
ExactTarget	Person accounts are supported, but more configuration is required.
Field History	Account and contact fields that appear on person account records can be tracked using the account field history settings. Person account field history is then captured in the Account History related list, the Account History report, and field audit trails.

Salesforce Functionality	Person Account Behavior
Fields	<p>Most standard account and contact fields and all custom account and contact fields are available for person account page layouts.</p> <p>Some business account fields (such as <code>Parent Account</code> and <code>View Hierarchy</code>) and some contact fields (such as <code>Reports To</code>) are not supported for person accounts.</p> <p>See Person Account Fields.</p>
Geocodes	Geocodes for addresses can be added to business accounts, but not person accounts.
Icons	<p>In Salesforce Classic, person accounts have a person icon (), while business accounts have a folder icon ().</p> <p>In Lightning Experience, person accounts have a person with building icon (), while business accounts have building icon ().</p> <p>Person accounts can be denoted in search results, list views, and lookup dialogs by adding the <code>Is Person Account</code> field to the appropriate search layout or list view.</p>
Import Wizards	Person accounts can be imported using the Data Import Wizard.
Lead Conversion	Leads that don't have a value in the <code>Company</code> field are converted to person accounts. Leads that do have a value in the <code>Company</code> field are converted to business account.
List Views	<p>Person accounts appear in all account and contact list views, except the Recent Contacts list on the Contacts home page.</p> <p>Quickly see which records are person accounts by adding the <code>Is Person Account</code> field to the list of fields to display. To include or exclude person accounts from a list view, add the <code>Is Person Account</code> field to the filter criteria.</p>
Mobile Configurations for Salesforce Classic	<p>Salesforce Mobile Classic Configurations that include the account object automatically deliver person accounts and business accounts to users' mobile devices.</p> <p>Person accounts can be excluded from the configuration's data set using the criteria "<code>Is Person Account equals False</code>." To mobilize only person accounts, use the criteria "<code>Is Person Account equals True</code>." If a mobile configuration includes accounts but not contacts, users assigned to that configuration see a Contacts tab in the mobile client application, and the tab contains person accounts.</p>
Packaging	Person accounts components and attributes can be included in managed and unmanaged packages.
Page Layouts	<p>Person accounts have their own page layouts that can include account and contact fields, account custom links, and account and contact related lists.</p> <p>Person accounts page layouts do not support the <code>Reports To</code> and <code>Parent Account</code> fields. See Person Account Fields.</p>
Pardot	Person accounts are supported, but additional configuration is required.
Partners	You can use the Partners related list to relate person accounts to each other. We recommend that you rename the Partners related list to reflect how your person accounts are connected.

Salesforce Functionality	Person Account Behavior
Process Builder	Creating or editing a person account triggers processes created with the Process Builder.
Record Types	Administrators can configure multiple record types for person accounts. In the user interface, a person account can only be changed to another person account record type. For more information, see Guidelines for Changing an Account's Record Type
Renamed Tabs and Standard Fields	To customize the names of tabs and fields displayed on person account records, administrators must customize the account and contact tabs and fields.
Salesforce1	For organizations that have enabled person accounts and Salesforce1, person accounts can be created, accessed, and managed within Salesforce1 for most features.
Search	In Lightning Experience and Salesforce1, person accounts appear in both account and contact search results. In Salesforce Classic, person accounts appear only in account search results. To help users differentiate person accounts from business accounts in search results, administrators can add the <code>Is Person Account</code> field to the appropriate search layout.
Self-Service Portal	As with contacts, person accounts can be enabled as users for your Self-Service portal.  Note: Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.
Sharing Settings	If you have enabled person accounts, the organization-wide default sharing for contacts is set to Controlled by Parent and is not editable. If you've customized your contact sharing settings and you want to enable person accounts, change your organization-wide default for contacts to Controlled by Parent. This setting removes all your contact sharing rules and manually shared contacts.
Social Accounts, Contacts, and Leads	As with contacts, you can link person accounts to social network profiles
Stay-in-Touch Requests	As with contacts, you can send individual and mass Stay-in-Touch requests to person accounts.
Storage	Person accounts count against both account and contact storage because each person account consists of one account as well as one contact.
Visual Workflow	Creating or editing a person account triggers flows created with Visual Workflow.
Workflow Rules	Creating or editing a person account triggers account workflow rules.

Guidelines for Changing an Account's Record Type

Record types determine the business processes, picklist values, and page layouts that are available to you when creating records. Before you change an account's record type, be aware of these important details.

If your organization uses person accounts, your administrator has configured two record types for accounts—one for business accounts, and another for person accounts. From the UI, you can change an account's record type from a business account to a business account or from a person account to a person account. However, to change an account's record type from a business account to a person account, or vice versa, you must use the API.

Once you have located an account on the Accounts home or list pages, click the account name to view the Account's detail page.

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator. Inline editing is available in Salesforce Classic only.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.
- To save the current account and create another one in Salesforce Classic, click **Save & New**.
- To open a printable display of the record details, in the top-right corner of the page, click **Printable View**. The printable display is available in Salesforce Classic only.
- To enable an account as a partner account, click **Manage External Account** and choose **Enable as Partner**. Available only in Salesforce Classic if your company enabled a partner portal.
- To [enable person accounts as Customer Portal users](#), click **Manage External User** and choose **Enable Customer User**. Available only in Salesforce Classic if your company has person accounts and a Customer Portal.

 **Note:** As the owner of an account, you can normally view all data related to that account.

However, your administrator can set an option on your role that determines whether you can view opportunities that you do not own that are associated with your accounts.

Also, if your accounts are assigned to [territories](#), your administrator can set options that determine whether users in that territory can view, edit, transfer, or delete your accounts.

SEE ALSO:

[Account Fields](#)

[Accounts](#)

[Select and Change Profile Images for Accounts, Contacts, and Leads](#)

Guidelines for Creating Accounts

Keep these guidelines in mind when you create accounts.

- To create business accounts, you need “Create” permission on accounts. To create person accounts, you need “Create” permission on both accounts and contacts.
- If your Salesforce admin has set up record types, you can be prompted to choose a `Record Type` when creating an account. Different record types can have different fields and different picklist values.
- To specify that a business account is a subsidiary of another business account, fill in the `Parent Account` field. You can then view an account hierarchy from the account detail page. In Lightning Experience, click **View Account Hierarchy**. In Salesforce Classic, click the **View Hierarchy** link. The `Parent Account` field isn't available for person accounts.
- Use the `Account Site` field to designate different locations of the same company. For example, suppose that Acme.com has offices in Paris and London. Create two accounts, both called Acme.com, but with `Account Site` values of Paris and London, respectively.
- If your Salesforce admin has set up divisions, the division of a new account is automatically set to your default division, unless you manually select a different one.
- If your Salesforce admin has set up territory management, account assignment rules can automatically assign newly created accounts to territories. See [Territory Management](#) on page 1369.

Understanding What Happens when You Delete Accounts

Most accounts and their associated records can be deleted in one click—but some accounts can't be deleted until associations have been removed.

 **Important:** If you can delete an account, you will see **Delete** as an option on the account's detail page and on its row on the account list page in both Salesforce Classic and Lightning Experience. If you don't see the delete option, you don't have permission to delete the account. Ask your Salesforce administrator for help.

Deleted accounts are moved to the Recycle Bin, along with these associated items.

 **Note:** You can't access the recycle bin from Lightning Experience, but deleted items still go into it. Switch to Salesforce Classic temporarily to view or restore recycle bin items.

- Contacts
- Opportunities
- Contracts (if they're not activated)
- Activities
- Notes
- Attachments
- Portal roles and groups (if all portal users in the account are disabled.)
- Partner relationships
- Relationship group members

If you restore an account from the Recycle Bin, any related items are also restored except for:

- Relationship group members in some cases. See [Removing Members from Relationship Group Members](#) on page 1325.
- Portal roles and groups. See [Using Accounts](#) on page 1177.

You can't delete an account if:

- You don't have the "Delete" permission on accounts
- You aren't the account's owner, above the account's owner in the organization role hierarchy; or an administrator
- The account is enabled as a partner account; it has associated cases, activated contracts, or related opportunities that are owned by other users; or it has associated contacts that are enabled for the Self-Service portal.

In addition, if you attempt to delete an account that has closed/won opportunities owned by you, a message displays asking you whether you want to delete the closed/won opportunities along with the account or to cancel the account deletion.

 **Note:** You don't need the "Delete" permission on any associated records that are included in the deletion.

Account Fields

Accounts have business account fields and Person Account fields.

Business Account Fields

A business account has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the account record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com fields are available only in orgs licensed to use a specific Data.com product. Those fields are identified in their descriptions.

Field	Description	Allows Value from Data.com or D&B
Account Currency	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Account Division	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically inherit the account's division. Available only in organizations that use divisions to segment their data.	
Account Name	Name of company. Up to 255 characters are allowed in this field.	✔ (D&B)
Account Name (Local)	The name of the account translated into the local language.	
Account Number	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
Account Owner	Assigned owner of account. Not available in Personal Edition.	

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available business account fields vary according to which Salesforce Edition you have.

Person accounts available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The available person account fields vary according to which Salesforce Edition you have.

Field	Description	Allows Value from Data.com or D&B
Account Record Type	Name of the field that determines what picklist values are available for the record. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.	
Account Site	Information about the account's location, such as <i>single location</i> , <i>Headquarters</i> , or <i>Branch</i> . Up to 80 characters are allowed in this field.	✓ (D&B)
Account Source	The source of the account record. For example, <i>Advertisement</i> , <i>Data.com</i> , or <i>Trade Show</i> . The source is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✓ (Data.com)
Annual Revenue	Amount of annual reported revenue.  Note: If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in this field to change. For organizations that use non-USD currencies, we ignore the Annual Revenue field when determining a record's clean status (so the Clean Status field's value does not change). We also remove the value from the Annual Revenue field on account records and the clean comparison page.	✓ (D&B)
Billing City	City portion of billing address. Up to 40 characters are allowed.	✓ (D&B)
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.	✓ (D&B)
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.	✓ (D&B)

Field	Description	Allows Value from Data.com or D&B
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.	✔ (D&B)
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed.	✔ (D&B)
Clean Status	<p>The record's clean status, as compared with Data.com. Values are Not Compared, In Sync, Reviewed, Different, Not Found, and Inactive. This field is available if you use Data.com Prospector or Data.com Clean.</p> <p> Note: If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in the Annual Revenue field to change. For organizations that use non-USD currencies, we ignore the Annual Revenue field when determining a record's clean status (so the Clean Status field's value does not change).</p>	✔ (Data.com)
Created By	User who created the account, including creation date and time. (Read only)	
Data.com Key	The company's ID in Data.com. When Salesforce records are compared with Data.com records (via manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
D&B Company	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the account. Use the lookup if you need to associate a different D&B Company record with the account. This field is only available to organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)
Description	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
D-U-N-S Number	<p>The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. This field is available if you use Data.com Prospector or Data.com Clean.</p> <p> Note: To see the entire D-U-N-S number, either</p> <ul style="list-style-type: none"> • Add the account to Salesforce if you haven't yet, or • Clean the account with Data.com if it already exists in Salesforce <p>Until you add or clean the record, its first five digits will be masked with asterisks (*).</p>	✔ (D&B)
Employees	Number of people employed by the account.	✔ (D&B)
Evaluate this account against territory rules on save	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See Territory Management on page 1369.	
Exclude from territory assignment rules	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See Territory Management on page 1369.	
Fax	Fax number. Up to 40 characters are allowed in this field.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
Industry	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Modified By	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
NAICS Code	The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into 20 industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy. This field is available if you use Data.com Prospector or Data.com Clean.	✔ (D&B)
NAICS Description	A brief description of an organization's line of business, based on its NAICS code. This field is available if you use Data.com Prospector or Data.com Clean.	✔ (D&B)
Ownership	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (D&B)
Parent Account	Parent company for companies that are subsidiaries of a larger company or organization. The parent account must be an existing account in Salesforce. You can enter the account name, or select (or optionally, create) the account using the lookup icon.	
Partner Account	Read-only field that indicates whether an account is a partner account.	
Phone	Primary phone number of account. Up to 40 characters are allowed in this field.	✔ (D&B)
Rating	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values,	

Field	Description	Allows Value from Data.com or D&B
	which are set by an administrator. Each picklist value can have up to 40 characters.	
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed.	✔ (D&B)
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.	✔ (D&B)
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.	✔ (D&B)
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed.	✔ (D&B)
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed.	✔ (D&B)
SIC Code	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	✔ (D&B)
SIC Description	A brief description of an organization's line of business, based on its SIC code.	✔ (D&B)
Territories	<p>The territories to which the account has been assigned. See Territory Management on page 1369.</p> <p>For organizations that use Enterprise Territory Management, this field is not available. Enterprise Territory Management offers a related list called Assigned Territories that you can add to account page layouts.</p>	
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol. Up to 20 characters are allowed in this field.	✔ (D&B)
Tradestyle	A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
	"DBA". This field is available if you use Data.com Prospector or Data.com Clean.	
Type	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Custom Links	Listing of custom links for accounts as set up by your administrator.	
Website	URL of account's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	✔ (Data.com)
Year Started	The year the company was established or the year when current ownership or management assumed control of the company. If the company establishment or ownership year is unavailable, then the year the Dun & Bradstreet record was created will be used. Dun & Bradstreet does not supply this data for branch locations. This field is available if you use Data.com Prospector or Data.com Clean.	✔ (D&B)

Person Account Fields

A person account has the following standard fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable. Fields with a checkmark in the Is Contact Field column are contact fields that are supported for person accounts but not business accounts.

Note that this list does not include any custom fields that your administrator may have created. Both account and contact custom fields are available for person accounts.

Field	Description	Is Contact Field
Account Currency	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Account Division	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically inherit the account's division. Available only	

Field	Description	Is Contact Field
	in organizations that use divisions to segment their data.	
Account Name	The name of the individual. In person accounts, the account name cannot be edited directly. Instead, Salesforce derives it by combining the <code>First Name</code> and <code>Last Name</code> fields in the appropriate order per the user's language setting. If <code>Middle Name</code> and <code>Suffix</code> fields have been enabled for the organization, those fields are also included in the account name.	
Account Name (Local)	The name of the account translated into the local language.	
Account Number	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
Account Owner	Assigned owner of account. Not available in Personal Edition.	
Account Record Type	Name of the field that determines what picklist values are available for the record. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.	
Account Site	Information about the account's location, such as <i>single location</i> , <i>Headquarters</i> , or <i>Branch</i> . Up to 80 characters are allowed in this field.	
Annual Revenue	Amount of annual reported revenue.	
Assistant	The contact's assistant. Maximum 40 characters.	✓
Asst. Phone	The assistant's phone number. Maximum 40 characters.	✓
Billing City	City portion of billing address. Up to 40 characters are allowed.	
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.	
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard	

Field	Description	Is Contact Field
	values or entered as text. If the field is a text field, up to 80 characters are allowed.	
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.	
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed.	
Birthdate	The contact's birthday. Click the field, and then choose a date from the calendar.	✓
Created By	User who created the account, including creation date and time. (Read only)	
Custom Links	Listing of custom links for accounts as set up by your administrator.	
Department	The associated business or organizational unit. Maximum 80 characters.	✓
Description	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	
Do Not Call	Whether the contact wants to be contacted by phone. If you use Data.com, the <code>Phone</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.	✓
Email	The contact's email address. A valid email address is required. Maximum 80 characters.	✓
Email Opt Out	Whether the contact wants to receive email. If you use Data.com, the <code>Email</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.	✓
Employees	Number of people employed by the account.	
Evaluate this account against territory rules on save	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See Territory Management on page 1369.	

Field	Description	Is Contact Field
Exclude from territory assignment rules	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See Territory Management on page 1369.	
Fax	Fax number. Up to 40 characters are allowed in this field.	
Fax Opt Out	Whether the contact wants to be included in broadcast faxes.	✓
First Name	The first or given name of the individual. Up to 40 characters are allowed in this field.	✓
Home Phone	The contact's home phone number. Maximum 40 characters.	✓
Industry	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Last Name	The surname or family name of the individual. Up to 80 characters are allowed in this field.	✓
Last Stay-in-Touch Request Date	The date when the most recent Stay-in-Touch request was sent.	✓
Last Stay-in-Touch Save Date	The date when the most recent Stay-in-Touch request was returned and merged.	✓
Lead Source	The record source: for example, Advertisement, Partner, or Web. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters for each picklist value.	✓
Mailing City	The city in the mailing address. Maximum 40 characters.	✓
Mailing Country	The mailing country for the address. Entry is selected from a picklist of standard values,	✓

Field	Description	Is Contact Field
	or entered as text. Up to 80 characters are allowed if the field is a text field.	
Mailing State/Province	The mailing state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓
Mailing Street	The street in the mailing address. Maximum 255 characters.	✓
Mailing Zip/Postal Code	The zip or postal code in the mailing address. Maximum 20 characters.	✓
Middle Name	Middle name of the individual. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	✓
Mobile	The contact's mobile phone number. Maximum 40 characters.	✓
Modified By	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
Other City	The city in another address for the contact. Maximum 40 characters.	✓
Other Country	Another country for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓
Other Phone	Another phone number for the contact. Maximum 40 characters.	✓
Other State/Province	Another state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓

Field	Description	Is Contact Field
Other Street	The street address in another address for the contact. Maximum 255 characters.	✓
Other Zip/Postal Code	The zip or postal code in another address for the contact. Maximum 20 characters.	✓
Ownership	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Phone	Primary phone number of account. Up to 40 characters are allowed in this field.	
Rating	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Salutation	The title for addressing the contact, for example, Mr., Ms., or Dr. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters.	✓
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed.	
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.	
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.	
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed.	
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed.	
SIC Code	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	

Field	Description	Is Contact Field
Suffix	<p>Name suffix of the individual. Up to 40 characters are allowed for this field.</p> <p> Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface. Then select Enable Name Suffixes for Person Names.</p>	✔
Territories	The territories to which the account has been assigned. See Territory Management on page 1369.	
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol. Up to 20 characters are allowed in this field.	
Title	The contact's position within the organization. Maximum 80 characters.	✔
Type	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Website	URL of account's website, for example, www.acme.com . Up to 255 characters are allowed in this field; only the first 50 are displayed.

Account History

The Account History related list of an account detail page tracks the changes to the account. Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the account, a new entry is added to the Account History related list. For person accounts, this addition includes any relevant contact fields that are set to be tracked. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the account are not tracked in the account history.

Considerations and Guidelines for Using Account Hierarchies

An account hierarchy shows accounts that are related through the `Parent Account` field, giving you a global view of a company.

[Considerations and Guidelines for Using Account Hierarchies in Lightning Experience](#)

In Lightning Experience, you view an account hierarchy by clicking the **View Account Hierarchy** action on an account detail page.

[Considerations and Guidelines for Using Account Hierarchies in Salesforce Classic](#)

In Salesforce Classic, you view an account hierarchy by clicking the **View Hierarchy** link on an account detail page.

SEE ALSO:

[Account Fields](#)

[Guidelines for Creating Accounts](#)

Considerations and Guidelines for Using Account Hierarchies in Lightning Experience

In Lightning Experience, you view an account hierarchy by clicking the **View Account Hierarchy** action on an account detail page.

Display of Accounts

The Account Hierarchy page displays up to 2,000 accounts in Lightning Experience. (To view accounts in a different part of the hierarchy, enter the hierarchy from a different account.) The hierarchy doesn't display details of accounts you don't have permission to view.

Accounts with Multiple Locations

For companies with multiple office locations, you can also use the `Account Site` field to distinguish among the locations.

Accounts in Divisions

If divisions are enabled in your Salesforce org, accounts that are related via the `Parent Account` field don't have to be in the same division.

Person Accounts Not Supported

Person accounts aren't supported for the `Parent Account` field or the **View Account Hierarchy** action.

Adding to a Hierarchy

To list an account as a child account, edit the account. In the `Parent Account` field, type the name of an account or click the lookup icon to search for a name. Or create an account and then add it to the child account's `Parent Account` field.

EDITIONS

USER PERMISSIONS

To view accounts:

- "Read" on accounts

Considerations and Guidelines for Using Account Hierarchies in Salesforce Classic

In Salesforce Classic, you view an account hierarchy by clicking the **View Hierarchy** link on an account detail page.

- An account hierarchy displays up to 500 child accounts in Salesforce Classic. The hierarchy doesn't display details of accounts you don't have permission to view.
- For companies with multiple office locations, you can also use the `Account Site` field to distinguish among the locations.
- If divisions are enabled in your Salesforce org, accounts that are related via the `Parent Account` field don't have to be in the same division.
- Person accounts aren't supported for the `Parent Account` field or the **View Account Hierarchy** action.
- To list an account as a subsidiary, edit the subsidiary account and type the name of an existing account in the `Parent Account` field. Alternatively, you can click the lookup icon to search for (or optionally, create) a parent account.

Merge Duplicate Accounts

Merge multiple accounts into one so you can keep your data clean and focus on closing deals.

[Guidelines and Considerations for Merging Duplicate Accounts](#)

Keep these considerations in mind when you merge duplicate account records.

[Merge Duplicate Accounts in Lightning Experience](#)

Merge multiple accounts into one using Lightning Experience.

[Merge Duplicate Accounts in Salesforce Classic](#)

Merge multiple accounts into one using Salesforce Classic.

SEE ALSO:

[Guidelines and Considerations for Merging Duplicate Accounts](#)

[Considerations for Merging Accounts Associated with Relationship Groups](#)

Guidelines and Considerations for Merging Duplicate Accounts

Keep these considerations in mind when you merge duplicate account records.

• [Merging Duplicate Accounts: Tips and Gotchas \(Salesforce Classic\)](#)

General

Who Can Merge

You can merge accounts if you're a Salesforce admin, the account owner, or a user above the account owner in the role hierarchy and you have the appropriate user permissions. (The permissions are "Delete" on accounts and "Edit" on related objects, such as opportunities and cases.)

Sharing Rules

In Professional, Enterprise, Unlimited, Performance, or Developer edition orgs, any sharing rules are applied to the merged account. Also, any manual sharing from the master record is applied to the merged account.

Redundant Relationships

If you try to merge accounts that are indirectly related to the same contact, Salesforce displays a message suggesting that you remove the redundant relationships. On account records, indirect relationships are managed from the Related Contacts related list.

Related Items, Chatter Feeds, and Attachments

When duplicate records are related to items such as campaigns or activities, Salesforce relates the items to the merged record, with some exceptions. Chatter feeds are retained from the master record only. Attachments in Chatter feeds are retained in Salesforce but aren't associated with the merged record. To associate the dropped files with the merged record, find them in Files home (in Lightning Experience) or the Files tab (in Salesforce Classic). Then add them to the Files related list on the merged record.

Hidden and Read-Only Fields

Salesforce retains any data in hidden or read-only fields, such as sharing settings, from the master record. Hidden fields aren't shown while you merge. A merged record retains the `Created By` user and `Created Date` from the oldest record merged, regardless of which record is the master. The record shows the merge date as the `Last Modified By` date.

Account Hierarchy

In Lightning Experience, you can choose the parent account to retain. In Salesforce Classic, the merged account retains the account hierarchy from the master record.

Non-Master Accounts

The non-master accounts are moved to the Recycle Bin.

Divisions

If divisions are enabled in your org, the merged account is assigned to the division from the master record unless you select otherwise.

Relationship Groups

Lightning Experience doesn't support merging of accounts associated with relationship groups.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Team Members

Team Members from Non-Master Accounts

The merged account retains all the team members from non-master accounts, even if the members are from different teams.

Permission to Merge on Teams

To merge accounts to which a team member has greater record level access than you do, you must have the “Modify All Data” permission on accounts. For example, suppose that you’re the account owner but an account team member has more access than you on any account child records. You need the “Modify All Data” permission to merge those accounts.

Person Accounts

No Support for Merging Person Accounts in Lightning Experience

Lightning Experience doesn’t support merging of person accounts.

Portal Support

In Salesforce Classic, you can’t merge person accounts that are enabled to use a Customer Portal.

Person Accounts and Business Accounts in Salesforce Classic

In Salesforce Classic, if person accounts are enabled in your org, both business accounts and person accounts are returned when you search for duplicates. However, you can’t merge a person account with a business account or the opposite. Person accounts are indicated by the person account icon ().

Redundant Relationships

In Salesforce Classic, if you try to merge person accounts that are indirectly related to the same contact or account, Salesforce displays a message suggesting you remove the redundant relationships. Indirect relationships with accounts and indirect relationships with contacts are evaluated separately. If you have conflicts with both, you must resolve them separately.

Portals

- To merge accounts associated with portals, you must have the “Manage Users” permission.
- When you merge accounts that have contacts associated with a portal, the contacts must have the same type of portal.
- When you merge accounts that have contacts associated with multiple portals of the same type, a contact’s access to a specific portal doesn’t change. A portal user’s profile determines the portal available to access.
- When you merge a partner account with a non-partner account, the partner account must be selected as the master record.
- When you merge a partner account with a non-partner account, the owner can’t be changed.
- To ensure that the merged account includes contacts associated with a portal, select the account with portal users as the master record.

Territory Management (Salesforce Classic Only)

This information applies to the original Territory Management feature only, and not to [Enterprise Territory Management](#).

- If none of the original accounts has `Exclude from account assignment rules` selected, then account assignment rules run on the merged account to determine its territories. Also, any territories that were manually added to the non-master accounts are manually added to the new account.
- If at least one of the original accounts has `Exclude from account assignment rules` selected, then the following happens.
 - Account assignment rules don’t run on the merged account.
 - The merged account inherits all the territories from the non-master accounts.

- If assignment rules were used to assign territories to the non-master accounts, it appears as if assignment rules are also used to assign territories to the newly merged account, even if the rules don't apply to the merged account.
- If a territory was manually assigned to one of the non-master accounts, the territory is manually assigned to the merged account.
- If a territory was added to one account manually and to another account by rules, the territory is manually added to the merged account.

Enterprise Territory Management (Salesforce Classic Only)

This information applies to the Enterprise Territory Management feature only, and not to the [original Territory Management](#).

- If a territory was manually assigned to one of the merged accounts (for models in all states), the territory is manually added to the merged account, if not already there.
- Account assignment rules run on the merged account for the active territory model only if you select *Select by default* for the `Evaluate this account against territory rules on save checkbox` on the applicable account page layout's layout properties.
- If the merged value of `Exclude from territory assignment rules = true`, then: 1) territory assignment rules are not evaluated even if the *Select by default* checkbox for the `Evaluate this account against territory rules on save checkbox` is selected on the applicable account page layout's layout properties; and 2) any existing rule based territory associations in the active model are removed from the merged account.
- For territory models in non-active states (`Planning` or `Archived`), rule-based associated territories don't change on the merged account even if the merged account field values do not match the rules.

Merge Duplicate Accounts in Lightning Experience

Merge multiple accounts into one using Lightning Experience.

1. Choose an account record. If duplicates exist, they're listed in a Potential Duplicates related list. Or click the **View Duplicates** link that appears on the account.
2. Choose up to three account records to merge. Click **Continue**.
3. Choose one account record as the master.
4. Choose the field values that you want to keep.
5. Confirm that you want to merge the records by clicking **Next**, and then click **Merge Accounts**.

Merge Duplicate Accounts in Salesforce Classic

Merge multiple accounts into one using Salesforce Classic.

1. From the Accounts tab, click **Merge Accounts** in the Tools section. If you don't see the merge option, ask your admin to check your user permissions.
2. To find the duplicate accounts, enter a search string. Then click **Find Accounts**.
3. Select up to three accounts you want to merge. Then click **Next**.
4. Select one account as the master record.
5. Select the fields that you want to retain from each record. Fields with conflicting values are highlighted.
6. Click **Merge**.

Considerations for Merging Accounts Associated with Relationship Groups

Merging multiple accounts into one helps you keep your data clean so you can focus on closing deals. Here's what you need to know about merging accounts that are members of relationship groups.

- An account can't exist more than once in the same relationship group.
- The account you select as the master record retains its original relationship group memberships. For example, if the master record "Joseph Bannon" was a member of the "Bannon Family" and "Bannon Law Firm" relationship groups, it remains a member of those relationship groups.
- The master record replaces the non-master records in all other relationship groups involved in the merge. For example, if the non-master record "Joe Bannon" was a member of "Bannon Trust Beneficiaries," the master record is transferred Joe Bannon's membership in Bannon Trust Beneficiaries.
- If there is a relationship group to which the master record did not originally belong but the multiple non-master records belong, the master record is transferred the membership of the non-master account that had higher priority (primary versus secondary) or the account whose member record was most recently modified in the relationship group. For example, if the non-master records "JR Bannon" and "Joe Bannon" both were members of "Acme LLP" and JR Bannon was primary, then the master record is transferred JR Bannon's membership in Acme LLP. Alternatively, if neither JR Bannon or Joe Bannon were primary or secondary but JR Bannon's member record in the relationship group was modified more recently, then the master record would be transferred JR Bannon's membership in Acme LLP.

Sharing Accounts

Your administrator defines your organization's sharing model and your organization's default account access levels for territories. However, you can extend sharing privileges for your own data on an account-by-account basis. You can use account sharing to increase access to your accounts; you cannot restrict access beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the account detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the account. On this page, you can do any of the following:

- To grant access to the record for other users, groups, roles, or territories, click **Add**.
 - 📌 **Note:** When you share an account, Salesforce prompts you to share any related [contacts](#), [opportunities](#), or cases, up to and including your access level. Enterprise, Unlimited, Performance, and Developer Edition users can also share related records from the record detail pages. Ensure that users have at least "Read" permission on shared records.

Alternatively, you can share account access by creating an [account team](#).

- Click **Expand List** to view all users that have access to the record.

Record Translated Names

Use local name fields to store translated names for accounts, contacts, or leads.

For example, you can store the name of an account in the default language in your Salesforce org and the account’s or user’s language. The following fields can have corresponding local names:

Standard Field	Local Name Field
Account Name	Account Name (Local)
Contact: First Name	Contact: First Name (Local)
Contact: Middle Name	Contact: Middle Name (Local)
Contact: Last Name	Contact: Last Name (Local)
Lead: Company	Lead: Company Name (Local)
Lead: First Name	Lead: First Name (Local)
Lead: Middle Name	Lead: Middle Name (Local)
Lead: Last Name	Lead: Last Name (Local)

EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in **Enterprise, Performance, Unlimited,** and **Developer** Editions

Local names do not affect the user’s language settings. Depending on your page layout settings, they can both be displayed on the detail or edit page.

Changing the Territories of an Account

To modify an account's manually assigned territories:

1. From the account detail page, click **Change** next to the `Territories` field.
2. At the `Rule-based territory assignments` list, view the territories that contain the account due to active account assignment rules. You cannot use this page to remove the account from these territories; to do so you must modify the account assignment rules that evaluated the account.
3. If the account has existing manual assignments to one or more territories, the names of those territories appear in the `Selected territories` list.
4. Click **Select** and **Deselect** to move territories between the Available territories list and the Selected territories list.
5. Optionally, click **Horizontal View** or **Vertical View** in the drop-down list to place the Selected territories list either alongside or below the Available territories list.
6. When the Selected territories list contains the territories to which the account should be manually assigned, click **Save** to finish and return to the account detail page.

USER PERMISSIONS

To change the territories of an account:

- "Manage Territories"

OR

You are a forecast manager. Forecast managers can manage territories of those users working below them in territory hierarchy.

Change a Record's Owner

You can give ownership of a record to another user as long as that user has at least "Read" permission for the type of record being transferred.

1. On the record detail page, click the link to change the owner.
If you don't see the link, you don't have permissions to change record ownership.
2. Enter or select a new owner. In organizations where the Salesforce Customer Portal or partner portal is enabled, you can filter the results that appear on the user lookup dialog by selecting either a queue or group of users from the `Owner` or `Assigned To` drop-down list.

 **Note:** You can only enter or select users who have permission to own the record. The User group and the Roles and Internal Subordinates group don't contain Customer Portal or partner users.

3. To notify the new owner, select the `Send Notification Email` checkbox.
The "From" email address displayed in the notification is your return email address set in your email settings.
For cases in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, the `Case Assigned Template` setting specified in Support Settings determines the email text. For other records, the email text is generated automatically and cannot be customized.

4. Depending on the type of object you are transferring and your user permissions, the following checkboxes can also appear:

Checkbox	Description	Appears For
<code>Change Division</code>	Transfers the record to the new owner's division. All records related to the account are transferred to the new division as well.	Accounts and leads in Salesforce Classic, if you can view or edit the <code>Division</code> field
<code>Transfer open opportunities not owned by the existing account owner or Transfer open opportunities not owned by you</code>	Transfers open opportunities owned by other users that are associated with the account.	Accounts in Lightning Experience Accounts in Salesforce Classic
<code>Transfer closed opportunities</code>	Transfers the closed opportunities associated with the account. This option applies only to closed opportunities owned by the account owner; closed opportunities owned by other users are not changed.	Accounts in Salesforce Classic
<code>Transfer open cases owned by the existing account owner</code>	Transfers any open cases associated with the account owned by the existing account owner.	Accounts in Salesforce Classic
<code>Transfer closed cases</code>	Transfers the closed cases associated with the account. This option applies only to closed cases owned by the account owner; closed cases owned by other users are not changed.	Accounts in Salesforce Classic

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To transfer single records:

- "Transfer Record"

Checkbox	Description	Appears For
Keep Account Team	Transfers all account team members on the account to the new owner.	Accounts in Salesforce Classic
Keep Opportunity Team	Preserves the opportunity team when the opportunity is transferred to the new owner. Any opportunity splits are preserved, and split percentages assigned to the previous owner transfer to the new one. If this box is unchecked, all opportunity team members and splits are deleted when the opportunity is transferred.  Note: If you transfer closed opportunities, the opportunity team and opportunity splits are maintained, regardless of this setting.	Accounts in Salesforce Classic Opportunities in Salesforce Classic

 **Note:** If you change an account owner with both `Transfer closed opportunities` and `Keep Opportunity Team` deselected, the opportunity team members' access for closed opportunities becomes Private (that is, the opportunity team members lose access to any closed opportunities).

5. Save your owner changes.

If your organization-wide default sharing for an object is set to Private, you may see an error after changing the owner of a record for that object. This is because you no longer have access to the record. This error is safe to ignore.

SEE ALSO:

[Transfer of Associated Items](#)

Transfer of Associated Items

When you change a record's owner, some of its associated records may also be transferred to the new owner.

 **Important:** Workflow rules that update owners *do not* also transfer associated items. To ensure transfer, click **Change** next to the owner's name in a record and make your transfer selections.

Record Type	Associated items that are also transferred
Accounts	Contacts, contracts with <i>Draft</i> status, attachments, notes, open activities, and orders with <i>Draft</i> status that are either associated with a transferring contract or no contract. Depending on your selections, this can also include open opportunities not owned by the current account owner, closed opportunities, open cases owned by the existing account owner, and closed cases. When a partner account is transferred, partner users associated with that account are moved into the role hierarchy beneath the new owner.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise Performance, Unlimited, and Developer** Editions

Record Type	Associated items that are also transferred
	Contracts and orders with <i>Activated</i> status are not transferred to the new owner, however, the new owner has read-only access to these contracts and orders.
Contacts	Notes, attachments, and open activities
Orders	Open tasks and future events (only applies if neither the old nor new owner is a queue)
Opportunities	Notes, attachments, and open activities
Leads	Notes, attachments, and open activities. Open activities are not transferred if you change lead ownership using the <code>Assign using active assignment rule</code> checkbox.
Cases	Notes, attachments, and open activities
Campaigns	Attachments and open activities
Contracts	Notes, attachments, open activities, and orders with <i>Draft</i> status
Custom objects	Notes, attachments, and open activities

 **Note:** You can't transfer events to which you have been invited and don't own.

Person accounts available in **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Related lists, such as opportunities, display information related to an account.

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.
- To directly add new items, click **New** (or the equivalent button) at the top of a related list. For example, to add a task to the Open Activities related list, click **New Task**.
- To change the number of records shown for related lists, click **View More** below a related list, or click **fewer** or **more** at the bottom of the page.
- If you are unable to see related records that belong to portal users, contact your Salesforce administrator.

Viewing Related Lists

What related lists you see are determined by several things.

- The Salesforce edition you are using
- Whether you are using Salesforce Classic or Lightning Experience
- Whether you are viewing a business account or a person account
- Your personal customization
- Page layout customizations set by your Salesforce administrator
- Your permissions to view related data

[Accounts](#)

Working Together on Accounts

Account Teams

An account team is a team of users who work together on an account. For example, an account team can include an executive sponsor, dedicated support representative, and project manager. Using account teams makes it easy to track collaboration on accounts.

Account teams aren't the same as opportunity teams, although they have the same team member roles.

You can build an account team for each account that you own. When selecting an account team member, specify the role that the person plays on the account. Depending on your sharing model, you can specify each account team member's level of access to the account and any contacts, opportunities, or cases associated with that account. That way, you can give some team members read-only access and others read/write access.

You can set up a default account team that includes the people who you normally work with on your accounts. You can choose to automatically add this default account team to all your accounts.

In a custom list view, you can filter account lists by the account teams in which you are a member. When creating or editing a custom list view for accounts, select the **My Account Teams** filter. In account reports, you can filter accounts by the account teams in which you are a member.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

[Add Account Team Members](#)

Add team members to an account so that the people who work together on the account can easily collaborate and track progress.

[Considerations for Removing Account Team Members](#)

Before you delete a member from an account team, make sure you're aware of these considerations.

[Guidelines for Setting Up Default Account Teams](#)

Save time by setting up a default account team—a group of coworkers you typically work with on account. Then add the team to accounts that you own.

[Account Team Fields](#)

An account team member has the following fields, listed in alphabetical order. Your page layout and field-level security settings determine which fields are visible and editable.

Add Account Team Members

Add team members to an account so that the people who work together on the account can easily collaborate and track progress.

Who can manage the account team members depends on the users' access. Account record owners and users above the owner in the role hierarchy can add, edit, and delete team members. In Salesforce Classic, other users with edit access on the account can only add team members. In Lightning Experience, other users with edit access on the account can add and edit team members, but only changes to the Team Role field are saved.

Record owners and users above the owner can also grant team members higher access to the record.

1. From the Account Team related list on an account, click to either add a team member or a default account team. If you don't see the Account Teams related list, ask your admin to add it to your page layout.
2. Fill in the information, including the user or default team. High-volume portal users can't be added to teams.

 **Note:** The access level can't be less restrictive than your org's default account access level. The options available to you vary depending on your org's sharing model and whether you're using Salesforce Classic or Lightning Experience. Regardless of sharing access, account team members must also have the "Read" permission on accounts to view accounts that list them as members.

3. Save the information.

SEE ALSO:

[Account Team Fields](#)

USER PERMISSIONS

To add team members to an account:

- "Read" on users

AND

"Edit" on accounts

To view accounts as team members:

- "Read" on accounts

Considerations for Removing Account Team Members

Before you delete a member from an account team, make sure you're aware of these considerations.

- For each account you own, you can remove any team member from the account team.
- Unless specified, removing a member of your account team does not remove that person from your opportunity teams.
- If a team member is on your default account team and you remove him or her from a specific account, those changes only affect that account. The setup of your default account team does not change. To remove users from your default account team, see [Guidelines for Setting Up Default Account Teams](#) on page 1210.
- If a user on an account team has Read/Write access (**Account Access**, **Contact Access**, **Opportunity Access**, and **Case Access**) and is deactivated, the access will default to Read Only if the user is reactivated.

Owner of account record, or above owner in your organization's role hierarchy

Guidelines for Setting Up Default Account Teams

Save time by setting up a default account team—a group of coworkers you typically work with on account. Then add the team to accounts that you own.

Account teams aren't the same as opportunity teams, although they have the same team member roles.

- To set up a default account team, access Advanced User Details in your personal settings.
- The access levels of the records can only grant the same or wider access than your organization's default access. However, at least one of the access levels must be set to a wider access than the organization's defaults. For example, if the organization-wide defaults for your contacts, opportunities, and cases are set to Private, then at least one of them must be set to a wider access for the account team members.
- `Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent.
- While you're defining your default opportunity team, you can choose to automatically add it to all your open opportunities. If you don't choose this option, you add the default team from the Opportunity Team related list of your opportunities.
- Clicking **Add Default Team** adds the default team of the opportunity owner, not of the user who clicks the button.
- Salesforce admins and users above you in the role hierarchy can add your default opportunity team to opportunities that you own.

Prepare Salesforce for Connecting to Pardot

Install an AppExchange package to get Salesforce ready to connect and sync with Pardot.

The package you'll download from the AppExchange automatically updates Salesforce with a custom application, custom tab, and custom fields for leads and contacts. After you install the package, you'll see a custom tab for the Pardot LeadDeck application. Keep in mind that you may need to customize your view to display the custom fields for leads and contacts. This helps your sales teams share information between Pardot and Salesforce.

If you're installing the Pardot AppExchange package for a

You need to

Production environment

1. Go to the [Pardot AppExchange package](#) for production environments.
2. Click **Continue** to install the package.
3. When prompted for your username and password, enter your production username and password.
4. Review the actions and click **Deploy** to complete the installation.
5. Confirm with your Salesforce administrator you have read permissions for ObjectChangeLogs.

Sandbox environment

1. Log out of Salesforce.
2. Go to the [Pardot AppExchange package](#) for sandbox environments.
3. When prompted for your username and password, enter your sandbox username and password.
4. Click **Continue** to install the package.
5. Review the actions and click **Deploy** to complete the installation.
6. Confirm with your Salesforce administrator you have read permissions for ObjectChangeLogs.

Set Up the Connector to Sync with Either Production or Sandbox Environments

Get your Salesforce connector ready to sync between Pardot and Salesforce for either a product or a sandbox environment.

Complete this procedure only if this is the first time you're establishing your connector. You'll need administrative rights in Salesforce for this procedure.

1. From Salesforce Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.
2. Create these trusted IP ranges.

Start IP Address	End IP Address
67.228.95.145	67.228.95.145

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Start IP Address	End IP Address
67.228.168.139	67.228.168.141
67.228.223.106	67.228.223.107

Add the Connector to Pardot

Add and manage connector settings directly in Pardot.

Complete this procedure only if this is the first time you're establishing your connector and you have administrative rights in Salesforce.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. Click **+ Add Connector**.
3. Select Salesforce.
4. Type a name for the connector.
Use a name that makes it easy for you to identify your connector.
Example: Salesforce Connector)
5. Type your Salesforce username and password.
Keem in mind that when your Salesforce password changes, you'll need to update the Salesforce password for your connector.

Options for Customizing the Connector

Customize the connector based on your preferences.

Select any of these options to customize your connector.

The option	Which
Automatically create prospects in Pardot if they're created in Salesforce	<p>Enables a trigger to set any newly created leads or contacts in Salesforce to sync to Pardot. This won't happen for historical leads or contacts—only for those created after installing the Pardot AppExchange package in Salesforce, and will work only for leads and contacts created with an email address.</p> <p>If this feature is enabled later on, any leads and contacts with email addresses that were created after the Pardot package was installed in Salesforce will be pushed down to Pardot. Select a default campaign from the dropdown for any prospect created with this option.</p>
Automatically change emails in Pardot to reflect changes in Salesforce	<p>Automatically updates email addresses for Pardot prospects if an email address of a lead or contact is updated in Salesforce.</p> <p>Learn more about keeping email address updates in sync in About Email Address Updates Between Salesforce and Pardot.</p>

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To create records:

- "Create," "Update," and "Read" on contacts and leads

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

The option	Which
Automatically match Salesforce users to Pardot users	Lets you send emails from any user fields, including, for example, support contacts and account managers. Learn how to set up this functionality is Send Emails from Salesforce .
Exclude Salesforce Partner and Customer Portal users from Prospect assignment	Prevents Salesforce Partner and Customer Portal users from displaying in the “CRM Username” dropdown when you edit a user in Pardot.
Allow editing of Prospect lists within the CRM	Lets users add and remove Pardot prospects from within Salesforce. If you check this box, you must add the Visualforce elements to your Leads and Contacts page layouts.
Connect to a Salesforce sandbox account	Let’s you connect to a sandbox environment.
Sync emails with the CRM	Automatically logs an activity for every email sent to a prospect (list, drip, autoresponder and 1-to-1 prospect emails).  Note: This can quickly fill up your activity views, especially on an account object. Disabling Email Logging in Pardot is not retroactive. If the email logging may interfere with your workflow in Salesforce, we recommended that you do not enable this option.
Sync plugin emails with the CRM	Logs an activity for emails you send through Pardot for Microsoft® Outlook®, our Thunderbird extension, our Apple Mail plug-in, or our add-in for Gmail.
Enable Salesforce emails for task creation	Lets you send a notification email to users when a task is created.
Enable Salesforce emails for assignment rules	Lets Salesforce send a notification email to users when assignment rules run.
Enable Salesforce emails for user and queue assignments	Lets Salesforce send a notification email to users when an assignment takes place for a user or queue.

Set Up the Connector to Sync with Sandbox Environments

Get your Salesforce connector ready to sync between Pardot and your Salesforce sandbox.

Complete this procedure only if you already have a Salesforce connector set up for your production environment, but want the connector to point to your sandbox environment instead.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. In the row for your Salesforce connector, click , then **Edit**.
3. In the `Username` field, append `.NSPARDOT` to your username.
(Example: christina.wills@pardot.com.NSPARDOT)
4. If your sandbox password differs from your password in production, enter your sandbox one in the `Password` field.
5. Select the option `Connect to a Salesforce sandbox account`.

Because your sandbox is a copy of your production Salesforce organization, you’ll see the connector for your sandbox, too.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Whitelist Pardot IP Addresses in Salesforce

Set up Pardot IP addresses in Salesforce so that Pardot can communicate with Salesforce.

Complete this procedure only if this is the first time you're establishing your connector. You'll need administrative rights in Salesforce for this procedure.

1. From Salesforce Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.
2. Create these trusted IP ranges.

Start IP Address	End IP Address
67.228.95.145	67.228.95.145
67.228.168.139	67.228.168.141
67.228.223.106	67.228.223.107
136.147.104.20	136.147.104.23
136.147.96.20	136.147.96.23

Turn On the Connector

Complete a simple task to turn on the Salesforce connector so that you can begin syncing between Pardot and Salesforce.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. In the row for your Salesforce connector, click **verify now**.

If Pardot is able to send data to and receive data from Salesforce, the status will change to .

Map Custom Leads Fields to Contacts Fields

Get the most out of contacts created from converted leads when you map custom fields between the two record types.

The connector creates leads in Salesforce from prospects in Pardot. But when you convert those Salesforce leads to contacts, only standard fields from the contacts appear for the newly converted contacts. Mapping custom fields between leads and contacts ensures you see all the information that helps you with your marketing and sales efforts.

1. From the object management settings for leads, go to the fields area, and then click **Map Lead Fields**.
2. For each custom lead field, choose a custom account, contact, or opportunity field into which you want the information inserted when you convert a lead.
3. Click **Save**.

Setting Up Pardot Custom Fields in Salesforce

Get your custom Pardot fields to appear in Salesforce.

The AppExchange package you installed to get Salesforce ready to connect and sync with Pardot sets up the custom fields for you, but the fields do not appear in Salesforce automatically. You need to complete a procedure to have these custom fields appear in Salesforce.

Add Sections to Leads and Contacts Page Layouts

Complete a procedure for getting Pardot fields to appear in leads and contacts page layouts.

1. In Salesforce, from the object management settings for leads, go to Page Layouts. A drag-and-drop box including your field options appears at the top of the page.
2. Drag a Section field to your Leads page layout.
3. In the pop-up window, enter section name *Pardot*.
4. For the number of columns, select **2 (Double)**.
5. Select the option for showing the section heading, and then click **OK**.
6. Return to the Fields section of the drag-and-drop editor and scroll right to locate the Pardot custom fields.
7. Drag all the Pardot fields into your new section.
8. Add another section using the drag-and-drop editor, but for the number of columns, select **1 (Single)**.
9. Select the option for showing the section heading, and then click **OK**.
10. Select **Visualforce Pages tab** and drag **Pardot Lead Activities** and **Pardot Lead List Membership** into your new section.

Set Up Salesforce to Add Campaign Prospects to Pardot

Set up Salesforce to quickly get prospects from your Salesforce campaigns into Pardot.

1. From the object management settings for campaigns in Salesforce Setup, go to Page Layouts.
2. Edit the layout, and select **Buttons**.
3. Drag the **Add to Pardot List** button to your row of custom buttons at the top of the Campaign view.
4. Save the layout.

Set Up Salesforce for Adding Leads and Campaigns to Pardot

Easily add buttons in Salesforce that make it easy to add leads and campaigns to Pardot, as well as send Pardot-tracked email from Salesforce.

If you want to add Salesforce leads and campaigns to Pardot, set up and use the **Send to Pardot** button. If email address associated with the Salesforce records:

- Don't yet exist in Pardot, the Send to Pardot feature creates new records for you in Pardot.
- Already exist in Pardot, no harm done—you won't get duplicate records in Pardot.

If you want to send Pardot-tracked email from Salesforce set up and use the **Send Pardot Email** button. You can send free-form tracked email, or use a marketing approved Pardot email template to send email to a lead or contact.

1. Log in to Salesforce as an administrator.
2. From the object management settings for leads, go to Page Layouts.
A drag-and-drop box including your field options appears at the top of the page.
3. In the Lead Layout box, select **Buttons**.
4. Select the **Send to Pardot** button and drag it into the Lead Detail section.
5. Select the **Send Pardot Email** button and drag it into the Lead Detail section.
6. Save the layout.
7. Repeat Steps 2 through 6 for Contacts.

Assign Your Salesforce Username to the Connector

Make sure that any actions you take with the connector are associated with you.

1. In Pardot, hover over **Admin**, then click **User Management > Users**.
2. In the row for your user profile, click , then **Edit**.
3. Scroll to the bottom of the Edit User box.
4. Select your Salesforce username from the drop-down menu.
5. Click **Save user**.
6. When you're in your Pardot user profile, you'll see your Salesforce username in the **CRM Username** field. Click **Verify**, and enter your Salesforce password.

Set Up Single Sign-On for Salesforce and Pardot

Avoid having to sign on to your two separate Salesforce and Pardot systems.

1. Log in to Pardot.
2. Hover over your email address, and then click **My Settings**.
3. Verify that your Salesforce username is correct. If it's correct, click **Verify**. If you need to change or add it, click **Edit My User Information** to change or add it.
4. When prompted, enter your Salesforce password, and then click **Verify**.
You'll receive a message letting you know whether the validation was successful.
5. If the validation was successful, log in to Salesforce and select the Pardot tab.
You should be able to see the contents of the tab without having to log in to Pardot separately.

Send Emails from Salesforce

Send emails from any user field, including support contacts, account managers, or anyone who is attached to a Pardot prospect.

Setting up your users and the necessary custom fields in Pardot lets you take advantage of this feature, and send emails to prospects that could appear to come from any user in Salesforce.

In	Do this
Salesforce	<ol style="list-style-type: none"> 1. Create the field you'd like to use to contain your CRM User Value, e.g. Relationship Manager, on the lead or contact record in Salesforce. This field should be the type "Lookup Field." If you already have the field created, make sure that it's a "Lookup Field" and that it's successfully populated. 2. Populate the lookup field with the user.
Pardot	<ol style="list-style-type: none"> 1. Create matching user seats for any Salesforce users. 2. On the user record, map the Pardot user seat to the Salesforce user. This lets Pardot to infer information about the user for variable tags when sending the email. 3. Create a custom field in Pardot with the designated type "CRM User" to hold the field values on the prospect record. This field is a read-only field in Pardot. 4. Map the custom field to the corresponding salesforce.com field.

About Email Address Updates Between Salesforce and Pardot

Learn how email address updates for your Salesforce contacts and leads automatically sync to your corresponding prospects in Pardot.

When you update email addresses either manually or with Data.com for your Salesforce contacts and leads, the following sync cycle updates the email addresses for corresponding Pardot prospects. Also, if you merge Salesforce contacts or leads and the email addresses for your primary records differ from the corresponding Pardot prospects, the following sync cycle updates email addresses for your prospects.

What Syncs when Email Addresses are Missing in Salesforce or Pardot

If you have Salesforce contacts or leads that don't include email addresses, but then subsequently add them, the sync cycle will not create new prospects in Pardot. If, however, prospects with matching email addresses already exists in Pardot, the sync cycle will update email addresses for the matching Salesforce leads or contacts.

Understand Sync Options for Pardot Accounts and Salesforce Person Accounts

Easily sync leads between the two systems after you assign your Pardot prospects to users.

Consider these options before you sync Pardot accounts and Salesforce person accounts.

If you want Pardot to

Create leads in Salesforce and sync with person accounts

By default, the connector creates Salesforce records as leads. But when leads are converted to person accounts, Pardot is unable to recognize person accounts. Pardot can't sync with person accounts. Instead, Pardot recreates leads to sync with.

If you use person accounts in Salesforce, you'll want to change this default behavior. By enabling person account syncing with lead creation, Pardot still creates records in Salesforce as leads, but when the leads are converted into person accounts, Pardot syncs with the person account and no additional Salesforce leads will be created for that prospect.

With this syncing, a Salesforce person account will sync to a Pardot prospect record that is associated with an Account in Pardot, which will not merge the two records into one view as in Salesforce. The field mapping will remain the same—contact fields will map to prospect fields and salesforce.com account level fields will map to Pardot account fields. This means that the Account Owner of a person account will sync to the Assigned User field on the account level in Pardot.

Create and sync person accounts only

Assigned prospects that have updated default field values (including the assigned owner) in Salesforce sync roughly every ten minutes, pushing the updates back to the Pardot record (because Salesforce wins in the event of a conflict in data). Updates to custom fields also sync with Salesforce, pushing those back to the Pardot record unless the option to have the Pardot value override the Salesforce value is enabled for that custom field.

Unassigned prospects in Pardot that have activities or updated records also sync if records in Salesforce use the same email address. Keep in mind that assigned prospects take higher priority for syncing than those that are unassigned in Pardot. If there are no matching email addresses in Salesforce, the prospect in Pardot will not sync until it's assigned to a user. This means that the connector will not create new records in Salesforce until the prospect is assigned in Pardot.

EDITIONS

Sync Leads between Pardot and Salesforce

Easily sync leads between the two systems after you assign your Pardot prospects to users.

If you already have leads in Salesforce, the connector will sync those leads to Pardot, merging the Pardot prospects and Salesforce leads between the two systems. If data in common fields between Salesforce and Pardot conflicts, including lead owner, the data from the Salesforce fields always wins. You can take advantage of this functionality when you set up custom fields in Pardot. You can also set up Pardot to send emails to prospects that appear to come from any user in Salesforce.

Sync Method	Do this
Manual	In Pardot, when you click the link Synchronize with CRM , prospects in Pardot and leads in Salesforce sync instantly, merging the data from Pardot with that from Salesforce.
Automatic	Assigned prospects that have updated default field values (including the assigned owner) in Salesforce sync roughly every ten minutes, pushing the updates back to the Pardot record (because Salesforce wins in the event of a conflict in data). Updates to custom fields also sync with Salesforce, pushing those back to the Pardot record unless the option to have the Pardot value override the Salesforce value is enabled for that custom field. Unassigned prospects in Pardot that have activities or updated records also sync if records in Salesforce use the same email address. Keep in mind that assigned prospects take higher priority for syncing than those that are unassigned in Pardot. If there are no matching email addresses in Salesforce, the prospect in Pardot will not sync until it's assigned to a user. This means that the connector will not create new records in Salesforce until the prospect is assigned in Pardot.

Tracking Prospects as Salesforce Contacts

Automatically create contacts in Salesforce from your Pardot prospects.

By default, the Salesforce connector creates Salesforce leads from your prospects in Pardot. If you don't want to track your prospects as leads in Salesforce, you can have a Pardot Services member adjust the default setting so that Pardot creates contacts in Salesforce instead of leads.

If this feature is enabled on your account, Pardot will look first at your Salesforce leads to see whether there's an existing lead record with the same email address with which Pardot can sync. If there's no existing lead record, Pardot looks for an existing contact record with the same email address. If no Salesforce lead or contact exists with the same email address, Pardot will create a new Salesforce contact record.

Tracking the Products Your Customers Buy

What Are Assets?

While products represent the items that your company sells, assets represent the specific products your customers have purchased. Assets have a serial number, date of purchase, and other information related to an individual sale. Depending on how your organization uses assets, they can represent a competitor product that your customer has or versions of your products.

Use assets to store specific information about the products your customers have. You can view assets on the Assets tab. Depending on your page layouts, you also can view asset related lists on your account, contact, and product page layouts.

You can introduce hierarchy to assets in your org to represent more complex products. An asset hierarchy can contain up to 10,000 assets. Define relationships between assets using the `Parent Asset` field on assets.

If your admin has set up entitlements, your customers may be eligible for support based on an asset they've purchased.

SEE ALSO:

[Viewing Asset Lists](#)

Getting Started with Assets

If your organization has enabled products, assets are automatically enabled for your organization. However, admins still need to customize their org before users can begin using assets.

To implement assets for your organization:

- Add the Assets tab to your home page.

Note: By default, the Assets tab is hidden in organizations created before Spring '15. You can make the Assets tab visible to your users by changing the user profiles.

- Add the Assets related list to account, contact, and product page layouts. Users can create new assets from these related lists.
- If you want to be able to make one asset a child of another asset, add the `Parent Asset` field and Child Assets related list to asset page layouts. If you'd like to give users more context, you can also add the read-only `Root Asset` field, which represents the top-level asset in an asset hierarchy.
- Add the Cases related list to the appropriate product and asset page layouts.
- Add the `Asset` field to your case page layouts. Consider changing the field-level security for the `Asset` field so that it displays or is required if necessary for your business.
- By default, your users have "Read," "Create," "Edit," and "Delete" permissions on assets. If necessary, revise these permissions for your users. Without the "Read" permission on assets, users will not see any assets or asset related lists in Salesforce.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- Optionally, customize asset fields and page layouts from Setup by entering *Assets* in the **Quick Find** box, then selecting **Assets**.

SEE ALSO:

[What Are Assets?](#)

Displaying the Assets Tab

The Assets tab is where you can view and work with assets. The Asset tab is visible in organizations created after Spring '15.

By default, the Asset tab is hidden for organizations created before Spring '15, so it doesn't appear in the All Tabs page. Update the user profile to change the tab visibility.

- From Setup, click **Administer | Manage Users | Profiles**.
- Click **Edit** next to the user profile that you want to update.
- In the Tab Settings list, change the setting for Assets to *Default On*.
- Click **Save**.

Now users with the updated profile can see the Asset tab in the All Tabs page and can add the Assets tab to their home pages.

Viewing Asset Lists

You can display a list of assets by opening the Assets tab. You also can display a list of assets by going to the Products tab and clicking a view from the Asset Views section.

To show a filtered list of items, select a predefined list from the View drop-down list, or click **Create New View** to define your own Custom view. To edit or delete any view you created, select it from the View drop-down list and click **Edit**.

- Click an asset name to view the detail. Click **Edit** or **Del** to [edit or delete the asset](#). For information on deleting assets, see [Deleting Assets](#) on page 1225.
- If Chatter is enabled, click  or  to follow or stop following an asset in your Chatter feed.

Displaying and Editing Assets

You can display an asset from the Products tab or a related account or contact.

Displaying Assets

Once you have located an asset from a related list, or the products home or list pages, click the name to display detailed information. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

Viewing Asset Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the asset.

Editing Assets

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.

Asset Related Lists

Below the asset detail are related lists that include information about associated cases, entitlements, activities, or notes and attachments. The related lists you see are determined by your personal customization and any customization your administrator has made to page layouts. Click on individual items to display additional information about them. Click **more** at the bottom of the page or **View More** below a related list to display more items.

 **Note:** Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

Printing Assets

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

To return to the last list page you viewed, click **Back to list** at the top of the asset detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

 **Note:** Users can view an asset if they can view the account or contact listed on the asset. However, sharing settings may prevent users from viewing the account associated with the contact on the asset.

Creating Assets

1. Click **New** on the Assets home page or on the Assets related list of an account, contact, or product. This action automatically inserts the account name, contact name, or product name, depending on the record you selected when you clicked **New**.
2. To associate the asset with a product, enter the exact product name. If the product name is unique, Salesforce automatically inserts this name in the `Asset Name` field.

If you do not know the name of the product:

- a. Click the `Product` lookup icon if the asset is based on a product.
- b. Enter a search filter to find a current product, and click **Go!**.
- c. Select the appropriate product. Salesforce automatically inserts the selected product name in the `Asset Name` field.

3. Enter a name for the asset.

4. Choose the account or contact for the customer who has purchased the asset.

If necessary, you can choose both an account and a contact that are not related. The asset displays on the contact selected on the asset as well as the account selected on the asset. However, it doesn't display on the account of the contact. If you only choose a contact, the asset displays on both the contact and the contact's account.

5. Optionally, select a parent asset. This field is useful if the asset you are creating is a component of another asset. For example, a "tent" asset could be the parent of a "rain fly" asset and a "tent pole set" asset. Creating hierarchical relationships between assets lets you track when an asset component was last replaced, link work order line items to child assets, and more.

Note:

- An asset hierarchy can contain up to 10,000 assets.
- Depending on how assets are set up in your org, the `Parent Asset` field may need to be added to the asset page layout.

6. To create an asset for a competitor's product, check `Competitor Asset`.

7. Click **Save**.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

Cloning Assets

Use the **Clone** button on an asset to quickly create a new asset with the same information as the selected asset. To clone an asset for your organization:

1. Click **Clone** on an existing asset.
2. Enter or change any information for the new asset.
3. Click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

SEE ALSO:

[Asset Fields](#)

Deleting Assets

Since assets are related to account and contact records, you can delete them from those records or individually using the Products tab. Before you delete an asset, review the following scenarios:

- **Is the asset associated with a case?**

Assets associated with cases cannot be deleted. This includes deleting an account or contact record that is associated with an asset listed on a case.

- **Is the asset associated with a product?**

When an asset is based on a product, deleting the product does not delete the asset.

- **Is the asset associated with an account or contact?**

If you delete an account or contact, all associated assets are also deleted and moved to the Recycle Bin.

Note that if you delete an account with a related contact that is associated with an asset, all three records are deleted. To restore all three records, restore the account record.

- **Does the asset have a parent asset and child assets?**

If you delete an asset with both a parent asset and child assets, keep in mind that its parent and children will no longer be linked in an asset hierarchy.

 **Note:** You can delete an asset individually without deleting any related record. However, if you later delete the related record, you cannot recover the asset from the Recycle Bin.

To delete an asset:

1. Locate the asset on the Assets related list of an account or contact, or on an asset list view from the Products tab.
2. Click **Del** next to the asset you want to delete.

Asset Fields

An asset has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Asset Division	Division to which the asset belongs. This value is automatically inherited from the related account if any. Otherwise the value is inherited from the related contact. Available only in organizations that use divisions to segment their data.
Asset Name	Identifying name for the asset. If you select a product from the product lookup, this name is automatically populated with the product name.
Account	Account associated with the asset. Each asset must be associated with an account or contact.
Contact	Contact associated with the asset. Each asset must be associated with an account or contact. If you choose both an account and contact, they do not need to be related to each other. Contacts that are not associated with an account cannot be linked to assets.
Competitor Asset	Checkbox to indicate if the asset represents a competitor's product. Use assets to track what customers have your competitor's products using this checkbox.
Description	Text that distinguishes this asset from others.
Install Date	Date the customer installed the asset.
Owner	Individual user to which the asset is assigned. By default, the asset owner is the user who created the asset record.
Parent Asset	The asset's parent asset.
	 Tip: View, create, and delete an asset's child assets in the Child Assets related list.
Price	Amount the customer paid for the asset.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Product	The product on which the asset is based.
Purchase Date	Date the customer bought the asset.
Quantity	The number of assets purchased.
Root Asset	Read Only. The top-level asset in an asset hierarchy. Depending on where an asset lies in the hierarchy, its root might be the same as its parent.
Serial Number	The model number on the asset.
Status	State of the asset.
Usage End Date	The date the asset expires or the last date it is under warranty. Use this field to store whatever date is appropriate for your business.

Set Field History Tracking on Assets

Track changes to asset records by enabling field history tracking.

Use field history tracking to see information about:

- The date and time when the field was changed
- What changed
- Who made the change

To enable tracking on asset fields, from the object management settings for assets, go to the fields section and click **Set History Tracking**. See also [Tracking Field History](#) on page 1023.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer** Editions

Specify the Asset Owner for Assets

Asset records have an `Asset Owner` field, which is used to set hierarchy and sharing-based access controls. By default, the asset owner is the user who creates the asset record.

Beginning Spring '15, the `Asset Owner` field is used for access control when the Assets object's sharing setting is *Private*, *Public Read-Only*, or *Public Read/Write*. If the Asset object's sharing setting is *Controlled by Parent*, the asset owner field has no effect on access control. That's because the parent account's settings control access to the asset.

If you activated Salesforce before Spring '15, you can automatically update the asset owner field on asset records when you enable the Asset object sharing preference. The sharing preference sets the value of the asset owner field to equal either:

- The user who created the asset
- The user who is the owner of the parent account

By default, the `Asset Owner` field doesn't appear on the page layout. To add the `Asset Owner` field to the page layout, from the object management settings for assets, go to Page Layouts.

1. From Setup, enter *Asset Settings* in the `Quick Find` box, then select **Asset Settings**.
2. Select the option `Enable Asset Sharing`.
The options for setting the default `Asset Owner` field appear for newly created asset records.
3. Set the `Asset Owner` to be either:
 - Creator of the asset
 - Owner of the parent account
4. Save your changes.

To change the asset owner of an asset record, click the Assets tab and select an asset record. Or, open the asset record from the Assets Related List on the Accounts, Contacts, or Products tabs. In the Asset Detail section, click **Change** next to the `Asset Owner` field and select a different user.

- "Customize Application"

Searching for Assets

1. Enter your search terms in the sidebar or header search box.
2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

You can also create an asset list view from the Products tab to find assets that match specific criteria.

Enabling Sharing Rules for Assets

Sharing rules allow you to make automatic exceptions to your organization-wide sharing settings for defined sets of users. If your organization was created before Spring '15, you must enable the sharing preference so you can create and apply sharing rules on assets in your organization.

Previously, the asset object was a child object of the Accounts object, so the asset object's visibility was based on the parent object's settings. In Spring '15, the asset object was redesigned to be an individual standard object, not a child object. As a result, you can create sharing rules and apply them to asset records.

 **Note:** Sharing is enabled by default in organizations created after Spring '15, so you can skip these steps. For organizations created before Spring '15, sharing is disabled by default. If you want to use sharing rules, then you must enable the sharing preference.

1. From Setup, enter *Asset Settings* in the Quick Find box, then select **Asset Settings**.
2. Select the checkbox next to **Enable Asset Sharing**.
3. Click **Save**.

Now you can create and apply sharing rules on assets.

After you've enabled asset sharing, specify how the system should populate the `Owner` field.

- "Manage Sharing"

Sharing Assets

To view and manage sharing details for assets, click **Sharing** on the asset detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the asset.

Your administrator defines the default sharing model for your entire organization. You can change this model to extend sharing to more users than the default set by your administrator. However, you cannot change the sharing model to make it more restrictive than the default.

On the Sharing Detail page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- To grant access to the record for other users, groups, roles, or territories, click **Add**.
 -  **Note:** To share an asset with another user, that user must have access to the account associated with the asset and the "Read" permission on assets.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Creating Asset Sharing Rules

Asset sharing rules can be based on the record owner or on other criteria, including record type and certain field values.

You can define up to 300 asset sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
 2. From Setup, enter *Sharing Settings* in the `Quick Find` box, then select **Sharing Settings**.
 3. In the Asset Sharing Rules related list, click **New**.
 4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
 5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
 6. Select a rule type.
 7. Depending on the rule type you selected, do the following:
 - **Based on record owner**—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
 - **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.
-  **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.

USER PERMISSIONS

To create sharing rules:

- "Manage Sharing"

8. In the `Share with` line, specify the users who should have access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
9. Select a setting for `Asset Access`.
10. In the remaining fields, select the access settings for the records associated with the shared assets.

Access Setting	Description
Controlled by Parent	Users can view, edit, or delete an asset based on whether he or she can perform that same action on the parent object associated with the Asset object. Controlled by Parent is the default access setting.
Private (available for associated contacts, opportunities, and cases only)	Users can't view or update records, unless access is granted outside of this sharing rule.
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

 **Note:** Asset Access is not available when the organization-wide default for assets is set to Controlled by Parent.

11. Click **Save**.

Tracking the People You Work With

Contacts

A contact is someone who's associated with one of your accounts or other records such as opportunities. Contacts are typically employees of the businesses that you sell to. Contact details provide the information that you need to work your deals effectively, such as name, mobile phone number, and job title.

[Considerations for Creating Contacts](#)

Before you create contacts, consider a few key points.

[Guidelines for Viewing and Managing Contacts](#)

Use the Contacts home page to view and manage your contacts.

[Considerations for Using Contact Roles](#)

Contact roles let you specify the part that a person plays in an account, case, contract, or opportunity. When you use contact roles, you have more information about who to contact and when. There are some things to be aware of when using contact roles.

[Update Contacts Via Stay-in-Touch Requests](#)

To quickly and easily request updated contact information from a contact or person account, send a Stay-in-Touch request.

[Considerations for Changing the Account for Contacts](#)

Consider key points before changing the account that's associated with a contact.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

[Merge Duplicate Contacts](#)

If duplicate contacts are associated with the same account, you can merge them. That way, your data is streamlined and up-to-date.

[Display and View a Contact's Org Chart](#)

Find out who's who at your contacts' companies. Salesforce can display an org chart with contact hierarchy for each of your contacts. That way, you have even more information for planning your sales strategy.

[Considerations for Deleting Contacts](#)

Most contacts can be deleted with one click. However, before you delete a contact, be aware of who can delete contacts and what happens to records that are associated with deleted contacts.

Considerations for Creating Contacts

Before you create contacts, consider a few key points.

- You can create a contact from several places in Salesforce.
 - Create a contact on an account's detail page.
 - [Import a contact](#) from a mobile device using the Salesforce1 app.
 - Create a contact from the Contacts area. You should always associate an account to the new contact. If you don't, the contact is private. Private contacts are accessible only to their owner and system administrators, which makes them hard to find and easy to forget.
- To create a contact that's automatically associated with an account, create the contact from the account's detail page.
- To track a contact's relationship with more than one account, use the Related Accounts related list to add additional account-contact relationships. By tracking all related accounts on a single contact record, you avoid creating duplicate contacts. Just make sure your admin has set up Contacts to Multiple Accounts.
- If your Salesforce org uses record types, you're sometimes prompted to choose a `Record Type` when creating a contact. Different record types can have different fields and picklist values.
- If your Salesforce org uses divisions, the division of a new contact is automatically set to the division of the related account.

Guidelines for Viewing and Managing Contacts

Use the Contacts home page to view and manage your contacts.

- Person accounts don't appear in the Recently Viewed list on the Contacts home page.
- If you're using Salesforce Classic, a printable view of the contacts list is available. You can save the printable view as a PDF.
- When you select a person account from a contact list view, the corresponding person account appears on the Accounts page.
- To view a filtered list of contacts, select a predefined view from the drop-down list. Admins of Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs can grant access to contacts beyond what the sharing model allows. See [Share Contacts](#).
If you're using Salesforce Classic:
 - To define your own custom view, click **Create New View**.
 - To edit or delete a view that you created, select it from the **View** drop-down list, and then click **Edit**.
- To make person accounts easy to find, create a custom list view, adding the **Is Person Account** icon as a column.
- If you're using Salesforce Classic, to [add contacts to a campaign](#), select the checkbox next to one or more contacts, and then click **Add to Campaign**. To select all displayed records, select the checkbox in the column header.

Considerations for Using Contact Roles

Contact roles let you specify the part that a person plays in an account, case, contract, or opportunity. When you use contact roles, you have more information about who to contact and when. There are some things to be aware of when using contact roles.

- **Important:** In Salesforce Classic, contact roles are available for accounts, opportunities, cases, and contracts. In Lightning Experience, contact roles are available for opportunities and contracts. Although contact roles work more or less the same for each available object, they work independently. Therefore, you need to set them up and use them separately for each object.
- To view the contact records that are listed in the Contact Roles related lists, you must have the proper user permissions and sharing access to those records.
- When you add contact roles for opportunities, you can select from up to 50 contacts that are associated with the record's account.
- A single contact or person account can have a different contact role on different records.

[Add and Manage Contact Roles](#)

Update Contacts Via Stay-in-Touch Requests

To quickly and easily request updated contact information from a contact or person account, send a Stay-in-Touch request.

 **Note:** Stay-in-Touch Requests is scheduled for retirement in all Salesforce orgs as of Summer '17. For more information, see, [Stay-in-Touch Request Retirement](#).

If the contact or person account has a valid email address, you can request updates from:

- Contacts that you own
 - Contacts that are associated with accounts that you own
 - Contacts that you can edit because of a sharing rule or manual record sharing
 - Person accounts that you own
1. On the detail page of a contact or person account, click **Request Update**.
An outgoing email is created according to your personal Stay-in-Touch settings.
 2. Edit the details of the email.
 3. Click **Send**. You can send individual Stay-in-Touch requests regardless of the recipient's `Email Opt Out` setting.
The recipient receives the email and clicks a link to provide updates or to confirm that no changes are necessary. You receive an email notification.
 4. To update, review, and accept or reject the new information, click the link in the email.

Considerations for Changing the Account for Contacts

Consider key points before changing the account that's associated with a contact.

-  **Note:** If the contact has a parent account, and the organization-wide default is Controlled by Parent, "Edit" access on the account is required to edit the contact.
- If any of the following are true, you can change the account that's associated with a contact.
 - You have access to the contact, and you're the owner of the target account or the manager of the owner in the role hierarchy.
 - You're the owner of the contact, or you have access to the contact, and you have access to the target account.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To request updates:

- "Send Stay-in-Touch Requests"
- AND
- "Send Email"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

- You're an admin.

If you don't meet any of these conditions, contact your admin to change the associated account.

- If you change the `Account Name` field:
 - Cases and opportunities that are associated with the contact remain associated with the previous account and don't roll up to the new account.
 - New cases and opportunities that are created for the contact are associated with the new account.

For contacts that are enabled for portals, [review these considerations](#).

[Enable the Customer Portal for Contacts and Person Accounts](#)

Considerations for Merging Duplicate Contacts

Keep these considerations in mind when you merge duplicate contact records.

Primary Account

In Lightning Experience, you can merge contacts that have different primary accounts unless the contact is associated with a portal user. In Salesforce Classic, you can merge only contacts that have the same primary account. The primary account is the account listed in the `Account Name` field on the contact record.

Redundant Relationships

If you try to merge contacts that are indirectly related to the same account, Salesforce displays a message suggesting that you remove the redundant relationship. On contact records, indirect relationships are managed from the Related Accounts related list.

Portal Users

When you use Lightning Experience to merge contacts associated with portal users, the portal user status isn't shown during merging. The merged record retains the portal user status of the master record. When you use Salesforce Classic to merge contacts associated with portal users, the portal user status is shown during merging. You choose the portal status you want to retain in the merged

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

record. In both Lightning Experience and Salesforce Classic, the master contact must be associated with a portal user. The merged contact retains the portal user status of the master contact. If a non-master contact is associated with a portal user, that user is deactivated.

Related Items, Chatter Feeds, and Attachments

When duplicate records are related to items such as campaigns or activities, Salesforce relates the items to the merged record, with some exceptions. Chatter feeds are retained from the master record only. Attachments in Chatter feeds are retained in Salesforce but aren't associated with the merged record. To associate the dropped files with the merged record, find them in Files home (in Lightning Experience) or the Files tab (in Salesforce Classic). Then add them to the Files related list on the merged record.

Campaigns

If the duplicate contacts are members of different campaigns, the date in the `Member Status Updated` field is retained for each contact and associated with the merged contact.

Hidden and Read-Only Fields

Salesforce retains any data in hidden or read-only fields, such as sharing settings, from the master record. Hidden fields aren't shown while you merge. A merged record retains the `Created By` user and `Created Date` from the oldest record merged, regardless of which record is the master. The record shows the merge date as the `Last Modified By` date.

Non-Master Contacts

The non-master contacts are moved to the Recycle Bin.

SEE ALSO:

[Merge Duplicate Contacts](#)

[Contact Fields](#)

[Considerations for Merging Contacts That Are Associated with Portal Users](#)

Considerations for Merging Contacts That Are Associated with Portal Users

Consider key points before you merge contacts that are associated with portal users.

- You can merge a portal contact with another portal contact. For example, you can merge contacts that are enabled to use the following.
 - A partner portal *with* contacts that are enabled to use a customer portal or the reverse
 - A partner portal or customer portal with contacts that are *not* enabled to use a portal
- Before you merge contacts that include partner users *and* customer users, decide which type of portal user to retain. The user that you don't retain is [disabled](#). However, after the contacts are merged, you can enable the contact for access to the portal from which it was removed during the merge process.
- Portal users who are disabled during the merge process retain ownership of any records that they own. For example, if a portal user owns a case, and the portal user is disabled, he or she remains the owner of the case until the case is updated with a new owner.
- You can merge contacts that are associated with various accounts by [transferring the contacts that you want to merge into one account](#) and then [merging the contacts that are associated with the common account](#).

EDITIONS

Available in: Salesforce Classic

The customer portal is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

To change org chart:

- "Edit" on contacts

-  **Note:** To maintain a complete org chart, make sure that every contact in an account contains another contact in the `Reports To` field. (The contact at the top of the org chart is an exception.) If your contact doesn't report to anyone, the org chart shows only a single person, regardless of how many other contacts are assigned to the same account.

SEE ALSO:

[Contacts](#)

[Update Contacts Via Stay-in-Touch Requests](#)

Considerations for Deleting Contacts

Most contacts can be deleted with one click. However, before you delete a contact, be aware of who can delete contacts and what happens to records that are associated with deleted contacts.

- You can delete a contact if you're an administrator, the contact owner, or a user above the contact owner in the organization role hierarchy, *and* if you have the "Delete" permission on the Contact object. If you meet these requirements, you'll see **Delete** as an option on the contact's detail page and on its row on the contact list page in.
- If you delete a contact, these associated records are also deleted. You don't need the "Delete" permission on the associated records.
 - Assets (without cases)
 - Attachments
 - Campaign history
 - Events
 - Notes
 - Tasks

Accounts, entitlements, and opportunities that are associated with the contact aren't deleted.

- The deleted contact is moved to the Recycle Bin. If you undelete the contact, any associated records are restored, including any inactive Self-Service usernames.
- If you delete or remove an activity's primary contact, another contact becomes the primary contact in its place. You can edit the activity to manually select another primary contact.
- You can't delete contacts that have these records associated with them.
 - Assets (with cases)
 - Cases
 - Contracts
 - Partner user
 - Service contracts
 - Active Self-Service users
 - Active Customer Portal users

Share Contacts

Share contacts with other users to make it easier to collaborate within your sales team.

To share contact records with other users, those users must have Read permission for Contacts. When you share a contact record that has an associated account, the account is also shared only if you have permission to share account records.

1. On a contact's detail page, click **Sharing**.

The sharing detail page lists the users, groups, roles, and territories that have sharing access to the contact.

2. On the sharing detail page, do any of the following.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views.
- To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Expand List** to view all users that have access to the record.
- To grant access to the record for other users, groups, roles, or territories, click **Add**.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

3. Save your changes.

SEE ALSO:

[Contacts](#)

[Guidelines for Viewing and Managing Contacts](#)

[Considerations for Changing the Account for Contacts](#)

[Considerations for Sharing and Accessing Contacts](#)

Considerations for Sharing and Accessing Contacts

Here's some things to know about sharing and accessing contact records.

- Contact sharing isn't available for organizations that have territory management or person accounts.
- You can't restrict access to contacts beyond your organization's default access levels.
- You need at least read access to the contacts and leads that you invite to an event. You need at least "Add Events" on a resource to invite it to an event.
- A contact that isn't linked to an account is always private, regardless of your organization's sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules don't apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.
- If a recipient doesn't have access to the account, you can't share the contact unless you also have permission to share the account.
- If your organization-wide default for contacts is set to Controlled by Parent, the `Contact Access` options aren't available when you share related records such as accounts. Instead, all access to contacts is determined by the user's access to the contact's account.
- If your organization-wide default for contacts is Controlled by Parent and your organization-wide default for accounts is Private, you can't view contacts for accounts that you don't own, even if you have the View All permission on the account object. However, if you own a contact on an account, you can view other contacts on the same account. (Access to a parent account gives you access to the associated child records.)

Contact Fields

Contacts have the following fields, listed in alphabetical order. Availability of fields depends on how your admin set up Salesforce.

Field	Description
Account Name	The account that the contact is linked to. Enter the account name, select the account from a list, or create an account. Private contacts don't have an account.
Allow Customer Portal Self-Registration	If you allow access to a customer portal, when selected, allows contacts to self-register for it.
Assistant	The contact's assistant. Maximum 40 characters.
Asst. Phone	The assistant's phone number. Maximum 40 characters.
Birthdate	The contact's birthday. Click the field, and then choose a date from the calendar.
Contact Currency	The default currency for all currency amount fields in the contact. Amounts are displayed in the contact currency and converted to the user's personal currency. Available when multiple currencies are used.
Contact Division	The division that the contact belongs to. This value is inherited from the related account. Available when divisions are used to segment data.
Contact Owner	The contact's assigned owner. Not available in Personal Edition.
Contact Record Type	The name of the field that determines what picklist values are available for the record. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.
Created By	The user who created the contact. Includes creation date and time. Read only.
Custom Links	A list of custom links for contacts, as set up by your administrator.
Department	The associated business or organizational unit. Maximum 80 characters.
Description	The contact's description. Maximum 32 KB of data. The first 255 characters appear in reports.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Field	Description
Email	<p>The contact's email address. A valid email address is required. Maximum 80 characters.</p> <p>Click the email address in this field to send an email using your personal email application. This action isn't logged as an activity on the contact record.</p> <p>If the Gmail Buttons and Links feature is enabled, click the Gmail link next to the field to send an email from your Gmail account.</p>
Fax	The contact's fax number. Maximum 40 characters.
First Name	The contact's first name, as displayed on the contact edit page. Maximum 40 characters.
First Name (Local)	The contact's first name, translated into the local language.
Home Phone	The contact's home phone number. Maximum 40 characters.
Last Modified By	The user who last changed the contact fields, including modification date and time. This field doesn't track changes that were made to any of the related list items on the contact. Read only.
Last Name	The contact's last name as displayed on the contact edit page. Maximum 80 characters.
Last Name (Local)	The contact's last name, translated into the local language.
Last Stay-in-Touch Request Date	The date when the most recent Stay-in-Touch request was sent.
Last Stay-in-Touch Save Date	The date when the most recent Stay-in-Touch request was returned and merged.
Lead Source	The record source: for example, Advertisement, Partner, or Web. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters for each picklist value.
Mailing City	The city in the mailing address. Maximum 40 characters.
Mailing Country	The country in the mailing address. Maximum 80 characters.
Mailing State/Province	The state or province in the mailing address. Maximum 80 characters.
Mailing Street	The street in the mailing address. Maximum 255 characters.
Mailing Zip/Postal Code	The zip or postal code in the mailing address. Maximum 20 characters.
Middle Name	<p>The contact's middle name, as displayed on the contact edit page. Maximum 40 characters.</p> <p>To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find</p>

Field	Description
	box, then select User Interface . Then select <code>Enable Middle Names for Person Names</code> .
Middle Name (Local)	The contact's middle name, translated into the local language. To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select <code>Enable Middle Names for Person Names</code> .
Mobile	The contact's mobile phone number. Maximum 40 characters.
Name	The contact's combined first name, middle name, last name, and suffix, as displayed on the contact detail page.
Other City	The city in another address for the contact. Maximum 40 characters.
Other Country	The country in another address for the contact. The entry is selected from a picklist of standard values or entered as text. If the field is a text field, maximum 80 characters.
Other State/Province	The state or province in another address for the contact. The entry is selected from a picklist of standard values or entered as text. If the field is a text field, maximum 80 characters.
Other Street	The street address in another address for the contact. Maximum 255 characters.
Other Zip/Postal Code	The zip or postal code in another address for the contact. Maximum 20 characters.
Other Phone	Another phone number for the contact. Maximum 40 characters.
Phone	The contact's primary phone number. Maximum 40 characters.
Reports To	The name of the contact's manager. Enter a contact name, or select a contact from the list.
Salutation	The title for addressing the contact, for example, Mr., Ms., or Dr. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters.
Suffix	The suffix in the contact's name, as displayed on the contact edit page. Maximum 40 characters. To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select <code>Enable Middle Names for Person Names</code> .
Title	The contact's position within the organization. Maximum 80 characters.

Field	Description
Username	<p>For Self-Service contacts only. The <code>Username</code> defaults to the <code>Email</code>. Contacts enter their usernames when logging in to the Self-Service portal.</p> <p> Note: Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.</p>

Contact Role Fields

Contact Roles define the role that a contact or person account plays in an account, case, contract, or opportunity. A contact role has the following fields. Lightning Experience also includes an Opportunities field.

Field	Description
Contact	The name of the contact or person account. Select an existing contact or create a new one.
Primary	<p>When selected, identifies the person as the primary contact for the record.</p> <p>The <code>Primary</code> option isn't available for cases. Instead, the contact listed in the <code>Contact Name</code> field on the case record is automatically the primary contact.</p>
Role	The role of the contact for the record. Your administrator can customize the selections for this picklist.

Add and Manage Contact Roles in Lightning Experience

To specify the part that each contact plays in your business process, add contact roles to opportunities or contracts.

 **Important:** In Lightning Experience, contact roles are available for opportunities and contracts. Although they work more or less the same for each available object, they work independently. Therefore, you need to set them up and use them separately for each object.

1. Click **Add Contact Role** in the Contact Roles related list of a opportunity or contract.
2. Click the contact field to select a contact or person account. Optionally, click **New Contact** to create a contact.
3. Select a role for the contact. If you don't select a role, the contact is still added to the Contact Role related list and can be edited later.
4. Optionally, designate a primary contact for the record.
5. Save your changes.
6. Keep the record's contact roles up to date by editing and deleting them as needed.

 **Example:** At AW Computing, Mary Smith evaluates all proposals and then forwards them to Tom Jones for a final decision. In the opportunity record for AW Computing, you designate Mary Smith as the Evaluator and Tom Jones as the Decision Maker. Now you know who to contact first!

Add and Manage Contact Roles in Salesforce Classic

To specify the part that each contact plays in your business process, add contact roles to accounts, cases, contracts, and opportunities.

 **Important:** In Salesforce Classic, contact roles are available for accounts, opportunities, cases, and contracts. In Lightning Experience, contact roles are available for opportunities and contracts. Although contact roles work more or less the same for each available object, they work independently. Therefore, you need to set them up and use them separately for each object.

1. Click **New** in the Contact Roles related list of an account, case, contract, or opportunity.
2. Use the lookup icon to select a contact or person account. Optionally, click **New** to create a contact.
3. Select a role for the contact.
4. Optionally, designate a primary contact for the record. Cases don't have this option.
5. Save your changes.
6. Keep the record's contact roles up to date by editing and deleting them as needed.

 **Example:** At AW Computing, Mary Smith evaluates all proposals and then forwards them to Tom Jones for a final decision. In the opportunity record for AW Computing, you designate Mary Smith as the Evaluator and Tom Jones as the Decision Maker. Now you know who to contact first!

Contacts to Multiple Accounts

People often work with more than one company. A business owner might own more than one company or a consultant might work on behalf of multiple organizations. Relate a single contact to multiple accounts so you can easily track the relationships between people and businesses without creating duplicate records.

When you use Contacts to Multiple Accounts, each contact still requires a primary account (the account in the `ACCOUNT_NAME` field). The contact and its primary account have a *direct* relationship. But you can add other accounts to the contact. These secondary account-contact relationships are *indirect*.

Contacts to Multiple Accounts works with person accounts. That means a person account can be either a related contact on a business account or a related account on a contact. A person account can also be related to another person account as either a related contact or related account. When you relate a person account to an account or contact, the relationship is always indirect. That's because person accounts don't have primary accounts, so person accounts can't be directly related to business accounts. And person accounts can't be primary accounts for contacts, so person accounts can't be directly related to contacts.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To add or edit contact roles:

- "Edit" on the object the contact roles are on, such as accounts, cases, contracts, or opportunities

AND

"Read" on contacts

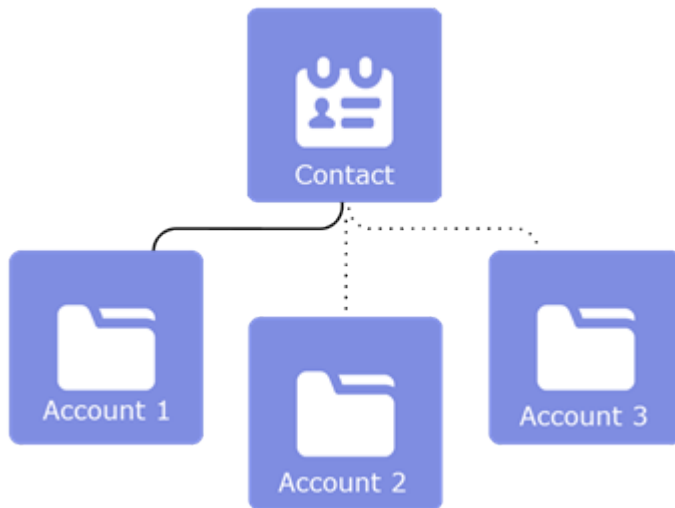

To view contact roles:

- "Read" on the object the contact roles are on, such as accounts, cases, contracts, or opportunities

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Example: John Smith is president of Acme Corporations, and Acme is the account on his contact record. But John is also involved with the nonprofit media organization Greendot Media. By adding Greendot Media as a related account on John's contact record, you can track this other relationship. John is considered a *direct* contact to Acme because Acme is the account on his contact record. And he's considered an *indirect* contact to Greendot Media and any other accounts that he becomes related to. John also appears on the Related Contacts related list for Greendot Media and any other accounts that he's indirectly related to.

[Considerations for Relating a Contact to Multiple Accounts](#)
[Set Up Contacts to Multiple Accounts](#)

Create and Edit Relationships Between Contacts and Accounts

To easily track the relationships between people and the businesses they work with, relate a single contact record to multiple account records.

▶ [Watch a Demo](#) (2:12 minutes)

1. From an account record, use the Related Contacts related list to create or edit relationships between accounts and contacts or person accounts.
 - a. Create a relationship by clicking **Add Relationship**.
 - b. Edit an existing relationship by clicking **View Rel** (in Salesforce Classic) or **View Relationship** (in Lightning Experience). Then click **Edit Relationship**.

2. Fill in the account-contact relationship information.

 **Note:** The `Direct` field indicates whether the account associated with the contact is the contact's primary account. The field is read only because it's a system-generated field based on the `Account Name` field on the contact. To remove a direct relationship between a contact and an account, change the contact's primary account or delete the contact. Person accounts always have indirect relationships to business accounts.

3. Save your changes.

To create and edit account and contact relationships from a contact or person account record, use the Related Accounts related list.

SEE ALSO:

[Contacts to Multiple Accounts](#)

[Considerations for Relating a Contact to Multiple Accounts](#)

[Account Contact Relationship Fields](#)

Considerations for Relating a Contact to Multiple Accounts

Get familiar with potential gotchas before you relate a single contact to multiple accounts.

General

- The account that's in the `Account Name` field on a contact record is the contact's *primary* account. The relationship between the contact and its primary account is a *direct* relationship. All other accounts that are related to the contact are *indirect* relationships.
- To remove a direct relationship between a contact and an account, change the contact's primary account or delete the contact.
- You can import account-contact relationships with the Data Loader, but not the Data Import Wizard.
- Community users with the Customer Community user license can't see indirect account-contact relationships.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, or delete relationships between account and contacts

- "Read" on accounts and "Edit" on contacts

To view relationships between account and contacts

- "Read" on accounts and contacts

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Account Contact Relationships

- All direct contacts are automatically included in the account record's Related Contacts related list, so your admin may have removed the Contacts related list from your page layouts.
- When you have access to a particular account, the related contacts that you have Read access to appear in the Related Contacts related lists. When you have access to a particular contact, all related accounts appear in the Related Accounts related list, but you can open only the accounts you have Read access to.
- When creating indirect relationships between accounts and contacts, the contact must have a primary account—it can't be a private contact.
- You can't create a new contact from the Account Contact Relationship detail page.
- If changing a contact's primary account triggers a workflow rule that changes the primary account to something else, the relationship between the contact and the account you had selected is saved as an indirect relationship. This is true *only* if your admin has configured the settings to save previous relationships.
- Some lists of most recently used items (such as a contact lookup field) only show direct relationships.

Merging

- If you try to merge contacts that are indirectly related to the same account, you'll get an error message telling you to remove the duplicate relationship. The same is true when merging accounts that are indirectly related to the same contact. The error message tells you which account–contact relationships are preventing the merge, regardless of whether you have access to the records. If you don't have access to a record, you can't navigate to it.
- When merging person accounts, indirect relationships with accounts and indirect relationships with contacts are evaluated separately. If you have conflicts with both, you'll get two errors and need to resolve them separately.

Microsoft Integration

- When syncing contacts between Salesforce and Microsoft Outlook, only the primary account relationship is synced.
- If you remove the account name from a contact in Outlook, the contact will not sync to Salesforce successfully if the contact has relationships to other accounts in Salesforce.

Admin Settings

- When you try to delete an account that has direct contacts that are related to other accounts, what happens depends on what your admin specified in the account settings. You're either blocked from deleting the account or allowed to delete the account. If you're allowed to delete the account, all direct contacts will be automatically deleted, regardless of whether they have relationships to other accounts.
- When you change a contact's primary account, what happens to the previous account relationship depends on what your admin specified in the account settings. The relationship between the contact and previous primary account will be deleted or saved as an indirect relationship.
- Whether activities roll up to a contact's parent account depends on what your admin specified in the activity settings.

Account Contact Relationship Fields

Contacts to Multiple Accounts lets you associate a single contact to multiple accounts through the Account Contact Relationship object. Your page layout and field-level security settings determine which fields are visible and editable.

Field	Description
Account	The name of the company the contact is related to.
Active	Indicates whether the contact is actively involved with the company.
Contact	The name of the person that's related to the account.
Direct	Indicates whether the account associated with the contact is the contact's primary account. This read-only field is based on the <code>Account Name</code> field on the contact record. For example, on the Acme account record, the Related Contacts related list automatically includes all contacts that have Acme in the <code>Account Name</code> field and marks them as direct contacts.
End Date	The date a relationship between a contact and account ended. Use with the <code>Start Date</code> field to keep a history of the relationship.
Roles	The contact's participating role in the account; for example, Buyer, Decision Maker, or Evaluator. You can select multiple roles for a contact.
Start Date	The date a relationship between a contact and account began. Use with the <code>End Date</code> field to keep a history of the relationship.

