Assign eligible profiles to the configuration to give users who are associated with the profiles access to Live Agent functionality. If a user is assigned a configuration at the profile and user levels, the user-level configuration overrides the configuration that’s assigned to the profile.

Setting	What It Does
Available Profiles	Indicates the user profiles that are eligible to be assigned to the configuration.
Selected Profiles	Indicates the user profiles that are assigned to the configuration.

Supervisor Settings

Supervisor settings determine the Live Agent functionality that’s available to support supervisors. In addition, these settings determine the default filters that apply to the Agent Status list in the supervisor panel.

Setting	What It Does
Chat Monitoring Enabled	Indicates whether supervisors can monitor their agents' chats in real time while their agents interact with customers.
Whisper Messages Enabled	Indicates whether supervisors can send private messages to agents while agents chat with customers.
Agent Sneak Peek Enabled	Indicates whether supervisors can preview an agent's chat messages before the agent sends them to the customer.
Default Agent Status Filter	Determines the default agent status, such as Online, Offline, or Away, by which to filter agents in the supervisor panel. When supervisors view the Agent Status list in the supervisor panel, they see a list of agents who have that status.
Default Skill Filter	Determines the default skill by which to filter agents in the supervisor panel. When supervisors view the Agent Status list in the supervisor panel, they see a list of agents who are assigned to that skill.
Default Button Filter	Determines the default button by which to filter agents in the supervisor panel. When supervisors view the Agent Status list in the supervisor panel, they see a list of agents who are assigned to that button.
Assigned Skills	Determines the skills that are visible to supervisors in the supervisor panel. When supervisors view the Agent status list in the supervisor panel, they see a list of agents who are assigned to these skills. If you don't select any skills, the Agent Status list displays agents who are assigned to any skill.

Chat Conference Settings

Determine whether agents can invite other agents to join them in a customer chat. Chat conferencing lets your agents include multiple agents in a single chat. That way, your agents can help your customers get the solutions that they need without making your customers wait for their chats to be transferred.

Note: Chat conferencing does not support the Related Entities panel. If you attempt to use it with chat conferencing, important details might not be saved on your record.

Setting	What It Does
Chat Conferencing Enabled	Indicates whether agents can invite other agents to join them in customer chats.

Chat Transfer Settings

Determine how agents can transfer chats to other agents.

Setting	What It Does
Chat Transfer to Agents Enabled	Indicates whether agents can transfer chats to another agent directly.
Chat Transfer to Skills Enabled	Indicates whether agents can transfer chats to agents assigned to a particular skill.
Chat Transfer to Skills	Determines the skill groups to which agents can transfer chats. Agents can transfer chats to available agents who are assigned to those skills.
Chat Transfer to Live Chat Buttons Enabled	Indicates whether agents can transfer chats to a button or queue.
Chat Transfer to Live Chat Buttons	Determines the buttons to which agents can transfer chats. Agents can transfer chats to available agents who are assigned to those buttons.

Supported Browsers for Live Agent Notifications

Live Agent notifications help agents respond to chats efficiently by alerting agents when certain events occur. The types of chat notifications that are supported are determined by the web browsers your agents use.

Two types of chat notifications are available in Live Agent.

Chat request notifications

Notifies an agent when the agent receives a chat request; available as audio notifications and desktop notifications

Disconnect notifications

Notifies an agent when the agent is disconnected from Live Agent; available as audio notifications only

Browser	Version	Audio Notifications Supported?	Desktop Notifications Supported?
Google Chrome™	Most recent stable version	Yes	Yes
Mozilla® Firefox®	Most recent stable version	Yes	Yes
Apple® Safari®	6.x on Mac OS X	Yes	Yes
Windows® Internet Explorer®	9	Yes	No

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Create Live Agent Deployments

A deployment is a place on your company's website that's enabled for Live Agent. Create deployments to implement Live Agent and control its functionality on your website.

To customize the chat window that your customers see, you first need to create a Force.com site to host your custom images.

A deployment consists of a few lines of JavaScript that you add to a Web page. Your organization can have a single Live Agent deployment or multiple deployments. For example, if you have a single service center that supports multiple websites, creating a separate deployment for each site enables you to present multiple chat windows to your visitors.