Considerations for Changing Accounts on Contacts That Are Enabled for Portals

Consider key points before you change the account on contacts that are enabled for portals.

- External users can access their own cases and opportunities from their previous accounts.
- You can transfer contacts that are enabled for a only to accounts that are enabled for a partner portal.
- Contacts' portal roles are automatically updated to match the name of the account that they're transferred to (unless they're high-volume customer users, which don't have roles). For example, the portal role "Account A Customer User" becomes "Account B Customer User" (because a

Import Contacts from Mobile Device Contact Lists into Salesforce

Sales reps can save time and eliminate typos by using the Salesforce1 app to import contacts from mobile device contact lists into Salesforce. This feature is available only in the Salesforce1 downloadable apps.

1. In Salesforce1, navigate to where you create contacts.
2. Tap **Import from Device** to open the device's contact list.
3. Select a contact.
4. To associate the contact with an account in Salesforce, go to the contact record in Salesforce and add an account.

When importing contacts from a mobile device, these fields are mapped from your device's contact to the Salesforce contact.

- Email
- Home Phone
- Mailing City
- Mailing Country
- Mailing Postal Code
- Mailing State
- Mailing Street
- Mobile
- Other Phone
- Phone

 **Note:** In some situations, mappings from the local device don't map as expected to the Salesforce1 contact record.

SEE ALSO:

[Considerations for Importing Contacts from a Mobile Device](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Considerations for Importing Contacts from a Mobile Device

When importing contacts into Salesforce from a mobile device's contact lists, there are a few things to be aware of.

- To use the Import from Device button, you need the Allow Salesforce1 to import Contacts from mobile device Contact lists permission.
- When importing contacts from an Android or iOS device using Salesforce1 into a Salesforce org that has State and Country picklist fields enabled, the `state` field isn't populated.
- If you have multiple mobile phone fields in your mobile device's contact, and the `Phone` field in Salesforce is empty:
 - The first mobile phone field maps to the `Phone` field in Salesforce.
 - The second mobile phone field maps to the `Mobile` field in Salesforce.
- When you select emails from the mobile device, Salesforce1 typically pulls the second email address location. If labels are created on the device, the integration tries to map from the local work email address to the standard contact email address in Salesforce.

Get High-Quality Data When You Need It Right in Salesforce

High-quality data is key to business success. When data quality is high, it means your records are complete and up to date. It means you have the right connections at the companies that interest you. And it means that you have the information you need to close deals and expand your business. In short, high-quality data lets you understand, adapt, focus, and execute with surgical precision. Data.com offers a suite of products to give your business the high-quality data it needs when it needs it. That way, you spend less time entering and updating data and more time growing your business.

The free version of Data.com is available to all Salesforce organizations and includes the following functionality.

- For organizations with Professional Edition and above, administrators can use Duplicate Management tools to control whether and when users can create duplicate records inside Salesforce. Administrators can customize the logic that's used to identify duplicates and can create reports on the duplicates that they allow users to save.
- All users can search across the complete Data.com database of accounts and contacts. However, free version users can't see phone and email information for contacts, see account cards or D&B data on account records, add records to Salesforce, or clean records. To take full advantage of Data.com's data, purchase Data.com licenses and set up the feature.

The Data.com product suite includes Data.com Prospector, Data.com Clean, and Data Integration.

- ✔ **Note:** For orgs with Performance Edition, users automatically get Data.com Prospector and Data.com Clean.

Data.com Prospector

Use Data.com Prospector to search valuable company information from Dun & Bradstreet and millions of crowd-sourced contacts to find the records your business needs. Add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. It's a great way to get the data you need to plan your sales territories, segment campaigns, find new accounts to engage, and expand your sales network.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Data.com Clean license available in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Data.com Social Key available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

[Data.com Clean](#)

Data.com Clean keeps your org up to date using data from Dun & Bradstreet and Data.com. Using Clean jobs, you can clean your records on a regular basis. You can also clean a single record or a list of records.

[Data Integration](#)

Data Integration keeps your org up-to-date, using data from Dun and Bradstreet, Data.com, or third-party data packages. When you activate a data integration rule, Data Integration does a bulk update of your records using data from the rule's data service. After the data integration rule is active, records are updated as needed after you add or modify them.

Data.com Prospector

Use Data.com Prospector to search valuable company information from Dun & Bradstreet and millions of crowd-sourced contacts to find the records your business needs. Add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. It's a great way to get the data you need to plan your sales territories, segment campaigns, find new accounts to engage, and expand your sales network.

All users can search Data.com for accounts and contacts. Users with a Data.com Prospector license can:

- Add accounts and contacts to their org, and add contacts as leads.
- Add contacts for an account directly from the account record.
- Export accounts and contacts from Data.com.
- Manually update account, contact, and lead records, regardless of whether they were added from Data.com.
- Get prospecting insights into accounts' business, financial, competitive, and industry details.
- Get company hierarchical views of parent-child relationships and account information, such as the annual revenue, ownership, and number of employees. (Available to Data.com Prospector users as a beta feature.)

There are two versions of Data.com Prospector: Corporate Prospector and Premium Prospector. Premium Prospector includes more Dun & Bradstreet fields for adding to or manually cleaning account, contact, or lead records. Premium Prospector users also have access to the Company Hierarchy page. The Salesforce Help refers to Data.com Premium Prospector unless otherwise noted. For more information on Premium Prospector, contact your Salesforce account manager.

Check out some guidelines to follow when prospecting for new companies and contacts with Data.com Prospector.

Considerations for Prospecting for Companies, Contacts, and Leads in Salesforce

There are several important limitations to note for users who are searching and adding records from Data.com.

- The subindustries under Government in the Data.com Industry Categories classification system are currently unavailable due to mapping limitations between the Data.com Industry Categories and the SIC system.
- By default, each user assigned a Data.com Prospector user license has a monthly record addition limit of 300. This number can be adjusted based on your agreement. Record additions expire at midnight on the last day of each month, as determined by your organization's default time zone.
- A single Data.com Prospector license is assigned every time you enable a user for Data.com Prospector.
- If your organization purchased only Data.com Prospector, only users with licenses can clean records.
- When adding records from Data.com, annual revenue is only available in US dollars. If `U.S. Dollar` is not an active currency for your organization, records added from Data.com do not include annual revenue information.

Prospect for Companies Fast Right In Salesforce

With a Data.com Prospector license, it's a cinch to find new companies in the industries and locations that you're most interested in. Add company information to Salesforce as new accounts in just a few steps.

Walk Through It: Prospect for Companies Fast Right in Salesforce

1. Click the Data.com tab.
2. Click **Find Accounts**.
3. Enter or select your search criteria. When you click the selection box in the `Industry` field, for example, you'll see the [Industry Selector](#), where you can use industry classifications to select from extensive lists of industries and subindustries to build an industry query as part of your search criteria. When you click the selection box in the `Location` field, you'll see the [Location Selector](#), where you can build a location query as part of your search criteria.
4. Click **Search**. Results are sorted by number of active contacts. To show records that have been flagged as inactive, under `Options`, select `Show Inactive Records`. Inactive records are marked with .
5. If the results list is long, you can:
 - Sort the results by any table heading. The `Updated` heading, for example, sorts results by when they were last updated.
 - Jump to a page by entering a number in the `Page` field.
 - Click the arrows to move from page to page.
6. If you don't see what you're looking for, use filters to narrow your results. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.
7. Add all accounts or a selection to Salesforce.
 - To add all accounts, click **Add to Salesforce** and select `All`.
 - To add selected accounts, select the ones you want, then click **Add to Salesforce** and choose `Selected`.
8. Click **Continue**.
If your selection includes duplicates, we'll add them if duplicate account records are allowed in your Salesforce organization. Adding more than 200 records can take a few minutes. If you add that many, we'll send you an email when the process is complete.
9. From the confirmation message, click **Go to Accounts** to view the list of new records on the Accounts home page.
If you use Data.com Prospector, when you add an account from Data.com, a corresponding D&B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the account record via its `D&B Company` field.

Prospect for Contacts Fast Right In Salesforce

Need contacts? With a Data.com Prospector license, you can find contacts in the companies, industries, and locations that you're most interested in. Then, add records to Salesforce as new leads.

1. Go to the Data.com tab.
2. Using the Find Contacts tab, enter or select your search criteria. When you click the selection box in the `Industry` field, for example, you'll see the [Industry Selector](#), where you can use industry classifications to select from extensive lists of industries and subindustries to build an industry query as part of your search criteria. When you click the selection box in the `Location` field, you'll see the Location Selector, where you can build a location query as part of your search criteria.
3. Click **Search**.
Results are sorted alphanumerically. To show records that have been flagged as inactive, under Options, select `Show Inactive Records`. Inactive records are marked with .
4. If the results list is long, you can:
 - Sort the results by any table heading. The `Updated` heading, for example, sorts results by when they were last updated.
 - Jump to a page by entering a number in the `Page` field.
 - Click the arrows to move from page to page.

Sorting and page navigation only work for lists of fewer than 100,000 records.

5. If you don't see what you're looking for, use filters to narrow your results. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.
The list updates automatically.
6. Add all contacts or a selection to Salesforce.
 - To add all contacts, click **Add to Salesforce** and select **All**.
 - To add selected contacts, first select the ones you want, then click **Add to Salesforce** and choose *Selected*.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:
Contact Manager (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To search Data.com for contacts:

- No permissions required

To add Data.com contacts:

- "Create" on contacts

To create an account when adding contacts:

- "Create" on accounts

You'll get a confirmation message showing the number of records you're adding.

7. Select **Contacts.**

Enter or select the account you want to associate the contacts with. You can associate only one account. If you need to create the account to associate, use the lookup.

8. Click **Continue.**

If your selection includes duplicates, we'll add them if duplicate contact records are allowed in your Salesforce organization. Adding more than 200 records can take a few minutes. If you add that many, we'll send you an email when the process is complete.

9. Click **Go to Account to return to the account record.**

Prospect for Key Contacts at Your Accounts

Need to find the right contact at one of your accounts? With a Data.com Prospector license, it's a cinch to search for contacts at your companies by title, location, and industry. Then, with a click, you can add those records to Salesforce.

Before you begin, make sure the **Get Contacts** button has been added to the Account page layout.

1. Go to the detail page of the account you want to add contacts for.

2. Click **Get Contacts.** From the drop-down, either:

- Select a filter to narrow your results by level or department, or
- Select **All...** to see all contacts for the account.

The Data.com tab opens and displays a list of contacts that match the account name and any filters you selected. For example, if you want to get manager contacts at Universal Telco, go to Universal Telco's account detail page. Click **Get Contacts** and under **By Level**, select the *Manager-Level* filter. The Data.com tab opens with a list of managers at Universal Telco.

3. Select more filters if you need a more targeted list. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.

4. Add all contacts or a selection to Salesforce.

- To add all contacts, click **Add to Salesforce**.
- To add selected contacts, first select the ones you want, then click **Add to Salesforce** and choose *Selected*.

5. Select **Contacts to add the records as contacts associated with the account you started from.** They'll be associated with the account you started from.

6. Click **Continue to add the records.**

If your selection includes duplicates, we'll add them if duplicate contact records are allowed in your Salesforce organization. Adding more than 200 records can take a few minutes. If you add that many, we'll send you an email when the process is complete.

Considerations for Prospecting for Data.com Contacts in Salesforce

Data.com Prospector customers can find the contacts they need from an **Account** page and add them to their organizations in just a few clicks.

Available with a Data.com Prospector license in: **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

The **Get More Contacts** button opens an interactive dialog for finding and adding Data.com contacts to your organization. This streamlined experience gets you the contacts you need when you need them, right from the Account page.

Here are a few things for you to know about `Get More Contacts`.

Limitation	Description
Maximum 200 contacts	You can add up to 200 contacts in a single request. When you select more than 200 contacts, you are asked to deselect some of the contacts.
Filters	<ul style="list-style-type: none"> Filters are connected by a logical AND operator. Add just one of each filter. Adding more than one of each filter can cause unpredictable results. <code>Department</code>—Select 1 or more departments from the scrollable list. <code>Level</code>—Select 1 or more levels from the scrollable list. <code>Title</code>—Enter a single title or a comma-separated list of titles.
Account must be clean	<code>Get More Contacts</code> works on clean accounts only. Clean accounts have been imported from Data.com, or your organization has cleaned the account after the record was added to your organization. If the selected account is not clean, talk with your administrator about how to clean the account.

[Filter Contacts from Get More Contacts List View](#)

Filter available Data.com results for the selected account, and then add the contacts you need.

Filter Contacts from Get More Contacts List View

Filter available Data.com results for the selected account, and then add the contacts you need.

You need a Data.com Prospector license.

 [Watch a Demo](#) (1:19 minutes)

You have different options depending on the field you want to filter. You can filter by Title, Department, and Level.

- Filters are connected by a logical AND operator.
- Add just one of each filter. Adding more than one of each filter can cause unpredictable results.
- **Department**—Select 1 or more departments from the scrollable list.
- **Level**—Select 1 or more levels from the scrollable list.
- **Title**—Enter a single title or a comma-separated list of titles.

There are some new icons to identify contacts when you use filters to refine your search results.

Icon	Description
	The contact is already in CRM.
	Your organization owns the contact.

1. From the **Get More Contacts** dialog, click  .
2. Click **Add Filter**.
3. Under **New Filter**, select a filter to add.
4. Under Value, select or enter the values you want.
5. Click **Done**.
6. To set another filter, click **Add Filter**.
7. To remove a filter, click .
8. To apply and save filters, click **Save**.

Prospect for Companies in the Same Corporate Hierarchy

Data.com Company Hierarchy uses Dun & Bradstreet company data in Data.com to display a hierarchical view of companies. It shows parent–child relationships and account information, such as annual revenue, ownership, and number of employees.

Data.com Company Hierarchy uses Dun & Bradstreet data to display a view of an account’s hierarchical relationship with related companies. To add an account in your Salesforce org, click the **Add Account** button next to the account.

Company Hierarchy is available as part of Data.com Prospector. In addition to showing the relationships between corporate entities, the hierarchy shows the associated annual revenue and number of employees for entities within the hierarchy. For context, the hierarchy also includes information from your Salesforce org such as whether an entity exists as an account record, and the account owner. Using this information, sales reps can identify relevant prospective customers, and then easily add them as accounts directly from the hierarchy view.

The Data.com Company Hierarchy shows different company types and how they’re related.

Company Type	Description
Global Headquarters	The highest organizational entity in a corporate hierarchical structure that oversees domestic or international companies and subsidiaries.
Domestic Headquarters	The highest level member in a corporate hierarchy within a single country. A DHQ typically reports to a GHQ.

Company Type	Description
Headquarters	A company that owns branches, divisions, or subsidiaries and has financial responsibility for the companies that report to it.
Branch	A secondary location of a headquarters.
Single Location	A company with no branches or subsidiaries.
Unmarketable	This company is unmarketable, and record details are intentionally hidden. You can't add this record from the hierarchy, but you can view or add active linked accounts.

[View the Company Hierarchy for Accounts](#)

Data.com Company Hierarchy displays a hierarchical relationship of accounts, along with important account details. View parent–child relationships and account information, such as annual revenue, ownership, and number of employees.

[Find New Accounts Using the Global Ultimate D-U-N-S Number](#)

If you use Data.com Prospector, it's a cinch to find new companies to do business with that are in the company hierarchy of existing accounts. Just do a search by Global Ultimate D-U-N-S Number right from a D&B Company record. You'll be able to see other companies within the same corporate structure and add those companies to Salesforce as new accounts.

[Guidelines for Adding Accounts in the Same Company Hierarchy to Salesforce](#)

Data.com Company Hierarchy searches Data.com for Dun & Bradstreet company records and displays company linkages in a hierarchical view. From the Company Hierarchy, you can add account records to Salesforce. Here are some guidelines to follow when you add Data.com records to Salesforce from Company Hierarchy.

Find New Accounts Using the Global Ultimate D-U-N-S Number

If you use Data.com Prospector, it's a cinch to find new companies to do business with that are in the company hierarchy of existing accounts. Just do a search by Global Ultimate D-U-N-S Number right from a D&B Company record. You'll be able to see other companies within the same corporate structure and add those companies to Salesforce as new accounts.

The Global Ultimate is the highest entity within an organization and is identified by a nine-digit Global Ultimate D-U-N-S Number. All companies that are part of the same corporate structure as the Global Ultimate are identified by the same Global Ultimate D-U-N-S Number.

 **Note:** Before you can search by Global Ultimate D-U-N-S Number, the `Search Global Ultimate D-U-N-S` button must be [added to the D&B Company page layout](#).

1. Go to the detail page of the D&B Company record you want to find accounts with the same Global Ultimate D-U-N-S Number for.
2. Click **Search Global Ultimate D-U-N-S**.
The Data.com tab opens and displays a list of accounts that match the Global Ultimate D-U-N-S Number of the D&B Company record.
3. If the results list is long, you can sort the results by any table heading. The **Location Type** heading, for example, sorts results by headquarters, single location, and branch.
4. If you don't see what you're looking for, use filters to narrow your results.
5. For more information about a particular account, such as its account site, click the account name to see its account card.
6. Add all accounts or a selection to Salesforce.
7. From the confirmation message, click **Go to Accounts** to view the list of new records on the Accounts home page.

Here are some things to keep in mind when searching by Global Ultimate D-U-N-S Number.

- Global Ultimate D-U-N-S Number search results *only* include accounts that are in Data.com, so you may not get *complete* Global Ultimate D-U-N-S results if some members of the corporate structure are not in Data.com.
- You can use filters to narrow down your Global Ultimate D-U-N-S Number search results.
- You can export records from your Global Ultimate D-U-N-S Number search results.
- You can't save the search.

- You can add only one record at a time from Company Hierarchy.
- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. When a duplicate record is added, it isn't counted against your record addition balance.
- If you can't add a record to Salesforce because of errors, we'll notify you and provide the error details in a .csv file.

Guidelines for Prospecting for Companies, Contacts, and Leads in Salesforce

Check out some guidelines to follow when prospecting for new companies and contacts with Data.com Prospector.

- A green dot (●) appears in the search results next to Salesforce records that have a value in the `Data.com Key` field (records that were imported or cleaned by Data.com). These records can't be added again unless they have first been deleted from Salesforce, or your organization allows duplicates.
 -  **Tip:** If a record is already in Salesforce, hover over the green dot and click the link to go directly to the record.
- A blue checkmark (✓) appears in search results next to records you've already purchased (added or exported) from Data.com. When you add Data.com contacts or accounts, each one counts against your record addition balance. If you add records you've already exported from Data.com, the added records don't count against your record addition balance.
- Regardless of your record addition limit or your record addition balance, you can't manually select more than 1,000 records at a time.
- Regardless of your record addition limit or your record addition balance, you can't add more than 100,000 records at a time.
- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. This includes records that were added from Data.com as both contacts and leads. When a duplicate record is added, it will *not* be counted against your record addition balance.
- If you can't add one or more records to Salesforce because of errors, we'll notify you and provide the error details in a .csv file.
- If your search produces a large number of results, you won't see any data past page 10. If this happens, you can refine your search to get the results you want. See [How can I see complete, relevant information for Data.com search results?](#)
- If you export Data.com contacts or accounts *instead of* adding them to Salesforce, each exported record counts against your record addition balance. If you export records you've already added to Salesforce or re-export records you previously exported, the exported records don't count against your record addition balance.
- If you export a group of Data.com contacts, you can still add those contacts back into Salesforce as contacts or leads without affecting your record addition balance.
- Regardless of your addition limit or the number of records you have left to add, you can't export more than 100,000 records at a time. Records will be exported in batches of 50,000. If two batches are needed, the records will be sent in a .zip file.
- If numeric values, such as phone numbers, are cut off in the .csv file, change the format of the field's column in the .csv file to *General* or *Text*, or open the file in a text editor such as WordPad.
- You can import a list of exported records back into Salesforce using Data Loader. Unless your Data.com preferences are set to allow duplicate records, the import process checks for duplicates using the Data.com ID number from the `Data.com Key` field. These records won't be imported from Data Loader.
 - Any record that has the same Data.com ID (from the `Data.com Key` field) as another record within the .csv file.
 - Any record that has the same Data.com ID (from the `Data.com Key` field) as a record already in Salesforce.

Understand Data.com Searches

Learn how the Data.com search features work, what fields are searched, and how to refine your search results using filters and location criteria so you can easily find the records most valuable to your business.

Searching Data.com for CRM records is simple. Start your search by entering search criteria in the fields on the Data.com tab. You can also [use search modifiers to target and narrow your search results](#). Depending on your entries and selections, you may end up with a large list of accounts or contacts. To find out how many, check the results list's header or footer. Click the **Reset Search** link if you need to clear all your entries and selections. You'll see your search results until you start a new search or refresh your browser page.

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:

Contact Manager (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

example, if you want to find Sun Microsystems and you enter either *Sun Microsystems* or *sun.com* in the `Company or website` field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems.

Also, account searches are based on both the `Account Name` field and the `Tradestyle` field. So, for example, if you are looking for United Parcel Services, you can search on its tradestyle, *UPS*, and still see *United Parcel Services, Inc.* in your search results.

Once you have a set of records, you can narrow your list by using filters if you need to. Just look for the filter categories at the left of the page, and select the checkboxes for the filters you need. Some searches generate filter options that are specific to your results. For example, if you want leads in `Healthcare, Pharmaceuticals & Biotech` industry—specifically `Doctors & Health Care Practitioners`—the list of filters in the `Title` category might include `Doctor, Chiropractor, Dentist, and Office Manager`. For searches that generate a large list of results for `Title, Company Name, and Website Domain Type` filters, we show the 25 filters with the most search results. To see a shorter list of filters, narrow your initial search.

Some filter categories are expanded automatically when you run a search, but you can click the links at the top of the `Filters` panel to expand or collapse them all. As you select filters, the search results list is updated automatically.

For example, if you search for contacts from your IBM account detail page, the `Data.com` tab will open and automatically enter IBM's URL, *www.ibm.com*, in the `Company or website` field on the `Find Contacts` subtab. The search will generate a list of thousands of IBM contacts all over the world. That's probably more than you need, so you can either:

- Refine your initial search by selecting location criteria (such as *Australia* or *United States*) or industry options (like *Computers & Electronics* or *Financial Services*)
- Narrow your search results list by selecting filters such as *Human Resources, C-Level, or Program Manager* or
- Select *IBM* in the `Company Name` filter category.

By refining your search criteria and filtering your results, you can narrow your list from more than 30,000 contacts to the 25 or so you want to call or email.

SEE ALSO:

[Understand Data.com Search Modifiers](#)

Understand Data.com Search Modifiers

When searching for Data.com accounts and contacts, you can use modifiers to target and narrow your search results. Here's how modifiers work, field by field.

Company or Website

- To search for or exclude multiple companies, separate them with commas: *,*. For example, *salesforce.com,Apple* returns results for both salesforce.com and Apple (for example, Apple Computer, Inc. and Apple Inc.), or either one, depending on Data.com data.
- To search for the exact name of a company, type the name within quotation marks: *" "*. For example, *"Apple, Inc."* returns only results with the exact company name Apple, Inc.
- To exclude a company from your results, before the company name, type a minus sign: *-*. For example, *-Oracle* returns a list of results that excludes Oracle. For company names with more than one word, after the minus sign, type the first part of the name. For example, *-Adobe* returns a list of results that excludes Adobe Systems.
- You can also use mixed search modifiers. For example, *salesforce, -Microsoft, "GE Healthcare"* returns all results including salesforce (for example, salesforce and salesforce.com, inc.); it excludes all results containing Microsoft; and it finds GE Healthcare but not GE Health Care.

Title

- To exclude a title, before the title, type a minus sign: *-*. For example: *-buyer*.
- To search for exact titles, type them within quotation marks: *" "*. For example: *"Managing Director"*.
- To search for multiple titles, separate them with commas: *,*. For example: *CEO,-Dr,"managing director"*.

Name or Email

- To search for results for an individual element in this field—just Name or just Email—type that element followed by a colon (*:*) and a space, then type the name, or email you're looking for. For example, *Name: Marc Benioff* returns results with only the name Marc Benioff. *Email: marcbenioff@salesforce.com* returns results with only the email address marcbenioff@salesforce.com.
- Modifiers will not work if you don't include *"name: "* or *"email: "*, and you can't mix and match these modifiers (for example, using *"name: "* and *"email: "* in the same search).
- To search for multiple names or emails, separate them with commas: *,*.
- To search for exact titles, names, or emails, type them within quotation marks: *" "*.
- To exclude a title, name, or email from your results, before the element, type a minus sign: *-*.

Location | City

- To search for multiple cities, separate them with commas: *,*. For example, *San Francisco, San Jose* returns results for both San Francisco and San Jose, or either one, depending on Data.com data.
- To search for exact cities, type them within quotation marks: *" "*. For example, *"San Francisco"*, won't return results for South San Francisco. Similarly, *"South San Francisco"* won't return any results for San Francisco.

Location | Postal/ZIP Code

- To search for multiple postal or ZIP codes, separate them with commas: *,*. For example, *94105, 94122* returns results for both 94105 and 94122, or either one, depending on Data.com data.
- To exclude a postal or ZIP code from your results, before the code, type a minus sign: *-*. For example, *-94122* returns a list of results that excludes 94122.

Location | Area Code

[Understand Data.com Searches](#)

How Is Industry Determined for Records in Data.com?

We use the primary SIC (Standard Industry Classification) code to determine the value of the `Industry` field on account cards and account records in Data.com. By using only the primary SIC code for this industry mapping, we're able to provide a more consistent and accurate value in the `Industry` field, which leads to more relevant search results, regardless of the industry classification system you use in your search query.

A limited number of Data.com accounts show `Data.com - Jigsaw` as the value of the `Source` field on their account card. These accounts do not have a value for the SIC code, and so their `Industry` value is determined using a different system. Contact Salesforce Customer Support for details.

 **Example:** You're searching Data.com for accounts with a SIC industry value of *Computer Peripheral Equipment*, which maps to `Electronics` in Data.com. Your Data.com search results will include all accounts with a value of `Electronics` in the `Industry` field. If you use the Data.com Industry Categories classification system and select the *Computers and Electronic* industry, which also maps to `Electronics`, your results will again include all accounts with a value of `Electronics` in the `Industry` field.

Data.com Industry Selector

When searching for accounts and contacts in Data.com, use the industry selector to add industries and subindustries to your search criteria.

Here's how it works.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:
Contact Manager (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:
Contact Manager (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

1. Select the industry classification system your organization uses.
 - *NAICS* (North American Industry Classification System): Used by business and government to classify North American business establishments according to the type of economic activity. This system includes 20 industry sectors, each with multiple levels of subindustries. Industries and subindustries are identified by numeric code, up to six digits.
 - *SIC* (Standard Industry Classification): Used by the United States government to classify business establishments according to the type of economic activity. This system includes 10 industry sectors, each with multiple levels of subindustries. Industries and subindustries are identified by numeric code, up to four digits.
 - *Data.com Industry Categories*: The Data.com system of classifying business establishments by industry and subindustry.

You can select a different industry classification system at any time, but doing so will clear your selections.

2. Use the selection panels to explore industries and their subindustries and add them to your search. If an industry has a numeric classification code, you'll see it here. When you hover over an industry name, you'll get two options.
 - Click the industry name to view its subindustries, if any, in the right panel. If an industry has any available subindustries, you'll see an arrow → to the right of the industry name.
 - Click **Add** to add the industry (including all its subindustries) to the **Categories to search by** (Categories) box.

When you click an industry name in the right panel, it moves to the left panel and its subindustries appear in the right panel. You can continue moving through the industry levels in this manner, adding any industries and subindustries you want to search on as you go. A circle ● to the right of a subindustry name means you have reached the final level of subindustries. When you add an industry to your search criteria, it appears in the Categories box and all of its subindustries are automatically included. You'll also see a solid green checkmark ✓ next to its name. Only the industry, however, appears in the Categories box.

To remove industries from the Categories box, hover over the industry name and click the ✕. If you remove any subindustries from the selection panel, the industry is removed from the Categories box, and its remaining subindustries appear instead. (This

partial selection is denoted by an outlined green checkmark  next to the industry name.) Keep in mind that if you select some but not all subindustries within an industry, the number of selections in the Categories box increases.

3. Use the navigation links at the top of the page to keep track of where you are within the industry levels. Click any link to return to that industry level in the selection panels.
4. Click the **Back** arrow to move up one industry level.
5. All industries and subindustries that you add to your search appear in the **Categories to search by** box. You can remove individual selections by clicking the  next to the industry or subindustry name. Clicking **Clear all** removes *all* your selections.
6. There's a limit on how many industries and subindustries you can add to one search. If you exceed the limit, you'll need to remove selections in order to continue your search.
7. If the **Categories to search by** box includes a long list of industries, you may need to click the arrow to expand the box to view them all.

Here's an example of how the industry selector works. John is looking for companies that manufacture computers. He decides to use the North American Industry Classification System (NAICS) and begins by clicking the **Manufacturing** industry to reveal its subindustries, which include **Food Manufacturing**, **Machinery Manufacturing**, and lots more. He finds **Computer and Electronic Product Manufacturing**, and clicks it, moving it to the left panel to reveal its subindustries in the right panel. He continues to navigate deeper in to the industry levels in this manner, clicking through subindustries until he ultimately finds what he's looking for: **Computer and Peripheral Equipment Manufacturing**. John clicks **Add** to add two subindustries, **Electronic Computer Manufacturing** and **Computer Storage Device Manufacturing**, to the **Categories to search by** box. Those selections remain in the Categories box even if he navigates to other levels in the selection panel and adds other industries. When he is finished adding industries to the Categories box, he does a last review of his selections, then happily clicks **Done** to return to the Data.com tab to complete his search.

[Understand Data.com Searches](#)

How can I see complete, relevant information for Data.com search results?

We've limited the number of details available for search results that exceed ten pages, to ensure data security.

To see complete, relevant account information in search results:

- Narrow your search using the search filters on the left of the page. Filtering out results that aren't the focus of your search gives fewer, more targeted results. For example, selecting Director-level accounts in a company's Sales department reduces the results from 50 pages to 4, listing only the accounts you're looking for.
- Sort your search results so that the target of your search appears in the first few pages. For example, sorting the Updated column lists the most recently updated accounts first.

Once you've identified the accounts you're looking for, purchase the accounts by adding or exporting them to Salesforce from Data.com. You see full details of the accounts and contacts you purchase and add to your organization.

Which Data.com user type am I?

It's easy to find out. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**. The **Data.com User Type** field identifies you as either a Data.com User or a Data.com List User. If the field is blank, you do not have a Data.com user license.

For a quick definition of your Data.com user type, just click the info icon () next to the field.

SEE ALSO:

[How Do Data.com User Types, Licenses, and Record Addition Limits Work?](#)

[Using Data.com FAQ](#)

How can I improve my Data.com search results?

It's easy. Just use [search modifiers](#). To see examples, just click the info icon () above each Data.com search field. It's also helpful to save searches you use frequently.

SEE ALSO:

[Understand Data.com Searches](#)

Why do I see companies I didn't search for in my Data.com search results?

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For example, if you want to find Sun Microsystems and you enter either *Sun Microsystems* or *sun.com* in

the `Company` or `Website` field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems.

SEE ALSO:

[Understand Data.com Searches](#)

[Using Data.com FAQ](#)

What's the limit of Data.com records I can add to Salesforce?

From Setup, in the Quick Find box, enter `Users` and then select **Prospector Users**. In the Data.com Users section, find your name and see what your monthly limit is and how many records you've already added or exported during the month. Your administrator sets the monthly allowance, which expires at the end of each month, regardless of whether you've met your limit.

If you're a Data.com List User, your name also appears in the Data.com List User section of the page. After you've used your monthly record additions, you'll share record additions from a pool with all other List Users in your organization. Your organization's pool has a limit, so if one Data.com List User reaches the limit, other Data.com List Users can't add records. List pools expire one year after purchase.

If adding a set of records causes you to exceed your addition limit, you'll see a message that tells you how many additions you have remaining. If you still need to add more records, contact your administrator.

[Using Data.com FAQ](#)

When I add CRM records from Data.com, how do I know which field values have Data.com data?

Just check the help topics that define the fields on those records. All fields that are enabled for Data.com data are identified.

- [Account Fields](#)
- [Contact Fields](#)
- [Lead Fields](#)

SEE ALSO:

[Using Data.com FAQ](#)

What does the `Account Site` field value on an Account record mean?

`Headquarters/Parent` indicates that a company is a legal entity with other locations.

`Single Location` indicates that a company is a headquarters with no other locations, and that it may or may not be a distinct legal entity.

`Branch` indicates that a company is not a distinct entity. Rather, a branch is a location of a headquarters or parent company.

SEE ALSO:

[What is the difference between the Account Site and Location Type fields?](#)

[Using Data.com FAQ](#)

Why does the `Ownership` field have a value of `Private` for companies I know are public?

Dun & Bradstreet (D&B), who provides this data, only tracks ownership information for headquarters or parent companies. If a publicly traded headquarters or parent company has any subsidiaries, such as branch locations, those subsidiaries show a value of `Private` unless they are traded independently. The value will also be `Private` if the ownership type is unknown.

SEE ALSO:

[What does the `Account Site` field value on an `Account` record mean?](#)

[Using Data.com FAQ](#)

I'm seeing a discrepancy between the numbers in the `Employees` and `Contacts` fields on an `Account` record. Why?

There are a number of possible reasons.

- The number of employees is only available on records that have a value of `Headquarters/Parent` in the `Account Site` field. This means that a branch location may show a value of zero in the `Employees` field but still have a number of contacts.
- The `Employees` field on `Account` records shows the total number of employees within a company, including all subsidiary and branch locations. The number of contacts, however, reflects only the contacts at that specific location. So a headquarters location that has 5,000 employees throughout its various locations may only have 3,000 contacts at the headquarters location.
- *Employee* totals come from Dun & Bradstreet (D&B) and usually *do not* include contract employees. *Contact* totals and related data come from the Data.com community and often *do* include contract employees as long as they have a valid company email address.

SEE ALSO:

[Using Data.com FAQ](#)

I use Data.com and I'm seeing a blank or zero (0) value in the `Employee` and `Revenue` fields. Why?

Dun & Bradstreet (D&B) collects revenue data for headquarters and single locations only, so records associated with branch locations won't have a value for the `Annual Revenue` field on `account` and `leads` records or the `Annual Sales Volume` field on D&B `Company` records.

Similarly, D&B doesn't always have confirmed employee counts for branches and single locations, so there might not be a value for the `Number of Employees` field on `lead` records, the `Employee` field on `account` records, or the `Number of Employee-Total` field on D&B `Company` records.

SEE ALSO:

[Using Data.com FAQ](#)

Why do some leads have a blank or zero (0) value in the `Annual Revenue` and `Number of Employees` fields after I use the Data.com Clean auto-fill feature?

Data.com Clean has improved its location-based matching and, as a result, contacts are now associated with their actual location, rather than the organization's headquarters location. Because Dun & Bradstreet (D&B) only collects revenue data for headquarters locations, leads associated with a branch location or single location won't have a value for the `Annual Revenue` field. Similarly, D&B doesn't always have confirmed employee counts for branch and single locations, so there might not be a value for the `Number of Employees` field on `lead` records.

If you want to map the revenue and employee data from the headquarters location to the branch or single location records, contact your Salesforce administrator.

SEE ALSO:

[Using Data.com FAQ](#)

When I use the Employees or Revenue filter to refine my account or contact search results, I get far fewer results than I expect. Why?

Dun & Bradstreet (D&B) doesn't collect revenue data for branch locations and doesn't always have confirmed employee counts for branches or single locations. Therefore, if you enter `1` as your minimum range in the Revenue filter, your search results will exclude all records that have a zero (0) Revenue value. Similarly, if you enter `0` as your minimum range in the Revenue filter, your search results will exclude all records that have a blank Revenue value. The Employee filter works the same way.

If you want all records with a zero (0) or blank Revenue or Employee value included in your filtered search results, be sure to leave the `Min` field blank.

SEE ALSO:

[What does the Account Site field value on an Account record mean?](#)

[Using Data.com FAQ](#)

Why do some account and D&B Company records have identical D-U-N-S Numbers?

If a company operates within a single country, its Global Ultimate (highest entity within an organization) and Domestic Ultimate (highest entity within an organization in a country) are the same entity, and therefore the values in their `D-U-N-S Number` fields are the same. For definitions of all the D&B fields, see [D&B Company Fields](#).

SEE ALSO:

[Using Data.com FAQ](#)

What is the difference between the Account Site and Location Type fields?

`Account Site` is the field found on account records and the Data.com account card. `Location Type` is the field found on D&B Company records. (D&B Company records are available to customers who have purchased Data.com Prospector.) Both fields contain the same values: `Single location`, `Headquarters/Parent`, and `Branch`.

SEE ALSO:

[Using Data.com FAQ](#)

Why did I receive a message that says, You have limited access to data, so you can't completely clean this record?

If you can't edit one or more fields on an account, contact, or lead record, you'll see this message when you use Data.com Clean to manually clean the record. You'll still be able to clean the fields that you can edit.

Ask your administrator to make sure you can edit the [Salesforce fields affected when cleaning records](#), including D&B fields. How your administrator does this depends on which edition of Salesforce your company uses.

- For Contact Manager and Group editions, make sure the fields are on the appropriate page layout.

- For Professional, Enterprise, Performance, and Unlimited editions, make sure field-level security is set to `Visible` for the fields.

SEE ALSO:

[Which Fields Are Affected by Data Integration Rules and Data.com Clean?](#)

[Using Data.com FAQ](#)

Why did I receive a message that says, You can't clean this record because you have limited data access, as set by your administrator?

If you don't have appropriate access to the `D&B Company` object, you'll see this message when you use Data.com Clean to manually clean an account.

Ask your administrator to make sure you have read access to the `D&B Company` object.

Get Critical Industry, Financial, and Competitive Insights for Your Accounts

Need detailed information about account businesses? Click the `Prospecting Insights` button on the account detail page to get data about your prospects' businesses and financials, as well as competitive and industry details—directly from Data.com in real time.

Prospecting Insights is available with Data.com Prospector licenses. Insights data is available for accounts that were imported from, or cleaned by, Data.com.

Before you begin, make sure that your administrator has added the `Prospecting Insights` button to the Account page layout.

1. Open the account detail page for a prospect.
2. Click **Prospecting Insights**.

If you click **Prospecting Insights** for an account that hasn't been imported from or cleaned by Data.com, a message recommends that you first clean the account.

Data.com Clean

Data.com Clean keeps your org up to date using data from Dun & Bradstreet and Data.com. Using Clean jobs, you can clean your records on a regular basis. You can also clean a single record or a list of records.

 **Note:** This information applies to Data.com Clean and not to Data Integration.

Data.com Clean compares your account, contact, and lead records with records from Data.com and creates a link between your records and matching Data.com records. Clean also provides [clean status information for accounts, contacts, and leads](#) on page 1288.

In Salesforce Classic, your users can do the following.

- Manually compare individual account, contact, and lead records side by side to matched Data.com records, and update records field by field .
- Select account, contact, and lead records from a list, and update them all at once.
- Manually refresh D&B Company records linked to accounts.

As a Salesforce admin, you can also do the following.

- Configure and run automated Clean jobs to flag field value differences on Salesforce records, fill blank fields, and overwrite field values. Configuring and scheduling Clean jobs is only available in Salesforce Classic.
- Use the [Data.com Match API](#) to create a custom solution for specific business purposes like updating leads as they are created and updating custom objects.

There are two versions of Data.com Clean: Corporate Clean and Premium Clean. Premium Clean includes more Dun & Bradstreet fields for adding to or manually cleaning account, contact, or lead records. The Salesforce Help refers to Data.com Premium Clean unless otherwise noted. For more information on Premium Clean, contact your Salesforce account manager.

Data.com Clean Version	Dun & Bradstreet (D&B) Fields
Data.com Corporate Clean	Basic set of Dun & Bradstreet fields.
Data.com Premium Clean	Basic set of Dun & Bradstreet fields, plus the <code>D&B Company</code> field. This field links to an associated <code>D&B Company</code> record with over 70 additional Dun & Bradstreet fields that are accessible on the <code>D&B Companies</code> tab.

Data.com Clean doesn't support person accounts.

 **Note:** Data.com Clean must be purchased 1:1 for Sales Cloud and Service Cloud seats.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Keep Your Salesforce Records Complete and Up To Date

Your business is only as good as its data. Spend less time updating data and more time growing your business using Data.com. Access valuable company information from Dun & Bradstreet as well as crowd-sourced data from Data.com to keep your org up to date.

[Clean Individual Account Records in Salesforce Classic](#)

Use Data.com Clean to manually clean an account record. With a manual clean, you do a side-by-side comparison of a single account record with its matched Data.com record, followed by a field-by-field update.

[Clean a List of Records](#)

With Data.com Clean, you can select account, contact, and lead records from a list and clean them all at one time. A Data.com Clean license is required to clean records from a list.

[Which Fields Are Affected by Data Integration Rules and Data.com Clean?](#)

When you use Data.com to update a record, the record's fields are updated with Data.com data.

[What Does the Clean Status Tell Me About a Record?](#)

The `Clean Status` field on account, contact, and lead records indicates how the record's data compares with data from Data.com. If you click the icon next to the status, you get more status details, plus options for refreshing the status. Depending on the status, you can also clean some records right from the `Clean Status` field.

[How Does Data.com Clean Match Your Records?](#)

If you clean your account, contact, and lead data with Data.com Clean, it's important to understand how your records are compared and matched with records from Data.com.

[Data.com Update Statuses](#)

For Data.com Prospector, Data.com Clean, and Data Integration, an update status field on your accounts, contacts, and leads indicates your record's status compared with Data.com data.

[Updating Records with Data.com Clean](#)

When you clean a record, you're comparing your data with information in Data.com. There are a few important concepts to understand about this process, including how to select matching records and mark Data.com records as incorrect.

EDITIONS

Professional, Enterprise, Performance, and Unlimited Editions

Clean Individual Account Records in Salesforce Classic

Use Data.com Clean to manually clean an account record. With a manual clean, you do a side-by-side comparison of a single account record with its matched Data.com record, followed by a field-by-field update.

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance**, and **Unlimited** Editions

USER PERMISSIONS

To clean account records:

- “Edit” on accounts

 **Note:** This information applies to Data.com Clean and not to Data Integration.

Manual Clean is available in orgs with a Data.com Clean license and to any Salesforce user in an org with a Data.com Prospector license. You can manually clean all the account records you have access to in Salesforce—not just the records you previously added from Data.com.

Data.com Clean offers several ways to clean account records. Users can clean individual records manually or clean groups of records from a list view. You can also clean batches of records in your org using automated Clean jobs.

 **Note:** If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month. This conversion can cause the values in the `Annual Revenue` field to change. For orgs that use non-USD currencies, we ignore the `Annual Revenue` field when determining a record’s clean status (so the `Clean Status` field’s value does not change). We also remove the value from the `Annual Revenue` field on account records and the Clean comparison page.

1. Open the record and check the Clean Status field. Even if its status is In Sync, you can manually clean the record. If you use Dun & Bradstreet’s DUNSRight matching service, you can match some records to a different one from Data.com.

 **Tip:** From the **Clean Status** field, you can get more status information (such as which fields have different data in Data.com) and then clean the record. Click the status icon (🚩) and the popup guides you.

2. Click **Clean** to open the comparison page and compare the Salesforce record with the Data.com record.
3. Compare the records. A check mark appears next to any Data.com field value that matches the corresponding value in your Salesforce record.
4. Select the checkbox next to any Data.com value you want to accept.
5. If you use DUNSRight Matching and want to look for a different match from Data.com, click **Wrong Match?**
6. When you’re satisfied that the record is accurate, click **Save**, even if you don’t accept any data from Data.com.

The **Clean Status** field reflects the record’s status, and its time stamp is updated to reflect your activity.

 **Note:** On an account, if you update the Company D-U-N-S Number field value while cleaning manually, delete the D&B Company field value. Otherwise, Clean can’t add updated values for those two fields or link the correct D&B Company record to the account.

If you click **Cancel**, your Salesforce record isn’t updated, but if Data.com finds a better match for the record, the values in its `Clean Status` and `Data.com Key` fields can change. These two fields always reflect the best match from Data.com as of the most recent Clean process, regardless of the method used to clean the record.

Suppose that you use Data.com Clean or Data.com Prospector and you've manually cleaned an account or lead record that isn't linked to a D&B Company record. When you click **Save**, Salesforce creates a D&B Company record (if available) and links it to the account or lead record. The next time you open the comparison page, the linked record is identified by its D-U-N-S Number in the `D&B Company Record Linked` field.

Clean a List of Records

USER PERMISSIONS

To clean account records:	"Edit" on accounts
To clean contact records:	"Edit" on contacts
To clean lead records:	"Edit" on leads
To create custom list views:	"Read" on the type of record included in the list
To create, edit, or delete public list views:	"Manage Public List Views"

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:
Professional, Enterprise, Performance, and Unlimited Editions

With Data.com Clean, you can select account, contact, and lead records from a list and clean them all at one time. A Data.com Clean license is required to clean records from a list.

 **Note:** This information applies to Data.com Clean and not to Data Integration.

 **Note:** You can clean a list of account records only if you use Data.com as your matching service.

Data.com Clean offers several ways to clean records. Users can clean individual records manually or clean groups of records from a list view. You can also clean batches of records using automated Clean jobs.

Cleaning from a list works for all the account, contact, and lead records you have access to, not just the ones you previously added from Data.com Prospector. When you click the Accounts, Contacts, or Leads tab, you can select a view to see a list of the records you're allowed to view. The results you see are called a *list view*. From the list view, simply select the records you want to clean and Data.com Clean does the rest.

 **Note:** If you're cleaning records from a standard list view, make sure that your Salesforce admin adds the `Clean Status` field to the view. If you're cleaning records from a custom list view you've created, add the `Clean Status` field yourself.

1. Click the tab (Accounts, Contacts, or Leads) for the object whose records you want to clean from your list.
2. Select a view from the dropdown that contains the `Clean Status` field and click **Edit**.
3. From the list, select the records you want to clean, and click **Clean**.
4. Select one of these Clean options.
 - `Update Clean Status` updates each record's `Clean Status` field.
 - `Update Clean Status and Fill Blank Fields` updates each record's `Clean Status` field and fill blank fields with Data.com data.

5. Click **Update**.

You see a confirmation message telling you how many records were matched and updated, and whether any errors occurred.

6. Review the changes to your records.

If you selected the option to update only the `Clean Status` field and now find records with a clean status of `Different`, you can manually clean each record from its detail page.

What Does the Clean Status Tell Me About a Record?

The Clean Status field on account, contact, and lead records indicates how the record's data compares with data from Data.com. If you click the icon next to the status, you get more status details, plus options for refreshing the status. Depending on the status, you can also clean some records right from the Clean Status field.

 **Note:** This information applies to Data.com Clean and not to Data Integration.

Here's an example that shows some of your options.

- This record's status is `Different` because when it was last compared, one week before, the records in Salesforce and Data.com had different values for some or all of their fields. The user who compared the records previously can have:
 - Decided not to accept any of the Data.com values.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

- Accepted some values from Data.com and kept some Salesforce values.
- Clicked **Cancel** on the comparison page.

Click the icon to view the popup, which provides additional information and Clean options.

2. This line tells you about the Salesforce record's most recent comparison activity.
In this case, a user compared the Salesforce account record with Data.com's version one week ago.
3. This section provides more details about the comparison. In this case, Data.com had *different* Email, Phone, and Mailing Address values for the contact.
4. You can click the **Clean...** link to compare the Salesforce and Data.com records yourself.
If you click **Cancel**, the record's clean status remains *Different*. If you click **Save**, even if you haven't accepted any Data.com values, the record's clean status is *Reviewed*.

How Does Data.com Clean Match Your Records?

If you clean your account, contact, and lead data with Data.com Clean, it's important to understand how your records are compared and matched with records from Data.com.

 **Note:** This information applies to Data.com Clean and not to Data Integration.

 **Tip:** For complete details about how the Data.com Clean matching service works, including a graphic overview and extensive examples, see the white paper [Data.com Clean Record Matching in Salesforce](#).

Watch a Demo:  [Understanding Matching Rules](#)

Using Data.com Clean, your records and Data.com records can be compared and matched in two ways.

- Manually, when a user clicks **Clean** on an individual account, contact, or lead record.
- Via Clean jobs, which automatically attempt to match all your account, contact, or lead records.

Automated clean jobs are only available to orgs that purchase Data.com Clean. *Manual* clean is available to all licensed Data.com Prospector users.

The first time one of your records is cleaned, either manually or via an automated job, the matching service searches Data.com for similar records. It examines the field values in each record and looks for enough identical or similar information to indicate that the two records represent the same entity (that is, the same account, contact, or lead). If Data.com finds a match, the two records are linked by a numeric value in the `Data.com Key` field. For contact and lead records, every time your record is cleaned, the matching service is used to match the record. For account records, every time your record is cleaned, the `D-U-N-S Number` field is used to match (or look up) the record. If the `D-U-N-S Number` field is blank, the matching service is used to find a match. If your record changes substantially the next time it is cleaned, the matching service sometimes looks for a better match from other Data.com records.

 **Note:**

- If you prefer to rematch account records with the matching service, regardless of whether a D-U-N-S Number is present, contact Salesforce Customer Support. Doing so, however, can cause some account records to have their Data.com Clean status set to Not Found.
- If you've remapped or skipped mapping for the `D-U-N-S Number` field, or if you purchased Data.com before December 16, 2011, the matching service is used to rematch account records.

For contacts and leads, the important fields are:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available with a Data.com Prospector license in:
Contact Manager (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in:
Professional, **Enterprise**, **Performance**, and **Unlimited** Editions

- Name
- Email

Use a direct email address rather than a group address like info@org.com. (Identical email values almost always trigger a match unless other values in the record conflict.) **Note:** Data.com does not store emails that contain personal contact information, such as emails from Gmail or Yahoo.

- Account Name for contacts; Company for leads.
- Title
- Phone

For accounts, the important fields are:

- Account Name
 - Make sure that the account name doesn't contain any unrelated artifacts, such as numbers (1002), special characters (!#@#), or unrelated words. (These symbols are acceptable if they are part of the company's name.)
 - Try to avoid country and state names as values unless they are part of the company's name.
 - If the account name contains more than one word, like DSGI Business (PC World Business), try both.
 - If an account name is also a Website (like salesforce.com), try leaving off the subdomain (for example, .com).
- Billing Address
 - Use a full address, if possible.
 - To optimize match rates, specify a value for the Country field.
 - Try to specify a value for the State or ZIP code field.
 - If you know the account's street name but not its street number, use the street name only. A street name without a street number is better than no value.
- Website
- Phone

Data.com Update Statuses

For Data.com Prospector, Data.com Clean, and Data Integration, an update status field on your accounts, contacts, and leads indicates your record’s status compared with Data.com data.

When you’re using Data.com Clean, the status field is called Clean Status. When you are using Data Integration, the status field is called Data Integration Status.

Status	Definition	API Value	Notes
 Not Compared	The current version of the Salesforce record has not been compared with Data.com. This status may occur because: <ul style="list-style-type: none"> The record was <i>created manually</i> in Salesforce (not <i>added from Data.com</i>) and has not yet been compared with Data.com. The Salesforce record was previously compared with Data.com but later edited by a user and not compared again. The Salesforce record was previously compared with Data.com but later updated by a workflow or other automated process (such as lead conversion) and not compared with Data.com again. You map Data.com fields to Salesforce fields and one or more newly mapped Data.com fields has no value. 	Pending	Records you add from Data.com are always <code>In Sync</code> until the data changes in one or both of the records. After you clean the record and a match is found in Data.com, the record’s <code>Clean Status</code> changes to <code>Reviewed</code> until one of these conditions is met. <ul style="list-style-type: none"> The two records are identical (<code>In Sync</code> status). The record is updated in Salesforce or Data.com (<code>Different</code> status). The record becomes inactive in Data.com (<code>Inactive</code> status).
 In Sync	When your Salesforce record was last compared with the Data.com record, the two were identical. Records with <code>In Sync</code> status are considered to be clean.	Matched	Records in <code>In Sync</code> status are considered to be clean, but you can repeat the clean process. Click the icon in the <code>Clean Status</code> field and check the time stamp to see when the record was last compared.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Status	Definition	API Value	Notes
 Reviewed	When your Salesforce record was last compared with the Data.com record, the user who compared them: <ul style="list-style-type: none"> Kept one or more values from the Salesforce record. May have also flagged a field value as <i>wrong</i> to Data.com. Marked a record as <i>Inactive</i>. or <ul style="list-style-type: none"> Your Clean jobs are set to overwrite values for one or more fields, and one or more values were overwritten during the most recent job. 	Acknowledged	Records in Reviewed status are considered to be clean, but you can repeat the clean process. After you clean the record and a match is found in Data.com, the record's Clean Status remains in Reviewed status until one of these conditions is met. <ul style="list-style-type: none"> The two records are identical (In Sync status). The record is updated in Salesforce or Data.com (Different status). The record becomes inactive in Data.com (Inactive status). Any fields previously flagged as <i>wrong</i> to Data.com have been reflagged as <i>right</i>.
 Different	The Salesforce record has different data from the corresponding Data.com record.  Note: It's important to remember that a record's clean status can change from In Sync or Reviewed to Different when values change in the matched Data.com record. This may happen regularly as updated information from Data.com and D&B is made available.	Different	After you clean the record and a match is found in Data.com, the record's Clean Status remains in Different status until one of these conditions is met. <ul style="list-style-type: none"> The two records are identical (In Sync status). A user reviews the two records and keeps one or more values from the Salesforce record (Reviewed status). The record becomes inactive in Data.com (Inactive status).
 Select Match(not used in Data Integration)	Data.com does not have a record qualified for an <i>automatic</i> match but does have one or more potential matches. You can select one from up to five (5) match candidates.	SelectMatch	This status is available with the Data.com Clean product and D&B DUNSRight matching service only.
 Not Found	The Salesforce record has no similar records in Data.com record.	NotFound	The record can't be cleaned in Salesforce because Data.com

Status	Definition	API Value	Notes
 Inactive	The Data.com record corresponding to the Salesforce record has been reported as inactive by either Data.com or a user in your organization. A contact record may be inactive if it contains out-of-date or inaccurate information. An account record is inactive if D&B has marked it as out of business.	Inactive	could not find a record to match it with. Inactive records are hidden from Data.com Prospector search results by default, but you can use filters to show them. If clean the record and report it as Active to Data.com, the record's clean status changes to <i>Reviewed</i> .
 Skipped	Either: <ul style="list-style-type: none"> The Salesforce record encountered an error related to a validation rule or trigger when it was last saved, causing the next incremental sync Clean job to set the record's status to <code>Skipped</code>. or <ul style="list-style-type: none"> The record's clean status was set to <code>Skipped</code> via the API. <p><i>Incremental sync</i> Clean jobs do not process records with <code>Skipped</code> clean status.</p> <p><i>Full sync</i> Clean jobs process records with <i>any</i> clean status that encountered errors related to validation rules, triggers, or other customizations when last saved, but those records' <code>Clean Status</code> field values do not change until the errors are resolved.</p>	Skipped	Work with your administrator to either: <ul style="list-style-type: none"> Modify the trigger, validation rule, or API customization that caused the error and the <code>Skipped</code> status, and then clean the record again manually or with Clean jobs. or <ul style="list-style-type: none"> Ask your administrator to consider selecting the <code>Skipped Records Clean Job Bypass</code> preference, which causes <i>both incremental and full sync jobs</i> to skip processing for records in <code>Skipped</code> clean status.

Updating Records with Data.com Clean

When you clean a record, you're comparing your data with information in Data.com. There are a few important concepts to understand about this process, including how to select matching records and mark Data.com records as incorrect.

[Report an Account, Contact, or Lead as Inactive or Active to Data.com](#)

When you use Data.com Clean to clean a Salesforce record, if you know the related account, contact, or lead is either out of business or not active at a company, you can report that information to Data.com. If an account, contact, or lead has been reported as *Inactive* to Data.com, we let you know. If you believe that the account, contact, or lead is *Active*, you can tell us that, too.

[Guidelines for Selecting an Account Matching Service](#)

If you use Data.com Prospector or Data.com Clean, you can select the matching service that your org uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

Report an Account, Contact, or Lead as Inactive or Active to Data.com

When you use Data.com Clean to clean a Salesforce record, if you know the related account, contact, or lead is either out of business or not active at a company, you can report that information to Data.com. If an account, contact, or lead has been reported as *Inactive* to Data.com, we let you know. If you believe that the account, contact, or lead is *Active*, you can tell us that, too.

 **Note:** This feature is not supported with Data Integration.

An account, contact, or lead can be designated as *Active* or *Inactive* by either Data.com or a Data.com Clean user. For accounts, *Inactive* means out of business, and for contacts or leads, it means the associated person no longer works at the company.

If a record is *Inactive*, we let you know the source of that status, and if the source is Data.com, we tell you why. For example, we tell you if an account is out of business, a contact is no longer employed at the company, or a contact or lead's phone or email is invalid.

1. From the account, contact, or lead record, click **Clean** to open the comparison page.
2. If the account, contact, or lead is inactive, click **Report as Inactive**.
3. Click **Save**.
The record's `Clean Status` field now shows that it's *Inactive*.
4. If an account has been reported as inactive, but the company remains in business, or a contact or lead has been reported as inactive, but the person still works at the company, you can clean its record again. On the comparison page, you see a message telling you the record's current reported status—`out of business` for accounts or *Inactive* for contacts and leads—and who reported it: Data.com or a user.
5. Click **Report as Active**.
The record's `Clean Status` field reverts to the value it had before the record was reported as *Inactive*. For example, if a contact's `Clean Status` is *Reviewed*, and then the

Guidelines for Selecting an Account Matching Service

If you use Data.com Prospector or Data.com Clean, you can select the matching service that your org uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

 **Note:** This information applies to Data.com Clean and not to Data Integration.

The available matching services are:

Data.com matching

Data.com's own matching technology, which matches on the `Account Name`, `Billing Address`, `Website`, and `Phone` fields.

The Data.com matching service is always used when cleaning accounts that have a valid `D-U-N-S Number`, even if the DUNSRight matching service is selected.

D&B DUNSRight™ matching

D&B's proprietary data-quality technology, which uses a rigorous process to normalize data and match D&B company records to your account records. The process also employs the D&B Confidence Code, which ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). D&B also provides letter-coded match grades for individual fields. For details about how D&B DUNSRight matching works, see [D&B Entity Matching](#).

EDITIONS

Data Integration

Data Integration keeps your org up-to-date, using data from Dun and Bradstreet, Data.com, or third-party data packages. When you activate a data integration rule, Data Integration does a bulk update of your records using data from the rule's data service. After the data integration rule is active, records are updated as needed after you add or modify them.

 **Note:** This information applies to Data Integration and not to Data.com Clean.

Data Integration updates your account, contact, and lead records with data from a data service. Available data services include Dun & Bradstreet, Data.com, and third-party data services. Updates are controlled by data integration rules. After you activate a rule, Data Integration automatically does updates whenever you add or edit a record. The rule's data service provides the data for this update. When you first activate a rule, Data Integration also does a bulk update of all your records from data in the rule's data service.

Data integration rules control how a data service matches its data to your records. Rules also control how the data service updates your records with data service data. You can activate and deactivate rules whenever you want.

Set options for Data Integration and rules in Setup. Options control whether Data Integration does bulk updates, how data integration rules affect triggers and workflow rules, and so forth.

[Use Data Integration to Update an Account in Salesforce Classic](#)

Use a data integration rule to manually update an account. The rule's data service updates the account based on the rule's update field mapping.

[Activate a Data Integration Rule](#)

To enable Data Integration for accounts, contacts, or leads, activate data integration rules. After you activate a rule, Data.com updates all records in the object. Data.com then continually updates records when you add or change them.

[How Do Data Integration Rules Match Your Records?](#)

When you clean your account, contact, and lead data with Data Integration, data integration rules compare your records to Data.com records. The comparison is based on the match field mapping settings for the rule.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Company Info for Accounts and Company Info for Leads rules require a Data.com Premium Clean license.

[How Do Data Integration Rules Match Your Records?](#)[How Do Data Integration Rules Update Your Records?](#)[Use Data Integration to Update an Account in Salesforce Classic](#)[Create a Custom Report Type for Account, Contact, or Lead Data Integration Info](#)

Use Data Integration to Update an Account in Salesforce Classic

Use a data integration rule to manually update an account. The rule's data service updates the account based on the rule's update field mapping.

Note: This information applies to Data Integration and not to Data.com Clean.

Data integration rules automatically update an account based on the rule's update field mapping. These updates usually occur when you add or change an account (*perpetual update*). Rule settings also let you update all accounts when you save the rule's settings or activate the rule (*bulk update*). Some data integration rules also featured *data refresh*, which regularly updates accounts.

You can also manually update an account using a data integration rule. Do a manual update when perpetual update is turned off, or when the data integration rule doesn't offer data refresh.

1. Open the account and go to the **Data Integration Rules** related list.
2. Choose the data integration rule you want to use to update the account, and click **Update**.
You can update an account even if the rule status is **In Sync**.
A dialog appears, showing you that your account was updated. Click **OK** to dismiss the dialog. The rule status is **In Sync**.

USER PERMISSIONS

To clean account records:

- "Edit" on accounts

Activate a Data Integration Rule

To enable Data Integration for accounts, contacts, or leads, activate data integration rules. After you activate a rule, Data.com updates all records in the object. Data.com then continually updates records when you add or change them.

 **Note:** This information applies to Data Integration and not to Data.com Clean.

Enable Data Integration for accounts, contacts, or leads by activating the data integration rule you want to use.

1. From Setup, enter *Data Integration Rules* in the **Quick Find** box.
2. From the View dropdown, select **All Data Integration Rules**.
3. Look at the Current Status column. If the status for the rule contains the word Active, you're done. You can activate other data integration rules.
 - a. If the status for the rule is Inactive, click the name of the rule.
 - b. In the detail page for the rule, click **Activate** to activate the rule.
 - c. In the dialog that appears, click **OK** to activate the rule.
 - d. To return to the list of data integration rules, click **Back to List: Data Integration Rules**.

The data integration rule is active, so Data Integration is enabled for this particular rule.

How Do Data Integration Rules Match Your Records?

When you clean your account, contact, and lead data with Data Integration, data integration rules compare your records to Data.com records. The comparison is based on the match field mapping settings for the rule.

 **Note:** This information applies to Data Integration and not to Data.com Clean.

For each active data integration rule, Data Integration compares and matches your records to Data.com records. The match is based on the rule's match field mapping. Each rule has its own default match mapping. In addition, based on your settings, Data.com updates your records when you first activate a rule or change its match mappings.

Data Integration matching has the following features and limitations.

Accounts

- The Company Info for Accounts rule requires a Premium Clean license.
- Geocodes for Account rules don't require a Data.com Clean license.
- Only the Data.com matching service is available.
- All Dun & Bradstreet countries are supported.

Contacts

The Geocodes for Contact Mailing Address rule doesn't require a Data.com Clean license.

Leads

- The Company Info for Leads rule requires a Data.com Premium Clean license.
- The Geocodes for Lead Address rule doesn't require a Data.com Clean license.
- Leads are matched to Dun & Bradstreet companies (domestic or global ultimate).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Company Info for Accounts and Company Info for Leads rules require a Data.com Premium Clean license.

Available in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To enable or disable Data Integration:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

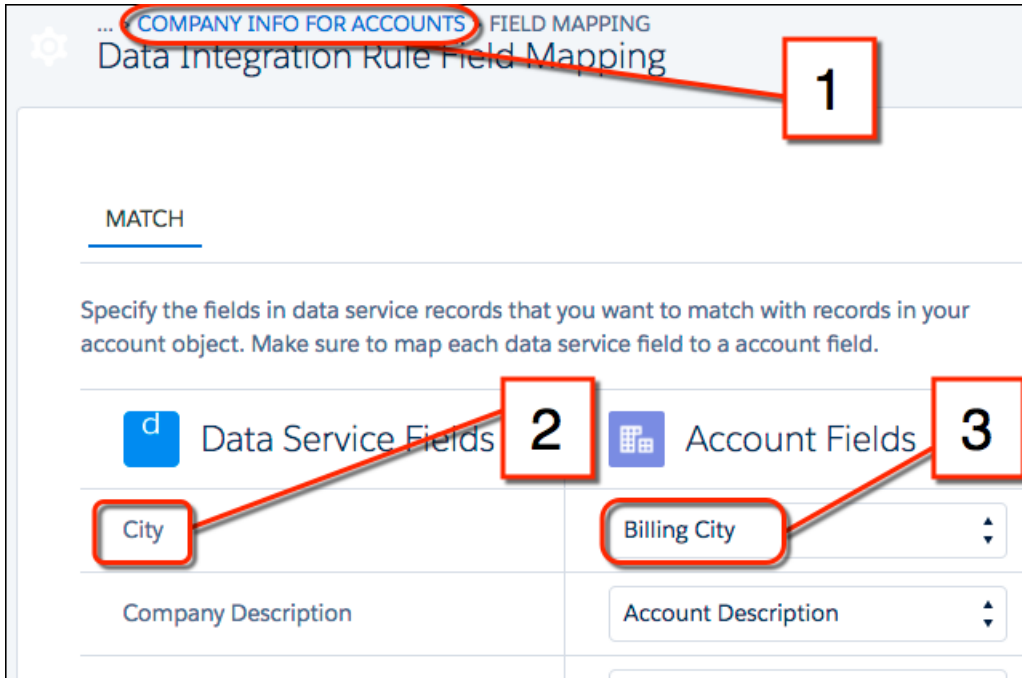

Company Info for Accounts and Company Info for Leads rules require a Data.com Premium Clean license.

Available in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Match mappings are partially customizable. The data service provides a fixed set of fields that it uses to match your records. You can't change the data service fields, but you can match them to fields you choose in your record, including custom fields.

Example: The match mapping for a rule is shown in the Edit Field Mappings page of a data integration rule. The first line is the name of the rule (1). The data service compares each field in the Data Service Fields list (2) to the corresponding field in the object fields list (3).

For example, this match mapping is for Company Info for accounts. It matches the contents of the Data.com data service field `City` (2) to the contents of the account field `Billing City` (3). You can also modify this mapping to match `City` to `Shipping City`.

SEE ALSO:

[Which Fields Are Affected by Data Integration Rules and Data.com Clean?](#)

How Do Data Integration Rules Update Your Records?

When you update your account, contact, or lead data with Data Integration, a data integration rule updates your records using data from in the rule's data service. The update is based on the update mapping for the rule.

 **Note:** This information applies to Data Integration and not to Data.com Clean.

A data integration rule is part of a data service that supplies data to your org. The rule updates a specific Salesforce object type. Based on the rule, Data Integration updates your records from data in the data service. The update is based on the rule's update *field mapping*. Each rule comes with its own default update mapping.

Data Integration performs an update when you add or change a record (*perpetual update*). Rule settings also let you update all records when you save the rule's settings or activate the rule (*bulk update*). Some data integration rules also featured *data refresh*, which regularly updates accounts.

Data Integration updating has the following features and considerations:

General considerations

- When a record is added or updated, Data Integration updates only blank fields.
- When data refresh is available, Data Integration determines if your record is out of sync with the data service. You can see the sync status in the record's detail page, and refresh the record if you choose.
- Data Integration updates your field only if the field types of the data service field and your record's field are compatible
- Data Integration updates your field only if the scale and precision of the data service field and your record's field are compatible.

Accounts

- The Company Info for Accounts rule requires a Data.com Premium Clean license.
- Geocodes for Account rules don't require a Data.com Clean license.
- All Dun & Bradstreet countries are supported.

Contacts

The Geocodes for Contact Mailing Address rule doesn't require a Data.com Clean license.

Leads

- The Company Info for Leads rule requires a Data.com Premium Clean license.
- The Geocodes for Lead Address rule doesn't require a Data.com Clean license.

Update mappings are partially customizable. The rule contains all the fields that the data service provides, and you can't change those fields. You can match the data service fields to fields you choose in your record, including custom fields.

 **Example:**

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Company Info for Accounts and Company Info for Leads rules require a Data.com Premium Clean license.

Available in: **Professional, Enterprise, Performance, and Unlimited** Editions

The update mapping for a rule appears when you edit the field mapping of a data integration rule.

The Update tab (1) displays data that's available from the data service. To copy data to your account, choose a target field in your account for each source field in the data service.

In this example, the data service provides data in the City field (2). During the update, the service copies the value of City to the Billing City field in the matched account.

- The data service update list has all the fields that the service provides for your object type. If the service has data for different object types, the update list can be different for each object.
- For the same object, the data service match list can be different from the data service update list.

Stay Up to Date with Social Networks and News

The News Component

Get instant access to relevant, timely news about customers, partners, and competitors. The News component includes articles and Twitter posts, and is available on accounts, contacts, leads, opportunities, and the Home page.

The News component provides relevant, timely news items that help you stay up-to-date with the companies, people, and industries you work with. News is available from US news sources in English.

News Based on Where You Access It

- On account records, news items appear based on the account, its executives, and its industry.
- On contact, lead, and opportunity records, news items appear based on the record's related account, and that account's executives and industry.
- On the Home page and the News app, news items appear based on recently viewed records, and on tasks and events for those records.
- In Salesforce 1, news also appears based on accounts associated with attendees on your scheduled mobile calendar events.

EDITIONS

Available in: Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited** Editions

Categories for News

Category	Includes news
Account News	Based on the record's account.
Industry News	About the industry that's listed on either the account or the record's related account.
Executive News	About individuals who hold executive roles at either the account or the record's related account. The executives don't need to be contacts within Salesforce for you to see news about them.
Trending at My Company	That your other users in Salesforce are reading.
General Business News	That's not directly related to the record's account, industry, or executives.

Share News on Chatter

If you come across an interesting news article, easily share it on Chatter. When you share an article from a record's detail page, it's posted to that record's Chatter feed. When you share an article from Home or the News app, it's posted to your Chatter profile for all your followers to see.

News Quality and Feedback

- Salesforce processes all news to ensure it's relevant and free from spam and inappropriate content.
- If you encounter inappropriate or incorrect news items, flag them using the feedback options.

Privacy and Security

- When enabled, some of your organization's data may be saved and/or processed by third-party services and other Salesforce technologies, each that may offer different privacy and security protections than the Salesforce Services. When data (such as the name or website of an account that's being queried) is shared or transferred, we make efforts to exclude your name and your organization's name. Salesforce is not responsible for the privacy and security of data that is shared with third parties when you use this feature.
- For most accounts, Salesforce provides news from our own news processing platform, which collects news from RSS feeds and Twitter content of news providers. On occasion, if a match isn't found in our database, we may search a third-party provider for news specific to your account, using the account name you've listed in Salesforce. In either event, Salesforce is not responsible for the content of news that is provided by third parties. Queries performed by Salesforce are performed using secure protocols and are not linked to individual Salesforce users.

Social Accounts, Contacts, and Leads

Increase your users' access to social intelligence and serve current and potential customers better with easy access to social networking within Salesforce

▶ [Watch a demo \(Salesforce Classic\)](#) (3:29 minutes)

Once an account, contact, or lead is linked to a social network profile, you and everyone else in your organization can access current social data without having to log in to other sites.

Social Network	What You See in Salesforce	Supported Objects in Salesforce Classic	Supported Objects in Lightning Experience Salesforce1	Objects Updatable with Data.com Social Key
Twitter	Twitter is a great way to see the public personas of your existing and potential customers and learn what's on their minds. You can see bios, recent tweets, and the people who are following and being followed by your accounts, contacts, and leads.	Accounts Contacts Leads	Accounts Contacts Leads	Contacts Leads
Facebook	Facebook gives you a more personal view of your existing and potential customers and helps you find common interests. For contacts, leads, and person accounts, you can see profiles, status updates, and the number of mutual friends you share. For business	Accounts Contacts Leads		Contacts Leads

EDITIONS

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

Contacts available in **All Editions** except **Database.com**

Leads available in: **Groups, Professional, Enterprise, Unlimited, and Developer Editions**

accounts, you can view your customers' corporate social media presence, including their company profile and wall posts.

Klout	Klout is a third-party service that analyzes people's influence across social networks, including Twitter, Facebook, and LinkedIn. Use Klout to see the influence of your accounts, contacts, and leads on social media, who they influence, who influences them, and the topics they talk about.	Accounts Contacts Leads
YouTube videos	YouTube helps you find and view videos related to your accounts, contacts, and leads.	Accounts Contacts Leads

After you or another user in your organization associate a social network profile with an account, a contact, or a lead, Salesforce always displays current information about it. Which details each Salesforce user can see depend on how they're connected with the account, contact, or lead on the social network, as well as the privacy settings for the profile. If you aren't signed in to the social network through Salesforce, you see only information the social network user has made publically available.

 **Important:** The Social Accounts, Contacts, and Leads feature uses Facebook, Klout, Twitter, and YouTube public APIs to display social information in Salesforce. Because these social networks have the option of modifying or terminating access to their APIs at any time, salesforce.com can't guarantee the future availability of this feature or any of its functionality, including access to the data that is currently provided or to any particular social network as a whole. As of the Winter '16 release, LinkedIn is no longer available through this feature.

Get Started in Salesforce1 or the Full Salesforce Site

To get started, simply go to any account, contact, or lead detail page and sign in to your social network accounts. Signing in creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce.

SEE ALSO:

- [Enable Social Accounts, Contacts, and Leads](#)
- [Configure Social Accounts, Contacts, and Leads](#)

Security and Privacy When Using Social Accounts, Contacts, and Leads

The Social Accounts, Contacts, and Leads feature is built to provide security and privacy for you and your data.

- Salesforce uses the trusted OAuth protocol when you sign in to your Facebook, Twitter, or Klout accounts. Your login credentials aren't exposed to Salesforce, and we never store your passwords.
 - Salesforce doesn't import or store social information. Each time you select a social profile or a YouTube video, Salesforce retrieves the information that you want to see directly from the social network. You'll always see current social information for your accounts, contacts, and leads.
 - Associating a Salesforce record with a social network account doesn't cause any activity on the social network. For example, when you associate a contact with a Twitter account, you don't become a Follower of that account on Twitter.
 - Salesforce never posts anything about you or your activities to your social network accounts.
 - Your accounts, contacts, and leads aren't notified when you use Salesforce to view their social network profiles. And your interaction with social networks through Salesforce is read-only as long as you're using the Social Viewer.
-  **Note:** If you leave the Social Viewer, for example by clicking a link that opens a new Web browser tab, you're leaving Salesforce and interacting directly with the social network. Actions you perform outside of the Salesforce Social Accounts, Contacts, and Leads viewer may be recorded on the social network.
- Your view of a Facebook or Twitter profile is unique to you and depends on how you're connected with each account, contact, or lead on each social network, as well as on the privacy settings currently in use by the account, contact, or lead. Other Salesforce users must sign in to their own social network accounts, and they'll only see what's permitted to them based on their own connection level. For example, if your Twitter profile is connected to your lead's Twitter profile, you could see that lead's other connections, but another user at your organization whose Twitter profile isn't directly connected with the lead won't.

Leads available in: **Groups, Professional, Enterprise, Unlimited, and Developer** Editions

Configure Social Accounts, Contacts, and Leads

You can disable the Social Accounts, Contacts, and Leads feature or turn some social networks on or off.

If you disable the Social Accounts, Contacts, and Leads feature for your login, you won't see any social networks for your accounts, contacts, or leads. Or, if you turn off access to an individual social network, you won't be able to view or access data for that social network.

 **Note:** In Salesforce Lightning Experience and the Salesforce1 mobile app, users can access Twitter only, even if other networks are enabled.

1. From your personal settings, enter *Social* in the *Quick Find* box, then select **My Social Accounts and Contacts Settings**, **My Social Accounts and Contacts**, or **Settings**—whichever one appears.
2. Set up Social Accounts and Contacts so that it works the way you want it to.
3. Click **Save**.

- "Edit" on the

View and Link Social Network Profiles

View current information about your accounts, contacts, and leads gathered from their social network profiles and activity by associating each record to a social network profiles on Twitter and FaceBook.

Once you've linked an account, contact, or lead with a social network profile, you can view profile details and the profile's latest activity on the social network from the account's, contact's, or lead's detail page.

 **Note:** What information and activities you can see for each social network profile varies depending on that profile's privacy settings, the permissions set by their friends or connections, and the social network's terms of use. For more information about security and privacy, see [Security and Privacy When Using Social Accounts, Contacts, and Leads](#).

You can link accounts, contacts, and leads with Twitter or Facebook profiles in Salesforce Classic. In Lightning Experience or Salesforce1 can view and link Twitter profiles only.

 [Watch a demo](#) (3:29 minutes)

1. From an account, contact, or lead detail page, sign in to the social network
2. If a social network profile isn't linked with the record yet, Salesforce automatically searches for profiles that match the record's name. Select a profile to link it with the record, or search again using different search parameters if none of the profiles are a good match.
3. View the social information that the social network is sharing with you.

To associate social network profiles to a particular object:

- "Edit" on the object

To view social network profiles associated with a particular object:

- "Read" on the object. Person accounts require "Read" on both accounts and contacts.

Select and Change Profile Images for Accounts, Contacts, and Leads

When you or another user have associated records for accounts, contacts, and leads to social networks profiles, the records display images from Twitter or Facebook profiles. For some networks, profile images appear in Salesforce even when you aren't logged in to the network.

By default, the profile image for an account, a contact, or a lead is the profile image from the first social network linked to the record. If your org has enabled Account Logos, profile images that you've manually added to accounts might be replaced with a fresher, more up-to-date image in Lightning Experience.

 **Note:** Profile images from Facebook are visible in Salesforce Classic only.

1. On an account, contact, or lead detail page, click any social network icon (   ).
2. In the Social Viewer, select the tab for the social network that has the image you want to use.
3. Click **Show Photo in Salesforce**.

Troubleshoot Social Accounts, Contacts, and Leads

Increase your users' access to social intelligence and serve current and potential customers better with easy access to social networking within Salesforce

 **Note:** Different social networks are available in different Salesforce products. Review the [social network availability information](#) on page 1300 to ensure the network you're trying to access is available in the product you're using.

Salesforce Classic

1. Click the social network icons in the header on account, contact, and lead detail pages to display the Social Viewer.
2. If no icons are visible, the Social Accounts, Contacts, and Leads feature may be disabled for your organization. Ask an administrator to [enable the feature](#).
3. If a social network icon is missing, that social network may be turned off.
 - Ask an administrator to [turn on the social network for your organization](#).
 - Review your personal settings and [turn on the network for your login](#).
4. Whether you can see the social data for a particular record depends on your permissions for the record and the privacy settings for the social profile.

Salesforce Lightning Experience

1. Open any account, contact, or lead record detail page.
2. If the Twitter card doesn't appear, the Social Account, Contacts, and Leads feature may be disabled for your organization. Ask an administrator to [enable the feature and turn on Twitter access](#) for your organization.
3. If the feature is enabled but the Twitter card doesn't appear, [review your personal settings](#).

Salesforce1

1. Open any account, contact, or lead record detail page.
2. If the Twitter card doesn't appear, try the following.
 - Ask an administrator to [enable the Social Accounts, Contacts, and Leads feature](#).
 - Ask an administrator to [turn on Twitter access for the organization](#).
 - Ask an administrator to [add the Twitter card to the mobile page layout](#) for accounts, contacts, and leads.
 - [Review your personal settings](#) to make sure Twitter is turned on for your login.

Cultivating High Net Worth Customers for Financial Services

Salesforce for Wealth Management Overview

What Is Salesforce for Wealth Management?

Salesforce for Wealth Management is an industry solution that is designed and customized for the wealth management industry.

Who Should Use Salesforce for Wealth Management?

Salesforce for Wealth Management is intended for wealth management professionals who advise high net worth clients. It allows you to build deeper customer relationships, integrate key systems to drive user adoption, and effectively support compliance processes.

How Do I Obtain Salesforce for Wealth Management?

Salesforce for Wealth Management is available for free on AppExchange for Enterprise, Unlimited, and Performance Editions. It includes all generally available Enterprise, Unlimited, and Performance Edition features such as Outlook integration, workflow, and the Force.com API. As a prerequisite, it requires [person accounts](#), which are enhanced account records designed for business-to-consumer industries such as financial services.

What Does Salesforce for Wealth Management Include?

Salesforce for Wealth Management contains the following components that set it apart from standard Salesforce functionality:

- Easy-to-use tabs with client-oriented fields
- Comprehensive client information including financial accounts, investment preferences, addresses, and personal interests
- Comprehensive “Know Your Client” suitability forms with an automated approval process
- Reports and dashboards specific to the wealth management process
- Relationship groups (also known as households)

SEE ALSO:

[Get Started With Salesforce for Wealth Management](#)

[Navigating the Salesforce for Wealth Management App](#)

Get Started With Salesforce for Wealth Management

As an administrator, perform the following tasks to set up Salesforce for Wealth Management for your organization:

Verify the Contents of the Salesforce for Wealth Management App

Verify that the Salesforce for Wealth Management custom app contains the correct tabs:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. In the list, click *Salesforce for Wealth Management*.
3. Verify that the following tabs are present in the Included Tabs list:
 - Home

USER PERMISSIONS

To view the setup options for custom apps:

- “View Setup and Configuration”

To manage custom apps:

- “Customize Application”

- Accounts
- Financial Accounts
- Holdings
- WM Assets
- Client Interests
- Know Your Clients
- Reports
- Dashboards
- Documents
- Console

4. If necessary, click **Edit** and choose the appropriate tabs to add or remove.

Configure Users' App Choices

In addition to the main Salesforce for Wealth Management custom app, the following custom apps are also available in the Force.com app menu:

- Salesforce Financial Accounts & Holdings
- Salesforce Clients and Interests
- Salesforce Know Your Client

Optionally, you can hide these apps from users in the Force.com app menu, because all appropriate tabs are already consolidated in the main Salesforce for Wealth Management custom app. To hide these apps:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the appropriate app name.
3. In the *Assign to Profiles* area, deselect the checkboxes in the *Visible* column that correspond to end users' profiles. Select only the checkboxes that correspond to administrator profiles.
4. Click **Save**.
5. Repeat this procedure as necessary for the remaining custom apps listed above.

Verify Record Types

From the object management settings for person accounts, go to Record Types to verify that the following record types are available for person accounts (clients).

Individual

This record type is for clients and prospective clients. It should be assigned to the *Individual* page layout.

Professional Relationship

This record type is for lawyers, accountants, and other professional relationships. It should be assigned to the *Professional Relationship* page layout.

Configure Users' Page Layouts

Ensure that the following components are included in users' page layouts, which can be configured from the management settings for each object by going to Page Layouts.

Home Tab Page Layouts

The home page layout for financial advisors, titled FA Home Page, should include the following components:

- Items To Approve
- Tasks
- Calendar
- Dashboard Snapshot
- Search
- Create New
- Recent Items
- Messages & Alerts
- Custom Links

Person Accounts Page Layout

The page layouts for person accounts (clients) should include the following related lists:

- Financial Accounts
- Holdings
- Client Interests
- Know Your Client
- Open Activities
- Activity History
- Partners
- Account Team
- Notes & Attachments

Verifying the Know Your Client Approval Process

Salesforce for Wealth Management includes an approval process that routes Know Your Client forms to the appropriate Salesforce users for approval.

Managing the Know Your Client Approval Process

About the Know Your Client Approval Process

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

The Know Your Client approval process is included in Salesforce for Wealth Management and has the following general definition:

USER PERMISSIONS

To create, edit, delete, or clone approval processes:

- “Customize Application”

To view approval processes:

- “View Setup and Configuration”

1. A financial advisor creates a new Know Your Client record.

Note: Data from a saved Know Your Client record can be merged into a printable Microsoft Word document using the provided mail merge template.

2. A financial advisor submits the Know Your Client record for approval, which sets the following actions in motion:
 - The Know Your Client record is locked and cannot be edited
 - `KYC Approval Status` becomes "Pending Approval"
 - `Date Know Your Client Submitted` becomes today
 - Know Your Client record type becomes "KYC Submitted"
 - An approval request is routed to the appropriate Salesforce user for review, and he or she is also sent an email notification using the appropriate email template
3. The lead financial advisor approves or rejects the approval request, which causes the following actions:
 - The record continues to be locked and cannot be edited
 - `KYC Approval Status` becomes "Approved" or "Rejected"
 - `Date KYC Approved/Rejected` becomes today
 - If the record was approved, a follow-up task is scheduled for the financial advisor to review the Know Your Client form in six months

Activating the Know Your Client Approval Process

To activate the Know Your client approval process:

1. From Setup, enter `Approval Processes` in the `Quick Find` box, then select **Approval Processes**.
2. In the `Manage Approval Processes For` drop-down list, select "Know Your Client."
3. Click **Activate** next to the approval process name.

[Managing Wealth Management Clients](#)

Navigating the Salesforce for Wealth Management App

To access the Salesforce for Wealth Management app, go to the Force.com app menu in the top right corner of any Salesforce page and select Salesforce for Wealth Management. To get started on any task, just click the tab you want.

SEE ALSO:

[Salesforce for Wealth Management Overview](#)

[Managing Wealth Management Clients](#)

Managing Wealth Management Clients

Clients are exclusively available in Salesforce for Wealth Management. A client is a person who you advise or do business with, a prospect who you potentially will do business with, or a professional relationship such as an accountant or lawyer. You can manage your clients on the Clients tab. In standard Salesforce terminology, clients are called “accounts.” However, Salesforce for Wealth Management uses the term “clients.”

Clients have all of the standard capabilities of account records.

In addition, the special capabilities of clients are as follows:

Client Record Types

Record types are categories that allow you to organize your records. You can assign client records to the following record types:

- “Business” specifies a corporate entity or trust
- “Individual” specifies an existing or prospective client
- “Professional Relationship” specifies an accountant, lawyer, or other professional relationship

Client List Views

On the Clients tab, you can use [list views](#) to conveniently access different sets of clients. For example, select “My A Clients” to view a list of your clients who have an “A” rating.

Client Details

The client detail page includes groups of fields tailored to wealth management clients. For example, one section tracks a client's preferences in several categories — you can specify that a client is interested in vacation homes, mid-cap stocks, the retail and entertainment sectors, golf, and US politics.

Financial Accounts Related List

The Financial Accounts related list provides an overview of the client's financial accounts, such as account names, account numbers, and current values. This information comes from the records on the Financial Accounts tab.

Holdings Related List

The Holdings related list provides an overview of the client's owned assets such as funds, stocks, and bonds. For each holding you can see values such as market value, last price, purchase price, and number of shares. This information comes from the records on the Holdings tab. Note that each holding is associated with a financial account record.

Client Interests Related List

The Client Interests related list provides an overview of the securities that the client is interested in buying or selling. This information comes from the records on the Client Interests tab.

Know Your Clients Related List

The Know Your Clients related list provides an overview of the Know Your Client forms that are associated with the client. This information comes from the records on the Know Your Clients tab.

Relationships Related List

A relationship refers to a client who has a role in the life of another client, such as a spouse, child, accountant, or attorney. Relationships are tracked in the Relationships related list on the client detail page, which is available as an option. In standard Salesforce terminology, relationships are called “partners.” However, Salesforce for Wealth Management uses the term “relationships.”

Client Team Related List

The Client Team related list tracks the financial advisors and other Salesforce users who are involved in the management of a particular client. In standard Salesforce terminology, client teams are called “account teams.” However, Salesforce for Wealth Management uses the term “client teams.”

USER PERMISSIONS

To view the Clients tab:

- “Read” on accounts

To view clients:

- “Read” on accounts

To create clients:

- “Create” on accounts and contacts

Relationship Group Members Related List

The Relationship Group Members related list displays the relationship groups of which the client is a member. It is available as an option and is called "Household Members" in some organizations.

Salesforce for Wealth Management Reports and Dashboards

Salesforce for Wealth Management Reports

Salesforce for Wealth Management offers industry-specific reports, which are grouped in the following folders on the Reports tab:

- Client Reports
- Client Interest Reports
- Financial Account Reports
- Holdings and WM Asset Reports
- Know Your Client Reports

To access these reports, select the appropriate folder from the drop-down list on the Reports tab, then click the appropriate report name.

Salesforce for Wealth Management Dashboards

Salesforce for Wealth Management offers industry-specific dashboards, such as a dashboard of financial accounts that allows you to analyze your book of business. To access these dashboards, go to the Dashboards tab and select the appropriate dashboard name from the drop-down list.

 **Note:** You can see a dashboard snapshot on the Home tab.

Establishing Relationship Groups of Your Customers

Relationship Groups Overview

What Are Relationship Groups?

Relationship groups are custom object records used to store collections of [accounts](#). For example, you can use relationship groups to manage the following:

- A household of people who reside at the same address
- An extended family consisting of multiple generations of relatives
- A professional group such as a medical practice or a law firm
- The trustees and beneficiaries of a trust

The accounts that you add to relationship groups are called *relationship group members*. For more information, see [Relationship Group Members](#) on page 1315.

Who Can Use Relationship Groups?

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

Your organization must have implemented [person accounts](#) before you can use relationship groups.

Your administrator can enable relationship groups by installing the Relationship Groups custom app.

What Are the Benefits of Relationship Groups?

Relationship groups allow you to:

- Track the familial and professional roles of different relationship group members
- Assign primary and secondary designations to the two most important members of a relationship group
- View roll-up related lists of all [activities](#) for the members of a relationship group
- View roll-up related lists of the custom objects that are related to the accounts in a relationship group

SEE ALSO:

USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups

AND

“Create” and “Edit” on relationship group members

AND

“Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

Relationship Group Fields

A relationship group custom object has the following default fields, listed in alphabetical order.

Name	Description
Description	A text description of the relationship group. Up to 255 characters are allowed.
Primary Name	The name of the primary relationship group member .
Secondary Name	The name of the secondary relationship group member .
Total Members	The total number of members in the relationship group.

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

To add custom fields to relationship groups, from the object management settings for relationship groups, go to the fields area, then click **New** in the Custom Fields & Relationships section.

SEE ALSO:

[Relationship Groups Overview](#)

[Using Relationship Groups](#)

Relationship Group Members

Relationship groups let you group closely related accounts together so you can manage them easier. The accounts that you add to the group are the members. For example, a relationship group might be medical practice or a law firm, while the individual doctors or lawyers would be the group members.

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

What Are Relationship Group Members?

The accounts that you add to relationship groups are called *relationship group members*. Like relationship groups, relationship group members are custom objects. Each relationship group member record represents an association between an account and a relationship group. For example, if you add the account “Mary Smith” to the relationship group “Smith Family,” a relationship group member record is created that links Mary Smith to the Smith Family.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. When discussing these master-detail relationships, accounts and relationship groups are sometimes referred to as the “parents” of relationship group members.

What Are the Limits on Relationship Group Members?

You can add a given account to up to 200 relationship groups. For example, an account “Joseph Brown” who is an attorney may be a member of several relationship groups—in some cases as an attorney, in other cases as a family member.

You can add up to 20 accounts to a particular relationship group. For example, a relationship group that represents a large extended family including grandparents, children, and grandchildren cannot have more than 20 relationship group members.

In a particular relationship group, you can specify only one relationship group member as primary, and only one relationship group member as secondary. In addition, you cannot add the same account more than once to a particular relationship group.

Where Can I View Relationship Group Members?

The Relationship Group Members related list displays on both the relationship group detail page and the account detail page. On the relationship group detail page, the related list summarizes the accounts that are members of the given relationship group. On the account detail page, the related list summarizes the relationship groups of which the given account is a member.

Relationship Group Member Fields

Relationship group members have the following fields.

Field Name	Description
Account	The name of the account.

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups
- AND
- “Create” and “Edit” on relationship group members
- AND
- “Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

Field Name	Description
Role	The familial, professional, or other role that an account has in a relationship group - for example, Client, Spouse, Child, Attorney, or Accountant. Your administrator defines the available values in this picklist.
Primary	Designates an account as the most important member of the relationship group. Only one relationship group member can be specified as primary.
Secondary	Designates an account as the second-most important member of the relationship group. Only one relationship group member can be specified as secondary.
Include in Roll-up	Specifies whether the activities and custom objects of an account display in related lists on the relationship group detail page.
Priority	Does not display in the relationship group wizard, but is available as a column in the Relationship Group Members related list on account and relationship group detail pages. This column displays the primary (👤) or secondary (👤) icon as appropriate next to account names.
Unique Key	This is a system field that prevents duplicate records. It does not display to users in Salesforce but is visible in the Force.com API. This field should be treated as read only; attempts to modify it through the API will be ignored.

SEE ALSO:

[Relationship Groups Overview](#)

[Relationship Group Considerations](#)

Relationship Group Considerations

To make the most of relationship groups and relationship group members, review the notable behaviors and limitations below.

Relationship Group Considerations

Relationship groups:

- Support roll-up related lists for activities and custom objects only.
- Are completely separate from the Partners related list on accounts.
- Do not have directly associated activities, notes, or attachments.
- Only support required custom fields that are configured with a default value. Such custom fields will display on relationship group detail and edit pages, but not in the relationship groups wizard.
- Only support validation rules on custom fields that were added after the Relationship Group managed package was installed.
- Cannot be renamed to a different name than “relationship group,” because they are a custom object in a managed package.

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

- Can be created and edited through the relationship group wizard regardless of field-level security settings on the `Description` field.

Relationship Group Member Considerations

Relationship group members:

- Are limited to a maximum of 20 per relationship group.
- Cannot be imported via the import wizard for custom objects.
- Do not support tagging.
- Have the division of the parent relationship group.
- Are owned by both the parent relationship group and the parent account.
- Do not support validation rules.
- Do not support universally required fields.
- Cannot be renamed to a different name than “relationship group member,” because they are a custom object in a managed package.
- Can have the fields `Primary`, `Secondary`, and `Include in Roll-Up` edited through the relationship group wizard even when the field-level security on those fields is “read-only.”
- Cannot be included in workflow rules or approval processes.
- Cannot be used in Salesforce to Salesforce.
- Are not supported in Connect Offline.
- Are only supported in API version 11.0 and later. In the API, using the `upsert` call on relationship group members is not supported.

USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups
- AND
- “Create” and “Edit” on relationship group members
- AND
- “Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

Creating Relationship Groups

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. To create a new relationship group:

1. On the Relationship Groups home page, click **New** next to `Recent Relationship Groups`.
 2. Enter the name and description of the relationship group:
 - a. Enter a name for the relationship group.
 - b. Optionally, enter a description for the relationship group.
 - c. Click **Next** to continue.
 3. Define the members of the relationship group:
 - a. Use the lookup fields to select the appropriate records.
 - b. In the `Role` drop-down list, specify the appropriate role for each person in the relationship group.
 - c. Designate one of the records as primary.
 - d. Designate another record as secondary.
 - e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
 - f. Select `Include in Roll-up` for the accounts whose related activities and custom objects should display on the relationship group detail page.
 - g. Click **Save** to finish.
 4. After completing the wizard, the detail page of the new relationship group displays so you can review your work.
-  **Note:** You can also add an account to a new or existing relationship group. To add an account, go to the Relationship Group Members related list and click **New**.

Adding Accounts to Relationship Groups

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. On the Accounts tab, you can add an account to a new or existing relationship group:

1. Open the detail page for the account you want to add to a relationship group.
2. On the Relationship Group Members related list, click **New**.
3. Choose whether to add the account to an existing relationship group or a new relationship group:
 - If you are adding the account to an existing relationship group, click the lookup icon to find the appropriate relationship group.
 - If you are adding the account to a new relationship group, enter a name and optionally a description for the new relationship group.
4. Click **Next**.
5. Define the members of the relationship group:
 - a. Use the lookup fields to select the appropriate records.
 - b. In the **Role** drop-down list, specify the appropriate role for each person in the relationship group.
 - c. Designate one of the records as primary.
 - d. Designate another record as secondary.
 - e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
 - f. Select **Include in Roll-up** for the accounts whose related activities and custom objects should display on the relationship group detail page.
 - g. Click **Save** to finish.
6. After completing the wizard, the detail page of the new relationship group displays so you can review your work.

Displaying and Editing Relationship Groups

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

The following sections describe how to display and edit relationship groups:

- [Accessing the Relationship Groups Tab](#)
- [Viewing Relationship Group Lists](#)
- [Displaying Relationship Group Records](#)
- [Editing Relationship Group Records](#)

Accessing the Relationship Groups Tab

The Relationship Groups tab is available by default in the Relationship Groups app. To switch to the Relationship Groups app, select Relationship Groups from the Force.com app menu in the top right corner of every Salesforce page.

Note that your administrator may have customized your profile to also display the Relationship Groups tab in other apps.

Viewing Relationship Group Lists

You can work with relationship group list views as you would any other custom object. .

Displaying Relationship Group Records

To open an individual relationship group record, click a relationship group name on the relationship groups home page or a relationship groups list view.

Note the following when viewing related lists on the relationship group detail page:

- The Relationship Group Members related list summarizes the accounts that are members of the relationship group. In the `PRIORITY` column, the icons ( and ) show which accounts are defined as primary or secondary for the relationship group. For more information on relationship group members, see [Relationship Group Members](#) on page 1315.
- The Activity History and Open Activities related lists on a relationship group are roll-ups of activities for the relationship group members; relationship groups themselves do not have their own tasks and events.
- If accounts have a relationship with a custom object, a related list for that custom object can display on the relationship group detail page. This requires that `Include in Roll-Up` is selected on an associated relationship group member record. For example, in the following theoretical scenario, the vehicles associated with members of the Stone family display in a Vehicles related list on both the account detail page and the relationship group detail page:
 - The account Sam Stone has a Toyota Prius car tracked in the Vehicles custom object related list on the account detail page
 - The account Chris Stone has a Ford Mustang car tracked in the same related list
 - Sam and Chris Stone are members of the Stone Family relationship group
 - Both associated relationship group member records have `Include in Roll-Up` selected

Searching for Relationship Groups

1. Enter your search terms in the sidebar or header search box.
2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

Your administrator can customize the search layout for relationship groups to include the primary and secondary account fields, so you can view and access those account records directly from relationship group search results.

SEE ALSO:

[Relationship Groups Overview](#)

Deleting Relationship Groups

Relationship groups are custom object records that you can delete as you would any other record.

A relationship group is the master object in a master-detail relationship with relationship group members. Consequently, when you delete a relationship group, all relationship group members on that relationship group are also deleted. Restoring a relationship group from the Recycle Bin also restores the associated relationship group members that were deleted. However, if you delete a relationship group that contains the same relationship group member as a deleted account, the shared relationship group member cannot be restored from the Recycle Bin.

Removing Members from Relationship Group Members

To remove an individual relationship group member, go to the Relationship Group Members related list on an account or relationship group detail page and click **Del** next to the appropriate relationship group member record.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. Also, there are rules that govern the number of relationship group members a relationship group can have, as well as prevent more than one relationship group member from being specified as either primary or secondary on a given relationship group. The following considerations apply to deleting relationship group members:

Deleting Accounts with Relationship Group Members

When you delete an account, its associated relationship group members are also deleted. However, you cannot restore an account from the Recycle Bin if restoring the account's deleted relationship group members would violate rules such as the maximum of 20 relationship group members per relationship group. Also, if you delete an account that shares a relationship group member with a deleted relationship group, the shared relationship group member is automatically purged from the Recycle Bin.

Deleting Relationship Groups with Relationship Group Members

See [Deleting Relationship Groups](#) on page 1324.

Restoring Individual Relationship Group Members

You cannot restore an individual relationship group member from the Recycle Bin in the following scenarios:

- Restoring the record would violate rules such as the maximum of 20 relationship group members per relationship group
- The deleted relationship group member was deleted during an account merge

Relationship group members are automatically and irrecoverably removed from the Recycle Bin in the following scenarios:

- If both parents (the relationship group and the account) of a relationship group member are deleted, the relationship group member is removed
- If a relationship group member is deleted individually and then one of its parents is deleted, the relationship group member is removed

[Campaigns Home](#)

[Five Steps for Managing Campaigns](#)

[Considerations for Campaigns](#)

Campaigns Home

Clicking on the Campaigns tab displays the campaigns home page. Any user can access the campaigns home page.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- In the **Recent Campaigns** section, select an item from the drop-down list to display a brief list of the top campaigns matching that criteria. From the list, you can click any campaign name to go directly to the campaign detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Campaigns Tab" search layout defined by your administrator and by your field-level security settings (available in Professional, Enterprise, Unlimited, Performance, and Developer Editions). The Recent Campaigns choices are:

Recent Campaigns Choice	Description
Recently Viewed	The last ten or twenty-five campaigns you viewed, with the most recently viewed campaign listed first. This list is derived from your recent items and includes records owned by you and other users.
My Active Campaigns	The most recent ten or twenty-five campaigns marked as Active, with the most recently created campaign listed first. This list only includes records owned by you.

- In the **Recent Campaigns** section, click **New** to create a new campaign.

Considerations for Campaigns

Review the following considerations before working with campaigns.

Communities

When working with campaigns within a community, there are some limitations.

- The View Campaign Hierarchy action does not appear on campaign detail pages.
- The Campaign Influence and Campaign Member Status related lists do not appear.
- You can't drill into the Campaign Hierarchy related list.
- The Add to Campaign action does not appear on the Lead Home or Contact Home pages.

Manage Campaigns

Make your marketing programs and post-campaign analysis more effective.

See the [Campaign Management Implementation Guide](#) for additional information.

1. Create the campaign.

After determining your marketing strategy, create a campaign to track your efforts.

2. Create your target list.

Define who you want to target with your campaign. The method used to create a target list depends on who you're targeting.

- **Rented or Purchased Lists:** Use the list of names as your target list. We recommend that you do not import the names into the system yet.
- **Existing Contacts, Leads, or Person Account:** Run a contact, lead, or person account report in Salesforce. Then use the **Add to Campaign** button to associate those records with your campaign. Or, go to a list view of contacts or leads and use the **Add to Campaign** button to associate those records with your campaign. Person accounts are included in contact list views. See [Managing Campaign Members](#) on page 1335.

3. Execute the campaign.

All campaign execution occurs outside of Salesforce—either online or offline.

- **Online:** Send email using an email execution vendor.
- **Offline:** Plan and host a conference, run print or radio advertisements, send direct mail pieces, or host a Web seminar.

4. Track responses.

Campaign responses can be divided into these groups based on the response tracking mechanism.

- **Website Response:** Prospects respond by completing a form on your website. Use Web-to-Lead to set up a jump page or microsite for the campaign. All responses are created as leads, and if the Web form includes the `Campaign` field value, the leads are directly associated to the campaign. You can also include the `Member Status` field in the form to automatically mark all submissions with a particular member status.
- **Manual Update:** Customers and prospects respond via phone or mail. A sales or marketing team member can manually update the Campaign History for the lead, contact, or person account.
- **Mass Update/Offline Response:** This includes any response that you track in an offline list, for example, trade show attendance or email responses from your email vendor. In Salesforce, use the Manage Members page to update the member status of leads, contacts, or person accounts that have been associated with your campaign. See [Editing Multiple Campaign Members](#) on page 1337. Alternatively, import the offline list into Salesforce via the Data Import Wizard. See [Add or Update Campaign Members with the Data Import Wizard](#).

5. Analyze campaign effectiveness.

[Campaigns FAQ](#)

[Who can import campaign members?](#)

Viewing Campaign Hierarchies

A campaign hierarchy allows you to group campaigns together within a specific marketing program or initiative, which enables you to analyze related marketing efforts more efficiently.

To view the hierarchy for a campaign, click **View Hierarchy** next to the `Campaign Name` field on the campaign detail page. If a campaign is not part of a hierarchy, its corresponding Campaign Hierarchy page shows only the campaign you selected.

A campaign hierarchy shows campaigns that are associated with one another via the `Parent Campaign` field. A hierarchy illustrates a relationship between campaigns, such as a grouping of campaigns within a specific marketing tactic. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns, and a campaign hierarchy can contain a maximum of five levels or generations. In other words, a campaign hierarchy has a maximum depth of five levels but an unlimited breadth on each level. Campaign members, such as contacts and leads, can be included on any level.

On the Campaign Hierarchy page, campaigns are indented to show that they are related to the campaigns above them. Campaigns are listed in descending order based on their hierarchy level. Click any campaign name to open the detail page for that campaign.

Statistics for an individual campaign are in the Campaign Statistics section of the campaign detail page. Aggregate statistics for parent and child campaigns are in the Campaign Hierarchy related list.

 **Note:** To ensure accurate reporting, all campaigns in a hierarchy must use the same currency.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view campaigns:

- "Read" on campaigns

Viewing Campaign Hierarchy Statistics

Campaign detail pages include a Campaign Hierarchy related list, which displays a parent campaign and all the campaigns directly below the parent campaign in the campaign hierarchy. You can create a campaign hierarchy by associating campaigns with one another using the `Parent Campaign` lookup field on the campaign detail page. Click any campaign in the related list to open the detail page for that campaign.

The Campaign Hierarchy related list provides statistics fields for each campaign in the list as well as the total value for the parent campaign and all the campaigns below it in the campaign hierarchy. Statistics fields are not visible in the related list until campaign hierarchies are enabled for your organization. For more information and a list of fields, see [Set Up Campaign Hierarchies](#) on page 1334.

The Campaign Hierarchy related list shows a maximum of two hierarchy levels: the parent campaign and its child campaigns. If a child campaign has children, those children do not appear in the related list but their data is included in the campaign hierarchy statistic field values. The campaign hierarchy statistic fields provide aggregate data regardless of whether you have sharing rights to view individual campaigns within the hierarchy. However, if you do not have access to a campaign that appears in the related list, you cannot view its detail page from the link on the related list. To view all the levels in a campaign hierarchy, click the **View Hierarchy** link next to the `Campaign Name` on the campaign detail page.

SEE ALSO:

- [Displaying and Editing Campaigns](#)
- [Campaign Fields](#)

Displaying and Editing Campaigns

Displaying Campaigns

Once you have located a campaign on the campaigns home or list pages, click the campaign name to display detailed information. You can also select a campaign name from the Campaign History related list of an associated lead, contact, or person account. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

Editing Campaigns

To update a campaign, click **Edit**, and then change the fields you want to update. When you have finished, click **Save**. You can also click **Save & New** to save the current campaign and create another.

Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.

Note: To edit a campaign that is a child of another campaign, you must have at least "Read" access on the parent.

Creating Campaign Hierarchies

When creating or editing a campaign you can use the `Parent Campaign` lookup field to assign a parent to your campaign. In the lookup dialog you can search for an existing campaign or create a new parent campaign. For more information on configuring campaign hierarchies for your organization, see [Set Up Campaign Hierarchies](#) on page 1334.

Calculating Campaign Statistics

The campaign detail includes campaign statistic fields, which are updated automatically and include values from all associated records regardless of whether you have read access to those records. If you have campaign hierarchies enabled, the Campaign Hierarchy related list contains aggregate statistics for a parent campaign and all the campaigns below it in the campaign hierarchy.

Note: The campaign statistics calculation process runs every two minutes and processes one campaign's statistics at a time. If there are a large number of campaigns or campaigns with large numbers of campaign members pending, there may be a delay of 10 minutes or more.

Linking Contacts, Leads, or Person Account to Campaigns

Select an option from the **Manage Members** drop-down button on the campaign detail page.

Advanced Setup

Click **Advanced Setup** to customize the `Member Status` values for a campaign. The `Member Status` values are the possible responses that a member can have to the campaign, for example, "Sent," "Responded," "Attended." See [Customizing Campaign Setup](#) on page 1333.

Campaign Related Lists

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- The lower portion of the display provides information related to the campaign including activities, attachments, campaign members, campaign hierarchies, and the opportunities that resulted from the campaign. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click individual items to display additional detail. Click **More** at the bottom of the page or **View More** below a related list to display more items.

Printing Campaigns

To view a printable display of all information for the campaign, click **Printable View** on the campaign detail page. Use your browser's Print function to print the display.

Sharing

To share a campaign with other users, groups, or roles, click **Sharing**. See [Sharing Campaigns](#) on page 1358.

To return to the last list page you viewed, click **Back to list** at the top of the campaign detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

Add Individual Members to Campaigns

Hand-pick individual campaign members from contact, lead, or person account detail pages.

1. From a contact, lead, or person account detail page, go to the Campaign History related list and click **Add to Campaign**.
2. Specify the campaign.
3. On the Campaign Member Edit page, specify the campaign member status.
4. Save your work.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To add or clone a campaign member:

- "Read" on campaigns
AND
"Edit" on leads and contacts

To edit individual campaign members:

- "Read" on campaigns
AND
"Read" or "Edit" on leads or contacts

Customizing Campaign Setup

For each campaign, Marketing Users must define campaign `Member Status` values that a lead, contact, or person account has for a campaign. For example, you could define values of “Planned,” “Sent Invitation,” “RSVP,” and “Attended” for a conference. Not available in Lightning Experience.

User Privileges for Customizing Campaign Setup

- Anyone can view a campaign's advanced setup. You can *edit* advanced setup if:
 - The `Marketing User` checkbox is selected in your user information
 - You have the “Edit” permission on campaigns
 - You have at least create sharing access on the campaign record
 - You are working in Salesforce Classic
- If you [replace member status values](#), all campaign records are updated regardless of your sharing access to the related contacts or leads.

Defining Member Status Values

New campaigns have two default member status values: “Sent” and “Responded”. You can edit or create them.

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Edit**.
3. Update the existing entries or add new values.
4. Click **Add More** to add entries. You can add up to 50 entries.
5. Select one entry as the “Default” value.
6. Choose which values count as “Responded.” Members with “Responded” values are tallied in the `Responses in Campaign` field on the campaign.

 **Note:** Modifying the Responded checkbox has broad effects. When you select or deselect the Responded checkbox, [campaign statistics](#) and campaign member details change accordingly. Specifically, the fields `Responded`, `Last Responded Date`, and `Last Modified` change on the campaign member record. For example, if you're working with a status called “Attended” and you select the `Responded` checkbox, existing campaign members whose status is “Attended” are counted as responses in campaign statistics and the date fields updated.

Replacing Member Status Values

You can globally replace the `Member Status` values for each campaign member. For example, you decide that “Attended” is a more appropriate value than “Showed Up.”

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Replace** in the Member Status Values related list.
3. Enter the value you want to change, and select the new value.
4. Click **Save**.

EDITIONS

To customize member status values:

- “Edit” on campaigns

AND

`Marketing User` checked in your user information

 **Note:** Replacing the campaign member status doesn't recalculate roll-up summary fields or fire workflow, triggers, or validation rules.

SEE ALSO:

[Managing Campaign Members](#)

Set Up Campaign Hierarchies

Analyze and report on the health of your related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative.

Hierarchies contain up to five levels. Each campaign can have one parent campaign, but an unlimited number of sibling campaigns.

To set up campaign hierarchies, add the `Parent Campaign` field to your campaign page layout and enable the campaign hierarchy statistics fields.

Use field-level security to make the fields visible. As you make each field visible, Salesforce displays the field's value in the **Hierarchy Total** section of the Campaign Hierarchy related list.

 **Note:** The campaign hierarchy fields provide aggregate data for a parent campaign and all the campaigns below it in the campaign hierarchy, regardless of whether a user has sharing rights to a particular campaign within the campaign hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy fields. If you do not want users to see aggregate hierarchy data that includes campaigns to which the users do not have access, you can choose to remove any or all of the campaign hierarchy fields from the Campaign Hierarchy related list. If you do not add the campaign hierarchy fields to the related list or page layout, you can still access these fields on reports.

Once campaign hierarchies are set up, users can create and assign parent campaigns using `Parent Campaign` and then view details about the hierarchy on the Campaign Hierarchy page or the Campaign Hierarchy related list.

 **Note:** All campaigns within a hierarchy must use the same currency.

The Campaign Hierarchy page, accessible from the **[view hierarchy]** link next to the **Campaign Name** on the campaign record, shows all the levels in a hierarchy and the campaigns included in each level. For more information, see [Viewing Campaign Hierarchies](#) on page 1329. The Campaign Hierarchy related list provides aggregate data for the parent campaign and all the campaigns below it in the hierarchy. For more information see [Viewing Campaign Hierarchy Statistics](#) on page 1330.

Managing Campaign Members

Managing Campaign Members

Campaign members are created from lead, contact, or person account records. Salesforce provides a variety of ways in which you can manage your campaign members. You can search for and add or edit multiple leads and contacts from the Manage Members page. You can add members to a campaign one at a time from contact or lead detail pages. With the Data Import Wizard, you can add up to 50,000 leads, contacts, or person accounts at a time to a campaign. You can also use the Data Import Wizard to update the statuses of up to 50,000 campaign members at a time.

Adding Campaign Members

You can [add new members to a campaign](#):

- Individually from the Campaign History related list on a contact, lead, or person account detail page
- By searching for contacts and leads from the [Manage Members page](#)
- [From a campaign, contact, person account, or lead report](#)
- [From a list view of existing contacts or leads](#)
- [From a CSV import file of existing leads](#)
- [From a CSV import file of existing contacts](#)
- [From a CSV import file of existing person accounts](#)
- [From a CSV import file of new leads](#)
- [From a CSV import file of new contacts](#)

Editing Campaign Members

You can edit the details of existing campaign members:

- Campaign History related list on a contact, lead, or person account detail page
- [From the Campaign Members related list](#) on a campaign detail page
- [From the Manage Members page](#)

Updating the Status of Existing Campaign Members

You can update the status of existing campaign members:

- From the Campaign History related list on a contact, lead, or person account detail page
- [From the Manage Members page](#)
- [From a campaign, contact, person account, or lead report](#)
- [From a CSV import file of existing members](#)

Removing Campaign Members

You can remove members of a campaign:

- From the Campaign History related list on a contact, lead, or person account detail page
- [From the Campaign Members related list](#) on a campaign detail page

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- [From the Manage Members page](#)

Example Uses

- **Create follow-up campaigns**—Search for a custom list view of contacts or leads that is restricted to an earlier campaign and a certain member status, such as “Attended”. Then add items from the generated list to a follow-up campaign. See [Add Multiple Members to a Campaign from a List View](#) on page 1341.
- **Leverage reporting functionality**—Customize a standard report or build a new custom report that returns a list of contacts, person account, or leads that you want to target. With the click of a button, you can add the entire list to a campaign. See [Add Campaign Members from Standard Reports](#) on page 1340.

Editing Multiple Campaign Members

Editing Campaign Members from the Manage Members Page

 **Note:** Before using the Manage Members page, verify that you are using a supported browser.

To update the campaign member status, edit campaign member details, or remove campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Edit Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list on a campaign detail page.
2. On the Existing Members subtab, optionally enter filter criteria to find existing members and click **Go!**.

 **Note:** For campaigns with campaign members created from both leads and contacts, you must have “Read” permission on leads and contacts to see all members. If you only have “Read” on leads, you see only campaign members created from leads. If you only have “Read” on contacts, you only see campaign members created from contacts.

3. Select the checkboxes next to the records you want to edit. To select all records on the current page, select the checkbox in the header row.
4. Optionally perform the following actions:
 - To change the campaign member status, select a status from the **Update Status** drop-down list.
 - To remove a member from a campaign, click **Remove**.
 - To edit the details of a campaign member, click **Edit**.
 - To [view, edit, delete, clone, a campaign member](#), click the campaign member's name in the Name column.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still [add contacts or leads to a campaign](#), [update campaign members](#), and [remove campaign members](#) using the campaign member wizards.

To update large numbers of campaign members, you can use the Data Loader application to export and then reimport campaign member data. Before uploading a CSV file with Data Loader, be sure to sort the file by Campaign ID. If you have problems reimporting your data, try splitting up the CSV file into a few smaller files and uploading them separately.

Adding Multiple Campaign Members

Adding Campaign Members from the Manage Members Page

You can add leads and contacts as members of a campaign from the Manage Members page. To add contacts to a campaign, the [Add to Campaign checkbox must be enabled](#).

 **Note:** Before using the Manage Members page, verify that you are using a supported browser.

To add campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Add Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list.
2. On the Add Members subtab, select the **Leads** or **Contacts** radio button to add leads or contacts, respectively.
3. Search for leads or contacts:
 - You can specify search filters and click **Go!**
 - Alternatively, you can select an existing view, such as all open leads, from the Use Existing View drop-down list. Your results will display automatically. If you select an existing view, you can modify its criteria by adding or changing filters, and clicking **Go!**

 **Note:** You cannot modify filter criteria if you selected a view that uses advanced options or that uses more than five filters. Filter criteria will be reflected in your search results for these views, though not all filter criteria will display.

4. Select the checkboxes next to the records you want to add. To select all records on the current page, select the checkbox in the header row.
5. Select a status from the **Add with Status** drop-down list.

A confirmation message will display and you will see the members you added on the Existing Members subtab.

 **Note:** If you are unable to add contacts, enable the [Add to Campaign checkbox](#):

1. From the object management settings for contacts, go to Search Layouts.
2. Click **Edit** next to Contacts List View.
3. Select [Add to Campaign](#).
4. Click **Save**.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still [add contacts or leads to a campaign](#), [update campaign members](#), and [remove campaign members](#) using the campaign member wizards.

Add Campaign Members from Standard Reports

USER PERMISSIONS

To add campaign members from a contact report: `Marketing User` checked in your user information
 AND
 "Edit" on campaigns
 AND
 "Read" on contacts
 AND
 "Read" on reports

To add campaign members from a lead report: `Marketing User` checked in your user information
 AND
 "Edit" on campaigns
 AND
 "Read" on leads
 AND
 "Read" on reports

To add campaign members from a person account report: `Marketing User` checked in your user information
 AND
 "Edit" on campaigns
 AND
 "Read" on contacts
 AND
 "Read" on reports

Adding members to a campaign is quick and easy when you add them from your lead, contact, and person accounts tabular, summary, and matrix reports.

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited**, and **Developer** Editions

1. From a report that returns lead, contact, or person account records, click **Add to Campaign**.
 If the **Add to Campaign** button is disabled, modify your report to return fewer than 50,000 records.
2. Enter the name of a campaign.
3. Select a member status for the new members.
4. Choose whether members already associated with the campaign keep their status. If you want, update their status with the one you selected for new members.

5. Click **Add to Campaign**.
6. Review the confirmation screen.
7. Click **Done** to return to the report.

Be aware of these considerations when adding campaign members from a report:

- If you interrupt the add campaign members process, some members can still be added to the campaign. That’s because members are added in batches.
- If lead or contact records are edited after you start the add campaign members process but before they are added, those leads or contacts will not be added to the campaign.
- You can add active leads to campaigns—not converted leads. If converted leads appear on your report, don’t worry, Only the active are part of the add to campaign process.

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Save time by adding up to 200 members to a campaign at once from your lead or contact list views. Or update the member status for members already associated with the campaign.

1. Navigate to a contact or lead list view.

2. Select up to 200 records to add to a campaign.
3. Click **Add to Campaign**.
4. Enter the name of a campaign.
5. Select a member status for the new members.
6. Choose whether members already associated with the campaign keep their current status. If you want, update their status with the one you selected for new members.
7. Add the members.

SEE ALSO:

[Managing Campaign Members](#)

Displaying and Editing a Campaign Member

From the campaign member detail page, you can edit, delete, or clone a campaign member record. Additionally, if the campaign member is based on a lead, you can convert the lead; if the campaign member is based on a contact, you can create an opportunity.

To view the campaign member detail page, click the campaign member's name in the Name, First Name, or Last Name columns on the Campaign Members related list on a campaign detail page or on the Existing Members tab.

 **Note:** To view a campaign member, you must have permissions on the campaign and the lead or contact. For example, to view a campaign member created from a lead, you must be able to view both the campaign and the lead.

To edit the campaign member detail page layout, from the object management settings for campaign members, go to Page Layouts, and then click **Edit** next to the page layout name.

Editing a Campaign Member

To edit a campaign member, click **Edit** on the campaign member detail page, change the fields you want to update, then click **Save**. Fields derived from the contact or lead can only be edited from the lead or contact detail pages.

 **Note:** If your administrator has enabled inline editing for your organization, you cannot use inline editing on the `STATUS` drop-down list on the campaign member detail page. Instead, click **Edit** on the campaign detail page to edit the `STATUS` drop-down list.

Cloning a Campaign Member

To clone a campaign member, click **Clone** on the campaign member detail page, then select a campaign and a contact or lead. Change the fields you want to clone for the new campaign member, then click **Save**.

Deleting a Campaign Member

To delete a campaign member, click **Delete** on the campaign member detail page.

 **Note:** Deleting a campaign member record is permanent; the record is not recoverable from the recycle bin. However, the original lead or contact record is not deleted.

Converting a Lead

If the campaign member was created from a lead, you can click **Convert Lead** on the campaign member detail page to convert the lead. When you convert a lead, the campaign member is still a part of the campaign, but its type changes from lead to contact.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view, edit, or remove campaign members:

- "Read" on campaigns
- AND
- "Read" on leads
- AND
- "Read" on contacts

To add campaign members:

- "Read" on campaigns
- AND
- "Edit" on leads
- AND
- "Edit" on contacts

Creating an Opportunity

If the campaign member was created from a contact, you can click **Create Opportunity** on the campaign member detail page to create an opportunity. When you create an opportunity, the campaign member is still a part of the campaign.

[Campaign Member Fields](#)

Campaign Member Fields

These are the fields (in alphabetical order) that make up a campaign member. Most campaign member fields are derived from the lead or contact record from which the campaign member was created and must be edited from the corresponding lead or contact record. Some of these fields may not be visible or editable depending on your page layout and field-level security settings.

Field	Description
Campaign	The campaign to which the lead or contact belongs.
Campaign Member Currency	The default currency for currency amount fields on the campaign member. Amounts display in the campaign member currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
Campaign Member Type	The record type of the campaign member, which determines the page layout available for the campaign member. (Read only)
City	City portion of the lead or contact's address.
Company (Account)	The company, if the campaign member is based on a lead, or the account, if the campaign member is based on a contact.
Contact	The name of the contact, if the campaign member is based on a contact.
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Created By	User who created the campaign member. (Read only)
Created Date	Date the campaign member was created. (Read only)
Description	Description of the lead or contact.
Do Not Call	Whether the contact wants to be contacted by phone. If you use Data.com, the <code>Phone</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.
Email	Email address of the lead or contact.
Email Opt Out	Whether the contact wants to receive email. If you use Data.com, the <code>Email</code> field value is hidden from search results and on the Contact

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
	Card, and it's blank in .csv files that are created when you export records.
Fax	Fax number of the lead or contact.
Fax Opt Out	Whether the contact wants to be included in broadcast faxes.
First Name	First name of the lead or contact.
First Responded Date	Date the campaign member first responded. (Read only)
Last Modified By	User who last changed the campaign member record. (Read only)
Last Modified Date	Date the campaign member record was last modified. (Read only)
Last Name	Last name of the lead or contact.
Lead	The name of the lead, if the campaign member is based on a lead.
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Mobile	Mobile phone number for the lead or contact.
Phone	Phone number for the lead or contact.
Responded	Indicates if the campaign member has responded.
Salutation	The salutation for addressing the person, for example, Mr., Ms., Dr., or Prof.
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Status	The status of the campaign member, for example, sent or responded.
Street	Street portion of the lead or contact's address.
Title	The title of the lead or contact, for example, President.
Zip/Postal Code	Zip or postal code portion of the lead or contact's address.

Importing Campaign Members

Add contacts, leads, and person accounts to campaigns via the Data Import Wizard.

With the Data Import Wizard, a designated marketing user can use a CSV (comma-separated values) file to import contacts, leads, or person accounts and track their responses at each stage of a campaign.

For example, you can mark each contact, lead, or person account as “Planned” at the beginning of the campaign. Then mark them as “Responded” after they respond. These responses are referred to as the member statuses.

Add or Update Campaign Members with the Data Import Wizard

To add or update many campaign members at once, launch the Data Import Wizard from the campaign detail page.

Add Campaign Members

Before you begin, make sure that your import file is in CSV format and contains values for these fields.

- Salesforce ID of the contact or lead. For person accounts, use the contact ID associated with the person account as the Salesforce ID.
- Campaign ID (if you're on a non-campaign page and want to import records)

 **Tip:** To obtain Salesforce IDs or other values from your org, run reports and then export the report data.

1. From the campaign detail page, select **Manage Members > Add Members - Import File**.
2. The Data Import Wizard appears.
3. Select the CSV file that contains your import data, and click **Next**.
4. Map column headers from your CSV file to these fields.
 - Salesforce ID of the contact or lead. For person accounts, use the contact ID associated with the person account as the Salesforce ID.
 - Campaign ID (if you're on a non-campaign page and want to import records)
5. Click **Next**.
6. Review the import settings, and then click **Start Import**. When we finish importing your data, we notify you by email. Review the results and resolve any errors that occurred.

Update Campaign Members

Before you begin, make sure that your import file is in CSV format and contains values for these fields.

- Salesforce ID of the contact, lead, or campaign member. For person accounts, use the contact ID associated with the person account as the Salesforce ID.
- Status of the campaign member.

 **Tip:** To obtain Salesforce IDs or other values from your org, run reports and then export the report data.

1. From the campaign detail page, select **Manage Members > Update Members - Import File**. The Data Import Wizard appears.
2. Select **Campaign Members**, then select **Update existing records**.
3. Select the CSV file that contains your import data, and click **Next**.
4. Map column headers from your CSV file to these fields.
 - Salesforce ID of the campaign member
 - Status of the campaign member
5. Click **Next**.
6. Review the import settings, and then click **Start Import**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To add or update campaign members via the Data Import Wizard:

- **Marketing User** selected in your user information

Campaign Fields

A campaign has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Active	Checkbox to mark whether the campaign is active or not.
Actual Cost	Amount of money spent to run the campaign.
Budgeted Cost	Amount of money budgeted for the campaign.
Campaign Currency	The default currency for currency amount fields in the campaign. Amounts display in the campaign currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
Campaign Member Type	Record type for campaign members; determines the page layout of the members of the campaign.
Campaign Name	Identifying name for the campaign.
Campaign Owner	Assigned owner of the campaign.
Campaign Record Type	Record type for the campaign; determines the picklist values available for the campaign.
Converted Leads in Campaign	Number of leads that were converted to accounts due to the marketing efforts in the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. For more information on converting leads, see Convert Qualified Leads on page 1386. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.

EDITIONS

Available in: **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer Editions**

Field	Description
Created By	User who created the campaign including creation date and time. (Read only)
Custom Links	Listing of custom links for campaigns as set up by your administrator.
Description	Description of the campaign. Up to 32KB of data are allowed in this field. Only the first 255 characters display in reports.
End Date	Ending date for the campaign. Responses received after this date are still counted.
Expected Response (%)	Percentage of responses you expect to receive for the campaign.
Expected Revenue	Amount of money you expect to generate from the campaign.
Last Modified By	User who last changed the campaign fields, including modification date and time. This does not track changes made to any of the related list items on the campaign. (Read only)
Opportunities in Campaign	Calculated field for number of opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Num Sent	Number of individuals targeted by the campaign. For example, the number of emails sent.
Won Opportunities in Campaign	Calculated field for number of closed/won opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Parent Campaign	The campaign above the selected campaign in the campaign hierarchy.
Start Date	Starting date for the campaign.
Status	Status of the campaign, for example, Planned, In Progress. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Total Actual Cost in Hierarchy	Calculated field for the total amount of money spent to run a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or

Updates to this field do not trigger workflow rules.</p>
<p><code>Type</code></p>	<p>Type of campaign, for example, Direct Mail or Referral Program. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.</p>

Sharing Campaigns

Your administrator defines your organization's sharing model for campaign access. However, you can extend sharing privileges for your own campaigns individually. Use campaign sharing to *increase* access to your campaigns; you cannot restrict access beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the campaign detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the campaign. On this page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- To grant access to the record for other users, groups, roles, or territories, click **Add**.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Special Considerations

- To share a campaign, you must have Public Full Access to the campaign and have the `Marketing User` checkbox selected in your personal information.
- The **Sharing** button is available depending on your organization-wide default for campaigns.
- Make sure you are sharing records with users who have the appropriate "Read" object permission for viewing the shared records.
- Sharing a campaign does not automatically grant read access to all the campaign members. Make sure that the user you are sharing a campaign with has visibility to the associated leads or contacts.
- The campaign hierarchy statistic fields provide aggregate data for a parent campaign and all the campaigns below it in the hierarchy, regardless of whether a user has sharing rights to a particular campaign within the hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy statistics. If you do not want users to see aggregate hierarchy data, remove any or all of the campaign hierarchy statistic fields from the [Campaign Hierarchy](#) related list. These fields will still be available for reporting purposes.

Customizable Campaign Influence

Customizable Campaign Influence lets you decide how credit is assigned to each campaign that contributes to bringing in an opportunity.

 **Note:** This information applies only to Customizable Campaign Influence and not to the original version of Campaign Influence.

[Add Influential Campaigns to an Opportunity](#)

Manage lists of campaigns that influence your opportunities directly on opportunity detail pages.

[View Campaign Results](#)

Understand the return on investment for a campaign by seeing the opportunities influenced by a campaign and the total revenue represented by those opportunities.

[Report on Campaign Results](#)

Get a better understanding of your campaigns' return on investment by creating custom report types that combine campaign influence with Opportunities, Campaigns, Contacts, and Accounts.

Add Influential Campaigns to an Opportunity

Manage lists of campaigns that influence your opportunities directly on opportunity detail pages.

 **Note:** This information applies only to Customizable Campaign Influence and not to the original version of Campaign Influence.

Consider these details before adding influential campaigns to your opportunities.

- If your business uses the Salesforce Campaign Influence model, you can't add influential campaigns manually to opportunities. Campaigns are automatically added to opportunities based on the rules your admin defines.
 - If your business uses another campaign influence model and your admin has allowed it, you can add influential campaigns to opportunities yourself.
1. View the detail page of an opportunity.
 2. Click **New** in the Campaign Influence related list.
 3. In the Campaign name field, enter a campaign name or click  to search for a campaign.
 4. If you are using the Salesforce Campaign Influence Model and you want to designate the campaign as the primary campaign, select **Primary Campaign Source**.
 5. Click **Save**.

View Campaign Results

Understand the return on investment for a campaign by seeing the opportunities influenced by a campaign and the total revenue represented by those opportunities.

 **Note:** This information applies only to Customizable Campaign Influence and not to the original version of Campaign Influence.

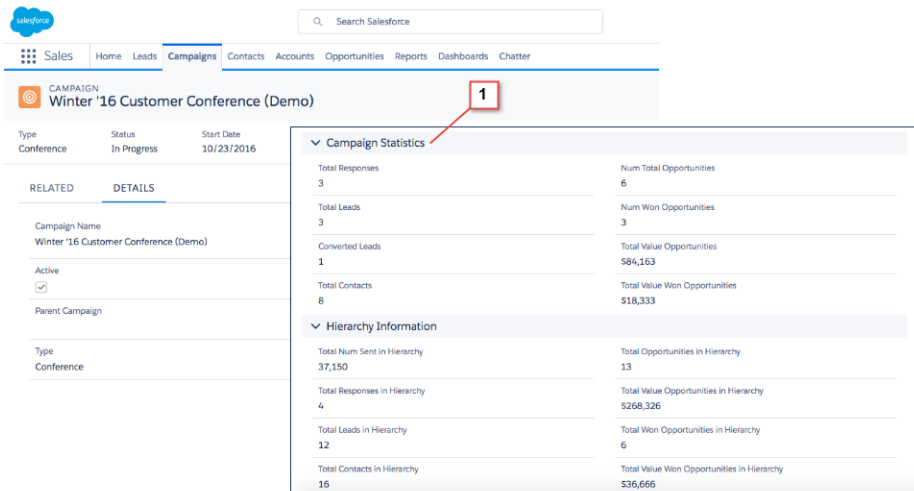

When you view a campaign detail page, the Influenced Opportunities (1) related list displays the opportunities generated by the campaign. The opportunities displayed are based on the primary campaign influence model designated by your admin.

The screenshot shows the Salesforce interface for a campaign named "Winter '16 Customer Conference (Demo)". It features a "Campaign Members" section with a donut chart showing 10 members, and an "Influenced Opportunities (6)" table below it. A red box with the number "1" points to the "Influenced Opportunities" section.

OPPORTUNITY NAME	CLOSE DATE	INFLUENCE (%)	REVENUE SHARE
Acme - 1,200 Widgets (Sample)	4/24/2016	33.33%	\$45,662.00
Acme - 10,000 Widgets (Demo)	6/10/2016	12.80%	\$12,300.00
Acme - 200 Widgets (Sample)	9/16/2016	33.34%	\$6,668.00
Global Media - 250 Widgets (Sample)	4/21/2016	33.33%	\$1,666.50
Salesforce.com - 200 Widgets	4/6/2016	50.00%	\$10,000.00
Salesforce.com - 200 Widgets (Sample)	9/1/2016	33.33%	\$6,666.00

The Campaign Statistics section (1) of the campaign detail page displays a summary of the opportunities generated by the campaign, including the number of opportunities, the total revenue from those opportunities, and the total revenue from won opportunities.

The screenshot shows the "Campaign Statistics" section of the Salesforce interface, which is highlighted with a red box and the number "1". The statistics are as follows:

Campaign Statistics	
Total Responses	3
Num Total Opportunities	6
Total Leads	3
Num Won Opportunities	3
Converted Leads	1
Total Value Opportunities	\$84,163
Total Contacts	8
Total Value Won Opportunities	\$18,333
Hierarchy Information	
Total Num Sent in Hierarchy	37,150
Total Opportunities in Hierarchy	13
Total Responses in Hierarchy	4
Total Value Opportunities in Hierarchy	\$268,326
Total Leads in Hierarchy	12
Total Won Opportunities in Hierarchy	6
Total Contacts in Hierarchy	16
Total Value Won Opportunities in Hierarchy	\$36,666

Report on Campaign Results

Get a better understanding of your campaigns' return on investment by creating custom report types that combine campaign influence with Opportunities, Campaigns, Contacts, and Accounts.

 **Note:** This information applies only to Customizable Campaign Influence and not to the original version of Campaign Influence.

Here are some examples of the custom report types that you can create to see how your campaigns are doing.

- Campaigns with Influenced Opportunities—reports which campaigns drove the most opportunities and had the best return on investment.
- Opportunities with Campaign Influence—reports how much your campaigns influenced your opportunities. Create a separate report for each influence model and add them to a dashboard so you can compare the results in each model.
- Contacts or Accounts with Campaign Influence—reports which contacts or accounts were influenced by campaigns.

Campaign Influence 1.0

Use the original version of Campaign Influence to understand the return on your campaign investments.

 **Note:** This information applies only to the original version of Campaign Influence and not to Customizable Campaign Influence.

Add Influential Campaigns to Opportunities

Manage lists of campaigns that influence your opportunities directly on opportunity detail pages.

 **Note:** This information applies only to the original version of Campaign Influence and not to Customizable Campaign Influence.

Consider these details before adding influential campaigns to your opportunities.

- Though multiple campaigns can be influential, you can designate only one campaign as the primary campaign source on the opportunity.
- The campaign you designate as the primary campaign source will always appear in the Campaign Influence related list.
- The opportunities fields of the campaign statistics section on a campaign detail page will populate for only the campaign you designate as the primary campaign source. For example, you have an email campaign and a telemarketing campaign that both influence the same opportunity, and you designate the email campaign as the primary campaign source. The campaign statistics opportunities fields will populate for only the email campaign.
- When you select `Primary Campaign Source`, the `Primary Campaign Source` field on the opportunity detail page updates with the name of the primary campaign. It's possible that workflow and Apex rules on opportunities can be triggered by this change.
- When you add campaigns using **Add Campaign** in the Campaign Influence related list, campaign member details don't appear in the related list.

Let's now add influential campaigns from the Campaign Influence related list.

1. View the detail page of an opportunity.
2. Click **Add Campaign** in the Campaign Influence related list.
3. Enter a campaign name in the `Campaign name` field or click  to search for a campaign.
4. If you want to designate the campaign as the primary campaign, select `Primary Campaign Source`.
5. Click **Save**.

You can also [configure filter criteria](#) that, when met, will automatically add influential campaigns to opportunities. For example, you can configure a filter to add only email and telemarketing campaigns.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Can I use mass email for my email campaigns?

Mass email is designed for small-scale sales and support mailings, not for marketing purposes. We recommend that you use Salesforce Marketing Cloud or a third-party application in the [AppExchange](#) that allows you to centrally manage email campaigns and track responses.

SEE ALSO:

[Campaigns FAQ](#)

How do I add contacts and leads to campaigns?

Your company's campaigns typically target existing customers (contacts) and prospective customers (leads). You can associate contacts and leads with campaigns as campaign members.

- To add an individual contact or lead to a campaign, click **Add to Campaign** on the contact or lead record, and then select a campaign.
- To add multiple contacts or leads to a campaign, use these tables to find the steps recommended for the source of contact or lead information that you're using.

Contact Source	Steps for Adding Contacts to Campaigns	Maximum Number of Records You Can Add
A report of existing contacts	Add Campaign Members from Standard Reports	50,000 per report
A .csv file of existing contacts	Add Existing Contacts to a Campaign with the Data Import Wizard	50,000 per import file
A .csv file of new contacts	Create Contacts and Add Them to a Campaign with the Data Import Wizard	50,000 per import file
A list view of existing contacts	Add Multiple Members to a Campaign from a List View	250 per list page

Lead Source	Steps for Adding Leads to Campaigns	Maximum Number of Records You Can Add
A report of existing leads	Add Campaign Members from Standard Reports	50,000 per report
A .csv file of existing leads	Add Existing Leads to a Campaign with the Data Import Wizard	50,000 per import file
A .csv file of new leads	Create Leads and Add Them to a Campaign with the Data Import Wizard	50,000 per import file
A list view of existing leads	Add Multiple Members to a Campaign from a List View	250 per list page

SEE ALSO:

[Campaigns FAQ](#)

How can I calculate the ROI for my campaigns?

The Campaign ROI Analysis Report is located on the Reports tab in the Campaign Reports folder. It calculates your campaigns' performance by return on investment (ROI) and average cost. For each campaign in the report:

- ROI, which is expressed as a percentage, is calculated as the net gain (Value Won Opportunities in Campaign - Actual Cost) divided by the Actual Cost.
- Value Won Opportunities in Campaign is the calculated amount of all closed or won opportunities where the campaign is the Primary Campaign Source on the opportunity.

SEE ALSO:

[Campaigns FAQ](#)

How can I track which opportunities resulted from campaigns?

One key benefit of campaigns is the ability to track how much business has been generated from each campaign. When you create an opportunity, you can fill in the `Primary Campaign Source` field to indicate that the opportunity resulted from a specific campaign.

In addition, when you convert a lead that is linked to a campaign, that campaign is automatically inserted into the opportunity `Primary Campaign Source` field.

If a lead or contact is linked to multiple campaigns, the campaign with which he or she is most recently associated is inserted into the opportunity `Primary Campaign Source` field.

The Opportunities related list on a campaign shows every opportunity that is linked to that campaign. You can also run the Campaign Revenue Report to track which opportunities are linked to your campaigns.

SEE ALSO:

[Campaigns FAQ](#)

How is Campaign influence different from ROI reports?

Campaign influence tracks pipeline and revenue for multiple campaigns, and ties all campaigns of a contact role to that opportunity for pipeline and ROI reporting. This is especially helpful for longer deal cycles when more than one campaign contributes to a closed deal or a converted lead.

SEE ALSO:

[Campaigns FAQ](#)

Who has access to campaigns?

Depending on your sharing settings, users in your org can view campaigns, view the advanced campaign setup, or run campaign reports. However, only designated marketing users with the appropriate user permissions can create, edit, and delete campaigns and configure advanced campaign setup. An administrator must select the `Marketing User` option on a user's personal information to designate that user as a marketing user.

In addition, marketing users with the appropriate user permissions can use the Data Import Wizard to add contacts, leads, and person accounts as campaign members. They can also use the Data Import Wizard to update the statuses of campaign members.

[Who can import campaign members?](#)

Explore Your Salesforce Org's Territory Model

A territory model includes a hierarchy and a list view of parent and child territories. If you manage, administer, or belong to a sales territory, you should explore your territory model to understand how Sales efforts are organized. Drill down to get important details on individual territories, including assigned accounts.

 **Note:** This information applies to Enterprise Territory Management only, not to previous versions of Territory Management.

1. From Setup, enter *Territory Models* in the `Quick Find` box, then select **Territory Models**. The list view displays your org's active territory model. Click the model's label if you want to view its detail page. Along with other details, this page tells you the last time account assignment rules were run to realign the territory.
2. From the list view, click the model's **View Hierarchy** link.
3. Click **Tree View** to expand and explore the hierarchy tree.
4. Within the hierarchy, click a territory label to view its detail page, where you can identify its territory type, assigned users and their access levels, assignment rules, and more.
5. From the top of the page, navigate back to the model's territory hierarchy and check out its other territories.

USER PERMISSIONS

To view an active territory model:

- "View Setup and Configuration"

Identify an Account's Sales Territories

Find out which Sales territory an account belongs to.

 **Note:** This information applies to Enterprise Territory Management only, not to previous versions of Territory Management.

1. Open the account record.
2. View the account's territories on the Territory Assignments related list.

SEE ALSO:

[View a List of the Accounts in Your Territories](#)

View a List of the Accounts in Your Territories

Create a list view that shows you which accounts are assigned to the territories you cover.

 **Note:** This information applies to Enterprise Territory Management only, not to previous versions of Territory Management.

The *My Territories* filter shows accounts that belong to the territories you're assigned to. The *My Territory Teams* filter shows accounts for territories you're assigned to *and their descendant territories* (if any).

1. Click the Accounts tab and click **Edit** next to the view menu.
2. Give the view a name, then specify *My Territories* or *My Territory Teams* in the filter criteria. Add other filters if you need them.
3. Choose other fields you want to filter on, then select *Account Name* and any other fields you want the list view to show.
4. Click **Save**.

Managing Accounts by Territory

Territory Management

Territory management is an account sharing system that grants access to accounts based on the characteristics of the accounts. It enables your company to structure your Salesforce data and users the same way you structure your sales territories.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer and Performance Editions** and in **Enterprise and Unlimited Editions** with the Sales Cloud

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management. Original Territory Management is available only with [Customizable Forecasts](#) and is not supported with [Collaborative Forecasts](#). If original Territory Management is enabled, you can no longer use Collaborative Forecasts. The newer Enterprise Territory Management can't be used with [Customizable Forecasts](#). Enterprise Territory Management and Collaborative Forecasts can both be enabled and used at the same time in your Salesforce organization, but the two features are not currently integrated to work together.

Particularly if your organization has a private sharing model, you may need to grant users access to accounts based on criteria such as postal code, industry, revenue, or a custom field that is relevant to your business. You may also need to generate forecasts for these diverse categories of accounts. Territory management solves these business needs and provides a powerful solution for structuring your users, accounts, and their associated contacts, opportunities, and cases.

 **Note:** Account ownership and its effect on record sharing remains valid and unchanged when territory management is in use.

Key benefits of territory management include:

- The ability to use account criteria to expand a private sharing model.
- Support for complex and frequently changed sales organization structures.
- Support for transferring users between territories, with the option to retain opportunities.
- Multiple forecasts per user, based on territory membership.
- Territory-based sales reports.

 **Note:** Territory management only affects accounts and the standard objects that have a master-detail relationship to accounts. For example, opportunities are included in territory management but leads are not.

What Is a Territory?

A territory is a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the account. By configuring territory settings, users in a territory can be granted read, read/write, or owner-like access (that is, the ability to view, edit, transfer, and delete records) to the accounts in that territory. Both accounts and users can exist in multiple territories. You can manually add accounts to territories, or you can define account assignment rules that assign accounts to territories for you.

You can also control users' access to the opportunities and cases associated with the accounts in the territory, regardless of who owns the records.

What Is a Territory Hierarchy?

Territories exist in a hierarchy which you can set up with as many nested levels as you wish. For example, you could create a top-level territory named "Worldwide Sales" that has the child territories "North America," "Europe/Middle East," "Latin America," "Africa," and "Asia/Australia." "North America" might have the child territories "Canada" and "United States." "United States" might have the child

territories “Western,” “Central,” “Southern,” and “Eastern.” Finally, “Western” might have the child territories “California,” “Oregon,” “Washington,” “Nevada,” “Arizona,” and “Utah.”

Territory hierarchies do not have to be focused on geography; they can be defined however you like.

How Do Territories Affect Forecasting?

When you enable territory management for your organization, the territory hierarchy also becomes the forecast hierarchy. Your forecast data is derived from the opportunities that are associated with the accounts in your territories. Users have a different forecast for each territory to which they are assigned. For example, if you are assigned to both “California” and “Arizona,” you have a separate forecast for the opportunities you have in each of these territories.” See [Viewing Customizable Forecasts](#) on page 1571.

[Territory Management FAQ](#)

Managing Territories

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Managing your organization’s territories involves the following tasks:

- Organize territories into hierarchies that represent your organization’s forecasting requirements and how users work in your organization.
- Configure organization-wide settings for territory management.
- Create new territories and edit existing territories.
- Assign users to territories.
- Define account assignment rules that evaluate accounts and assign them to territories.
- Select accounts from lists and manually assign them to territories.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** and **Performance** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

USER PERMISSIONS

To manage territories:

- “Manage Territories”

OR

You are a forecast manager. Forecast managers can manage territories of those users working below them in territory hierarchy.

Assigning Opportunities to Territories

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

An opportunity can be assigned to a territory when the opportunity is created—either manually or during lead conversion—or when account assignment rules run that affect existing opportunities. This topic includes the following sections:

- [Territory Assignment for Manually Created Opportunities](#)
- [Territory Assignment for Converted Leads](#)
- [Notes About Territory Assignment for Opportunities](#)

Territory Assignment for Manually Created Opportunities

When an opportunity is created from the Opportunities tab or from the Quick Create area on the sidebar, Salesforce compares the territories associated with the opportunity's account to the territories that the opportunity owner is a member of:

- If there is a single territory that both the account and the opportunity owner belong to, the opportunity is assigned to that territory if "Evaluate this account against territory rules on save" is selected.
- If more than one territory is common to both the account and the opportunity owner, the opportunity is not automatically assigned to any territory. The opportunity owner must manually assign a territory to the opportunity.
- If no territory is common to both the account and the opportunity owner, the opportunity owner cannot assign the opportunity to a territory.

Territory Assignment for Converted Leads

When a lead is converted to an opportunity, that opportunity's territory assignment depends on several factors, including:

- Whether the account associated with the opportunity is assigned to one or more territories
- Whether the lead owner is a member of the same territory as the account
- The number of users assigned to a territory
- Whether a forecast manager is assigned to the territory

If the account associated with the opportunity is assigned to only one territory, use the following table to determine how the opportunity's territory is assigned:

Lead Owner Belongs to Same Territory as Account	Number of Users Assigned to Territory	A Forecast Manager is Assigned to the Territory	Results
Yes	1	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	1	N/A	The opportunity is assigned to the same territory as the account and the opportunity owner is the sole member of the territory.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** and **Performance** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

USER PERMISSIONS

To create opportunities:

- "Create" on Opportunities

Lead Owner Belongs to Same Territory as Account	Number of Users Assigned to Territory	A Forecast Manager is Assigned to the Territory	Results
No	0	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.
Yes	>1	Yes	The opportunity is assigned to the same territory as the account and the forecast manager becomes the opportunity owner.
Yes	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	>1	Yes	The opportunity is assigned to the forecast manager of the territory.
No	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.

If the account associated with the opportunity is assigned to more than one territory, use the following table to determine how the opportunity's territory is assigned:

Lead Owner's Territory Membership	Results
Lead owner has one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to the account's territory.
Lead owner has more than one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to any territory that he or she has in common with the account.
Lead owner has no territories in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner cannot assign the opportunity to any territories.

Notes About Territory Assignment for Opportunities

- The following actions do not change an opportunity's territory:
 - Manually assigning the opportunity's account to a territory

- Changing which account is associated with the opportunity
- Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
- Transferring the opportunity to a new owner
- Territory assignment rules do not update an opportunity if the opportunity's `Close Date` is before the current date and the opportunity's `Stage` is `Closed Won` or `Closed Lost`.
- When an opportunity is not automatically assigned to a territory, we recommend that users be notified if the opportunity is not assigned to a territory manually within one day. You can set up time-based workflow to notify users about unassigned opportunities.
- Restoring an account or opportunity from the Recycle Bin restores the territory assignment, but it does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are inconsistent with the new rules.
- When opportunities are transferred from one user to another, whether individually or as a group, the territory assignment on the opportunities is unaffected. However, if the opportunities are assigned to a user who is not already a member of the opportunity's territory, that user is added as an inactive member of the territory.
- When users are removed from a territory, you can specify who should receive their open opportunities. Also, when users are transferred from one territory to another, you can specify which opportunities the users should continue to own and select a recipient for any remaining opportunities. If you do not specify a recipient:
 - If the parent territory has a forecast manager, the forecast manager takes ownership of the user's open opportunities. The forecast manager is assigned to the territory and `Active in Territory` is unchecked.
 - If the parent territory does not have a forecast manager, the user remains in the territory and `Active in Territory` is unchecked.

How does Salesforce handle territory management?

-  **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

In Developer and Performance Edition orgs, and in Enterprise and Unlimited Edition orgs with the Sales Cloud, you can enable Territory Management to organize your users into territories and provide access to accounts and their related opportunities and cases.

In Professional Edition orgs, Salesforce's role hierarchy allows you to manage the roll-up of information among your company's territories. The hierarchy structure is not based on traditional titles, but rather on a hierarchy of roles. Multiple people with different titles can be assigned to the same role. Users always have access to the data that is owned by or shared with users assigned to roles below them in the hierarchy. A user's role also determines which data is accessible to him or her in forecasts.

A typical org may have three levels of roles, for example:

- The top role may include your VPs of sales, marketing, and client services, and your CFO. These users will be able to view all information at lower levels and perform roll-ups on that information.
- The middle level may include various vice president or regional managers. These roles can access the data owned by or shared with all users below them in the hierarchy. For example, the Western VP role can view and perform roll-ups of the information owned by users in the Western Reps role.
- Since no roles are below the various Reps roles, the users in those roles cannot perform any roll-ups or view anyone's information except their own.

-  **Note:** Your role hierarchy interacts with your org's sharing model to determine exactly what information a user can see, given the sharing setting is selected to use hierarchies. For forecasts, a user's role always determines which information he or she can view, regardless of the sharing model. Likewise, in a Private sharing model, a user's role determines his or her access to other users' data. However, in a Public Read/Write or Public Read Only org, users can view (and edit, for Public Read/Write) information of all other users, in addition to having access to the data of users below them in the hierarchy.

Are opportunities transferred to different users when account assignment rules are run?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

When account assignment rules cause an opportunity to be reassigned to a territory to which you already belong, you automatically become the owner of that opportunity when you meet any of the following criteria:

- You are the only member of the territory.
- You are the only forecast manager in the territory.
- You are the only territory member enabled for forecasting.

If none of these criteria are met, the original opportunity owner is added to the territory as an inactive member.

SEE ALSO:

[Territory Management FAQ](#)

Are the territory hierarchy and the role hierarchy different?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Yes. The territory hierarchy and the role hierarchy are independent. See the following comparison:

Territory Hierarchy	Role Hierarchy
Is available by contacting Salesforce	Is available by default
Determines forecasts	Has no impact on forecasting when territory management is enabled
Supports assigning a user to multiple territories	Supports assigning a user to only one role
Affects account and opportunity reports	Affects all other reports
Grants access to records regardless of ownership. Users receive whatever access is most permissive across both hierarchies.	Grants access to records based on ownership. Users receive whatever access is most permissive across both hierarchies.

SEE ALSO:

[Territory Management FAQ](#)

How are opportunities assigned to territories?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Opportunities are automatically assigned to territories based on the following actions.

- Creating a new opportunity
- Running account assignment rules

When account assignment rules are run, opportunities are automatically assigned to the same territory as the account when:

- An opportunity does not have a territory and its account is added to a territory.
- An account moves from one territory to another. However, if an account assignment rule prohibits opportunities from moving outside a given part of the territory hierarchy, the opportunities do not move and no longer belong to any territories.

Opportunities are not automatically assigned to the same territory as the account when:

- An account is removed from a territory and not reassigned to a new territory in the same operation. The account's opportunities from the original territory no longer belong to any territories.
- An account is reassigned to multiple territories in one operation. The account's opportunities from the original territory no longer belong to any territories, unless the `Confine Opportunity Assignment` checkbox is checked.

 **Note:** If the opportunity owner is not part of the new territory, he or she is added as an inactive member of the territory.

The following actions do not change an opportunity's territory.

- Manually assigning the opportunity's account to a territory
- Changing which account is associated with the opportunity
- Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
- Transferring the opportunity to a new owner.

SEE ALSO:

[Territory Management FAQ](#)

How do manually assigned accounts differ from those assigned by account assignment rules?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Manually assigned accounts are not evaluated when running account assignment rules. After they have been manually assigned to a territory, they remain there until they are manually removed from the territory.

SEE ALSO:

[Territory Management FAQ](#)

How does opportunity confinement work?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

If the `Confine Opportunity Assignment` checkbox is selected for a territory, the territory's opportunities remain in the territory or its child territories when you run account assignment rules. The following exceptions apply:

- If an opportunity's account moves to only one of the territory's children, then the opportunity follows the account and is reassigned to the account's new territory. This includes when an account moves to multiple territories and only one of the new territories is a child of the original territory.
- If an opportunity's account moves to more than one of the territory's children, then the opportunity's territory field is set to blank.
- If an opportunity's account moves completely out of the territory and its children, then the opportunity's territory field is set to blank.

SEE ALSO:

[Territory Management FAQ](#)

Must I be assigned to the same territories as the opportunities I own?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

When an open opportunity is assigned to you and you do not belong to that opportunity's territory, you are assigned to the territory with `Active in Territory` unchecked in the Assigned Users related list of the territory.

SEE ALSO:

[Territory Management FAQ](#)

What happens when I undelete an account or opportunity that was assigned to a territory?

Note: This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Undeleting an account or opportunity restores the territory assignment, but does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are not consistent with the new rules.

SEE ALSO:

[Territory Management FAQ](#)

What kinds of records have territories?

Note: This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Accounts, opportunities, and users have territory fields. Accounts and users can be associated with multiple territories. An opportunity can be associated with only one territory.

SEE ALSO:

[Territory Management FAQ](#)

When do account assignment rules evaluate accounts?

Note: This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Active account assignment rules automatically evaluate accounts and assign them to territories when:

- An account is created using the Salesforce user interface, the Force.com API version 20.0 or earlier, or a client such as Connect Offline.
- An account is imported using an import wizard.
- An account is created by the conversion of a lead.
- An account is edited and saved if the `Select by default` checkbox is selected for the "Evaluate this account against territory rules on save" checkbox option under **Layout Properties**. If the account assignment rule initiates an opportunity ownership change, you must have transfer access on the opportunity.
- An account is edited and saved via the Force.com API.
- **Run Rules** is clicked on a territory detail page, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.
- **Save & Run Rules** is clicked on the manage account assignment rules page for a territory, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.

- Duplicate accounts are merged.

Tracking Potential Opportunities as Leads

Leads

Track prospects apart from your contacts and opportunities with Salesforce lead records. After you've qualified your lead records, convert them to contacts and create accounts for them (if you don't already have the accounts in Salesforce). And hopefully, create opportunities to bolster your pipeline.

Regardless of whether you're working in Lightning Experience or Salesforce Classic, you work with a list of leads. From the list, you quickly create, locate, and work with the leads you're focusing on at the moment.

Associate relevant events and tasks with those leads. And convert your qualified leads to contacts that have opportunities associated to them. For any lead records that you mark Unqualified, plan to revisit them later to see whether those prospects' needs for your products and services changed.

SEE ALSO:

[Convert Qualified Leads](#)

[Manage Email and Templates in Lightning Experience](#)

[Manage Work and View Past Activity in Lightning Experience](#)

Guidelines for Creating Leads

Get some guidance when you manually create leads to track your prospects.

- From the Leads tab, you can automatically assign the lead using the active lead assignment rule. To do so, select `Assign using active assignment rules`. Otherwise, the lead belongs to you.

If you automatically assign the new lead, the record type of the lead can change, depending on the behavior your admin specified for assignment rules.

- If your sales team uses divisions (Salesforce Classic only), the division of a new lead is automatically set to your default division, unless you manually select a different one.
- Your admin determines the default lead status for new leads.
- The lead is marked Read and doesn't appear in the My Unread Leads list view. In Salesforce Classic, if you click **Save & New**, the lead is marked Unread.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Leads Home

Clicking on the Leads tab displays the leads home page.

- In the **Lead Views** section, select a list view from the drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.

To view the leads in a queue, choose that queue list from the drop-down list. For every queue your administrator creates, Salesforce adds a corresponding queue list view.

 **Note:** The org-wide sharing model for an object determines the access users have to that object's records in queues:

Public Read/Write/Transfer

Users can view and take ownership of records from any queue.

Public Read/Write or Public Read Only

Users can view any queue but only take ownership of records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

Private

Users can only view and accept records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

Regardless of the sharing model, users must have the "Edit" permission to take ownership of records in queues of which they are a member. Salesforce admins, users with the "Modify All" object-level permission for Cases or Leads, and users with the "Modify All Data" permission, can view and take records from any Case or Lead queue regardless of their membership in the queue.

- In the **Recent Leads** section, select an item from the drop-down list to display a brief list of the top leads matching that criteria. From the list, you can click any lead name to go directly to the lead detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Leads Tab" search layout defined by your administrator and by your field-level security settings (available in Professional, Enterprise, Unlimited, Performance, and Developer Editions). The Recent Leads choices are:

Recent Leads Choice	Description
My Unread Leads	The last ten or twenty-five leads assigned to you which you have not yet viewed or edited. This list only includes records owned by you.
Recently Viewed	The last ten or twenty-five leads you viewed, with the most recently viewed lead listed first. This list is derived from your recent items and includes records owned by you and other users.
Recently Created	The last ten or twenty-five leads you created, with the most recently created lead listed first. This list only includes records owned by you.

- If Quick Create has been enabled by your administrator, you can add a new lead from the **Quick Create** area in the sidebar on the leads homepage. Alternatively, click **New** next to the **Recent Leads** section to create a new lead.

Reassign Leads from a Queue

Accepting leads from a queue is an easy way to reassign leads to yourself.

1. Go to a list view that shows a lead queue. If you don't see a lead queue, ask your admin to add you as queue member.
2. Select the leads you want to own.
3. Click **Accept**.

To reassign a single lead from a queue, go to the record detail page and change the record owner.

Lead Fields

A lead has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the lead record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com lead fields are available only to organizations that use a specific Data.com product.

Field	Description	Accepts Data.com or D&B Value
Address	Street address for the lead, for example, 475 Boardwalk Ave. Up to 255 characters are allowed in this field.	✔ (Data.com)
Annual Revenue	Amount of annual revenue at lead's company.	✔ (D&B)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To change or accept ownership of leads from a queue:

- "Edit" on leads

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description	Accepts Data.com or D&B Value
Campaign	Name of the campaign responsible for generating the lead. Displays only when creating a new lead. Data entered in this field is stored in the Campaign History related list on the lead.	
City	City portion of the lead's address, for example, San Francisco. Up to 40 characters are allowed in this field.	✔ (Data.com)
Clean Status	The record's clean status, as compared with Data.com. Values are Not Compared , In Sync , Reviewed , Different , Not Found , and Inactive . This field is available if you use Data.com Prospector or Data.com Clean.	✔ (Data.com)
Company	Name of company with which lead is affiliated. Up to 255 characters are allowed in this field.	✔ (D&B)
Company D-U-N-S Number	Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. This field is available if you use Data.com Prospector or Data.com Clean.  Note: To see the entire D-U-N-S number, either <ul style="list-style-type: none"> • Add the lead to Salesforce if you haven't yet, or • Clean the lead with Data.com if it already exists in Salesforce Until you add or clean the record, its first five digits will be masked with asterisks (*).	✔ (D&B)
Company Name (Local)	Name of the company in the local language.	
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Created By	User who created the lead, including creation date and time. (Read only)	
D&B Company	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the lead. Use the lookup if you need to associate a different D&B Company record with the lead. This field is only available to organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)
Data.com Key	The company's ID in Data.com. When Salesforce records are compared with Data.com records (via manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
Description	Description of the lead. Up to 32KB of data are allowed in this field. Only the first 255 characters appear in reports.	

Field	Description	Accepts Data.com or D&B Value
Do Not Call	Whether the contact wants to be contacted by phone. If you use Data.com, the <code>Phone</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.	
Email	Email address of lead. Must be a valid email address in the form: <code>jsmith@acme.com</code> . Up to 80 characters are allowed in this field. Click the email address in this field to send an email using your personal email application. If the Gmail Buttons and Links feature is enabled, you can click the Gmail link next to the field to send an email from your Gmail account. See Gmail™ in Salesforce on page 3898 for more information.	✔ (Data.com)
Email Opt Out	Whether the contact wants to receive email. If you use Data.com, the <code>Email</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.	
Fax	Lead's fax number. Up to 40 characters are allowed in this field.	
Fax Opt Out	Lead has not requested to be included in broadcast faxes.	
First Name	First name of the lead, as displayed on the lead edit page. Up to 40 characters are allowed in this field.	✔ (Data.com)
First Name (Local)	First name of the lead translated into the local language.	
Industry	Primary business of lead's company. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Last Name	Last name of the lead, as displayed on the lead edit page. Up to 80 characters are allowed in this field.	✔ (Data.com)
Last Name (Local)	Last name of the lead translated into the local language.	
Last Transfer Date	The date the lead owner was last changed.	
Lead Currency	The default currency for all currency amount fields in the lead. Amounts display in the lead currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Lead Division	Division to which the lead belongs. Available only in organizations that use divisions to segment their data.	
Lead Owner	Assigned owner of the lead.	
Lead Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a lead process. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.	

Field	Description	Accepts Data.com or D&B Value
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Lead Status	Status of the lead, for example, Open, Contacted, Qualified. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Middle Name	Middle name of the lead, as displayed on the lead edit page. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	
Middle Name (Local)	Middle name of the lead translated into the local language.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	
Mobile	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	
Modified By	User who last changed the lead fields, including modification date and time. This does not track changes made to any of the related list items on the lead. (Read only)	
Name	Combined first name, middle name (beta), last name, and suffix (beta) of lead, as displayed on lead detail page.	✔ (Data.com)
No. of Employees	Number of employees at the lead's company.	✔ (D&B)
Phone	Lead's primary phone number. Up to 40 characters are allowed in this field.	✔ (Data.com)
Partner Account	Read-only field that indicates the lead is owned by a partner user.	
Rating	Indicates value or prospect of the lead, for example, Hot, Warm, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Read	Flag indicating that the lead has been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Read" do not contain a check mark in the Unread column on leads list views.	
Salutation	Title for addressing the lead, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	

Field	Description	Accepts Data.com or D&B Value
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Suffix	Name suffix of the lead, as displayed on the lead edit page. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select <i>Enable Name Suffixes for Person Names</i> .	
Title	Position of lead within his or her company. Up to 80 characters are allowed in this field.	✔ (Data.com)
Unread	Flag indicating that the lead has not been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Unread" contain a check mark in the Unread column on leads list views.	
Custom Links	Listing of custom links for leads as set up by your administrator.	
Website	URL of company's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	
ZIP	ZIP code or postal code portion of the lead's address. Up to 20 characters are allowed in this field.	✔ (Data.com)

Convert Qualified Leads

Keep the sales process moving when you qualify a lead and then convert it to a contact. Relate that contact to either an existing account in Salesforce, or an account that you create. And if the lead you're converting results in a deal that looks promising, create an opportunity record at the same time.

Keep in mind that you can't reverse lead conversion. When you convert leads to contacts or accounts, the process sometimes creates duplicate records. If so, we show you a warning (custom warnings set up by your administrator do not appear during lead conversion). How these duplicate records are handled depends on how your administrator has set up Apex Lead Convert and Duplicate Management. For example, your administrator can require that you resolve the duplicates before you finish converting.

Once converted, a lead record is no longer searchable, unless your admin has assigned you the "View and Edit Converted Leads" permission. The new account, contact, or opportunity record created from the converted lead is searchable. In Lightning Experience, both the converted lead record and the new record based on the converted lead are searchable. However, you can't view or edit the converted lead record from the search results page.

1. In a lead record, choose to convert the lead.
2. Select an account, or enter a name for an account that you're creating.
3. *Salesforce Classic only*: If you update a person account, select the option to overwrite the lead source in the person account with the value from the lead.
4. If you create an opportunity record, give it a name.
5. Convert the lead.

- [Lead Conversion Mapping](#)

Considerations for Converting Leads

Learn what happens to qualified leads when you convert them to accounts, contacts, and opportunities.

When you convert qualified leads, Salesforce moves any campaign members to the new contacts. The leads become read-only records, unless your administrator gives you permission to edit them. If existing accounts and contacts share the names specified on the leads, you can choose to update the existing accounts and contacts. Salesforce adds information from the lead into empty fields; Salesforce does not overwrite existing account and contact data.

All open and closed activities from the leads are attached to the accounts, contacts, and opportunities. You can assign the owners of these new records, and schedule follow-up tasks. When you assign new owners, only the open activities are assigned to the new owner. If you have custom lead fields, that information can be inserted into custom account, contact, or opportunity fields.

Your admin can also set up your custom lead fields to populate custom account, contact, and opportunity fields automatically. You can't view converted leads, unless your admin has assigned you the "View and Edit Converted Leads" permission. However, converted leads do appear in lead reports. Salesforce updates the `Last Modified Date` and `Last Modified By` system fields on converted leads when picklist values included on converted leads are changed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To convert leads:

- "Create" and "Edit" on leads, accounts, contacts, and opportunities

AND

"Convert Leads"

AND

"Read" on any related campaigns

To avoid creating duplicate records when converting leads:

- "Require Validation for Converted Leads"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Campaigns	<p>If the lead matches an existing contact and both records are linked to the same campaign, the campaign member status is determined by whichever is further along in the lifecycle of the campaign. For example, if the lead member status is “sent” and the contact member status is “responded,” the responded value is applied to the contact.</p> <p>Related campaign information is always associated with the new contact record, regardless of the user's sharing access to the campaign.</p> <p>When more than one campaign is associated with a lead, the most recently associated campaign is applied to the <code>Primary Campaign Source</code> field on the opportunity, regardless of the user's sharing access to the campaign.</p>
Chatter	<p>When you convert a lead to an existing account, you don't automatically follow that account. However, when you convert the lead to a new account, you automatically follow the new account, unless you disabled feed tracking for accounts in your Chatter settings.</p>
Data.com / D&B Company	<p>If you use Data.com Premium, when you add a lead from Data.com, a corresponding D&B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the lead record via its <code>D&B Company</code> field. If you later convert that lead:</p> <ul style="list-style-type: none"> • And if the account is created from the conversion, the lead's <code>Company D-U-N-S Number</code> field value transfers to the account's <code>D-U-N-S Number</code> field, and the lead's <code>D&B Company</code> field value transfers to the account's <code>D&B Company</code> field. • Its <code>Data.com Key</code> field value transfers to the contact's <code>Data.com Key</code> field. <p>If you use Data.com Corporate, no D&B Company record is created, but the lead's <code>Data.com Key</code> field value transfers to the contact's <code>Data.com Key</code> field.</p>
Divisions	<p>The new account, contact, and opportunity are assigned to the same division as the lead. If you update an existing account during lead conversion, the account's division is not changed, and the new contact and opportunity inherit the account's division.</p>
Duplicate Management	<p>When you convert leads to contacts or accounts, the process sometimes creates duplicate records. If so, we show you a warning (custom warnings set up by your administrator do not appear during lead conversion). How these duplicate records are handled depends on how your administrator has set up Apex Lead Convert and Duplicate Management. For example, your administrator can require that you resolve the duplicates before you finish converting.</p>
Enterprise Territory Management	<p>Filter-based opportunity territory assignment is not triggered when an opportunity is created through lead conversion.</p>
New Accounts and Contacts	<p>When <i>new</i> accounts or contacts are created during lead conversion, the values of mapped lead fields <i>overwrite</i> the default values of the mapped account and contact fields.</p>
Existing Accounts and Contacts	<p>When updating <i>existing</i> accounts or contacts during lead conversion, the values of mapped lead fields <i>do not</i> overwrite the values of the mapped account and contact fields.</p>
Local Lead Names	<p><code>Company Name (Local)</code> on the lead automatically maps to <code>Account Name (Local)</code>, along with their associated standard name fields.</p>

Person Accounts	<p>With person accounts enabled, you can convert leads to either person accounts or business accounts. Leads that don't have a value in the <code>Company</code> field are converted to person accounts. Leads that do have a value in the <code>Company</code> field are converted to business account.</p> <p>We recommend that you use different lead record types and page layouts to differentiate leads that convert to person accounts from those that convert to business accounts. Specifically, remove the <code>Company</code> field from the page layouts for leads that convert to person accounts. Then, make the <code>Company</code> field required on the page layouts for leads that convert to business accounts.</p> <p>If you convert a lead and attach it to a person account that someone else owns, that person account owner becomes the contact owner.</p> <p>If you convert a lead that someone else owns and attach it to a person account that you own, the lead owner becomes the contact owner.</p>
Record Types	<p>If the lead has a record type, the default record type of the user converting the lead is assigned to records created during lead conversion.</p> <p>The default record type of the user converting the lead determines the lead source values available during conversion. If the desired lead source values are not available, add the values to the default record type of the user converting the lead.</p>
Salesforce to Salesforce	<p>When you convert a lead, Salesforce to Salesforce inactivates the shared record and updates the External Sharing related list in your connection's lead record with an Inactive (converted) status. Due to inactivation of the shared record, changes to the Lead Status during conversion aren't reflected in your connection's lead record.</p>
Search	<p>Once converted, a lead record is no longer searchable in Salesforce Classic. However, the new account, contact, or opportunity record created from the converted lead is searchable. In Lightning Experience, both the converted lead record and the new record based on the converted lead are searchable; however, you can't access the converted lead record to view or edit from the search results page.</p>
Standard and Custom Lead Fields	<p>The system automatically maps standard lead fields to standard account, contact, and opportunity fields.</p> <p>For custom lead fields, your administrator can specify how they map to custom account, contact, and opportunity fields.</p> <p>The system assigns the default picklist values for the account, contact, and opportunity when mapping standard lead picklist fields that are blank. If your organization uses record types, blank values are replaced with the default picklist values of the new record owner.</p>
Territory Management	<p>If your organization uses territory management, account assignment rules evaluate the new account and can assign it to one or more territories. If the rules assign the account to exactly one territory, then the opportunity is also assigned to that territory. If the rules assign the account to multiple territories, then the opportunity is not assigned to any territory.</p>
Apex Triggers	<p>During lead conversion, triggers fire. Universally required custom fields and validation rules are enforced.</p> <p>When updating a lead, triggers that cause the lead to convert can cause a warning. The warning tells the user that the lead is no longer accessible to them. The lead is inaccessible because it has been converted to a contact. Refer to the new contact instead.</p> <p>If the <code>Require Validation for Converted Leads</code> checkbox on the Lead Settings page is deselected, Salesforce ignores lookup filters when converting leads.</p>

Workflow You can't convert a lead that's associated with an active approval process or has pending workflow actions. Converting a lead to a person account won't trigger workflow rules.

When a lead is converted by someone who isn't the lead owner, all workflow tasks associated with the lead that are assigned to that user, except email alerts, are reassigned to the lead owner. Workflow tasks assigned to users other than the lead owner and lead converter aren't changed.

If validation and triggers for lead convert are enabled, then converting a lead can trigger a workflow action on a lead. For example, if there's an active workflow rule that either updates a lead field or transfers the owner of a lead, that rule can trigger when the lead is converted, even if the lead isn't visible on the Leads tab as a result of the conversion. Allow the workflow process to finish before updating lead fields, otherwise save or lead convert fails. If a workflow rule creates a task as a result of a lead conversion, the task is assigned to the newly created contact and related to the associated account or opportunity.

Lead Sharing in Salesforce Classic

Extend sharing privileges beyond the basic sharing model for your own data on a lead-by-lead basis.

Your administrator defines the sharing model for your company. And if that sharing model for leads is Private or Public Read Only, you can use lead sharing to increase access to your leads. You cannot, however, restrict access beyond your company’s default access levels.

You can see sharing details when you click **Sharing** on the lead detail page.

[Merge Duplicate Leads in Salesforce Classic](#)

Work only the prospects that matter by merging duplicate records.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Considerations for Merging Duplicate Leads

Keep these considerations in mind when you merge duplicate lead records.

- When duplicate leads that are members of different campaigns are merged, Salesforce retains the campaign `Member Status Updated` date for each campaign the merged lead is a member of.
- When duplicate records are related to items such as campaigns or activities, Salesforce relates the items to the merged record, with some exceptions. Chatter feeds are retained from the master record only. Attachments in Chatter feeds are retained in Salesforce but aren't associated with the merged record. To associate the dropped files with the merged record, find them in Files home (in Lightning Experience) or the Files tab (in Salesforce Classic). Then add them to the Files related list on the merged record.
- Salesforce retains any data in hidden or read-only fields, such as sharing settings, from the master record. Hidden fields aren't shown while you merge. A merged record retains the `Created By` user and `Created Date` from the oldest record merged, regardless of which record is the master. The record shows the merge date as the `Last Modified By` date.
- In all requested meetings, the master record replaces the duplicate records. Also, all meeting messages written by the duplicate records are automatically associated with the master. (Meeting messages appear on the requested meeting's Web page and are visible to all invitees.)
- In all scheduled meetings, the master record replaces the duplicate records. However, you must add the new master record to the meeting invitee list in the scheduled meeting.

[Merge Duplicate Leads in Salesforce Classic](#)

Merge Duplicate Leads in Lightning Experience

Work only the prospects that matter by merging duplicate records.

1. Choose a lead record. If duplicates exist, they're listed in a Potential Duplicates related list. Or click the **View Duplicates** link that appears on the lead.
2. Choose up to three lead records to merge. Click **Continue**.
3. Choose one lead record as the master.
4. Choose the field values that you want to keep.
5. Confirm that you want to merge the records by clicking **Next**, and then click **Merge Leads**.

SEE ALSO:

[Considerations for Merging Duplicate Leads](#)

Merge Duplicate Leads in Salesforce Classic

Work only the prospects that matter by merging duplicate records.

1. Select a lead record.
2. Click **Find Duplicates**.
3. Select up to three leads in the matching leads list that you want to merge.

If you want, enter a new lead name or company and click **Search** to find another lead to merge. Salesforce performs a phrase search for matches in the `Name` and `Company` fields. It also considers an implied wildcard after any entry. Search results include matches for any fields you enter. For example, you enter *Bob Jones* who works at *Acme*. Search results include anyone named *Bob Jones* at any company and any lead with *Acme* as a company.
4. Click **Merge Leads**.
5. Select one lead as the "Master Record." Salesforce retains any data from hidden or read-only fields in the Master Record. If you have the "Edit Read Only Fields" permission, you can select which read-only fields to retain. Hidden fields don't appear during the merge process.
6. Select the fields that you want to retain from each record.
7. Click **Merge**.
8. Click **OK**.

- [How are lead fields mapped to other fields during conversion?](#)

What is a Lead?

Leads are people who are interested in your product and service. Converting leads to loyal customers will provide success within a business. By managing your leads in a systematic and structured way, you can increase both the numbers of leads you generate and how many leads you convert.

SEE ALSO:

[Leads FAQ](#)

What are the advantages of using leads?

Using leads allows your company to maintain two separate lists - one for prospective customers and one for existing customers. You can store your prospects as leads, and then once a lead becomes qualified, you can convert it to an account, contact, and, optionally, an opportunity.

Leads are especially useful if your company has two separate teams - one that handles lead generation and mass marketing and one that handles sales. The lead generation team can concentrate their work on the Leads tab, and the opportunity team can use the Account, Contact, and Opportunity tabs.

SEE ALSO:

[Leads FAQ](#)

Can I convert existing accounts or contacts into leads?

No. As an alternative, create an opportunity for the account or contact. If you prefer to use a lead, create a report containing the accounts or contacts you want to convert into leads, export them, and then import them as leads.

SEE ALSO:

[Leads FAQ](#)

How many leads can we capture from our website?

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, you can capture up to 500 leads in a 24-hour period. If your organization exceeds its daily Web-to-Lead limit, the Default Lead Creator (specified in the Web-to-Lead setup page) receives an email containing the additional lead information. If your company regularly exceeds the Web-to-Lead limit, click **Help & Training** at the top of any page and select the My Cases tab to submit a request for a higher limit directly to Salesforce.

When your organization reaches the 24-hour limit, Salesforce stores additional requests in a pending request queue that contains both Web-to-Case and Web-to-Lead requests. The requests are submitted when the limit refreshes. The pending request queue has a limit of 50,000 combined requests. If your organization reaches the pending request limit, additional requests are rejected and not queued. Your administrator receives email notifications for the first five rejected submissions. Contact Salesforce Customer Support to change your organization's pending request limit.

SEE ALSO:

[Leads FAQ](#)

What if my company reaches the limit for web-generated leads?

The daily limit for Web-to-Lead requests is 500. If your company generates more leads than the maximum allowed, the Default Lead Creator (specified in the Web-to-Lead setup page) will receive an email containing the captured information. Contact Customer Support if your company would like to generate over 500 Web-to-Lead requests per day.

SEE ALSO:

[Leads FAQ](#)

Can I capture leads from multiple web pages?

Yes. Insert the generated HTML code into the web pages from which you want to capture leads. Whenever someone submits information on any of those web pages, a lead will be created.

SEE ALSO:

[Leads FAQ](#)

How can our webmaster test the Web-to-Lead page?

Add the following line to your Web-to-Lead page code if you want to see a debugging page when you submit the form. Don't forget to remove this line before releasing the Web-to-Lead page on your website.

```
<input type="hidden" name="debug" value="1">
```

SEE ALSO:

[Leads FAQ](#)

Who owns new web-generated leads?

Your administrator can create a lead assignment rule to determine how web leads will be automatically assigned to different users or queues. In addition, your administrator must customize the Lead Settings to specify a Default Lead Owner to whom all web leads will be assigned if the assignment rule fails to locate an owner. If you do not use assignment rules, all web leads will be assigned to the Default Lead Creator (specified in the Web-to-Lead setup).

SEE ALSO:

[Leads FAQ](#)

What status is assigned to web-generated leads?

All new web leads are marked with a status equal to the "default status" that your administrator selects when editing the `Lead Status` picklist values. In addition, web-generated leads are marked with the "Unread" flag; they have a check mark in the Unread column on the lead list views. When a user views or edits a new web lead, the lead is automatically set to "Read." This way you can easily locate all new leads using the My Unread Leads list view.

SEE ALSO:

[Leads FAQ](#)

How can I be sure that leads won't be lost?

The daily limit for Web-to-Lead requests is 500. If your organization exceeds its daily Web-to-Lead limit, the Default Lead Creator (specified in the Web-to-Lead setup page) receives an email containing the additional lead information.

If a new lead cannot be generated due to errors in your Web-to-Lead setup, Customer Support is notified so that we can assist you in correcting it.

Salesforce ensures that your leads won't be lost if they are submitted during a scheduled Salesforce downtime.

SEE ALSO:

[Leads FAQ](#)

How can I tell which of my leads are new?

When a lead is assigned to you, either manually transferred, imported, or generated from the web, the lead is marked as "Unread," that is, it has a check mark in the Unread column on leads list views. To view your new leads, select the My Unread Leads list view on the Leads tab. When you view or edit an "Unread" lead, it is automatically marked as "Read."

SEE ALSO:

[Leads FAQ](#)

What happens when I convert leads?

When you convert leads, Salesforce creates accounts, contacts, and opportunities using information from the leads you're converting. Salesforce moves any campaign members to the new contacts, and the leads become read-only records. If existing accounts and contacts share the names specified on the leads, you can choose to update the existing accounts and contacts. Salesforce adds information from the lead into empty fields; Salesforce does not overwrite existing account and contact data.

All open and closed activities from the leads are attached to the accounts, contacts, and opportunities. You can assign the owners of these new records, and schedule follow-up tasks. When you assign new owners, only the open activities are assigned to the new owner. If you have custom lead fields, that information can be inserted into custom account, contact, or opportunity fields. Your admin can also set up your custom lead fields to populate custom account, contact, and opportunity fields automatically. You can't view converted leads, unless your admin has assigned you the "View and Edit Converted Leads" permission. However, converted leads do appear in lead reports. Salesforce updates the `Last Modified Date` and `Last Modified By` system fields on converted leads when picklist values included on converted leads are changed.

Once converted, a lead record is no longer searchable, unless your admin has assigned you the "View and Edit Converted Leads" permission. The new account, contact, or opportunity record created from the converted lead is searchable.

SEE ALSO:

[Leads FAQ](#)

How are lead fields mapped to other fields during conversion?

When you convert a lead, data in standard lead fields is transferred into standard account, contact, and opportunity fields. For custom lead fields, the data is mapped to custom account, contact, and opportunity fields as specified by your admin.

Any standard lead picklist fields that are blank inherit the default picklist value for accounts, contacts, and opportunities. If you use record types, all records created during lead conversion adopt the default record type for the owner of the newly created account, contact, and opportunity.

SEE ALSO:

[Lead Conversion Mapping](#)

[Leads FAQ](#)

Can I automatically email leads that come from my website?

Yes. You can create auto-response rules to email these prospects using templates that vary based on criteria that you set up.

SEE ALSO:

[Generate Leads from Your Website for Your Sales Teams](#)

[Leads FAQ](#)

Why can't I see the **Sharing** button on a record in Salesforce Classic?

The **Sharing** button lets users grant other users access to a record beyond the organization-wide defaults or sharing rules. You can easily remove this access after it's no longer needed.

You have access to the **Sharing** button when your sharing model is either Private or Public Read Only for a type of record or related record. For example, the **Sharing** button may appear on an account even though your organization-wide default for accounts is Public Read/Write, if your organization-wide default for related opportunities is Public Read Only.

When the button is available on the page layout, administrators see the button on all records. Non-administrators see this button on records that only they own.

Managing Activities, Opportunities, and Products

Plan and Track Meetings and Tasks

Activities

Events and tasks are the engine of sales productivity. With Salesforce, you can be prepared for any meeting and know which task is your highest priority right now. Track meetings and tasks together in lists and reports to keep your finger on the pulse of all your leads, contacts, opportunities, accounts, and campaigns. Events and tasks also serve historical reporting purposes in Salesforce. Whether you're a manager delegating tasks, part of a sales team, or a sales rep who closes 50 deals a month, activities in Salesforce help you power through your day.

1. [Track Activities Together](#)

Activities in Salesforce are your events, your tasks, calls you've made, and emails you've sent. Salesforce gives you multiple ways to track your activities together for a more complete picture of your progress on deals and accounts.

2. [How to Track Your Next Steps and Past Activity](#)

See at a glance what just happened and what to do next on the deals and accounts that you're working on.

3. [Considerations for Using Activities](#)

Keep in mind these considerations for using activities, including the effects of enabling Shared Activities and designating primary contacts, as well as understanding how activities roll up to account records and what the Last Activity date represents.

4. [Considerations for Changing How Activities Roll Up to Accounts](#)

By default, the `Related To` field on an activity determines which account the activity appears on. Often that account ends up being the contact's primary account, but this behavior doesn't always make the most sense. For example, if users can relate a contact to multiple accounts, the contact's primary account isn't always relevant to the activity. It might make more sense for the activity to appear on one of the contact's secondary, or indirect, accounts. You can turn off this default roll up behavior from the Activities Settings page, but be aware of the implications.

5. [Activities Reporting](#)

You can run various reports to get insight into the progress and history of your accounts and deals. If your Salesforce admin has enabled Shared Activities, you can run certain standard or custom reports. These reports display details about events, tasks, calls, and emails, and their related contacts, accounts, opportunities, and other associated records.

6. [Access to Activities](#)

Know who can view, create, and delete events and tasks, and when they have access. Calendar sharing and access are controlled separately from access to individual activities.

7. [Activity Reminders in Salesforce Classic](#)

Salesforce displays event and task reminders in a reminder window. When you're using Salesforce Classic, the reminder window opens whenever a reminder is triggered. When you log in to Salesforce Classic, a sound plays if you have reminders that have been triggered since the last time you logged in. You can customize reminders in your personal settings.

8. [Archived Activities](#)

Salesforce archives events and tasks on a schedule according to certain criteria.

Track Activities Together

Activities in Salesforce are your events, your tasks, calls you've made, and emails you've sent. Salesforce gives you multiple ways to track your activities together for a more complete picture of your progress on deals and accounts.

1. [Track Activities Together in Lightning Experience](#)

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. Track events, tasks, calls, and emails—collectively called activities—on the Home page, on the Kanban Board, in the activity timeline, and in reports.

2. [Track Activities Together in Salesforce Classic](#)

You can track events, tasks, calls, and emails—collectively called activities—in lists, calendars, and reports. Track all activities on an account to get a complete picture of the preparation, follow-up, and other planned and completed work associated with the account. Activities share many fields, such as subject, contact name, and related record.

Track Activities Together in Lightning Experience

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. Track events, tasks, calls, and emails—collectively called activities—on the Home page, on the Kanban Board, in the activity timeline, and in reports.

- Use the Home page.
On the Home page, Upcoming Events shows the next five meetings on your calendar today, and Today's Tasks shows your next five tasks due today. Past events drop off Upcoming Events as the day progresses.
- Use the Kanban Board.
A yellow triangle on an opportunity or a lead indicates that the deal has no scheduled meetings or tasks. To get the deal moving, click the triangle and create an activity.
- Use the activity timeline.
The activity timeline displays your open tasks, upcoming meetings, and past activity (including calls logged and emails sent) on an opportunity, a lead, an account, or a contact.
- Use activities reports.
You can run various reports to get insight into the progress and history of your accounts and deals. If your Salesforce admin has enabled Shared Activities, you can run certain standard or custom reports. These reports display details about events, tasks, calls, and emails, and their related contacts, accounts, opportunities, and other associated records.

EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

Track Activities Together in Salesforce Classic

You can track events, tasks, calls, and emails—collectively called activities—in lists, calendars, and reports. Track all activities on an account to get a complete picture of the preparation, follow-up, and other planned and completed work associated with the account. Activities share many fields, such as subject, contact name, and related record.

Activities List Views

Salesforce provides several list views of activities. You can also define your own.

All Activities

Shows events and tasks that you can view. In Personal Edition, the All Activities list view shows all your activities.

My Activities

Shows events and tasks that you own.

My Delegated Activities

Shows activities that you created but that are owned by someone else.

 **Note:** Assigning multiple Salesforce users to an event or task is like delegating that activity to those users. The My Delegated Activities list view also shows activities for all assignees, even if you still own that activity. In the list view, the invited user appears as the person assigned to the activity, but the activity's detail page shows you as the assignee.

My Team's Activities

Shows activities owned by users who report to you in the role hierarchy. For your convenience, your team's activities are converted to your time zone.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

Other Lists of Activities

Open Activities Related List

The Open Activities related list on a record displays all future events and open tasks related to a record.

Activity History Related List

The Activity History related list of a record displays all completed tasks, logged phone calls, saved interaction logs, expired events, outbound email, mass email, email added from Microsoft® Outlook®, and merged documents for the record and its associated records.

Console Tab

The Console tab lets you find, view, and edit activities and their related records on one screen.

Activities Reports

Standard and Custom Activities Reports

You can run various reports to get insight into the progress and history of your accounts and deals. If your Salesforce admin has enabled Shared Activities, you can run certain standard or custom reports. These reports display details about events, tasks, calls, and emails, and their related contacts, accounts, opportunities, and other associated records.

How to Track Your Next Steps and Past Activity

See at a glance what just happened and what to do next on the deals and accounts that you're working on.

1. [Manage Work and View Past Activity in Lightning Experience](#)

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. The Home page and the activity timeline both display your open tasks and upcoming meetings. The activity timeline also shows you past activity on an opportunity, a lead, an account, or a contact.

2. [Work on Open Activities and View Activity History in Salesforce Classic](#)

The Open Activities and Activity History related lists tell you at a glance what just happened and what to do next on the deals and accounts you're working on. Use the buttons and links to create a task, request a meeting or an update from a contact, log a call, or send an email. If you use person accounts, you can enter them in either the `Name` or `Related To` field of an event or a task.

Manage Work and View Past Activity in Lightning Experience

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. The Home page and the activity timeline both display your open tasks and upcoming meetings. The activity timeline also shows you past activity on an opportunity, a lead, an account, or a contact.

- Take the next steps on a deal or account.

On the Home page, Upcoming Events shows the next five meetings on your calendar today. Today's Tasks shows your next five tasks due today.

In the activity timeline, use the Next Steps area to manage open tasks and preview upcoming meetings. Add tasks and meetings using the activity composer above the timeline. You can focus on one kind of activity at a time by choosing a view.

Activities that you add to the timeline appear automatically on the opportunity, lead, or other record that you're working with. Your activities for other related records also appear under Next Steps. If you add a task on an opportunity, the task also rolls up to the contact related to the opportunity.

EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create tasks and log calls

- "Edit Tasks"

To create events

- "Edit Events"

To send email

- "Send Email"

 **Note:** You can remove a contact or a record on an activity without deleting the activity. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Instead of deleting the task, remove Contact B from the `Name` field.

- View past activity.

The Past Activity area shows your past meetings, calls that you've logged, and emails that you've sent. Like the items under Next Steps, items under Past Activity appear on other related records.