1. From Setup, enter *Deployments* in the **Quick Find** box, then select **Deployments**.
2. Click **New**.
3. Choose the settings for your deployment.
4. Click **Save**.
Salesforce generates the deployment code.
5. Copy the deployment code, and then paste it on each Web page where you want to deploy Live Agent. For best performance, paste the code immediately before the closing body tag (that is, `</body>`).

 **Note:** If you're using security zones in Internet Explorer 9, verify that your deployment and any website that hosts that deployment are in the same security zone. Due to an issue with Internet Explorer, it's not possible to launch a chat window from a website that's in a different security zone. For more information on security zones, refer to Internet Explorer help.

 **Note:** If you move instances for an instance refresh or org migration, regenerate the code using these steps after the maintenance is complete.

Live Agent Deployment Settings

Live Agent deployment settings control the functionality that's available to agents and their supervisors while agents chat with customers.

Apply settings when you create or edit a Live Agent deployment.

Basic Information

Configure the basic functionality that's available on a particular Live Agent deployment.

Setting	What It Does
Live Chat Deployment Name	Names the deployment. This deployment name, or a version of it, automatically becomes the <code>Developer Name</code> .
Developer Name	Sets the API name for the Live Agent deployment.

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Setting	What It Does
Chat Window Title	Sets the name of the chat window as it appears to customers.
Allow Visitors to Save Transcripts	Indicates whether customers can save copies of their chat transcripts after they finish chatting with an agent.
Allow Access to Pre-Chat API	Indicates whether developers can access and implement the pre-chat API.  Warning: The pre-chat API gives developers access to potentially personal information that customers provide in pre-chat forms, such as the customer's name and email address.
Permitted Domains	Determines the domains that can host the deployment. When using permitted domains: <ul style="list-style-type: none"> • List as many domains as you need to, but only one per line. • Use only the domain and subdomain. For example, use xyz.domain.com, domain.com, or www.domain.com. Don't include http:// or mappings to specific pages within a domain, such as domain.com/page. • Make sure that you specify all the domains that you want to allow to host the deployment. • To make the deployment usable on any domain, leave the Permitted Domains field empty.
Enable Custom Timeouts	Indicates whether a warning and timeout for the agent are enabled for when the customer is idle in a chat.
Idle Connection Warning Duration	Indicates the duration, in seconds, that the customer can remain idle or disconnected before a warning is sent to the agent. The default value is 40 seconds. Appears when <code>Enable Custom Timeouts</code> is selected.
Idle Connection Timeout Duration	Indicates the duration, in seconds, that the customer can remain idle or disconnected before the chat ends. The default value is 110 seconds. Appears when <code>Enable Custom Timeouts</code> is selected.

Chat Window Branding

You can optionally customize your chat windows with custom images by associating your deployment with a Force.com site and its static resources.

Setting	What It Does
Branding Image Site	Determines the Force.com site that's associated with the deployment. By associating your deployment with a Force.com site, you can customize your deployment with branding images. Store your branding images as static resources with your Force.com site.
Chat Window Branding Image	Sets the custom graphic that appears in the customer's chat window.
Mobile Chat Window Branding Image	Sets the custom graphic that appears in the customer's chat window when the customer accesses chat from a mobile site.

Permitted Domains and Live Agent Deployments

To enhance security and minimize the number of illegitimate chat requests that you receive, use the permitted domains option when you create Live Agent deployments. There are a few considerations to keep in mind when you use permitted domains.

- List as many domains as you need to, but only one per line.
- Use only the domain and subdomain—for example, xyz.domain.com, domain.com, or www.domain.com. Don't include http:// or mappings to specific pages within a domain, such as domain.com/page.
- Specify all the domains that you want to allow to host the deployment.
- To make the deployment usable on any domain, leave the Permitted Domains field empty.

Create Chat Buttons

Create chat buttons to enable customers to request a chat with an agent directly from your website.

Before you create chat buttons, you need to:

- Create skills. Each chat button is associated with a particular skill or set of skills so that chats that are initiated from the button are routed to the appropriate agents.
- Create a Force.com site and static resources to use custom images for the online and offline versions of your button. If you don't have a Force.com site, you can specify online and offline button images or text by modifying the code that's generated when you create a button.