Work on Open Activities and View Activity History in Salesforce Classic

The Open Activities and Activity History related lists tell you at a glance what just happened and what to do next on the deals and accounts you're working on. Use the buttons and links to create a task, request a meeting or an update from a contact, log a call, or send an email. If you use person accounts, you can enter them in either the `Name` or `Related To` field of an event or a task.

Open Activities

The Open Activities related list shows you open tasks, future events, and requested meetings related to other records. For example, suppose that an upcoming meeting on your calendar is related to a contact. That event is displayed in the Open Activities related list of the contact and the account that the contact is related to.

Use Open Activities to do the following:

- Create events and tasks that are automatically related to the record
- Request a meeting with a contact ( denotes a meeting request that's emailed to a contact)
- Ask a contact for an update
- Edit, close, or delete activities on the list

You can send meeting requests and requests for updates to a contact, a lead, or a person account.

Activity History

The Activity History related list shows all completed tasks, logged phone calls, saved interaction logs, expired events, outbound email, mass email, email that's added from Microsoft® Outlook®, and merged documents for the record and its associated records. For example, suppose that you've completed a task related to a contact. That task is displayed in the Activity History related list of the contact and the account that the contact is related to.

Use Activity History to do the following:

Log a Call

Note the results of an unplanned phone call, and schedule a follow-up task. The call appears as a completed task under Activity History, and the task appears under Open Activities.

Mail Merge

Generate personalized documents by using data and Microsoft Word templates that your administrator provides. You can choose whether to show the merged document under Activity History. This button isn't available on all types of records.

Send an Email

Send an email to a contact, and relate the email to the contact and the corresponding account, opportunity, case, or custom object. If the subject is longer than 100 characters, it is truncated with ellipses (...). This button isn't available on all types of records.

EDITIONS

Available in Salesforce Classic in: **All Editions**

USER PERMISSIONS

To create tasks and log calls

- "Edit Tasks"

To create events

- "Edit Events"

To send email

- "Send Email"

Send Gmail

Send an email to a contact from your Gmail account. If you don't see this link, ask your Salesforce admin to enable Gmail Buttons and Links. If the Gmail to Salesforce feature is also enabled, the email that you send appears under Activity History on the contact or lead record.

Request Update

Send an email to a contact to request updated contact information. You can update your contact record when you receive the response. This email and mass Stay-in-Touch emails appear under Activity History.

View All

Display a printable view of the activity history for the record, if the record has activity history.

Choose Whether to Display Activity in Self-Service Portal

If your Salesforce admin has added the Case Activities related list to the View Cases page layout in the Self-Service portal, and you've set the field-level security to visible for the `Visible in Self-Service` checkbox on activities, you have the following options for each activity.

- **Make Public:** Display a completed activity under Activity History on the case in the Self-Service portal.
- **Make Private:** Hide a completed activity under Activity History on the case in the Self-Service portal.

Considerations for Using Activities

Keep in mind these considerations for using activities, including the effects of enabling Shared Activities and designating primary contacts, as well as understanding how activities roll up to account records and what the Last Activity date represents.

Shared Activities

- You can relate an event or task to up to 50 contacts (but only one lead). The activity is then related to the contacts in the activity timeline, related lists, and reports.
- The detail page for each contact shows related events and tasks in the Open Activities and Activity History related lists, alongside other contact details. Conversely, on the detail page for an event or a task, you see the names of all contacts related to that activity, alongside other details. If you don't see all contacts that you've related to an activity, ask your Salesforce admin to add the Name related list to activity detail page layouts.
- You must designate one contact as the primary contact on the activity. If you delete the primary contact, the next contact on the activity's related list becomes the new primary contact. Or you can manually edit the activity to select a primary contact. Lists and reports display primary and secondary contacts differently.
- If you don't see the option to add more than one contact to an activity, ask your Salesforce admin to enable Shared Activities.

Activities Roll Up to Accounts

Regardless of whether Shared Activities is enabled, the activity's `Related To` field helps determine an activity's relationship to an account.

EDITIONS

Available in Lightning Experience in: **All Editions**

Available in Salesforce Classic in: **All Editions**

Content of the <code>Related To</code> Field	Record That the Activity Rolls Up To
An account	That account
An opportunity	The account on that opportunity
A contract	The account on that contract
A custom object with master-detail relationship with the account object	The account on that custom object record

Content of the <code>Related To</code> Field	Record That the Activity Rolls Up To
Something other than the above, including empty	The contact's primary account

If *Shared Activities* is enabled, then an activity is also related to each contact's primary account.

 **Note:** If your admin has set up your org so that you can relate a contact to multiple accounts, roll up behavior may have been changed so that activities don't roll up to a contact's primary account. For more information, see [Considerations for Changing How Activities Roll Up to Accounts](#).

Last Activity Date

The last activity date is either the due date of the most recently logged event against the record or the most recently closed task associated with the record. The Last Activity date can show up in activities related lists and reports, as well as on record details pages (such as accounts, contacts, and leads).

Regardless of whether *Shared Activities* is enabled or not, the last activity date for an account record is based on all the activities that roll up to the account via the `Related To` field. For an account, the last activity date can represent an activity that's related to an opportunity. The last activity date for a contact or lead is based on all the activities that are related to that contact or lead via the `Name` field.

If *Shared Activities* is enabled, things change slightly. For account records, the last activity date is still based on the activities that roll up to the account via the `Related To` field. But if the `Related To` field is blank, the activities are based on the primary contact's account. The last activity date for contacts and leads is based on only the activities where the contact or lead is the primary contact on the activity.

 **Example:** Jane is a contact who is related to two tasks. Jane is *not* the primary contact for the first task, which has a due date of November 30. Jane *is* the primary contact for the other task, which has a due date of November 15. The Last Activity date on Jane's contact record is November 15.

[Considerations for Using Events and Calendars in Lightning Experience](#)

[Considerations for Using Tasks in Lightning Experience](#)

Considerations for Changing How Activities Roll Up to Accounts

By default, the `Related To` field on an activity determines which account the activity appears on. Often that account ends up being the contact's primary account, but this behavior doesn't always make the most sense. For example, if users can relate a contact to multiple accounts, the contact's primary account isn't always relevant to the activity. It might make more sense for the activity to appear on one of the contact's secondary, or indirect, accounts. You can turn off this default roll up behavior from the Activities Settings page, but be aware of the implications.

To fully understand the default roll up behavior, see [Considerations for Using Activities](#).

Existing Activities

When you change the roll up setting, only new activities are affected. Existing activities are only affected if they're updated in a way that causes the roll up to be recalculated, such as when an activity is closed.

Roll Up to Account Records

Like the default behavior, the activity's `Related To` field determines which account an activity will be related to. But, unlike the default behavior, the activity doesn't roll up to the primary account of the contact that's specified in the `Name` field.

EDITIONS

Available in: Lightning Experience and Salesforce Classic.

Available in : **All** Editions

Last Activity Date

Like the default behavior, the activities that roll up to an account via the `Related To` field determine the last activity date. But, unlike the default behavior, the `Name` field on activities is always ignored when determining an account's last activity date.

Person Accounts

In Salesforce Classic, changing the roll up behavior doesn't affect person accounts. When an activity is related to a person account via either the `Related To` field or the `Name` field, the activity will always appear on the person account record. That's because a person account is its own primary account.

In Lightning Experience, the person account must be specified in the activity's `Related To` field in order for it to appear on the person account record. This is true when Shared Activities is *not* enabled.

Lead Convert

If you create an activity while converting a lead but don't create an opportunity from the lead, the activity doesn't roll up to the lead's primary account regardless of what's specified by the activity rollup setting.

Activities Reporting

You can run various reports to get insight into the progress and history of your accounts and deals. If your Salesforce admin has enabled Shared Activities, you can run certain standard or custom reports. These reports display details about events, tasks, calls, and emails, and their related contacts, accounts, opportunities, and other associated records.

1. [Reports That You Can Run on Activities](#)

Run standard or custom reports that display details about your tasks or events and their related contacts, accounts, opportunities, and other associated records.

2. [Report on Sales Reps' Meetings with Customers](#)

Get insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

EDITIONS

Available in Lightning Experience in: **All** Editions

Available in Salesforce Classic in: **All** Editions

Reports That You Can Run on Activities

Run standard or custom reports that display details about your tasks or events and their related contacts, accounts, opportunities, and other associated records.

To View This Information

Activities related to another record type, such as opportunities

Use This Report

Click **Create New Custom Report** on the Reports tab and select the Activities report type.

EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** Editions

To View This Information **Use This Report**

Number of contacts related to an activity

Activity reports. Add the `Relation Count` column to your reports.

For example, you have a task with five contacts. When you run the Tasks and Events report, it displays "5" to indicate the number of contacts related to the task.

One row per contact for each activity

The Activities with Contacts report. Select at least one field from the Contact object.

For example, your report includes a task with five contacts. If you include the `Last Name` field from the contact object on the report, you see five rows (one row for each contact) related to this activity. If you don't add fields from the contact object, you see only one row for the activity.

The Activities with Contacts report is the only report that:

- Displays all contacts on an activity
- Can be filtered using attributes of contacts other than the primary contact

Other reports show the primary contact and the total number of contacts on an activity, but they don't show details of the other contacts.

The Activities with Contacts report doesn't indicate which contacts are primary or secondary.

An activity's primary contact in two different reports: Tasks and Events, and Activities with Cases

Either the Tasks and Events report or the Activities with Cases report.

For example, if the primary contact for a task is Ron Dean, these reports display that name in the `Contact` field.

The primary contact also appears in the `Name` field on the task detail page or event detail page.

Report on Sales Reps' Meetings with Customers

Get insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

1. Create a custom report type.
 - a. For Primary Object, choose **Users**.
 - b. Complete the remaining required fields: label, description, and category.
 - c. Click **Next**.
2. Define a relationship between activities and users.
 - a. Relate the Activity Relationships object to the Users object.
 - b. Click **Save**.
3. Define the fields that appear in this report type.
 - a. In the Fields Available for Reports section, click **Edit Layout**.
 - b. Add the following Activity Relationships fields to the layout: *Date*, *Subject*, *Name*, *Related To*, *Relation Count*.
 - c. Change the label for the *Name* field to *Contact* and for the *Related To* field to *Opportunity*.
 - d. For each field, select the option to display the field by default.
 - e. Click **Save**.
4. Create a report.
 - a. In the Reports tab, select the report type that you created in steps 1–3.
 - b. Choose **Summary Format**, and create a grouping by Full Name.
 - c. Run and save the report.

You now have a report that you can use to help your sales teams optimize the time that they spend with customers.

 **Note:** If Shared Activities isn't enabled, custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.

- [Creating a Custom Report](#)

EDITIONS

Available in Lightning Experience in: **All Editions**

Available in Salesforce Classic in: **All Editions**

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

To view activities owned by you and users below you in the role hierarchy:

- No permissions needed

To view all activities:

- "View All Data"

Access to Activities

Know who can view, create, and delete events and tasks, and when they have access. Calendar sharing and access are controlled separately from access to individual activities.

Watch a Demo: [Who Sees What: Organization-Wide Defaults \(Salesforce Classic\)](#)

Several kinds of settings affect your access to events and tasks owned by others in your Salesforce org.

Role

You have access to view and edit your own activities plus activities assigned to people below you in the role hierarchy of your Salesforce org.

Permissions

People with the “View All Data” permission can view all activities.

Sharing Model

When the activity sharing model is “Controlled By Parent,” people with “View All” permission for the type of object on the related record can view the activity.

Important:

- Suppose you relate one or more contacts to an activity that other people can view. Those people can view the activity along with the name, account name, and title of each contact you relate to the activity—regardless of whether they can otherwise view that information.
- An event with the `Private` checkbox selected is accessible only by the person assigned to the event.

Example: You can view an activity when one of the following applies:

- You’re assigned to the activity
- You’re above the user assigned to the activity in the role hierarchy
- You have at least read access to the record to which the activity is related
- You have the “View All Data” permission
- You have the “View All” object-level permission for at least one contact and the related opportunity, account or case, and Shared Activities is enabled
- You have the “View All” object-level permission for the related opportunity or account, where the sharing model applied to the record is “Controlled By Parent”, and Shared Activities isn’t enabled

You can edit or delete an activity (in Salesforce Classic only) when the following applies:

- You have the “Edit Tasks” and “Edit Events” permissions
- AND
- You’re assigned to the activity, or
 - You’re above the user assigned to the activity in the role hierarchy, or
 - You have the “Modify All” object-level permission in the related record, where the record’s sharing model is “Controlled By Parent.” (with Shared Activities enabled, you need the “Modify All” object-level permission for at least one contact and the related record), or
 - You have the “Modify All Data” permission

EDITIONS

Available in Lightning Experience and Salesforce Classic

Available in all editions

Activity Reminders in Salesforce Classic

Salesforce displays event and task reminders in a reminder window. When you're using Salesforce Classic, the reminder window opens whenever a reminder is triggered. When you log in to Salesforce Classic, a sound plays if you have reminders that have been triggered since the last time you logged in. You can customize reminders in your personal settings.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

Information in Reminder Windows

- Up to 100 of the oldest reminders that you haven't dismissed
- The type of activity—event or task
- The activity subject (click to see activity details)
- When the event is scheduled to start or the task is due
- When the reminder is due or that the reminder is overdue

Order of Reminders

Event reminders are sorted by start date and time, and task reminders are sorted by due date. If the option `Sort reminder window by due date` is *not* set, the window displays reminders in the following order:

1. The task and event reminder date and time.
2. The task due date *or* the event start date and time.
3. Ascending alphabetical order by subject.

If `Sort reminder window by due date` is set, the reminders are displayed in the following order:

1. The task due date *or* the event start date and time; if the task has no due date, then the reminder window displays it first
2. The task and event reminder date and time
3. Ascending alphabetical order by subject

Display of Dates and Times

The table shows how reminders display the event start time or task due date.

Activity Type	Due Date or Time That You Specified	Due Date or Start Time Shown in the Reminder
Event	An event time	The date and time that you selected when you created or edited the event
	An all-day event	The date that you selected and the time set for <code>Start of day</code> in your Personal Information Settings page
Task	A due date	The date that you selected when you created or edited the task
	No due date	The value <code>None</code>

Customizable Reminder Settings

Follow these steps to customize your reminder settings.

1. From your personal settings, enter `Reminders` in the `Quick Find` box, then select **Activity Reminders**.

2. Change the settings as desired.

Table 11: Reminder Settings

Setting	Result When Setting Is Enabled
Trigger alert when reminder comes due	The reminder window opens when a reminder is due.
Play a reminder sound	Salesforce plays a reminder sound when a reminder is due.
By default, set reminder on events to:	Salesforce sets a reminder on all new events. You choose the amount of time before the event start time when you want a reminder; the default is 15 minutes. You can disable the reminder or change the reminder time when you edit an event.
By default, set reminder on tasks to:	Salesforce sets a reminder on all new tasks. You choose the date and time when you want task reminders; the default is 8:00 AM the day that a task is due. You can disable the reminder or change the reminder time when you edit a task.
Sort reminder window by due date	Salesforce sorts reminders by due date first and then by the reminder date and time.

If Salesforce doesn't display reminders that you've set, make sure that your browser isn't blocking pop-ups. To test your settings, click **Does Your Browser Block Reminders?**

Snoozing Reminders

You can snooze one or more reminders at a time. The default snooze option is to remind you again in 5 minutes.

If you click **Snooze** when `Sort reminder window by due date` is not selected, the time overdue is based on the snooze time when the reminder opens again. If you close the reminder window, it opens again when you're notified of the next reminder.

Dismissing Reminders

You can dismiss one or more reminders at a time. To dismiss all reminders in the window, click **Dismiss All**. If the number of reminders exceeded 100 before you clicked **Dismiss All**, then after you click **Dismiss All**, the window displays the additional reminders.

Archived Activities

Salesforce archives events and tasks on a schedule according to certain criteria.

1. [Criteria for Archiving Activities](#)

Salesforce archives certain year-old events and tasks every Saturday at approximately 5:00 AM Greenwich Mean Time (GMT).

2. [Where Archived Activities Are Displayed](#)

After Salesforce archives activities, you can view them in exported data and in certain locations in Salesforce Classic. Activities are archived regardless of whether you use Salesforce Classic, Lightning Experience, or Salesforce1. However, although you can view archived activities in exported data and in Salesforce Classic, you can't view them in Lightning Experience or Salesforce1.

EDITIONS

Available in Lightning Experience and Salesforce Classic in: **All Editions**

3. [Considerations for Archiving Activities](#)

Salesforce doesn't delete archived activities, but you can manually delete them. When you create or refresh a sandbox, archived activities aren't copied.

Criteria for Archiving Activities

Salesforce archives certain year-old events and tasks every Saturday at approximately 5:00 AM Greenwich Mean Time (GMT).

Salesforce archives activities as follows.

- Events that ended more than 365 days ago
- Closed tasks due more than 365 days ago
- Closed tasks created more than 365 days ago, if they have no due date

Where Archived Activities Are Displayed

After Salesforce archives activities, you can view them in exported data and in certain locations in Salesforce Classic. Activities are archived regardless of whether you use Salesforce Classic, Lightning Experience, or Salesforce1. However, although you can view archived activities in exported data and in Salesforce Classic, you can't view them in Lightning Experience or Salesforce1.

You can view archived activities in these locations.

- In Salesforce Classic, by clicking **View All** in the Activity History related list
- In Salesforce Classic, in the printable view of the record in the `Name or Related To` field
- By using the URL for the activity, if you know it
- In weekly data export files

Considerations for Archiving Activities

Salesforce doesn't delete archived activities, but you can manually delete them. When you create or refresh a sandbox, archived activities aren't copied.

Events and Calendars

Use Salesforce to track meetings with customers, prospects, and colleagues. Drill down from events to related records, feeds, files, contracts, and more. You can also track events in reports.

1. [Manage Events](#)

In Salesforce, events are a powerful tool for keeping on top of customer relationships and closing deals. You can relate events to opportunities, leads, accounts, and contacts. Track them on those records, in your calendar, and in reports.

2. [Use Calendars to Track and Visualize Dates in Salesforce Objects](#)

Want an easy, visual way to track upcoming or ongoing campaigns? Support cases? Retail store events? Opportunities due to close? Create a calendar from a standard or custom object: Choose a date field that represents data you want to track, and the calendar displays data in that field as calendar items. You can customize most calendars by applying a list view. We've included a few popular examples. You can hide or show calendars, and you can edit and delete them. Some considerations apply to creating calendars.

3. [Calendar Sharing in Salesforce Classic](#)

Grant others access to view or edit your calendar in Salesforce Classic, or view a calendar that a coworker shares with you.

EDITIONS

Available in Lightning Experience and Salesforce Classic in: **All** Editions

EDITIONS

Available in Lightning Experience and Salesforce Classic in: **All** Editions

EDITIONS

Available in Lightning Experience and Salesforce Classic in: **All** Editions

4. [Calendar Views](#)

Calendar views display your events in Salesforce.

5. [Considerations for Using Events and Calendars](#)

Salesforce always displays an event's date and time in the time zone you've chosen in My Settings. Working with meetings and scheduling is different in Lightning Experience and Salesforce Classic.

6. [Invitations and Scheduling in Salesforce Classic](#)

In Salesforce Classic, you can invite people to meetings, accept meeting invites, and use Cloud Scheduler to propose meeting times. You can also create a Microsoft® Outlook® appointment for an event in Salesforce.

[Tasks](#)

Manage Events

In Salesforce, events are a powerful tool for keeping on top of customer relationships and closing deals. You can relate events to opportunities, leads, accounts, and contacts. Track them on those records, in your calendar, and in reports.

1. [Manage Events in Lightning Experience](#)

Create, update, and track meetings using the Home page, your calendar or calendars you create, the Kanban Board, or the activity timeline.

2. [Manage Events in Salesforce Classic](#)

With your calendar in Salesforce, everyone stays informed—your sales team, your sales manager—and meeting prep is easy. You can track, create, and update your own and others' meetings and invitation responses in different locations in Salesforce. Salesforce displays events in activities list views and calendar views; Chatter feeds; and records that events are related to, such as contacts and accounts. You can also track events in reports.

Manage Events in Lightning Experience

Create, update, and track meetings using the Home page, your calendar or calendars you create, the Kanban Board, or the activity timeline.

- On the Home page, Upcoming Events shows the next five meetings on your calendar today. Past events drop off the list as the day progresses.
- In the navigation menu, choose **Calendar** to work with all your events and to create events. Plus, create other calendars from a standard or custom object: Choose the date field you want to track, and the calendar displays data in that field as calendar items.

You can't share your event calendar with others or invite others to an event, and coworkers can't subscribe to calendars you create.

- On the Kanban Board, opportunities show alerts when no open activities exist. To create an event, click the yellow triangle.
- Use the activity timeline to monitor and update upcoming and past events on an opportunity, a lead, an account, or a contact.
- Use activities reports to view events owned by people below you in the role hierarchy of your Salesforce org.

EDITIONS

Available in Lightning Experience in: **All** Editions except **Personal** and **Contact Manager** Editions

USER PERMISSIONS

- To create events
- "Edit Events"

-  **Note:** You can remove a contact or a record from an event without deleting the event. For example, suppose that an event is related to Contact A and Contact B, but you want to relate it only to Contact A. Instead of deleting the event, remove Contact B from the `Name` field.

Manage Events in Salesforce Classic

With your calendar in Salesforce, everyone stays informed—your sales team, your sales manager—and meeting prep is easy. You can track, create, and update your own and others' meetings and invitation responses in different locations in Salesforce. Salesforce displays events in activities list views and calendar views; Chatter feeds; and records that events are related to, such as contacts and accounts. You can also track events in reports.

Track Events

You can track events belonging to you and to others in the following locations. To see activities list views, click  on the Home tab or any calendar view, or go to the calendar day or week view.

Events That You Own

- The Home tab, in the Calendar section
- An activities list view: Choose an existing list view or customize one
- Your Chatter feed: Follow an event to track posts, comments, and updates about it

Events Owned by People Who Have Shared Their Calendars with You

The multi-user calendar view

Events That You've Assigned to Others

- The **My Delegated Activities** list view
- Activities reports

Events Owned by People Below You in Your Organization's Hierarchy

- The **My Team's Activities** list view
- Activities reports

Upcoming Events

- A calendar view
- The **Upcoming Events** list view
- The Open Activities related list for a record related to an event

Past Events

- A calendar view
- The **My Activities** list view
- The Activity History related list for a record related to an event

Events Related to Another Record, Such as a Contact or an Account

- The other record's detail page, in the Open Activities and Activity History related lists
- Your Chatter feed and in the Chatter feed for the other record
- Activities reports

EDITIONS

Available in Salesforce Classic in: **All Editions**

Events with invitees not available in: **Personal Edition**

USER PERMISSIONS

To create events

- "Edit Events"

View Event Details

In a calendar view, in an activities list view, in a related list, or on the Home tab, there are two ways to see event details:

- Hover your mouse over an event's subject.
- Click the subject.

On an event detail page, to view the details of a single event in a recurring series () , select the View Event subtab. To view the details for the series, select the View Series subtab.

 identifies events with invitees.

Create Events

On the Home Tab

On the Home tab, under Calendar, click **New Event** or **New Meeting Request**.

In a Chatter Feed

If you create an event in the feed for a record such as a contact, Salesforce automatically relates the event to the record.

In the Sidebar

In the sidebar in Salesforce, in the Create New drop-down list, select **Event**.

On the Detail Page of Another Record

On the Open Activities related list, click **New Event** or **New Meeting Request**. Salesforce automatically relates the event or meeting request to the record.

On the Detail Page of an Event with Invitees

On the detail page of an event that you've invited one or more people to, click **Clone**. You can clone an event that has at least one invitee and isn't a recurring event.

In a Calendar View

- Click **New Event**.
- In a day view, click a time, such as 9:00 AM.
- In a day or week view, double-click a time slot. You can't double-click to create a recurring event or an event that you invite people to. If double-clicking doesn't open a new event, ask your administrator to enable Click-and-Create Events.
- In a week or month view, click .

In an Activity List View ()

In a list view, click **New Event**.

In a List View of Contacts, Leads, or Other Records

In a list view of contacts, leads, or other records, click  at the bottom of the page to add a weekly calendar view to the page. Create an event related to a record by dragging the record from the list view down to a time slot on the calendar. If you don't see , ask your Salesforce admin to enable Drag-and-Drop Scheduling.

 **Note:** If you schedule meetings with people in a different time zone, your calendar shows their available and busy times in your time zone. An individual person's `Time Zone` setting (as specified on the personal information page) overrides the `Default Time Zone` set for the Salesforce org.

Update Events

Anywhere (except reports) that you can view event details, you can edit any event that you have permission to edit.

You can edit an event in several ways:

- To reschedule an event, in a calendar view, drag the event to a different time slot. For best results, place your mouse over the subject line of the event before dragging it. If the event is a recurring event (🔄), only the single occurrence that you drag is changed, not the entire series.
- Click **Edit** next to the event in an activities list view, an Open Activities related list, or an Activity History related list. The event detail page opens.
- Go to a calendar view, an activities list view, a related list, or the Home tab. Hover your mouse over the subject of an event. A small window with editing options appears.
- Use Cloud Scheduler to collaborate with others in choosing a meeting date and time. When you confirm the meeting date and time, you convert the meeting into a Salesforce event, which you can edit or delete like any other event.

Use Calendars to Track and Visualize Dates in Salesforce Objects

Want an easy, visual way to track upcoming or ongoing campaigns? Support cases? Retail store events? Opportunities due to close? Create a calendar from a standard or custom object: Choose a date field that represents data you want to track, and the calendar displays data in that field as calendar items. You can customize most calendars by applying a list view. We've included a few popular examples. You can hide or show calendars, and you can edit and delete them. Some considerations apply to creating calendars.

EDITIONS

Available in Lightning Experience in: **Enterprise, Unlimited, and Developer Editions**

1. [Create a Calendar](#)

Here's how to create a calendar based on a standard or custom object in Salesforce.

2. [Create a Calendar of Opportunity Close Dates](#)

See all your opportunities' scheduled close dates at a glance.

3. [Create a Calendar of Task Due Dates](#)

Make a calendar that shows when your tasks are due.

4. [Create a Calendar of Direct-Mail Campaigns](#)

Get a visual overview of all your direct-mail campaigns.

5. [Create a Calendar to View Open Cases by SLA](#)

Monitor open cases and increase compliance with your service level agreement.

6. [Considerations for Calendars Created from a Salesforce Object](#)

Considerations for calendars created from a Salesforce object include support for list view filtering, a limit on the number of items that can be displayed, no support for subscribing to calendars, and support for standard objects.

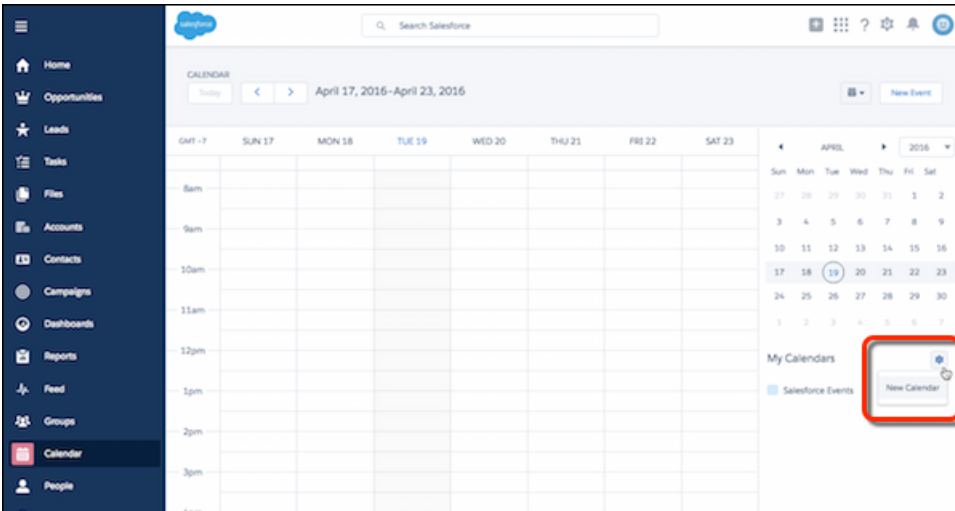

Create a Calendar

Here's how to create a calendar based on a standard or custom object in Salesforce.

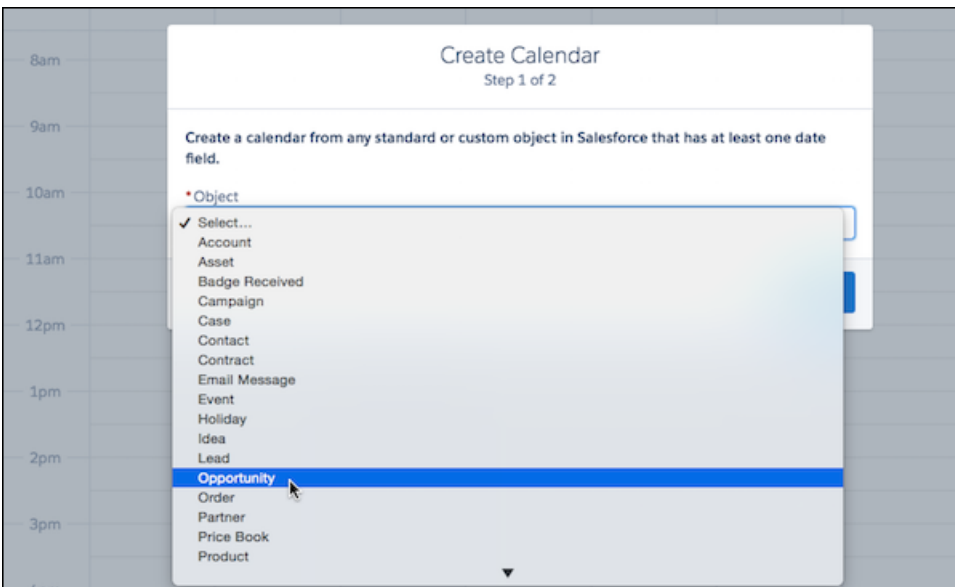

1. Start creating a calendar.

EDITIONS

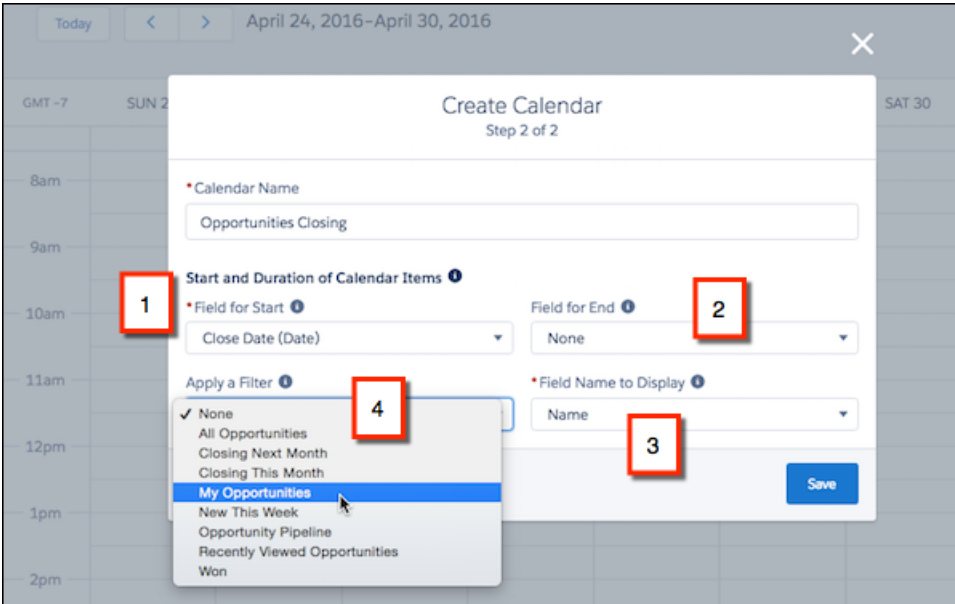

Available in Lightning Experience in: **Enterprise, Unlimited, and Developer Editions**

2. Choose an object to base the calendar on.

3. Select fields that determine what the calendar displays (1, 2, 3).
 If you want, filter the calendar items by selecting a list view (4).

The calendar displays items differently depending on the date fields you select.

(Date) Fields

Close Date (Date)

The names of some date fields include (Date). If you select a (Date) field, the calendar displays items across the top (as all-day items).

(Date/Time) Fields

Last Modified Date (Date/Time)

The names of other date fields include (Date/Time). If you select a (Date/Time) field in **Field for Start**, the calendar displays items in time slots. If you also select a field in **Field for End** (it's optional) and the items' duration exceeds 24 hours, the calendar displays the items across the top (as all-day items).

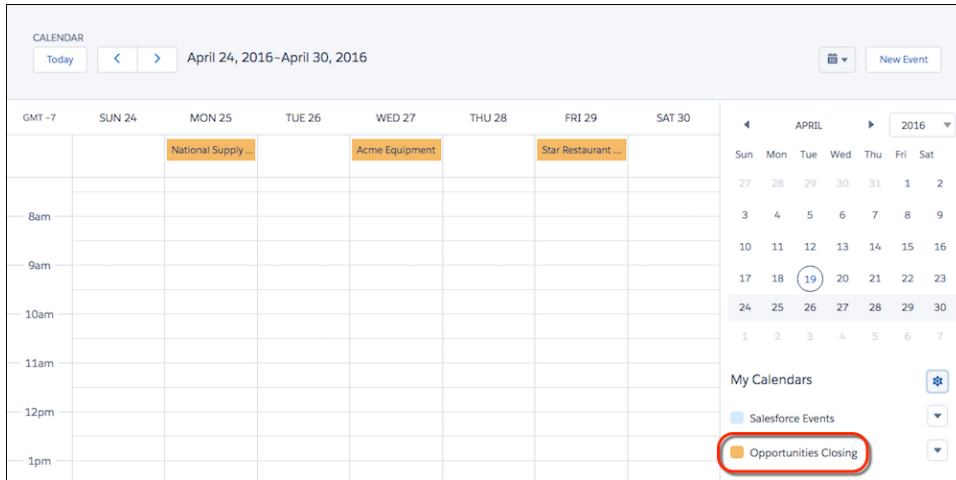

Selecting Start and End Fields

Field for End is optional. If you use it, you must select the same type of field as you do in **Field for Start**. For example, if you select a (Date) field in one, you can't select a (Date/Time) field in the other. If you select fields that generate dates in the wrong order (end before start), Salesforce displays an error message when you save the calendar.

The color of each calendar is the color of the object it's based on. (If a custom object has a theme, the theme determines the color of the calendar.) You can hide or show individual calendars. (You can hide the Salesforce Events calendar, too, but it's not otherwise configurable.)

Suppose that you show a calendar containing enough items to push the total items past the limit (150 items) in that view. Salesforce displays an alert and hides items on other calendars.

SEE ALSO:

[Considerations for Calendars Created from a Salesforce Object](#)

Create a Calendar of Opportunity Close Dates

See all your opportunities' scheduled close dates at a glance.

Use the following selections.

Object

Opportunity

Calendar Name

Opportunities Closing

Field for Start

Close Date (Date)

Field for End

None

Apply a Filter (Optional)

My Opportunities, or another list view

Field Name to Display

Name

Now you have a calendar to remind you of close dates across all your opportunities.

SEE ALSO:

[Create a Calendar](#)

EDITIONS

Available in Lightning Experience in: **Enterprise, Unlimited, and Developer** Editions

Create a Calendar of Task Due Dates

Make a calendar that shows when your tasks are due.

First, ask your Salesforce admin to replace the Due Date field in the Task layout with a custom Date/Time field. Then use the following selections.

Object

Task

Calendar Name

Tasks Due

Field for Start

Due Date and Time (Date/Time)

Field for End

None

Apply a Filter (Optional)

My Tasks

Field Name to Display

Subject

Now you can see your task due dates alongside your Salesforce events.

EDITIONS

Available in Lightning Experience in: **Enterprise, Unlimited, and Developer** Editions

Create a Calendar of Direct-Mail Campaigns

Get a visual overview of all your direct-mail campaigns.

Use the following selections.

Object

Campaign

Calendar Name

Direct Mail

Field for Start

Start Date (Date)

Field for End

End Date (Date)

Apply a Filter (Optional)

All Active Direct-Mail Campaigns

Field Name to Display

To display the name of each campaign on the calendar: Name

To display each campaign's owner on the calendar: Owner

Now you can visually track direct-mail campaigns by name or owner.

EDITIONS

Available in Lightning Experience in: **Enterprise, Unlimited, and Developer** Editions

SEE ALSO:

[Create a Calendar](#)

Create a Calendar to View Open Cases by SLA

Monitor open cases and increase compliance with your service level agreement.

Use the following selections.

Object

Case

Calendar Name

Time Left in SLA

Field for Start

Date Opened (Date)

Field for End

Custom formula field, Opened (Date) + 36 hours: SLA Expiration

Apply a Filter (Optional)

All Open Cases, or another list view

Field Name to Display

Customer Name

Now you can see at a glance whether you're meeting your SLA.

Considerations for Calendars Created from a Salesforce Object

Considerations for calendars created from a Salesforce object include support for list view filtering, a limit on the number of items that can be displayed, no support for subscribing to calendars, and support for standard objects.

List View Filtering

No list views are available for filtering calendars based on the Events or Tasks objects. The list view shows all your tasks, open and closed, and all your events. For calendars created from other objects, list views with the scope My and All are supported, but list views with the scope My Team are not.

Calendar Item Limit

You can view up to 150 calendar items total in the day or week view, including Salesforce events and the items on calendars you create. Suppose that you select a calendar containing enough items to push the total past the limit in that view. Lightning Experience displays an alert and hides items on other calendars.

Subscribing to Calendars

You can't subscribe to calendars that other people create. Each calendar can be accessed only by the person who created it.

Standard Objects Supported

Account	Endorsement	Partner	Social Post
Asset	Event	Price Book	Solution
Campaign	Holiday	Product	Task

EDITIONS

Available in Lightning Experience in: **Enterprise, Unlimited, and Developer** Editions

Case	Idea	Report	Topic
Contact	Lead	Skill	User
Contract	Opportunity	Skill User	User Provisioning Request
Email	Order	Social Persona	Work Order

For more information, see [Activities: Events and Calendars](#) on page 215 in What's Not in Lightning Experience.

Calendar Sharing in Salesforce Classic

Grant others access to view or edit your calendar in Salesforce Classic, or view a calendar that a coworker shares with you.

Watch a Demo: [Who Sees What: Organization-Wide Defaults \(Salesforce Classic\)](#)

1. [Share Your Calendar in Salesforce Classic](#)
You can grant coworkers, personal and public groups, roles, or roles and subordinates access to view or edit your calendar in Salesforce Classic.
2. [View a Coworker's Calendar in Salesforce Classic](#)
When coworkers share their calendars with you, you can view the calendars in Salesforce Classic.

SEE ALSO:

[Activity Reminders in Salesforce Classic](#)

[Access to Activities](#)

Share Your Calendar in Salesforce Classic

You can grant coworkers, personal and public groups, roles, or roles and subordinates access to view or edit your calendar in Salesforce Classic.

Watch a Demo: [Who Sees What: Organization-Wide Defaults \(Salesforce Classic\)](#)

Options vary for sharing your calendar with others, depending on the organization-wide calendar sharing level that your Salesforce admin sets. The options can make your calendar more available to others, but not less. Calendar sharing settings affect the visibility of items on a calendar, but they don't give coworkers access to event detail pages.

Events associated with a record that you own are visible to anyone above you in the role hierarchy.

1. From your personal settings, enter *Calendar Sharing* in the Quick Find box, then select **Calendar Sharing**.
2. To share your calendar with others, click **Add**. Select the users, roles, or groups whose activities you want to display in your calendar.
3. Specify how you want to share your calendar. Select one of the following:

EDITIONS

Available in Salesforce Classic in: **All** Editions Except **Personal**, **Group**, and **Contact Manager** Editions

EDITIONS

Available in Salesforce Classic in: **All** Editions Except **Personal** Edition

USER PERMISSIONS

To create events

- "Edit Events"

Hide Details

Coworkers can see whether given times are available but can't see any other information about the nature of events in your calendar.

Hide Details and Add Events

Coworkers can see whether given times are available but can't see details of events. They can insert events in your calendar.

Show Details

Coworkers can see detailed information about events in your calendar.

Show Details and Add Events

Coworkers can see detailed information about events in your calendar, and they can insert events in your calendar.

Full Access

Coworkers can see detailed information about events in your calendar, insert events, and edit existing events.

SEE ALSO:

[Access to Activities](#)

View a Coworker's Calendar in Salesforce Classic

When coworkers share their calendars with you, you can view the calendars in Salesforce Classic.

Your access to view event details, edit events, or create events varies by calendar. Your access to a given calendar depends on how your Salesforce admin sets up your org and the calendar sharing options that your coworker has chosen.

You can view all events owned by people below you in the role hierarchy.

- In day, week, or month view, click **Change** next to the name at the top of the calendar, then select the calendar that you want to view.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

Calendar Views

Calendar views display your events in Salesforce.

1. [Calendar Views in Lightning Experience](#)

Your calendar displays all events that you own in Salesforce, including events that take place outside your business hours. Calendars you create from a Salesforce object display data in date fields as calendar items. View, create, and edit your events in a day, week, or month view.

2. [Calendar Views in Salesforce Classic](#)

Calendar views display your own calendar and coworkers' calendars along with list views of open tasks. On the Home tab, the Calendar section shows upcoming events, a date picker for the month, and links to other calendar and activity views. You can share your calendar with coworkers and print calendars and task lists.

Calendar Views in Lightning Experience

Your calendar displays all events that you own in Salesforce, including events that take place outside your business hours. Calendars you create from a Salesforce object display data in date fields as calendar items. View, create, and edit your events in a day, week, or month view.

SEE ALSO:

[Considerations for Using Events and Calendars in Lightning Experience](#)

Calendar Views in Salesforce Classic

Calendar views display your own calendar and coworkers' calendars along with list views of open tasks. On the Home tab, the Calendar section shows upcoming events, a date picker for the month, and links to other calendar and activity views. You can share your calendar with coworkers and print calendars and task lists.

Where to Select or Switch Views

You access calendar views in the following locations.

- The Calendar section at the bottom of the Home tab (if your Home tab doesn't display the Calendar section, ask your Salesforce admin to customize your home page layout)
- The Calendar shortcut in the sidebar that opens your last used calendar view (if your Salesforce admin has enabled the shortcut)
- The detail page for an event or a task
- An activities list view

In any view, when you hover your mouse over an event that you have permission to see and edit, an overlay displays event details and actions that you can perform. Your Salesforce admin configures the content of the overlays.

Day, Week, Month, and Activity Views

Calendar views display events as follows:

- A day at a time:  or **Today**
- On a date that you choose using 
- A week at a time:  or **This Week**
- In a week view, with or without weekends
- A month at a time:  or **This Month**
- On a day that you choose: Click in the week or month view
- In a list of activities (events and tasks): 

Inside any calendar view, you can switch views by clicking the icon for a different view. In a week or month view, click a date to see that day's view.

Single-User View and Views of Other Calendars

The single-user view () displays up to 1,000 events in one month in any of the following:

- Your own calendar
- The calendar of another user (not available in Personal Edition)

EDITIONS

Available in Lightning Experience

Available in: **All Editions** except **Group** or **Contact Manager** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Group** or **Contact Manager** Editions

- A public calendar
- A resource calendar

Click **Change** to switch users or calendars. Click **Share My Calendar** to allow other users to view your calendar. To reset your view to your own calendar, click **Back to My Calendar**.

 **Note:** Activities related to another record are visible to users above the activity owner in the role hierarchy regardless of whether your organization's sharing settings specify the use of hierarchies.

All single-user day and week views of a user's calendar display a list of the user's open tasks alongside the calendar. A drop-down list lets you choose other views, for example overdue tasks or tasks due today.

By default, your daily and weekly calendar views display the range of hours specified as *Start of Day* and *End of Day* on your Personal Information page.

If you sync events from Outlook using Salesforce for Outlook, you may see a banner at the top of your calendar that is linked to a list of your unresolved events: synced Outlook events that haven't been assigned to Salesforce records.

Multi-User View

The multi-user view () displays several users' calendars and activities together. Choose an existing list view of users from the **View** drop-down list or click **Create New View**.

The view shows each person's availability. A legend in the view shows busy and out-of-office time. If an event is set to show the time as free, then multi-user views don't display it.

Consider these limitations of the multi-user view:

- Drag-and-drop editing isn't available in the multi-user view.
- The multi-user calendar works differently in the partner portal. For example, partners can view events only on the calendars of people in their own company and their channel manager.

Printable View

After you select a view and click **Printable View**, adjust the view before printing it.

- To send the printable view to a printer, click **Print This Page**.
- To change the dates before printing, click , , **Today**, **This Week**, or **This Month**.
- In a day or week view, select a different task list view if you like.
- In multi-user views, in the **Sort by** drop-down list, select *Time* to include all users' events on a single calendar. Or select *User* to display a separate calendar for each user.

Considerations for Using Events and Calendars

Salesforce always displays an event's date and time in the time zone you've chosen in My Settings. Working with meetings and scheduling is different in Lightning Experience and Salesforce Classic.

1. [Considerations for Using Events and Calendars in Lightning Experience](#)
When you use events and calendars in Lightning Experience, keep in mind these considerations for creating, updating, and owning events and other calendar items.
2. [Considerations for Using Events and Calendars in Salesforce Classic](#)
Be aware of these considerations for creating, updating, owning, and inviting others to events in Salesforce Classic.

Considerations for Using Events and Calendars in Lightning Experience

When you use events and calendars in Lightning Experience, keep in mind these considerations for creating, updating, and owning events and other calendar items.

Business Hours

Your calendar doesn't indicate the business hours you've selected in your personal settings.

No Recurring Events

You can't create or edit recurring events. However, if a coworker uses Salesforce Classic to create a series of recurring events, you can view and edit the events in the series in Lightning Experience.

Outlook Appointments

You can't create a Microsoft® Outlook® appointment from a Salesforce event.

Event Invitations

You can't invite people to meetings, update events, accept or decline events, or view a list of invitees to an event. However, if someone creates a meeting in Salesforce Classic and invites you to it, it is displayed in your calendar.

Calendar Views

The calendars in Lightning Experience have no print view. You can't hide weekends.

List View Filtering

No list views are available for filtering calendars based on the Events or Tasks objects. The list view shows all your tasks, open and closed, and all your events. For calendars created from other objects, list views with the scope My and All are supported, but list views with the scope My Team are not.

Calendar Item Limit

You can view up to 150 calendar items total in the day or week view, including Salesforce events and the items on calendars you create. Suppose that you select a calendar containing enough items to push the total past the limit in that view. Lightning Experience displays an alert and hides items on other calendars.

Calendar Sharing and Ownership

You can't share your calendar with your manager or other coworkers. Managers in the role hierarchy can use reports to view events owned by people below them in the role hierarchy, but not to edit them. Only one person can own a meeting. If you reassign a meeting to someone else, it no longer appears on your calendar.

Public Calendars and Resource Calendars

You can't create public calendars or resource calendars, and you can't view public calendars or resource calendars created in Salesforce Classic.

Calendar Visibility for User-Created Calendars

When a user creates a calendar view from an object, only the user can see the calendar. Previously, anyone above the user in the hierarchy, or anyone with the "View All Data" permission, could see—and—delete, the calendar. This extensive visibility could cause slow response times.

Cloud Scheduler

Lightning Experience doesn't support Cloud Scheduler meeting requests.

EDITIONS

Available in Lightning Experience in: **All** Editions except **Personal** and **Contact Manager** Editions

SEE ALSO:

[Considerations for Using Tasks in Lightning Experience](#)

[Considerations for Using Activities](#)

Considerations for Using Events and Calendars in Salesforce Classic

Be aware of these considerations for creating, updating, owning, and inviting others to events in Salesforce Classic.

Event Editing

Permission to Edit Other People's Events

Your org's calendar sharing model and your personal calendar sharing control permission to edit other people's events. However, regardless of these settings, managers in the role hierarchy can always edit events owned by people who report to them.

Permission to Edit Public Calendars and Resource Calendars

The calendar sharing model controls permission to edit events in public and resource calendars.

Changes to Fields in Single Events and Their Series

If you change a field in a single event and then change that field in the series, the series change overrides the change to the single event.

Event Deletion

Declining Event Invitations

If you decline an event that you've been invited to, Salesforce removes the event from your calendar. Only the event owner can delete an event with invitees.

Notification for Deleted Event Series

If an event owner deletes a series of recurring events, every invitee receives an email notification that the series of events has been canceled.

Handling of Past and Future Events in Deleted Series

If you delete a series of events, you delete only future events. Events that have already happened aren't affected.

If a series is deleted and it contains events that occurred in the past, the series isn't moved to the Recycle Bin. As a result, the series can't be restored from the Recycle Bin.

If a series is deleted and it doesn't contain past events, Salesforce moves the series to the Recycle Bin. Individual events that were part of the series aren't moved to the Recycle Bin.

Handling of Series Restored from Recycle Bin

If you restore a series from the Recycle Bin, single events are created. Those single events contain both the details defined by the series and any changes or additions made to them individually before the series was deleted.

Deleted Public Calendars

If you delete a public calendar, Salesforce doesn't put it in the Recycle Bin.

Recurring Events

Effects of Changes to an Event Series and Single Events in a Series

Warning: Change to any fields in an event series overrides changes previously made to single events.

If you change the following settings, the status of invitees for future events is reset to Not Responded. You lose messages sent with invitees' responses and other changes to single future events. Triggers and workflows are also reset, and links to future events break.

- All-day event checkbox
- Start or end time

EDITIONS

Available in Salesforce Classic in: **All Editions**

Events with invitees not available in: **Personal Edition**

- Location
- Recurrence frequency
- Recurrence start or end date, if you send updates to invitees

If you don't send updates, and you only extend the recurrence end date, then future events aren't affected.

Display of Original and New Start or End Time for a Changed Series

If the organizer changes the scheduled time of an event in a recurring series, the calendar views and the Home tab's Calendar section show the updated time. However, the detail page of the single event continues to show you the original time until you accept or decline the series.

Maximum Number of Single Events in a Series

- Daily: 100
- Weekly: 53
- Monthly: 60
- Yearly: 10

Click **Calculate max end date** to enter the maximum end date allowed for the frequency that you selected.

Duration of Events

If your Salesforce admin has enabled multiday events, then you can create events up to 14 days long, except recurring events. When you create a recurring event, the maximum duration of the single events in the series is 24 hours. After you create the series, you can change the duration to up to 14 days if your Salesforce admin has enabled multiday events.

Event Reminders

If you create a recurring event and you leave the reminder checkbox selected, you receive a reminder for each single event in the series.

Attachments to Events

You can attach files to a series of recurring events. After you create a series, you can add or delete attachments to each single event in the series.

Attachments are displayed on the event detail page only, not on the detail page for other records that the event is related to. If you don't see the Attachments related list on the event detail page, ask your Salesforce admin to add it to the event page layout.

Inviting People and Scheduling Resources

Access Requirements for Inviting People and Resources

You need at least read access to the contacts and leads that you invite to an event. You need at least "Add Events" on a resource to invite it to an event.

Permission to Edit Events with Invitees

 identifies an event with one or more invitees. You can edit an event that you've invited people to only if you own the event. If the event isn't a recurring event, you can assign it to a different person.

If you want to send an email update, you can send it to all invitees or only to the people you added or deleted during editing.

Event Attendance

Declining an event removes it from your calendar. The event owner doesn't receive an email notification when an invitee accepts or declines an invitation.

Maximum Number of Invitees

The maximum number of invitees for regular events is 1,000. However, for recurring events, the maximum is 100.

Relating Events to Multiple Contacts (Shared Activities)

Maximum Number of Related Contacts

You can relate an event to up to 50 contacts (but only one lead) in the `Name` field, including one primary contact. If you don't see

next to the `Name` field, ask your administrator to enable Shared Activities.

No Support for Recurring Events or Multiple Event Owners

You can't relate multiple contacts to a recurring event series or an event owned by multiple people.

Assigning Events to Coworkers

Default Event Owner

By default, an event is assigned to the user who creates it. To assign independent copies of a new event to multiple people, click

next to **Assigned To**. In the window that opens, click the Multiple Users tab. The `Assigned To` field isn't available in Personal Edition.

Events in Chatter

New Events in Chatter Feeds

If a new event is related to a record like a lead, account, or custom object, the event appears in the feed for that record. On any record that you follow, you see feed items for all events, regardless of who created them.

Creating Events in Feeds

Your Salesforce admin specifies whether you can use Chatter to create events for different types of records. For example, some people can view but not create events in the feeds for accounts that they have access to.

No Recurring Events in Chatter

Your Chatter feed doesn't display recurring events, either in series or singly, and you can't follow recurring events in Chatter.

Invitations and Scheduling in Salesforce Classic

In Salesforce Classic, you can invite people to meetings, accept meeting invites, and use Cloud Scheduler to propose meeting times. You can also create a Microsoft® Outlook® appointment for an event in Salesforce.

1. [Invite People to an Event and Schedule Resources in Salesforce Classic](#)

Invite users, contacts, and leads to a meeting, and schedule meeting resources.

2. [Quickly Schedule a Meeting About an Account, a Contact, or a Lead in Salesforce Classic](#)

Drag-and-drop scheduling lets you schedule events related to accounts, contacts, and leads without leaving the list view page. You drag records from list views onto weekly calendar views and enter the details of the event in an overlay.

3. [Create an Outlook Appointment for an Event in Salesforce Classic](#)

Create an appointment in Microsoft® Outlook® from the details of an event.

4. [Create an Event in a Public Calendar in Salesforce Classic](#)

A public calendar contains a schedule of events that is available to a group of users, such as a sales events calendar for a sales department. If your Salesforce admin has set up a public calendar and you're assigned to that group, you can view the calendar. You can also add an event just as you would add an event to your own calendar.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

5. [Use Cloud Scheduler to Request Meetings in Salesforce Classic](#)
Cloud Scheduler lets you request a meeting with a contact, a lead, a person account, or a coworker.
6. [Respond to Event Invitations in Salesforce Classic](#)
Accept or decline an invitation to an event. After you've accepted an invitation, you can add the event to Outlook.

Invite People to an Event and Schedule Resources in Salesforce Classic

Invite users, contacts, and leads to a meeting, and schedule meeting resources.

1. On the Event detail page, in the Select Invitees section, click **Select**.
2. In the Select Invitees dialog box, search for the type of invitee: users, leads, contacts, or resources.
3. Enter a name or part of a name or leave the field blank to expand the search. Click **Find**.
4. Use  and  to select and deselect people or resources. To invite more people or resources, search again and select the invitees you want.
5. Click **Done**.
6. Review the calendar of each invitee and adjust the date and time of the event if necessary.
The availability of invitees is indicated in color on their calendars: busy time is blue and out-of-office time is red. If an invitee has more than one event scheduled for a particular time, all the events are shown on the calendar. To see the details of an event, hover your mouse over the event on the calendar.
7. To remove an invitee from an event, click **Remove** next to the invitee's name.
8. Click **Save & Send Update**.
Invited leads, contacts, and person accounts receive an email containing a link to a web page. They can accept or decline the invitation for the event or event series. You also receive an email summary of the event. If an invited resource is available at the given time, the resource automatically accepts the invitation.

Quickly Schedule a Meeting About an Account, a Contact, or a Lead in Salesforce Classic

Drag-and-drop scheduling lets you schedule events related to accounts, contacts, and leads without leaving the list view page. You drag records from list views onto weekly calendar views and enter the details of the event in an overlay.

If you don't see the  **Open Calendar** link, ask your administrator to enable drag-and-drop scheduling.

1. Click the  **Open Calendar** link at the bottom of a list view.
A weekly view of a calendar appears below view.
 2. Drag a record from the list to a time slot on the calendar.
A popup window for creating an event appears. The event is already related to the record that you dragged from the list view.
- The  **Open Calendar** link appears only at the bottom of list views for accounts, contacts, and leads.
 - Drag-and-drop scheduling isn't available for the Console tab, events that people have been invited to, recurring events, accessibility mode, or Connect Offline.
 - List views that include drag-and-drop scheduling can take slightly longer than usual to be displayed.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal**

USER PERMISSIONS

To enable drag-and-drop scheduling:

- "Customize Application"

To create events:

- "Edit Events"

USER PERMISSIONS

To create events:

- When you drag the bar in between the list and calendar to resize either one, the size is saved for all views in which you use drag-and-drop scheduling. You can resize the list and calendar at any time.

Create an Outlook Appointment for an Event in Salesforce Classic

Create an appointment in Microsoft® Outlook® from the details of an event.

1. On the detail page for an event, click **Add to Outlook**.
2. Click **Open** to immediately add the event to Outlook, or save it to your computer as a `.vcs` file. If you save it as a `.vcs` file, import the file into Outlook.

The Outlook appointment is added to the “salesforce.com” folder and tagged with the “salesforce.com” category so that duplicates aren’t created during synchronization.

Consider the following when you add an event to Outlook.

- When you view the event in Outlook, the description doesn’t display line breaks that you entered in the event’s `Description` field. Line breaks are replaced by two spaces in the `.vcs` file.
- You can also sync your Salesforce events to Outlook using Lightning Sync or Salesforce for Outlook.

Note: You can also use Lightning for Outlook and Salesforce for Outlook to add Microsoft® Outlook® emails to Salesforce. These email integration applications let you log an outbound or sent email as a task in Salesforce. Then you can associate this task with a contact, a lead, or another record.

Create an Event in a Public Calendar in Salesforce Classic

A public calendar contains a schedule of events that is available to a group of users, such as a sales events calendar for a sales department. If your Salesforce admin has set up a public calendar and you’re assigned to that group, you can view the calendar. You can also add an event just as you would add an event to your own calendar.

1. On a calendar view, click **[Change]** to switch to a public calendar.
2. Choose the time and date of the event:
 - On the day view, click a time such as **9:00 AM** to add an event.
 - On the week or month view, click **+** to add an event on a particular date.
3. Enter the details of your event.
4. Click **Save**. Alternatively, click **Save & New Task** to save the event and begin creating a task, or **Save & New Event** to save and begin creating an event.

Use Cloud Scheduler to Request Meetings in Salesforce Classic

Cloud Scheduler lets you request a meeting with a contact, a lead, a person account, or a coworker.

1. [How Cloud Scheduler Works in Salesforce Classic](#)

When you use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker, Salesforce creates a unique Web page for your meeting that displays the proposed meeting times. When invitees visit the page, they select the times that work for them and send you a reply. Salesforce tracks all the responses so that you can pick the best time to meet when you confirm the meeting.

2. [Request a Meeting in Salesforce Classic](#)

Use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker.

3. [Tips for Proposing Meeting Times in Salesforce Classic](#)

When you request a meeting using Cloud Scheduler, you can either propose meeting times or let Salesforce propose times for you. One of the benefits of letting Salesforce propose meeting times happens when there's a long delay between the time you send the meeting request and when the first invitee views it. For example, if you request a meeting with a contact on a Monday and that contact doesn't view your request until Thursday, Salesforce proposes times from Thursday forward instead of when the meeting request was sent.

4. [Change the Invitees to a Requested Meeting in Salesforce Classic](#)

When you use Cloud Scheduler to request a meeting, you can add and remove invitees at any time.

5. [Reschedule a Requested Meeting in Salesforce Classic](#)

If you used Cloud Scheduler to request a meeting that hasn't been confirmed, you can reschedule it and propose new times. However, when you confirm a meeting, it's converted to an event, so you can't propose new times. To reschedule an event, edit the event to change its date and send an update to the invitees.

6. [Confirm a Requested Meeting in Salesforce Classic](#)

After you use Cloud Scheduler to request a meeting, wait for the invitees to reply with the times they can meet. When this happens, you receive an email notification, and the meeting in Salesforce is automatically updated with the times the invitees selected. You can then choose the best time to meet and confirm the meeting.

7. [Cancel a Requested Meeting in Salesforce Classic](#)

If you used Cloud Scheduler to request a meeting and the meeting hasn't been confirmed, you can cancel the meeting, and Salesforce automatically sends a cancellation notice to the invitees. When you confirm a meeting, then it's converted to an event, which you can delete like any other event.

How Cloud Scheduler Works in Salesforce Classic

When you use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker, Salesforce creates a unique Web page for your meeting that displays the proposed meeting times. When invitees visit the page, they select the times that work for them and send you a reply. Salesforce tracks all the responses so that you can pick the best time to meet when you confirm the meeting.

Step 1: You Request a Meeting and Propose Meeting Times

Go to either the Calendar section on the Home tab or the Open Activities related list on the detail page of the contact, lead, or person account you want to request a meeting with. Click **New Meeting Request** to open the Meeting Request page.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

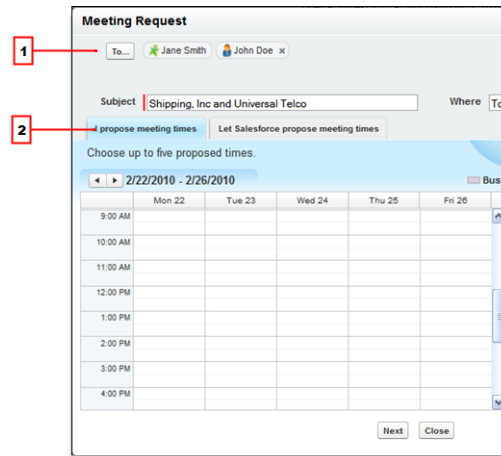

USER PERMISSIONS

To request a meeting:

- "Edit Events"

AND

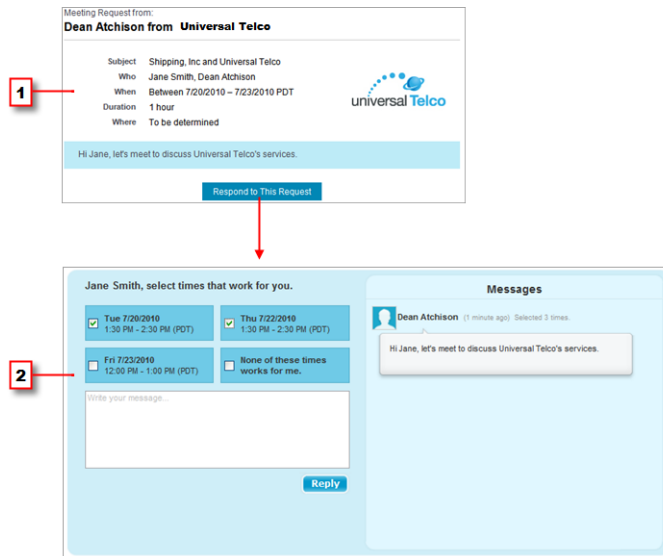

"Send Email"

1. Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
2. Click in the calendar to propose up to five meeting times, or let Salesforce propose times for you.

Step 2: Invitees Pick the Times They Can Meet

Salesforce emails a meeting request to the invitees so they can pick the times they are available.

1. In the meeting request, invitees click **Respond to This Request** to open your meeting's Web page.
2. On the meeting Web page, invitees pick the proposed times that work for them and send you a reply.

Step 3: You Confirm the Meeting

Salesforce keeps track of all the responses so you can see when each invitee is available. You then select the best time to meet and confirm the meeting.

Request a Meeting in Salesforce Classic

Use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker.

Before you use Cloud Scheduler, consider these tips:

- You must have at least read access to the contacts, leads, and person accounts that you request a meeting with.
- Each invitee must have an email address specified in their record so Salesforce can send them a meeting request.
- You can invite up to 50 people to a meeting. Invitees can consist of only contacts, leads, or person accounts, only coworkers who use Salesforce, or a combination.
- We recommend you install [Salesforce for Outlook](#) so you can sync your calendar events between Salesforce and Microsoft® Outlook®.

When proposing meeting times, it's helpful to have your Salesforce calendar up-to-date so you can see your free and busy times.

To request a meeting:

1. Go to either the Calendar section on the Home tab or the Open Activities related list on the detail page of the contact, lead, or person account you want to invite to a meeting.
2. Click **New Meeting Request**.
If this button doesn't display in the Calendar on the Home tab or on the Open Activities related list, ask your Salesforce administrator to add it.
3. Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
 - a. Select the type of invitee from the drop-down list. person accounts are returned in contact searches and can be added as invitees.
 - b. Enter a name or part of a name in the text field, or leave the field blank to expand the search.
 - c. Click **Go!**
 - d. In the Search Results area, select the boxes next to the people you want to invite and click **Insert Selected**. To add more invitees, perform a new search and select more people as needed. If there's a warning icon (⚠️) next to a person's name, you can't invite them to the meeting because they don't have an email address specified in their record. After you add an email address to their record, you can invite them to meetings.
 - e. Click **Done**.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

USER PERMISSIONS

To request a meeting:

- "Edit Events"
- AND
- "Send Email"

- f. To remove someone you just invited, click “x” next to the person’s name in the **To** field. You can remove all invitees unless you requested the meeting from an Open Activities related list. In that case, the first contact, lead, or person account in the **To** field can’t be removed.

4. Enter a subject and location.

If you requested the meeting from an Open Activities related list, the default subject is a combination of the account name for the lead or contact and the company name specified in your personal information. For example, if you’re meeting with a contact from the Sterling company and you work for ACME, the default subject is `Sterling and ACME`. The default location is always `To be determined`.

5. Select one of these tabs:

- **I propose meeting times**—Propose up to five meeting times by picking times in the calendar.
- **Let Salesforce propose meeting times**—Choose the duration and time frame of the meeting and let Salesforce propose up to five meeting times for you.

6. Click **Next**.

7. Write a message to the invitees, and click **Send**.

Note the following:

- Your email signature is automatically added to your message.
- After you click **Send**, Salesforce emails a meeting request to the invitees.
- Your meeting’s Web page displays all messages between you and the invitees. This includes messages that invitees write when responding to your request.
- If you requested the meeting from an Open Activities related list, the meeting appears on the detail page for that contact or lead only. It doesn’t appear on the Open Activities related list for any other invitee. For example, if you requested a meeting with Jane Smith from her contact detail page and then clicked the **To** field to invite John Doe, the requested meeting only appears on the Open Activities related list for Jane Smith and not John Doe. If you requested the meeting from the Calendar section on the Home tab, the meeting doesn’t appear on the Open Activities related list for either Jane Smith or John Doe.

After you send your meeting request, wait for the invitees to reply with the times they can meet. Then confirm the meeting by selecting a final meeting time.

Tips for Proposing Meeting Times in Salesforce Classic

When you request a meeting using Cloud Scheduler, you can either propose meeting times or let Salesforce propose times for you. One of the benefits of letting Salesforce propose meeting times happens when there’s a long delay between the time you send the meeting request and when the first invitee views it. For example, if you request a meeting with a contact on a Monday and that contact doesn’t view your request until Thursday, Salesforce proposes times from Thursday forward instead of when the meeting request was sent.

Proposing Meeting Times

When you propose meeting times:

- Proposed times aren’t saved to your Salesforce calendar. The meeting only appears in your calendar after you [confirm the meeting](#).
- When the invitees view your meeting request, the proposed times are shown in your time zone. Proposed times aren’t shown in the invitees’ time zones.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

USER PERMISSIONS

To request a meeting:

- “Edit Events”
- AND
- “Send Email”

- You can't propose a time that occurs in the past (before the black line in the calendar).
- The calendar's shaded areas show when you and the other invited coworkers are busy based on your Salesforce calendars. Darker shades show when multiple coworkers are busy at the same time.
- Use the `Duration` field to change the length of your meeting.
- To remove a time you proposed, hover over the proposed time and click "x".

Letting Salesforce Propose Meeting Times

When Salesforce proposes meeting times:

- You won't know which times are proposed until after you send the meeting request. Once the first invitee views your request, Salesforce checks the calendars of all coworkers invited to the meeting and proposes meeting times based on their availability. Salesforce tries not to propose the same times that invitees have already selected for other unconfirmed meetings. For example, if you request a meeting for the next five business days and your invitees respond that they can meet on Tuesday and Wednesday from 2:00 to 3:00 p.m., and then you request another meeting for the same time frame, Salesforce won't propose times for Tuesday and Wednesday from 2:00 to 3:00 p.m. unless your calendar is completely booked with confirmed meetings and other events.
- By default, Salesforce proposes meeting times between 9:00 a.m. and 5:00 p.m. in your time zone. However, if you have changed the `Start of day` and `End of day` fields in your Personal Information Settings page, Salesforce uses those settings instead.

 **Note:** If you don't want to meet at a specific time of day (like your lunch hour), schedule a recurring event in your Salesforce calendar to block out that time.

The following table describes the settings that control how Salesforce proposes meeting times.

Field	Description
<code>Duration</code>	The length of your meeting.
<code>Time Frame</code>	<p>How far in advance Salesforce proposes meeting times:</p> <ul style="list-style-type: none"> • Next 5 Business Days/Next 10 Business Days—Salesforce tries to spread out the proposed times over the specified time frame. For example, if your time frame is Next 5 Business Days and the first invitee views the request on a Monday, Salesforce tries to propose a time for each day of that week. If some of your days are booked, Salesforce condenses the proposed times into fewer days. Business days exclude Saturdays and Sundays. • Whenever—Salesforce tries to propose five meeting times over the next five business days, and if it can't propose enough times, it extends the range over the next 10 business days. If Salesforce still can't find five times to propose, it looks for available times over the next four weeks. When you select this option, some of the times Salesforce proposes could be seven weeks away (5 business days + 10 business days + 20 business days = 7 weeks).

Change the Invitees to a Requested Meeting in Salesforce Classic

When you use Cloud Scheduler to request a meeting, you can add and remove invitees at any time.

1. Open your meeting using one of these methods:
 - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
 - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
 - From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.
2. Do either of the following:
 - Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
 - Click "x" next to an invitee's name to remove them from the meeting.

You can remove all invitees unless you requested the meeting from an Open Activities related list. In that case, the first contact, lead, or person account in the $\text{T}\circ$ field can't be removed.

The calendar automatically updates based on the people you added or removed from the meeting.

 **Note:** If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

3. Click **Send Update**.
4. Enter a message. For example, you might want to inform your invitees who you're adding or removing from the meeting.
5. Click one of the following:
 - **Send to All Invitees**—Sends an update to all existing and added invitees and a cancellation notice to removed invitees.
 - **Send Only to Changed Invitees**—Sends an update to added invitees and a cancellation notice to removed invitees.

Reschedule a Requested Meeting in Salesforce Classic

If you used Cloud Scheduler to request a meeting that hasn't been confirmed, you can reschedule it and propose new times. However, when you confirm a meeting, it's converted to an event, so you can't propose new times. To reschedule an event, edit the event to change its date and send an update to the invitees.

If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

1. Open your meeting using one of these methods:
 - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
 - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
 - From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

USER PERMISSIONS

To add and remove invitees from a requested meeting:

- "Edit Events"
- AND
- "Send Email"

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

USER PERMISSIONS

To reschedule a meeting:

- "Edit Events"
- AND
- "Send Email"

2. Click **Reschedule** and propose new times.

Once the invitees reply to your updated request, you can confirm the meeting.

Confirm a Requested Meeting in Salesforce Classic

After you use Cloud Scheduler to request a meeting, wait for the invitees to reply with the times they can meet. When this happens, you receive an email notification, and the meeting in Salesforce is automatically updated with the times the invitees selected. You can then choose the best time to meet and confirm the meeting.

The meeting confirmation page displays as read-only to coworkers without the “Edit Events” permission and coworkers without the “Edit” permission on the contact or lead record associated with a proposed meeting.

If your administrator added required fields to events, you're prompted to update those fields before the meeting is converted to an event.

1. Open your meeting using one of these methods:

- From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
- If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
- From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Select a time, and click **Confirm**.

The **Confirm** button displays after you select a meeting time. If you don't select a time, the **Send Update** button displays instead so you can send the invitees a message without confirming a meeting time.

Use the following tools to help you pick a time:

- Green check marks show when each invitee can meet.
- **Free** shows when you are available based on your Salesforce calendar.
- If none of the times work for the invitees, propose new times and reschedule the meeting.

3. Optionally, enter a message to the invitee.

4. Click **Send** to confirm the meeting.

Salesforce then:

- Emails the invitees with the final date and time of the meeting.
- Converts the requested meeting to a new multi-person event. The last message you sent to the invitees appears in the event's **Description** field, but all other messages between you and the invitees aren't saved.

This event appears in the Calendar section on the Home tab. If you requested the meeting from an Open Activities related list, the event also appears in the Open Activities related list for that contact, lead, or person account.

Available in Salesforce Classic in: **All Editions Except Personal Edition**

USER PERMISSIONS

To confirm a meeting:

- “Edit Events”
- AND
- “Send Email”

Cancel a Requested Meeting in Salesforce Classic

If you used Cloud Scheduler to request a meeting and the meeting hasn't been confirmed, you can cancel the meeting, and Salesforce automatically sends a cancellation notice to the invitees. When you confirm a meeting, then it's converted to an event, which you can delete like any other event.

1. Open your meeting using one of these methods:
 - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
 - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
 - From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Click **Cancel Meeting**.

You can also click **Del** next to the meeting from the Open Activities related list.

 **Note:** If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

3. Click **OK** to confirm the cancellation.

Salesforce emails a meeting cancellation to all invitees. Canceled meetings are permanently removed and aren't stored in the Recycle Bin.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition**

USER PERMISSIONS

To cancel a meeting:

- "Edit Events"

AND

"Send Email"

Respond to Event Invitations in Salesforce Classic

Accept or decline an invitation to an event. After you've accepted an invitation, you can add the event to Outlook.

When a coworker invites you to an event, you receive an email containing a link to the event. The event is also displayed on the Home tab. To accept or decline the event:

1. Click the event description.
2. Optionally, enter a response.
3. If the event is a single event, click **Accept Meeting** or **Decline Meeting**. If you have been invited to a series of events, click **Accept Series** or **Decline Series**.

 **Note:** If you want to attend some events in a series of events but decline the others, accept the series and then decline specific events.

Tasks

Keep your to-do list in Salesforce and stay right on top of your deals and accounts. Easily relate every task to records for leads, contacts, campaigns, contracts, and other information that you need. Salesforce gives you different tools to maximize productivity—quick ways to create and update tasks, prefiltered task lists, and task notification options.

1. [Manage Tasks](#)

In Salesforce, tasks are a powerful tool to help you track your work and close deals. Relate them to opportunities, leads, accounts, and contacts, and manage them on those records, in lists, and in reports.

2. [Considerations for Using Tasks](#)

Salesforce always displays a task's due date in the time zone you've chosen in My Settings. Your Salesforce admin can add conditions for closing a task, such as requiring you to enter a comment. If your Salesforce admin has set up more than one Closed or Open status for tasks, choose a status to continue. Working with tasks is different in Lightning Experience and Salesforce Classic.

3. [Repeat a Task](#)

Easily adjust the due date of a recurring task, or cut the clutter of recurring tasks in your future task list. Use repeating tasks to make a task recur a specified number of days after a trigger that you choose. The next task in the series is created only when the current task is due or marked completed. Repeating tasks are a streamlined alternative to regularly recurring tasks when you don't have to get a task done on a specific day.

4. [Assign Tasks to Multiple People in Salesforce Classic](#)

Assign up to 100 coworkers an independent copy of the same task. For example, you can create a task "Submit your expense reports" with the appropriate due date and assign it to a team of account executives.

5. [Task Notifications](#)

Set options for sending or receiving an email notification when a task is assigned.

[Activities](#)

[Events and Calendars](#)

Manage Tasks

In Salesforce, tasks are a powerful tool to help you track your work and close deals. Relate them to opportunities, leads, accounts, and contacts, and manage them on those records, in lists, and in reports.

1. [Manage Tasks in Lightning Experience](#)

Create, update, and monitor your own tasks, tasks delegated to others, and tasks on an opportunity, a lead, an account, or a contact. Use the Home page, the task list, or the activity timeline. You can also track tasks in reports.

2. [Manage Tasks in Salesforce Classic](#)

You can track, create, and update your own and others' tasks in different locations in Salesforce. Tasks are displayed in activities list views and calendar views; Chatter feeds; and records that tasks are related to, such as contacts and accounts. You can also track tasks in reports.

Manage Tasks in Lightning Experience

Create, update, and monitor your own tasks, tasks delegated to others, and tasks on an opportunity, a lead, an account, or a contact. Use the Home page, the task list, or the activity timeline. You can also track tasks in reports.

[Use Tasks in Lightning Experience to Boost Sales Productivity](#)

- On the Home page, Today's Tasks shows your next five tasks due today.
- In the Kanban view for opportunities, cards show alerts when a task is overdue or when no open activities exist. To create or update a task, click the yellow triangle.
- On an individual opportunity, lead, account, or contact, use the composer and the activity timeline to create and work with tasks, meetings, calls, and emails.
- Use the task list to work with tasks due today, all your open tasks, overdue tasks, and tasks completed in the past seven days. In the navigation menu, go to **Tasks** and choose a view.

To keep recently overdue tasks (due in the past 30 days) on your radar but out of your way, **My Tasks** collapses them when they total 10 or more. **All Overdue** includes all overdue tasks. **Delegated** displays tasks that you've created and assigned to people below you in the role hierarchy of your Salesforce org.

You can also use activities reports to view tasks assigned to people below you in the role hierarchy of your Salesforce org.

-  **Note:** You can remove a contact or a record from a task without deleting the task. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Instead of deleting the task, remove Contact B from the Name field.

[Considerations for Using Tasks in Lightning Experience](#)

Manage Tasks in Salesforce Classic

You can track, create, and update your own and others' tasks in different locations in Salesforce. Tasks are displayed in activities list views and calendar views; Chatter feeds; and records that tasks are related to, such as contacts and accounts. You can also track tasks in reports.

Track Tasks

You can track tasks belonging to you and to others in the following locations. To see activities list views, click  on the Home tab or any calendar view, or go to the calendar day or week view.

Tasks Assigned to You

- The Home tab, in the My Tasks section
- An activities list view: Choose an existing list view or customize one
- Your Chatter feed: Follow a task to track posts, comments, and updates about it

Tasks Due Soon

- The **My Activities** list view
- **Today** in the Salesforce1 app for iOS or Android
- The Salesforce1 **My Tasks** list

Tasks Related to Another Record, Such as a Contact or an Account

- The other record's detail page, in the Open Activities and Activity History related lists

EDITIONS

Available in Lightning Experience in: **All** Editions except **Personal** and **Contact Manager** Editions

USER PERMISSIONS

To create tasks

- "Edit Tasks"

EDITIONS

Available in Salesforce Classic in: **All** Editions

USER PERMISSIONS

To create tasks

- "Edit Tasks"

- Your Chatter feed and in the Chatter feed for the other record
- Activities reports

Note: You can eliminate a contact or a record on a task without deleting the entire task. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Rather than deleting the task, remove Contact B from the `Name` field.

Delegated Tasks (Assigned to People below You in Your Organization’s Hierarchy)

- The **My Delegated Activities** list view
- Activities reports
- The Salesforce1 **Delegated Tasks** list

Overdue Tasks

- The **Overdue** activities list view
- The Salesforce1 **Overdue Tasks** list

Completed Tasks

- The **My Activities** list view
- The Salesforce1 **Completed Tasks** list

Tasks That You’ve Assigned to Others

- The **My Delegated Activities** list view
- Activities reports

Tasks Assigned to People below You in Your Organization’s Hierarchy

- The **My Team’s Activities** list view
- Activities reports

View Task Details

In a calendar, in an activities list view, in a related list, or on the Home tab, there are two ways to see task details:

- Hover your mouse over a task’s subject.
- Click the subject.

On a task detail page, to view the details of a single task in a recurring series () , select the View Task subtab. To view the details for the series, select the View Series subtab.

Create Tasks

On the Home Tab

On the Home tab, under My Tasks, click **New**.

In a Chatter Feed

If you create a task in the feed for a record such as a contact, Salesforce automatically relates the task to the record.

In the Sidebar

In the sidebar in Salesforce, in the Create New drop-down list, select **Task**.

On the Detail Page of Another Record

- On the Open Activities related list, click **New Task**.
- On the Activity History related list, click **Log a Call** to add a task record with a status of Completed.

Salesforce automatically relates the task to the record.

In a Calendar Day or Week View

Under My Tasks, click **New**.

In an Activity List View ()

In a list view, click **New Task**.

Update Tasks

Anywhere (except reports) that you can view task details, you can edit any task that you have permission to edit.

Considerations for Using Tasks

Salesforce always displays a task's due date in the time zone you've chosen in My Settings. Your Salesforce admin can add conditions for closing a task, such as requiring you to enter a comment. If your Salesforce admin has set up more than one Closed or Open status for tasks, choose a status to continue. Working with tasks is different in Lightning Experience and Salesforce Classic.

1. [Considerations for Using Tasks in Lightning Experience](#)
Be aware of these considerations for owning, viewing, creating, and updating tasks.
2. [Considerations for Using Tasks in Salesforce Classic](#)
Be aware of these considerations for owning, viewing, creating, and updating tasks.

SEE ALSO:

[Activity Reminders in Salesforce Classic](#)

Considerations for Using Tasks in Lightning Experience

Be aware of these considerations for owning, viewing, creating, and updating tasks.

Tasks Can Have One Owner at a Time

Only one person can own a task. If you reassign the task to someone else, it no longer appears in your task list, unless the person is below you in the role hierarchy. In that case, you see the task in the Delegated view in your task list.

Managers Can't Edit Others' Tasks

Anyone can reassign a task to a coworker. Managers in the role hierarchy can view tasks that they've assigned to people below them in the role hierarchy. They can also use reports to view tasks of people below them in the role hierarchy, but not to edit them.

Limitations on Email Notifications of Task Assignments

Lightning Experience doesn't display an option to send an email when you assign a task. It also doesn't display a setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available. It depends on how your admin has set up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or created with a status of Completed.

No Task Reminders

Lightning Experience doesn't display task reminders.

Maximum Number of Tasks and Calculating the End Date

There is a limit to how many recurring tasks you can create in a series, and the limit varies based on task frequency. The latest possible end date depends on the maximum number of tasks.

EDITIONS

Available in Lightning Experience in: **All** Editions except **Personal** and **Contact Manager** Editions

For example, a recurring task that repeats every month supports up to 60 tasks in the series, so the end date can be scheduled up to 5 years after the start date.

Frequency	Maximum Number of Tasks	Latest End Date (From the Start Date)
Daily	100	100 days
Weekday	100	20 weeks
Weekly	53	1 year
Monthly	60	5 years
Yearly	10	10 years

Your limits may be different, depending on your Salesforce implementation.

[Considerations for Using Events and Calendars in Lightning Experience](#)

[Considerations for Using Activities](#)

Considerations for Using Tasks in Salesforce Classic

Be aware of these considerations for owning, viewing, creating, and updating tasks.

Recurring Tasks [\(G\)](#)

Only the Default Record Type Is Allowed

If you apply a record type other than the default, Salesforce still applies the default record type to your recurring task. Salesforce doesn't display picklist fields associated with the default record type.

No Due Date in Recurring Tasks

The `Due Date` field is disabled in recurring tasks because tasks in the series have different due dates.

Effects of Changes to a Task Series and Single Tasks in a Series

 **Warning:** Changes to a series of recurring tasks override changes to single tasks that are due in the future. (Changes to a series don't affect tasks due before the current date.) If you change either of the following settings in a series, links to tasks due in the future break. Triggers and workflows are also reset.

- Frequency
- Recurrence start or end date

Task Status

You can't change the status of a task series. You can only change the status of single tasks in a series.

Task Reminders

If you create a recurring task and you leave the reminder checkbox selected, you receive a reminder for each single task in the series.

If you dismiss a reminder, you won't be reminded about that task again.

EDITIONS

Available in Salesforce Classic in: **All** Editions

Attachments to Tasks

You can attach files to a series of recurring tasks. After you create a series, you can add or delete attachments to each single task in the series.

Attachments are displayed on the task detail page only, not on the detail page for other records that the task is related to. If you don't see the Attachments related list on the task detail page, ask your Salesforce admin to add it to the task page layout.

Maximum Number of Tasks and Calculating the End Date

There is a limit to how many recurring tasks you can create in a series, and the limit varies based on task frequency. The latest possible end date depends on the maximum number of tasks.

For example, a recurring task that repeats every month supports up to 60 tasks in the series, so the end date can be scheduled up to 5 years after the start date.

Frequency	Maximum Number of Tasks	Latest End Date (From the Start Date)
Daily	100	100 days
Weekday	100	20 weeks
Weekly	53	1 year
Monthly	60	5 years
Yearly	10	10 years

Your limits may be different, depending on your Salesforce implementation.

Relating Tasks to Multiple Contacts (Shared Activities)

Maximum Number of Related Contacts

You can relate a task to up to 50 contacts (but only one lead) in the `Name` field, including one primary contact. If you don't see

next to the `Name` field, ask your Salesforce admin to enable Shared Activities.

No Support for Recurring Tasks or Multiple Task Assignees

You can't relate multiple contacts to a recurring task series or a task assigned to multiple users.

Assigning Tasks

Task Is Assigned to User Who Created It

By default, a task is assigned to the person who creates it. To assign independent copies of a new task to multiple people, click  next to **Assigned To**; in the window that opens, click the Multiple Users tab. The `Assigned To` field isn't available in Personal Edition.

Task Notifications

Email Notifications

Depending on the way that your Salesforce admin has configured your Salesforce org, one of the following can happen:

- You automatically receive an email notification for every task assigned to you. You can turn off these notifications by going to the Reminders & Alerts page in your personal settings and deselecting the **Email me when someone assigns me a task** checkbox.
- You don't automatically receive an email notification for every task assigned to you. If you want an email sent to anyone you assign a task to, including yourself, select **Send Email Notification** when you create a task. (Depending on how your Salesforce admin has configured your Salesforce org, this checkbox may be unavailable.)

Mobile Task Notifications

Salesforce1 has separate settings for the task assignment notifications that you receive via your mobile device.

Tasks in Chatter

New Tasks Appear in Chatter Feeds

If a new task is related to a record like a lead, account, or custom object, the task appears in the feed for that record. On any record that you follow, you see feed items for all tasks, regardless of who created them.

Creating Tasks in Feeds

Your Salesforce admin can specify whether you can use Chatter to create tasks for different types of records. For example, some people can view but not create tasks in the feeds for accounts that they have access to.

No Recurring Tasks in Chatter

Your Chatter feed doesn't display recurring tasks, either in series or singly, and you can't follow recurring tasks in Chatter.

No Email or Call Logging in Case Feeds

On cases, feeds don't include email tasks or call logging tasks.

Email-to-Case

Viewing Associated Emails

If your organization has enabled Email-to-Case or On-Demand Email-to-Case, some tasks are associated with Email-to-Case or On-Demand Email-to-Case emails. To view the associated email, click the link at the top of the task. See [Working with Case Emails](#) on page 2271 for more information.

Salesforce for Outlook

Unresolved Items

Tasks that are emails received via Email to Salesforce or Salesforce for Outlook sometimes display a banner that links to the My Unresolved Items page. Use this page to assign any unassociated emails to related Salesforce records.

Repeat a Task

Easily adjust the due date of a recurring task, or cut the clutter of recurring tasks in your future task list. Use repeating tasks to make a task recur a specified number of days after a trigger that you choose. The next task in the series is created only when the current task is due or marked completed. Repeating tasks are a streamlined alternative to regularly recurring tasks when you don't have to get a task done on a specific day.

If you don't see the repeating tasks option when you create a task, ask your Salesforce admin to add repeating tasks to a page layout.

The screenshot shows a task configuration window with two main sections:

- 1 Repeat This Task:** A dropdown menu currently set to "After date completed".
- 2 Recurrence Interval:** A text input field containing the number "14".

1. For **Repeat This Task**, select **After due date** or **After date completed**.
2. For **Recurrence Interval**, enter the number of days after the task's due date or completed date when you want the next task to be due.

If **Repeat This Task** on an existing task is set to **(Task closed)**, it indicates that the task was closed as part of a repeating series. You can use this information to distinguish repeating tasks from other tasks for reporting purposes.

If you use Salesforce for Outlook to sync tasks, individual tasks in a repeating series are synced as they're created.

Note: When tasks in a series are set to repeat after their due date, Salesforce doesn't create recurrences that would have been due in the past. Instead, Salesforce keeps adding the interval until a repeated task has a due date in the future. For example, suppose that someone sets a task to repeat three days after it's due but doesn't complete the task until five days after it's due. Instead of creating a task that's already overdue, Salesforce gives the new task a due date of tomorrow.

Assign Tasks to Multiple People in Salesforce Classic

Assign up to 100 coworkers an independent copy of the same task. For example, you can create a task "Submit your expense reports" with the appropriate due date and assign it to a team of account executives.

1. On the New Task page, click the lookup icon (🔍) next to the **Assigned To** field.
2. In the lookup window, select the **Multiple Users** tab.
3. Add up to 100 people (including members of groups) to Selected Members.

Tip: Personal groups are a convenient way to organize users into groups that are meaningful to you. For details, see [Creating and Editing Groups](#).

4. Click **Done**.
The New Task page displays your selections and the total number of tasks next to the **Assigned To** field.

5. Save the task.

You've now assigned copies of the task to the coworkers you selected. Coworkers can edit, reassign, or delete their individual tasks.

Task Notifications

Set options for sending or receiving an email notification when a task is assigned.

1. [Task Notifications in Lightning Experience](#)

Lightning Experience doesn't display an option to send an email when you assign a task. It also doesn't display a setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available. It depends on how your admin has set up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or created with a status of Completed. Ask your Salesforce admin for details.

2. [Task Notifications in Salesforce Classic](#)

Salesforce can send an email notification when someone creates or assigns a task, depending on how your Salesforce admin has set up your org.

Task Notifications in Lightning Experience

Lightning Experience doesn't display an option to send an email when you assign a task. It also doesn't display a setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available. It depends on how your admin has set up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or created with a status of Completed. Ask your Salesforce admin for details.

Task Notifications in Salesforce Classic

Salesforce can send an email notification when someone creates or assigns a task, depending on how your Salesforce admin has set up your org.

Ask your Salesforce admin which way task notifications work in your org:

- You can set your own preference for email notifications when someone assigns you a task.
- Someone who assigns you a task can determine whether to send you an email notification of the task.
- You can't receive email notifications when someone assigns you a task.

If you can set your own preference for email notifications when someone assigns you a task, then you receive email notifications by default. If you don't want to receive the email, change the setting:

- In your personal settings, go to **Reminders & Alerts > Events and Tasks** and deselect **Email me when someone assigns me a task**.

Track Your Products, Prices, and Payment Schedules

Products

Products in Salesforce represent the products and services that your company offers to customers.

Products Concepts

Before you use products in Salesforce, make sure that you understand the basics.

Guidelines for Creating Products

If you're an admin or sales operations manager, you'll create products in Salesforce to track the products and services that your company sells. After you create a product, your sales reps can add it to their quotes, opportunities, and orders. Before you get started, review a few key guidelines.

Products Concepts

Before you use products in Salesforce, make sure that you understand the basics.

Products are the items and services that you sell to customers. Each product can exist in multiple price books with different prices.

When you view the detail page of an opportunity, quote, order, or service contract, the Products related list or the Quote Line Items related list shows the associated products for that record. Use these related lists to choose a price book for the record, add or edit products, and, for opportunities, establish or edit product schedules. For example, on a quote detail page, click **Add Line Item** on the Quote Line Items related list to select a product to list on the quote.

If products are shared with external contacts via Salesforce to Salesforce, choose one of the list views under Products from Connections to view products that your business partners have shared with you.

[Considerations for Removing a Product from a Price Book](#)

Before you remove a product from a price book, consider a few key points.

[Considerations for Removing Products and Price Books](#)

Review a few key points before you remove a product or a price book.

Price Books Concepts

Learn about price books and price book entries.

A *price book* is a list of products and their prices.

- The *standard price book* is the master list of all your products and their default *standard prices*. Salesforce creates the standard price book when you start creating product records. It includes all your products and their standard prices regardless of any custom price books that include those products.
- A *custom price book* is a separate list of products with custom prices, called *list prices*. Custom price books are ideal for offering products at different prices to different market segments, regions, or other subsets of your customers. Create a separate price book for each set of customers that you want to address. For example, if you have one set of prices for domestic customers and another for international customers, create a domestic price book and an international one.

A *price book entry* is a product with its price as listed in a price book. Each price book entry specifies a currency for the price.

- *Standard price book entries* are the default (standard) prices for the products and services in the standard price book. When you create a product record, Salesforce creates a standard price book entry. You can mark the standard price book entry as active or inactive, depending, for example, on whether you intend to start selling the product right away.
- *Custom price book entries* are the custom (list) prices for the products and services in your custom price books. Custom price book entries can be created only for products with active standard price book entries.
- In Lightning Experience, Product detail pages display the Standard Price related list and the Price Books related list as a single Price Books related list.
- If you customize the Price Book Entry detail page layout, no field dependencies exist for price book entry fields in the user interface. If the `Use Standard Price` checkbox is removed from the page layout, and this checkbox is selected for a price book entry, you can't edit the list price. The `List Price` field is disabled and can't be enabled on this page.

Set Product Prices in Lightning Experience

Track different types of prices for each of your products to fit the way you sell to different market segments and customers.

Set Standard Prices in the Standard Price Book

1. Select a product.
2. From the product page, click **Add Standard Price** from the Price Books related list. If you've already added a standard price, click **Edit** from the Show More menu to change it.
3. Enter the new standard price in the `List Price` field.
4. To make this price available to products on opportunities, quotes, or other custom price books, select `Active`.
5. Save your changes.

The standard price is automatically associated with the product in your standard price book.

Set List Prices in Custom Price Books

1. Select a product.
2. On the product page, click **Add to Price Book** from the Price Books related list.
3. Choose the price book and currency for the new list price, and then click **Next**.
4. Enter the list price. Alternatively, if you want the price in the chosen price book to match the standard price, select `Use Standard Price`.
5. To make this price available to be used when adding the product to opportunities or quotes, select `Active`.
6. Save your changes.

Edit a Price Book Entry

Click **Edit** next to a price book record in any of these locations.

- The price book detail page, in the Products related list
- The product detail page, in the Price Books related list

For information about fields, see [Product, Price Book, Price Book Entry, and Product Schedule Fields](#).

Set and Edit Product Prices in Salesforce Classic

Track different types of prices for each of your products to fit the way you sell to different market segments and customers.

Set Standard Prices

1. Select a product.
2. On the product detail page, click **Add** from the Standard Price related list.
If you've already added a standard price, click **Edit** to change it or **Edit All** to edit all standard prices in other currencies.
3. Enter the standard price.
4. Select **Active** to make this price available to products on opportunities, quotes, or other custom price books.
5. Save your changes.
The standard price is automatically associated with the product in your standard price book.

Set List Prices

1. Select a product.
2. On the product detail page, click **Edit** from the Price Books related list next to the custom price book that will contain the list price.
If you haven't already added the product to a custom price book, click **Add to Price Book** from the Price Books related list.
3. Enter the list price. Alternatively, if both prices are the same, select **Use Standard Price**.
4. Select **Active** to make this price available to products on opportunities or quotes.
5. Save your changes.

Edit a Price

Click **Edit** next to a price book entry record in any of these locations.

- The price book detail page, in the Products related list
- The product detail page, in the Standard Price related list
- The product detail page, in the Price Books related list
- The price book list view

Guidelines for Sharing Price Books

Extend access to price books to more of your sales team members through sharing in Salesforce Classic.

If you're an admin or a user with the "Edit" permission on price books, you can extend sharing of a price book to more users. However, you can't change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click **Sharing** on the price book detail page. The sharing detail page lists the users, groups, roles, and territories that have sharing access to the price book. On this page, you can do any of the following.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views.
- To edit or delete any view that you created, select it from the `view` drop-down list, and then click **Edit**.
- To grant access to the record for other users, groups, roles, or territories, click **Add**.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Does your sales team want to see prices on the product detail page? If your organization-wide default for price books is "No Access," you can give your entire organization "View Only" access to your standard price book.

Considerations for Removing Price Books

To remove price books from related lists, you can archive, deactivate, or delete the price books. Each removal option has a different result. Before you remove a price book from your related lists, determine which option best fits your business needs.

- Deleting, deactivating, or archiving a custom price book doesn't affect other price books or your product lists. However, these actions can affect your opportunities and quotes. Changing associations with opportunities or quotes is sometimes required before you can remove an associated price book.
- You can deactivate the standard price book, but you can't delete or archive it.

Considerations for Deleting Price Books

- You can't delete a price book while it's in use on opportunities or quotes. If you try to, the system creates a list of the opportunities or quotes that the price book is used on.
- When you delete a price book, you delete all entries in the price book. The deleted price book and its entries are moved to the Recycle Bin. You can restore them for up to 15 days.

Considerations for Deactivating Price Books

- You can activate, deactivate, or reactivate price books at any time by changing the price book's properties.
- You can deactivate a price book even if it's used on an opportunity or quote.
- You can continue to manage entries in your price book while it's deactivated.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

- To share price books:
- "Edit" on price books

EDITIONS

Quotes available in: **Performance and Developer** Editions and **Professional, Enterprise, and Unlimited** Editions with the Sales Cloud

Considerations for Archiving Price Books

- You can archive a price book even if it's in use on an opportunity or quote.
- An archived price book is visible, but not accessible, in all associated records.
- Entries in archived price books don't appear in search results.
- You can't recover or delete an archived price book.

SEE ALSO:

- [Price Books Concepts](#)
- [Products Concepts](#)

Considerations for Removing a Product from a Price Book

Before you remove a product from a price book, consider a few key points.

- If you remove a product from a price book, all related price book entries are removed.
- If you restore the product from the Recycle Bin, any related price book entries are restored with it.
- If opportunities, quotes, service contracts, or contract line items are associated with a product, you can't remove the product.
- You can't remove a product that's used on an opportunity or quote. If you try to remove it, Salesforce displays a list of the opportunities and quotes. That way, you can remove the product from those opportunities and quotes and try again. If you don't want to remove the product from all opportunities and quotes, you can deactivate (recommended) or archive the product. See [Considerations for Removing Products and Price Books](#).

EDITIONS

Products and price books available in: **Performance, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Quotes available in: **Performance and Developer** Editions and in **Professional, Enterprise,** and **Unlimited** Editions with the Sales Cloud

Considerations for Removing Products and Price Books

Review a few key points before you remove a product or a price book.

- When you remove a product or price book, all related price book entries are removed. However, if several price books contain the same product, removing the product from one price book doesn't affect the other price books. Similarly, if you remove a price book, the products that it contained aren't removed from any other price book.
- To remove a product completely, remove it from the standard price book.
- If opportunities, quotes, service contracts, or contract line items are associated with a product, you can't remove the product.
- You can't remove a product or price book that's associated with an approval process or has a pending workflow action.
- If your product or price book is used on an opportunity, quote, or order, you have three options.
 - Deactivate it by editing it and then deselecting the `Active` field. We recommend deactivating a product or price book that's on an opportunity or quote because it will no longer be available to users. You can reactivate it later. Deactivation doesn't affect the history of an opportunity line item.
 - Remove the related product or price book from all opportunities and quotes. When you try to remove a product or price book that's used on an opportunity or quote, Salesforce displays a list of the opportunities or quotes that use it.
 - If you remove a price book, remove it from each opportunity and quote that's listed.
 - If you remove a product, remove it from each opportunity and quote that uses it.
 Then remove the price book or product.
 - Archive the product or price book and each related price book entry. Use this option with caution. Archived products and price books can't be recovered because they're not stored in the Recycle Bin. Archived products and price books still appear on any opportunities or quotes that contained them before they were archived.

If you archive a price book, it's still visible in the associated records but not accessible or retrievable.

Scheduled products can be added and viewed in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Establish Schedules for Products on Opportunities

After you add product schedules, use them to set up payments for product sales and realized revenue on opportunities.

Product Schedules Concepts

If you're an admin or sales operations manager, you can create default schedules for products and schedules for individual product line items on opportunities. Start by learning the basics.

- A *quantity schedule* determines when a product is delivered.
- A *revenue schedule* determines when a product is paid for.
- A *default schedule* is associated with a specific product in a specific price book. Every time the product is added to an opportunity, the default schedule is used. You can override the default schedules on any opportunity.

You determine which types of schedules your Salesforce org can use and which types of schedules can be established for each individual product.

- A quantity schedule is suitable if your customers pay once but receive the product in increments, for example, as with an annual magazine subscription for a monthly magazine. A quantity schedule defines the dates, number of units, and number of installments for payments, shipping, or other use as determined by your company.
- A revenue schedule is suitable if your customers make regular payments but receive the product once, for example, if you sell customized products that are charged in installments but delivered once. A revenue schedule defines the dates, revenue amounts, and number of installments for payments, recognizing revenue, or other use.
- A revenue and quantity schedule is suitable if your customers receive their orders on a delivery schedule and pay for the products using a payment schedule, for example, a monthly product subscription that's paid for monthly.
- A default schedule is suitable if all your customers make product payments on the same timetable or you deliver products on a regular schedule. If you typically customize schedules, there's no advantage to creating default schedules.

SEE ALSO:

[Product Schedules](#)

Considerations for Using Product Schedules

Consider key points and review examples before you add product schedules or establish schedules on opportunity products.

Considerations for Using Default Product Schedules

- If you add or change a product schedule, opportunities with that product aren't updated. If a product has a default quantity schedule and a default revenue schedule, the quantity schedule is calculated first to determine the total product revenue. Then the revenue schedule is applied to that amount.
- If you have a quote line item with a discount, and the corresponding product record has a default schedule, you can't edit the `Discount` field.
- If a product has default schedules established on the product record, the schedules are automatically created when you add the product to the opportunity. The dates of the installments begin with the date that you specified when adding the product. If you didn't specify a product date, the installment dates begin with the opportunity `Close Date`.

EDITIONS

Schedules can be established in: Salesforce Classic

Scheduled products can be added to opportunities and viewed in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Examples of Using Default Product Schedules

- **Default Revenue Schedule Only:** Your ASP company sells yearly contracts of product licenses at \$1,200 per license. When a customer buys licenses, the licenses are all “delivered” at one time, but you recognize the revenue monthly. In this case, set a revenue schedule of Schedule Type=Divide, Installment Period=Monthly, and Number of Installments=12.

With this default revenue schedule, a salesperson sells 200 licenses at a unit price of \$1,200 per license per year on an opportunity on March 15. The 200 licenses are all “delivered” on March 15. The total revenue for this product is the quantity of 200 multiplied by the unit price of \$1,200 per year, for a total yearly revenue of \$240,000. The revenue schedule divides the total revenue into monthly installments of \$20,000 on the 15th of every month for the next year.

- **Default Quantity Schedule Only:** Your medical supplies company sells a box of tongue depressors for \$10 per box. You normally have yearly contracts with hospitals to deliver boxes monthly. In this case, set a quantity schedule of Schedule Type=Repeat, Installment Period=Monthly, and Number of Installments=12.

With this default quantity schedule, a salesperson sells 1,000 boxes on an opportunity on January 1. The quantity schedule creates 12 monthly installments of 1,000 boxes each, for a total quantity of 12,000 boxes. The total revenue from this opportunity is calculated using the unit price and the total quantity, so \$120,000 is booked on January 1.

- **Default Quantity and Revenue Schedules:** Your manufacturing company sells widgets for \$10 each. You normally have yearly contracts to deliver widgets weekly, but your customers pay quarterly. In this case, set a quantity schedule of Schedule Type=Repeat, Installment Period=Weekly, and Number of Installments=52. Set a revenue schedule of Schedule Type=Divide, Installment Period=Quarterly, and Number of Installments=4.

With these default schedules, a salesperson sells 2,000 widgets on an opportunity on January 1. The quantity schedule is applied first, and it schedules 2,000 widgets to be delivered every week for a year, for a total quantity of 104,000. The total revenue is calculated using the unit price and the total quantity. The total revenue of \$1,040,000 is then divided into quarterly installments of \$260,000.

- [Product Schedules Concepts](#)

Guidelines for Adding Entitlement Templates to Products

If you're an admin or sales operations manager, follow key guidelines for using the Entitlement Templates related list.

Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

The Entitlement Templates related list displays a product's applicable entitlement templates. Administrators determine an Entitlement Template related list's availability and content.

- To search for entitlement templates, enter a name, or part of a name, in the text entry field, and then click **Go!**.
- To add entitlement templates to a product, click **Add Entitlement Template**, select the checkboxes next to the templates that you want to add, click **Insert Selected**, and then click **Done**.
- The actions that you can perform on the entitlement template are listed under Action. For example, click **Remove** to remove an entitlement template from the product.
- The name of the template is listed under Entitlement Template. Click to view the template's details.

EDITIONS

- The user who created the entitlement template is listed under Created By.

Product, Price Book, Price Book Entry, and Product Schedule Fields

Products, price books, and product schedules have the following fields, listed in alphabetical order. Availability of fields depends on how Salesforce is set up.

Product Fields

Field	Description
Active	Whether the product is ready for use in a price book, opportunity, or quote, and whether you can find the product in searches and see the product in views.
Created By	The name of the user who created the product record, including the date and time of creation.
Custom Links	A list of custom links for products from Salesforce.
Last Modified By	The name of the user who last saved the record, including the date and time of the most recent save to the record.
Product Code	The internal code or product number that you use to identify the product.
Product Currency	In multicurrency organizations, the currency that you use for the product. If the product currency differs from the user currency, currency-related fields for opportunities, quotes, and quote line items appear in both currencies. The product's currency is converted to the user's currency, and the converted amount appears in parentheses.
Product Description	The text that distinguishes this product from other products.
Product Family	The category that you specify for the product.
Product Name	The product's name.
Quantity Scheduling Enabled	Whether the product can have a quantity schedule.
Revenue Scheduling Enabled	Whether the product can have a revenue schedule.

EDITIONS

Products, price books, and quotes available in: both Salesforce Classic and Lightning Experience

Orders available in Salesforce Classic

Products, price books, and orders available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Quotes available in: **Performance** and **Developer** Editions and in **Professional, Enterprise,** and **Unlimited** Editions with the Sales Cloud

Price Book Fields

Field	Description
Active	Whether you can add the price book to an opportunity or quote.
Created By	The name of the user who created the price book, including the date and time of creation.
Description	The text that distinguishes this price book from others.
Is Standard Price Book	Whether the price book is the standard price book. A read-only checkbox.
Last Modified By	The name of the user who last saved the record, including the date and time of the most recent save to the record.
Price Book Name	The price book's title.

Price Book Entry Fields

Field	Description
Active	Whether the price book entry (product and list price) is active and can be added to an opportunity or quote.
Created By	The name of the user who created the price book entry, including the date and time of creation.
Currency	This field is available only for Salesforce orgs with multiple currencies enabled and represents the currency to use for the price book entry (product and list price).
Last Modified By	The name of the user who last saved the price book entry record.
List Price	The price of the product within the price book, including currency.
Price Book	The price book that contains the price for this entry.
Product	The product's name.
Product Code	The internal code or product number that's used to identify the product.
Standard Price	The standard price for the product. This field is derived and doesn't exist on the underlying PricebookEntry standard object.
Use Standard Price	Whether the price book entry inherits its price from the standard price book.

Schedule Fields

Field	Description
Schedule Type	Whether the product revenue or quantity is divided into multiple installments or repeated for each installment.
Installment Period	The interval for installments; for example, Weekly or Monthly.
Number of Installments	The number of installments in the schedule.

Considerations for Cloning Products

If you're an admin or a sales operations manager, you can clone a product to quickly create another product with the same information and price book entries. Consider key points before you clone a product.

When you clone a product:

- Price book entries in price books that you don't have sharing access to aren't created.
- If you have read-only access to a field, the value of that field isn't carried over to the cloned record.

EDITIONS

Products and price books available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Considerations for Creating and Maintaining Price Books

Before you create a price book, consider a few key points.

- To create a custom price book by cloning an existing price book, click **Clone** on the price book detail page.
- You can delete products from custom price books without affecting the original product listing or its entries in other price books. When you delete a product from the standard price book, the product is still available and active, but its standard price is deleted and removed from all custom price books. If you delete the product from the standard price book, and it's still associated with any custom price books, click **OK** to remove it from all custom price books.
- You can add products, quote line items, or order products from a single price book only.
- To include a product on an opportunity, quote, or order, choose a price book that contains the product. The last price book that you used on an opportunity or quote is selected by default. To select a different price book, click **Choose Price Book** in the Products related list on an opportunity or the Quote Line Items related list on a quote. Choose Price Book appears when you have access to more than one price book. If you have access to more than one price book and the option isn't visible, ask your administrator to add it to your page layout.
- If you change the price book for an opportunity that has products, all products are deleted from the Products related list, but the value in the opportunity's Amount field remains.

Quotes available in: **Performance and Developer Editions** and **Professional, Enterprise, and Unlimited Editions** with the Sales Cloud

Considerations for Setting Prices

If you're an admin or a sales operations manager, consider key points before you set prices for your products in Salesforce.

- The following price types are available.
 - A *standard price* is the default price that you associate with a product. It's automatically included in your standard price book.
 - A *list price* is the custom price that you associate with a product in a custom price book. For example, you can maintain one set of prices for domestic orders and another for international orders.
 - *Sales prices* are the actual prices that sales reps specify for the products that they add to opportunities and quotes. Sales prices can be the same as the list prices from the price book that's used for the opportunity or quote, or they can include discounts or other modifications.
- Before you can add a new product to an opportunity, quote, or custom price book, add a standard price to the product, and mark it as active. This pricing is the default pricing of the product.
- Before you can assign list prices for products, create custom price books. List prices are available to use when you add products to an opportunity or quote from a custom price book.
- To represent the price, for example, \$100.00, enter *100* or *100.00*, with or without the \$ symbol.
- You can expand the format of your price fields to up to eight decimal places. To change your decimal place settings, contact Salesforce.

Considerations When Using the Salesforce Classic User Interface

- You can add standard or list prices only through the multiline add pages (the Add Standard Price page and the Add List Price page). These pages don't support custom fields. To add standard or list prices and populate custom fields, add the price book entry via the multiline add pages, navigate to the Price Book Entry Edit page for the added record, and then update the custom fields.
 - 📌 **Note:** This consideration doesn't affect price book entries that were created or edited by using Data Loader or the API.
- If the price book entry contains required custom fields, you can't create price book entries in the user interface. You can create these price book entries only by using Data Loader or the API.
- You can edit prices in either of the following locations.
 - The multiline edit pages (the Edit Standard Price page and the Edit List Price page)
 - The Price Book Entry Edit page

Building Your Pipeline with Opportunities

Opportunities

Track and manage your potential deals with Salesforce opportunities.

See key details about the deals, including which accounts you're working with, who the players are, and the amounts of the potential sales. As your deals progress toward the Proposal stage:

- Add products and attach files, such as contracts or data sheets.
- Log the calls you make.
- Use Notes to jot down things during customer meetings.
- Create tasks for key activities and calendar events for client meetings.
- Send email to the opportunity contact or other key decision-makers.

During negotiation, share sales strategies with colleagues or to ask your manager for targeted guidance using Chatter. As you drive your deal from one stage to the next, update the opportunity record with the current stage. You'll be closing deals in no time.

Move an Opportunity to the Next Stage in Salesforce Classic

Track opportunity progress as you get closer to closing your deal.

 **Note:** These steps work in Salesforce Classic. If you see the App Launcher icon (☰) on the left side of the navigation bar at the top of your screen, you're in Lightning Experience. If not, you're in Salesforce Classic.

1. Edit the opportunity record you want to update.
2. Select the new stage.
3. Save the record.

Add and Edit Products on Opportunities

Track what's selling and in what quantity by adding products to opportunities. Then make sure that you maintain accurate records by updating the quantities and prices of the products.

1. Navigate to the opportunity that you want to edit.
2. From the Products related list, either select **Edit** next to the product you want to modify or select **Add Product** to add a new product. If you're adding the first product, choose a price book for the opportunity.
3. When adding a new product, select one or more products from the list, or search for a product.
4. Enter the attributes for each product. Admins can customize this page to include fields that are specific to your business.
5. Enter the `Sales Price` for the product. The sales price defaults to the list price that's specified in the price book that's assigned to the opportunity. Depending on your user permissions, you can override this value.
6. If the product has a discount, type the discount as a number with or without the percent sign (%) in the `Discount` field. If the `Discount` field isn't available, check with your administrator.
7. Enter the number of products at this price in the `Quantity` box.

Schedule Reminders to Update Opportunities

To ensure your team is keeping their opportunities up to date, create an automated email that contains a report of your team's open opportunities and send it to your direct reports.

For example, you can schedule a weekly report of all the opportunities for the current fiscal quarter owned by anyone on the team and have the report distributed to everyone on the team.

1. Make sure that opportunity update reminders are enabled.
2. From your personal settings, enter *Reminder* in the **Quick Find** box, then select **My Update Reminder**.
3. Check **Active** if you want reminders to start after you save the settings.
4. Enter a name and address for the sender of the reminders.
5. Choose a recipients option.
6. Enter any other recipients in the **CC** field. Separate email addresses with commas, semi-colons, spaces, or new lines.
7. Enter a subject and message to be included in the email reminders.
8. Select a schedule frequency.
9. Select **Include Past Due Opportunities** to include all open opportunities that have a closing date within 90 days before the specified **Close Date**.

For example, suppose that your organization uses a normal fiscal year and the current quarter started on 4/1/2012. You configure update reminders for opportunities closing in the current quarter and then select **Include Past Due Opportunities**. When the update reminder is sent on 6/15, it includes all opportunities from 4/1 to 6/15. It also includes open opportunities with a closing date between 1/2 and 4/1 (there are 91 days in Q1).
10. Choose a **Close Date** to include opportunities with dates within that range.
11. Select the fields to include in the email reminders.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Field	Description
Last Login Date	Most recent login date of the opportunity owner
# of Open Opportunities	Total number of opportunities in the report
# Not Updated in Last 30 Days	Total number of opportunities that have not been updated in 30 days
Open Opportunity Amount	Total of all opportunity amounts in report
Total Closed Amount	Total closed amount for all opportunities in report. If your organization uses multiple currencies, this amount is converted to the user's currency. If your organization uses

Field	Description
	advanced currency management, the conversion is done using dated exchange rates.
Last Update Date	Most recent date the opportunity owner submitted a forecast. If your organization uses multiple currencies, this amount is converted to the user's currency. If your organization uses advanced currency management, the conversion is done using dated exchange rates.

12. Click **Save**.

When there are no records in an opportunity update reminder, Salesforce doesn't send an email. If no email is sent for three consecutive opportunity update reminders, the scheduled reminder is deactivated.

Opportunity Field History

Field History lets you track the changes made to an opportunity, including changes to the stage, so you can quickly see who changed the opportunity and when.

There are two related lists that track changes to the fields on an opportunity record.

Opportunity Field History

Any time a user modifies any of the standard or custom opportunity fields that are set to be tracked, a new entry is added to the Opportunity Field History related list. All entries include details of the change and who made it. Your administrator can choose which fields to track.

Stage History

Any time a user changes the `Amount`, `Probability`, `Stage`, or `Close Date` fields, a new entry is added to the Stage History related list. All entries include details of the change and who made it. Your administrator can't choose which fields to track.

Changes to the `Amount` and `Quantity` fields are tracked even when the field is updated as the result of a change to an opportunity's products or schedules.

- "Read" on opportunities

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All** Editions for organizations activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions for organizations activated after Summer '09

Guidelines for Creating Opportunities

Many of your Salesforce org's opportunities can be generated when you convert qualified leads, but you can also create opportunities manually in both Salesforce Classic and Lightning Experience.

Contacts and Contact Roles

- To associate an opportunity with an account or contact, you must have at least read access to the account or contact.
- In Salesforce Classic, when you create an opportunity from a contact record, that contact is automatically listed as the primary contact in the Contact Roles related list of the opportunity. In Lightning Experience, when you create an opportunity from a contact record, you're prompted to assign a contact role to that contact.

Divisions

If your organization uses Divisions, the division of a new opportunity is automatically set to the division of the related account.

Forecasts

- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, opportunities you create are automatically given the forecast category that corresponds to the opportunity stage you assign. Your administrator correlates opportunity stages and forecast categories when editing the `stage` picklist values.
- If the opportunity is set to close in a given month, as determined by the `Close Date`, the opportunity is automatically added to the forecast for that particular month, unless the forecast category on the opportunity is set to *Omitted*.

Multicurrency

If your organization uses multiple currencies, your opportunity amounts are initially shown in your personal currency. Change the `Opportunity Currency` picklist to track the sales revenue in another currency.

Opportunity Splits

When team selling and splits that total 100% are enabled, you're automatically added to the opportunity team and initially assigned 100% of the split.

Territory Management

If your organization uses [territory management](#), opportunities that you create are automatically assigned a territory when both of the following conditions are met.

- You belong to or have edit privileges on the same territory as the account on the opportunity.
- You have no other territories in common with that account. (Note that if you have the "Manage Territories" permission, you have access to all territories, including the parent territories of the account. In this case, you *do* have other territories in common with the account, unless the account is only assigned to a single top-level territory. No territory is assigned to the opportunity.) For example, if you are in the territories Berkeley and San Francisco and the account is in the territories Portland, San Francisco, and Seattle, the opportunity is assigned to the San Francisco territory.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Opportunity Splits available in: Salesforce Classic

Available in: **All Editions** for orgs activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions** for orgs activated after Summer '09

Opportunity Splits and territory management available in: **Performance and Developer Editions** and in **Enterprise and Unlimited Editions** with the Sales Cloud

Considerations for Deleting Opportunities

Before you delete Salesforce opportunities, make sure you're familiar with these considerations.

- You can delete an opportunity if you're an administrator, the opportunity owner, or a user above the opportunity owner in the organization role hierarchy, and you have the "Delete" permission on opportunities.
- When you delete an opportunity, all related notes, attachments, quotes, quote line items, quote PDF files, events and tasks, partner relationships, competitor strengths/weaknesses, contact roles, and stage history are deleted.
- The deleted opportunity is moved to the Recycle Bin and can be restored. If you restore the opportunity, any related items are also restored.
- Associated contacts and accounts are not deleted with the opportunity.

SEE ALSO:

[Delete Records](#)

Considerations for Cloning Opportunities

Cloning an opportunity quickly creates an opportunity with the same information as the existing one. Before you clone Salesforce opportunities, make sure you're familiar with these considerations.

- If you have read-only access to a field, the value of that field isn't included in the cloned opportunity.
- If the opportunity has an associated opportunity team, the team isn't included in the cloned opportunity..
- If the opportunity has any associated products that contain unique custom fields, delete the values in the custom fields before cloning the opportunity.
- If the clone button isn't visible, you might not have permission to create opportunities, or your Salesforce admin might have removed it from the page layout. Ask your Salesforce admin for help.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Considerations for Sharing Opportunities

By sharing your opportunities with other user you give visibility into your pipeline so others can provide you with important information to help you close your deals. Before you share your opportunities, make sure you're aware of these considerations.

- Your administrator determines your organization's sharing model, including the default opportunity access levels for territories.
- While you can increase access to your opportunities, you can't restrict it below your organization's default access levels.
- To share an opportunity with another user, that user must have the "Read" permission on opportunities.
- The sharing detail page lists the users, groups, roles, and territories that have sharing access to the opportunity.

Guidelines for Finding Similar Opportunities

Close your deals faster by taking advantage of the rich information contained in successfully closed deals that are similar to yours. Here are some guidelines to help you find the opportunities that will help you close your deals.

- Use the Similar Opportunities related list on the opportunity's detail page to find Closed/Won opportunities with common information.
- The criteria used to find similar opportunities is determined by your administrator. The search finds a maximum of 10,000 opportunities with close dates in a three-month period and displays up to 300 of the records that best match the search criteria. The results are ranked by the number of matching fields.
- Results can be filtered by Close date or by matching fields.
- To see how a record in the search results is similar to your current deal, hover over the opportunity name. The matching fields are highlighted in the Match Criteria sidebar.

SEE ALSO:

[Enable and Configure Similar Opportunities](#)

Considerations for Adding Products to Opportunities

If you're an admin or sales operations manager, consider key concepts before you add products to opportunities.

- The opportunity `Amount` is the sum of the products that you add to the opportunity. You can't edit the `Amount` unless you delete the products from the opportunity.
- The total price is the quantity multiplied by the sales price.
- You can add products with schedules in Lightning Experience or Salesforce1, but must switch back to Salesforce Classic to enable product schedules, or to establish or modify schedules for products.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All** Editions for organizations activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions for organizations activated after Summer '09

EDITIONS

Available in: Salesforce Classic

Available in: **All** Editions for organizations activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions for organizations activated after Summer '09

EDITIONS

Products and price books available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- For multicurrency orgs, the opportunity `Currency` is tied to the currency of the associated price book entry. You can't edit the `Currency` unless you delete the products from the opportunity.

Opportunity Fields

The fields for opportunities contain a wide variety of information to help you track your pending and potential sales. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Account Name	<p>Name of account that opportunity is linked to. You can enter the account name, or select the account using the lookup icon.</p> <p>If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.</p>
Amount	<p>Estimated total sale amount. For organizations using multiple currencies, the amount is shown in your personal currency by default. Change the <code>Opportunity Currency</code> picklist to track the amount in another currency.</p> <p>For opportunities with products, the amount is the sum of the related products. You cannot directly edit the amount unless the opportunity has no products. To change the amount for an opportunity that contains products, edit the sales price or quantity of the related products.</p> <p>If you change the price book for an opportunity that has products, all products are deleted from the Products related list, but the value in the opportunity's Amount field remains.</p>
Close Date	<p>Date when you plan to close the opportunity. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.</p> <p>Opportunities with a <code>Close Date</code> in a given month will tally in the forecast for that month, unless you assign them to the Omitted category while editing the forecast.</p> <p>When you set an open opportunity's <code>Stage</code> to a type of "Closed/Won," the <code>Close Date</code> is set to the current date in Coordinated Universal Time (UTC). At certain times of day, UTC will differ by one day from your time zone.</p>

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
Contract	Contract that the opportunity is linked to.
Created By	User who created the opportunity including creation date and time. (Read only)
Custom Links	Listing of custom links for opportunities as set up by your administrator. Available only in Salesforce Classic.
Description	Description of the opportunity. Up to 32KB of data are allowed. Only the first 255 characters display in reports.
Expected Revenue	Calculated revenue based on the <code>Amount</code> and <code>Probability</code> fields.
Forecast Category	Forecast category name that is displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. The setting for an opportunity is tied to its <code>Stage</code> . For more information on forecast categories, see Working with Forecast Categories on page 1570.
Last Modified By	User who last changed the opportunity fields, including modification date and time. This does not track changes that are made to any of the related list items on the opportunity. (Read only)
Lead Source	Source of the opportunity, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Next Step	Description of next task in closing opportunity. Up to 255 characters are allowed in this field.
Opportunity Currency	<p>The default currency for all currency amount fields in the opportunity. Amounts are displayed in the opportunity currency, and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.</p> <p>For opportunities with products, the currency is tied to the currency of the associated price book. You cannot directly edit this field unless you first delete the products.</p>
Opportunity Division	<p>Division to which the opportunity belongs. This value is automatically inherited from the related account.</p> <p>Available only in organizations that use divisions to segment their data.</p>
Opportunity Name	Name of the opportunity, for example, Acme.com - Office Equipment Order. Up to 120 characters are allowed in this field.
Opportunity Owner	Assigned owner of opportunity. Not available in Personal Edition.

Field	Description
Opportunity Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a sales process. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.
Partner Account	Read-only field that indicates the opportunity is owned by a partner user.
Primary Campaign Source	<p>Name of the campaign responsible for generating the opportunity.</p> <p>For opportunities created during lead conversion, this field is automatically filled in with the campaign name from the lead. If the lead has multiple associated campaigns, the campaign with the most recently updated member status is inserted into the opportunity.</p> <p>For opportunities with multiple influential campaigns, click Edit next the primary campaign in the Campaign Influence related list on the opportunity detail page and select the <code>Primary Campaign Source</code> checkbox. The campaign will display in the <code>Primary Campaign Source</code> field on the opportunity.</p>
Private	<p>Indicates that the opportunity is private. Only the record owner, users above that role in the hierarchy, and administrators can view, edit, and report on private opportunities. Not available in Group or Personal Editions. Private opportunities do not trigger Big Deal Alerts or workflow rules. Private opportunities count towards your forecasts only if you have Customizable Forecasting or Collaborative Forecasts enabled. Users with the "View All Forecasts" permission can see private opportunities within the Forecasts tab.</p> <p> Note: When you mark opportunities <code>Private</code>, any opportunity teams, opportunity splits, and sharing are removed. (The owner of a private opportunity receives 100% of split types that total that amount.)</p>
Probability	<p>Likelihood that opportunity will close, stated as a percentage.</p> <p>The <code>Probability</code> value is always updated by a change in the <code>Stage</code> value, even if <code>Probability</code> is marked as read only on your page layout. Users with access to edit this field can override the value.</p>
Quantity	Total of all <code>Quantity</code> field values for all products in the Products related list if the opportunity has products. General use field if the opportunity does not have products.
Stage	Current stage of opportunity based on selections you make from a predefined list, for example, Prospect or Proposal. Entry is selected from a picklist of up to 100 available values, which are set by an administrator. Each picklist value can have up to 40 characters.

Field	Description
	Your administrator correlates the values in this picklist with Forecast Category values that determine how the opportunity contributes to your forecast. When you set an open opportunity's <code>Stage</code> to a type of "Closed/Won," the <code>Close Date</code> is set to the current date in Coordinated Universal Time (UTC). At certain times of day, UTC will differ by one day from your time zone.
Synced Quote	Quote that's synced to the opportunity. Only one quote can sync to the opportunity at a time.
Territory	Territory with which the opportunity is associated. Only available if your organization has territory management.
Type	Type of opportunity, for example, Existing Business or New Business. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.

[Opportunity Product Fields](#)[Opportunities](#)

Opportunity Product Fields

The fields for opportunity products contain information to help you track what's selling. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Active	Whether the price book entry (product and list price) is active and can be added to an opportunity or quote.
Created By	Name of the user who created the product.
Date	Close date of a particular opportunity product.
Discount	Discount for the product as a percentage.
Last Modified By	User who last changed the opportunity product fields. (Read only)
Line Description	Text to distinguish this opportunity product from another.
List Price	The price of the product within the price book, including currency.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
Opportunity	Name of the opportunity for this opportunity product.
Product	Item listed in the Products related list on an opportunity.
Product	The product's name.
Quantity	Number of units for the opportunity product.
Sales Price	Price for the products in the opportunity product.
Subtotal	Difference between standard and discounted pricing. Converted currency amounts when the opportunity's currency is different from the user's currency.
Total Price	Sum of all the product amounts for this opportunity product.

Teaming Up for Sales Opportunities

Opportunity Teams

An opportunity team is a group of Salesforce users who work together on a sales opportunity.

Opportunity teams shows who's working on the opportunity and what each team member's role is. You can grant your opportunity team members special access to the opportunity and its related records, making it easier for everyone to work together.

Using opportunity teams makes it easier for you to track the work of a team, too. In opportunity reports, filter opportunities by the opportunity teams that you're a member of. When creating or editing a custom list view for opportunities in Salesforce Classic, select the My Opportunity Teams filter.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Guidelines for Using Opportunity Teams](#)

An opportunity team is a group of Salesforce users who work together on a sales opportunity. If you're using opportunity teams, refer to these guidelines.

[Guidelines for Editing Members of an Opportunity Team](#)

Keep the details about your opportunity team members up-to-date by changing their access level, team role, and more. If you're editing team members, refer to these guidelines for information.

[Considerations for Deleting Members from an Opportunity Team](#)

Keep your opportunity teams up-to-date by deleting members who are no longer part of a team. If Opportunity Splits is enabled, consider the following before you delete a team member.

[Guidelines for Setting Up and Adding a Default Opportunity Team](#)

Save time by setting up a default opportunity team—a group of coworkers who you typically work with on opportunities. Then add the team to opportunities that you own. If you're working with a default opportunity team, refer to these guidelines for additional information.

[Opportunity Splits](#)

Guidelines for Using Opportunity Teams

An opportunity team is a group of Salesforce users who work together on a sales opportunity. If you're using opportunity teams, refer to these guidelines.

-  **Note:** Opportunity teams aren't the same as account teams, although they share a set of available team member roles.
- Set up opportunity teams for opportunities that are owned by you or someone below you in the role hierarchy.
- Set up a default opportunity team to include the users who you normally work with on opportunities. You can choose to add your default opportunity team to all your opportunities automatically.
- When you set up an opportunity team, you:
 - Add team members.
 - Specify each member's role on the opportunity, such as Executive Sponsor.
 - Specify each team member's level of access to the opportunity: read/write access or read-only access.
- Changes that you make to the opportunity team on an opportunity don't affect your default opportunity team or the opportunity teams on your other opportunities.
- If your Salesforce admin has enabled Opportunity Splits, you can split credit for an opportunity among members of an opportunity team.
- Adding, editing, or deleting opportunity team members requires read/write access on the opportunity.
- You can't use opportunity teams for private opportunities.

SEE ALSO:

Opportunity Splits and settings for opportunity teams available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

Guidelines for Editing Members of an Opportunity Team

Keep the details about your opportunity team members up-to-date by changing their access level, team role, and more. If you're editing team members, refer to these guidelines for information.

- If the team member that you need to update doesn't appear in the Opportunity Team related list, view the full list.
- You edit opportunity team members on the detail page of the opportunity team member that you need to update.
- When editing inactive users with assigned split percentages, you can edit only the split-related fields.
- If your Salesforce admin defined custom fields, you'll see them when you edit a team member, even if your admin didn't add them to the Add Opportunity Team Members page.
- The member's opportunity access level can't be less than your Salesforce org's default opportunity sharing access.

Opportunity Splits and settings for opportunity teams available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

Considerations for Deleting Members from an Opportunity Team

Keep your opportunity teams up-to-date by deleting members who are no longer part of a team. If Opportunity Splits is enabled, consider the following before you delete a team member.

- If the team member that you want to delete is assigned a split percentage greater than zero, reassign the split before you delete the member.
- You can't delete the opportunity owner from the opportunity team. To remove this member from splits calculations, assign the member a split percentage of zero, or transfer ownership of the opportunity.

- "Read" on users
AND
"Edit" on opportunities
AND
Owner of the opportunity, or above the owner in your organization's role hierarchy

To view an opportunity for which you're a team member:

- "Read" on the opportunity

Guidelines for Setting Up and Adding a Default Opportunity Team

Save time by setting up a default opportunity team—a group of coworkers who you typically work with on opportunities. Then add the team to opportunities that you own. If you're working with a default opportunity team, refer to these guidelines for additional information.

- To set up a default opportunity team, access Advanced User Details in your personal settings.
- While you're defining your default opportunity team, you can choose to automatically add it to all your open opportunities. If you don't choose this option, you add the default team from the Opportunity Team related list of your opportunities.
- Clicking **Add Default Team** adds the default team of the opportunity owner, not of the user who clicks the button.
- Salesforce admins and users above you in the role hierarchy can add your default opportunity team to opportunities that you own.

Opportunity Splits

Opportunity splitting lets you share revenue from an opportunity with your team members. Team members working on an opportunity can roll their individual sales credits into quota and pipeline reports for the entire team.

▶ [Watch a Demo \(Salesforce Classic\)](#) (1:44 minutes)

If your Salesforce admin has enabled Opportunity Splits, and you're the opportunity owner or above the owner in the organization hierarchy, you can add and adjust splits for the opportunity.

- To credit team members who are directly responsible for opportunity revenue, use *revenue* splits, which always total 100% of the opportunity amount.
- To credit supporting team members, use *overlay* splits, which can total any percentage of the opportunity amount, including percentages over 100%.

Your Salesforce org's `Split on Opportunity - Amount` field comes with one revenue split and one overlay split. If custom split types are enabled for your org, your Salesforce admin can create three more split types. Your admin decides which types of splits always total 100%. To have custom split types enabled for your org, ask your admin to contact Salesforce.

Your admin can also create custom fields for opportunity splits, allowing you to better track and store information about splits that you create for team members.

 **Note:** Splits can't be rolled up to sales territories. For information about including splits in your forecasts, see [Change Between Forecast Types](#).

[Considerations for Creating Opportunity Splits](#)

If you're creating opportunity splits to share opportunity revenue with coworkers, review these guidelines for information.

[Create Opportunity Splits](#)

Add and adjust splits to share revenue from opportunities with your team members.

SEE ALSO:

[Create Opportunity Splits](#)

Considerations for Creating Opportunity Splits

If you're creating opportunity splits to share opportunity revenue with coworkers, review these guidelines for information.

- The opportunity owner is automatically included in the opportunity team and initially assigned 100% of the split types that always total 100%.
- If you can't add a team member when you're editing the opportunity split, add the member in the Opportunity Team related list on the main opportunity page. (To add members while editing splits, contact your Salesforce admin.)
- If you don't see splits on a field, ask your Salesforce admin to check your field-level security limits.
- To determine whether a split type always totals 100%, look for "must total 100%" in the description of the split.

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Feedback requires a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Work.com Feedback allows you to request and offer unsolicited feedback on a person or topic, and also respond to feedback related to performance summaries.

Feedback offers, feedback requests, and feedback related to performance summaries are all managed from the Feedback tab. The Feedback tab displays the recent feedback you’ve viewed by default, and you can filter to see different types of feedback records. For example, select **New Feedback Requests** to see feedback records that require their input. You can also create custom list views with different filter options.

The default feedback filters include:

- All Feedback—All feedback, including one-time feedback and performance summary feedback
- Declined Feedback Requests—All the feedback you’ve requested that others have declined
- Feedback About Me—All the completed feedback about you
- Feedback About My Team—All the completed feedback about your team
- Feedback About Others—Completed feedback about others
- Feedback About Topics—Completed feedback about topics

- New Feedback Replies—New replies to the feedback you’ve requested
- New Feedback Requests—New feedback requests for one-time feedback and performance summaries

Feedback Requests Home

View: All Feedback (dropdown menu open with options: All Feedback, Declined Feedback Requests, Feedback About Me, Feedback About My Team, Feedback About Others, Feedback About Topics, New Feedback Replies, New Feedback Requests)

Buttons: Go!, Edit | Create New View, Offer Feedback, Request Feedback, Recently Viewed

Feedback About	Feedback Type	Due Date	Feedback From	Created Date	Feedback Request State
Perkins, Dan	Personal		Perkins, Dan	7/20/2015 10:32 AM	Submitted
Strudel, Sally	Manager Summary	10/15/2015	Perkins, Dan	8/13/2015 10:52 AM	Draft

On the feedback page, you can:

- View and filter your feedback list for new requests, replies, and other feedback
- Click a feedback record to view and edit details about the feedback
- Offer or request feedback

Feedback Visibility

Visibility options are based on the type of feedback you choose.

Feedback Requested

Only people to whom you sent the feedback request and an administrator with “Modify All Data” or “View All Data” access can view your request.

Feedback Requested About	Person Receiving the Request	Person’s Manager	Administrator with MAD/VAD Access
Topic	✓		✓
Myself	✓		✓
Another User	✓		✓

Feedback Offered

You can only view feedback that is shared with you. For example, you won’t be able to view feedback about yourself that was shared only with your manager.

Feedback Offered	Person	Person’s Manager	Administrator with MAD/VAD Access
Person Only	✓		✓
Person and Manager	✓	✓	✓
Manager Only		✓	✓

Goals Overview

Work.com Goals allow you to define, track, and measure your work. Access goals via the Goals tab or Chatter profile pages.

The Goals tab on a user’s profile displays the goals for that person. The top-level Goals tab is a general list view that can be configured to display different lists of goals (such as My Goals, My Team’s Goals, or Key Company Goals). The tabs and list views that appear may vary depending on how your administrator configured Work.com.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Goals requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition,** or **Developer Edition,** and is included in **Performance Edition.**

USER PERMISSIONS

To view goals:

- “Read” on Goals and Goal Links

To create goals:

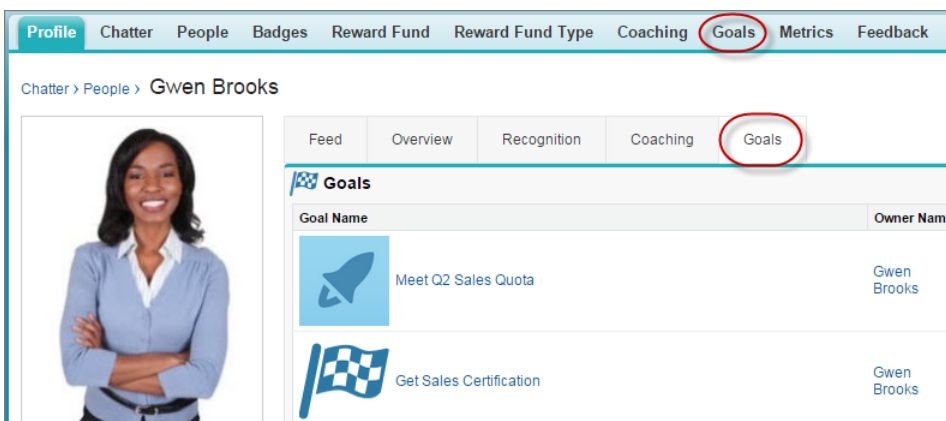

- “Create” on Goals and Goal Links

To edit goals:

- “Edit” on Goals and Goal Links

To delete goals:

- “Delete” on Goals and Goal Links

Click a goal in your list view to access the detail page.

Goals support Chatter feeds on goal records, so different users can collaborate in the feed and keep up-to-date on a goal's progress.

The goal detail page lists the metrics, tasks, events, notes, attachments, and other information related to a particular goal. Align goals with others by linking your goals with parent goals or subgoals.

Modify sharing settings to better control who can see and update your goals. For example, if goals in your organization are set to private by default, goal owners and administrators can share goals with select users or groups to increase collaboration and visibility. Choose between read-only and read/write access for more granular control over goal access.

On the Open Activities related list, click **New Task** or **New Event** to create a task or event tied to a specific goal. You can also create tasks or events for individual metrics, if desired.

Action	Metric Name	Progress	Status	Due Date	Current Value	Initial Value	Target Value	Owner Name	Comment	Weight
Edit Del	Get 5000 in Sales	66	On Track	9/1/2015	3,300.00	0.00	5,000.00	Dan Perkins		60.00
Edit Del	Get Sales Certification	0	Postponed	9/1/2015				Dan Perkins		10.00

Action	Metric Name	Progress	Status	Due Date	Current Value	Initial Value	Target Value	Owner Name	Comment	Weight
Edit Del	Finish Sales Training	100	Completed	8/1/2015				Dan Perkins		30.00

Add metrics to your goals to calculate your progress. You can also link metrics to data in your favorite reports to keep track of your work in Salesforce. Assign weights to different metrics to precisely track the completion of the goal.

Create a Goal

Define, track, and measure your work with Work.com Goals.

1. Click the top-level Goals tab.

If the Goals tab isn't displayed, select Work.com from the Force.com app drop-down menu at the top-right or click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter a name for the goal, and specify additional details.

You can adjust a goal's sharing settings after it's created. Note that all goal images are externally available.

 **Tip:** To create a key company goal, select the **Key Company Goal** field. After the goal is created, click **Sharing** on the goal's detail page and share it with the All Internal Users group. Set the Access Level to Read Only to share it with the rest of your organization, or set it to Read/Write to allow everyone to collaborate on the goal.
4. Set the goal's status:
 - Draft—The goal details are in draft state and haven't been finalized yet.
 - Published—The goal details have been finalized and the goal is in progress.
 - Completed—The goal is completed.
 - Canceled—The goal is canceled and no longer applies.
 - Not Completed—The goal is not completed.
5. Click **Save**.

You can reassign goals to other users by clicking **Change** next to Owner Name on a goal's detail page. Metrics can be owned by different users, so be sure to reassign metrics to the appropriate owner as well.

Metrics

Use metrics to track and surface your data.

Create new metrics from the Metrics tab or from a goal detail page. Users can create standalone metrics or tie them to specific goals.

The screenshot shows the 'Metrics Home' interface. At the top, there is a 'View: All' dropdown and a 'Go!' button, along with a 'Create New View' link. Below this is a 'Recent Metrics' section with a 'New' button and a 'Recently Viewed' dropdown. The main content is a table with the following data:

Metric Name	Owner Name	Progress	Status	Due Date
 Get 50000 in Sales	Gwen Brooks	70	On Track	7/31/2015
 Pass Certification Test	Gwen Brooks	100	Completed	
 Finish Sales Training Course	Gwen Brooks	100	Completed	

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Metrics requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Use Progress or Completion metrics to track the status of different goals that you set for yourself or others. Anyone with read/write access can refresh metric values, and metrics can also appear in relevant coaching spaces and performance summaries.

Anyone with read/write access can refresh metric values, and metrics can also appear in relevant coaching spaces and performance summaries.

Create a Metric

Track and surface your work with Work.com Metrics.

1. Click the Metrics tab.

Alternatively, you can click **New Metric** on a goal's detail page.

2. Click **New**.
3. Select a Progress or Completion record type and click **Continue**.

- Progress metrics measure achievement based on how much is finished compared to a targeted value. They're ideal for tracking hard numbers and percentages. For example, create progress metrics to *Convert 50 Leads* or *Achieve 100% Customer Satisfaction*.
- Completion metrics measure whether the metric was completed or not. They're ideal for tracking milestones or when you don't have metrics based on hard numbers. For example, create a completion metric to *Become Salesforce Certified*.

4. Enter a name for the metric and specify additional details.

5. For Progress metrics, enter a target value.

You can update the current value manually or link it to a Salesforce report. To link a metric value to a report:

- a. In the Current Value field, click **From a Salesforce report**.
- b. Select the Report Name.
- c. Select the Summary Field.

6. Set the metric's status.

7. Click **Save**.

Recognition Overview

Recognize and thank your coworkers by posting custom messages, badges, and rewards to their Chatter feed.

Work.com Recognition includes Thanks with unlimited custom badges and the ability to tie badges to tangible rewards such as gift cards. Managers can create reports and dashboards to view data on Recognition leaders. In addition to the required user permissions, your administrator must enable Thanks and Rewards for your organization. Depending on how your administrator configured Work.com, the Recognition tab and Badges tab may appear as top-level tabs. Additionally, the Recognition tab may appear as a subtab on your Chatter profile.

Note: Users can create, edit, share, and give thanks badges without a Work.com license. However, users will still need a Work.com license to use badges tied to rewards. For more information about obtaining Work.com, contact Salesforce.

EDITIONS

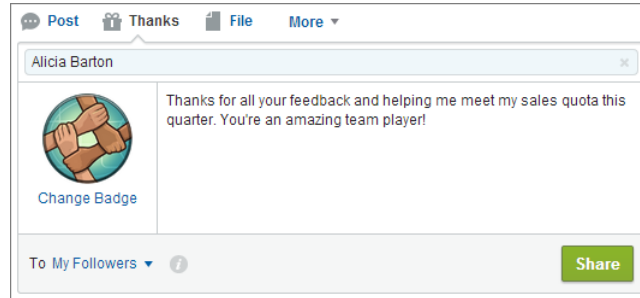

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Access the library of available badges from the Badges tab. Click **New** to create a badge, or click a badge to see or edit badge details. You can only view the badges you have permission to give, and your ability to create or edit badges may be limited depending on how your feature is configured.

Give thanks badges from the Chatter publisher. Users are currently limited to giving badges to one user at a time. For more information, see [Give Thanks to Your Coworkers](#).

View the badges a user has received on the Recognition tab of their Chatter profile.

Create a Badge

Create custom badges to uniquely recognize and thank your coworkers.

[Walk Through It: Create a Thanks Badge](#)

1. Click the Badges tab.
If the Badges tab isn't displayed, click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter a name and description for the badge, add a badge image, and optionally assign rewards and badge limits.

Note:

- Only users with Rewards enabled can create a Rewards badge.
- Badges can't be transferred from a sandbox organization to a production organization.
- You can limit access to badge records with the Access related list, but badge images are externally available.

Badge Field	Description
Badge Name	The name of the badge.
Active	Indicates that the badge is active and available to give. This setting is enabled by default.
Reward Fund	Select a reward fund for this badge, if applicable.
Owner Name	The name of the badge owner.
Company Badge	Select to make this badge a company badge. Only users with the Chatter moderator permission can create and edit company badges. Company badges enable all users to give the badge.
Description	A description that explains the significance of the badge.
Image URL	A visual representation of the badge. Click the image field to select a picture from a directory on your computer. Badge images are stored at 128 x 128 pixels and are externally available.
Limit Number	The number of badges that are available. This can be per user or across all users. The default value is unlimited badges.
Limit Start Date	Indicates when the system begins to count the number of badges used. The default value is the date the badge is created.

Reward Funds

Work.com Rewards allow you to tie tangible rewards to your badges. You can attach badges to tangible rewards from most digital gift codes globally.

Your administrator must enable Thanks and Rewards in your organization.

Work.com Rewards supports your choice of rewards programs or brands in addition to the default Amazon.com™ reward fund type. Reward information is stored in two objects, Reward Fund Type and Reward Fund. Here's a quick introduction to the differences between the two.

Reward Fund Type

This object holds the fixed information about a reward such as the currency type, redemption information, and CSV file upload details. Examples include Amazon.com™, iTunes™, or Starbucks™.

Reward Fund

This object holds the gifts codes and can only be tied to a single reward fund type. Each reward fund has a set value that you determine by purchasing gift codes for the specific denomination.

For example, a reward fund called Q1 US Rewards may contain codes linked to Amazon.com gift cards worth \$100 each. Another reward fund called Q1 Customer Service Rewards may contain codes linked to Amazon.com gift cards worth \$20 each. These reward funds would be related to the same reward fund type. However, a reward fund linked to Starbucks gift cards would be related to a different reward fund type.

You can create reward badges in three steps.

1. Create a reward fund type or use the default Amazon.com reward fund type.
2. Create a reward fund and upload reward codes.
3. Tie a thanks badge to a reward fund.

- "Read" on Reward Funds

To create Reward Funds:

- "Create" on Rewards
- "Create" on Reward Funds

Create Reward Fund Types

Use reward fund types to specify general reward information, such as currency codes, redemption information, and CSV file upload details.

1. Click the Reward Fund Type tab.
If the Reward Fund Type tab isn't available, click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter the Reward Fund Type details.

Information

Field	Description
Reward Fund Type Name	The name of the reward fund type. Try to pick something descriptive, like Amazon.CA (Canada) or Starbucks (US).
Credit System	Select Gift Codes to tie your rewards to a cash reward. Select Points if the reward is not tied to cash. Reward Fund Types that use Points ignore the Currency Code field.
Active	Whether the reward fund type is active or not.
Owner Name	The owner of the reward fund type.
Currency Code	The type of currency.
Predefined	Read-only setting that indicates if a reward fund type is predefined, like the default Amazon.com type. You can't change the name, credit system, or currency code on predefined reward fund types. Predefined fund types are system-generated and can't be edited.

Redemption

Field	Description
Redemption Url	The URL where the reward is redeemed. This field is optional based on the type of reward code. For reward codes that are links, do not enter a redemption URL.
Redemption Information	The instructions for redeeming the reward, including any extra steps the user may need to take to redeem the reward.
Terms and Disclaimer	Extra legal information about the reward fund type.

Upload Configuration

Field	Description
Reward Code Column	The column in a CSV file that specifies the reward codes. The upload uses the second column by default. Enter a number to specify a different column.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

USER PERMISSIONS

To view Reward Fund Types:

- "Read" on Reward Fund Types

To create Reward Fund Types:

- "Create" on Reward Fund Types
- "Read" and "Create" on Reward Funds
- "Read" and "Create" on Rewards

Upload Configuration

Field	Description
Reward Value Column	The column in a CSV file that specifies the reward values. The upload uses the third column by default. Enter a number to specify a different column.

4. Click **Save**.

SEE ALSO:

- [Reward Funds](#)
- [Create Reward Funds](#)
- [Create a Badge](#)
- [Recognition Overview](#)

Create Reward Funds

Use reward funds to hold the gift codes related to a reward fund type.

Users can build reward badges from the reward funds they created. Reward funds can include Amazon.com™ gift cards purchased from one of our third-party vendors, such as TangoCard™, or different rewards programs beyond Amazon.com.

1. Click the Reward Fund tab.
If the Reward Fund tab isn't available, click **+** to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Name your fund, select the Reward Fund Type, and enter the reward value.
4. Click **Save**.
5. Upload or enter your gift codes.
 - To upload gift codes through a CSV file, select **Upload CSV**, then select **Choose File**. Select a CSV file and click **Upload**.

By default, the upload uses the second column for reward codes and the third column for reward values. However, you can set these to different values on the related reward fund type. Here's an example of how you might format your CSV file:

	A	B	C
1	Sequence Number	Reward Code	Reward Value
2	1	1111-222222-3333	10
3	2	1111-222222-4444	10
4	3	1111-222222-5555	10
5	4	1111-222222-6666	10
6	5	1111-222222-7777	10

Coaching Overview

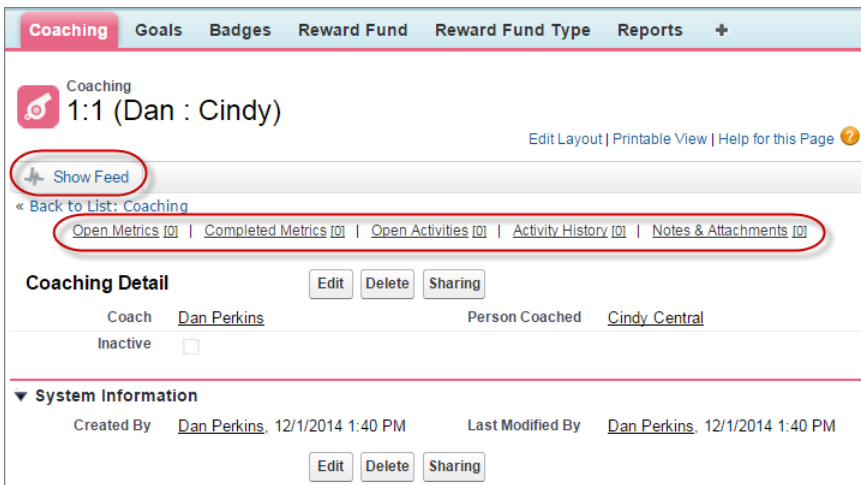

With Work.com Coaching, you can privately coach or be coached by anyone in your company. You can also share coaching spaces to include additional observers and participants. Access Coaching via the Coaching tab or your profile page.

On the coaching page you can:

- View a list of your coaching spaces.
You should create your own filters (such as My Coaches, People I Coach, and Inactive Relationships) that are suitable for your organization.
- Click **New** to create a coaching space. You can have as many coaching spaces as you want.

Click a coaching space in your list view to access the detail page.

From this page you can:

- Click **Show Feed** to see the feed related to a coaching space.
Your administrator must enable Chatter feed tracking to display the feed.
- Access the goals, metrics, activities, notes, and attachments related to a particular coaching space.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

Coaching requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition,** or **Developer Edition,** and is included in **Performance Edition.**

USER PERMISSIONS

To view coaching spaces:

- "Read" on Coaching

To create coaching spaces:

- "Create" on Coaching

- Set coaching spaces to inactive when they're no longer useful. This retains the record history, and the coaching space can also be reactivated anytime.
- Delete coaching spaces if you have the right access level.

Configure Work.com Email Settings

Enable Work.com email to receive notifications related to your Work.com feedback and rewards.

1. From your personal settings, enter *work.com* in the **Quick Find** box, then select **Email Settings** under Work.com.
2. In the General section, select **Receive emails**.
You can deselect this option at any time, if you no longer want to receive any Work.com emails.
3. In the Personal section, select which type of emails you want to receive.

Email Setting	Description
Someone gives me a reward	Select this option, if you want to receive an email when someone gives you a reward.
I am asked for a feedback, or receive feedback to a question I've asked	Select this option, if you want to receive an email when someone asks for your feedback or someone answers a question you asked.

4. Click **Save**.

To configure email settings:

- No additional permissions required

Creating Quotes and Documenting Contracts

Quotes

Quotes in Salesforce represent the proposed prices of your company's products and services. You create a quote from an opportunity and its products. Each opportunity can have multiple associated quotes, and any one of them can be synced with the opportunity. When a quote and an opportunity are synced, any change to line items in the quote syncs with products on the opportunity, and vice versa. Get an overview of all your quotes on the Quotes tab. And if you're using Lightning Experience, track sales activity in Path and stages in Kanban.

[Create and Manage Quotes](#)

Create quotes to show your customers the prices of the products and services that you offer. Create a set of quotes to show different combinations of products, discounts, and quantities so customers can compare prices. Then add products as needed to keep your quotes up to date.

[Sync Quotes and Opportunities](#)

Link a quote to the opportunity that it was created from. That way, updates to one record are always reflected in the other.

[Create and Email Quote PDFs](#)

Provide quotes to your customers the easy way: via PDF. Create quote PDFs from a standard template or from your company's design. Email quotes to your customers. Then delete quotes that you no longer need.

[Considerations for Deleting Quotes](#)

Before you delete a quote, it's a good idea to understand how deleting a quote affects quote-related PDFs and syncing with opportunities.

AND

"Read" on Products and Price Books

Create and Manage Quotes

Create quotes to show your customers the prices of the products and services that you offer. Create a set of quotes to show different combinations of products, discounts, and quantities so customers can compare prices. Then add products as needed to keep your quotes up to date.

1. Click **New Quote** on the Quotes related list on an opportunity. The `Subtotal`, `Discount`, `Total Price`, and `Grand Total` fields show values from the opportunity.
2. Complete the fields.
3. Save your changes.
 - A unique quote number is added.
 - Products on the opportunity are copied to the quote as line items.
 - The grand total is recalculated based on the taxes and shipping information that you entered.

To add a line item to a quote:

1. Click **Add Products** (Lightning Experience) or **Add Line Item** (Salesforce Classic) in the Quote Line Items related list.
2. If no price book was selected on the opportunity, select a price book for the quote. Otherwise, the quote uses the opportunity's price book.
3. Enter search criteria in the lookup to locate a line item.
4. Select the products that you want to add, and then click **Next** (Lightning Experience) or **Select** (Salesforce Classic).
5. Complete the fields. The sales price defaults to the product's list price as recorded in the price book. Depending on your permissions, you can edit the sales price.
6. Save your changes.

The line items are added to the Quote Line Items related list. The grand total in the detail section is the sum of the related line items. The discount is the average discount for the line items.

Sync Quotes and Opportunities

Link a quote to the opportunity that it was created from. That way, updates to one record are always reflected in the other.

1. Open the quote that you want to sync, and then click **Start Sync**.
2. Follow the prompts until the quote and opportunity are synced.
The opportunity's `Synced Quote` field and quotes related list identify the quote that's synced.
3. To stop syncing between a quote and an opportunity, open the synced quote, and then click **Stop Sync**.
Updates are no longer synced between the records.
4. To sync a different quote with an opportunity, follow the steps for syncing a quote.
The previously synced quote stops syncing, and the new quote starts.

Email Multiple Quote PDFs and Other Documents in Lightning Experience

Make it easy for your customers to compare. Email one or more quote PDFs and other documents at the same time in Lightning Experience.

1. Click **Send Email** on a quote's activity timeline. An email task opens.
2. Enter the customer's email address, a subject, and body text.
3. Click **Attach file**, add quotes and other documents one at a time, and then send.

Email a Quote PDF in Salesforce Classic

Email a quote for your customer's approval in Salesforce Classic.

1. Click the email option on the PDF preview, on the quote detail page, or next to the PDF in the Quote PDFs related list. An email task opens with the current quote PDF attached.
2. Enter the customer's email address, a subject, and body text, and then send.

Considerations for Deleting Quotes

Before you delete a quote, it's a good idea to understand how deleting a quote affects quote-related PDFs and syncing with opportunities.

- If you have the appropriate permissions, and you're an admin, the quote owner, or someone above the quote owner in the organization role hierarchy, you can delete quotes.
- When you delete a quote, here's what happens. All related PDFs, notes, and attachments are deleted. If the quote is synced with an opportunity, the record is removed from the opportunity's Quotes related list. The deleted quote is moved to the Recycle Bin (Salesforce Classic only).
- If you undelete a previously synced quote, it's no longer synced with the opportunity.

Considerations for Creating and Managing Quotes and Quote Line Items

Before you create a quote or work with quote line items, review a few key points.

- 📌 **Note:** Your user permissions determine which tasks you can perform. See your Salesforce admin for help with any tasks that you can't perform on your own.
- Relevant price books, products, and [list prices](#) must be active in an opportunity before you can create a quote for the opportunity.
- Professional, Enterprise, Performance, Unlimited, and Developer Edition orgs can activate record types and ask you to choose a `Record Type` when creating a quote. Record types determine the picklist values and business processes that are available when you create or edit a record.
- If you use divisions (Salesforce Classic only), the division of a new quote is automatically set to the division of the related opportunity.
- If a quote is synced with an opportunity, and you add a line item to the quote, the new line item is copied to the opportunity as a product in the Products related list.
- If an opportunity is syncing with a quote, deleting the quote line item deletes the corresponding product from the opportunity's Products related list.
- Custom field syncing isn't supported. When a quote is created from the API, the quote line items aren't created based on the opportunity line items. New opportunity line items are created based on the quote line items.
- If a product has default schedules, the schedules aren't created when you add a line item to a quote. If the line item is copied from the opportunity, you can view the schedule from the opportunity. To change the schedule, edit the product record directly.
- If you have a quote line item with a discount, and the product has a default schedule on the product record or an individual schedule on the opportunity product record, you can't edit the `Discount` field of the line item.

EDITIONS

Available in: **Performance** and **Developer** Editions

In Sales Cloud, also available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Considerations for Creating Quote PDFs

Before you create quote PDFs, consider a few key points.

- Quote PDFs don't support right-to-left languages. The text aligns to the left side of the page instead of the right.
- Text fields in a related list in a quote PDF are truncated to fewer than 256 characters. This limit occurs on rich text area fields, other types of text fields, standard fields, and custom fields.
- Your Salesforce admin determines which status is the default for new quotes and which statuses allow you to email a quote PDF. For example, your admin can prevent you from emailing a quote whose status is *In Review*.

How Quote Syncing Works

Quote syncing lets you link a quote to the opportunity that it was created from and synchronize all updates between the two records. An opportunity can have multiple quotes, but it can sync with only one quote at a time.

While a quote and an opportunity are synced, any addition or change to the list of products in one record syncs with the list of products in the other one. Adding or removing a line item from a quote updates the synced opportunity's Products related list. Adding or removing a product from the opportunity updates the synced quote's Quote Line Items related list. Product sorting also syncs between the two records. The quote and opportunity continue to sync each way until you stop syncing or delete one of the records.

You can sync quotes and opportunities that don't have any products. When you add a product to either record, it's automatically added to the record that it's synced to.

If an opportunity and a quote are synced, the opportunity identifies the synced quote in the following places.

- The Synced Quote field on the Opportunity detail page
- The Syncing checkbox in the Quotes related list

You can't edit the opportunity's Amount field, even if you stop syncing.

If you replace the synced quote with another synced quote, the existing opportunity line items are replaced by the newly synced quote records.

If you stop the sync between a quote and an opportunity, the link is broken and the records are no longer automatically updated with each other's changes.

SEE ALSO:

[Sync Quotes and Opportunities](#)

[Troubleshooting Quote Syncing](#)

Troubleshooting Quote Syncing

Errors can occur when you try to sync quotes under certain conditions. Review common error messages, and learn how to resolve them. If you don't have the appropriate permissions, contact your Salesforce admin.

This quote can't be synced because it has inactive or archived products.

- If the product isn't active, edit the product and select the `Active` checkbox.
- If the product has been archived and the opportunity isn't closed, delete the product.

This quote can't be synced because it has an inactive or archived price book.

- If the price book isn't active, edit the price book and select the `Active` checkbox.
- If the price book has been archived and the opportunity isn't closed, delete the price book.

This quote can't be synced because it has inactive or archived list prices.

- If the list price isn't active, edit the list price and select the `Active` checkbox for the list price.
- If the list price has been archived and the opportunity isn't closed, delete the list price.

EDITIONS

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Performance** and **Developer** Editions

In Sales Cloud, also available in: **Professional**, **Enterprise**, and **Unlimited** Editions

This quote can't be synced because it has an inactive currency.

Activate the currency from Setup by entering *Manage Currencies* in the *Quick Find* box, then selecting **Manage Currencies**.

This quote can't be synced because one or more of the schedules for the opportunity products have changed since the quote was created.

Create a different quote and sync it, or open the product, delete the schedule, and then re-create the schedule.

This quote can't be synced because another quote that's being synced for this opportunity is locked due to a workflow approval process. Opportunities can only sync with one quote at a time.

To unlock the other quote, finish the approval process or recall the request for approval.

The SyncedQuote field is read only within a trigger.

Determine whether your Salesforce org is using an Apex trigger that's attempting to modify the `SyncedQuote` field. The `SyncedQuote` field is read only and can't be modified with a trigger. An admin can modify the trigger.

Contracts

A contract is a written agreement between parties. Many companies use contracts to define the terms for doing business with other companies. Use Salesforce to establish and document the contracts that you have with your accounts and opportunities. Track the contract through your approval process. And use workflow alerts to remind yourself of contract renewals.

[Guidelines for Creating Contracts](#)

When you create a contract, consider the type of information that's needed to maximize the quality of your data.

Guidelines for Creating Contracts

When you create a contract, consider the type of information that's needed to maximize the quality of your data.

- The start date (required)
- How long the contract will be in effect: the term in months (required)
- The end date

Some admins configure Salesforce to calculate the contract end date based on the contract start date and contract term. If the contract end date is calculated, it doesn't appear on the contract's edit page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance** and **Developer** Editions

Available in: **Professional**, **Enterprise**, and **Unlimited** Editions with the Sales Cloud

If you use divisions (Salesforce Classic only), the division of a new contract is set to the division of the related account.

[Contract Fields](#)

Contract Fields

Your page layout and field-level security settings determine which fields are visible and editable.

A contract has the following fields, listed in alphabetical order.

Field	Description
Account Name	Name of the account associated with the contract.
Activated By	Name of the person who activated the contract.
Activated Date	Activation date of the contract.
Billing City	City portion of billing address. Up to 40 characters are allowed.
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed.
Company Signed By	User at your company who authorized the contract.
Company Signed Date	Date when the contract was authorized.
Contract Division	Division to which the contract belongs (Salesforce Classic only). This value is inherited from the related account. Available only in orgs that use divisions to segment data.
Contract End Date	Last day when the contract is in effect. Your admin can configure Salesforce to calculate the contract end date based on the contract start date and contract term. If this field is

EDITIONS

Available in: **Professional**, **Enterprise**, and **Unlimited** Editions with the Sales Cloud

Field	Description
	auto-calculated, it doesn't appear on the contract edit page.
Contract Name	Title for the contract that distinguishes it from other contracts.
Contract Number	Unique number assigned to the contract. Numbering for contracts starts at 100. (Read only.) Admins can modify the format and numbering for this auto-number field.
Contract Owner	User who owns the contract record.
Contract Start Date	First day when the contract is in effect.
Contract Term (months)	Number of months that the contract is in effect.
Created By	User who created the contract record.
Customer Signed By	Contact on the account that authorized the contract.
Customer Signed Date	Date when the contact signed the contract.
Customer Signed Title	Title of the contact who signed the contract.
Description	Statement describing the contract.
Last Modified By	User who most recently changed the contract record.
Owner Expiration Notice	Number of days before the contract end date when you want to send the notification, if the contract owner and account owner wants to be notified of an upcoming contract expiration.
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed.
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed.
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed.
Special Terms	Any terms that you've agreed to and want to track in the contract.
Status	Stage that the contract has reached in the contract business process. Your admin can add values to this picklist within three system-defined contract status categories: Draft, In Approval Process, and Activated. You can use these status categories to track contracts within your business process using reports and views.

Field	Description
Custom Links	List of custom links for contracts set up by your admin.

[Guidelines for Creating Contracts](#)

Activate Contracts

Activate a contract to indicate that it's in effect. An activated contract is read-only.

Open a contract, and then click **Activate**.

SEE ALSO:

[Contracts](#)

Contract History

Curious about the changes made to a contract during its lifecycle? View the Contract History related list on a contract's detail page.

Here's how it works. When someone modifies a standard or custom field whose history is tracked on a contract, an entry is added to the Contract History related list. Entries show the date, time, nature of the change, and who made the change. (Changes to the contract's related lists aren't tracked here.)

The default is to track changes for contracts with a status of In Approval Process or Activated. To track changes for contracts with any status, ask your Salesforce admin to [Customize Contracts](#).

To report on activated contracts whose fields are tracked, choose **Contract History** under Contracts and Orders in the Reports area.

If you're using Lightning Experience, switch to Salesforce Classic to see Contract History.

USER PERMISSIONS

To activate contracts:

- "Activate Contracts"

AND

"Read" and "Edit" on contracts

To delete activated contracts:

- "Delete Activated Contracts"
AND
"Read" on accounts

Managing and Tracking Customer Orders

Orders

Use orders to track your customers' requests for products and services.

An *order* is an agreement between a company and a customer to provision services or deliver products with a known quantity, price, and date. Your Salesforce admin determines whether you add orders to contracts or accounts.

For example, an Internet service provider probably requires customers to commit to a year of service. That company requires contracts as a reference for every order. But a company that sells clothing probably sells products in a single transaction. That company associates each order with an account.

[Guidelines for Creating Orders](#)

When you're creating orders, make sure that you follow key guidelines.

[Editing and Deletion Limitations for Orders and Reduction Orders](#)

Some fields aren't editable after an order is created. Others aren't editable after an order has been reduced.

[Considerations for Activation Limitations](#)

Protect the integrity of your order data with activation limitations for orders and reduction orders.

[Share Orders](#)

Your Salesforce admin defines your company's default sharing model. You can change this model to extend sharing to more users than the default allows. You can't change the sharing model to make it more restrictive than the default.

[Order History](#)

Track changes to an order, such as when the status is modified, on its detail page by using the Order History related list.

[Order Fields](#)

Your page layout and field-level security settings determine which fields are visible and editable.

[Reduction Orders](#)

[Sales Features: What's Different or Not in Lightning Experience](#)

Guidelines for Creating Orders

When you're creating orders, make sure that you follow key guidelines.

- Associate each order with an account and optionally with a contract, depending on your Salesforce admin's settings.
- You can create an order from the Orders tab and then manually add the associated account and contract. But if you create an order directly on an account or contract via its Orders related list, no extra step is required. The order is associated with that record.
- To create an order with the same details as another order, you can clone it. (If you're using Lightning Experience, when you clone an order with products, the products aren't cloned. Clone the order, and then add products as needed to the new order.)
- If you clone an order with products, you can't change the new order's currency or price book.

USER PERMISSIONS

To create an order from the Orders tab:

- "Create" on orders

To create an order on a contract:

- "Create" on orders AND "Read" on contracts

To create an order on an account:

- "Create" on orders AND "Read" on accounts

Editing and Deletion Limitations for Orders and Reduction Orders

Some fields aren't editable after an order is created. Others aren't editable after an order has been reduced.

- In Salesforce Classic, you can't edit the status category of an order or reduction order from Draft to Activated or vice versa. The status field is updated based on other processes. For example, when you click **Activate**, the status category is changed from Draft to Activated. The status picklist values sometimes differ depending on your Salesforce admin's settings.

In Lightning Experience, Status picklist values aren't filtered based on an order's status, so all status values appear in the picklist.

- After an order is created, you can change its `Account` field only when the following conditions are true.
 - The order is in Draft status.
 - If the order has an associated contract, that contract is associated with the new account.
- After an order is created, you can change its `Contract` field only when the following conditions are true.
 - The order is in Draft status.
 - The account associated with the order is the same as the account associated with the new contract.
 - The currency associated with the order is the same as the currency associated with the new contract.
 - If the order has an associated price book, that price book is associated with the new contract.
- After a price book is assigned to an order, you can't change or remove the price book assignment.
- If an order has an associated reduction order, you can't edit the order's end date.
- Before you delete an activated order or reduction order, deactivate it. And before you deactivate the order, deactivate and delete any associated reduction orders.
- Only the order owners, account owners, contract owners, and Salesforce admins can delete related orders.

-  **Note:** When you delete a contract, all related orders, notes, attachments, events, tasks, history, and approval requests are deleted. Associated accounts aren't deleted with the contract. The deleted contract is moved to the Recycle Bin (Salesforce Classic only). If you undelete the contract, its related items are also restored.

Considerations for Activation Limitations

Protect the integrity of your order data with activation limitations for orders and reduction orders.

- You can activate orders for active contracts but not for inactive contracts.
- You can activate orders only if they include order products.
- You can activate reduction orders for order products only if they result in positive quantities.
- After you activate an order or reduction order, you can modify order products. You can't add or remove them.
- Before you can deactivate an order that has reduction orders, you must deactivate and delete its reduction orders.

Share Orders

Your Salesforce admin defines your company's default sharing model. You can change this model to extend sharing to more users than the default allows. You can't change the sharing model to make it more restrictive than the default.

1. To view and manage sharing details, click **Sharing** on the order detail page.

The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the order. The Sharing button isn't available when the organization-wide default for orders is controlled by the parent.

2. To grant access to the record for other users, groups, roles, or territories, click **Add**.

Note: You can share orders only with people who have "Read" permission on orders.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Orders are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Reduction orders are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To activate orders:

- "Activate Orders"

To deactivate orders and reduction orders:

- "Edit Activated Orders"

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Order History

Track changes to an order, such as when the status is modified, on its detail page by using the Order History related list.

When someone modifies a standard or custom field, an entry is added to the Order History related list (available in Salesforce Classic only), regardless of the order's status. All entries include the date, the time, the nature of the change, and who made the change. Modifications to the related lists on the order aren't tracked in the order history.

Order Fields

Your page layout and field-level security settings determine which fields are visible and editable.

Orders and reduction orders have the following fields.

Field	Description
Account Name	Name of the account associated with the order. (Read-only for reduction orders.)
Account Number	Unique number automatically assigned to the account associated with the order. (Read-only for reduction orders.)
Activated By	Name of the user who activated the order. (Read-only.)
Activated Date	Date when the order was activated.
Billing City	City portion of billing address. Up to 40 characters are allowed.
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Billing Street	Street address used for billing. Up to 255 characters are allowed.
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed.
Bill To Contact	Contact to whom the order is billed.

Field	Description
Company Authorized By	User at your company who authorized the order.
Company Authorized Date	Date when the order was authorized.
Contract End Date	Last day when the contract is in effect. (Read-only.)
Contract Name	Title for the parent contract that distinguishes it from other contracts. (Read-only.)
Contract Number	Unique number automatically assigned to the contract. Numbering for contracts starts at 100. (Read-only for reduction orders.)
Created By	User who created the order record. (Read-only.)
Currency	Default currency for all currency amount fields in the order. (Read-only for reduction orders.)
Customer Authorized By	Contact on the order's account who authorized the order.
Customer Authorized Date	Date when the contact authorized the order.
Description	Description of the order.
Last Modified By	User who most recently changed the order record.
Opportunity	Opportunity that's associated with the order.
Order Amount	Total amount of the order.
Order End Date	Date when the order ends.
Order Name	Title for the order that distinguishes it from other orders.
Order Number	Unique number automatically assigned to the order. Numbering for orders starts at 100. (Read-only.)
Order Record Type	Record type assigned to this order.
Order Reference Number	Reference number assigned to this order.
Order Start Date	Date when the order becomes effective.
Order Type	Type of order. Entry is selected from a picklist of available values, which a Salesforce admin sets. Each picklist value can have up to 40 characters.
Original Order	For reduction orders only. Prepopulated with the ID of the parent order when you create a reduction order by clicking Reduce Order .
Owner	Owner of the order. Can be a user or queue. Order owners have full access to their orders regardless of their account access.
PO Date	Date when a purchase order was entered.
PO Number	Number of the purchase order.

Field	Description
Quote	Quote that's associated with the order.
Reduction Order	If selected, the order record represents a reduction order. Automatically selected when you create a reduction order by clicking Reduce Order . (Read-only.)
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed.
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values or entered as text. If the field is a text field, up to 80 characters are allowed.
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed.
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed.
Ship To Contact	Contact to whom the order is shipped.
Status	<p>Indication of the stage that the order has reached in the order business process.</p> <p>You can add values to this picklist within two system-defined order status categories: Draft and Activated. You can use these status categories to track orders within your business process using reports and views. Some user permissions apply specifically to draft statuses. Others apply specifically to activated statuses.</p>

Order Products

An *order product* is a product or service that's provided to a customer according to an associated order.

All order products in an order are associated with a price book. The Order Products related list on an order indicates in parentheses which price book the order is associated with. For example, if the Government price book is associated with your order products, the related list is titled Order Products (Government).

A *reduction order product* is a product or service to be returned, reduced, deprovisioned, or disabled according to an associated reduction order. Each reduction order product is directly associated with an order product.

[Add Products to an Order](#)

Track what you're selling by adding products to your customers' order records.

Add Products to an Order

Track what you're selling by adding products to your customers' order records.

Note:

- You can use only one price book per order.
- You can add order products to draft orders only.
- If you're using Lightning Experience, you can add only one product at a time.

1. Open the order that you want to add products to.
2. In the Order Products related list, click **Add Product**.
3. If a price book isn't selected for this order, select the price book that you want to use, and then save your changes.
4. Select the products to add to your order.
5. Enter a quantity and unit price for each order product.
6. Add line descriptions if needed.

Order Product Fields

Your page layout and field-level security settings determine which fields are visible and editable. Order products and reduction order products have the following fields.

Field	Description
Available Quantity	Number of units available to be reduced. When a reduction order is activated, an order product's available quantity is updated to reflect the quantity of relevant reduction order products. Value must be greater than or equal to 0. (Read-only.)
Created By	User who created the order product record. (Read-only.)
End Date	End date for the order product.
Last Modified By	User who most recently changed the order record.
Line Description	Description for this order product record.
List Price	Default price set by the price book on the parent order. (Read-only.)
Order	Parent order for this order product.
Order Product Number	Automatically generated number that identifies the order product record. (Read-only.)
Original Order Product	Number that identifies the order product being reduced. Required if the order product is reducing another order product. (Read-only.)
Product	Name of the product used in this order product record. (Read-only.)
Product Code	Internal code or product number used to identify the product. (Read-only.)
Quantity	Quantity of units of the product.
Quote Line Item	Quote line item that's associated with the order product. The quote line item's quote must match the quote that's associated with the order product's parent order.
Start Date	Start date for the order product.
Total Price	Quantity of the order product multiplied by the unit price.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Orders are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Reduction orders available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Unit Price	Unit price for the order product.

SEE ALSO:

[Order Products](#)[Order Fields](#)

Reduction Orders

Use reduction orders to track requests to reduce, return, deactivate, or disable a customer's products or services.

A *reduction order* is an agreement between a company and a customer to process product returns, deprovision services, or reduce services that have been provisioned. For example, if a customer has purchased 30 items through an order and then requests to cancel that order, you can create a reduction order to track the request.

You can create multiple reduction orders for a single order, but you can't create a single reduction order for multiple orders. For example, to reduce order products that were purchased through three activated orders, you create three reduction orders—one for each original order—even if all those orders are for the same account.

[Reduce Orders](#)

If your company accepts returns or reductions on activated orders, you can reduce the relevant orders to reflect those exchanges of goods and services.

[Add Products to a Reduction Order](#)

After creating a reduction order, indicate which products need to be reduced and the quantities to reduce those products.

Reduction orders are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Reduce Orders

If your company accepts returns or reductions on activated orders, you can reduce the relevant orders to reflect those exchanges of goods and services.

Note:

- If you're using Lightning Experience, you can't create reduction orders. Switch to Salesforce Classic.
- You can reduce activated orders only.
- You can apply a reduction order toward one order only. To reduce order products across multiple orders, create a reduction order for each original order.

1. Go to the detail page of the order that you're reducing.
2. Click **Reduce Order**.
3. Enter the details for the reduction order, and then save your changes.
4. Add products to indicate which order products on the original order need to be reduced.

- [Considerations for Activation Limitations](#)
- [Order Fields](#)
- [Order Product Fields](#)

Add Products to a Reduction Order

After creating a reduction order, indicate which products need to be reduced and the quantities to reduce those products.

Note:

- If you're using Lightning Experience, you can't select products to reduce. Switch to Salesforce Classic.
- An order product is reducible only if its Available Quantity is greater than zero. You can partially reduce a product, but you can't reduce it to less than zero.
- You can reduce up to 200 order products in one reduction order.

1. Open the reduction order that you want to add products to, or [reduce an existing order](#) to create a reduction order.
2. In the Order Products related list, click **Select Products to Reduce**.
3. In the Quantity to Reduce column, enter the number of units to reduce each order product's quantity.
 - To fully reduce an order product, enter the same number in Quantity to Reduce as appears in Available Quantity.
 - If you don't want to reduce an item, leave the Quantity to Reduce blank.

For example, if the original order included 3,000 coffee sleeves, and your customer needs only 2,000, enter *1000* in the Quantity to Reduce column.

Forecasting Sales

Predicting and Planning Sales Cycles with Collaborative Forecasts

Collaborative Forecasts

Collaborative Forecasts makes it easy to predict sales revenue and quantities.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

[Collaborative Forecasts Concepts](#)

Predict sales revenue and quantities from your opportunity pipeline, and incorporate product families, opportunity splits, and custom opportunity currency fields if needed.

[Guidelines for Using Collaborative Forecasts](#)

Review key guidelines to make sure that you get the most out of Collaborative Forecasts.

[Collaborative Forecasts Elements](#)

Collaborative Forecasts lets you find and communicate opportunity and forecast information easily. If you're using Collaborative Forecasts, make sure that you learn about the elements that comprise a forecast.

[Monthly and Quarterly Forecasts](#)

The Collaborative Forecasts rollup table displays forecast amounts for individual months or quarters and a range of months or quarters, depending on your Collaborative Forecasts settings. Six months or four quarters is the default. Your admin can also enable custom periods.

[Forecast Hierarchy](#)

The forecast hierarchy in Collaborative Forecasts is a nested, expandable list of forecast users that determines how forecasts roll up within your company and who can view and adjust them. The forecast hierarchy is based on the role hierarchy and specifies which users are forecast managers.

[Partner Portal User Opportunities in Collaborative Forecasts](#)

Partner portal users are external to your Salesforce org but sell your products and services through indirect sales channels. Your partner portal users use a portal to log in to Salesforce. Partners can create opportunities, and users can assign opportunities to them.

[Guidelines for Using Multiple Currencies in Collaborative Forecasts](#)

If your company uses forecasts and multiple currencies, your Salesforce admin chooses a forecast currency and enables forecast types. The forecast currency is your corporate currency or each forecast owner's personal currency.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional** (no custom field forecasts), **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

[Guidelines for Using Forecasting Reports](#)

When using Collaborative Forecasts, review guidelines for how to get the most from forecasting reports.

[Sales Features: What's Different or Not in Lightning Experience](#)

Collaborative Forecasts Concepts

Predict sales revenue and quantities from your opportunity pipeline, and incorporate product families, opportunity splits, and custom opportunity currency fields if needed.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Use Collaborative Forecasts to manage sales expectations and to predict and plan your company's sales cycle from pipeline to closed sales. A forecast is an expression of expected sales revenue based on the gross rollup of a set of opportunities. The forecast amounts on the forecasts page are totals and subtotals of the opportunities in the four forecast categories—Pipeline, Best Case, Commit, and Closed. Depending on how your admin sets up Salesforce, these amounts can reflect opportunities from one or multiple forecast categories. On the forecasts page, roll over the  (Salesforce Classic only) next to the column names to see which forecast categories roll up to the totals in each column. In the rollup table on the forecasts page, forecast amounts are organized by forecast rollup, time period, and optionally by product family (Salesforce Classic only). Forecasts can include adjustments made by forecast managers to their immediate subordinates' forecasts and adjustments made by forecast users to their own forecast amounts.

Your admin can enable up to four types of forecasts that you can switch between. Each type of forecast stores its own quota and adjustment data.

Users can view forecast amounts and their related opportunities by forecast rollup for an individual or for everyone below them in the forecast hierarchy. For example, they can see the July Best Case forecast for all the sales managers who report to them, all the sales reps who report to any one of their managers, or just one individual. Users can also adjust their own forecasts and the forecasts of subordinates one level below. The user interface makes all these tasks simple.

- Conduct status calls with an opportunity team.
- Select and view forecasts using an interactive, expandable table.
- See forecast summary information for single months or quarters and a multimonth or quarter range for each forecast rollup.
- If you use product families, see forecast summaries for each product family.
- If you use opportunity splits, see the split percentages and amounts that contribute to each forecast (Salesforce Classic only).
- View and use the list of opportunities related to each forecast amount that you select. Access opportunity details directly from this list.
- Hover over a column boundary and click to adjust the width to view data more easily (Salesforce Classic only).
- Make adjustments and view adjustment details, such as the original forecast amount and who made the adjustment. If multiple types of forecasts are enabled, each forecast type maintains separate adjustments.
- If you're a forecast manager, move up and down through the forecasts hierarchy easily.
- View revenue- or quantity-based forecasts.
- View forecasts in multiple currencies.
- View quota information on each user's forecast page. If multiple types of forecasts are enabled, each forecast type maintains separate quota information.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional** (no custom field forecasts), **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

- Use Collaborative Forecasts reports.
- Include the opportunities of your partner portal users in your forecasts.

SEE ALSO:

[Guidelines for Setting Up Collaborative Forecasts](#)

[What's the difference between the Forecasting versions?](#)

Guidelines for Using Collaborative Forecasts

Review key guidelines to make sure that you get the most out of Collaborative Forecasts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

General Guidelines

- Track important details at the opportunity level.
- Measure everything related to potential deals—activities such as emails, meetings, and outreach—to determine their contributions to revenue.
- Create actionable tasks with next steps and completion dates pertaining to opportunities.
- Map your sales stages to forecast categories. Adjust close probability based on historical data to increase your forecast accuracy.
- When adjusting forecasts, have conversations with your subordinates so that they understand your expectations.
- Because opportunities can change frequently, revisit forecast adjustments weekly to avoid out-of-date adjustments.
- To ensure that the forecast visibility rolls up to every level of the hierarchy, designate each sales manager with subordinates as a forecast manager in your forecast hierarchy.
- Customize your forecast category names to match your business process and terminology.

Navigating Forecast Information

- To view or adjust a subordinate's forecasts, click **Jump to**, begin typing up to 20 characters in the text box that appears, and then select the subordinate's name.

 **Note:** Only forecast managers who have Collaborative Forecasts users reporting to them in the forecast hierarchy can see "Jump to." In Lightning Experience, you can drill down and up within the forecast hierarchy, but "Jump to" isn't available.

- To expand a row on the forecasts page, click it.
- Hover over a name to display the **Details** link. Navigation links with the names of forecast managers appear at the top of the page as you drill down through the forecast hierarchy. Click these links to quickly move through the hierarchy.

Viewing Forecast Information

- Keep your window sized to 1,024 pixels or greater.
- Because of the format and amount of information in the forecast rollup table, working with forecasts in mobile browsers can be difficult.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional** (no custom field forecasts), **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

- If you have multiple forecast types enabled, select which of them to view by clicking the name of the forecast in the upper-right dropdown list (Salesforce Classic) or gear (Lightning Experience) on the forecasts page and then choosing a different type from the menu.
- Run reports to analyze trends and check performance.
- Create dashboards for metrics of all activities related to potential sales.

Collaborating with Chatter

- Use Chatter to share opportunity and forecast information with your team and bring attention to important details.
- If Chatter is enabled and you're a forecast manager, hover over a subordinate's name and click **Chat Now** to display Chatter options such as Follow or Send a message.

SEE ALSO:

[Collaborative Forecasts Concepts](#)

[Guidelines for Using Forecasting Reports](#)

Collaborative Forecasts Elements

Collaborative Forecasts lets you find and communicate opportunity and forecast information easily. If you're using Collaborative Forecasts, make sure that you learn about the elements that comprise a forecast.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Adjustment

A layer of detail that you can add to a forecast amount. An adjustment shows forecast managers' or sales reps' judgment about the final amount that they expect a forecast's opportunities to bring in at the close of the forecast period. Some forecast managers need to adjust their own or a subordinate's forecast. For example, they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think that opportunity amounts are understated or overstated. Forecast managers can adjust forecasts that include only gross opportunity amounts and forecasts that have adjustments made by someone else in their opportunity team. An adjustment doesn't change the underlying gross rollup amount—it just adds a layer of detail. If multiple types of forecasts are enabled, each forecast type maintains separate adjustments.

Forecast managers can adjust their own Commit and Best Case forecasts and the forecasts of subordinates one level below them in the forecast hierarchy. They can view adjustments that subordinates make at every level below them in the forecast hierarchy. Adjustments made to their subordinates' forecasts roll up into their own forecasts. When you adjust, you can include an explanatory note. Adjustment notes don't appear in reports.

Amount Without Adjustments

The sum of a person's owned revenue opportunities and the person's subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy. This amount is visible only on reports.

Amount Without Manager Adjustments

The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and the owner's subordinates' opportunities, including adjustments made by the forecast owner on the owner's or subordinates' forecasts. It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional** (no custom field forecasts), **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

Corporate Currency

The currency in which your corporate headquarters reports revenue and the basis for all currency conversions.

Forecast

An expression of expected sales revenue based on the gross rollup of a set of opportunities. The forecast amounts on the forecasts page are totals and subtotals of the opportunities in the four forecast categories—Pipeline, Best Case, Commit, and Closed. Depending on how your admin sets up Salesforce, these amounts can reflect opportunities from one or multiple forecast categories. On the forecasts page, roll over the  (Salesforce Classic only) next to the column names to see which forecast categories roll up to the totals in each column.

In the rollup table on the forecasts page, forecast amounts are organized by forecast rollup, time period, and optionally by product family (Salesforce Classic only). Forecasts can include adjustments made by forecast managers to their immediate subordinates' forecasts and adjustments made by forecast users to their own forecast amounts.

Here you can view forecasts and related opportunities by forecast category for everyone below you in the forecast hierarchy or just one person. For example, you can see the July Best Case forecast for all the sales managers who report to you, all the sales reps who report to any one of your managers, or just one individual.

Forecast Amount

The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Forecast Category

The category within the sales cycle to which an opportunity is assigned based on its opportunity stage. The standard forecast categories are Pipeline, Best Case, Commit, Omitted, and Closed. You can customize the forecast category names.

Forecast Currency

Your corporate currency or each forecast owner's personal currency.

Forecast Display Currency

The currency that you select to display forecasts in. The selection must be an enabled currency and is made directly from the forecasts page.

Forecast Hierarchy

A nested, expandable list of forecast users that determines how forecasts roll up within your company and who can view and adjust them. The forecast hierarchy is based on the role hierarchy and specifies which users are forecast managers. When Collaborative Forecasts is enabled for you, a forecast hierarchy is generated based on your role hierarchy, but sometimes you need to add or remove managers, sales reps, or other users.

Forecast Owner

A forecast-enabled user who owns opportunities or is a forecast manager in the forecast hierarchy. Forecast managers can have their own opportunities.

Forecast Quantity

The quantity forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Forecast Range

The date range that you want displayed in your forecast. Depending on your settings, the range can include months or quarters.

Forecast Type

A forecast that's configured to use a specific type of data. You can use the opportunity `Amount` field, opportunity splits, overlay splits, custom opportunity fields, or product families. Each forecast type has its own measurement: revenue or quantity. To use both, enable a separate forecast type for each. Salesforce admins can enable up to four forecast types. You can't use quantity forecasts with opportunity splits or custom opportunity field forecasts.

- Opportunity-quantity forecasts roll up based on the opportunity's `Quantity` field, while opportunity-revenue forecasts roll up based on the opportunity's `Amount` field.
- For opportunity splits-revenue forecasts, the rollup is based on the opportunity's `Amount` field and the split percentage that's assigned to the sales rep.
- For custom opportunity field forecasts, the rollup is based on the custom field amount.
- For product family-revenue forecasts, the rollup is based on the sum of the `Total Price` field for all opportunity line items in that product family.
- Product family-quantity forecasts roll up based on the `Quantity` field for all opportunity line items in that product family.
- For opportunities without opportunity line items or with line items that don't have a specified product family, the totals roll up into the Products Not Categorized row on the forecasts page.

Gross Rollup

An expression of expected sales revenue based on the gross value of a set of opportunities. A forecast always includes a gross rollup amount and can also include adjustments.

Opportunities

The sales and pending deals that you want to track.

Opportunity Splits

Sharing credit across an opportunity team. If your forecast data source is opportunity splits, you can see the split information on the forecasts page (in Salesforce Classic only).

Opportunity Stage

The current stage of an opportunity, such as Prospect or Proposal. Opportunity stage values correlate with forecast category values to determine how the opportunity contributes to a forecast.

Owner Only Amount

The sum of a person's revenue opportunities, without adjustments.

Owner Only Quantity

The sum of a person's quantity opportunities, without adjustments.

Personal Currency

A user's default currency for quotas, certain forecasting versions, and reports. This currency must be one of your active currencies in Salesforce. Your quota amounts appear in your display currency.

Product Family

A way to categorize your products. For example, if your company sells hardware and software, you can create two product families: Hardware and Software.

Quantity Without Adjustments

The sum of a person's owned quantity opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.

Quantity Without Manager Adjustments

The forecast number as seen by the forecast owner. This is the sum of the owner's quantity opportunities and subordinates' opportunities, including adjustments made on the subordinates' forecasts. It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.

Quota

The monthly or quarterly sales goal that's assigned to a user. A manager's quota equals the amount that the manager and team are expected to generate together. The quota rollup is done manually by users and managers, and revenue or quantity data can be used. If you have multiple types of forecasts enabled, each type maintains separate quota information.

Revenue

The total expected revenue from the opportunities that fit in a given category.

Rollup Table

The table at the top of the forecasts page. The opportunities list at the bottom of the forecasts page corresponds dynamically with selections on the rollup table.

Subordinate

A Collaborative Forecasts user below you in the forecast hierarchy. You can view all your subordinates' forecasts. If you enable adjustments, you can view all your subordinates' adjustment information and adjust the forecasts of subordinates one level below you in the hierarchy. Forecast amounts and adjustments roll up into the forecasts on your forecasts page.

SEE ALSO:

[Collaborative Forecasts Concepts](#)

Monthly and Quarterly Forecasts

The Collaborative Forecasts rollup table displays forecast amounts for individual months or quarters and a range of months or quarters, depending on your Collaborative Forecasts settings. Six months or four quarters is the default. Your admin can also enable custom periods.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Depending on your Collaborative Forecasts period settings, you can forecast up to 12 months or eight quarters in the future or past. If your forecast range includes the current month or quarter, the forecasts page displays the current month or quarter. Otherwise, the first month or quarter of the range is selected. Regardless of whether your company uses monthly or quarterly forecasts, forecast managers can use quotas and adjust their subordinates' forecasts. Quota and adjustment periods are based on the period settings.

The forecast date range becomes the default for all Collaborative Forecasts users. Users can use this default or set a different date range display for their own forecasts. After users change their individual forecast date range displays, admins can't override them. However, when changing the *period* display from monthly to quarterly or quarterly to monthly, the change is reflected in all users' forecasts.

Forecast Hierarchy

The forecast hierarchy in Collaborative Forecasts is a nested, expandable list of forecast users that determines how forecasts roll up within your company and who can view and adjust them. The forecast hierarchy is based on the role hierarchy and specifies which users are forecast managers.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Based on your role, you can be added to or removed from the forecast hierarchy. And your position within the hierarchy can change. For example, some sales reps with no direct reports can view only their own forecasts. However, if they become sales managers, they're added to the forecast hierarchy as forecast managers.

People designated as forecast managers can view the forecasts and opportunities of users, including partner portal users, below them in the forecast hierarchy. Forecast managers can also adjust the forecasts of direct reports. Only managers who adjust and people above them in the hierarchy can view the adjustment.

Not everyone can view the chart that displays your team's forecast hierarchy. If you have questions about your forecast hierarchy, see your admin or forecast manager.

[Adjusting Forecasts in Collaborative Forecasts](#)

[Guidelines for Using Collaborative Forecasts](#)

Partner Portal User Opportunities in Collaborative Forecasts

Partner portal users are external to your Salesforce org but sell your products and services through indirect sales channels. Your partner portal users use a portal to log in to Salesforce. Partners can create opportunities, and users can assign opportunities to them.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Opportunities that a partner portal user creates can roll up to the forecast of the account owner. The account owner must be the person's forecast manager in the forecast hierarchy for the opportunities to roll up into the forecast. For example:

- Gordon Johnson owns a partner account called Acme.
- Gordon has an Acme contact named Anne Smith.
- Anne is a partner portal user.
- Anne reports to Gordon in the forecast hierarchy.

If Anne adds opportunities in her portal, Gordon sees those opportunities in his forecast. Because Gordon is Anne's forecast manager, he can adjust forecast amounts based on her opportunities and see how she's tracking against her quota.

Guidelines for Using Multiple Currencies in Collaborative Forecasts

If your company uses forecasts and multiple currencies, your Salesforce admin chooses a forecast currency and enables forecast types. The forecast currency is your corporate currency or each forecast owner's personal currency.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

- When you use Collaborative Forecasts, you select a *display currency*, which can be any currency that's enabled in Salesforce. To change the currency, select a different currency from the dropdown list (Salesforce Classic) or gear (Lightning Experience) in the upper right of the forecasts page.
- If you use revenue-based forecasts, when currency rates change, opportunities and adjustments roll up with the changed value along with values in the forecast table.
- If you use quantity-based forecasts, when currency rates change, opportunities and adjustments roll up with the changed value.
- The processing indicator () appears as changed values roll up (Salesforce Classic only).
- Rate changes impact all forecast periods (historical, current, and future).
- Deactivating a currency that's set as a user's personal currency resets the user's currency to the corporate currency.
- To edit your personal currency settings, edit your personal information.

Guidelines for Using Forecasting Reports

When using Collaborative Forecasts, review guidelines for how to get the most from forecasting reports.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

- To determine whether forecasting reports are available, go to the Reports tab, and then click **New Report**. Select the folder in which your Salesforce admin has placed the forecasting report types. If you don't see the fields or report type names described in this table, check with your admin.
- If reports that use a specific forecast type don't run, that forecast type was likely deleted. Check with your admin.
- Reports contain the latest information at the time when you run the report. If changes are in progress while the report is running, you might see a difference between your report amounts and the forecasts page.
- The data that you see in reports depends on what you can view in Collaborative Forecasts. For example, forecast managers can view adjustments, but someone who's not a forecast manager running a similar report doesn't see the adjusted amounts in reports. A forecast amount can consist of a rollup of many users' forecast amounts, so examine report results closely when using summary fields.

Report Element	How to See It
A forecast summary from a specific user's perspective.	Create a Forecasting Item report and add a filter using Owner: Full Name. Filter by a specific person's name.
The sum of a person's revenue opportunities, without adjustments.	Add Owner Only Amount to your Forecasting Item report. For example, if you own two opportunities, each worth \$10,000, the Owner Only Amount is \$20,000. To view the same information for quantity, add Owner Only Quantity to the report.
The sum of a person's owned revenue opportunities and the person's subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy. This amount is visible only on reports.	Add Amount Without Adjustments to your Forecasting Item report. For example, if the sum of the amount of all opportunities owned by you is \$20,000, and the sum of the amount of your subordinates' opportunities is \$55,000, the Amount Without Adjustments is \$75,000. To view the same information for quantity, add Quantity Without Adjustments to the report.
The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and the owner's subordinates' opportunities, including adjustments made by the forecast owner on the owner's or subordinates' forecasts. It doesn't include	Add Amount Without Manager Adjustments to your Forecasting Item report. For example, Anne has an Amount Without Adjustments of \$75,000, made up of \$20,000 of her own opportunities and \$55,000 of opportunities owned by Ben, her subordinate. She adjusts Ben's amount to \$65,000 for a total of \$85,000. If you adjust

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

Report Element**How to See It**

adjustments made by forecast managers above the owner in the forecast hierarchy.

Anne's number from \$85,000 to \$100,000, you see \$85,000 in Amount Without Manager Adjustments, because Anne sees this amount (and Anne can't see your adjustments because you're her manager). To see the amount that includes your adjustment to \$100,000, look at Forecast Amount. To view the same information for quantity, add Quantity Without Manager Adjustments to the report.

The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Add Forecast Amount to your Forecasting Item report. For example, you're a forecast manager and have another forecast manager reporting to you who has an Amount Without Manager Adjustment totaling \$85,000. If you adjust the forecast to \$100,000, the Forecast Amount is \$100,000. To view the same information for quantity, add Forecast Quantity to the report.

Whose forecast amounts have adjustments made to them.

Add Has Adjustment to your Forecasting Item report. For example, if you make a manager adjustment to one of your subordinate's forecast amounts, this checkbox is selected. If your subordinate adjusts one of his or her subordinate's amounts, this checkbox is selected. However, unless you have the "View All Data" permission, if your forecast manager adjusts your forecast amount, this checkbox remains deselected. You don't have access to your forecast manager's adjustment information. Also add Has Owner Adjustment. If a forecast user adjusts his or her own forecast, this checkbox is selected.

Quota detail for your forecasts.

Create a Forecasting Quotas report. For example, depending on how your Salesforce admin set up the report type, you can include fields, such as the full name of the quota owner. Then you can filter by your own name to see quotas that you created and their related accounts and owners.

How forecast amounts today compare with earlier forecast amounts.

[Create a Forecasts with Historical Trending report](#), and then compare the value of the Forecast Amount field at the beginning of the month with its value at the end of the month, sorted by owner.

Results for your direct reports only.

When creating a forecasting report, choose My Direct Reports' *<item name>* from the Show menu.

Which type of forecast the results are from.

Refer to the Forecasting Type field in the report results. This field is included in the default page layout for Forecasting Item and Quota reports.

Viewing and Editing Forecasts

Learn about several basic tasks to help you view and edit information in Collaborative Forecasts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

[Change Your Forecast Date Range Display](#)

The Collaborative Forecasts rollup table displays forecast amounts for individual months or quarters and a range of months or quarters, depending on your Collaborative Forecasts settings. When your Salesforce admin sets up Collaborative Forecasts, a default forecast date range display is selected. For example, your default can be three months into the future. Use this default or change the date range that's displayed for your own forecast.

[Change Between Forecast Types](#)

If you have multiple types of forecasts enabled in Collaborative Forecasts, select the type to use in your forecasts.

[Guidelines for Viewing Opportunity Details from a Forecast](#)

From your forecasts detail page or any subordinate's forecasts detail page in Collaborative Forecasts, you can view the opportunities that make up a forecast: for a month or month range, for all your subordinates, or just one.

[Guidelines for Refreshing Forecasts](#)

Certain actions can change forecast amounts in Collaborative Forecasts. For example, while you're viewing a forecasts page, your subordinates can edit related opportunities and adjust the forecasts of their own subordinates. And you can adjust one of your subordinates' forecasts from your own page. To see these changes, refresh the forecasts page.

Change Your Forecast Date Range Display

The Collaborative Forecasts rollup table displays forecast amounts for individual months or quarters and a range of months or quarters, depending on your Collaborative Forecasts settings. When your Salesforce admin sets up Collaborative Forecasts, a default forecast date range display is selected. For example, your default can be three months into the future. Use this default or change the date range that's displayed for your own forecast.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

The range that you select is relative to the current month or quarter. For example, in January, you select January as your beginning month and April as the ending month. In February, the date range displayed becomes February to May, and so on. Your date range selection remains until you choose another one.

1. Click the **Forecasts** tab.
2. If you're using Lightning Experience, click the gear in the upper right of the forecasts page. If you're using Salesforce Classic, click **Change** in the rollup table.
3. Select a beginning and ending period.
4. Save your changes.

Guidelines for Viewing Opportunity Details from a Forecast

From your forecasts detail page or any subordinate’s forecasts detail page in Collaborative Forecasts, you can view the opportunities that make up a forecast: for a month or month range, for all your subordinates, or just one.

Note: This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

- If your sales team forecasts on product families, you can view your own or a subordinate’s opportunities for each product family. When you select a cell in the rollup table, the opportunities related to that cell appear in a list at the bottom of the page. You can sort the opportunities by column header.
- To view a subordinate’s opportunities for a single product family, click **+** next to the subordinate’s name to display the product family rows, and then click the product family name.
- To view the splits for an opportunity, hover over the split percentage for the opportunity and click  (Salesforce Classic only). The Opportunity Splits detail window appears, showing splits that roll up to the selected forecast cell in bold. Splits on the opportunity that don’t roll up to the selected forecast cell appear in gray. Opportunities that contain only a single 100% split for the opportunity owner don’t display split details.

Revenue and Quantity Forecast Measurements

Calculate forecasts on revenue or quantity in Collaborative Forecasts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

- Opportunity-quantity forecasts roll up based on the opportunity's `Quantity` field, while opportunity-revenue forecasts roll up based on the opportunity's `Amount` field.
- For opportunity splits-revenue forecasts, the rollup is based on the opportunity's `Amount` field and the split percentage that's assigned to the sales rep.
- For custom opportunity field forecasts, the rollup is based on the custom field amount.
- For product family-revenue forecasts, the rollup is based on the sum of the `Total Price` field for all opportunity line items in that product family.
- Product family-quantity forecasts roll up based on the `Quantity` field for all opportunity line items in that product family.
- For opportunities without opportunity line items or with line items that don't have a specified product family, the totals roll up into the Products Not Categorized row on the forecasts page.

For example:

- A sales manager needs to forecast using revenue because the sales vice president sets quota amounts based on the US dollar.
- A sales rep needs to forecast using quantity because of an incentive to sell 10,000 units of a promotional product.

Custom Opportunity Field Forecasts

Track and predict revenue beyond the standard opportunity Amount field in Collaborative Forecasts.

 **Note:** This information applies to Collaborative Forecasts and not to Customizable Forecasts.

You can forecast on custom currency fields on opportunities. For example, your sales team can use a custom field such as Margin, Monthly Recurring Revenue, Annual Contract Value, or any other currency field that your company requires. Your Salesforce admin can set up forecasts based on a custom field, which sales managers can then view on the forecasts page.

If you use opportunity splits with your custom field, your forecast incorporates those splits. You can use a custom field forecast by itself or with other forecasts, such as an opportunity-revenue forecast based on the opportunity Amount field. Your admin can also set up a forecast for the standard Expected Revenue field.

 **Note:** If forecast managers or sales reps viewing the forecast can't access the custom opportunity field, they can see forecast amounts but not the custom field values in the opportunity list.

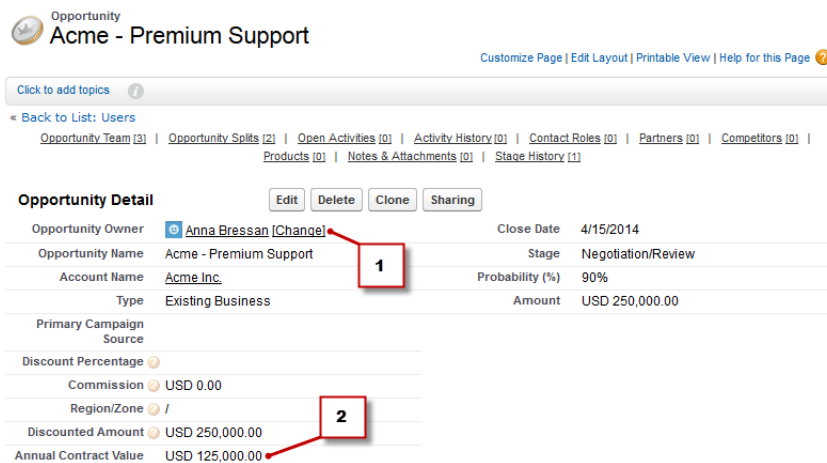

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise,** and **Developer** Editions

Forecasting on Annual Contract Value: A Simple Custom Field Forecast

Here we see an opportunity owned by sales rep Anna Bressan. Anna has many multiyear deals, so the revenue received from a deal each year is tracked in a custom Annual Contract Value field.

- This area shows the Annual Contract Value forecast for Anna (1).
- This forecast has the same name as the custom field (2).
- The Forecasted Amount is the value of the Annual Contract Value field that rolls up into Anna’s forecast (3).
- This area shows the Forecasted Amount from the Annual Contract Value field on Anna’s Acme - Premium Support opportunity (4).

Note: To enable a custom field forecast, your Salesforce admin must enable opportunity splits for the custom field. However, the opportunity owner automatically receives a 100% split for the field, so if your company doesn’t plan to use splits with the field, the rollup is the same as if there were no splits.

A Custom Field Forecast with Opportunity Splits

If you use opportunity splits on your custom field, your custom field forecast rolls up those splits. For example, here we can see that sales rep Anna owns an opportunity, which includes a custom split on the Annual Contract Value field for Kevin, a sales engineer responsible for increasing overall Annual Contract Value for the company. In this case, Kevin’s 25% split rolls up into his Annual Contract Value forecast.

Opportunity Detail

Opportunity Owner: [Anna Bressan](#) (Change) 1

Opportunity Name: Acme - Premium Support

Account Name: [Acme Inc](#)

Type: Existing Business

Close Date: 4/15/2014

Stage: Negotiation/Review

Probability (%): 90%

Amount: USD 250,000.00

Annual Contract Value: USD 125,000.00 2

Opportunity Team

Action	Team Member	Member Role
Edit	Anna Bressan	Opportunity Owner
Edit Del	Kevin Bailey	Pre Sales Engineer

Opportunity Splits

Action	Team Member	Opportunity Split Type	Percent (%)	Amount	Note
Del	Anna Bressan 3	Annual Contract Value	75.00	USD 93,750.00	
Del	Kevin Bailey	Annual Contract Value	25.00	USD 31,250.00	

- Anna owns this opportunity (1).
- The opportunity contains a custom currency field called Annual Contract Value (2).
- Kevin receives a 25% split on the Annual Contract Value field (3).

Kevin’s manager can view the Annual Contract Value forecast where he can see the deal to which Kevin is contributing, along with all the other opportunities that his sales engineer team is working on. Kevin’s manager can see that Kevin is receiving a 25% credit for all his opportunities, which contribute to a total of \$1,026,000 revenue in his Best Case forecast. If Kevin’s manager thinks the deal will ultimately close for a higher amount, his manager can adjust the Best Case forecast amount upward. Anna’s manager can see Anna’s 75% split in her forecast.

Kevin Bailey Forecast

	Closed	Commit	Best Case	Pipeline
Total: 3 Months (Change)	USD 36,250.00	USD 326,875.00	USD 1,026,000.00	USD 812,000.00

- This area shows Kevin’s 25% split on Anna’s Acme – Premium Support opportunity (2).

Forecasts from the Standard Expected Revenue Field

The standard `Expected Revenue` field is useful for opportunities that are likely to produce more or less revenue than indicated in the `Amount` field. If you use the `Expected Revenue` field, your admin can set up a forecast for it. The `Expected Revenue` forecast then appears in the dropdown list in the same way as a custom field forecast.

Overlay Splits Forecasts

Track revenue in Collaborative Forecasts from sales team members who help close opportunities but aren’t directly responsible for them.

Note: This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

As a sales manager, you probably use revenue splits for crediting team members who are directly responsible for opportunities. To provide more flexibility with how you assign credit for opportunities, you can use overlay splits, which help you and other team members allocate credit to overlay sales roles for working on opportunities. Overlay splits can add up to any percentage of the opportunity amount, sometimes exceeding 100%. For example, your sales team can include sales engineers, product specialists, or partners who help close deals but aren’t directly responsible for them.

Overlay forecasts let you predict revenue from overlay splits. Forecast amounts roll up through the role hierarchy based on the opportunity’s `Amount` field and the overlay team member’s split percentage.

Here you can see that sales rep Scott owns an opportunity, which includes an overlay split for sales engineer Owen, who’s working with Scott to close the deal. For Scott, the opportunity `Amount` field rolls into his opportunity revenue forecast.

Opportunity Detail

Opportunity Name: Anaco Limited - 400K
 Opportunity Owner: Scott Thompson (Change) **1**
 Account Name: Anaco Limited
 Type: New Business

Amount: \$396,000.00
 Profit:
 Close Date: 12/27/2013
 Stage: Needs Analysis
 Forecast Category: Best Case
 Probability (%): 20%

Description
 Description: Great sales cycle, with our new product this looks like a great fit
 Next Step: calling up the chain

Marketing Information
 Lead Source: Google Adwords

System Information
 Created By: Scott Thompson, 8/9/2013 2:04 PM
 Last Modified By: Valerie Jones
 Opportunity Record Type: Simple (Change)

Opportunity Team

Action	Team Member	Member Role
Edit	Scott Thompson	Opportunity Owner
Edit Del	Sue Martin	Account Manager
Edit Del	Owen Overlay	

Opportunity Splits

Action	Team Member	Opportunity Split Type	Percent (%)	Amount	Note
Del	Owen Overlay	Overlay	50.00 2	\$198,000.00	specialist

- Scott owns this opportunity (1).
- Owen receives a 50% split (2).

Owen’s manager can also view the overlay forecast where he can see the deal to which Owen is contributing, along with all the other opportunities that his sales engineer team is working on. Owen’s manager can see that Owen is receiving a 50% credit for this deal, which contributes to a total of \$948,000 revenue in his Best Case forecast. If Owen’s manager thinks the deal will close for a higher amount, he can adjust the Best Case forecast amount.

Karen Adams Forecast

Forecast Adjustments

Collaborative Forecasts users who anticipate differences between the current forecast and actual future results can change forecast rollup amounts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

[Adjusting Forecasts in Collaborative Forecasts](#)

Add adjustments to the Best Case and Commit forecast amounts. Then change or remove adjustments as needed.

[Adjust Forecasts](#)

To add an adjustment to a Best Case or Commit forecast amount in Collaborative Forecasts, click its cell in the forecast table, and then enter the new amount.

[View and Edit Forecast Adjustments](#)

View details about forecast adjustments in Collaborative Forecasts, including who made the adjustments, the adjusted amounts, and the original gross rollup (the forecast amount before adjustments). Edit adjustments that you've made as needed.

[Adjustments Purges in Collaborative Forecasts](#)

Adjustments can be purged when you change some forecast and custom fiscal year settings. The data on which the forecasts are based remains untouched.

Adjusting Forecasts in Collaborative Forecasts

Add adjustments to the Best Case and Commit forecast amounts. Then change or remove adjustments as needed.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To adjust forecasts, adjustments must be enabled. Your Salesforce admin can enable managers to adjust subordinates' forecasts, all Collaborative Forecasts users to adjust their own forecasts, or both.

An adjustment shows forecast managers' or sales reps' judgment about the final amount that they expect a forecast's opportunities to bring in at the close of the forecast period. Some forecast managers need to adjust their own or a subordinate's forecast. For example, they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think that opportunity amounts are understated or overstated. Forecast managers can adjust forecasts that include only gross opportunity amounts and forecasts that have adjustments made by someone else in their opportunity team. An adjustment doesn't change the underlying gross rollup amount—it just adds a layer of detail. If multiple types of forecasts are enabled, each forecast type maintains separate adjustments.

Forecast managers can adjust their own Commit and Best Case forecasts and the forecasts of subordinates one level below them in the forecast hierarchy. They can view adjustments that subordinates make at every level below them in the forecast hierarchy. Adjustments made to their subordinates' forecasts roll up into their own forecasts. When you adjust, you can include an explanatory note. Adjustment notes don't appear in reports.

For example, let's say you're a sales manager who's adjusted the forecast of one of your sales reps down from \$2,000 to \$1,500. Your vice president, who's your forecast manager, sees \$1,500 when viewing your forecast, along with an icon indicating that the amount contains an adjustment. The vice president can decide to adjust it back to \$2,000.

Forecast managers' own forecasts pages show all their forecast amounts and related opportunity details. When managers view a subordinate's forecasts page, they see the totals that the subordinate sees. Any adjustments that the managers make to subordinates' amounts from their own forecast page don't appear on the subordinate's forecasts page. Instead, the managers see that subordinate's forecasts and any adjustments that the subordinates made to their own amounts or amounts of their subordinates. For example, let's say you're a vice president of sales. On your own forecasts page, you see a July Best Case forecast of \$1,250 (including a \$50 adjustment that you made) for one of your first-level subordinates, a sales manager. However, when you view the sales manager's forecasts page, the July Best Case forecast is \$1,200, because it doesn't include your adjustment. If a manager and a subordinate adjust the same forecast amount, only the manager's adjustment rolls up the forecast hierarchy.

If multiple types of forecasts are enabled, each forecast type maintains separate adjustments. For example, if opportunity-revenue and opportunity-quantity forecasts are enabled, you can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast aren't displayed as adjustments in any other forecast type. So if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you don't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue forecast, you see your adjustment of \$90,000. If you use product family forecasts, you can't adjust your own product family forecast amounts.

When an opportunity moves from one forecast category to another, such as from Pipeline to Best Case, the unadjusted raw amounts change for each of those rollups. However, forecast amounts with adjustments don't change in the rollup table on the forecasts page. We recommend updating or removing your adjustments to each forecast rollup to account for changes in the stage of opportunities.

 **Note:** While you're viewing a forecasts page, your subordinates can be adjusting forecast amounts or editing related opportunities. Or you can adjust one of your subordinates' forecasts from your own page. All these events change forecast amounts. Click **Refresh** to view the most recent forecast amounts.

This table shows who can view and adjust your forecasts.

User	Can view your forecasts?	Can adjust your forecasts?
Your manager's manager	Yes	No
Your manager	Yes	Yes. The manager adjusts amounts from his or her own forecasts page.
You	Yes	Yes, if enabled by your admin. You can adjust forecast totals only, not the subtotal for My Opportunities.
Your direct report	No	No
Your subordinate who's not a direct report	No	No

This table shows whose forecasts you can view and adjust.

User	Can you view forecasts?	Can you adjust forecasts?
Your manager's manager	No	No
Your manager	No	No
You	Yes	Yes, if enabled by your Salesforce admin
Your direct report	Yes. However, if you select a direct subordinate's forecast, you see the same view as that subordinate, so your adjustments aren't visible.	Yes. You adjust these amounts from your own forecasts page.
Your subordinate who's not a direct report	Yes. You see the same view that the subordinate sees.	No. Your direct reports can adjust their own direct reports' forecasts.

If a forecast contains an adjustment:

- In Lightning Experience, you see the  icon next to the forecast amount.
- In Salesforce Classic, you see these icons next to the forecast amount.

Icon in Salesforce Classic

Definition

- You adjusted the forecast amount. You see this indicator only on your forecasts page.
- One of your subordinates adjusted the forecast. You see this indicator on your forecasts page and your subordinates' forecasts pages.

Icon in Salesforce Classic	Definition
	You and one or more subordinates adjusted the forecast. You see this indicator only on your forecasts page, because when you drill down to a subordinate's page, you see the page as that user sees it.
	Save your adjustment.
	Undo your adjustment and restore the previous value of the forecast. Hover over the button to see a tool tip that tells you if the previous value includes an adjustment.
	The adjustment includes a note.
remove	Remove your adjustment and restore the previous value, which can include someone else's adjustment.

Adjust Forecasts

To add an adjustment to a Best Case or Commit forecast amount in Collaborative Forecasts, click its cell in the forecast table, and then enter the new amount.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To adjust forecasts, adjustments must be enabled. Your Salesforce admin can enable managers to adjust subordinates' forecasts, all Collaborative Forecasts users to adjust their own forecasts, or both.

If you use product family forecasts, adjust a subordinate's individual product family totals rather than the total for all product families.

1. Find the forecast that you want to adjust, and then hover over its cell and click .
2. Enter your adjustment.
3. To include information about why you made the adjustment, add a note (140 characters maximum).
4. Save your changes. An icon appears in the cell to show that you adjusted the forecast. The adjustment rolls up to the period range total rows on the page.

Adjustments Purges in Collaborative Forecasts

Adjustments can be purged when you change some forecast and custom fiscal year settings. The data on which the forecasts are based remains untouched.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Adjustment purges happen when your Salesforce admin does any of the following.

- Disables Collaborative Forecasts.
- Disables manager adjustments. Only adjustments made by forecast managers to their subordinates' forecasts are purged.
- Disables owner adjustments. Only adjustments made by forecast users to their own forecasts are purged.
- Changes your forecast period setting from quarterly to monthly or from monthly to quarterly.
- Disables a forecast type. Only adjustments for that forecast type are purged.
- Changes the start month of your fiscal year when the forecast period is set to quarterly. Quotas and adjustments are purged.
- Deletes a product family. Quotas and adjustments are purged for the deleted product family.
- Switches from cumulative forecast rollups to individual forecast category rollups or from individual to cumulative rollups.
- Creates a custom fiscal year for the first time. All adjustments and quotas for the corresponding and following standard fiscal years are purged.

Quotas in Collaborative Forecasts

A forecast quota is the monthly or quarterly sales goal that's assigned to a sales team member. A manager's quota equals the amount that the manager and team are expected to generate together. The quota rollup is done manually by users and managers, and revenue or quantity data can be used. If you have multiple types of forecasts enabled, each type maintains separate quota information.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

If forecast quotas are enabled, quota data appears in these locations on the forecasts page.

- A column that contains quota amounts for a specific period. If your forecast includes product families, this column includes quotas for each product family.
- A row that contains the percentage amounts attained for a specific period in a specific forecast rollup (Salesforce Classic only).

[Considerations for Using Quotas in Collaborative Forecasts](#)

Before you use forecast quotas, review some considerations.

[Show and Hide Quota Information in Collaborative Forecasts](#)

Considerations for Using Quotas in Collaborative Forecasts

Before you use forecast quotas, review some considerations.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

- Viewing quota attainment information isn't available in Lightning Experience.
- In product family forecasts, sales managers can't see their own quotas and quota attainment for individual product families. Only their total quota appears in the rollup table. For example, if three sales reps have combined quota amounts of \$75,000 and their forecast manager has an individual quota of \$30,000, the manager's quota is \$105,000.
- You can edit direct subordinates' quotas only ("Manage Quotas" permission required)—not your own.

Estimating Revenue and Sales with Customizable Forecasts

Customizable Forecasting Overview

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Customizable forecasting is a flexible solution for estimating how much revenue your organization can generate or how many items your organization can sell. You can set up customizable forecasting to reflect how your organization forecasts its sales. With it, you can forecast on a monthly or quarterly basis, use different dates when applying amounts to forecasts, forecast based on revenue or quantity or both, and define additional quotas based on product families.

Use customizable forecasts to review your forecast and drill down through your forecast amounts to see the opportunities included in your forecast. Override forecast amounts directly from the opportunity, or override the forecast from the Forecasts tab without notifying users below you in the forecast role hierarchy.

Clicking the Forecasts tab displays your forecast for the selected forecast period.

- Click **Submit** to submit a forecast, making a snapshot of the forecast data available in the forecast history and forecast reports. See [Submitting Customizable Forecasts](#).
- Click **Forecast History** to display the forecast data you submitted in the past. Then, click **Forecast Summary** to return to the current forecast data.
- Click **Printable View** to display the selected forecast in a simple, print-ready layout.
- Review your forecast and the forecasts of any direct reports or forecasts that are manually shared with you. See [Viewing Customizable Forecasts](#) for instructions on different viewing options.
- Click the Forecast subtab to see forecast details. See [Viewing Customizable Forecasts](#) for more information.
- Click the Opportunities subtab to see the opportunities that are included in the displayed forecast. On the Opportunities subtab, you can choose, or create, a list view to further filter the displayed opportunities. See [Viewing Customizable Forecasts](#) for more information.
- Click the edit icon () to make changes to the adjusted forecast total, or to add an override to a particular forecast amount. For instructions on overriding forecast amounts, see [Overriding Customizable Forecasts](#).

If your forecast is not available, contact your administrator about adding you to the forecast hierarchy (or the territory hierarchy, if your organization uses territory management).

 **Note:** The Forecasts tab is unlike other tabs in that it automatically calculates data for you based on your opportunity data. You do not need to create or delete forecast records.

For information on implementing customizable forecasting for your organization, see [Setting Up Customizable Forecasting](#).

Do I Have Customizable Forecasting?

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Customizable forecasting may be difficult to distinguish because the tab name does not change when you convert to customizable forecasting. Here's how to tell if you have it:

Click the Forecasts tab.

- If you see either the **Introducing Customizable Forecasting** or **Request Now!** buttons, you don't have customizable forecasting.
- If you don't see either button, your organization already has customizable forecasting.

To enable customizable forecasting:

1. From Setup, enter *Forecasts (Customizable)* in the **Quick Find** box, then select **Forecasts Hierarchy**.
2. Select **Enable Customizable Forecasting**.
3. Once customizable forecasting is enabled, see [Setting Up Customizable Forecasting](#).

Setting Quotas for Customizable Forecasting

Users with the appropriate permission can set their individual quota. Administrators and users with the appropriate permission can always edit any quota, and managers can always change the quotas of users that report directly to them in the role hierarchy.

1. Do one of the following:
 - To set your personal quota, access your personal information in your personal settings.
 - To change the quota of a user that reports to you, from Setup, enter *Users* in the **Quick Find** box, then select **Users**, and click the full name of the appropriate user.
2. Click **Edit** in the Quotas related list.
3. Select the appropriate range start and range length. If available, select a territory and product family.

 **Note:** If your organization uses custom fiscal years, you cannot set quotas for a period that does not have a defined fiscal year.

4. Enter the quota amounts for revenue and/or quantity.
5. Select the appropriate currency if you work with more than one currency.
6. Click **Save** to save the quota and return to the user detail page, or click **Quick Save** to save the values and continue to edit the quota.

 **Tip:** Using **Quick Save** allows you to quickly set a different quota for each product family.

 **Note:** If these options are not available to you, you may not have customizable forecasting. To determine if your organization has enabled customizable forecasting, see [Do I Have Customizable Forecasting?](#) on page 1569. Delegated administrators won't see the quotas related list on user records.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set your quota:

- "Edit Personal Quota"

To set any user's quota:

- "Manage Internal Users"

AND

"Modify All Data"

You can also use tools like the [Data Loader](#) to do mass updates on quotas. When updating quotas, set the quota field value on the `RevenueForecast` or `QuantityForecast` objects.

SEE ALSO:

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

Working with Forecast Categories

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your forecast is a representation of your opportunity amounts, dates, and stages. Click the Forecasts tab and notice that your forecast amounts are listed in different categories. Depending on its stage, an opportunity amount can be included in the following forecast categories:

- **Best Case** includes amounts you are likely to close, closed/won opportunity amounts, and amounts in the Commit category.
- **Closed** includes amounts for closed/won opportunities.
- **Commit** includes amounts you are confident about closing and closed/won opportunity amounts.
- **Omitted** means the amount does not contribute to your forecast.
- **Pipeline** includes amounts from all open opportunities.

 **Note:** You can edit the forecast category field on opportunities to change the value displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. For example, you can change the value of the Commit category to Won to make the category name match your business processes.

Each value in the opportunity `Stage` picklist is automatically mapped to a `Probability` and value in the `Forecast Category` picklist. Change the `Stage` of an opportunity and the `Probability` as well as the `Forecast Category` changes with it.

For example, your organization may have mapped the “Negotiation/Review” stage to the “Best Case” forecast category. This means that the amounts of your opportunities in “Negotiation/Review” are included in your “Best Case” forecast amount. Your organization may have set up different mappings but an example of how these fields map is below:

Stage	Probability	Forecast Category
Prospecting	10%	Pipeline
Qualification	10%	Pipeline
Needs Analysis	20%	Pipeline
Value Proposition	50%	Pipeline
Id Decision Makers	60%	Pipeline
Perception Analysis	70%	Pipeline
Proposal/Price Quote	75%	Pipeline
Negotiation/Review	90%	Best Case
Closed Won	100%	Commit

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Regardless of whether you use customizable forecasting or not, your forecasts still rely on how your opportunity `Stage` picklist values map to values in the `Forecast Category` picklist.

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

Managing Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your forecasts represent your opportunity amounts, dates, and stages. To make sure your forecasts are an accurate representation of your revenue potential:

1. Review your forecast amounts. See [Viewing Customizable Forecasts](#) for instructions on different viewing options.
2. Determine if you want to override any amounts.
3. Override amounts if necessary. This requires the appropriate user permission. See [Overriding Customizable Forecasts](#) on page 1573.
4. Submit your forecast to make a snapshot of your forecast data available in your forecast history and forecast reports. See [Submitting Customizable Forecasts](#).

Viewing Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

When you click the Forecasts tab, review the amounts listed and determine if they are ready to be submitted.

- Initially, your name appears in the title bar and above `Find a Forecast:`, indicating that you are viewing your own forecast. Users with the appropriate permissions can click the magnifying glass icon and select another user or role to view that person's forecast. When you are viewing a forecast other than your own, the role or username will be displayed in the title bar and above `Find a Forecast:`. In addition, your access level will be displayed above `Find a Forecast:`.

 **Note:** [User Sharing](#) does not fully support Customizable Forecasting. You'll see all users in the organization regardless of the organization-wide default for the user object.

- If your organization uses manual forecast sharing, click **Sharing** to view the forecast sharing settings or to share the forecast with other users.
- If your organization uses territories, choose an option from the `Territory` picklist to summarize the forecast by that territory. See [Territory Management](#).

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

- If your organization uses product families, choose an option from the `Product Family` picklist to summarize the forecast by that product family. Choosing `--All--` product families disables the **Submit**, and **Forecast History** options; choose another product family to use these options. See [Define Customizable Forecast Settings](#) for information on customizing your organization to use product families.
- If your organization forecasts on both revenue and quantity, select whether to include revenue, quantity, or revenue and quantity. This controls which information is displayed for each amount listed.
- Select a date range under `Range Start` to view another forecast period. Forecast details for opportunities that closed more than two years before you implemented Customizable Forecasting or more than 10 years in the future are not available.
 -  **Note:** Organizations that implemented Customizable Forecasting prior to the Salesforce Winter '07 release can see forecasts outside of this range.
- Select a `Range Length` to view fewer or more forecast periods.
 -  **Note:** If you are using custom fiscal years, periods before the first defined custom fiscal year or after the last defined fiscal year use calendar months or calendar quarters (depending on your forecast setting) for the range start and period length.
- Select an option next to `Display Units` to view forecast totals using a different unit of measurement. To display what portion each total is of your quota, choose **% Quota**.

Viewing Forecast History

When viewing a forecast from the Forecasts tab, click **Forecast History** to view snapshots of your forecast data taken when you submit it. You can also view the submitted forecasts of subordinate users. Click **Forecast Summary** to return to the previous view.

Viewing Forecast Amount Details

Select the Forecasts subtab to see forecast details. Click any forecast amount to view details of the opportunity amounts included in that forecast amount. From the details page, click any item listed to view it. Click **Edit** to override that item. See [Overriding Customizable Forecasts](#) for instructions on overriding forecast amounts from the opportunity.

If you have direct reports (users that report directly to you), their forecasts display below yours. The `Choose a view` option allows you to change the way forecast information is displayed for your direct reports. Use this option to group forecast data by subordinate or forecast period.

- **View by Period** displays a list of direct reports and their forecasts for each forecast period. Click any name to view the forecast for that user.
- **View by Direct Report** displays a list of forecast totals for each direct report. Click **View** next to any subordinate name to view the forecast for that user.
- Clicking any amount displays the opportunities and forecast overrides included in that amount.

Viewing Opportunities

Select the Opportunities subtab to see the opportunities that are included in the displayed forecast. On the Opportunities subtab, you can choose, or create, a list view to further filter the displayed opportunities. Click any opportunity to see the opportunity details. To override the opportunity, click **Edit**. For more information on overriding opportunities, see [Overriding Customizable Forecasts](#).

If you have the “View All Forecasts” permission, you can see opportunities on the Opportunities subtab regardless of their sharing settings.

 **Note:** When a [partner portal is transferred to another account](#), the opportunities on each account are automatically recalculated through your organization's forecast hierarchy.

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

Overriding Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

You can make your forecast a more accurate assessment of your forecasted sales by overriding forecast amounts as needed. Any user can override a forecast from the opportunity by changing the `Stage` or `Forecast Category` of the opportunity. Users with the "Override Forecasts" permission can override their forecast or any direct report's forecast at the forecast level.

When an opportunity moves from one forecast category to another, such as from Best Case to Commit, the unadjusted raw amounts change for each of those categories, but any amounts with overrides do not change. You should update or remove your overrides to each forecast category to account for changes in the stage of opportunities.

Overriding Your Forecast from the Opportunity

1. Click the Opportunities subtab on the Forecasts page.
2. Click **Edit** for the opportunity you want to override.
3. Make any changes to the details. The options available differ depending on whether you own the opportunity.
4. If products are on the opportunity and you want to change the forecast category for that product, select **Change Category**, then select the appropriate `Product Forecast Category`.
5. Click **Save**. The opportunity is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).

Click **Save & Refresh** to update the record and redisplay the totals.

Overriding Your Forecast Total

1. Click the Forecasts subtab on the Forecasts page.
2. Click the edit icon () to override the adjusted total.
3. Enter a new amount and any comment.
4. Click **Save**. The forecast is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).

Overriding the Forecast of Your Direct Reports

1. Click the Forecasts subtab on the Forecasts page.
2. Click the edit icon () to override your direct report's forecast.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

3. Choose one of the override options to control which override amounts, if any, are included in the forecast:
 - **Accept John Doe’s forecast**—Use this option to accept the forecast of your direct report, including any overrides that he or she has made.
 - **Reject any override on John Doe’s forecast, but accept forecast overrides from other subordinates**—Use this option to ignore overrides made on your direct report's forecast, but include any overrides made on forecasts further down in the hierarchy.
 - **Reject all forecast overrides**—Use this option to ignore all forecast-level overrides but include opportunity-level overrides. If you have overridden amounts at the opportunity, your own opportunity forecasts are used in this calculation. Choose this option if you want forecast amounts to be based on opportunity amounts including overrides made at the opportunity level.
 - **Override the forecast and set it to**—Use this option to enter an amount that replaces the current amount in your forecast. Your manager will see this amount in your forecast but your subordinates will not.
 4. If you forecast on both revenue and quantity, choose an override option for quantity forecast.
 5. Click **Save**. The forecast is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).
-  **Note:** The Forecasts tab is unlike other tabs in that it automatically calculates data for you based on your opportunity data. You do not need to create or delete forecast records.

Override Customizable Forecasts from an Opportunity

A forecast override is an amount that more accurately represents your forecasted sales. You can view a list of overrides and make changes from the opportunity detail page.

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

1. From the Opportunity Forecasts related list on an opportunity record, click **Edit**.
2. Make changes to the details. See [Overriding Customizable Forecasts](#) for instructions on overriding opportunity forecast amounts.

If your organization uses territory management, the territory to which the opportunity is assigned displays in the `Territory` drop-down list.

If you are a forecast manager for multiple territories, the drop-down list shows the territories from which you can override the opportunity. Choose a value and click **Edit** to override the opportunity from the desired territory.

SEE ALSO:

Customizable Forecast Fields

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Here is a description of the fields (in alphabetical order) that make up a forecast in customizable forecasting:

Forecast Fields

Field	Description
Comments	The comments you enter when overriding your forecast.
Forecast Category	Category determined by the opportunity Stage value. Options are: <ul style="list-style-type: none"> • Omitted means the amount does not contribute to your forecast. • Pipeline includes amounts from all open opportunities. • Best Case includes amounts you are likely to close, closed/won opportunity amounts, and amounts in the Commit category. • Commit includes amounts you are confident about closing and closed/won opportunity amounts. • Closed includes amounts for closed/won opportunities.
Forecast Item	Record that contributes to the forecast. This displays in the detail of a forecast amount.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Field	Description
Revenue	The total expected revenue amount from the opportunities that fit in a given category.
Quantity	The total number of units that are forecasted to sell as part of the opportunities in a given category.
My Forecast Override	The amount you enter when overriding a forecast amount.
Submitted By	The user who submitted a forecast.
Type	Type of override. Options are "Opportunity" or "Forecast Override."

Opportunity Forecast Fields

Opportunity Forecast Field	Description
My Forecast Amount	The amount you enter when overriding your direct report's opportunity amount.
My Forecast Category	The category selected when you override the category of an opportunity.
My Forecast Comments	The comments you enter when overriding one of your opportunities or the opportunity of a direct report.
My Forecast Period	The period you selected when overriding a direct report's opportunity period.

SEE ALSO:

[Managing Customizable Forecasts](#)

Manually Sharing a Forecast

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your administrator defines your organization's forecasting hierarchy, which determines which users can view the forecast data. However, your administrator can manually extend sharing privileges for forecast data, and you may be able to manually extend sharing privileges for your own forecast data as well. Manual forecast sharing can only increase access to forecast data; it cannot restrict access for users who already have access. To manually share a forecast, you must be an administrator or a forecast manager who has been given access to share your forecast data.

To see which users can view your forecast or to share your forecast data, do one of the following:

- From Setup, enter *Forecasts Hierarchy* in the **Quick Find** box, then select **Forecasts Hierarchy**, then click **Share** next to the view you want to share.
- Click **Sharing** on the forecast home page to share your own forecast data.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

The User and Group Sharing list shows you all the users who currently have access to this forecast data. It also details the level of access they have, whether they can submit a forecast, and the reason they have that access. The reasons a user might have access to forecast data are:

Reason	Description
Administrator	The user is an administrator, or has the “Modify All Data” permission.
Delegated Forecast Manager	A user has access to forecast data that was granted via the Sharing button on the forecast.
Forecast Manager	A user has access due to being a forecast manager in the forecast hierarchy.
Owner	The owner can always see his or her own forecast data.
View All Forecasts Permission	The user has the “View All Forecasts” permission.

On the Forecast Sharing Detail page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant other users or groups access to the forecast data.
-  **Note:** Manual sharing extends to the opportunity data that makes up the forecast. If a user has permission to override forecast data, then the user also has permission to override the opportunity forecast data.
- Click **Expand List** to view all users that have access to the forecast data.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

SEE ALSO:

[Define Customizable Forecast Settings](#)

[Setting Up Customizable Forecasting](#)

Submitting Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

On the Forecasts tab, your forecast totals are always available to you and users above you in your role hierarchy. However, forecast totals are only available in forecast history and reports after you submit them. You can submit your own forecast or any forecast data that has been manually shared with you and you have permission to submit.

To submit your forecast:

1. Click **Submit** from your forecast on the Forecasts tab.
2. Click **OK** to confirm. Salesforce takes a snapshot of your forecast totals and makes them available in reports and your forecast history.

Selling Through Multiple Channels

Drive Sales with Partners

Partners are the companies with which you collaborate to close your sales deals. For each opportunity or account you create, the Partners related list allows you to store information about your partners and the roles they play in the opportunity or account. A partner must be an existing account within Salesforce.

If your organization has been enabled for partners, you can create partner accounts. Partner accounts are business accounts that a channel manager uses to manage partner organizations, partner users, and activities. **They are completely separate from account partnerships that are displayed in the Partners related list on an account.** For more information about creating and managing partner portals, see [Create and Manage Partner Portals](#).

 **Tip:** If your organization uses person accounts, you can use partner roles to relate person accounts to each other. For example, if you have individual person account records for several members of a household or family, then you can use partner roles such as “Spouse” or “Sibling” to associate those records.

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions for organizations activated after Summer '09

Sharing Information with Partners

Partners are companies or individuals that directly drive sales or help you close sales deals.

You can track partner sales in your Salesforce org in different ways.

- [Add partners](#) to account and opportunity records.
- Enable your org for partners, create partner accounts, create partner users, and collaborate with them on your channel sales data in a partner community (recommended) or partner portal.
- Use [Salesforce to Salesforce](#) if your partner has a Salesforce org of their own.

SEE ALSO:

- [Create a Partner Community with Salesforce Lightning Partner Management](#)
- [Create and Manage Partner Portals](#)

Viewing and Adding Partners

The opportunity and account detail pages include a Partners related list for viewing and adding partner relationships.

- To view account information for a specific partner, click the partner's name in the Partners related list.

If you do not have access to view and edit a partner account, the account name appears in the related list but you have no access to other information about that account.

- Click **Del** next to a partner to the partner relationship.

Note: If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.

- To add a partner to an opportunity or account:
 1. Click **New** in the Partners related list.
 2. For opportunities only, select the **Primary** option to indicate the primary partner for the opportunity, if applicable.

An opportunity can have only one primary partner. Setting a new primary partner automatically removes the "Primary" status from any existing primary partner.

Marking a partner as "Primary" allows you to report on the partner in all of the opportunity reports.
 3. In the **Partner** column, enter the name of an existing account by typing into the box or clicking the lookup icon to perform an account search. Alternatively, click **New** from the lookup dialog to create a new account.
 4. In the **Role** column, choose the role that the partner account plays in the current account or opportunity.

Deleting Partners

Removing a partner from an opportunity or account removes the partner's relationship with the opportunity or account, but does not delete the account.

 **Note:** If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.

To remove a partner relationship from an opportunity or account, click **Del** next to the partner's name.

Removing a partner affects an opportunity or account in the following ways.

Deleting a Partner From	Does This
An account	Removes the partner from the account and from <i>all</i> opportunities for that account with which the partner was associated.
An opportunity	<p>If the partner is associated with only one opportunity for an account, the partner is removed from both the opportunity <i>and</i> the account.</p> <p>If the partner is associated with multiple opportunities for an account, the partner is removed from that opportunity <i>only</i>. The partner remains associated with other opportunities <i>and</i> with the account.</p>

Salesforce to Salesforce

Salesforce to Salesforce Overview

Salesforce to Salesforce enables business collaboration both within and across Salesforce organizations. This allows you to share [certain records](#) with your business partners that use Salesforce and get real-time updates on the shared data. For example, you can share lead and opportunity data with business partners and manage your entire pipeline and programs within Salesforce.

Salesforce to Salesforce allows you and your business partners to collaborate more easily and effectively. With Salesforce to Salesforce, you can share records with one or more connections, and each connection can accept records you share with them - even if other connections have accepted the same record.

Salesforce to Salesforce allows your business partners to:

- Access all their programs from one place
- Easily integrate your data with the data they manage in Salesforce
- Integrate their business processes with updates received from you

Salesforce to Salesforce allows you to:

- Have 100% visibility into your partner activity
- Manage your entire pipeline, both internal sales and channel sales, in one place
- Rapidly and easily share data across multitiered partnerships
- Integrate your business processes with updates received from your partners using workflow and assignment rules

If you want to connect to partners but aren't sure if they use Salesforce, you can use [connection finder](#) to find out.

If you receive an invitation to connect with a business partner using Salesforce to Salesforce, see [Accepting or Rejecting an Invitation to Join Salesforce to Salesforce](#) on page 1584.

To invite other companies to connect with you using Salesforce to Salesforce, see [Inviting Business Partners to Connect using Salesforce to Salesforce](#).

 **Note:** Salesforce to Salesforce doesn't just let you share information with business partners; it's also part of a high-availability solution called Organization Sync. For information about Organization Sync, see [Organization Sync](#).

Inviting Business Partners to Connect using Salesforce to Salesforce

Before you can start sharing data with your business partners, you need to set up a connection to them using Salesforce to Salesforce. To create that connection, you need to invite your business partner.

 **Note:** Before beginning the invitation process, you need to create an account and an associated contact for your business partner.

To invite a business partner to connect using Salesforce to Salesforce:

1. Click the Connections tab.
2. Click **New**.
3. Enter a contact name or use the lookup icon to select a contact.

 **Important:** Make sure that the email address is valid; otherwise, your invitation may be sent to the wrong person.

4. Optionally, select a related account.

 **Note:** The account associated with the connection can be changed after the invitation is sent.

5. Choose a user to manage the connection.
6. Optionally, choose a template to apply to the connection.
7. Click **Save & Send Invite**.

To invite multiple business partners to connect using Salesforce to Salesforce:

1. Click the Contacts tab.
2. Select a standard or custom list view, then click **Go!**
3. In the list view, select the checkboxes next to the contacts you want to invite.

 **Important:** Make sure that the email addresses are valid; otherwise, your invitations may be sent to the wrong people.

4. Click **Invite to Connect**.
5. Choose a user to manage the connection.
6. Optionally, choose a template to apply to the connection.
7. Click **Save & Send Invite**.

The people you invite will receive an email invitation to connect with you using Salesforce to Salesforce. They can choose to accept or decline your invitation. You can check whether they have accepted or declined the invitation by reviewing your connections on the Connections tab. From the Connections tab, you can also resend or cancel the invitation. To learn more about connections, see [Connections Home Page](#) on page 1585.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To invite to a business partner to connect using Salesforce to Salesforce:

- "Manage Connections"

 **Note:** For information about sending an Organization Sync replication connection invitation in Salesforce to Salesforce, see [Connect the Organizations](#).

SEE ALSO:

- [Finding Out if Your Partners Use Salesforce](#)
- [Connection Templates in Salesforce to Salesforce](#)
- [Creating and Applying Connection Templates](#)

Accepting or Rejecting an Invitation to Join Salesforce to Salesforce

If a business partner sent you an invitation to connect using Salesforce to Salesforce, you can accept or reject that invitation by following these steps:

1. Click the link in the invitation email to go to the Salesforce login page.
2. Log in as the System Administrator or as a user with the “Manage Connections” permission.
3. Review the details of the invitation.
4. Click **Accept** or **Decline**.

If you aren't sure whether you want to accept or decline, click **Decide Later**. The invitation displays on the Connections tab with a connection status of Invitation Received. You can easily accept or decline it at a later date.

When you accept or reject an invitation, the company that invited you receives an email notifying them of your decision. The content of that email can be configured by changing the appropriate email template.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To accept or reject an invitation to connect using Salesforce to Salesforce:

- “Manage Connections”

Connections Home Page

The Connections tab allows you to manage your Salesforce to Salesforce connections and connection templates. From the Connections tab, you can:

- Select the Connections subtab to manage connections. Connections include everyone that you have invited, whether they have accepted, declined, or have not yet responded, as well as all the invitations you have received. Recent connections are automatically displayed on the Connections subtab.
 - To view details about a connection, click the connection name.
 - To invite new connections, click **New**, then enter the connection details and click **Save & Send Invite**.
 - To deactivate a connection, click **Deactivate**.
 - For invitations to connect that have been sent but not accepted, you can click **Resend** to resend the invitation, or **Cancel Invitation** to cancel the invitation. For more information about inviting connections, see [Inviting Business Partners to Connect using Salesforce to Salesforce](#) on page 1583.
- Select the Templates subtab to manage connection templates. Templates allow you to define and publish sets of objects and fields to one or more standard Salesforce to Salesforce connections. Recent templates are automatically displayed on the Templates subtab.
 - To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
 - To view details about a template, click the template name.
 - To create a new template, click **New**.
 - To edit a template, click **Edit** next to the template you want to edit. For more information about using templates, see [Creating and Applying Connection Templates](#) on page 1587.

 **Note:** To learn about Organization Sync, a high-availability feature built on the framework of Salesforce to Salesforce, see [Organization Sync](#).

To view and manage connections for Salesforce to Salesforce:

- “Manage Connections”

To view and manage templates for Salesforce to Salesforce:

- “Manage Connections”

Managing Connections

From the Connections tab, you can view connection details and manage connections. The connection details include information on the status of the connection, the owner of the connection, information about the company, published and subscribed fields, and a connection history.

To view a connection:

1. Click the Connections tab.
2. On the Connections subtab, click the name of the connection that you want to view.

From the connection detail page, you can:

Accept an Invitation

If a business partner has sent you an invitation to connect using Salesforce to Salesforce, click **Accept** to accept the invitation. After you accept the invitation, you can subscribe to objects that the connection has published and begin sharing objects with the connection using the Published Objects and Subscribed Objects related lists on a connection detail page.

Cancel an Invitation

If an invitation you sent hasn't been accepted, you can cancel the invitation by clicking **Cancel Invitation**. If your partner hasn't received the invitation, click **Resend** to send it again.

Deactivate Connections

If you have created a connection with a business partner and you no longer wish to use the connection, click **Deactivate**. If a connection is deactivated, you can still view and update records that your connection shared with you, but updates you make won't be sent to your connection. If you sent records to your connection that they didn't accept, the records are removed from their organization, and vice versa.

Edit Connections

When displaying the connection, you can modify the connection by editing the connection details. To change the objects published to a connection, click **Publish/Unpublish**, or to use a connection template, click **Edit** and select an active template. To edit the published fields on an object, click **Edit** next to the object. To change the objects you're subscribed to, click **Subscribe/Unsubscribe**. For more information, see the following:

- [Publishing Objects in Salesforce to Salesforce](#) on page 1596
- [Subscribing to Objects in Salesforce to Salesforce](#) on page 1589
- [Publishing Fields in Salesforce to Salesforce](#) on page 1597
- [Subscribe to Fields in Salesforce to Salesforce](#) on page 1590

View Connection History

You can view a detailed history of the connection in the Connection History related list of the connection detail page. To export the connection history, select **Download connection history (csv)**. This lets you download a comma-separated values file that includes the following information:

- Connection status changes
- Changes to which account is associated with the connection
- Changes to which contact is associated with the connection
- Connection owner changes
- Changes to published fields
- Email communications sent to your business partners
- Errors related to validation rules and Apex triggers with validation rules resulting from:
 - Records manually accepted

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To manage connections:

- "Manage Connections"

- Records automatically accepted
- Records updated by Connection User

 **Note:** System errors, for example, code errors, aren't logged in the Connection History.

[Connection Templates in Salesforce to Salesforce](#)

Connection Templates in Salesforce to Salesforce

Connection templates allow you to define objects and fields that can be published to connections. Connection templates can be assigned to one or more standard Salesforce to Salesforce connections, making the process of publishing fast and easy. From the Connections tab, click the Templates subtab to view, create, and edit connection templates.

When a connection template is applied to a connection, the object and field rules are applied to that connection.

The following rules apply to connection templates:

- Objects and fields that are not already published but are published in the connection template are published.
- Objects and fields that have the same publish or unpublish status as the template are unchanged.
- Objects and fields that are already published but are not published in the connection template are unpublished.

SEE ALSO:

[Creating and Applying Connection Templates](#)

[Connections Home Page](#)

Creating and Applying Connection Templates

Creating and Editing Connection Templates

Connection templates allow you to define object and field publishing rules that can be applied to one or more standard Salesforce to Salesforce connections.

To create a connection template:

1. Select the Connections tab.
2. Select the Templates subtab.
3. Click **New**.
4. Type a name and an optional description.
5. Select the **Active** checkbox if you want to be able to assign the template to standard connections.
6. Click **Save** to save the template, or click **Save & Add Objects** to add objects to the template.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and view connection templates:

- "Manage Connections"

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and view connection templates:

- "Manage Connections"

7. If you clicked **Save & Add Objects**, select the checkboxes next to the objects you want to add, then click **Save**.
 -  **Note:** If you clicked **Save**, you can click **Add/Remove Objects** on the template detail page to add objects.
8. Click **Edit** next to an object you added to the Published Objects related list.
9. Select the fields you want to publish for the object, then click **Save**.
10. Repeat steps 8 and 9 for each object you added to the Published Objects related list.

To deactivate a connection template:

1. On the Templates subtab, click **Edit** next to the template you want to deactivate. Alternatively, click **Edit** on the template detail page.
2. Deselect the **Active** checkbox.
3. Click **Save**.

 **Note:** Only active connection templates can be assigned to connections. If you want to use a template that you had deactivated, you can do so by selecting the **Active** checkbox.

Assigning Connection Templates to Connections

You can assign connection templates to connections when [inviting one or more new connections](#), or you can assign connection templates to existing connections.

To assign a connection template to an existing connection:

1. Select the Connections tab.
2. Select the Connections subtab.
3. Click the name of the connection you want to assign the template to.
4. Click **Edit**.
5. In the `Template` field, type the name of the template or click the lookup icon to search for a template.
6. Click **Save**.

Sharing Records Using Salesforce to Salesforce

Once you have created a connection to another organization, you can share data with them. Your business partners do not have direct access to your record; they have a record in their organization that is connected, using Salesforce to Salesforce, to your record. Any updates to the shared information on either record is reflected on the other record. You can share records with one or more connections. Each connection has the opportunity to accept shared records, even if other connections have also accepted the same record.

 **Note:** Making records available to business partners using Salesforce to Salesforce is not the same as sharing records within your organization.

You can control the type of records you share with your business partners by selecting which objects and fields to publish.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

In addition, you can control how the information your business partner makes available to you is used in your organization by subscribing to objects and mapping the fields on those objects to fields on your own objects.

Individual records and their related records are made available to your connections by forwarding the record to one or more connections, or by assigning the record to a queue that contains connections. When you forward a record to a connection, you can select which related records to include, and you can send your connection contact an email notification that a record has been made available.

Similarly, your business partners can make records available to you. When a record has been made available to you by a business partner, you can view basic details about the record from a view on the object's home page. Then you choose whether to [accept the record](#), and its related records, or not. Additionally, when [subscribing to an object](#), you can specify that the object's records are automatically accepted when shared by your connection. This is particularly helpful if you're expecting the connection to share a large volume of records.

Once you have accepted a record, you can make it available to other connections in the same way you can make any record available using Salesforce to Salesforce. This allows you to work in a multi-tiered business network. In a multi-tiered network, changes made to the shared record in any organization updates the information in all the organizations that are sharing the record.

SEE ALSO:

[Publishing Fields in Salesforce to Salesforce](#)

[Subscribe to Fields in Salesforce to Salesforce](#)

[Tips for Using Salesforce to Salesforce](#)

Subscribing to Objects in Salesforce to Salesforce

When you are connected to a business partner using Salesforce to Salesforce, you can subscribe to objects that your business partner has published. When you subscribe to an object, you map it to an object in your organization. Standard objects must map to standard objects in your organization, but you can map custom objects to any custom object. For example, if your business partner has published a custom object named Prospects, you can map that to a custom object named Client.

To subscribe to objects for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Subscribed Objects related list, click **Subscribe/Unsubscribe**.
4. Choose the objects you want to subscribe to by selecting the object in your organization you want mapped to that object. Select `--None--` if you do not want to subscribe to a published object.
5. Select the `Auto-Accept` checkbox next to an object if you want to automatically accept records of that type when shared by your connection. The checkbox appears once you select a mapping.

Note: This checkbox is not available for:

- Child objects. Opportunity products, tasks, and public case comments are [automatically accepted](#) when the parent record is accepted. Attachments are automatically accepted if marked public and the `Share With Connections` checkbox is selected.
- Objects that have one or more master objects, such as custom junction objects or detail objects in a master-detail relationship.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To subscribe to published objects :

- "Manage Connections"

Additionally, `Auto-Accept` does not apply to any record that is shared as the child of another record, for example a case record that is the child of a case record that you already accepted.

6. Click **Save**.

 **Note:** If your business partner stops publishing an object to which you are subscribed, you are automatically unsubscribed from that object.

Once you have subscribed to an object, you can [map published fields](#) on that object to fields on your object. For example, you can map the `Description` field on leads to a custom field on leads called `Partner Description`. This would allow you to use your own field to describe the lead for users within your organization rather than using the description provided by your business partner.

Additional Considerations

- If you choose to auto-accept leads or cases, any active assignment rules in your organization run when a record is automatically accepted.
- In order to automatically accept a record shared by your connection, the connection owner for that record must be an active user.

Subscribe to Fields in Salesforce to Salesforce

When you accept an invitation from a business partner to join Salesforce to Salesforce, you can subscribe to fields that your business partner has published and map those fields to your fields. When your business partner updates the fields on a record that you're sharing, the fields will be updated on the shared record in your organization.

For example, if your business partner has published the `Description` field, you could map that field to a custom field called `Partner Description`. This would allow you to use your own field to describe the lead for users within your organization.

Before subscribing to fields, see [Best Practices for Mapping Fields in Salesforce to Salesforce](#).

To map fields on a subscribed object:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Subscribed Objects related list, click **Edit** next to an object.
4. Map your business partner's published fields to your organization's fields by choosing the appropriate field in the drop-down list.

 **Note:** Fields can only be mapped to fields with the same data type, length (for text and numeric fields) and decimal places (for numeric fields), so the drop-down list only shows fields with the correct data type. You can see the data type details of a published field by hovering your mouse over the information icon () next to the field. Select `--None--` if you don't want to populate any of your fields with the data from a published field.

5. If the field is a picklist, click **Edit Values** to map each published picklist value to a picklist value in your organization.
6. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To subscribe to published fields :

- "Manage Connections"

 **Note:** Changes to field mappings and picklist values may not show up in your business partner's organization for up to 15 minutes while Salesforce refreshes the cache. This cache enables us to support larger transaction volumes and reduce the number of API calls that count against your organization's limits.

SEE ALSO:

[Managing Connections](#)

[Publishing Fields in Salesforce to Salesforce](#)

Best Practices for Mapping Fields in Salesforce to Salesforce

When you subscribe to a field in Salesforce to Salesforce, you map it to a field in your organization. This mapping lets updates to that field sync for all shared records. Before you map fields, look at these important best practices.

 **Important:** This information applies to standard Salesforce to Salesforce connections. If you're mapping fields for a replication connection as part of Organization Sync, some of this information may not apply.

Auto-Mapping Fields

- When subscribing to fields, select **Auto-Map Fields** to automatically map your business partner's fields to your fields. After you select this option, click **Save** for your changes to take effect.
- For any unmapped field, Salesforce checks if the field's API name matches that of any of your fields. If there are no matches, Salesforce checks for matching field labels. If Salesforce still can't find a match, `--None--` is selected.
- Selecting **Auto-Map Fields** doesn't overwrite previous selections, and deselecting it doesn't affect fields that were mapped previously.
- The following standard fields are automatically mapped:
 - Account: `Account Name`, and, if you are using person accounts, `Last Name`
 - Attachment: `Body`, `Content Type`, `File Name`
 - Case: `Subject`
 - Case Comment: `Body` and `Published`
 - Contact: `Last Name`
 - Custom Object: `Name`
 - Lead: `Last Name` and `Company`
 - Opportunity: `Name`, `Closed Date`, and `Stage`
 - Product: `Product Name`
 - Task: `Subject`
 - Opportunity Product: `Quantity`, `Sales Price`

Mapping Picklist Fields

- If a picklist value is mapped to `--None--`, and your business partner enters a picklist value, your picklist field is to the same value. For example, if you subscribe to the Lead Status picklist, and your business partner has the value `Internal` in that picklist, your record gets a lead status of `Internal`.
- To convert a custom field to a picklist field, stop publishing the field, change the field type, then publish the field again.
- When mapping picklist fields, if the subscribed org has the picklist field restricted to the values defined in the value set, and the publishing org does not have this restriction, the field is not available for mapping on the subscribing org.

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Mapping Currency Fields

- If you map a currency field, and a record shared by your connection uses a currency that your organization hasn't enabled, that currency field isn't updated when your organization auto-accepts the record. If you're manually accepting the record, the currency is updated only if your organization uses the same currency as the record.

For example, suppose that your connection has shared an opportunity with you. Your organization uses the Euro only. Your connection updates the opportunity amount to \$300. The opportunity amount isn't updated in your record because your organization doesn't support the U.S. Dollar.

- If you map a currency field and either you or your connection changes the currency on a record containing that field, updates you make to the field are no longer propagated to the other organization, and updates your connection makes to the field aren't reflected in your organization.
- You can map roll-up summary fields to currency fields with the same currency type. For example, a roll-up summary with the currency type `U.S. Dollar` can be mapped to a currency field that uses the U.S. Dollar.

Mapping Quantity and Revenue Schedules

- If Quantity Schedules or Revenue Schedules are enabled in your connection's organization and you subscribe to the Products object from that connection, you must subscribe to the following fields and map them to matching fields in your organization.

Type of Schedule	Fields to Map
Quantity Schedule	<ul style="list-style-type: none"> - <code>Number of Quantity Installments</code> - <code>Quantity Installment Period</code> - <code>Quantity Schedule Type</code>
Revenue Schedule	<ul style="list-style-type: none"> - <code>Number of Revenue Installments</code> - <code>Revenue Installment Period</code> - <code>Revenue Schedule Type</code>

Mapping Different Field Types

- Only map person account fields to person account fields, and business account fields to business account fields.
- If your connection is using person accounts and you aren't, the person account field `Last Name` is used as the Account Name when your connection shares a person account record with you. If you enable person accounts, you are automatically subscribed to `Last Name`. Any changes to Last Name and Account Name are synced.
- You can't map a standard number field to a custom number field.
- You can map lookup fields to text fields that have a length of 80 or more characters. If your connection edits a lookup field that you mapped to a text field, the text field is updated with their changes.
- You can map auto-number fields to text fields that have a length of 30 or more characters.
- You can map formula fields to fields of the same data type; for example, a formula field that has a number data type can be mapped to a field with a number data type. If a formula field is a text data type, it can be mapped to a text field with a length of 80 or more characters. Conversely, fields can't be mapped to formula fields; for example, a formula field with a currency data type can be mapped to a currency field, but a currency field cannot be mapped to a formula field. System audit fields are not supported.

Unsubscribing to Fields

- You are automatically unsubscribed from a field if:

- Your business partner stops publishing the field
- You delete a custom field that is mapped to a published field
- The field type of a custom picklist or custom multi-select picklist is changed (for example, if a custom picklist is changed to a text field)

SEE ALSO:

[Subscribe to Fields in Salesforce to Salesforce](#)

Accepting Records Shared from a Connection

Salesforce to Salesforce allows you to accept records that have been made available to you by business partners with whom you have connections. When accepting a record, you can assign it to yourself, another user, a queue, or, if it is a lead or case, use your organization's assignment rules to automatically assign it. If the record is a child of another record you have accepted, you can assign it to the parent record when accepting it. Additionally, when [subscribing to an object](#), you can specify that the object's records are automatically accepted when shared by your connection.

If validation rules prevent you from accepting shared records, create a validation rule with the `Received Connection Name` field not equal to null; this will ignore validation rules for records you accept from your connections. To create this rule, use the following formula:

```
IF(OR(ISNEW(), ISNULL(Id)), if(ConnectionReceivedId =null,
TRUE, FALSE), NOT(AND( ISCHANGED(ConnectionReceivedId),
NOT(ConnectionReceivedId = null))))
```

You should also create a similar rule for any Apex trigger that has validation checks.

To accept records that have been made available to you:

 **Note:** When you manually accept a record, it takes some time for all mapped fields on the record to be updated.

If an error occurs when accepting a record, see the Connection History for details.

1. Select the tab of the record type you are accepting.
2. Select a connections list view and click **Go!** For example, on the Leads tab, in the **Leads from Connections** section, select a list view from the drop-down list and click **Go!**
3. For accounts, contacts, and opportunities, click **Accept** next to the record you want to accept. For cases, leads and custom objects, select the checkbox next to the records to accept, then click **Accept**.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To accept shared records:

- "Read" and "Edit" on the object

To view records shared by a connection:

- "Manage Connections" or have access to the list view

 **Note:** If a record is a child of a record you have accepted, the name of the parent record is displayed in the Parent Record Name column. If the record is a parent record or has no parent record, this column is blank.

When you accept a record that has public attachments, the attachments are automatically accepted if you selected the `Share With Connections` checkbox on the attachment.

Accepting Opportunity Records

When you accept an opportunity, you have the option to relate the opportunity to an object and a price book, and to relate the opportunity to a new account or opportunity, or to use an existing account or opportunity. If you create a new opportunity or account, you can also set the owner of that record.

Accepting Account Records

When you accept an account, you have the option relate the account to another object and to create a new account, or to use an existing account. If you create a new account, you can also set the owner of that record.

Accepting Contact Records

When you accept a contact, you have the option relate the contact to another object and to create a new account or contact, or to use an existing account or contact. If you create a new contact or account, you can also set the owner of that record.

Accepting Case, Lead, and Custom Object Records

When you accept a case, lead or custom object, you have option to relate the case, lead or custom object to another object and to assign the lead or custom object to a new owner.

 **Note:** If you choose to `Assign using active assignment rule` and no assignment rule criteria is met, the lead, case, or custom object is assigned to the Default Lead, Case, or Custom Object Record Owner.

Accepting Product Records

When you accept a product, you have the option to create a new product or relate the product to an existing product.

Additional Considerations

- After accepting a shared record, if you update a field that your business partner has subscribed to, the field is automatically updated on the record in your business partner's organization. Likewise, if your business partner updates a field to which you have subscribed, it is automatically updated in your organization. When your business partner updates the record, the `Last Updated By` field will be set to "Connection User".
- Once you have accepted a record, you can make it available to other connections in the same way you can make any record available using Salesforce to Salesforce. This allows you to work in a multi-tiered business network. In a multi-tiered network, changes made to the shared record in any organization updates the information in all the organizations that are sharing the record.

- When your business partner shares child records at a later time using the **Manage Connections** link in the related list of a record you have already accepted, the [child records can be automatically added](#) to your organization.

SEE ALSO:

- [Sharing Records Using Salesforce to Salesforce](#)
- [Connections Home Page](#)
- [Tips for Using Salesforce to Salesforce](#)

Automatically Accepting Related Records From a Connection

Rules for Automatically Accepting Related Records From a Connection

When you share records using Salesforce to Salesforce, you can also share child records. When you accept a record from a connection, or when your connection accepts a record from you, the child records can be automatically accepted provided that certain criteria are met. Similarly, when a child record is shared at a later time using the **Manage Connections** link in the related list, and the parent record has already been accepted, the child record can be automatically accepted.

In order for a child record to be accepted automatically, the following criteria must be met:

- The parent record must already be accepted in the organization.
- The record must be related as a child to the parent record.
- The child record cannot have two master records.
- The child record cannot have multiple relationships to the same parent object.
- The connection owner must be an active user.
- The owner of the parent record must be an active user.

 **Important:** When child records are accepted automatically, there may be a slight delay before they are visible in the related list of the parent record. Additionally, when a child record is shared using the **Manage Connections** link in the related list of a parent record, there may be a slight delay before the Sent Connection Name displays.

If a child record does not meet the criteria for automatic acceptance, it will need to be manually accepted from its object tab. For example, an opportunity record will need to be accepted from the Opportunities tab. A child record that needs to be manually accepted will display with the parent record name so that it can be properly assigned. For more information, see [Accepting Records Shared from a Connection](#) on page 1593.

SEE ALSO:

- [Subscribe to Fields in Salesforce to Salesforce](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To accept or reject records:

- “Read” and “Edit” on the record

Publishing Objects in Salesforce to Salesforce

The objects you publish are the objects that your users can share with your business partners using Salesforce to Salesforce. If you have accepted an invitation, created new custom objects, or you have decided to share more information with your business partner, you may want to publish additional objects. Alternatively, you may find that you want to limit the objects you publish to a particular business partner.

You can publish the following objects:

- Account
- Attachment
- Case
- Case Comment
- Contact
- Lead
- Opportunity
- Opportunity Product
- Product
- Task
- Custom Object

To define published objects for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Published Objects related list, click **Publish/Unpublish**.
4. Select the objects you want to publish to your business partner. Deselect objects you no longer want to publish.
5. Click **Save**.

 **Note:** You cannot publish objects that you do not have permission to edit.

When you update your published objects, an email is sent to your business partner notifying them of the change. You can customize this email by editing the Update Connection communication template.

Your business partner is automatically unsubscribed to objects when you:

- Stop publishing an object
- Delete a custom object to which your business partner is subscribed

Once you have published an object, you can manage the fields you publish on that object. For more information on publishing fields, see [Publishing Fields in Salesforce to Salesforce](#) on page 1597.

Additional Considerations

- All custom objects in your organization appear in the list of objects, however, Salesforce to Salesforce only supports deployed custom objects. You cannot forward a record for a custom object that has not been deployed.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To publish objects:

- “Manage Connections”

- If you publish the case comment object, all public case comments will be shared with your connections. To avoid sharing a comment on a specific case, select **Make Private**.

SEE ALSO:

[Publishing Fields in Salesforce to Salesforce](#)

[Forwarding Related Records to a Connection](#)

Publishing Fields in Salesforce to Salesforce

When working with a business partner in Salesforce to Salesforce, you control which objects you share with them by publishing the objects. In addition, you can control which fields you publish on those objects. By default, the following fields are published:

- Account: `Account Name`, and, if you are using person accounts, `Last Name`
- Attachment: `Body`, `Content Type`, `File Name`
- Case: `Subject`
- Case Comment: `Body` and `Published`
- Contact: `Last Name`
- Custom Object: `Name`
- Lead: `Last Name` and `Company`
- Opportunity: `Name`, `Closed Date`, and `Stage`
- Product: `Product Name`
- Task: `Subject`
- Opportunity Product: `Quantity`, `Sales Price`

Salesforce to Salesforce displays the API label for each field.

In addition to those required fields, you may want to publish more fields, or limit the fields you are currently publishing to a particular business partner.

To define published fields for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Published Objects related list, click **Edit** next to the published object.
4. Select the fields you want to publish to your business partner. Deselect fields you no longer want to publish.
5. Click **Save**.

 **Note:** You cannot publish fields that you do not have permission to edit.

Changes to fields may not show up in the subscribing connection for up to 15 minutes while Salesforce refreshes the cache. This cache enables us to support larger transaction volumes and reduce the number of API calls that count against your organization's limits.

You cannot publish rich text area (RTA) fields.

Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.

When you change which fields you publish, an email is sent to your business partner notifying them of the change. You can customize this email by editing the Update Connection communication template.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To publish fields:

- "Manage Connections"

Your business partner is automatically unsubscribed to fields when you:

- Stop publishing a field
- Delete a custom field to which your business partner is subscribed
- Change the type of a field to which your business partner is subscribed
- Change the size or precision of a long text area, text, percent, number, or currency field.

These fields remain published, but your business partner must re-subscribe to them.

Occasionally, new releases of the Salesforce service include new standard fields. Because Salesforce organizations around the world aren't upgraded to new releases simultaneously, you can't publish these new fields to a business partner until their organization is upgraded. Service upgrades occur during scheduled system maintenance periods. To view the system maintenance schedule, go to trust.salesforce.com.

Other Tips and Considerations

- When publishing fields, consider sending your business partner information about the fields. This helps them to create a mapping strategy that makes sense for your program.
- Translate your published custom field names into the languages your partners use. This allows them to see the field names in their own language.
- If you're using person accounts, and your connection has not enabled person accounts, the person account `Last Name` is used as the `Account Name` when you share a record. If your connection enables person accounts, they are automatically subscribed to `Last Name`. Any changes to `Last Name` and `Account Name` are synchronized.
- If you want to publish the `Middle Name`, `Informal Name`, and `Suffix` fields on contacts, the fields must be enabled in both your org and your partner's org, or your partner's org must be configured to auto-accept contacts.

[Managing Connections](#)

[Subscribe to Fields in Salesforce to Salesforce](#)

Making Records Available to a Connection

Salesforce to Salesforce allows you to share records with business partners to whom you are connected. There are two ways to share records: forward records directly to connections, or assign records to a queue of connections. You can share the same records with multiple connections. Once shared, connections must choose to accept the records.

 **Note:** Don't forward a record to the connection that originally shared it. Doing so causes errors when Apex triggers run.

Sharing a Record with Connections

You can share records with business partners to whom you are connected. You can only forward records that you or your subordinates own; System Administrators can forward all records.

 **Note:** Any lead record you are forwarding must include a populated `Company Name` field.

You cannot forward a record for a custom object that has not been deployed.

1. To forward a record and its related records:
 - View the record's detail page.
 - In the External Sharing related list, click the forward button.
2. To forward multiple records to connections:
 - Select the tab of the type of record you want to forward.
 - Select a list view from the `View` drop-down list, then click **Go!**
 - In the list view, select the checkboxes next to the records you want to forward. To select all records, select the checkbox in the column header.
 - Click **Forward to Connections**.
3. Select the connection(s) to forward the record to in the Available Connections list.
4. Click the Add arrow () to move the connection(s) to the Selected Connections list.
5. Optionally select **Send Notification Email (new invitees only)** to send email notifying the connection's representative that you forwarded the record. Only new recipients of the record receive the email; connections that you previously forwarded the record to don't receive another email.
6. Optionally select the checkboxes next to related records you want to forward. You can also [share related records separately](#).
7. Click **Save**.

The records are forwarded to the specified connections.

 **Tip:** Certain fields, like currency fields, must be mapped a certain way in Salesforce to Salesforce. For details, see [Best Practices for Mapping Fields in Salesforce to Salesforce](#).

Sharing Attachments

You can share attachments as child records of any supported object. Attachments are automatically accepted by a connection, providing the following criteria are met:

- The Attachment object type is published to your connection and your connection is subscribed to the object.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To assign records to a connection:

- "Read" and "Edit" on the record

To stop sharing a record:

- "Read" and "Edit" on the record

To forward multiple records to a connection:

- "Manage Connections"

- The parent record for the attachment is shared with the connection.
- The attachment is not marked “Private.”
- The `Share With Connections` checkbox on the attachment is selected.
- The attachment is 20 MB or less.

Stop Sharing Records

To stop sharing a record:

 **Note:** You can only stop sharing records that you or your subordinates own. System Administrators can stop sharing all records.

1. View the record's detail page.
2. In the External Sharing related list, click **Stop Sharing**.

When you stop sharing the record with a connection, changes to the record in your organization are not reflected on the record in the connection's organization. The shared record is not deleted from the other organization.

SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

[External Sharing Related List](#)

External Sharing Related List

Salesforce to Salesforce allows you to share records with one or more connections; each connection has the opportunity to accept records you share with them, even if other connections have already accepted the same record. When working with a record that you have received from a connection, or a record that you have shared with a connection, the record detail page includes a header indicating the record's status. The record may also contain the External Sharing related list, which shows details on which connections this record is shared with, and the sharing status.

Externally shared records will have one of the following statuses:

Active (sent)

The record has been shared and accepted by an external organization.

Active (received)

The record has been sent to you from an external organization, and it has been accepted.

Pending (sent)

The record has been shared, but not accepted by an external organization.

Inactive

The record is no longer shared with an external organization.

Inactive (deleted)

The record was accepted by an external organization, but that organization has deleted the record.

Inactive (converted)

The record is a lead that was accepted by an external organization and converted into an opportunity by that organization. When a lead is converted, Salesforce to Salesforce inactivates the shared record so that it is no longer updated in the subscribing connection.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To see the external sharing status of a record

- “Read” on the record

To stop sharing a record:

- “Manage Connections”

 **Note:** If you change the Lead Status during conversion, it is not reflected in the subscribing connection.

SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

[Making Records Available to a Connection](#)

Forwarding Related Records to a Connection

Salesforce to Salesforce allows you to forward records that are children of records already shared with connections. You select the child record types that can be shared when you [share a parent record](#).

Child records are [automatically shared](#) with connections after the parent record has been accepted by the connection, provided certain criteria are met.

Consider the following tips when sharing related records:

- A related record will no longer be shared with a connection if the related record is edited from an unshared record.
- A maximum of 100 tasks per related record can be shared. This maximum includes open and closed tasks.

To stop sharing a related record from its parent record detail page:

1. Select the parent record's detail page.
2. In the related list of the record you want to stop sharing, click **Manage Connections** in the Sent Connection Name column. For example, to stop sharing a contact related to an account, click **Manage Connections** in the Contacts related list on the account detail page.
3. Select the connection(s) that you want to stop sharing with in the Selected Connections list.
4. Click the Remove arrow () to move the connection(s) to the Available Connections list.
5. Click **Save**.

Alternatively, to stop sharing a related record from its detail page:

1. View the record's detail page.
2. In the External Sharing related list, click **Stop Sharing**.

To stop sharing a case comment or attachment, you must make the records private.

Sharing Opportunity Products with Connections

An opportunity product is related to both opportunity and product records. For this reason, it can only be shared as a child record of a shared opportunity, provided the associated product is also shared.

If all of the following criteria are met, opportunity products are automatically shared with connections.

- The Opportunity Product object type is published to your connection, and your connection has subscribed to the object.
- The opportunity and the product associated with the opportunity product are shared with your connection.
- In the connection's organization, the opportunity is associated with an active price book during acceptance.
- In the connection's organization, the product is associated with the same active price book as the opportunity.
- In the connection's organization, the product is active.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To assign records to a connection:

- "Read" and "Edit" on the record

To forward related records to a connection:

- "Read" and "Edit" on the record

To stop sharing a record:

- "Read" and "Edit" on the record

- In both organizations, the opportunity currency is the same.

When sharing opportunity products, keep these additional rules in mind:

- If quantity or revenue schedules are enabled in the connection's organization, Quantity and Sales Price fields won't be updated in their organization.
- If the price book associated to the opportunity product is changed or deleted in one organization, the opportunity product will no longer be shared.
- If the opportunity is no longer shared, the opportunity product will no longer be shared.

 **Note:** Currently, if you edit the stage of multiple opportunity records by performing a global find and replace, that change will not be reflected in organizations that you had forwarded the records to in Salesforce to Salesforce.

For example, suppose you perform a global find and replace which causes the stage of all inactive opportunities to change from `Inactive` to `In Review`.

If any of the affected opportunities had been forwarded to a business partner in Salesforce to Salesforce, those opportunities will still be in the `Inactive` stage in your partner's Salesforce organization. For the stage change to be reflected in their organization, they would need to open each affected opportunity, click **Edit**, and click **Save**.

Sharing Case Comments with Connections

You can share a case comment as a child record of a case. Case comments are automatically accepted by a connection, providing the following criteria are met:

- The Case Comment object type is published to your connection, and your connection has subscribed to the object.
- The case to which the case comment is associated is shared with the connection.
- The case comment is not marked "Private."

[Sharing Records Using Salesforce to Salesforce](#)

Tips for Using Salesforce to Salesforce

Managing Connections with Custom Reports

Use custom reports to keep track of Salesforce to Salesforce activity and updates. For details, see [Reporting in Salesforce to Salesforce](#).

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Managing Records

- If validation rules prevent you from accepting shared records, create a validation rule with the `Received Connection Name` field not equal to null; this will ignore validation rules for records you accept from your connections. To create this rule, use the following formula:

```
IF(OR(ISNEW(), ISNULL(Id)), if(ConnectionReceivedId =null,
TRUE, FALSE),NOT (AND(ISCHANGED(ConnectionReceivedId),
NOT(ConnectionReceivedId = null))))
```

You should also create a similar rule for any Apex trigger that has validation checks.

- To track records that you are sharing with connections, create a custom report. For example, you can create a custom report that shows all the leads that you have shared with connections that were deleted by the connection:
 - Use the Leads and Connections report type
 - Enter the filter criteria “Status equals Inactive (deleted)”
- Make your view of unaccepted records from connections more useful by creating a custom list view. For example, create a list view that hides unaccepted leads from connections that are more than a month old.

 **Note:** You must have the “Manage Connections” permission to create these list views.

- Only users with the “Manage Connections” permission can view objects shared from a connection, therefore, you should create custom list views that you can assign to people who need access to this information.
- If you are expecting to receive large volumes of records from a connection, [enable Auto-Accept for the appropriate objects](#) on page 1589. For example, if a connection shares a large number of leads with your organization on a regular basis, select the `Auto-Accept` checkbox next to Opportunity on the Add or Remove Subscribed Objects page.
- To see changes made by a connection, enable field tracking on the object and add the history related list to page layouts. Another option is to create a custom history report that includes the `Received Connection Name` field.
- To automatically assign all incoming leads or cases to a specific user, create an assignment rule that includes the following rule entries:

- *Received Connection Name contains name of connection*
- *Created By contains Connection User*

You can do the same with escalation rules.

- If you want to assign a case to a connection using an escalation rule on the case, you must assign the case to a queue where the connection is a member. For example, if you have a connection that acts as your third-party service agency and all cases meeting certain criteria should be escalated to this connection, you must:
 - Create a queue that contains the connection as a member.
 - Create an escalation rule with the appropriate criteria.
 - Add an escalation action that automatically assigns cases meeting the specified criteria to that queue

Other Tips

- If you want to connect to partners but aren't sure if they use Salesforce, you can use [connection finder](#) to find out.
- When you convert a lead, Salesforce to Salesforce inactivates the shared record and updates the External Sharing related list in your connection's lead record with an Inactive (converted) status. Due to inactivation of the shared record, changes to the Lead Status during conversion aren't reflected in your connection's lead record.

- To learn how to use workflows to automate updates to records and connections in Salesforce to Salesforce, see [Using Workflows in Salesforce to Salesforce](#).

Reporting in Salesforce to Salesforce

To track Salesforce to Salesforce activity and updates, create custom reports.

When it comes to using custom reporting to efficiently manage your Salesforce to Salesforce connections, the possibilities are endless! Here are some ways you might use custom reports in Salesforce to Salesforce:

- Create a custom report with the Connections with Accounts report type to track connection activity and other connection details. The report only displays connections that are associated with accounts.
- Create custom report types to view connection information for each of your published or subscribed objects.
- Create a custom report to view records that are shared with multiple connections. Alternatively, to view records shared with multiple connections in a list view, add the `Sent Connection Name` field to an existing or new view and verify that enhanced lists are disabled.
- Create a custom report with the Connections with Leads report type to view all leads that you shared with connections and that the connection then deleted.

Using Workflows in Salesforce to Salesforce

You can use workflow to automate updates to records and connections in Salesforce to Salesforce.

Workflow rules are only triggered for records shared in Salesforce to Salesforce when:

- You accept a parent record
- A child record is inserted
- You are subscribed to the fields that are configured to trigger the workflow rules

Some suggestions for criteria for workflow rules for Salesforce to Salesforce include:

- `Received Connection Name` field on leads, opportunities, and custom objects
- `Current User` equals `parent`
- `Last Modified By` field equals `Connection User`

For example, you can create a task for a user every time a connection updates a lead:

1. Create a workflow rule with the following criteria:
 - Evaluation criteria: `Evaluate the rule when a record is: created, and every time it's edited`
 - Run the rule when `criteria are met`.
 - Rule criteria: `"Lead: Last Modified By equals Connection User"`.
2. Add a workflow task.

You can use workflows for many Salesforce to Salesforce processes, including updating values on picklists when a connection has edited the field. When you accept a record, only the following fields trigger workflow rules:

 **Note:** If your organization is set up to automatically accept records, workflow rules are triggered by any field you subscribed to.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Object	Fields Triggering Workflows
Account	<ul style="list-style-type: none"> • Account Name • City • Country • Received Connection Name • Sent Connection Name • State • Type
Case	<ul style="list-style-type: none"> • Case Number • Priority • Status • Subject • Type
Contact	<ul style="list-style-type: none"> • Email • Last Name • Mailing Address • Phone • Title
Lead	<ul style="list-style-type: none"> • Company • Email • Industry • Lead • Lead Source • Name • No. of Employees • Phone • Received Connection Name • Sent Connection Name • State • Status • Title
Opportunity	<ul style="list-style-type: none"> • Account Name • Amount • Close Date • Name • Received Connection Name

Object	Fields Triggering Workflows
	<ul style="list-style-type: none"> • Sent Connection Name • Stage
Custom Object	<ul style="list-style-type: none"> • Connection Name • Name • Sent Date

All subsequent updates made to any fields on accepted records trigger workflow rules.

 **Note:** Sometimes it makes sense to use an Apex trigger instead of a workflow. Suppose that you have a workflow rule that updates a secondary field, **field B**, when **field A** is updated. Even if your Salesforce to Salesforce partner subscribed to fields A and B, updates to field B that are triggered by your workflow rule aren't sent to your partner's organization. This prevents a loop of updates.

If you want such secondary field updates to be sent to your Salesforce to Salesforce partners, replace the workflow with an Apex trigger that uses post-commit logic to update the secondary field.

 **Note:** In bi-directional connections, Salesforce to Salesforce updates are triggered back only on "after" triggers (for example, "after insert" or "after update"), not on "before" triggers.

Verifying Your Business Partners Use Salesforce

About Connection Finder

If your partners use Salesforce, it is beneficial to connect your Salesforce organizations so that you can share records and collaborate on relevant business processes. Before you can connect, you need to find out if your partners use Salesforce. Use Connection Finder to email your partners a link to a simple survey asking if they use Salesforce. Survey responses are recorded on the contact and account records for each partner. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

[Tips and Additional Considerations for Connection Finder](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, and Unlimited** Editions

Setting Up Connection Finder

Connection Finder allows you to email surveys to find out if your partners are Salesforce customers. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

To use connection finder, you must perform the following activities:

1. [Enable connection finder](#) in your organization.
2. [Configure connection finder settings](#).
3. Add the **Find Connections** button to the contacts list view by customizing the search layout. Add the button to the contact detail page by customizing the contacts page layout.
4. Add the `Uses Salesforce` field to the contacts page layout.
5. Add the `Salesforce Customer` field to the account page layout.

 **Note:** The `Uses Salesforce` and `Salesforce Customer` fields also appear on the contact and account records in any Customer Portal or partner portal you set up.

Enabling Connection Finder

To activate connection finder:

1. From Setup, enter *Connection Finder* in the `Quick Find` box, then select **Salesforce to Salesforce Connection Finder**.
2. Click **Edit**.
3. Select `Enabled`.
4. Click **Save**.

The connection finder settings are now available to configure. Additionally, the default email template and required related fields are created and available for use.

 **Note:** Disabling connection finder inactivates outstanding surveys and removes the **Find Connections** button. The `Uses Salesforce` and `Salesforce Customer` fields remain on contact and account records, respectively.

Configuring Connection Finder Settings

You can determine the content and look of the email you send to partners.

1. From Setup, enter *Connection Finder* in the `Quick Find` box, then select **Salesforce to Salesforce Connection Finder**.
2. Click **Edit**.
3. Select an email template.

The default connection finder template is automatically selected. You can also create custom email templates for your survey.

 **Note:** Custom email templates must contain the survey URL. `{!Contact.PartnerSurveyURL}` is available as a contact merge field when creating templates.

4. Optionally, select a logo using the lookup.

 **Note:** You must first upload your logo to the Documents tab and mark it as `Externally Available Image`.

Salesforce recommends adding a branded logo, as it appears at the top of the survey page. If no logo is selected, the logo portion of the survey page remains blank.

5. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To enable Connection Finder and edit settings:

- "Modify All Data"

Finding Out if Your Partners Use Salesforce

If your partners use Salesforce, it is beneficial to connect your Salesforce organizations so that you can share records and collaborate on relevant business processes. Before you can connect, you need to find out if your partners use Salesforce. Use Connection Finder to email your partners a link to a simple survey asking if they use Salesforce. Survey responses are recorded on the contact and account records for each partner. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

1. In the Contact list view, select the partners you want to survey and click **Find Connections**. Alternatively, on a contact detail page, click **Find Connections**.

 **Note:** **Find Connections** doesn't appear if:

- The contact record doesn't have a valid email address
- The contact is not associated with an account

If the contact is a person account, **Find Connections** appears in the list view, but shows an error message if the user clicks the button. **Find Connections** does not appear on the contact detail page.

2. Enter a subject for the email.
3. Edit the body text, supplied by the default template, or click **Change Template** to choose a different email template.

 **Note:** The default email template is selected by your administrator. You can select a different template or edit the body text, however, you must include the survey URL: `{ !Contact . PartnerSurveyURL }`.

You cannot edit body text if you chose multiple recipients.

4. Click **Check Spelling** to spell check the body text.
5. Click **Preview** to see what your email will look like to the recipient.
6. Click **Send**.

The email is sent to the selected partners, who have 90 days to respond to the survey before the link becomes invalid. The partner's response is recorded in the `Uses Salesforce` field on the partner's contact record and the `Salesforce Customer` field on the account record. A closed activity is also added for the contact.

 **Tip:** Salesforce recommends creating a custom list view or custom report so that you can track customer responses in one convenient location.

If the partner's organization uses Salesforce, the survey displays a section asking if the recipient has administrator privileges for Salesforce. If not, the recipient can optionally provide their administrator's contact information and a new contact record is created in Salesforce for that user, unless one already exists.

 **Note:** This section doesn't appear if a contact for that partner, whose `Uses Salesforce` value is *Yes*, *admin user*, already exists in your organization.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To email partners asking if they use Salesforce:

- "Send Email" (single recipient)

OR

"Mass Email" (multiple recipients)

Tips and Additional Considerations for Connection Finder

- Create a custom list view or custom report to track your survey responses in one location. Add the `Uses Salesforce` field to contact list views and reports. Add the `Salesforce Customer` field to account list views and reports.
- Create translated versions of the default connection finder template to send to international partners. To do so, clone the default template, make the necessary language changes, and include the survey URL: `{ !Contact . PartnerSurveyURL }`. You can then choose the appropriate template when sending out requests to your partners.

 **Note:** The survey page is in English, but includes a `Language` drop-down so that recipients can view the survey in their native language.

- When creating validation rules for the `Uses Salesforce` field, use the API value, not the label seen in the user interface. For example:

```
CONTAINS (TEXT (UseSalesforce ), 'YesNotAdmin')
```

<code>Uses Salesforce</code> drop-down value	API value
No	No
No Response	NoResponse
Not Sure	NotSure
Yes, admin user	YesAdmin
Yes, not admin user	YesNotAdmin

- If a partner provides details for their Salesforce administrator, Salesforce checks to see if there is already a contact in your Salesforce organization with that email address. If so, the `Uses Salesforce` field on the contact record is set to *Yes, admin user*. If the field is already set to *No*, it is not updated.

 **Note:** A partner can only add an administrator if one does not already exist as a contact in your organization.

- The `Salesforce Customer` field is dependent upon the values in its contacts' `Uses Salesforce` field.

Participating in Social Networks from Within Salesforce

Salesforce for Twitter and Facebook Overview

Salesforce for Twitter and Facebook gives you an easy way to interact with customers and prospects in real-time on Twitter and Facebook, directly from within Salesforce.

Salesforce for Twitter and Facebook users can search, monitor, join, and respond to social media conversations that are relevant to your company, all from within Salesforce. Users can also:

- Find out what people are saying about your company now
- Create cases, contacts, and leads from Tweets and Facebook wall posts and comments
- Share information with Twitter and Facebook communities

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Engage with millions of people sharing opinions, asking questions, and looking for help

You can enable Salesforce for Twitter and Facebook by downloading the free app from the [AppExchange](#). You can find more documentation from the Resources section of the app listing for Salesforce for Twitter and Facebook.

Using Salesforce-Integrated Email

Email Management

Salesforce offers several ways for you to manage email and increase productivity. Manage emails and templates. Relate emails to Salesforce records. To make sure that you get the information you're looking for, learn about each type, and then explore further.

[Manage Email and Templates in Lightning Experience](#)

If you're using Lightning Experience, you can email contacts, leads, and your own colleagues directly from account, person account, contact, lead, opportunity, campaign, and case records you have access to. Or send to any valid email address. Attach files. Automate with merge fields. Use a template if you want to: either choose from the samples we offer or create your own. Templates are shared automatically with your organization.

[Manage Email in Salesforce Classic](#)

If you're using Salesforce Classic, use Email Author to email your contacts, leads, person accounts, and coworkers directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

[Relate Emails to Salesforce Records with Email to Salesforce](#)

Relate emails to leads, contacts, and opportunities or to other specific records in Salesforce. That way, it's easy to track your sales-related communications.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in all editions

Manage Email and Templates in Lightning Experience

If you're using Lightning Experience, you can email contacts, leads, and your own colleagues directly from account, person account, contact, lead, opportunity, campaign, and case records you have access to. Or send to any valid email address. Attach files. Automate with merge fields. Use a template if you want to: either choose from the samples we offer or create your own. Templates are shared automatically with your organization.

[Access and Sharing for Email Merge Fields, Templates, and Attachments](#)

Using integrated email in Lightning Experience? It's important to understand how access and sharing work for merge fields, templates, and attachments.

[Send Email from a Record](#)

Send rich-text email, including attachments, directly from the record you're on. Send to customers, colleagues, or any valid email address. Email is available for a number of items, including accounts, person accounts, contacts, leads, opportunities, campaigns, and cases. When you send an email, Salesforce creates an email record to track the email and store its content. Find a link to the email record in the Activity feed of the record the email was sent from or on related records.

EDITIONS

Available in: Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** editions

[Find Email Sent from a Salesforce Record](#)

After you send an email, Salesforce creates an email record to track the email and store its content. The activity feed includes a link to that email. If you sent email to a contact or lead, each of those records includes a link to the email. For emails that *don't* include any contacts or leads as recipients, the email and the feed item are created for the object you were on when you sent the email. If you use Automatic BCC, as defined in your email settings, you receive a copy of the email in the inbox of your specified return address.

[Send Email through Gmail or Office 365](#)

Send your Salesforce email through your Gmail or Office 365 account. Emails sent in Lightning Experience look like they were sent from your Gmail or Office 365 inbox. You can also see the emails you've sent in your Gmail or Office 365 Sent Items folder.

[Create a Template to Standardize Common Emails](#)

Create email templates to save time and standardize email sent by you or others in your organization. Use merge fields if you need them. Your page layout and field-level security settings determine which fields are available for merging. Templates you create are automatically public: they're available for use by others in your organization.

[Use a Template to Standardize Email You Send](#)

Use a template to save time and standardize email you send. You can create your own or use templates created by others in your organization. Or use one of the samples Salesforce provides. If you select a template that has attached files, you need file access to include them in emails you send from that template. If you need file access, we'll let you know.

Access and Sharing for Email Merge Fields, Templates, and Attachments

Using integrated email in Lightning Experience? It's important to understand how access and sharing work for merge fields, templates, and attachments.

Merge Fields

Merge fields are available from the Account, Contact, Opportunity, Lead, Campaign, Case, and User objects, as well as from the Person Account record type. From those items, most commonly used standard fields (and some custom fields) are available as merge fields. From that set of fields, some fields may not be available to individual users because of field-level security settings. Contact merge fields are not available for person accounts.

Templates

- Templates created in Salesforce Classic can't be used in Lightning Experience, and vice versa.
- Templates created from one object are available for that object only. For example, a template created for leads isn't available for selection from an opportunity record.
- Templates you create are automatically public: they're available for use by others in your organization.

Attachments

- Salesforce Files and Content Deliveries must be enabled before you can select and attach files from Salesforce Files. If these features are not enabled, users will be able to upload attachments only.
- Any attachment larger than 3 MB is sent as a content delivery link, not as a file. For emails with multiple attachments, if the aggregate size of all attachments is greater than 3 MB, then *all* attachments are sent as content delivery links.
- If you don't have access to a file, you can't attach it to an email or a template. We let you know if you need access, so you can ask the file's owner.

EDITIONS

Available in: Salesforce Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- Access becomes public, via the link, for files attached to emails from Salesforce Files. Public access allows anyone with the link to view, share, and download the file.

SEE ALSO:

- [Add Images and Files to Email Messages in Case Feed](#)
- [Email Editions and Permissions](#)

Send Email from a Record

Send rich-text email, including attachments, directly from the record you're on. Send to customers, colleagues, or any valid email address. Email is available for a number of items, including accounts, person accounts, contacts, leads, opportunities, campaigns, and cases. When you send an email, Salesforce creates an email record to track the email and store its content. Find a link to the email record in the Activity feed of the record the email was sent from or on related records.

-  **Note:** If your company doesn't have Enhanced Email enabled, Salesforce creates a task record instead of the email record. If you're unsure whether you have Enhanced Email enabled, talk to your administrator.

To attach files to an email or use a template with attached files, you need file access. If you don't have access, we'll let you know.

1. Open the record from which you want to send the email.
2. Click the Activity tab and then click **Email**.

-  **Tip:** If you prefer to compose from a window, click the arrow button to pop out your email. While the composer window is active, you can scroll the record page to view details and other information or navigate anywhere else in Salesforce.

3. Write your email. If the recipient has opted out of receiving mass email or previous emails to the address have bounced, you'll see an indicator next to their name.
4. Add attachments if you need to.
5. Preview and send.

You'll find a link to the email in the activity feed under Past Activity. You can also find a link in the activity timeline on related records. If you use Automatic BCC, as defined in your email settings, you'll receive a copy of the email in the inbox of your specified return address.

-  **Example:** Jane is working a deal, or opportunity, to sell 600 widgets to Acme Corporation. The contact for Acme is John Stamos and the opportunity record is Acme 600 Widgets. Jane needs to send an email to John, including a term sheet, and she wants that email associated with the 600 widgets opportunity record. It's also handy to have the email available from John's contact record. Jane opens the Acme 600 Widgets record and writes the email, attaching the term sheet. After she sends the email, she can find a link to the email on the Acme 600 Widget opportunity record and the John Stamos contact record.

SEE ALSO:

- [Edit Your Email Settings](#)

EDITIONS

Available in: **Salesforce Lightning Experience**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To send email:

- "Send Email" permission and access to the record the email is sent from.

To attach files to email or templates:

- Access to the file you're attaching.

Find Email Sent from a Salesforce Record

After you send an email, Salesforce creates an email record to track the email and store its content. The activity feed includes a link to that email. If you sent email to a contact or lead, each of those records includes a link to the email. For emails that *don't* include any contacts or leads as recipients, the email and the feed item are created for the object you were on when you sent the email. If you use Automatic BCC, as defined in your email settings, you receive a copy of the email in the inbox of your specified return address.

 **Note:** If your company does not have Enhanced Email enabled, Salesforce saves sent emails as task records instead of email records. You find the task records the same way you would find email records. If you are unsure of whether your company uses Enhanced Email, speak with your administrator.

1. Open either the record that was originally open when you wrote the email or the record for the contact or lead you sent it to.
2. To find the email in Past Activity, click the Activity tab.
3. To open its task record, where you can view the message and related details, click the email link. And if you use Automatic BCC, you can find the sent email in your inbox.

Send Email through Gmail or Office 365

Send your Salesforce email through your Gmail or Office 365 account. Emails sent in Lightning Experience look like they were sent from your Gmail or Office 365 inbox. You can also see the emails you've sent in your Gmail or Office 365 Sent Items folder.

Emails sent through workflows and triggers are still sent through Salesforce. Also, bounce management isn't supported when you send through external email accounts.

Email delivery information for Send through Gmail or Office 365 is not available in the email logs. Email logs should be obtained from Gmail or Office 365 instead.

1. From your personal settings, enter *My Email Settings* in the **Quick Find** box, and select **My Email Settings**.
2. Select how you'd like to send your email.
Your Salesforce admin can enable either Gmail or Office 365 for your org. You can't choose between the two.
3. Click **Save**.

Create a Template to Standardize Common Emails

Create email templates to save time and standardize email sent by you or others in your organization. Use merge fields if you need them. Your page layout and field-level security settings determine which fields are available for merging. Templates you create are automatically public: they're available for use by others in your organization.

Templates created from one object are available for that object only. For example, a template created for leads isn't available for use from an opportunity record.

 **Tip:** Found a great template that needs updates or modifications? Select that template, then edit and save. If you want to keep the original, save your changed version as a new template.

1. Open a record, such as an opportunity or account, that offers email.
2. Click the Activity tab, then click the Email tab.
3. Compose the email to use as your template. Templates can include all the features of other email: rich text, merge fields, and attachments. If you need to navigate the record or other Salesforce pages as you work, pop out the composer window.
4. Click the Templates icon and then save the template as new.

Use a Template to Standardize Email You Send

Use a template to save time and standardize email you send. You can create your own or use templates created by others in your organization. Or use one of the samples Salesforce provides. If you select a template that has attached files, you need file access to include them in emails you send from that template. If you need file access, we'll let you know.

1. Open the record from which you want to send email.
2. Click the Activity tab, then click the Email tab.
3. To insert a template, click the Templates icon. Select the template you want and its contents appear. Edit your email as needed, then preview and send!

Manage Email in Salesforce Classic

If you're using Salesforce Classic, use Email Author to email your contacts, leads, person accounts, and coworkers directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

[Send Email in Salesforce Classic](#)

Email your contacts, leads, person accounts, and coworkers directly from account, contact, lead, opportunity, case, campaign, or custom object pages in Salesforce Classic.

[Send Mass Email in Salesforce Classic](#)

Send an email to a group of contacts, leads, person accounts, or coworkers all at the same time! Email a list of contacts, leads, or person accounts for small-scale sales or support. Mass email is intended to facilitate your business processes, not to replace your email application or handle mass-marketing campaigns.

Considerations for Sending Email in Salesforce Classic

Before you send email, consider a few key points.

General

- You can enter only one name in the To field.
- You can include a signature in text emails only.

Email Templates

- When authoring an email, you can choose a predefined template for the message. To personalize your message, you can include merge fields that are replaced with information from the Salesforce record when the email is sent. For example, your company can use a standard template to communicate solution information to customers with cases. Your Salesforce admin can maintain company-wide templates, and you can maintain your own templates.
- Email templates give you access only to the fields that are accessible to you via your page layout and field-level security settings. (Field-level security is available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.)
- If your template contains a merge field for which no data exists in a particular record, that field doesn't appear in the email that you send. To find such blank fields, modify your recipient list view to search for the merge fields that you're using in your template. Then enter the criterion "<field> equals," leaving the third field blank. Edit those records that have blank fields before you send email.
- If you modify an email template, your changes affect the HTML version of the template.
- You can't modify custom email templates.

Tracking Email

To track email that you sent, use HTML formatting when authoring. Also make sure that your Salesforce admin has added the HTML Email Status related list to your contact, lead, and person account pages.

- "Send Email"

Guidelines for Working with Email

Consider a few pieces of advice for working with emails, including information for customers that use Email-to-Case and Enhanced Email.

- You can't use custom currency fields with emails.
- Emails can have only one record type.
- Workflow rules can use emails only to update fields on cases.
- In Salesforce Classic, you can attach multiple files to an email as long as the total size of all attached files doesn't exceed 10 MB. In Lightning Experience, total size of all attached files can't exceed the Salesforce limit for maximum file size.
- If the combined size of all files attached to an email exceeds 3 MB, or if you use mass email, the actual files are not attached to the email when it's sent. Instead, a link to each file is attached to the email. When a recipient clicks a link, it opens the corresponding attachment in Salesforce Files. For example, if you attach two 1.7 MB files to an email and send it, the recipient receives the email with two links attached to it.
- Attachments that are sent as links are stored for 30 days.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in all editions

For Organizations that Use Email to Case

- Email messages that aren't associated with cases can't be displayed in communities.
- You may need to review triggers and workflow rules that use the EmailMessage object. For EmailMessage records associated with cases, the `ParentID` field is always populated. With Enhanced Email, EmailMessage records may be associated with other records and the `ParentID` field may be blank. As a result, you may need to update your triggers and workflow rules to handle email messages with a blank `ParentID` field.

For Organizations that Use Enhanced Email

- An email is stored as both an Email Message record and a Task record. However, the email detail page only shows the Email Message record—not the Task record.
- If your organization uses business logic that incorporates tasks and emails, you may need to:
 - Recreate any custom Task fields on the Email Message object.

- Migrate any Task object triggers to the Email Message object.

SEE ALSO:

[Send Email in Salesforce Classic](#)

[Send Mass Email in Salesforce Classic](#)

Considerations for Sending Mass Email

Before you send mass email, consider a few key points.

- You can send a mass email to a recipient list that consists of contacts, leads, person accounts, or users that you can view in Salesforce.
- If a standard email field is hidden via field-level security, the Mass Email links for contacts and leads don't appear.
- Mass email can be sent to an address in a standard email field. Mass email with a custom email field isn't supported.
- Before you send a mass email, create a custom view of contacts, leads, person accounts, or cases without an email address. In the search criteria, choose "Email equals," and leave the third field blank. You can then update those records before sending your emails. You can't validate an email address without sending an email message.
- You can't send a mass email using a Visualforce email template.
- Attachments in mass emails are sent as links rather than as physical files. When recipients click the attachment link in the email, the attachment opens in a separate browser window, and they can download the file. Attachments are stored for 30 days.
- Mass email functionality does not recognize duplicates or remove them from a mass email list. All records that meet the filter criteria are pulled into the list, even if they share the same email address.
-  **Note:** The addressed and sent-to numbers in mass email status messages differ in the following situations.
 - The mass email would cause your organization to exceed its daily mass email limit. Salesforce does not send the message to any of the intended recipients in this case.
 - One or more selected recipients opted out of receiving mass email after the mass email was scheduled but before it was processed.
 - One or more selected recipient email addresses were removed from the contact or lead after the mass email was scheduled but before it was processed.
 - The user who sent the mass email was deactivated after the mass email was scheduled but before it was processed. Salesforce does not send mass emails scheduled by a user who is deactivated.

Send Mass Email in Salesforce Classic

Send an email to a group of contacts, leads, person accounts, or coworkers all at the same time! Email a list of contacts, leads, or person accounts for small-scale sales or support. Mass email is intended to facilitate your business processes, not to replace your email application or handle mass-marketing campaigns.

 **Note:** You can't use an organization-wide address to send a mass email.

Watch a Demo:  [Sending Mass Email \(Salesforce Classic\)](#)

1. Depending on who the recipients of your mass email are, do one of the following.

For contacts or person accounts

On the Contacts or Cases tab, in the Tools section at the bottom of the page, click **Mass Email Contacts**. If your Salesforce org has person accounts, the link also appears on the Accounts tab.

For leads

On the Leads tab, in the Tools section at the bottom of the page, click **Mass Email Leads**.

For coworkers (other Salesforce users)

If you have the "Manage Users" permission, from Setup, enter *Mass Email Users* in the Quick Find box, then select **Mass Email Users**.

2. Select a list view of recipients, and then click **Go!**
3. All recipients in the list view are selected by default. To remove recipients, deselect them.
4. Click **Next**.
5. Choose an email template.
6. To view the templates, click the **Preview** links.
7. Click **Next**.
8. On the confirmation page, select the processing options to use. The mass email name that you specify appears in the queue and status messages that you receive from Salesforce, not in the email that you're sending.
9. In Delivery Options, send the email, or choose a date and time zone for sending the email in the future.
10. Click **Send**, and then click **Finished**.

Guidelines for Sending Mass Email

If you're sending mass email, refer to these guidelines for additional information.

- By default, the My Contacts, My Leads, Active Users, or My Cases views include all records with an email address. To change the list of recipients, create a custom view. If the record contains no email address, or `Email Opt Out` is selected, a contact, lead, or person account isn't included in any email list views. Person accounts are included in contact list views.
- In the email template preview window, the template displays any merge fields included in it, such as `{ !Account . AccountNumber }`. When you send your email, data from the recipients' records, or any applicable substitute text, is inserted into the email in place of those merge fields.
- When `Store an activity for each message` is selected (default), the Activity History item is associated with the contact, lead, or person account and is displayed as "Mass Email:<Template Description>." The email subject, body, and attachments aren't stored in the Activity History item. Logging Activity History items requires access for viewing or editing the records in the recipient list and the "Edit Task" permission.
- If the email deliverability option `Notify sender when mass email completes` is selected, you receive an auto-generated status email from Salesforce for each mass email that you send. The subject line of the status email contains the value that you entered in the `Mass Email Name` field when sending the mass email.
- To view and cancel mass emails that you've scheduled, from your personal settings, enter `Mass Emails` in the `Quick Find` box, then select **Mass Emails** or **My Mass Emails**.

To view and cancel mass emails that anyone in your company scheduled, if you have the "Manage Users" permission, from Setup, enter `Mass Emails` in the `Quick Find` box, then select **Mass Emails**.

SEE ALSO:

[Send Mass Email in Salesforce Classic](#)

[Guidelines for Configuring Deliverability Settings for Emails Sent from Salesforce](#)

View the Status of Your Mass Email

Stay in-the-know with an auto-generated status email for each mass email that you send.

1. Make sure that your Salesforce org is configured to receive email notifications for mass emails. See your Salesforce admin for help.
2. When creating the mass email, enter a value in the `Mass Email Name` field. This value appears in the subject line of the status email.
3. Send the mass email.

The status message that you receive shows the number of recipients that the mass email was addressed and sent to.

Available in all editions

How Does Email to Salesforce Work?

When you send email from external email applications, use Email to Salesforce to automatically relate those emails to your Salesforce Lead, Contact, and Opportunity records.

When composing, forwarding, or replying to an email, you enter a special Email to Salesforce address in the BCC field (or any other recipient field). Salesforce receives a copy of the email. Depending on your configuration, Salesforce adds the email to the Activity History related list of the record whose email address matches the recipient's email address, or to the My Unresolved Items page. From the My Unresolved Items page, you can manually assign the email to a record. Unassigned emails also appear in your open task list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Relating Emails to Leads, Contacts, and Opportunities

If you configure Email to Salesforce to associate emails to matching leads or contacts, Salesforce searches the **To** and **CC** fields for the email addresses of your leads or contacts. If any leads or contacts are found, Salesforce saves the email to the Activity History related list on the appropriate record.

If you configure Email to Salesforce to associate emails to matching opportunities, Salesforce searches the **To** and **CC** fields for the email addresses of your contacts. If contacts are found, Salesforce saves the email to the Activity History related list on all open opportunities, as long as the contact is assigned a contact role on the opportunity.

If Salesforce can't match any email addresses for recipients that appear in the **To** and **CC** fields of emails that you add to Salesforce, the My Unresolved Items page displays one row for each email.

Relating Emails to Specific Records

To relate an email to a specific Salesforce record, include the record ID in the subject line or body of the email.

If you configure Email to Salesforce to associate email with matching leads, contacts, or opportunities, an unresolved task is created when an email is associated with a lead, contact, or opportunity using a record ID but not a matching email address. For example, you configure emails to be associated with matching leads. You then send an email directly to your Email to Salesforce address with a lead record ID in the body or subject line of the email. The email is associated with the lead, and an unresolved task is created.

Getting Started

When your Salesforce admin activates Email to Salesforce, you receive an email that contains your system-generated Email to Salesforce address. This address also appears in your personal settings.

Access your personal settings to configure Email to Salesforce before you use it.

[Considerations for Using Email to Salesforce](#)

[Set up Email to Salesforce](#)

[Relate Emails to Your Salesforce Records Using Email to Salesforce](#)

[Guidelines for Using Email to Salesforce](#)

Considerations for Using Email to Salesforce

Before you use Email to Salesforce, consider a few key points.

General Considerations

- Use Email to Salesforce to capture email sent with external email applications such as IBM® Lotus Notes® and Microsoft® Outlook® and with webmail such as Gmail® and Yahoo! Mail®.
- Email to Salesforce attempts to match the email address in the **To** or **CC** fields with the one in the **Email** standard field. Email to Salesforce doesn't support matching on custom email fields.
- Salesforce ignores invalid IDs or IDs for records that you don't have read access to.
- Email to Salesforce is required to use the Add Email feature with Salesforce for Outlook. Disabling one feature disables the other. With Salesforce for Outlook, you add emails via Add Email and Send and Add, not the **BCC** field.
- If you enter a recipient's email address in the **BCC** field, the owner of the address receives the email, but the email isn't related to records that contain the email address.

Limits

- The maximum number of email addresses that Email to Salesforce can match is 50. If the combined number of addresses in the **To** and **CC** fields exceeds this limit, Email to Salesforce processes only the first 50 unique addresses in the email.
- Email to Salesforce can create a maximum of 50 email activities for each email that it receives. It can relate up to 50 contacts to each email task record.
- The size limit for an attached file is 25 MB when attached directly to the related list. The size limit for an email message, including attachments, is 25 MB. For each matching record, all attachments that are sent with the email are duplicated, which affects your data size limit. Any attachments that aren't added are listed in the confirmation email that you receive from Salesforce.
- Email text and HTML are truncated to 32 KB.

Available in all editions

Set up Email to Salesforce

To be able to use Email to Salesforce, start by configuring it.

1. From your personal settings, enter *Email to Salesforce* in the *Quick Find* box, then select **My Email to Salesforce**.
2. Enter your own email address in *My Acceptable Email Addresses*. If you send email from more than one address, separate each address with a comma.

 **Important:** Your Email to Salesforce address accepts email only from addresses that you list here. If you don't list an email address, email that's sent to your Email to Salesforce address isn't associated with any records.

3. Under *Email Associations*, select options as needed.
4. If you exclude multiple email domains from automatic association in *Excluded Domains*, separate them with commas.
5. Click **Save**.

Relate Emails to Your Salesforce Records Using Email to Salesforce

Email to Salesforce lets you track your sales-related emails in Salesforce. Relate emails that you send with external email applications to leads, contacts, opportunities, and other specific Salesforce records.

To relate emails sent from external email applications to leads, contacts, or opportunities:

1. Compose an email from an email account that you listed in *My Acceptable Email Addresses* on the *My Email to Salesforce* setup page.
2. Enter your Email to Salesforce address in the *BCC* field.
3. Enter the email recipients in the *To* and *CC* fields.
4. Send the email.

To relate externally sent emails to specific Salesforce records:

1. Compose an email from an email account that you listed in *My Acceptable Email Addresses* on the *My Email to Salesforce* setup page.
2. Locate the record ID of the record to associate the email with. The record ID is the 15-digit, case-sensitive, alphanumeric code at the end of the URL for the record.
3. In the subject line or body of the email, type *ref:* followed by the record ID. For example: *ref: 701D000000HQZY*.
4. Enter your Email to Salesforce address in the *To*, *CC*, or *BCC* field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

5. Send the email.

SEE ALSO:

- [Considerations for Using Email to Salesforce](#)
- [Guidelines for Using Email to Salesforce](#)
- [Set up Email to Salesforce](#)

Guidelines for Using Email to Salesforce

If you're using Email to Salesforce, review a few key points for additional information.

General Guidelines

- For easy access, add your Email to Salesforce address to the address book of your email program.
- When you use Email to Salesforce to save a message as an email activity, the default task type is specified by the `Send Email Default` setting. To change the default value, edit the `Task Type` picklist field.
- Emails that come from excluded domains go to My Unresolved Items. From there, manually assign them or leave them unassigned.
- To save a message as an email activity without sending it to another person, forward the email with your Email to Salesforce address in the `To` field. Make sure that no other email address is in the `To`, `CC`, or `BCC` fields. Salesforce receives a copy of the email and searches the `From`, `To`, and `CC` fields in the forwarded email for the email addresses of your leads and contacts. If any leads or contacts are found, Salesforce saves the email in the Activity History related list on the appropriate record.
- If Email to Salesforce matches an email address to multiple lead or contact records in Salesforce, you can associate the email with all matching records, the oldest record, or the record with the most activity.
- If Email to Salesforce matches an email to multiple opportunity records in Salesforce, the email is included in the activity history on all matching open records.

Record IDs

- The record ID is the 15-digit, case-sensitive, alphanumeric code at the end of the URL for a record. For example, if you view the detail page of a campaign record, the URL resembles this one:
`https://yourInstance.salesforce.com/701D0000000HQZy`. The record ID for this record is `701D0000000HQZy`.
- You can type record IDs on a separate line or within the email body text if surrounded by `()`, `[]`, or `{}`. For example: `(ref: 701D0000000HQZy)`. Separate multiple record IDs with commas, for example: `ref: 701D0000000HQZy, 801D0000000IRAz, 901D0000000JSBa`.

EDITIONS

Handle Emails That Email to Salesforce Doesn't Assign to Records

When emails are sent to Salesforce via Email to Salesforce or Salesforce for Outlook, some are assigned to related records based on your Email to Salesforce settings. The rest are added to My Unresolved Items, where you assign them to related Salesforce records or confirm that you want to leave them unassigned.

Available in: both Salesforce Classic and Lightning Experience (only when prompted to resolve Salesforce for Outlook items from the Windows system tray)

Available in: **All** Editions except **Personal** Edition

1. Access your unassigned emails in My Unresolved Items.
2. Choose one of these actions.
 - Assign to related records: Enter a related record in one or both fields. If you need to, select the correct record type from the drop-down list. If you assign a lead, you can't assign more records. To cancel an assignment, clear an entry.
 - Leave unassigned: The text *Unresolved Email*: is removed from the subject line, and the email is assigned to you as a completed task. If the task's *Status* picklist includes more than one "completed" status, Salesforce uses the first one.

3. Save your changes.

Assigned emails are added to the associated records. All modified items are removed from the list.

Using Salesforce-Integrated Email FAQs

Can I use Salesforce to send mass emails?

If you want to send mass marketing emails, we recommend using Salesforce Marketing Cloud or a third-party application in the [AppExchange](#) that allows you to centrally manage email campaigns and track responses. These tools allow your marketing team to track the number of qualified leads and ROI for their email campaigns.

If you want to send mass sales emails, in Salesforce Classic, click **Contacts**. In the Tools section, choose **Mass Email Contacts**, and then follow the Mass Email wizard.

SEE ALSO:

- [General Importing Questions](#)
- [Send Mass Email in Salesforce Classic](#)
- [Can I use Salesforce to send HTML emails?](#)

USER PERMISSIONS

To view or edit unresolved emails:

- "Edit" on tasks and "Read" on the objects that you assign to the email

AND

"Email to Salesforce"

OR

"Add Email" in Salesforce for Outlook and "Email to Salesforce"

To create Salesforce records:

- "Edit" on tasks

AND

"Show Quick Create" and "Create" on those objects

To see recently used data in the related records fields:

- "Lookup Auto-Completion" in Search Settings

Can I use Salesforce to send HTML emails?

Yes, you can use Salesforce to send HTML emails to contacts, leads, person accounts, and users in your org. You can send emails to individuals, send mass emails to multiple contacts, and set up templates for HTML emails you send frequently.

Generating Form Letters with Templates

Mail Merge

A mail merge is the process of generating form letters and other Microsoft® Word documents that are personalized for the recipient, who is often a contact or lead. The content of each document is predefined in a mail merge template. Mail merge templates include variables called merge fields where data from your Salesforce records—for example a contact's name and address—displays in the generated document.

 **Important:** Salesforce is ending support for Standard Mail Merge and Connect for Office on March 4, 2017. This change means that Salesforce no longer provides support or maintenance when there is an issue. To let sales reps continue running mail merges with Salesforce data, migrate your sales reps to [Extended Mail Merge](#).

 **Note:** Standard mail merge requires:

- Microsoft® Internet Explorer® versions 9, 10, and 11
- Microsoft Word 2003 or 2007
- Microsoft Windows Vista® (32-bit only) - Until [Salesforce disables TLS 1.0](#).

EDITIONS

This feature is available in
Salesforce Classic

Available in all editions

Generating Single Mail Merge Documents

To generate a Microsoft Word document for an individual record, open the record's detail page and click **Mail Merge** on the Activity History related list.

Generating Mass Mail Merge Documents

To generate Microsoft Word documents for multiple records, such as when sending a mass mailing, see the [Salesforce Bulk Mail Merge Process](#) document.

Alternatively, if Extended Mail Merge has been enabled for your organization you can easily generate mail merge documents—such as form letters with matching envelopes and address labels—for multiple records at the same time.

SEE ALSO:

[Installing the Mail Merge ActiveX Control](#)

[Generate Mass Mail Merge Documents with Extended Mail Merge](#)

[Send a Single Mail Merge Document](#)

Installing the Mail Merge ActiveX Control

Salesforce is ending support for Standard Mail Merge and Connect for Office on March 4, 2017. To let sales reps continue running mail merges with Salesforce data, migrate your sales reps to Extended Mail Merge.

 **Important:** Salesforce is ending support for Standard Mail Merge and Connect for Office on March 4, 2017. This change means that Salesforce no longer provides support or maintenance when there is an issue. To let sales reps continue running mail merges with Salesforce data, migrate your sales reps to [Extended Mail Merge](#).

With standard mail merge, the first time you generate a mail merge document you must install an ActiveX control that helps Salesforce communicate with Word. **You must be logged in as a Windows user with sufficient administrative privileges to download ActiveX controls.** If you are unable to download ActiveX controls, contact your IT department or Windows system administrator for assistance.

Standard mail merge requires:

- Microsoft® Internet Explorer® versions 9, 10, and 11
- Microsoft Word 2003 or 2007
- Microsoft Windows Vista® (32-bit only) - Until [Salesforce disables TLS 1.0](#).

Configure your Web browser to accept ActiveX controls as follows:

1. Click **Tools > Internet Options** to open the Internet Options dialog.
2. Go to the Security tab.
3. Click the icon for the **Internet** zone, then click **Custom level**.
4. In the "ActiveX controls and plug-ins" section, select **Enable** or **Prompt** for the following settings: "Download signed ActiveX controls," "Run ActiveX controls and plug-ins," and "Script ActiveX controls marked safe for scripting."
5. In the "Downloads" section, select **Enable** for the "File download" setting.
6. Click **OK**.
7. Repeat the custom level settings above for the **Trusted sites** zone.
8. Ensure that Salesforce is a trusted site by clicking the **Sites** button and looking for `https://*.salesforce.com` in the list. If it is not there, type `https://*.salesforce.com` in the text box and click **Add**. Click **OK**.
9. Go to the Advanced tab of the Internet Options dialog.
10. In the Security section at the bottom of the Settings box, confirm that "Do not save encrypted pages to disk" is blank and does not have a check mark.
11. Click **OK**.
12. You may need to restart Internet Explorer for your changes to take effect.

If you use Internet Explorer 7 or 8, the first time you perform a mail merge, the popup message `Exception: Automation server can't create object` may occur. You can disregard this message. Click **OK** to close the popup and proceed with your mail merge.

 **Note:** Extended Mail Merge does not require the installation of an ActiveX control.

Managing Templates

Your administrator can create and maintain templates for defining letterheads, sending outbound email, and generating mail merge documents.

- Letterheads define the look and feel of your HTML email templates. Your HTML email templates can inherit the logo, color, and text settings from a letterhead.
- Email templates allow you to send email to contacts, leads, and others using predefined templates.
- Mail merge templates allow you to create custom documents using the information from your records. For example, you can create a customized thank you letter to a specific lead.

SEE ALSO:

[Create a Letterhead](#)

[Manage Email Templates](#)

[Managing Mail Merge Templates](#)

Create Mail Merge Templates

1. Open a new blank document in Microsoft® Word 2007.
2. Use Word to compose the document so it contains the text, data, and formatting your users require.
3. Locate the text or data variables in your Word document that will change each time the template is used. For example, in the salutation "Dear Bob," "Bob" is a variable because it will change when the letter is sent to a different person.
4. Replace each variable with the appropriate Salesforce merge field.

 **Important:** Each mail merge field label you use must be unique.

- a. Place your cursor where you want to insert a merge field.
- b. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
- c. Select **Mail Merge** in the Categories drop-down list.
- d. Select **MergeField** in the Field names box.
- e. In the Field Properties area of the Field name box, manually enter the valid merge field, such as `Opportunity_LineItem_ProductName`. To create a complete list of the standard and custom fields available in your Salesforce organization, visit the [Locate Record Field Names for Mail Merge](#) article.
- f. Click **OK**.

 **Note:** To list information about all products associated with an opportunity, insert the `Opportunity_LineItem_Start` merge field where you want to begin listing product information. Then, insert all the merge fields you want to include for each product on an opportunity. Finally, insert the `Opportunity_LineItem_End` to end the list.

5. Save your Word document.
6. Proceed to [Uploading Mail Merge Templates to Salesforce](#) on page 1631.

[Mail Merge](#)

Modify Existing Mail Merge Templates

1. Download the [sample mail merge templates](#) and unzip the files to a convenient directory on your hard drive.
2. Review the instructions provided in `salesforce_mailmerge_templates_howto.doc`.
3. Open the desired sample template in Microsoft Word.
4. Save a copy of the sample template to your computer's desktop or other convenient location. In Word 2007, select **Save As** from the Office button then choose an appropriate file name and destination folder.
5. Optionally, customize the text and formatting of the template.
6. Press ALT+F9 to display the hidden mail merge field codes.

Each of the mail merge fields should now appear in curly braces as follows: `{MERGEFIELD Contact_FullName * MERGEFORMAT}`

7. Change or add merge fields as necessary.
 - a. Place your cursor where you want to insert a merge field.
 - b. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
 - c. Select **Mail Merge** in the Categories drop-down list.
 - d. Select **MergeField** in the Field names box.
 - e. In the Field Properties area of the Field name box, manually enter the valid merge field, such as `Opportunity_LineItem_ProductName`. To create a complete list of the standard and custom fields available in your Salesforce organization, visit the [Locate Record Field Names for Mail Merge](#) article.
 - f. Click **OK**.

Note: To list information about all products associated with an opportunity, insert the `Opportunity_LineItem_Start` merge field where you want to begin listing product information. Then, insert all the merge fields you want to include for each product on an opportunity. Finally, insert the `Opportunity_LineItem_End` to end the list.

[Managing Mail Merge Templates](#)

[Considerations for Using Merge Fields in Mail Merge Templates](#)

[Mail Merge](#)

Create Mail Merge Templates with Microsoft® Word

The Connect for Office Word add-in provides a complete list of valid merge fields for you to insert. When Salesforce disables TLS 1.0, we're ending support for Connect for Office.

Important: When [Salesforce disables TLS 1.0](#), we're ending support for Connect for Office. This change means that there's no guarantee that Connect for Office can establish a connection between Salesforce and Microsoft® Word or Excel. Even if sales reps can establish a connection, Salesforce no longer provides support or maintenance when there's an issue.

Important: Each mail merge field label you use must be unique.

1. Open Microsoft Word.

2. **If you use** **You'll**

Word 2003 or earlier	Select Log In from the Salesforce drop-down menu on the toolbar.
Word 2007	Open the Salesforce tab on the Ribbon, click the Merge Fields drop-down menu, and then select Log In .

3. Enter your Salesforce username and password.

4. Click **Login**.

Note: When you are successfully logged in and have an active session, the **Log In** command in the drop-down button is disabled. To log out, click **Log Out**.

5. Create your mail merge template from an existing or blank Word document.

6. Place your cursor where you want to insert a Salesforce merge field. To replace an existing merge field, select the entire merge field in your template. Mail merge fields must be unique.

7. In Word 2003 and earlier, select **Insert Merge Field** from the **Salesforce** drop-down menu. In Word 2007, click the **Merge Fields** drop-down menu at the Salesforce tab on the Ribbon, and then select **Insert Merge Field**.

8. In the Insert Merge Fields dialog, select a field type and then select the merge field you want to insert. If you use products in Salesforce, see [Including Opportunity Product Data in Mail Merge Templates](#) on page 1630.

EDITIONS

Available in: Salesforce Classic

Available in all editions

9. Click **Insert** to add the merge field at your current cursor position in your Word document.
10. Insert additional merge fields as desired to build your mail merge template.
11. After your mail merge template is complete, upload it to Salesforce from Setup by entering *Mail Merge Templates* in the **Quick Find** box, then selecting **Mail Merge Templates**.

Including Opportunity Product Data in Mail Merge Templates

Products are available in Professional, Enterprise, Unlimited, Performance, and Developer Editions. To add opportunity product data to your mail merge template, in the Insert Merge Fields dialog select Opportunity Line Item Fields and then select the fields to insert. This inserts a table with the selected merge fields and special “start” and “end” fields. (You can download sample [default mail merge templates](#) which include a table of opportunity product data.) You can modify this table as needed, but the `Opportunity_LineItem_Start` merge field must be before all opportunity product merge fields and the `Opportunity_LineItem_End` merge field must be after all opportunity product merge fields. These start and end fields trigger Salesforce to list all of the products on the opportunity.

If you also want to insert product merge fields into the table of opportunity product merge fields, you can do so manually without using the Salesforce Word add-in:

1. In your Word document, place your cursor where you want to insert the merge field.
2. In Word 2003 and earlier, select **Insert** and then **Field** from the Word menu bar. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
3. Select **Mail Merge** in the Categories drop-down list.
4. Select **MergeField** in the Field names box.
5. In the Field name box in the Field Properties area, enter the merge field name manually, such as `Opportunity_LineItem_ProductName`.
6. Click **OK**.

Uploading Mail Merge Templates to Salesforce

Administrators and users with the “Manage Public Templates” permission must upload completed Microsoft Word mail merge templates to Salesforce to make them available for use.

 **Tip:** Before uploading a template, we recommend reviewing [Guidelines for Uploading Mail Merge Templates](#).

1. In Salesforce, from Setup, enter *Mail Merge Templates* in the **Quick Find** box, then select **Mail Merge Templates**.
2. Click **New Template**.
3. Enter a name and description for the template. This will help users correctly choose a template when generating mail merge documents.

If your organization uses Extended Mail Merge, choose the appropriate document type: *Document, Label, or Envelope*.
4. Click **Browse** to select your Word mail merge template.
5. Click **Save** to finish.

SEE ALSO:

[Managing Mail Merge Templates](#)
[Generate Emails From Records](#)
[Mail Merge](#)

Using Letterheads

A letterhead defines the logo, page color, and text settings for your HTML email templates. For best results, create a single letterhead to use for all your HTML email templates. You can create letterheads and make them available organization-wide.

To use letterheads, from Setup, enter *Letterheads* in the **Quick Find** box, then select **Letterheads**.

From the Letterheads list page:

- To view a letterhead, select the name from the list.
- To edit a letterhead, click the name from the list and choose one of the edit options: **Edit Properties** or **Edit Letterhead**.
- To delete a letterhead, click **Del** next to the name. You cannot delete a letterhead that is used in any HTML email templates.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or change letterheads:

- “Manage Letterheads”

Create a Letterhead

Letterheads define the look and feel of your HTML email templates. Your HTML email templates can inherit the logo, color, and text settings from a letterhead.

A letterhead consists of properties and details. The properties are only visible inside your organization; they help users identify a letterhead. The details are applied to an email when using that letterhead. Use the letterhead wizard to create both the properties and details of your letterhead.

1. From Setup, enter *Letterheads* in the **Quick Find** box, then select **Letterheads**.
2. Click **New Letterhead**.

Setting Letterhead Properties

1. Check **Available For Use** if you would like users to be able to use the new letterhead immediately.
2. Enter a **Letterhead Label**. The label is used to refer to the letterhead on user interface pages.
3. If necessary, change the **Letterhead Unique Name**. This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Letterhead Unique Name** field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
4. Enter a description for this letterhead. The name and description fields are for internal use only to describe the letterhead to other users.
5. Click **Save**. The letterhead detail page appears.

Setting Letterhead Details

1. Set the attributes for the letterhead.
 - Click **Edit Background Color**, and enter a color for the background of your letterhead. Click the color picker button to choose a color.
 - Click **Edit Header Properties**, and select the color, alignment, and height for the top section of the letterhead.
 - Click **Select Logo** to include an image of your company logo in the top or bottom section of the letterhead.

 **Note:** You must upload the logo image to the Documents tab before you can add it to the letterhead. Make sure the document is marked as an **Externally Available Image** so it is visible to non-Salesforce users when it is received in an email. For more information, see "Upload and Replace Items on the Documents Tab" in the Salesforce Help.

To select an image, choose a folder, and click the document name to attach the document. Alternatively, click **Search in Documents**, and enter the file name to search for documents by name.

- Click **Remove Logo** to delete the image from the letterhead.
- Click **Edit Top Line**, and enter a color and height for a horizontal line below the header. Click the color picker button to choose a color.
- Click **Edit Body Colors**, and enter the background color for the main body of your letterhead.
- Click **Edit Middle Line**, and enter a color and height for the middle border in your letterhead. Click the color picker button to choose a color.
- Click **Edit Footer Properties**, and select a color, alignment, and height for the bottom section of the letterhead.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All Editions**, except **Personal**

USER PERMISSIONS

To create or change letterheads:

- "Manage Letterheads"

- Click **Edit Bottom Line**, and select a color and height of a bottom horizontal line. Click the color picker button to choose a color.
2. Optionally, click **Preview** to display the letterhead in a separate browser window.
 3. Click **Save**.

To create an HTML email template that contains the settings in your letterhead, see [Create HTML Email Templates](#) on page 2094.

SEE ALSO:

[Manage Email Templates](#)

[Create Custom HTML Email Templates](#)

Letterhead Fields

Here is a description, in alphabetical order, of the fields that appear on the Letterhead Detail page.

Field	Description
Available For Use	Check mark that indicates the letterhead can be applied to an HTML template.
Created By	Name of the user who created the letterhead, including the date and time.
Description	Text that helps distinguish this letterhead from others.
Letterhead Label	Internal name to identify the letterhead.
Letterhead Unique Name	This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the <code>Letterhead Unique Name</code> field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
Modified By	Name of the user who last modified the letterhead, including the date and time.
Namespace Prefix	The namespace prefix used by the email template within the API.

SEE ALSO:

[Create a Letterhead](#)

Manage Email Templates

In Salesforce Classic, you can create four different types of email templates: text, HTML with letterhead, custom, and Visualforce. All of these email templates can include text, merge fields, and attached files. You can also include images on your HTML and Visualforce templates. You can use email templates when you send an email from the Activity History or HTML Email Status related list of a record. Text and HTML templates can also be used when you send mass email. A button to check the spelling of your template is available for text templates and Visualforce templates without HTML tags.

- **Text** - All users can create or change text email templates. See [Create Text Email Templates](#) on page 1636.
- **HTML with letterhead** - Administrators and users with the “Edit HTML Templates” permission can create HTML email templates based on a letterhead. See [Create HTML Email Templates](#) on page 2094.
- **Custom HTML** - Administrators and users with the “Edit HTML Templates” permission can create custom HTML email templates without using a letterhead. You must either know HTML or obtain the HTML code to insert in your email template. See [Create Custom HTML Email Templates](#) on page 2093.
- **Visualforce** - Administrators and developers can create templates using Visualforce. Visualforce email templates allow for advanced merging with a recipient's data, where the content of a template can contain information from multiple records. See [Create Visualforce Email Templates](#).

 **Note:** You can't send a mass email using a Visualforce email template.

To access your email templates, do one of the following:

- If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
- If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Click the name of any email template to go to the [Viewing Email Templates](#) page.
- To edit or delete a template, click **Edit** or **Del** next to the template name in the list.
- Click **New Template** to create any type of email template.

 **Note:** Email templates used in the following features must be both public and active:

- Web-to-Lead
- Web-to-Case
- Email-to-Case or On-Demand Email-to-Case
- Assignment rules
- Escalation rules
- Auto-response rules

To create or change Visualforce email templates:

- Customize Application

To create or change public email template folders:

- Manage Public Templates

Viewing Email Templates

To view a template, click the template name in the list. The options vary depending on the template type (custom, HTML, Visualforce, or text):

- For text templates, click **Edit** to change the message content, subject, or merge fields.
- For custom and HTML templates:
 - Change the content or merge fields of the HTML version by clicking **Edit HTML Version**.
 -  **Note:** All custom and HTML email templates include a text-only version for recipients who can't view HTML emails. If you leave the text-only version blank, the text-only version is generated automatically when you edit the HTML version.
 - Change the content or merge fields of the text-only version by clicking **Edit Text Version**.
 -  **Warning:** We recommend that you leave the text-only version blank. If you leave it blank, Salesforce automatically creates the text-only content based on the current HTML version. If you enter content manually, subsequent edits to the HTML version aren't reflected in the text-only version.
- For Visualforce templates:
 - Change the markup of the template page by clicking **Edit Template**.
 - The Visualforce Attachments related list indicates which attachments are being generated through Visualforce markup.
 - If the Visualforce markup references components in installed managed packages, the Version Settings related list shows the package versions of the installed packages containing the components. Some kinds of components in installed managed packages can include another class, a trigger, or a custom object.
 - If the email template includes encrypted data, remember that the data is displayed as encrypted within the generated email and in the Visualforce template page. For security reasons, it isn't displayed in plain text.
- View a sample of the template populated with data from records you choose and send a test email by clicking **Send Test and Verify Merge Fields**.
- Click **Attach File** from the Attachments related list. The attached file is included in every email based on the template.

To select a file:

 - To search for files in the Documents tab, click the **Search in Documents** link. If you select an image logo or other graphics file, mark the document `Externally Available` on the Documents tab.
 - Alternatively, select a file from your computer or from a document folder by choosing an option from the **File Location** drop-down list.
- If you have the "Manage Public Templates" permission, you can click **[Change]** next to the `Author` field to select a different author. By default, the author is the person who created the email template.
- Remove the template by clicking **Delete**.
- Clone a template by clicking **Clone**. For more information, see [Clone Email Templates](#) on page 1639.
- If "Developer Mode" is enabled, see what components the template references by clicking **Show Dependencies**.

Create Text Email Templates

You can create plain-text email templates to send to recipients who can't read HTML email.

1. Do one of the following:
 - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
 - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
 2. Click **New Template**.
 3. Choose the **Text** template type, and click **Next**.
 4. Choose a folder in which to store the template.
 5. To make the template available for use, select the **Available For Use** checkbox.
 6. Enter a name in **Email Template Name**.
 7. If necessary, change the **Template Unique Name**. This unique name refers to the component when you use the Force.com API. In managed packages, this unique name prevents naming conflicts in package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Template Unique Name** field, you can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
 8. If desired, choose a different character set from the **Encoding** drop-down list.
 9. Enter a **Description** for the template. Both template name and the description are for your internal use only.
 10. Enter a **Subject** for the message.
 11. Enter the text of the message.
 12. If desired, enter merge fields in the template subject and text body. When you send an email, these fields are replaced with information from your records.
 13. Click **Save**.
-  **Tip:** View a sample of the template populated with data from records you choose and send a test email by clicking **Send Test and Verify Merge Fields**.

Create Custom HTML Email Templates

You can create custom HTML email templates without using letterhead. If you don't know HTML, you can paste HTML code into your template.

1. Do one of the following:
 - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
 - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
2. Click **New Template**.
3. Choose **Custom (without using Letterhead)** and click **Next**.
4. Choose a folder in which to store the template.
5. To make the template available for use, select the **Available For Use** checkbox.
6. Enter a name in **Email Template Name**.
7. If necessary, change the **Template Unique Name**. This unique name refers to the component when you use the Force.com API. In managed packages, this unique name prevents naming conflicts in package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Template Unique Name** field, you can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
8. If desired, choose a different character set from the **Encoding** drop-down list.
9. Enter a **Description** for the template. Both template name and the description are for your internal use only. The description is used as the title of any email activities you log when sending mass email.
10. Click **Next**.
11. Enter a **Subject** for the message.
12. Enter the HTML source text for the message. Include all the HTML tags.

To create or change Visualforce email templates:

- Customize Application

To create or change public email template folders:

- Manage Public Templates

Add Images to Email Templates

You can include images, such as logos, in your custom HTML and Visualforce email templates.

When creating custom HTML or Visualforce templates, use an `img` tag to reference the image. We recommend uploading the images to the Documents tab and referencing the copy of the image on the Salesforce server.

 **Note:** For HTML with letterhead email templates, logos or images come from the [letterhead](#) you choose when creating the email template.

1. Add an image to the Documents tab.
2. On the Documents home page, open the image by clicking its name.
3. Right-click the image and get its reusable URL address. When you use the URL, you reference the copy of the image on the Salesforce server.
4. Open your custom HTML or Visualforce template.
5. Place the HTML tag ``, using the image's URL address, where you want to insert the image in the email template.

 **Note:** You can also use the URL of an external website, such as ``. However, you have more control over an image if it's stored in your org.

Example: Custom HTML (Without Letterhead) Email Template

```

```

Example: Visualforce Email Template

```
<apex:image id="Logo"
value="https://yourInstance.salesforce.com/servlet/servlet.ImageServer?
id=015D0000000Dpwc&oid=00DD0000000FHAG&lastMod=1270576568000"
/>
```

[Create a Letterhead](#)

Email Template Fields

An email template has the following fields, listed in alphabetical order.

Field	Description
API Version	(Visualforce email templates only) Displays the version number of the Force.com API the template was created under.
Author	The person who created the template.
Available for Use	Indicates if users can use the template when sending emails. Not exposed in Salesforce Lightning.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**, except **Personal**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

HTML and Visualforce email templates not available in: **Personal Edition**

USER PERMISSIONS

To create or change HTML email templates:

- Edit HTML Templates

To create or change Visualforce email templates:

- Customize Application

To create or change public email template folders:

- Manage Public Templates

Field	Description
Created By	The name of the user who created the template.
Description	Description of the template. This text is used as the title of any activities logged when sending mass email. The Activity History item displays as "Mass Email: {Template Description}".
Template Unique Name	This unique name refers to the component when you use the Force.com API. In managed packages, this unique name prevents naming conflicts in package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the <code>Template Unique Name</code> field, you can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
Email Layout	(HTML email templates only) Name of the column layout sample that decides the text columns. Not exposed in Salesforce Lightning.
Encoding	Indicates the character set for the email template. Not exposed in Salesforce Lightning.
Folder	The place where the template is stored. Not exposed in Salesforce Lightning.
Last Used Date	The most recent date that any user sent an email using the template.
Letterhead	(HTML email templates only) Name of the letterhead that decides the logo, colors, and text settings. Not exposed in Salesforce Lightning. See Letterhead Fields on page 1633 for more details.
Modified By	The name of the user who last modified the template.
Namespace Prefix	The namespace prefix used by the email template within the API.
Subject	Subject of the email. This text appears in the Subject field of every email sent with this template. It is also used as the title of an activity logged when sending a single email. The Activity History item displays as "Email: {Template Subject}". The subject is not stored in Activity History items that you log when sending mass email.
Email Template Name	Name to identify the template.
Text Body	Body of the email. This text appears in the body of every email sent with this template. The maximum size is 384 KB. Not exposed in Salesforce Lightning.
Times Used	The total number of times that users have sent emails using the selected template. This includes single and mass emails.

Merge Fields for Cases

The list of available merge fields depends on the type of data that you're working with. Most of the merge fields for cases correspond directly with a case field. This table explains the more advanced merge fields that represent values derived from processing a case record.

Field	Merge Field	Description
Articles as PDFs	Case.Articles_as_PDFs	Articles associated with the case converted to PDF attachments. In the Emails related list on the case detail page, users can click Send an Email and choose a template containing this merge field. The attachments can be previewed or deleted before the email is sent.
Email Thread	Case.Email_Thread	A thread of all emails where the case contact is a sender or recipient (To, CC, or BCC). The emails are listed in reverse chronological order so the most recent emails appear at the top of the thread. The thread inserts the text version of the emails. You can't use this merge field in Visualforce pages. The limits for the email thread are: <ul style="list-style-type: none"> • Maximum number of emails: 200 • Email body truncation size: 32 KB
Last Case Comment	Case.Last_Case_Comment	The description of the most recent comment to be created on a case.
Solution Attachments	Case.Solution_Attachments	Attachments for the case solution..
Solution Description	Case.Solution_Description	The details of the solution associated with the case. If more than one solution is associated with the case, the description of each solution appears in a list.
Solution Subject	Case.Solution_Subject	The title of the solution associated with the case. If more than one solution is associated with the case, the title of each solution appears in a list.
Solution Subject and Description	Case.Solution_Subject_and_Description	The title and details of the solution associated with the case. If more than one solution is associated with the case, the title and description of each solution appears in a list.

EDITIONS

Available in: Salesforce Classic

The available merge fields vary according to which Salesforce edition you have.

Field	Merge Field	Description
Suggested Solutions	<code>Case.Suggested_Solutions</code>	Links to the subject and description of each suggested solution that may help customers solve their issues.  Note: Sending mass emails using templates with the suggested solutions merge field can take several minutes and isn't recommended.
Case Thread Id	<code>Case.Thread_Id</code>	A unique identifier for the case email thread in Email-to-Case. The thread ID is the unique ID of each case email, such as [ref:_DV0Txx._500V0U9YB:ref]. By default, the thread ID is added to both the subject and body of case emails. The default location for the thread ID is at the end of the body. Use this merge field to position it elsewhere in the body.

Notes on Merge Fields for Cases

Merge fields for entitlements on cases

Merge fields for entitlements on cases aren't supported. For example, if you add the `Entitlement Name` `{!Case.Entitlement}` merge field to an email template, the field is not populated on the template.

Merge fields for Email-to-Case or On-Demand Email-to-Case

If you have enabled Email-to-Case or On-Demand Email-to-Case, you can create email templates that support agents can use to respond to case emails. These templates can include merge fields that display information from the original email in the response. See [Manage Email Templates](#) on page 1634.

Merge fields for Web-to-Case

To reference the name, email, phone, or company of the customer who submitted an online case with Web-to-Case, use the relevant `{!Case_OnlineCustomer...}` field. To reference the contact or account associated with a case, use the relevant contact or account merge fields.

Merge Fields for Communities

You can add merge fields to Communities email templates.

When you enable Salesforce Communities in your organization, three text-based email templates are created:

- Communities: Changed Password Email
- Communities: Forgot Password Email
- Communities: New Member Welcome Email

These templates use unique merge fields. These merge fields are not available to select and copy when editing a template, but you can enter them manually. These merge fields will only work properly if used in a text or HTML template selected for a community.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Field Name	Description
<code>{!Community_Name}</code>	The name of the community, as entered during community creation.

Field Name	Description
<code>{!Community_Url}</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if:</p> <ul style="list-style-type: none"> The template containing this field is selected as the Welcome New Member template for a community, and Send welcome email is selected, OR The template containing this field is selected as either the Forgot Password or Change Password template and the user receiving the email is an external user who is a member of the community.
<code>{!Receiving_User.Username}</code>	The user name of the user who will receive the welcome email.

You can create custom email templates for communities using Visualforce, which allows you to use custom company branding in your email templates. For Visualforce email template, use the `$Network` global merge field type and its properties, as described in this table.

Field Name	Description
<code>\$Network.Name</code>	The name of the community, as entered during community creation.
<code>\$Network.NetworkUrlForUserEmails</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if it is used in a Visualforce email template for one of three email types supported for Communities.</p>

If your community is using cases, approvals, or workflows, emails created from an email template that use the `{!<any_object>.Link}` or `{!Case.Link}` merge fields include a link to the record in the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

Field Name	Description
<code>{!Case.Link}</code>	<p>Used in:</p> <ul style="list-style-type: none"> Case comment notifications to contacts and owners Case creation and update notifications to contacts

Field Name	Description
{!<any_object>.Link}	Used in: <ul style="list-style-type: none"> Approval requests sent to approvers and delegated approvers Workflow email alerts

To find out if your email templates use these merge fields, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**, then click **Edit** next to any email template.

Generate Mass Mail Merge Documents with Extended Mail Merge

 **Note:** You can generate mail merge documents using the Extended Mail Merge feature. Extended Mail Merge is available by request only. Contact Salesforce Customer Support if you are interested in this feature.

In addition, your administrator must activate the feature before you can use Extended Mail Merge.

With Extended Mail Merge, you can easily generate mail merge Microsoft® Word documents—such as form letters with matching envelopes and address labels—for multiple records at the same time.

1. Click the accounts, contacts, or leads tab. Other kinds of records are not currently supported.
2. In the Tools area, click **Mass Mail Merge** to start the mass mail merge wizard.
3. Choose an appropriate list view from the **view** drop-down list.
4. Select the records to include in the mail merge. To select all records currently displayed on the page, select the checkbox in the column header.
5. Click **Next**.
6. Select the types of Word documents you'd like to generate. The supported document types are documents, envelopes, and labels.
7. Select the **Log an activity...** checkbox to log the generation of these mail merge documents by adding a completed task on each record.
8. Click **Next**.
9. Select the appropriate [mail merge templates](#).
For documents, choose whether to create one Word document that includes all output or a separate Word document for each record.
10. Optionally, click **Preview Template** to review the Word document with merge fields but without your data. Note that although you can edit the Word document that opens, those changes won't be applied to your current mail merge request. To make a newly revised template available for mail merge, it must be [uploaded](#) first.

EDITIONS

This feature is available in Salesforce Classic

Available in all editions

USER PERMISSIONS

To generate mass mail merge documents:

- "Manage Public Documents"

11. Click Finish.

-  **Note:** If your request exceeds the maximum size limit for Extended Mail Merge, you're prompted to select either fewer records or smaller templates.

Salesforce sends you an email when your generated documents are ready. When mail merge documents are:

- Under 3 MB, Salesforce sends them to your email as either Word document (.doc) or Zip file (.zip) attachments. If the attachment size exceeds your organization's maximum email attachment size, or your administrator has set all mail merge documents to be saved to the Documents tab, Salesforce automatically saves your generated documents to the Documents tab. You'll receive an email with a link to the document's location.
- Over 3 MB, Salesforce saves them to your personal documents folder on the Documents tab.

Mail Merge Considerations

Extended Mail Merge supports the following additional environments: the Mozilla Firefox Web browser and the Apple Mac OS. Furthermore, it doesn't require the installation of an ActiveX control.

Extended Mail Merge supports Microsoft Word 2007.

- Extended Mail Merge does not support templates saved in .docx or .dotx file formats.
- Mail merge documents give you access only to the fields that are accessible to you via your page layout and field-level security settings.
- Extended mail merge doesn't support formatting from rich text area fields.
- Using mail merge from a record detail page automatically triggers standard workflow and validation rules for that record. Using Extended Mail Merge, however, doesn't trigger those rules.
- With Extended Mail Merge, a mail merge operation can't exceed the following limits:
 - 1,000 records
 - The selected mail merge template(s) total size can't be larger than 1 MB.
 - For mass mail merges, the number of selected records multiplied by the combined sizes of the selected mail merge templates can't be larger than 50 MB.
- When you preview a mail merge document, you see only the template. The preview doesn't populate merge fields with your data because there's no record detail available to the preview template.

SEE ALSO:

[Mail Merge](#)

[Send a Single Mail Merge Document](#)

Send a Single Mail Merge Document

Create mail merge documents using fields supported objects.

-  **Important:** Salesforce is ending support for Standard Mail Merge and Connect for Office on March 4, 2017. This change means that Salesforce no longer provides support or maintenance when there is an issue. To let sales reps continue running mail merges with Salesforce data, migrate your sales reps to [Extended Mail Merge](#).

1. Click **Mail Merge** in the Activity History related list on the appropriate record. Accounts, contacts, leads, cases, opportunities, and custom objects are supported.

EDITIONS

This feature is available in Salesforce Classic

Available in all editions

 **Note:** With standard mail merge, the first time you create a mail merge document you must install an ActiveX control that helps Salesforce communicate with Word. For more information, see [Installing the Mail Merge ActiveX Control](#) on page 1626.

2. Use the lookup to specify the record from which information will be merged.

3. Select a mail merge template.

4. Click **Generate**.

If the custom object has a master-detail relationship with opportunities, the primary contact for the opportunity is selected by default.

5. Salesforce then generates your document:

- If your organization uses standard mail merge, Word opens with your generated document. When the document displays, choose **Save As** from the **File** menu to save the document to your hard drive.
- If your organization uses Extended Mail Merge and your request exceeds the maximum size limit, you are prompted to select a smaller mail merge template. With Extended Mail Merge, Word does not open when you click **Generate**. Instead, Salesforce sends you an email that either includes your generated Word document as an attachment or provides a link to it on the Documents tab.

6. If you chose to log an activity for the mail merge, enter the task information, and optionally create a follow-up task.

The `Subject` of the mail merge task is set to the mail merge template name by default, and the task is displayed as a completed activity in the Activity History related list. The merged document is not stored with the task.

You can log an activity for mail merge if you have access to view or edit the record you are merging and are able to create tasks (that is, you have the “Edit Task” permission).

7. Print and mail your document or send it as an email attachment.

Mail Merge Considerations

Extended Mail Merge supports the following additional environments: the Mozilla Firefox Web browser and the Apple Mac OS. Furthermore, it doesn't require the installation of an ActiveX control.

Extended Mail Merge supports Microsoft Word 2007.

- Extended Mail Merge does not support templates saved in `.docx` or `.dotx` file formats.
- Mail merge documents give you access only to the fields that are accessible to you via your page layout and field-level security settings.
- Extended mail merge doesn't support formatting from rich text area fields.
- Using mail merge from a record detail page automatically triggers standard workflow and validation rules for that record. Using Extended Mail Merge, however, doesn't trigger those rules.
- With Extended Mail Merge, a mail merge operation can't exceed the following limits:
 - 1,000 records
 - The selected mail merge template(s) total size can't be larger than 1 MB.
 - For mass mail merges, the number of selected records multiplied by the combined sizes of the selected mail merge templates can't be larger than 50 MB.

- When you preview a mail merge document, you see only the template. The preview doesn't populate merge fields with your data because there's no record detail available to the preview template.

Connect Offline

Force.com Connect Offline

With Force.com Connect Offline, work on your key deals anywhere, any time—totally unplugged.

Connect Offline is a client application that lets you access a subset of Salesforce records using the same browser-based interface as the online system but without an Internet connection. Use Connect Offline to view, edit, create, and delete accounts, activities, contacts, opportunities, leads, and custom object records (including relationship groups). You can also add and update products and schedules on opportunities.

The subset of Salesforce records accessible in Connect Offline is referred to as a *briefcase*.

Administrators can create *briefcase configurations*, which are sets of parameters that determine the records available in the briefcases of users with a specific profile. Organizations can have multiple briefcase configurations and associate each with a different set of profiles to simultaneously suit

the needs of various types of offline users. For example, one configuration might include leads and opportunities in the briefcases of users with a Sales Representative profile, while another configuration includes accounts and related opportunities in the briefcases of users with an Account Executive profile. Users without an assigned briefcase configuration can [configure the settings for their own Connect Offline briefcase](#) and can [manually select the accounts the briefcase includes](#).

When online, users can [synchronize their Connect Offline briefcases with Salesforce](#). During synchronization, the changes to records in the briefcase are implemented in Salesforce, and vice-versa. This ensures that both Salesforce and Connect Offline have the most current records. If updates to a record in the briefcase conflict with updates to a record in Salesforce, Connect Offline displays the conflict resolution tool, which allows users to easily [resolve the conflict](#).

To start using Connect Offline today, log into Salesforce and [install the Connect Offline client application](#).

SEE ALSO:

[Install Connect Offline](#)

[What is Your Default Connect Offline Briefcase Contents?](#)

[Log in to Connect Offline](#)

[Tabs Available in Connect Offline](#)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Log in to Connect Offline

1. On your computer, click **Start > Programs > salesforce.com > Connect Offline**, or double-click the Connect Offline desktop icon.

 **Important:** The first time you log into Connect Offline, you must have an Internet connection.

2. Enter your Salesforce username and password.

 **Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

3. Select the `Update tab names` checkbox if you want Connect Offline to reflect any changes to the names of fields, objects, and tabs in Salesforce since the last time you selected this option.

 **Note:** Salesforce automatically updates your tabs the first time you log in.

4. Select the `Synchronize my data` checkbox to synchronize your Connect Offline briefcase with Salesforce.
5. Click **Login**.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

User Permissions Needed

To view records in Connect Offline:

- "Read" on the appropriate type of record such as accounts, contacts, or opportunities

To update records in Connect Offline:

- "Create," "Edit," or "Delete" on the appropriate type of record such as accounts, contacts, or opportunities

Briefcase Configuration

Manage Connect Offline Briefcase Configurations

Connect Offline *briefcase configurations* are sets of parameters that determine the records available in the briefcases of both individual users as well as users with a specific profile. You can create multiple briefcase configurations and associate each with different users and profiles to simultaneously suit the needs of various types of offline users. For example, one configuration might include leads and opportunities for sales representatives, while another configuration includes accounts and related opportunities for account executives.

Users without assigned briefcase configurations see the [default briefcase contents](#) and can manually configure settings for their own Connect Offline briefcase; however, Salesforce recommends using briefcase configurations instead of allowing users to manually configure their own offline briefcases because briefcase configurations provide:

- Centralized configuration
- Synchronization with any custom object, as opposed to personal briefcase settings that only support custom objects related to accounts, contacts, opportunities, or leads
- The ability to define [data sets](#) with greater flexibility and filtering capabilities

To manage briefcase configurations for your organization, from Setup, enter *Offline Briefcase Configurations* in the **Quick Find** box, then select **Offline Briefcase Configurations**.

- To create a briefcase configuration, click **New Offline Briefcase Configuration**.
- To define a data set for an offline briefcase configuration, click the name of the briefcase configuration, then click **Edit** in the Data Sets related list.
- To make changes to a briefcase configuration, click **Edit**.
- To delete a briefcase configuration, click **Del**.
- To view details about a briefcase configuration, click its name.
- To clone a briefcase configuration, select the briefcase configuration you want to clone and click **Clone**.
- To activate a briefcase configuration, click **Edit** next to the configuration you want to activate, select **Active**, and click **Save**.
- To deactivate a briefcase configuration, click **Edit** next to the configuration you want to deactivate, deselect **Active**, and click **Save**.

 **Important:** If you deactivate an active briefcase configuration, users assigned to that configuration cannot synchronize their briefcases.

SEE ALSO:

[What is Your Default Connect Offline Briefcase Contents?](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view Connect Offline briefcase configurations:

- “View Setup and Configuration”

To create, change, or delete Connect Offline briefcase configurations:

- “Manage Mobile Configurations”

Create an Offline Briefcase Configuration

1. From Setup, enter *Offline Briefcase Configurations* in the Quick Find box, then select **Offline Briefcase Configurations** to access the briefcase configurations list page.
2. Click **New Offline Briefcase Configuration**.
3. Enter a name for the briefcase configuration.
4. Select the **Active** checkbox if you want to activate the briefcase configuration immediately after you create it. The configuration does not work until you select this checkbox.
5. Enter a description for the briefcase configuration.
6. Select users and profiles from the **Available Members** box and click the **Add** arrow to assign them to the briefcase configuration. If you do not immediately see the user or profile you want to add, enter the profile name in the search box and click **Find**. You can assign each user or profile to only one briefcase configuration.

If there are users and profiles in the **Assigned Members** box you do not want to assign to the briefcase configuration, select them and click the **Remove** arrow.

 **Warning:** If you remove a user or profile from an active briefcase configuration, those users can no longer synchronize their briefcases to that configuration. The next time the users synchronize, Connect Offline synchronizes their briefcases with the [default briefcase content](#).

When you assign profiles to a briefcase configuration, the configuration applies to all Connect Offline users with that profile and overrides users' personal briefcase configurations.

7. Click **Save**.
8. Also, you must [create the data sets](#) for this offline briefcase configuration to determine the data that members of the configuration receive in their briefcase.

Note that your offline briefcase configuration is not active until you select the **Active** checkbox. Also, you must [create the data sets](#) for this briefcase configuration to determine the records that users with this configuration can access in Connect Offline.

SEE ALSO:

[Manage Connect Offline Briefcase Configurations](#)

[What is Your Default Connect Offline Briefcase Contents?](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To create, change, or delete briefcase configurations:

- "Manage Mobile Configurations"

Define Connect Offline Data Sets

After you create a briefcase configuration, define its data sets to specify the records that users can access in Connect Offline if that briefcase configuration is assigned to their profile.

Data sets are the parameters in briefcase configurations that determine which records appear in the briefcases of users assigned to the briefcase configuration. Each data set pertains to records of a single object and is classified by the name of that object. For example, the Accounts data set only includes account records. Filters and limits within each data set let you further restrict the records the data set includes.

Data sets can have child data sets for records associated with a top-level (parent) data set. For example, if the first level of your hierarchy has an Accounts data set, you can add a Contacts child data set for all contact records related to the account records.

A single briefcase configuration can have multiple data sets for the same object and at different levels. For example, you can have an Events parent data set and an Events child data set under Leads.

To define the data sets for a briefcase configuration:

1. From Setup, enter *Offline Briefcase Configurations* in the Quick Find box, then select **Offline Briefcase Configurations**.
2. Click the name of the briefcase configuration that you want to modify.
3. In the Data Sets related list, click **Edit**.
4. From the Data Sets page, you can:
 - Add a data set.
 - Remove a data set by selecting the data set you want to remove and clicking **Remove**.
 - Edit a data set by selecting the data set you want to edit in the hierarchy. The right pane displays the filters for that data set.

As you define and modify the data sets, Salesforce automatically saves your changes.

5. In the Test Data Size section, select a user and click **Estimate Data Size** to estimate the amount of data the data sets will synchronize to a user's briefcase. Larger data sets take longer to synchronize and consume more disk space on users' computers.

Note: The `Select a user` field defaults to the name of the user currently logged in; however, it is important to test the data size for users who will actually be assigned to the briefcase configuration for which you are defining the data sets.

When the test completes, the Test Data Size section provides data set size summary information, and the data set hierarchy at the top of the page displays the number of records generated by each data set and the size of each data set. Use these statistics to identify data sets that might require additional filtering criteria to reduce the size.

The test statistics in the Test Data Size section do not automatically refresh if you edit the data sets. Click **Refresh Data Size** to update the test results.

6. Click **Done** when you are finished.

Adding Data Sets

To add a data set:

1. In the hierarchy, select **Data Sets** to create a parent data set, or select an existing data set to create a child data set.
2. Click **Add...**

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view Connect Offline data sets:

- "View Setup and Configuration"

To create, change, or delete Connect Offline data sets:

- "Manage Mobile Configurations"

3. In the popup window, select the object for the records you want the data set to include. Salesforce lets you create parent data sets for all custom objects and the following standard objects:

- Accounts
- Contacts
- Events
- Leads
- Opportunities
- Products
- Tasks
- Users

For child data sets, the popup window only lists objects that relate to the selected parent data set.

 **Note:** Salesforce automatically transfers parent records of objects if that type of parent record is anywhere in the data set, even if the parent object is not connected to the child object in the hierarchy.

4. Click **OK**. The data set you created appears in the hierarchy.

5. Optionally, use filters to restrict the records that a parent or child data set includes:

- a. Use the Filter by Record Ownership options to configure Salesforce to automatically synchronize records based on the owner of the record. The possible options are:
 - **All Records:** Salesforce automatically synchronizes all records the user can access.
 - **User's Records:** Salesforce automatically synchronizes all records the user owns.
 - **User's Team's Records:** Salesforce automatically synchronizes all records owned by the user and the user's subordinates in the role hierarchy.
 - **User's Account Team's Records:** Salesforce automatically synchronizes accounts for which the user is an account team member, but does not include accounts owned by the user.
 - **User's Opportunity Team's Records:** Salesforce automatically synchronizes opportunities for which the user is an opportunity team member, but does not include opportunities owned by the user.
 - **None (Search Only):** Salesforce does not automatically synchronize any records for this data set.

Salesforce only displays options that relate to the selected data set. For example, selecting an account data set displays the **User's Account Team's Records** option, while selecting an opportunity data set displays the **User's Opportunity Team's Records** option.

If your offline needs for an object require a combination of the available record ownership filters, you can add the same object data set up to four times on the same hierarchy level. For example, a sales manager might want to synchronize his opportunities, opportunities owned by his subordinates, and opportunities for which he is an opportunity team member. In this case, you would add an opportunity data set and select **User's Team's Records**, then add a second opportunity data set at the same level in the hierarchy and select **User's Opportunity Team's Records**. Note that objects with only one ownership filter option cannot be added multiple times at the same level of the hierarchy.

- b. Set the filter criteria to automatically synchronize only records that meet specific criteria in addition to the Filter by Record Ownership option you selected. For example, you can set the filter to only include opportunity records with amounts greater than \$50,000, or contact records with the title "Buyer." Several \$User global variables are available in offline configuration filters.

Click **Add Filter Logic** to change the default AND relationship between each filter.

- c. To prevent a single data set from consuming a large amount of memory, select the second radio button under Set Max Record Limit and enter the maximum number of records this data set can transfer to a briefcase. Use the Order By and Sort drop-down lists to specify which records are synchronized if the number of records available is higher than the limit you set.

If the limit is reached, Salesforce synchronizes records in accordance with the Order By and Sort settings. For example, if the settings are Last Modified Date and Descending, Salesforce transfers the most recently modified records and removes the same number of records that were least recently modified.

If you selected the **None (Search Only)** Filter by Record Ownership option, the limit you set does not apply because no records are automatically synchronized.

Tip: Do not use Set Max Record Limit in place of filters. Only use Set Max Record Limit as a safety mechanism, and use filters as the primary means of limiting the number of records in the briefcase. This ensures that your Connect Offline users receive the correct records.

6. Click **Done** when you are finished.

Notes on Data Sets

- Connect Offline users can view opportunity contact roles in their briefcases. To add contact roles to a briefcase, include the contact data set as a child of the opportunity data set in your briefcase configuration.
- Recurring events are not available in Connect Offline.
- Each data set can synchronize a maximum of 5,000 records.
- If you add a custom object containing a custom tab icon to a data set, the look and feel of the custom tab defaults to the Star tab style in Connect Offline.
- Connect Offline does not support the Force.com app menu. If your briefcase configuration synchronizes custom objects, all the tabs for those custom objects are visible when you log into Connect Offline, even if they belong to different apps.

Add Accounts to Your Connect Offline Briefcase Manually

If an administrator doesn't assign a briefcase configuration to your profile, click the **Include Offline** button on any account detail page to manually add the account to your Connect Offline briefcase.

The next time you synchronize your briefcase, Salesforce transfers the account to Connect Offline, as well as:

- All contacts associated with the account, if you have at least read access to the contacts
- All opportunities associated with the account, if you have at least read access to the opportunities. This includes opportunities that have been shared with you, that are owned by users below you in the role hierarchy, or where you are on the opportunity team. Products and schedules for downloaded opportunities are also included.
- All the custom objects that have a master-detail relationship with the account
- Tasks and events related to the included account, according to these guidelines:
 - Events dated this month, the past two months, or up to 24 months in the future
 - All open tasks up to 24 months in the future

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To manually add accounts to Connect Offline:

- "View" on accounts

- Closed tasks with a due date this month, the past two months, or 24 months in the future
- Tasks with a blank due date that were created or modified this month or within the past two months

You can manually add up to 100 accounts in your briefcase.

 **Note:** The **Include Offline** button automatically appears on the account detail page for all Connect Offline users assigned to profiles without any briefcase configurations. You do not need to add the **Include Offline** button to account page layouts.

Removing Manually-Added Accounts from Connect Offline

You can remove manually added accounts from your briefcase as follows:

1. From your personal settings, enter *Connect Offline* in the *Quick Find* box, then select **Force.com Connect Offline**.
2. Click **Briefcase Setup**.
3. Select the checkbox next to the account to remove.
4. Click **Remove from Briefcase**.

The next time you synchronize your briefcase, Salesforce removes the account from your briefcase, as well as its related contacts, opportunities, and activities, and custom object records that have a master-detail relationship with the account.

What is Your Default Connect Offline Briefcase Contents?

If your user profile does not have an associated briefcase configuration, your default briefcase automatically includes the following:

- All of your contacts (including your private contacts) and read access to related accounts or opportunities
- All contacts associated with the accounts in your briefcase, if you have at least read access to the contacts
- All opportunities associated with the accounts in your briefcase that are either open or have a close date in the current month, the past two months, or up to 24 months in the future if you have at least read access to the opportunities. This includes opportunities that have been shared with you, that are owned by users below you in the role hierarchy, or where you are on the opportunity team. Products and schedules for downloaded opportunities are also included.
- All of your leads up to a maximum of 5000
- All custom object records that have a master-detail relationship with any account, contact, or opportunity that is included in your briefcase
- Your tasks and events, as well as tasks and events related to the accounts in your briefcase, according to these guidelines:
 - Events dated the past two months or up to 24 months in the future
 - All of your open tasks up to 24 months in the future
 - Closed tasks with a due date the past two months or up to 24 months in the future
 - Tasks with a blank due date that were created or modified this month or within the past two months

 **Note:** For tasks and events that are related to custom objects not available offline, the *Related To* field on the activity indicates that the record is not available in Connect Offline.

If your user profile does not have an associated briefcase configuration, your default briefcase also includes all accounts associated with opportunities you own; however, you can change the account selection in your briefcase to include one of the following options instead:

- Accounts that you manually include

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

- Accounts related to the activities in your briefcase
- All your accounts

To edit your account selections, edit **Briefcase Setup**.

[Troubleshoot Connect Offline](#)

Change Your Connect Offline Briefcase Account Selection

If an administrator does not assign a briefcase configuration to your profile, your briefcase contains the [default briefcase contents](#), which includes accounts that are associated with opportunities you own, accounts that you [manually include](#), and accounts related to your contacts. To change the selection of accounts in your Connect Offline briefcase:

1. From your personal settings, enter *Connect Offline* in the `Quick Find` box, then select **Connect Offline**.
2. Click **Briefcase Setup**.
3. Click **Edit** next to Briefcase Settings.
4. Choose one of the following options to specify the accounts you want to include in your briefcase:
 - Manually selected — Up to 100 accounts that you [manually include](#) by clicking the **Include Offline** button on the account detail page, and accounts related to your contacts.
 - Opportunity-based briefcase — Up to 5000 accounts that are associated with opportunities you own (in addition to accounts that you [manually include](#) and accounts related to your contacts). The following restrictions apply:
 - You must have at least read access to the account.
 - The opportunity must be open or have a close date in the past two months or up to 24 months in the future.
 Opportunity-based briefcase is the default briefcase configuration.
 - Activity-based briefcase — Up to 5000 accounts related to the activities in your briefcase (in addition to accounts that you [manually include](#) and accounts related to your contacts).
 - All my accounts — Up to 5000 accounts you own or where you are on the account team (in addition to accounts that you [manually include](#) and accounts related to your contacts).
5. Click **Save**.

Important: If an administrator assigns a briefcase configuration to your profile after you change the selection of accounts in your briefcase, the assigned briefcase configuration overrides your briefcase account selection the next time you synchronize Connect Offline.

Synchronize Your Briefcase

When using Connect Offline with an Internet connection, you can synchronize your briefcase with Salesforce. During synchronization, Connect Offline updates Salesforce to reflect any changes you made to your briefcase records while offline. Connect Offline also updates your briefcase records to reflect any changes in Salesforce since your last synchronization. This ensures that both Salesforce and Connect Offline have the most current records.

Your briefcase automatically synchronizes the first time you log into Connect Offline. When you are using Connect Offline with an Internet connection, you can synchronize your briefcase anytime by clicking **Synchronize Briefcase** in the upper right corner of the browser window.

Data conflicts can occur during synchronization if a user modified an online record that you also modified offline. If updates to a record in your briefcase conflict with updates to a record in Salesforce, Connect Offline displays the Conflict Resolution tool, which allows you to easily [resolve the conflicts](#). If you do not want to resolve the conflicts at that time, click **Cancel** to exit the Conflict Resolution tool. You can return to the Conflict Resolution tool later by clicking the link in the Errors section of the Connect Offline Home tab.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Emptying Your Briefcase

The **Empty Briefcase** link in the upper right corner of the browser window resets Connect Offline to its initial state.

Warning: If you click the **Empty Briefcase** link, Connect Offline deletes all of your briefcase files and settings. Only empty your briefcase if you change the time zone on your computer or if your administrator requests you to do so.

Resolve Connect Offline Conflicts

When you synchronize, data conflicts occur if a user modified the same record in Salesforce that you modified in Connect Offline. For example, a conflict occurs if you change a contact's phone number in Connect Offline and another user changes that contact's address in Salesforce before you synchronize.

When a conflict occurs, Connect Offline displays a conflict resolution tool that enables you to resolve the conflict by identifying the most recent and correct values. The left side of the window displays a list of the records that have data conflicts, while the right side of the dialog box displays the fields that have conflicting data for the record you select in the left side.

To use the conflict resolution tool:

1. In the left pane, use the drop-down list to choose whether to display records in a tree or list view, then choose the record that you want to resolve.
2. In the right pane, use the drop-down list to choose whether to display all fields on the record or only those that have conflicting data, then select the radio button next to the correct value.
3. If necessary, click the pencil icon () and manually enter the value you want to save.

Note: The pencil icon is not available for read-only fields on some objects, such as products on opportunities.

4. Repeat these steps for each record listed in the left pane. When you have selected a value to resolve the conflict, the status of the record in the left pane displays a green check.
5. Click **Submit** when you have finished making selections for all records in conflict.

When working with the conflict resolution tool, note the following:

- If you choose not to resolve your data conflicts at this time, click **Cancel**. You can continue to work in Connect Offline, but the conflict resolution tool displays whenever you synchronize your data.
- Connect Offline lets you enter values that violate validation rules; however, such validation rule violations appear as data conflicts in the conflict resolution tool.

The conflict resolution tool displays only one violation at a time. If a record violates multiple validation rules, resolve and synchronize each violation separately.

- The field values on some objects, such as products on opportunities, are read only in the conflict resolution tool; however, you can change these values as follows:
 1. Switch to the tree view in the left pane.
 2. Select the deepest branch after expanding all the branches.
 3. Choose the `Your Values` radio button to save the Connect Offline values, or the `Salesforce Values` radio button to save the ones on the server instead. The values of the read-only fields change accordingly.
 4. Click **Submit**.

If you click **Submit** without choosing an option, Connect Offline stores the value on the client for any read-only values in conflict resolution.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view records in Connect Offline:

- "Read" on the appropriate type of record such as accounts, contacts, or opportunities

To update records in Connect Offline:

- "Create," "Edit," or "Delete" on the appropriate type of record such as accounts, contacts, or opportunities

Tabs Available in Connect Offline

A subset of tabs and features are available in Connect Offline.

The tabs you see may differ if your administrator renames any Salesforce standard tab names or adds custom objects to your briefcase configuration.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Home Tab

- View, create, modify, or delete your events and tasks except multi-person events
- Update or empty your briefcase contents
- Synchronize, search, and view recent items in the sidebar
- Expand the Briefcase Info section to see the number of records you have in Connect Offline for each object, and the number of records that you have modified since your last synchronization.

 **Note:** The list of modified records in Briefcase Info does not include deleted records. Also, search results do not include long text area fields like account **Description**.

- Click the icons below the calendar to display different views of activities
- To launch the Conflict Resolution tool, click the “You have conflicts to resolve” link when it displays in the sidebar.

Accounts Tab

- View your recent accounts on the accounts home page
- Select a standard list view to list the offline accounts
- View, create, modify, or delete accounts
- View, create, modify, or delete [person accounts](#). This feature is available in Connect Offline version 3.5.2.13 or later.
- View, create, modify, or delete custom objects associated with offline accounts
- Link contacts, opportunities, and activities to offline accounts
- Use your organization’s record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your Briefcase may include some records that are read only depending on the records’ sharing settings.

Relationship Groups Tab

- Track the familial and professional roles of different relationship group members
- Assign primary and secondary designations to the two most important members of a relationship group
- View roll-up related lists of all activities for the members of a relationship group
- View roll-up related lists of the custom objects that are related to the accounts in a relationship group

 **Note:** This feature is available in Connect Offline version 3.5.2.13 or later. Related lists on the relationship group detail page are not available in Connect Offline.

Contacts Tab

- View your recent contacts on the contacts home page
- Select a standard list view to list the offline contacts

- View, create, modify, clone, or delete contacts
- View, create, modify, or delete custom objects associated with offline contacts
- Link activities to offline contacts
- Use your organization's record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your briefcase may include some records that are read only depending on the records' sharing settings.

Opportunities Tab

- View your recent opportunities on the opportunities home page
- Select a standard list view to list the offline opportunities
- View, create, modify, clone or delete opportunities
- View, create, modify, or delete custom objects associated with offline opportunities
- Associate activities and contact roles to offline opportunities
- Add and update contact roles, products, and schedules, and change the price book for an opportunity
- Use your organization's record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your briefcase may include some records that are read only depending on the records' sharing settings.

Leads Tab

- View your recent leads on the leads home page
- Select a standard list view to list the offline leads
- View, create, modify, or delete leads depending on sharing settings
-  **Note:** Changes made to leads in Connect Offline do not trigger assignment rules.
- Link activities to offline leads
- Use record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
-  **Note:** Leads and custom object records are only available in Connect Offline 2.0 and later, which is indicated by the briefcase icon  you use to launch the application.

Notes on Working with Connect Offline

Consider the following when using Connect Offline:

- Multi-person events are visible in Connect Offline but you can't create or edit them. If you have been invited to an event, but are not the organizer, you can't modify or delete that event offline.
- Automatically generated fields such as formula fields and auto-number fields are not available in Connect Offline.

- Related lists in Connect Offline do not display lookup fields.

[Troubleshoot Connect Offline](#)

Troubleshoot Connect Offline

Review the following common situations and solutions to troubleshoot Connect Offline issues.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Activities

Unable to edit the record associated with an activity offline

While you may be able to change the record associated with a task or event in Salesforce, the `Related To` field on an activity is only available in Connect Offline when the related record is available offline. For example, if an event is associated with an account that is not in your Briefcase, you will not be able to change the account on the event using Connect Offline.

Visible in Self-Service field is not available offline

While you may see this field in your activity page layouts using Salesforce, it is not visible from Connect Offline because the field indicates if an activity is associated with a case and cases are not available in Connect Offline.

Unable to update group events in Connect Offline

Multi-person events are visible in Connect Offline but you can't create or edit them. If you have been invited to an event, but are not the organizer, you can't modify or delete that event offline.

Briefcase Contents

Unable to edit some records in my briefcase

Depending on your briefcase settings, records are read only if they are available offline only because they are associated with records that are included offline due to your briefcase settings. For example, if you have selected an opportunity-based briefcase, some accounts will be read only offline even though they are not related to an opportunity, but because they are related to a contact in your briefcase.

Briefcase exceeds limit

Read only records that are included by association with other records in your briefcase do not count toward your limits. For example, the maximum number of accounts you can include is 5000 but your briefcase may contain 5200 if you have 200 accounts included because they are related to other records in your briefcase.

Browsers

Windows XP SP2 displays a warning banner in Connect Offline

To prevent the warning banner from displaying, modify your Internet Explorer settings as follows:

1. Launch Internet Explorer.
2. Click the **Tools** menu and choose **Internet Options**.
3. Select the **Advanced** tab.
4. Locate the Security section.
5. Enable `Allow active content to run in files on My Computer`.

6. Click **Apply**.
7. Click **OK**.

Unable to download and install Connect Offline using Firefox

Although other browsers are supported in Salesforce, you must use Internet Explorer to download and install Connect Offline.

Receiving error that says “A connection with Salesforce could not be established to update your Connect Offline.”

This message can appear in the following scenarios:

- Your computer is configured to use a proxy server to connect to the Internet that requires authentication. This connection is made automatically using Single Sign-On or another manner to authenticate where you do not have to enter a username or password to connect to the Internet.
- Your computer is behind a firewall
- Your computer is actively running antivirus software

Conflict Resolution

Unable to choose fields in conflict resolution

The field values on some objects, such as products on opportunities, are read only in the conflict resolution tool; however, you can change these values as follows:

1. Switch to the tree view in the left pane.
2. Select the deepest branch after expanding all the branches.
3. Choose the `Your Values` radio button to save the Connect Offline values, or the `Salesforce Values` radio button to save the ones on the server instead. The values of the read-only fields change accordingly.
4. Click **Submit**.

If you click **Submit** without choosing an option, Connect Offline stores the value on the client for any read-only values in conflict resolution.

Conflict resolution prompts me to create a new record or retry

Your sharing settings may have changed. If you have access to perform the action, click **Retry**. Otherwise, create a new record in Connect Offline.

Cannot change value of dependent picklist in conflict resolution tool

When resolving conflicts for a dependent picklist field, you cannot change the picklist value of the conflicting field. To resolve these types of conflicts, select whether to apply the Salesforce value or the Connect Offline value.

 **Note:** In offline mode, if a dependent picklist's controlling field is hidden by field-level security, the information icon for the dependent picklist displays the controlling field's API name rather than the label name.

Fields

Unable to see lookup fields in Connect Offline related lists

Related lists in Connect Offline do not display lookup fields.

Unable to see custom formula fields and auto-numbers in Connect Offline

Automatically generated fields such as formula fields and auto-number fields are not available in Connect Offline.

Auto-number fields do not generate in Connect Offline

When you create a record in Connect Offline that increments an auto-number field, Connect Offline displays a label for that field while you are using Connect Offline. When you synchronize, Salesforce inserts the next unique number in the field.

Home Tab

Record count is wrong in Home tab list of modified records

In the sidebar, the list of modified records in briefcase Info does not include deleted records.

Installation

What gets installed?

Connect Offline installs SForceDB.exe, which runs continuously in the background and hosts the Connect Offline database.

Unable to install Connect Offline

Connect Offline requires Salesforce to install components that edit the registry on your computer. If your organization imposes security that prevents you from editing the registry, log in as the administrator of your machine before installing these components or contact your IT department for assistance.

Can I do mass deployments of Connect Offline?

Yes, you can perform system-wide deployments.

How can I tell what Connect Offline version my users have?

Each user's Connect Offline version is listed in the Login History.

Leads

Unable to see leads in Connect Offline

Leads are only available in Connect Offline 2.0 and later. If you are using Connect Offline 2.0 or later, you will launch the application using this icon: . To upgrade Connect Offline:

1. Synchronize your data in Connect Offline.
2. Optionally, remove the previous installation of Connect Offline using Add/Remove Programs in the Windows Control Panel.
3. Install Connect Offline. by going to the Connect Offline page in your personal settings.
4. Synchronize your data in Connect Offline.

Check to make sure you have the appropriate user permissions to view leads.

Lead assignment rules do not appear to be working

Leads created in Connect Offline will not be automatically assigned based on lead assignment rules. Once connected to Salesforce again, assign them by doing a mass transfer of records.

Multicurrency Display Differences

Opportunity amounts display a fractional difference

If your organization has enabled multicurrency, and the currency used for an opportunity is different from the corporate currency, a small display difference may be observed. The converted amount you see in the offline opportunity detail page may be off by a cent or two as compared to the same page in the Salesforce application. There is no error in the actual stored value.

Relationship Groups

Unable to see the Relationship Groups tab in Connect Offline

The Relationship Groups tab is only available if the Relationship Groups AppExchange package is installed in the Salesforce organization with which you synchronize Connect Offline.

Search

Search results are missing fields

Search results do not include long text area fields such as account `Description`.

Timeouts, Timestamps, and Time Zones

The timestamps of files updated in Connect Offline do not appear as expected

For records that you create or update in Connect Offline, the `Created By` and `Modified By` fields reflect the time on your PC, even after synchronization.

Activities that you create in Connect Offline reflect the time you enter and the time zone of your PC. During synchronization, Salesforce converts the activity times to the time zone set in your Salesforce personal information.

If you change the time zone on your computer, empty and synchronize your briefcase to reflect the change in Connect Offline.

Connect Offline times out when synchronizing large data sets

Edit the `HttpTimeout` registry setting in `HKEY_LOCAL_MACHINE\SOFTWARE\salesforce.com\Offline2`. The default is 360 seconds.

Edit Stay-in-Touch Settings

 **Note:** Stay-in-Touch Requests is scheduled for retirement in all Salesforce orgs as of Summer '17. For more information, see, [Stay-in-Touch Request Retirement](#).

To set your preferences for requesting contact information updates:

 **Note:** If your organization uses person accounts, person accounts are also affected by these settings. For more information, see [What Is a Person Account?](#) on page 1170.

1. From your personal settings, enter `stay-in-touch` in the `Quick Find` box, then select **My Stay-in-Touch Settings**.
2. Choose `Yes` for `Automatic Bcc` to receive copies of your sent Stay-in-Touch emails. This option is only available if your organization has not enabled compliance BCC emails.
3. Enable the reminder if you would like to be prompted to send a Stay-in-Touch request whenever you save a new contact.
4. Enter a default subject for the email.
5. In the note area, enter a message to the recipient.
6. In the signature area, enter a signature with your contact information.
7. Use the merge fields area at the top of the page to display available merge field values, which you can copy and paste into the subject, note, or signature boxes as needed.
8. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except for **Database.com**

Experience Salesforce in Microsoft® Email Applications

Relate important Microsoft emails to Salesforce records, such as contacts, leads, and opportunities. And see related Salesforce content directly in your Microsoft email applications.

Team up with your Salesforce administrator to choose between our cloud- and desktop-based Microsoft integration products.

Cloud-Based Lightning for Outlook

Stay on top of important sales opportunities when you work in Microsoft® Outlook®. When using Outlook Web App (OWA), Outlook 2016, Outlook for Mac 2016, or Outlook 2013, manage your sales more efficiently. Relate email and events along with their attachments to Salesforce records—all without installing and maintaining software. And sync contacts and events between your email applications and Salesforce using Lightning Sync.

Desktop-Based Salesforce for Outlook

Sync contacts, events, and tasks between your desktop-based version of Outlook and Salesforce. Select an email in Outlook to see related Salesforce records, like leads, contacts, tasks, and opportunities. And relate that email to the Salesforce records of your choice.

My Unresolved Items

When you use Salesforce for Outlook, Lightning Sync, or Email to Salesforce to sync items or add emails from your email app to Salesforce, any items that these features can't automatically assign to Salesforce records appear in My Unresolved Items.

Connect for Outlook: (Retired)

Before you get interested in our retired, legacy Connect for Outlook product, we urge you to explore either our cloud- or desktop-based Microsoft integration products: Lightning for Outlook or Salesforce for Outlook.

Cloud-Based Lightning for Outlook

Stay on top of important sales opportunities when you work in Microsoft® Outlook®. When using Outlook Web App (OWA), Outlook 2016, Outlook for Mac 2016, or Outlook 2013, manage your sales more efficiently. Relate email and events along with their attachments to Salesforce records—all without installing and maintaining software. And sync contacts and events between your email applications and Salesforce using Lightning Sync.

Also, create Salesforce contacts, events, leads, opportunities, tasks, and cases—directly in Outlook.

Lightning for Outlook

Stay on top of important sales opportunities when you work in Outlook. When using Outlook® Web App (OWA), Outlook 2016, Outlook for Mac 2016, or Outlook 2013, you can manage your sales more efficiently. Relate email and attachments to Salesforce records. And, create Salesforce records—directly in Outlook.

Lightning Sync: Keep Your Microsoft® Items in Sync with Salesforce

Keep your contacts and events in sync between your email system and Salesforce without installing and maintaining software.

Lightning for Outlook

Stay on top of important sales opportunities when you work in Outlook. When using Outlook® Web App (OWA), Outlook 2016, Outlook for Mac 2016, or Outlook 2013, you can manage your sales more efficiently. Relate email and attachments to Salesforce records. And, create Salesforce records—directly in Outlook.

After your administrator enables Lightning for Outlook, you complete one-time procedures to get your Salesforce content to appear in your email application.

Then, when you select an email (1), then select **Salesforce** (2), relevant sales-related records appear (3). For the records that appear, you can relate the email to multiple contacts—provided your administrator enabled Shared Activities. Also add the email to one other record that accepts tasks, like an opportunity, a lead, or a case. You choose whether to include the attachments.

EDITIONS

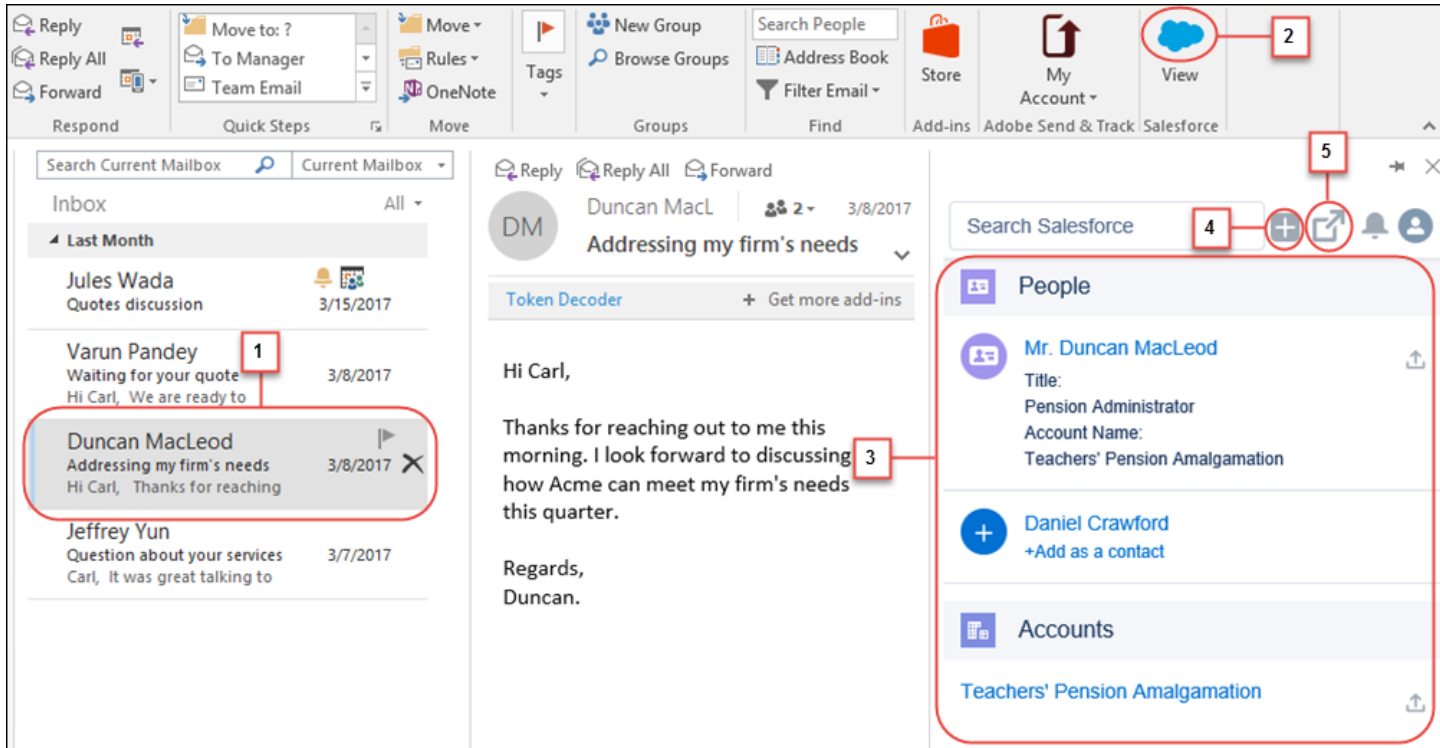

Available in: Salesforce Classic and Lightning Experience

Available with Sales Cloud, Service Cloud, and Force.com in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available with Sales Cloud, Service Cloud, and Force.com in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Salesforce records directly from Outlook (4). Select the record to see more details about it in your email application. With the inline edit feature, you can also modify records in their email application. Or get complete details about the record or the email related to it directly in Salesforce (5).

Similar to the way you relate emails, Lightning for Outlook lets you relate these calendar events to Salesforce records.

- Any event you attend
- Any event you organize, if you're working in Outlook 2016 for Windows or Outlook Web App on Office 365

To relate an event, select it in your Microsoft email application. Then, select Salesforce (1).

Lightning Sync: Keep Your Microsoft® Items in Sync with Salesforce

Keep your contacts and events in sync between your email system and Salesforce without installing and maintaining software.

Your productivity increases when your administrator sets up your company to sync contacts and events between your email server and Salesforce. That's because there's no need for you to duplicate your work between the two systems. Lightning Sync can sync contacts and events you create and maintain, whether you're at your desk or working remotely from your mobile device.

Depending on the settings your administrator selected, Lightning Sync automatically syncs contacts between your company's email system and Salesforce in both directions, or one direction. In addition, Lightning Sync can sync events in one direction, from your Exchange-based calendar system to Salesforce.

EDITIONS

Available to manage from:
both Salesforce Classic and
Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Your administrator can select more settings to define your sync experience. Ask your administrator about how you're set up to sync in these cases:

- Are you syncing all calendar events or only the events you relate to Salesforce using [Lightning for Outlook](#)?
- Are you syncing private events?
- Are events you delete from your calendar automatically removed from Salesforce?
- Are your events automatically related to relevant Salesforce contacts, or one relevant lead?

Lightning Sync for Microsoft Limitations

Currently, Lightning Sync doesn't:

- Sync events from Salesforce to Exchange
- Sync recurring events
- Delete syncing contacts in one action

[Get Ready to Sync Events with Lightning Sync for Microsoft® Exchange](#)

You can choose which events sync from your Microsoft calendar application to Salesforce.

[Get Ready to Sync Contacts with Lightning Sync for Microsoft® Exchange](#)

Learn how to sync contacts between your company’s email application and Salesforce using Lightning Sync.

[Fix Sync Issues](#)

If you have trouble syncing between your email application and Salesforce using Lightning Sync, ask your Salesforce administrator to reset your sync process. Resetting clears out and then restores the connections between the records in your email and calendar application, and your records in Salesforce.

SEE ALSO:

[Lightning Sync Setup Guide \(for Users\)](#)

[My Unresolved Items](#)

Get Ready to Sync Events with Lightning Sync for Microsoft® Exchange

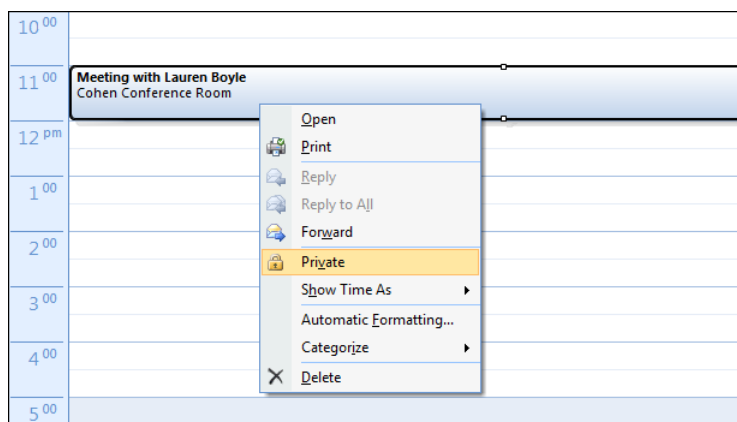

You can choose which events sync from your Microsoft calendar application to Salesforce.

If your administrator has set up Salesforce to sync events, your events sync automatically from the calendar in your company’s email system to Salesforce.

You can prevent personal events from syncing with Salesforce in different ways.

- Create a separate calendar in your calendar application to keep track of your personal events. Lightning Sync is designed to sync only your primary Microsoft® Exchange calendar to Salesforce.
- Ask your admin if your sync configuration is set up to sync private events. If you’re not syncing private events, you can assign your personal events with the `Private` option from your calendar application, and those events won’t sync with Salesforce.

For example, you can mark an event as private from Microsoft Outlook® like this.

It’s best if you manage the events you don’t want to sync before your administrator initiates sync for the first time. If your events begin syncing before you manage them, you can still remove them from Salesforce by deleting them manually.

Other events sync from your calendar to Salesforce every few minutes. If you’re syncing a lot of events, your first sync might take some time.

EDITIONS

Available to manage from: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To sync events from your calendar to Salesforce:

- “Create” on events, AND An active Lightning Sync configuration

Get Ready to Sync Contacts with Lightning Sync for Microsoft® Exchange

Learn how to sync contacts between your company's email application and Salesforce using Lightning Sync.

After your administrator initiates contacts sync for you, Lightning Sync creates a folder in your email application called `Salesforce_Sync`. You can find the `Salesforce_Sync` folder under your contacts directory. Any contacts that have synced from Salesforce to your email application are in `Salesforce_Sync`. Don't rename, move, or delete the `Salesforce_Sync` folder, or syncing between Salesforce and your email application stops.

1. Ask your administrator which direction you're set up to sync.
 - If you're set up to sync from Salesforce to your email application only, syncing is already in progress, and you don't have to do anything else. Soon you can access your Salesforce contacts directly from your email application.
 - If you're set up to sync from your email to Salesforce or to sync both ways, it's time to move the contacts that you want to sync into the `Salesforce_Sync` folder.
2. In your email application, select the contacts you want to sync. You can select multiple contacts at a time.

3. Move—do not copy—your selected contacts to the folder `Salesforce_Sync`. If you copy your contacts, you get duplicates, which are a hassle!

The contacts you move to the `Salesforce_Sync` folder begin to sync every few minutes. If you move numerous contacts to `Salesforce_Sync`, your first sync can take some time.

EDITIONS

Available to manage from: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To sync contacts both ways:

- "Read" and "Edit" on contacts, and "Read" on accounts, AND

Contact sync direction set to "Sync both ways" in Exchange configurations

To sync contacts from Salesforce to Exchange:

- "Read" on contacts, AND

Contact sync direction set to "Salesforce to Exchange" in Exchange configurations

To sync contacts from Exchange to Salesforce:

- "Create" on contacts, AND

Contact sync direction set to "Exchange to Salesforce"

Fix Sync Issues

If you have trouble syncing between your email application and Salesforce using Lightning Sync, ask your Salesforce administrator to reset your sync process. Resetting clears out and then restores the connections between the records in your email and calendar application, and your records in Salesforce.

1. To reset sync for your contacts, make sure your `Salesforce_Sync` folder in your email application contains only the contacts you want to sync with Salesforce.
2. To reset sync for your events, make sure the events that you don't want to sync are assigned the `Private` option in your calendar application.
3. Ask your Salesforce administrator to reset your sync process.

Desktop-Based Salesforce for Outlook

Sync contacts, events, and tasks between your desktop-based version of Outlook and Salesforce. Select an email in Outlook to see related Salesforce records, like leads, contacts, tasks, and opportunities. And relate that email to the Salesforce records of your choice.

Watch a Demo: [▶ Getting Started with Salesforce for Outlook](#)

Salesforce for Outlook, a Microsoft® Outlook® integration application that you install, syncs contacts, events, and tasks between Outlook and Salesforce. In addition to syncing these items, you can add Outlook emails, attachments, events, and tasks to multiple Salesforce contacts, and view Salesforce records related to the contacts and leads in your emails and events—all directly in Outlook.

You may be able to customize what you sync and the sync directions between Outlook and Salesforce. Your administrator determines the level at which you can customize these settings in Salesforce.

Here's a quick look at how Salesforce for Outlook helps you avoid duplicating your work and boost your productivity.

Download the Salesforce for Outlook Installer

Download the installer from Salesforce.

1. Close Microsoft® Outlook®.
2. If you're downloading Salesforce for Outlook for the first time, continue to the next step. If you're upgrading, first close Salesforce for Outlook by right-clicking the Salesforce for Outlook icon (📧) in your system tray, and clicking **Exit**. Then, follow the steps based on the version that you're upgrading from:
 - a. To upgrade from Salesforce for Outlook v2.4.2 or earlier, uninstall your current version from the Microsoft Windows® Control Panel.
 - b. To upgrade from Salesforce for Outlook v2.5.0. or later, continue to the next step.
3. From your personal settings, enter *Salesforce for Outlook* in the **Quick Find** box, then select **Salesforce for Outlook**.
4. Click **Download**. Then click **Save File**. If the **Download** button is unavailable, ask your administrator to assign you to an Outlook configuration.

If you're an administrator, deploy installations to multiple users simultaneously using the `.msi` version of the installer.

USER PERMISSIONS

To sync using Salesforce for Outlook:

- Valid data set for each object being synced

To change sync folders:

- Your Outlook profile set as the default in your Outlook Mail Settings AND

Allow users to modify "Outlook folder for syncing contacts" in your Outlook configuration

Install and Set Up Salesforce for Outlook

1. Open the installation file you downloaded and saved, and complete the installation wizard.

 **Note:** If you don't yet have .NET 4 installed, the installation wizard installs it for you. Keep in mind that the installation wizard prompts you to restart your machine after it installs .NET 4. After restarting, run the installation wizard again to complete the installation process.

2. Open Microsoft® Outlook®. The setup wizard opens, and the Salesforce for Outlook icon (📧) appears in your system tray. If the wizard doesn't open, you can start it manually. Right-click 📧 and click **Settings**.
3. If you want to log in to a Salesforce site other than the default, click **Change URL** and pick the server to which you want to connect. If the server you want isn't listed, select *Other...* and enter the URL, such as a custom domain used by your organization.
4. Enter your Salesforce username and password.
5. Click **Approve**. Doing so creates a secure connection between Outlook and Salesforce. You don't have to log in again unless you encounter an error.

 **Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. Doing so lets you connect without IP restrictions from anywhere.

6. Click **Next**, and review the sync directions set up by your administrator. To sync your Outlook items to different folders, click **Change Folder** and select folders that are within your default folder or the main Mailbox folder.

7. Click **Next**, and then select your sync method.

- Choose to sync all your contacts, events, and tasks. Mark items that you don't want to sync with the "Don't Sync with Salesforce" category in Outlook.
- Choose to sync individual contacts, events, and tasks. Mark items that you want to sync with the "Sync with Salesforce" category in Outlook.

EDITIONS

Specify Which Salesforce Fields Sync to Microsoft® Outlook®

Depending on your Salesforce for Outlook permissions, map fields from the Salesforce records you sync to Outlook.

Edit Your Salesforce for Outlook Email Settings

See whether your administrator lets you add emails to Salesforce from Microsoft® Outlook®, and change your email settings based on your needs.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.

If **Add Email** is selected, the **Add Email** and **Send and Add** options appear in Outlook.

 **Note:** If you don't see the **Add Email** and **Send and Add** options, ask your administrator to activate Email to Salesforce.

2. Click **Email to Salesforce Settings**.
3. Enter your own email address in **My Acceptable Email Addresses**. If you send email from more than one address, separate each address with a comma.
4. Choose whether all emails are sent to My Unresolved Items (so that you can manually assign them to related records) or to have Salesforce try to assign them first.
5. Configure Email to Salesforce to add emails as activities to matching opportunities, leads, contacts, or all three. If you configure Email to Salesforce to associate emails to matching leads or contacts, Salesforce searches the **To** and **CC** fields for the email addresses of your leads or contacts. If any leads or contacts are found, Salesforce saves the email to the Activity History related list on the appropriate record.
6. If you selected leads or contacts:
 - Specify how Email to Salesforce processes emails that contain lead or contact information that matches duplicate records.
 - Select **If no matching records are found, create a task and send it to My Unresolved Items** to have email sent to My Unresolved Items if no matching records are found. If this checkbox isn't selected, and Salesforce can't identify the email addresses in the **To** or **From** fields, the email isn't saved in Salesforce.
7. Select **Always save email attachments** to save attachments on emails sent to Salesforce.
8. To receive a confirmation email when an email is sent to Salesforce, select **Email me confirmation of association**.
9. Click **Save**.

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Customize Your Salesforce for Outlook Sync Direction

Depending on whether your administrator gave you permission, customize sync directions between Microsoft® Outlook® and Salesforce based on your preferences.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.
2. Select one of these options under Sync Direction for a particular object.
 - *Outlook to Salesforce*—During its first sync, a record in Outlook creates or updates a record in Salesforce. During future syncs, changes made to Outlook records appear in Salesforce, regardless of whether the Salesforce version has changed. In addition, deleting a synced record in Outlook deletes its Salesforce counterpart. Salesforce changes are never sent to Outlook. The required conflict behavior setting for this option is *Outlook always wins*. This option isn't available for contacts.
 - *Salesforce to Outlook*—When data first syncs, a record in Salesforce creates or updates a record in Outlook. During future syncs, changes made to Salesforce records appear in Outlook, regardless of whether the Outlook version of the record has changed. In addition, deleting a synced record in Salesforce deletes its Outlook counterpart. Outlook changes are never sent to Salesforce. The required conflict behavior setting for this option is *Salesforce always wins*.
 - *Sync both ways*—When records sync, changes to Outlook and Salesforce sync between the two systems. If records conflict, the conflict behavior setting determines which record wins.
3. Save your changes. All changes take effect the next time your data syncs. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator can change your settings as needed.

Edit Conflict Settings

Specify what happens when Salesforce for Outlook encounters a conflict as it syncs records between Microsoft® Outlook® and Salesforce.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.
2. Under Conflict Behavior for each object you're syncing, select one of these options.
 - *Salesforce always wins*
 - *Outlook always wins*
3. Save your changes. All changes take effect the next time your data syncs. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator can change your settings as needed.

Viewing Your Salesforce for Outlook Matching Criteria

See the matching criteria your administrator assigned to you.

If you have multiple Salesforce contacts that match a contact in Outlook, Salesforce for Outlook needs a way to determine which contact to sync. Your administrator sets criteria for the way Salesforce for Outlook chooses the correct contact.

Review the matching preference assigned to you. Available options include:

- *Most recent activity*—Choose the Salesforce contact that shows the most recent activity (such as a phone call or email), as shown in the contact's Activity History related list. This option is the default matching criteria.
- *Last updated*—Choose the Salesforce contact that was most recently modified.
- *Oldest*—Choose the Salesforce contact that has the earliest creation date.

Specify Which Salesforce Fields Sync to Microsoft® Outlook®

Depending on your Salesforce for Outlook permissions, map fields from the Salesforce records you sync to Outlook.

Field mappings define which Salesforce and Outlook fields correspond when items sync between the two systems.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.
2. Under Data Settings, click **Edit Field Mappings** under *Contacts*, *Events*, or *Tasks* to display all the fields for records on that object.
3. Review which Salesforce fields are mapping to each Outlook field.
4. Edit the Salesforce or Outlook field mappings you'd like to change, or create mappings for custom fields. Salesforce for Outlook lets you edit any field mapping with a picklist. You can add more mappings at the bottom of the list. You can remove mappings by clicking the X next to the mapping.

 **Warning:** If you map a custom field that is universally required, make sure that it has a default value to avoid errors. Also, mapping custom fields that require validation by Salesforce can cause sync errors. For example, you map a custom Salesforce field that requires a unique value. If you enter a non-unique value in the Outlook field, you receive a sync error.

5. Click **Save**. Field mappings begin syncing on items the next time those items are updated in either Salesforce or Outlook. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator can change your settings as needed.

View Salesforce for Outlook Errors

Whenever Salesforce for Outlook has problems syncing your data, the system tray icon changes to an error icon (❗), and the status text at the top of the system tray shortcut menu displays the number of errors.

To view these errors, double-click the system tray icon or click the text in the shortcut menu to open the Salesforce for Outlook Error dialog box. If an error relates to a specific Outlook record, you can click the record's link to edit that record in Outlook.

To refresh the list after you resolve errors, click **Try Again**. Salesforce for Outlook syncs your data and removes any errors that have been resolved.

Syncing Between Microsoft® Outlook® and Salesforce Overview

Stop duplicating your contacts, events, and tasks in Outlook and Salesforce and start syncing between the two systems with Salesforce for Outlook.

User permissions needed to sync	When you sync	You'll Need
Contacts	From Salesforce to Outlook	"Read" on contacts; Contacts sync direction set to <i>Salesforce to Outlook</i>
	Both ways	"Read" and "Edit" on contacts, and "Read" on accounts; Contacts sync direction set to <i>Sync both ways</i>
Events and tasks	From Outlook to Salesforce:	"Read" and "Edit" on events; Events and Tasks sync direction set to <i>Outlook to Salesforce</i>
	From Salesforce to Outlook	"Read" and "Edit" on events; Events and Tasks sync direction set to <i>Salesforce to Outlook</i>
	Both ways	"Read" and Edit" on events; Events and Tasks sync direction set to <i>Sync both ways</i>
	Multiday events	"Enable Multiday Events" on activities
	Recurring Salesforce tasks to Outlook	"Sync recurring Salesforce tasks to Outlook"

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

Before you download and install Salesforce for Outlook, make sure your Outlook folders include the items you want to sync. If you're syncing from Outlook to Salesforce, moving a record out of a synced Outlook folder deletes that record in Salesforce. If you're syncing from Salesforce to Outlook, removing a record from Salesforce deletes that record in Outlook.

Learning about Sync Schedules

Salesforce for Outlook syncs your items based on your system activity. Events and tasks sync automatically every ten minutes; contacts sync automatically every hour. If, however, Salesforce for Outlook detects keyboard or mouse inactivity for 30 minutes, the sync frequency for events and tasks changes to 30 minutes. After two hours of inactivity, the frequency for all updates changes to hourly, and after four hours, the frequency changes to every four hours.

You can, of course, sync manually whenever you'd like. Just right-click the system tray icon (), and then click **Sync > Sync Now**.

Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.
If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.
- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

Syncing Contacts with Salesforce for Outlook

You can keep your important Outlook and Salesforce contacts in sync using Salesforce for Outlook. When contacts initially sync, Salesforce for Outlook checks to see whether a contact with the same email address exists in both Outlook and Salesforce. If a matching email address exists, the two contacts are synced. If it doesn't exist, Salesforce for Outlook checks to see whether a contact with the same first name, last name, and company name exists. If it doesn't exist, a new contact is created and the two are synced.

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. You can set up Salesforce for Outlook to sync in the following ways, depending on whether your administrator allows you to change sync directions.

- *Salesforce to Outlook*
- *Sync both ways*

Salesforce for Outlook lets you sync up to 5,000 contacts, and isn't case-sensitive when matching contacts.

This diagram shows how contacts sync.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To sync contacts from Salesforce to Outlook:

- "Read" on contacts

AND

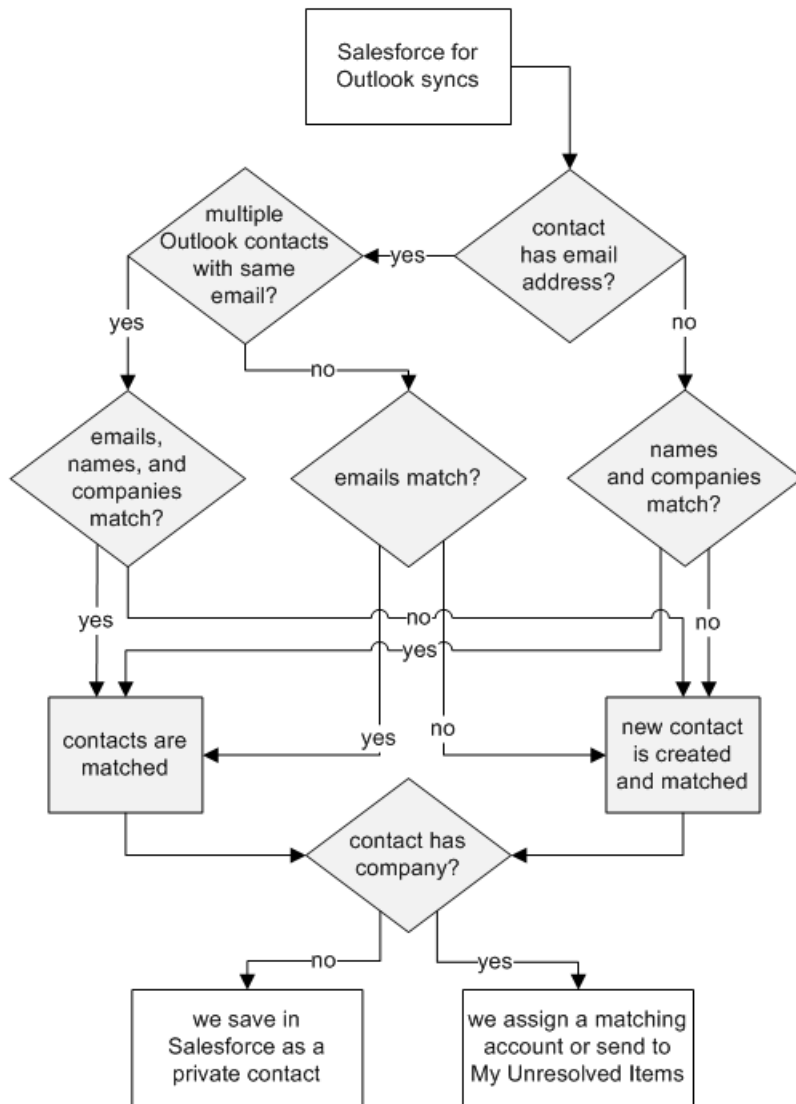

Contact sync direction set to *Salesforce to Outlook*

To sync contacts both ways:

- "Read" and "Edit" on contacts, and "Read" on accounts

AND

Contact sync direction set to *Sync both ways*

Syncing Contacts from Salesforce to Outlook

If	Then
A contact already exists in Outlook	The Salesforce contact replaces the Outlook contact and the two are synced.
A contact doesn't yet exist in Outlook	Salesforce for Outlook syncs the Salesforce contact, which creates the contact in Outlook.
You delete a contact in Outlook	Salesforce for Outlook won't sync the Salesforce contact again.
Multiple matching contacts exist in Outlook	Salesforce for Outlook selects one of them and syncs it.
You update a contact in Salesforce	The Salesforce contact overwrites the Outlook contact.

If	Then
You update a contact in Outlook	The updates remain in the Outlook contact, but won't sync to Salesforce. The next time updates are made to the Salesforce counterpart, the Salesforce counterpart overwrites the Outlook contact.
You delete a Salesforce contact	The Outlook counterpart is also deleted. If the Outlook contact is deleted and the Salesforce contact is updated, the contact is recreated in Outlook.

Syncing Contacts Both Ways Between Salesforce and Outlook

If	Then
A contact exists on one side only	The contact is automatically created on the other side and the two are synced.
A matching contact exists	One contact record replaces the other one, and the records are synced. If your Outlook configuration specifies that Outlook contacts win, the Outlook version replaces the Salesforce version, and vice versa if Salesforce is set to win. Any change to either record is automatically reflected in the other. If records conflict, the conflict behavior setting determines which record wins.
Multiple matching Salesforce contacts exist	As long as there's only one version of the Outlook contact and that contact has an email address, we sync the Outlook contact with a Salesforce contact based on your matching preference, such as the contact that was most recently updated.
You update a contact	Both contacts are updated with the latest changes. If records conflict, the conflict behavior setting determines which record wins.
You delete a Salesforce contact and update an Outlook contact	The Outlook counterpart is deleted if Salesforce is set to win, and the contact is recreated in Salesforce if Outlook is set to win.
You delete an Outlook contact and update a Salesforce contact	The Salesforce counterpart is deleted if Outlook is set to win, and the contact is recreated in Outlook if Salesforce is set to win.

Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

[Resolving Your Synced Contacts](#)

Syncing Events with Salesforce for Outlook

You can keep your Outlook and Salesforce events in sync using Salesforce for Outlook. After an event is in Salesforce, you can assign it to related records, like contacts, accounts, opportunities, and so on. Syncing events also lets you maintain an accurate view of your availability when you create events and request meetings from your Salesforce calendar.

Which Events Sync

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. The event filters in your configuration determine which events sync. The possible filters are:

- *TODAY*—Syncs events that end on or after today. The start time is 12:00 a.m.
- *LAST MONTH*—Syncs events that ended on or after the first day of last month.
- *LAST N DAYS*—Syncs events that ended on or after a specified number of days ago, such as *LAST 30 DAYS*.

Event updates stop syncing once the event falls outside of the range you're configured to sync.

The following items don't sync: all-day events beginning on the first day you're configured to sync, and event attendees. Multiday events sync as single events in either direction. Recurring event patterns must match exactly. Salesforce for Outlook syncs events based on their end dates rather than their start dates. For example, if you're syncing current and future events only, a two-day event that started yesterday still syncs.

How We Match Events

When events first sync, we either link them with existing events that have the same subject and time or create new events if nothing matches.

How You Assign Events to Salesforce records

After an event is added to Salesforce, you can assign it to other records using the My Unresolved Items page or the *Related To* and *Name* fields on the event record. The event is added to the associated record's Activity History or Open Activities related list. You can't save changes if your events have a required custom field or an activity custom field becomes required after items are added to your unresolved events list.

Who Sees Synced Events in Salesforce

Events that aren't marked as private are visible Salesforce to you, those above you in your role hierarchy, and anyone who has access to the records they're associated with. You can also grant access to view your calendar to other users, personal and public groups, roles, or roles and subordinates.

EDITIONS

[Resolving Your Synced Events](#)

[Syncing Recurring Events with Salesforce for Outlook Overview](#)

Syncing Recurring Events with Salesforce for Outlook Overview

If your organization is set up to sync recurring events, you can keep them synced between Outlook and Salesforce using Salesforce for Outlook. You can sync recurrences with the following patterns.

- Daily
- Weekly
- Monthly
- Yearly

After you sync recurring events to Salesforce, you can assign the recurrences to related records, such as contacts, accounts, opportunities, and so on. Syncing recurring events also helps you maintain an accurate view of your availability when you create events and request meetings from your Salesforce calendar.

Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

Understanding Differences Between Outlook and Salesforce

Recurring events work differently between Outlook and Salesforce.

For	You should know that
Ranges of occurrences	<p>If your recurrences include more than 100 occurrences, Salesforce for Outlook creates the series with 100 occurrences in Salesforce.</p> <p>After the dates of occurrences pass, Salesforce for Outlook then automatically adds another group of occurrences, bringing the total future occurrences up to 100 again. The schedule on which Salesforce adds these groups depends on the number of occurrences that passed and when you last synced, as well as whether you changed any existing occurrences.</p>

EDITIONS

Available for set up from: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To sync recurring events between Outlook and Salesforce:

- "Recurring Events"

In addition, "Read" and "Edit" on events, and event sync direction set to any of the following directions.

Outlook to Salesforce,

Salesforce to Outlook, or

Sync both ways

For	You should know that
Monthly occurrences	Salesforce for Outlook doesn't support the Outlook recurrence pattern option weekend day .
Yearly occurrences	<p>Salesforce for Outlook lets you set up events that recur every year. If you enter a number other than <i>1</i> for the Recur every option in Outlook recurrence patterns, Salesforce for Outlook won't sync the recurring series. This means that you can set up yearly recurrences, but not recurrences for every other year or every three years.</p> <p>In addition, Salesforce for Outlook doesn't support the Outlook recurrence pattern option weekend day.</p>
Events lasting longer than 24 hours	Salesforce doesn't support recurring events lasting longer than 24 hours.

Modifying Recurring Series

You can modify recurring series, but it's good to know what to avoid, so that you won't lose any details for occurrences that you've individually modified.

If you modify	You should know that
Recurring series in Outlook	<p>Those changes won't propagate to individually modified occurrences in Salesforce.</p> <p>For example, you modify the appointment time of an occurrence, and then later modify the appointment time for the entire series. The appointment time modification for the series won't propagate to the one modified occurrence.</p> <p>Critical changes include modifications to:</p> <ul style="list-style-type: none"> • Appointment times • Recurrence patterns • Ranges of occurrences <p>If you make critical changes to recurring series, individually modified occurrences lose their modifications.</p>
Start dates for recurring series in Outlook	Salesforce doesn't support modifications to start dates that already occurred.
End dates for recurring series in Salesforce	This is a critical change in Outlook, and will clear any modifications you make to individual occurrences within the series. Those modifications won't propagate to Outlook. You can, however, modify end dates in Outlook, but that type of critical change will clear all modifications you've made to individual occurrences—in both Outlook and Salesforce.
Individual occurrences	<ul style="list-style-type: none"> • You may lose those changes if you make critical changes to the recurring series. • If you delete an occurrence, and then move the following occurrence into its place, Salesforce for Outlook doesn't update Salesforce correctly. Instead, the occurrence you deleted in Outlook remains in Salesforce along with the occurrence you moved into its place. <p>For example, you change your recurring event in Outlook. You delete the October 4th occurrence, and move the October 5th occurrence into its place. In Salesforce, you'll see two occurrences on October 4th: the one you deleted, and the one you moved into its place. For October 5th, you'll have no occurrences.</p>

If you modify**You should know that**

- Outlook modifications propagate to occurrences in Salesforce, regardless of whether the ones in Salesforce include critical modifications. Deleted occurrences in Salesforce, however, remain deleted, and aren't replaced with individually modified occurrences from Outlook.

[Syncing Events with Salesforce for Outlook](#)

Syncing Tasks with Salesforce for Outlook

Keep Microsoft® Outlook® and Salesforce tasks in sync.

After a task is in Salesforce, you can assign it to related records, like contacts, accounts, and opportunities.

Which Tasks Sync

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. The task filters in your configuration determine which tasks sync. The possible filters are:

- *TODAY*—Syncs tasks that are due on or after today. The start time is 12:00 a.m.
- *LAST MONTH*—Syncs tasks that were due on or after the first day of last month.
- *LAST N DAYS*—Syncs tasks that were due on or after a specified number of days ago, such as *LAST 30 DAYS*.

Salesforce for Outlook doesn't sync every kind of task. These kinds of tasks sync until they fall outside of the date range set in your task filter:

- Recurring Salesforce tasks to Outlook
- Completed tasks, if marked as completed after Salesforce for Outlook syncs
- Deferred tasks
- In progress tasks
- Not started tasks
- Repeating tasks, which you create in Salesforce
- Tasks flagged for follow-up
- Waiting on someone else tasks

Which Tasks Don't Sync

- Recurring Outlook tasks to Salesforce
- Completed tasks, if marked as completed before Salesforce for Outlook syncs
- Emails or contacts added to your to-do list when you flag items for follow-up (because Outlook doesn't consider these items to be tasks)

How We Match Tasks

When tasks first sync, we link them with existing tasks that have the same subject and due date. If you don't assign due dates to tasks, we link them using the same subject only.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To sync tasks from Outlook to Salesforce:

- "Read" and "Edit" on tasks, and task sync direction set to *Outlook to Salesforce*

To sync tasks from Salesforce to Outlook:

- "Read" and "Edit" on tasks, and task sync direction set to *Salesforce to Outlook*

To sync tasks both ways:

- "Read" and Edit" on tasks, and task sync direction set to *Sync both ways*

How You Assign Tasks to Salesforce Records

After a task is added to Salesforce, you can assign it to other records using the My Unresolved Items page or the `Related To` and `Name` fields on the task record. The task is added to the associated record's Activity History or Open Activities related list. You can't save changes if your tasks have a required custom field or an activity custom field becomes required after items are added to your unresolved tasks list.

Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

Automatic Account Assignments for Synced Contacts

After syncing contacts from Outlook, Salesforce for Outlook tries to automatically assign them to accounts, as shown in this diagram.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To assign accounts:

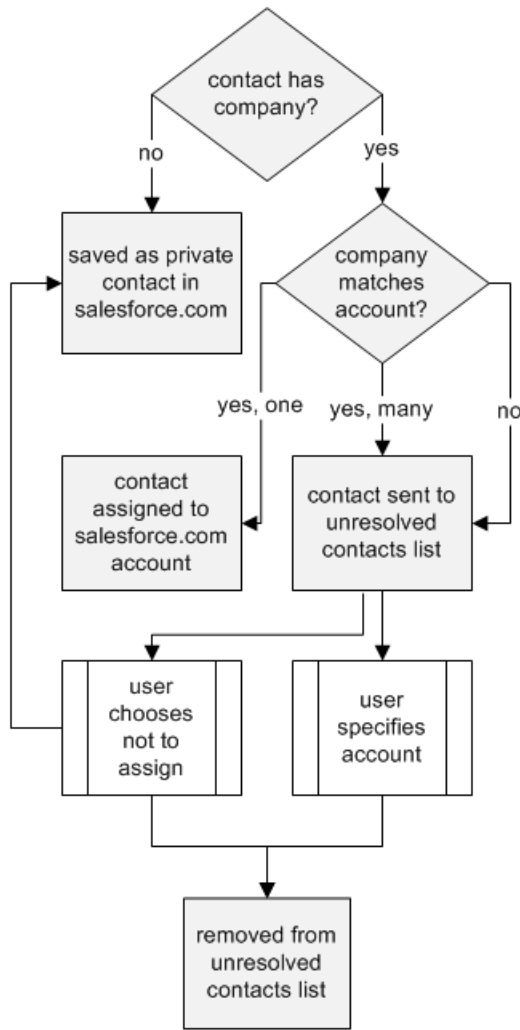

- "Read" on accounts and "Edit" on contacts

To create new accounts:

- "Create" on accounts and "Edit" on contacts

AND

"Show Quick Create"

This table describes the account assignment process.

If	Then
A contact's company matches a single Salesforce account	The contact is assigned to that account.
A contact's company matches many Salesforce accounts or none	The contact is sent to My Unresolved Items in Salesforce, which you can access from the Contact home page or the Salesforce for Outlook system tray application. You can use this list to manually assign contacts to existing accounts, create new accounts, or confirm that contacts are private.
A contact doesn't have a company name	The contact is treated as a private contact and is not sent to My Unresolved Items.
A contact's company changes in Outlook	If a matching account is found in Salesforce, the contact is assigned to that account. Otherwise, the contact is sent to My Unresolved Items to be resolved.

If	Then
An unresolved contact is deleted in Outlook	The contact is removed from My Unresolved Items the next time you open the list.
An unresolved contact is changed in Outlook	The contact record is updated in My Unresolved Items. If the contact's company changes, Salesforce checks to see if that information matches any existing accounts and assigns it to an account if it finds a match.

Manage How Microsoft® Outlook® Items Sync with Salesforce

Manage your contacts, events, and tasks using Outlook categories to get your Outlook items to sync with Salesforce the way you want—by either selecting the items you'd like to sync, or syncing all your items, and selecting the items you'd like to prevent from syncing.

View your sync settings from the Windows® system tray, and then manage how you'll sync your Outlook items with Salesforce.

1. Right click the Salesforce for Outlook icon () in the system tray.

2. Click **Settings**, and then click **Next**.
3. See whether you're set up to sync items with the Sync Only the Outlook Items I Select option or the Sync All Outlook Items option.
 - If you're set up to sync with the Sync Only the Outlook Items I Select option, Salesforce for Outlook syncs only the Outlook items you choose. You'll [assign the category Sync with Salesforce to the items you want to sync](#) on page 1701.
 - If you're set up to sync with the Sync All Outlook Items option, Salesforce for Outlook syncs all your Outlook items. You'll [assign the category Don't Sync with Salesforce to the items you want to prevent from syncing](#) on page 1701.
4. Click **Cancel**.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

Choose Which Microsoft® Outlook® Items Sync with Salesforce

If you're set up to sync your Outlook contacts, events, and tasks to Salesforce using the `Sync Only the Outlook Items I Select` option in Salesforce for Outlook, you'll need to select which Outlook items you want to sync.

1. In Outlook, select the contacts, events, and tasks you want to sync.
2. On the Outlook ribbon, click **Categorize**.
3. Select the category `Sync with Salesforce`.
The items you categorized will start syncing during the next sync cycle.

Prevent Which Microsoft® Outlook® Items Sync with Salesforce

If you're set up to sync your Outlook contacts, events, and tasks to Salesforce using the `All Outlook Items` option in Salesforce for Outlook, you can still control which items you don't want to sync.

1. In Outlook, select the contacts, events, and tasks you want to prevent from syncing.
2. On the Outlook ribbon, click **Categorize**.
3. Select the category `Don't Sync with Salesforce`.
The items you categorized will stop syncing after the next sync cycle.

Delete Items Syncing with Salesforce for Outlook

Remove an item syncing with Salesforce for Outlook from both Salesforce and Outlook by deleting the item in one system only. Take care to give special treatment to recurring tasks and recently-updated items you want to delete.

First, check the sync direction for the contact, event, or task you want to delete. Next, delete the item from the system in which the item is set to flow from. If your items are set to sync in both directions, you can delete items from either system.

As a result, Salesforce for Outlook automatically removes the corresponding item in the other system.

 **Note:** Recurring tasks only sync from Salesforce, so there's no need to check the sync direction before deleting those items: always delete recurring tasks in Salesforce.

1. From your personal settings, enter *Salesforce for Outlook* in the `Quick Find` box, then click **View My Configuration**.
2. Review the sync direction setting for the contact, event, or (non-recurring) task that you want to delete.
3. Delete the item in the system from which sync is flowing.
For example, if you want to delete a contact, and your contacts are set to sync from Outlook to Salesforce, delete the contact in Outlook.
The item you deleted is removed from both systems during the next sync cycle.

If the item was not removed from both systems, you—or another sales rep—may have updated that record within the same sync cycle and Salesforce for Outlook gave preference to the update over the delete. This behavior happens as a result of `Conflict Behavior` set in someone's Salesforce for Outlook configuration, which would have let the update in one system "win" over the delete in the other. In this case, delete the record again to remove it from both systems. Or maybe check with your coworker first, who obviously cares about that item!

Available in all editions

Use Salesforce for Outlook to get insight into Salesforce contacts and leads related to your important Outlook emails—directly in Outlook. The Salesforce Side Panel displays Salesforce records to which you can add Outlook emails, events, and tasks.

Watch a Demo: [▶ Using the Salesforce Side Panel to Work with Records in Microsoft® Outlook®](#)

When you select an email from the Inbox or an event from the Calendar in Outlook, the Salesforce Side Panel displays related Salesforce contact and lead details directly in Outlook. After your administrator enables the side panel in your Outlook configuration, the side panel displays up to 10 contacts and leads from your email's `From`, `To`, and `Cc` fields.

In addition, the Salesforce Side Panel:

- Displays as many as four activities, opportunities, and cases related to the contacts and leads that appear in the side panel.
- Lets you add Outlook emails and their attachments to multiple Salesforce records.
- Lets you add Outlook events and tasks to multiple contacts and to one other record with which you can relate tasks, such as an account, a case, or even a custom object record.
- Discovers duplicate contacts or leads. You choose the most appropriate ones to display in the side panel.
- Lets you create Salesforce records directly from the side panel.
- Includes a Search feature to find additional Salesforce records.
- Includes links to view full record details directly in Salesforce.

Here's how you'll use the side panel.

1. Select an email or event in Outlook.
2. Review the Salesforce content that appears in the side panel, which displays contacts and leads based on the order they appear in your email's **FROM**, **TO**, and **CC** fields. For each contact and lead, it's easy to view related activities, opportunities, and cases. If you want to view full record details, just click on a record's link to open it directly in Salesforce.

To add your email or event to the Salesforce records of your choice, click or next to those records. Email attachments are included automatically when you add an email to Salesforce, unless your organization has enabled the feature that allows you to select specific email attachments. In that case, you'll see next to the individual attachments in your side panel. Click the icon to add those attachments to Salesforce.

If you have the Social Accounts and Contacts feature enabled in Salesforce, the side panel displays either Facebook® or Twitter™ profile photos—whichever ones you chose to show in Salesforce for those contacts and leads.

3. Select the other contacts and leads related to your email to view their details, along with related activities, cases, and opportunities.
4. Quickly see the Salesforce records to which you've added emails or events. If you'd like to create a new account, case, contact, lead, opportunity, or a custom object record related to your email, click . If you don't see records you're looking for, click to find other records, and then add emails, events, or tasks from the Outlook tasks list to them. There's even a collapse feature () to hide the side panel.

Keep track of important Outlook emails related to Salesforce records from the Salesforce Side Panel.

Complete this procedure using the Salesforce Side Panel, a feature that's available in Salesforce for Outlook. You can learn about the side panel in [View and Work with Salesforce Records from Microsoft® Outlook®](#).

1. Make sure you've set up My Email to Salesforce. From your personal settings, enter *My Email to Salesforce* in the Quick Find box, then select **My Email to Salesforce**.
2. In Outlook, either:
 - Select an email from your Inbox.
 - Create a new email.

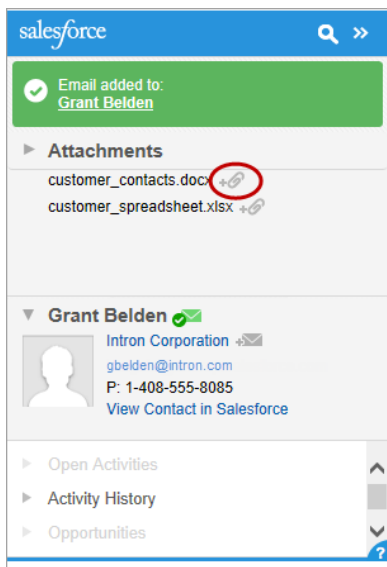

You can add an Outlook email and its attachments to multiple Salesforce records.

3. In the side panel, click  for the contact, account, case, opportunity, or lead to which you want to add the email. The side panel confirms the Salesforce records to which you added your email.

If you're sending a new email, we add it to the Salesforce records after you click **Send**.

4. You add attachments differently depending on how you're set up to use the side panel.
 - If the attachments section appears after you add your email to Salesforce, click  to include specific email attachments on the record.

- If you don't see the option to add attachments, your attachments are included automatically when you add your email to Salesforce, or the attachment exceeded [General Email Limits](#).

Remove Microsoft® Outlook® Emails from Salesforce Records

USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:	“Side Panel” in your Outlook configuration
To add Outlook emails (including attachments), events, and tasks to Salesforce records:	“Add Email” in your Outlook configuration AND “Enable” on <code>Email to Salesforce</code>
To add specific email attachments to Salesforce:	“Allow users to select attachments” in your Outlook configuration
To add emails (including attachments), events, and tasks to multiple contacts:	“Allow Users to Relate Multiple Contacts to Tasks and Events” in Activity Settings
To add emails to multiple Salesforce records that accept tasks:	Contact Salesforce Customer Support

EDITIONS

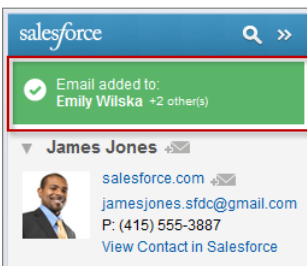

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

You can remove Microsoft Outlook emails from your Salesforce records with the Side Panel for Salesforce for Outlook.

Complete this procedure using the Salesforce Side Panel, a feature that’s available in Salesforce for Outlook. You can learn about the side panel in [View and Work with Salesforce Records from Microsoft® Outlook®](#).

1. In Outlook, select the email you want to remove from Salesforce records.
2. In the Salesforce Side Panel, find the Salesforce record from which you want to remove the email. The upper section of the side panel displays the records to which you’ve already added your email.
3. With your mouse, hover over , which turns to , then click it to remove your email from the Salesforce record. The side panel displays updates for the remaining Salesforce records to which you’ve added your email.

SEE ALSO:

Add Microsoft® Outlook® Events to Salesforce Records

Add Outlook events to Salesforce records by using the Salesforce Side Panel. The event is added to the Salesforce record as an activity, which you can see on the record's Activity History or Open Activities related lists.

1. In Outlook, select an event or event series you want to add to Salesforce records. You can add an event to multiple contacts, and to one other record with which you can associate tasks, such as an account, a case, or an opportunity.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:

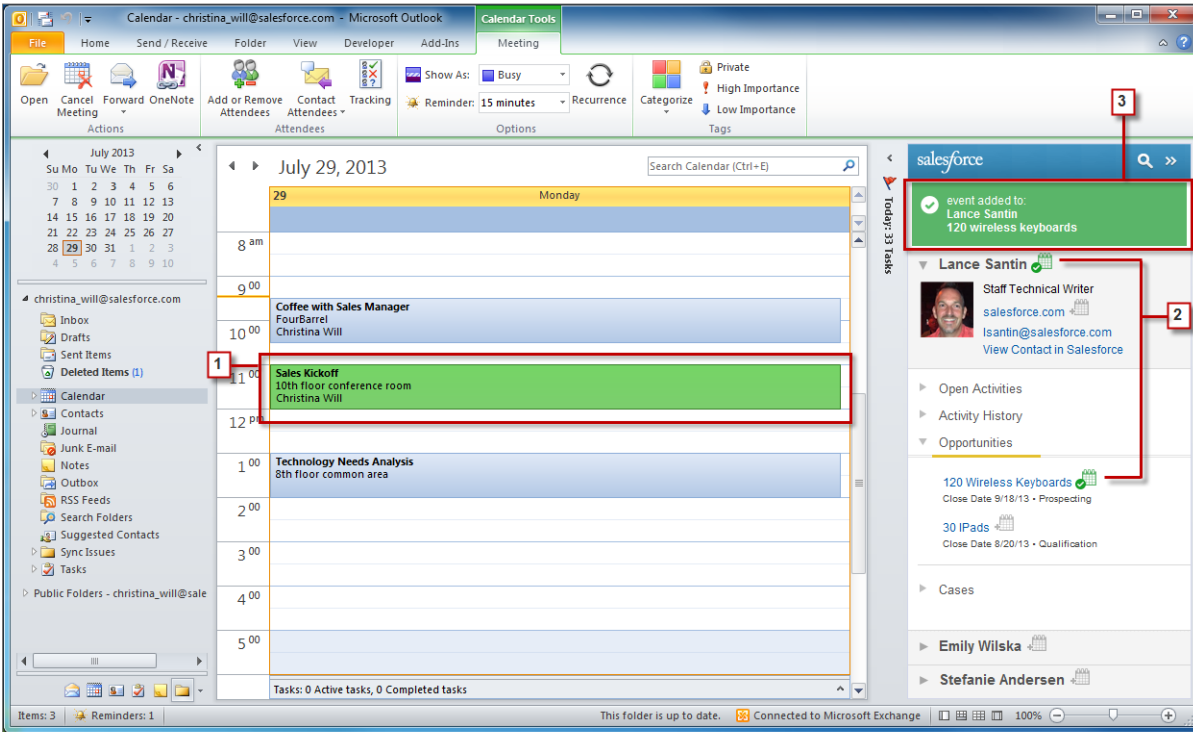

- "Side Panel" in your Outlook configuration

To add Outlook emails (including attachments), events, and tasks to Salesforce records:

- "Add Email" in your Outlook configuration

To add emails (including attachments), events, and tasks to multiple contacts:

- "Allow Users to Relate Multiple Contacts to Tasks and Events" in Activity Settings

2. In the Salesforce Side Panel, click  for the contact, account, case, opportunity, or lead to which you want to add the event. You'll see  after you add the event.
3. Review the Salesforce records to which you added your event.

Add Microsoft® Outlook® Tasks to Salesforce Records

You can add Outlook tasks to multiple Salesforce contacts and to one other record that accepts tasks, like an account, a lead, or an opportunity. The task is added to the Salesforce record as an activity, which you can see on the record's Activity History or Open Activities related lists.

Add Outlook tasks to Salesforce records from Tasks in Microsoft Outlook.

1. Select the task that you want to add to a Salesforce record.
2. Click  in the side panel to display the Salesforce record to which you'd like to add the task.
3. Click  next to the record in the search results.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:

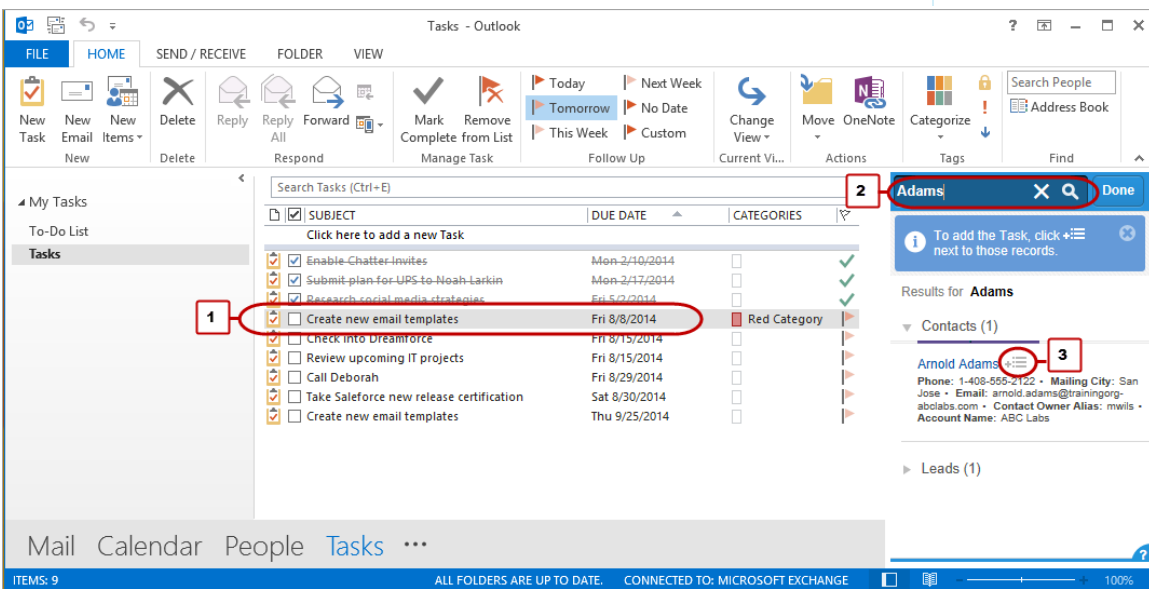

- "Side Panel" in your Outlook configuration

To add Outlook emails (including attachments), events, and tasks to Salesforce records:

- "Add Email" in your Outlook configuration

To add emails (including attachments), events, and tasks to multiple contacts:

- "Allow Users to Relate Multiple Contacts to Tasks and Events" in Activity Settings

You'll see  after you add the task.

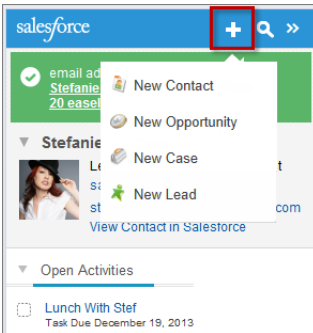

Create Records Directly from the Salesforce Side Panel

Quickly create different kinds of records directly from the side panel in Microsoft® Outlook®.

Depending on how your administrator set up your Salesforce Side Panel Publisher access, you can create accounts, cases, contacts, leads, opportunities, and other types of records customized for your organization—directly from the side panel.

1. Select an email in Outlook, then click .

You'll see something like this.

2. Choose an action.
The actions available to you depend on the ones your administrator set up, such as New Contact.
3. Complete the record detail by providing relevant details.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To display the Salesforce Side Panel:

- "Side Panel" in Outlook configurations

To create new records from the Salesforce Side Panel:

- "Create" and "Read" on all objects that users create records from AND "Visible" on all required fields in records that users create

- Click  to save the record.
Keep in mind that email attachments aren't included in the created records.

Searching for Salesforce Records in Microsoft® Outlook®

USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:	"Side Panel" in your Outlook configuration
To add Outlook emails (including attachments), events, and tasks to Salesforce records:	"Add Email" in your Outlook configuration AND "Enable" on Email to Salesforce

EDITIONS

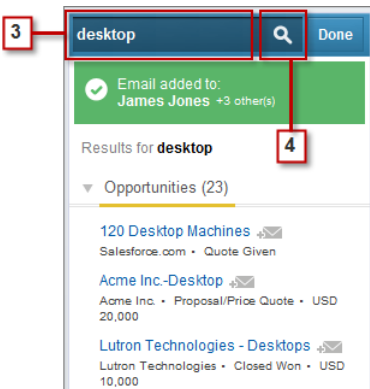

This feature available to manage from: both Salesforce Classic and Lightning Experience
Available in all editions

To add specific email attachments to Salesforce:	“Allow users to select attachments” in your Outlook configuration
To add emails (including attachments), events, and tasks to multiple contacts:	“Allow Users to Relate Multiple Contacts to Tasks and Events” in Activity Settings
To add emails to multiple Salesforce records that accept tasks:	Contact Salesforce Customer Support

Complete this procedure using the Salesforce Side Panel, a feature that’s available in Salesforce for Outlook. You can learn about the side panel in [View and Work with Salesforce Records from Microsoft® Outlook®](#).

When you’re viewing details that appear in the Salesforce Side Panel, you may want to search for additional Salesforce records. Search results display contacts and any other records with which you can associate tasks, such as a campaign, a case, or an opportunity.

1. From Outlook, select an email for which you want to display additional Salesforce records.
2. In the side panel, click .
3. Type your search term. For example, if you want to search for Salesforce records related to *desktops*, type *desktop*.

4. Click the search icon to display Salesforce records related to your search term.

Create Cases from the Outlook Ribbon with Salesforce for Outlook

Note: Before you use this feature, consider [creating records directly from the Salesforce Side Panel](#) instead. Just keep in mind that when you create cases from the side panel, email attachments aren't included.

If you don't see the **Create Cases** drop-down list button in Microsoft® Outlook®, contact your administrator, who can enable this feature.

If you track cases in Salesforce, you can create new ones from your Microsoft® Outlook® emails. Your administrator needs to first create Email-to-Case destinations that appear in the drop-down list button **Create Cases** in Outlook. For each destination, you can choose the assignee, which can be either individual users or queues. When you create cases, you can add up to ten emails simultaneously for each destination.

1. In Outlook, select up to 10 sent or received emails and click **Create Cases**.
2. Select a destination from the drop-down list. Salesforce for Outlook adds the emails you selected as a case in Salesforce.

[How does Salesforce for Outlook protect emails?](#)

[Does Salesforce support single sign-on \(SSO\) for Salesforce for Outlook?](#)

[How secure is Salesforce for Outlook?](#)

What's the difference between private items in both Salesforce and Microsoft® Outlook®?

Private items in Microsoft Outlook and Salesforce differ in unexpected ways. Before choosing to sync private events, consider how they're displayed to colleagues in each system.

Item	Private in Outlook	Marked private in Salesforce
Contacts	Your Exchange administrator can see your contacts. Other users cannot.	Other Salesforce users can see contacts that are associated with accounts. Contacts that aren't associated with accounts are private and aren't visible to other Salesforce users except for Salesforce administrators who can view, edit, and report on contacts.
Events	Your Exchange administrator can see your events. Other users cannot.	Only blocks of time, and not event details are visible to other Salesforce users, except for Salesforce administrators who can view, edit, and report on events.
Tasks	Your Exchange administrator can see your tasks. Other users cannot.	Salesforce doesn't include any means for keeping tasks private. So other Salesforce users can see your tasks.

SEE ALSO:

[Desktop-Based Salesforce for Outlook](#)

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Does Salesforce for Outlook support terminal servers?

No. Salesforce for Outlook does not support terminal servers, such as Citrix.

SEE ALSO:

[Desktop-Based Salesforce for Outlook](#)

Why is my Salesforce for Outlook installation failing on the prerequisites screen?

Your system may not meet all system requirements for Salesforce for Outlook. Verify your system meets these requirements, then try installing Salesforce for Outlook again.

SEE ALSO:

- [Desktop-Based Salesforce for Outlook](#)
- [Install and Set Up Salesforce for Outlook](#)
- [Salesforce for Outlook System Requirements](#)

Can I map custom fields I'm syncing with Salesforce for Outlook?

Yes. You can map a Salesforce field to a custom Outlook field, or an Outlook field to a custom Salesforce field using Salesforce for Outlook. These field types are available to map:

- Outlook text fields
- Salesforce text fields
- Some Salesforce picklist fields

To map to custom fields, open an Outlook configuration. Under **Field Mapping**, select *Custom Field...* from the end of the corresponding **Outlook Field** picklist. Enter the field's name and click **OK**.

SEE ALSO:

- [Specify Which Salesforce Fields Sync to Microsoft® Outlook®](#)

Can I mass configure Salesforce for Outlook?

Yes, you can create a configuration in Salesforce and assign it to profiles or even specific users. When those users set up Salesforce for Outlook, the configuration's settings are automatically deployed to Outlook.

SEE ALSO:

- [Manage Your Salesforce for Outlook Configuration](#)

Can I use filter logic in Salesforce for Outlook data sets?

Admins can use filter logic to limit which records your users sync using Salesforce for Outlook, but users can't.

SEE ALSO:

- [Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Can I sync person accounts by using Salesforce for Outlook?

No. You can't upload person accounts by using Salesforce for Outlook.

For information on how to import person accounts into your Salesforce organization, see [Data Import Wizard](#) on page 649.

SEE ALSO:

- [Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Can I add cases using Salesforce for Outlook?

Yes, Salesforce for Outlook supports adding emails to Salesforce as cases.

SEE ALSO:

[Create Cases from the Outlook Ribbon with Salesforce for Outlook](#)

[Set Up Create Case for Salesforce for Outlook Users](#)

Can I associate Outlook records to custom objects using Salesforce for Outlook?

You can assign synced events and tasks to several different objects, including custom objects, but you can assign synced contacts only to accounts.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why does Salesforce for Outlook create duplicate records in Microsoft® Outlook®?

If you either mark items as Private or assign them to the Outlook category *Don't Sync with Salesforce*, and you sync contacts, events, and tasks from Salesforce to Outlook, Salesforce for Outlook may create duplicate records in Outlook.

This can happen if you have Salesforce items that contain the same information as the Outlook items you either marked as Private or assigned to the category *Don't Sync with Salesforce*. These items were never mapped to each other, so Salesforce for Outlook treats them separately, resulting in duplicates.

If you want to remove duplicates, it's best to remove the ones in Outlook that you either marked as Private or assigned to the Outlook category *Don't Sync with Salesforce*. Doing this ensures that you don't delete information in Salesforce to which other users may have contributed.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why does Salesforce for Outlook create duplicate contacts in Salesforce and Microsoft® Outlook®?

If you sync your team's records and they include different information for some of the same contacts you own, Salesforce for Outlook may create duplicate contacts in both Salesforce and Outlook.

For example, you and a team member both have a contact for Christina Wills. But the two contacts list different companies for her. Salesforce for Outlook syncs the contacts for you and your team members, resulting in duplicates in Salesforce and Outlook.

To avoid this, coordinate with your team members so you share the same contact information. You'll need to remove the contacts containing the outdated information.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why does Salesforce for Outlook delete my Outlook records after I sync?

Salesforce for Outlook automatically syncs records you own, as well as records to which you have read/write access that are:

- Associated with accounts you own

- Associated with accounts of which you are an account team member
- Owned by members of your sync profile's groups

If you try to sync a record from Outlook to Salesforce that doesn't fit in the above categories, the sync process may attempt to delete that record from Outlook during a later sync. To avoid deletion of these records, assign them to the Outlook category *Don't Sync with Salesforce*.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why isn't Salesforce for Outlook adding emails to the right contact or lead in Salesforce?

One of the following may be occurring.

If you see	Salesforce for Outlook may be adding your emails to	You should
Duplicate records in Salesforce Side Panel	The wrong records	Consider merging the duplicate records
No matching record in Salesforce side panel	My Unresolved Items	Add the matching contacts or leads to Salesforce and associate the unresolved emails with your new contacts or leads
		Remove your company's domain from Excluded Domains in your My Email to Salesforce settings

SEE ALSO:

[Edit Your Salesforce for Outlook Email Settings](#)

Why can't I add emails to Salesforce?

If you receive the error message `User is not authorized to send emails to this service` when you use Salesforce for Outlook to add emails, your email address isn't authorized in Salesforce.

To authorize email addresses in Salesforce:

1. From your personal settings, enter *My Email to Salesforce* in the **Quick Find** box, then select **My Email to Salesforce**.
2. In **My Acceptable Email Addresses**, enter the email addresses you want to authorize. Salesforce allows you to add emails through Salesforce for Outlook from only the addresses listed in this field. You cannot leave this field empty.

SEE ALSO:

[Edit Your Salesforce for Outlook Email Settings](#)

When I add emails to Salesforce, how can I include email attachments?

If you meet these requirements, you can include email attachments when you add emails to Salesforce.

- You and your administrator enable the correct settings.
- Salesforce has enough space to store the attachment.

- The attachment file size doesn't exceed Salesforce general email limits.

When you add an email to Salesforce, the email is added as a new task. When you add email attachments using Salesforce for Outlook or Email to Salesforce, attachments are included on the `Attachments` related lists. When you add attachments using Lightning for Outlook, attachments are added to your Salesforce Files.

Depending on how your administrator configured your settings, you can add email attachments to Salesforce in one of several ways.

If you're using	You enable	Your administrator enables	Add attachments to Salesforce like this
Lightning for Outlook	Lightning for Outlook in supported versions of Microsoft® Outlook, by selecting <code>Manage add-ins</code> . If Lightning for Outlook isn't available, add it from the Microsoft® Office Store.	Lightning for Outlook in Salesforce Setup	After you add the email to Salesforce from Lightning for Outlook, select the option to include attachments.
Salesforce for Outlook with side panel		Side Panel and Add Email in your Outlook configuration	Automatically, after you add an email to Salesforce from the side panel.
		Side Panel, Add Email, and Allow users to select attachments in your Outlook configuration	When you select  after you add an email to Salesforce from the side panel.
Salesforce for Outlook without side panel	Email to Salesforce in your Email settings, with <code>Always save email attachments</code> selected	Email to Salesforce in Salesforce Setup and an active Outlook configuration that includes you	Automatically, after you add an email to Salesforce using the <code>Add Emails</code> or <code>Send and Add</code> buttons in Outlook.
Email to Salesforce	Email to Salesforce in your Email settings, with <code>Always save email attachments</code> selected	Email to Salesforce in Salesforce Setup	Automatically, after you send the email to your Email to Salesforce address.

How do I enable contacts for sync in Salesforce for Outlook?

Your administrator needs to perform the following two tasks before you can sync contacts between Microsoft® Outlook® and Salesforce.

- Your administrator creates a configuration that allows users to sync contacts.
- Your administrator defines a data set for that configuration.

After your administrator performs those tasks, you may have permissions to enable contacts for sync by completing the following procedure.

1. From your personal settings, enter *Salesforce for Outlook* in the **Quick Find** box, then select **Salesforce for Outlook**.
2. Click **View My Configuration**.
3. Under the Sync Settings section, verify you have **Contacts** selected. If you're unable to select it, contact your administrator, who can enable contact syncing for you.

How does Salesforce for Outlook protect emails?

Salesforce supports both delegated authentication and Security Assertion Markup Language (SAML) requirements for Salesforce for Outlook. When using SAML for Salesforce for Outlook, My Domain is required.

SEE ALSO:

- [Edit Your Salesforce for Outlook Email Settings](#)

Does Salesforce support single sign-on (SSO) for Salesforce for Outlook?

Yes. Salesforce supports both delegated authentication and Security Assertion Markup Language (SAML) requirements for Salesforce for Outlook. When using delegated authentication, users need to log into Salesforce the first time they use Salesforce for Outlook. When using SAML for Salesforce for Outlook, My Domain is required.

How secure is Salesforce for Outlook?

Salesforce for Outlook, a .NET application you install on your machine, securely connects to Salesforce. Specifically,

For	Salesforce for Outlook uses
Usernames and passwords	OAuth 2.0 to authenticate with Salesforce. We store usernames and encrypted OAuth refresh tokens locally. We never store passwords.
Connections to Salesforce	SSL 128-bit encryption through an HTTPS connection.

My Unresolved Items

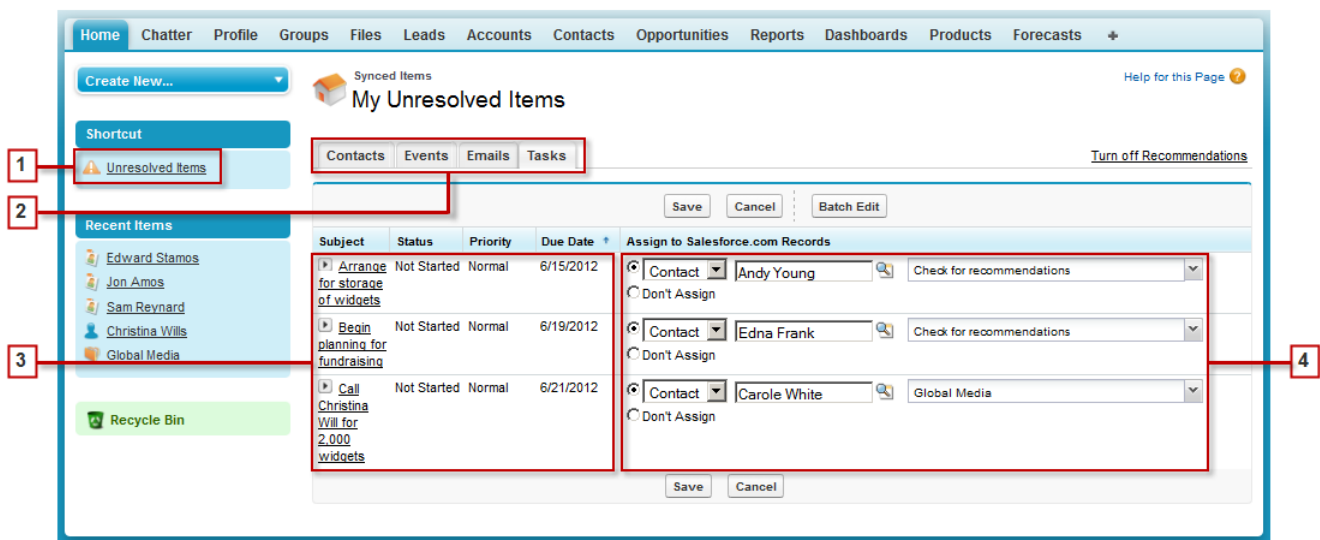

When you use Salesforce for Outlook, Lightning Sync, or Email to Salesforce to sync items or add emails from your email app to Salesforce, any items that these features can't automatically assign to Salesforce records appear in My Unresolved Items.

As part of your daily routine, you'll use this page to manage the unresolved items that require your attention. Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience (only when prompted to resolve Salesforce for Outlook items from the Windows system tray)

Available in all editions

1. Easily access the My Unresolved Items page using the **Unresolved Items** shortcut on the sidebar.
2. Quickly review unassigned items by type using the tabs Contacts, Events, and Tasks.
3. View your unassigned items.
4. Assign your items to Salesforce records—either manually or using Salesforce recommendations—or confirm you want to leave them unassigned.

Using Features that Make Resolving Items Easy

The following features help you resolve items quickly and easily.

To	Use the feature	This feature helps you save time because
Assign multiple items simultaneously	Batch Edit	You can assign up to 50 items in any one queue simultaneously.
Have Salesforce provide recommendations	Recommendations	Salesforce provides recommendations for accounts, cases, and opportunities to which you can assign your items. If you don't want to see these recommendations, click the

To	Use the feature	This feature helps you save time because
		<p data-bbox="630 254 1386 317">Turn off Recommendations link. [Resolving Your Synced Contacts](#)

When contacts sync from your email app with Salesforce for Outlook or Lightning Sync, some contacts are automatically assigned to accounts based on their company. The rest are added to My Unresolved Items, where you can either assign contacts to Salesforce accounts or confirm that you want to leave them unassigned.

[Resolving Your Synced Events](#)

[Resolving Your Synced Outlook Tasks](#)

SEE ALSO:

[Resolving Your Synced Outlook Tasks](#)

[Resolving Your Synced Contacts](#)

[Resolving Your Synced Events](#)

Resolving Your Synced Contacts

When contacts sync from your email app with Salesforce for Outlook or Lightning Sync, some contacts are automatically assigned to accounts based on their company. The rest are added to My Unresolved Items, where you can either assign contacts to Salesforce accounts or confirm that you want to leave them unassigned.

1. Access your unresolved contacts from the sidebar shortcut **Unresolved Items**.
2. Resolve each contact in any of these ways.
 - Assign an account.
 - Select an account under Choose Suggested Account in the drop-down list. We suggest accounts only if we detect possible matches based on the contact's company. Suggested accounts always show the `Account Name` field and the first three additional fields defined in your account search layout. If your organization has contact lookup filters that prevent certain accounts from being assigned to contacts, those accounts won't appear as suggested accounts and can't be assigned to contacts.
 - Select *Search Salesforce.com...* In the lookup, either click **New**, enter account information, and click **Save**, or enter search criteria, click **Go!**, and click the right account. If you don't see the lookup, you may need to first allow popups from Salesforce.
 - Leave unassigned—Select *Don't Assign New Account* from the drop-down list if you want to confirm that a contact with no account should remain unassigned. Unassigned contacts aren't related to Salesforce records and are visible to you and your administrator only.
 - Choose an account if there's a conflict—If the email contact and Salesforce contacts' companies are different, click *Don't Assign New Account* in the drop-down list to overwrite one with the other. The Salesforce account overwrites the email contact company if Salesforce is set to win, and the email contact overwrites the Salesforce account if the email contact is set to win.
 - Cancel a selection—Select *None Selected*— from the drop-down list.
3. Click **Save** to save your changes. All modified items are removed from the list. Remaining items continue to sync, and you can return any time to resolve them. Clicking **Cancel** cancels all changes on the page. Every contact assigned to an account now appears on the Contacts related list for that account.

Note: You can also resolve a contact from the contact record by marking it private or by assigning it to an account.

Your unresolved contacts list works like a standard list view. Click **Edit** or **Create New View** to define filters and customize columns.

Resolving Your Synced Events

When non-recurring events sync from your email app with Salesforce for Outlook or Lightning Sync, they appear in your Salesforce calendar and on the My Unresolved Items page. Use this page to either assign events to related Salesforce records or confirm that you want to leave them unassigned.

 **Note:** Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

1. Access your unresolved events from the sidebar shortcut **Unresolved Items**.
2. Depending on how you want to resolve an event, choose either of these actions.
 - Assign to related records—Enter a related record in one or both fields. If you need to, first select the correct record type from the drop-down list. If you assign a lead, you can't assign additional records. Clear an entry to cancel an assignment.
 - Leave unassigned—Click **Don't Assign**. Unassigned events, such as internal meetings or personal appointments, aren't linked to any other records and are visible to you only.
3. Click **Save** to save your changes. All modified items are removed from the list. Remaining items continue to sync, and you can return any time to resolve them. Clicking **Cancel** cancels all changes on the page. The event is added to the associated record's Activity History or Open Activities related list. You can't save changes if your events have a required custom field or an activity custom field becomes required after items are added to your unresolved events list.

 **Note:** You can also resolve an event from the event record by marking it private or by assigning it to other Salesforce records using the `Related To` and `Name` fields. Assigned and private events are automatically removed from your unresolved events list. Click  next to the subject to see an event's description.

To see recently used data in the related records fields:

- "Lookup Auto-Completion" in Search Settings

Resolving Your Synced Outlook Tasks

When tasks sync from Outlook with Salesforce for Outlook, they appear on the My Unresolved Items page. Use this page to either assign tasks to related Salesforce records or confirm that you want to leave them unassigned.

1. Access your unresolved tasks from the sidebar shortcut **Unresolved Items**.
2. Depending on how you want to resolve a task, choose either of these actions.
 - Assign to related records—Enter a related record in one or both fields. If you need to, first select the correct record type from the drop-down list. If you assign a lead, you can't assign additional records. Clear an entry to cancel an assignment.
 - Leave unassigned—Click **Don't Assign**. Unassigned tasks, such as internal meetings or personal appointments, aren't linked to any other records and are visible to you only.
3. Click **Save** to save your changes. All modified items are removed from the list. Remaining items continue to sync, and you can return any time to resolve them. Clicking **Cancel** cancels all changes on the page. The task is added to the associated record's Activity History or Open Activities related list. You can't save changes if your tasks have a required custom field or an activity custom field becomes required after items are added to your unresolved tasks list.

 **Note:** You can also resolve a task from the task record by assigning it to other Salesforce records using the `Related To` and `Name` fields. Assigned tasks are automatically removed from your unresolved tasks list.

Connect for Outlook: (Retired)

Before you get interested in our retired, legacy Connect for Outlook product, we urge you to explore either our cloud- or desktop-based Microsoft integration products: Lightning for Outlook or Salesforce for Outlook.

 **Important:** Effective Winter '16, we retired Connect for Outlook. This means the product no longer saves your emails or syncs your contacts, events, and tasks between Microsoft® Outlook® and Salesforce.

But don't worry! Become even more productive when you migrate to either Lightning for Outlook or Salesforce for Outlook. Team up with your Salesforce administrator to determine which product is best for you and your colleagues.

How do I uninstall Connect for Outlook?

 **Important:** Effective Winter '16, we retired Connect for Outlook. This means the product no longer saves your emails or syncs your contacts, events, and tasks between Microsoft® Outlook® and Salesforce.

But don't worry! Become even more productive when you migrate to either Lightning for Outlook or Salesforce for Outlook. Team up with your Salesforce administrator to determine which product is best for you and your colleagues.

1. Close Microsoft® Outlook®.
2. In Windows®, open the Control Panel.
3. Select the option to uninstall programs.
4. Scroll to Salesforce Outlook Edition, and then follow the prompts to uninstall it.

Lightning for Gmail: Experience Salesforce from Gmail™ (Beta)

Get visibility into Salesforce content right where you work, so you can efficiently manage your sales pipeline and close deals faster—directly from Gmail™. Lightning for Gmail—the email integration for Gmail users—gives you a quick view of your sales-related records without making you switch between Salesforce and Gmail.

 **Note:** This release contains a beta version of Lightning for Gmail, which means it's a high-quality feature with known limitations. Lightning for Gmail isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for this feature in the [IdeaExchange](#).

After your administrator enables Lightning for Gmail, you complete one-time procedures to get your Salesforce content to appear in your email application.

Then you can:

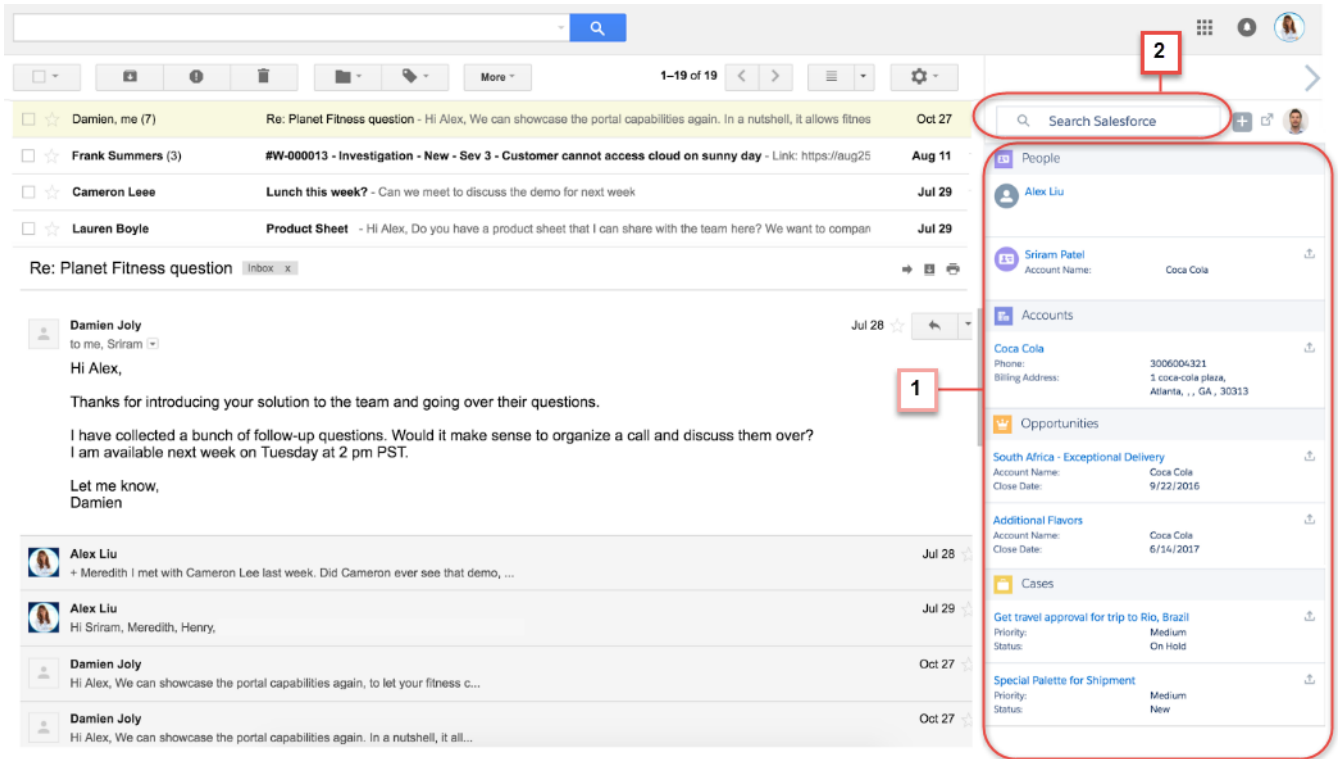

- View Salesforce contacts, leads, accounts, opportunities, and cases relevant to the Gmail messages you received or sent (1).
- Create new Salesforce records, including custom objects from the Action Publisher.

EDITIONS

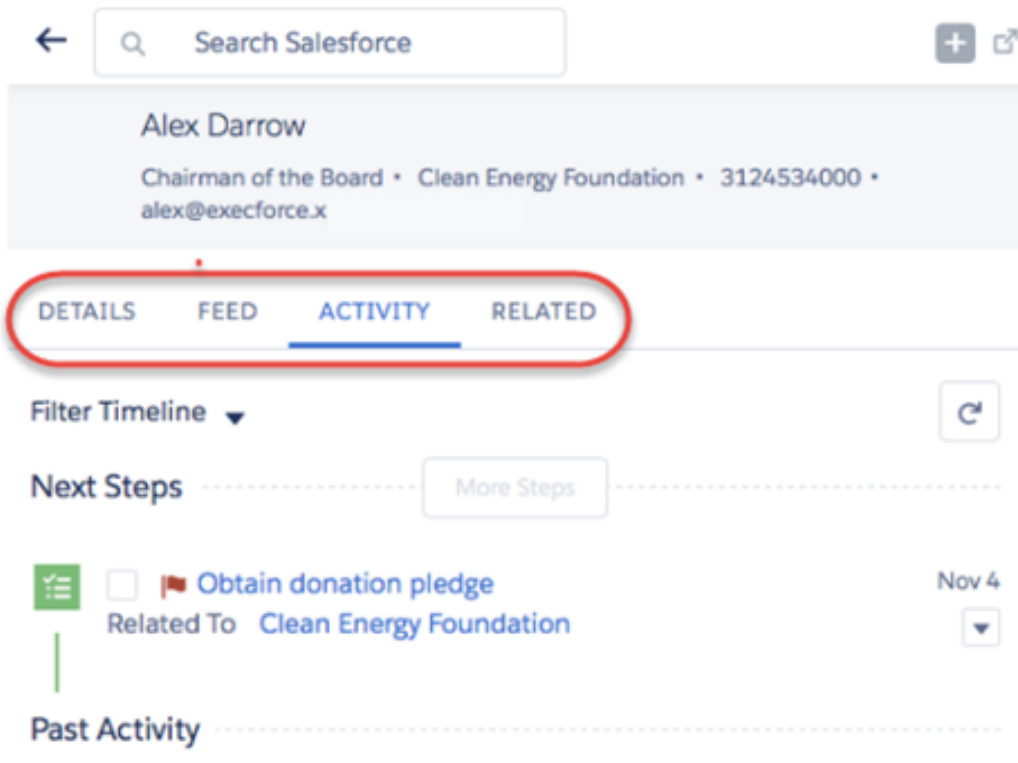

Available in Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

- Search for custom object records and create a Salesforce record using actions available to you. With the inline editing feature, you can also modify records without leaving Gmail

- Drill down for more details on a Salesforce record right from Lightning for Gmail. In addition to a record's detail page, you get to see its Chatter feed, activity timeline, and related lists.

- View and relate Gmail emails and Google calendar events to Salesforce records.

Get Started with Lightning for Gmail

[Lightning for Gmail: Set Up Lightning for Gmail \(Beta\)](#)

Sales reps can now see, create, and modify Salesforce records directly in Gmail.

Lightning for Gmail: Set Up Lightning for Gmail (Beta)

Sales reps can now see, create, and modify Salesforce records directly in Gmail.

Before you can begin experiencing Lightning for Gmail, you have to complete these steps to add Lightning for Gmail to the Chrome browser.

1. In the [Chrome Web Store](#), enter *Lightning for Gmail* in the Search box, then select the **Lightning for Gmail** extension.
2. Click **Add to Chrome** and confirm **Add extension** to add it to your Gmail account.
3. After adding Lightning for Gmail to Chrome and navigating to Gmail, to log into Salesforce, enter your Salesforce credentials in the new pane displayed to the right of the Inbox.

Tip: For better viewing experience, we recommend that you turn off Gmail's People widget. For more support, visit Google's support website and search for keywords mentioned here.

EDITIONS

Available in Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

To enable Lightning for Gmail

- "Customize Application"

Lightning Sync for Google: Keep Your Contacts and Events in Sync with Salesforce (Beta)

Keep your Google Contacts and Google Calendar™ events in sync between Google and Salesforce without installing and maintaining software.

 **Note:** This release contains a beta version of Lightning Sync for Google, which means it's a high-quality feature with known limitations. Lightning Sync for Google isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for Lightning Sync for Google in the [Lightning Sync Success Community](#).

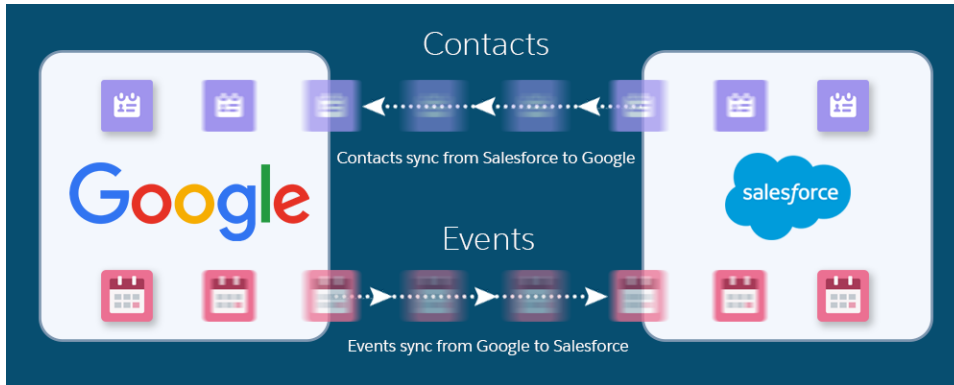

Your productivity increases when your administrator sets up your company to sync Google contacts and events with Salesforce. That's because there's no need for you to duplicate your work between the two applications. Lightning Sync for Google can sync contacts and events you create and maintain, whether you're at your desk or working remotely from your mobile device.

Lightning Sync can sync your contacts from Salesforce to Google Contacts (which you can access from Gmail™). Lightning Sync also can sync your events from Google Calendar™ to Salesforce.

EDITIONS

Available to manage from: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Your administrator defines your sync experience by selecting settings in Salesforce. Ask about how you're set up to sync in these cases:

- Are you syncing private events?
- Are events you delete from your calendar automatically removed from Salesforce, too?
- Are your events automatically related to relevant Salesforce contacts, or one relevant lead?

Lightning Sync for Google Limitations

Keep in mind that for now, Lightning Sync for Google doesn't:

- Sync contacts from Google Contacts to Salesforce
- Sync events from Salesforce to Google Calendar
- Sync recurring events
- Sync Available or Busy status on events
- Let you edit which Google contact and event fields map to Salesforce contact and events fields

Get Ready to Sync Contacts and Events with Lightning Sync for Google

Get Ready to Sync Contacts with Lightning Sync for Google

Learn how to find the contacts syncing from Salesforce to Google Contacts when you're set up to use Lightning Sync for Google.

After your Salesforce admin initiates contacts sync for you, Lightning Sync creates a group in Google Contacts called `SALESFORCE_SYNC`. Any contacts that have synced from Salesforce to Google are found in the `SALESFORCE_SYNC` group. Gmail™ accesses those contacts automatically when you attempt to email or chat with those contacts.

Don't rename, move, or delete the `SALESFORCE_SYNC` group, or syncing between Salesforce and Google Contacts could stop.

EDITIONS

Available to manage from: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Get Ready to Sync Events with Lightning Sync for Google

Choose which events sync from Google Calendar™ to Salesforce when your Salesforce admin sets you up to use Lightning Sync for Google.

If your administrator has set up Salesforce to sync events with Lightning Sync for Google, your events sync automatically from Google Calendar to Salesforce.

You can prevent personal events from syncing with Salesforce in different ways.

- Create a separate calendar in your calendar application to keep track of your personal events. Lightning Sync is designed to sync only your primary Google Calendar to Salesforce.
- Ask your admin if your sync configuration is set up to sync private events. If you're not syncing private events, you can assign your personal events with the `PRIVATE` option from Google calendar, and those events don't sync with Salesforce.

It's best if you manage the events you don't want to sync before your administrator initiates sync for the first time. If your events begin syncing before you manage them, you can still remove them from Salesforce by deleting them manually.

Other events sync from your calendar to Salesforce every few minutes. If you're syncing many events, your first sync could take some time.

EDITIONS

Available to manage from: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Make and Receive Calls with Voice

Use Voice to access telephony features without ever leaving Salesforce. Make and receive calls, add call notes, and log call information with ease. It just takes a single click from phone number fields in Lightning Experience, such as numbers on contacts, leads, and list views.

 **Note:** For now, we support outgoing calls to the U.S. and Canada only.

EDITIONS

Available in: Lightning Experience

Available in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

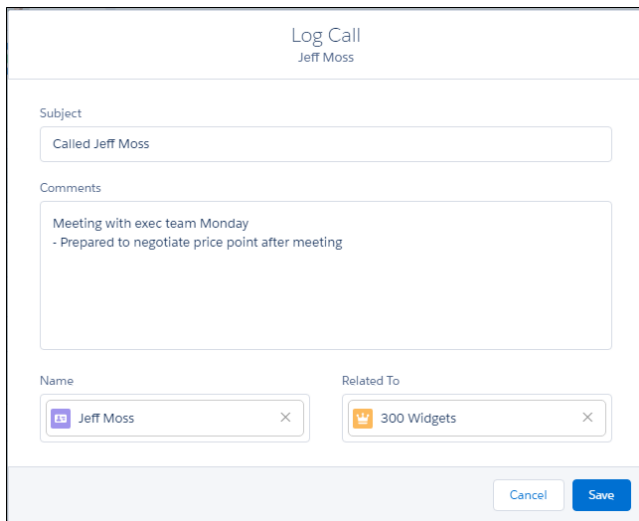

Voice is available for an additional cost as an add-on license.

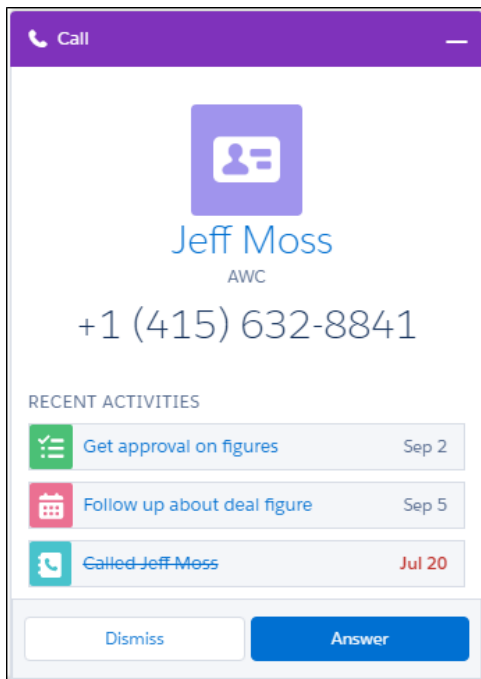

The call appears in the utility bar at the bottom of your screen, so you can multitask while you're on a call. You can access relevant records, add call notes directly in the call panel, or create tasks, events, or other records related to the call.

 **Tip:** Assign yourself a Voice number so the calls you make don't appear to be coming from an unknown number.

Select **Auto-log** to have call details added to the activity timeline automatically. You can also add more details manually after a call has ended.