You need to create the buttons that visitors click to start chats. Like a deployment, a button consists of several lines of JavaScript that you copy and paste into Web pages. A single deployment can have multiple buttons; each button enables you to refine the chat experience for visitors. For example, your service deployment might have buttons for personal computer, laptop, or tablet issues. Each button is mapped to a skill or set of skills to ensure that visitors' inquiries go to only those agents who can solve the visitors' problems.

1. From Setup, enter *Chat Buttons* in the **Quick Find** box, then select **Chat Buttons & Invitations**.
2. Click **New**.
3. Select Chat Button from the **Type** field.
4. Choose the remaining settings for your chat button.
5. Click **Save**.
6. Copy the button code, and then paste it on each Web page where you've deployed Live Agent. Make sure that you paste the code in the area on the page where you want the button to appear.

Tip: Because the code changes with each modification, remember to copy and paste the code each time that you update the button.

Chat Button Settings

Chat button settings control the behavior of the chat buttons that customers use to interact with agents.

Apply settings when you create or edit a Live Agent chat button.

Basic Information

Configure the basic functionality that's available on a particular Live Agent chat button.

Setting	What It Does
Type	<p>Determines the type of button that you want to create.</p> <p> Warning: When you create a chat button to host on your website, you must set this option to Chat Button.</p>

EDITIONS

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Setting	What It Does
Name	Names the chat button. This button name, or a version of it, automatically becomes the <code>Developer Name</code> .
Developer Name	Sets the API name for the chat button.
Language	Sets the default language for text in the chat window.
Enable Customer Time-Out	Indicates whether chats are ended if the customer doesn't respond within a specified period.
Customer Time-Out (seconds)	Sets the amount of time that a customer has to respond to an agent message before the session ends. The timer stops when the customer sends a message. The timer resets to 0 each time the agent sends a message.
Customer Time-Out Warning (seconds)	Sets the amount of time that a customer has to respond to an agent message before a warning appears and a timer begins a countdown. The warning disappears (and the timer stops) each time the customer sends a message. The warning disappears (and the timer resets to 0) each time the agent sends message. The warning value must be shorter than the time-out value (we recommend at least 30 seconds).
Custom Agent Name	Sets the agent's name as it appears to customers in the chat window.
Auto Greeting	<p>Sets a customized greeting message that the customer receives automatically when an agent accepts the customer's chat request.</p> <p>Optionally, use merge fields to customize the information in your greeting by using the Available Merge Fields tool. For example, you can personalize the chat experience by using merge fields to include the customer's name in the greeting.</p> <p> Note: If you specify an automatic greeting message in both your Live Agent configuration and in an individual chat button, the message that's associated with your chat button overrides the message that's associated with your configuration.</p>

Routing Information

Configure how the button or invitation routes chats to the best-fit agent.

Setting	What It Does
Routing Type	Sets how chats are routed to an agent.

Setting	What It Does
Skills	Associates skills with the button. Incoming chat requests that originate from the button are routed to agents with the skills that you specify.
Push Time-Out (seconds)	Sets the amount of time an agent has to answer a chat request before the request is rerouted to another agent.
Enable Queue	Indicates that queueing is enabled. Queueing allows incoming chat requests to wait in a queue until an agent with the appropriate skills is available to accept the chat.
Queue Size Per Agent	Determines the queue's capacity to hold chat requests per available agent. For Live Agent routing or when chats have a size of 1, this is the number of chats allowed to queue for each agent.
Overall Queue Size	Determines the queue's capacity to hold chat requests. For Live Agent routing or when chats have a size of 1, this is the maximum number of chats allowed to queue.
Reroute Declined Requests	Lets a chat request that's been declined by all available agents be rerouted and sent to all available agents again. Available only for requests with Least Active and Most Available routing types.
Automatically Accept Chats	Lets chat requests originating from this button be automatically accepted by the first available agent.

Chat Button Customization

You can optionally customize your chat button with custom images by associating your deployment with a Force.com site and its static resources.

Setting	What It Does
Site for Resources	Determines the Force.com site that's associated with the chat button. By associating your button with a Force.com site, you can customize the button with branding images. Store your branding images as static resources with your Force.com site.
Online Image	Sets the custom button graphic that appears when the chat button is unavailable.
Offline Image	Sets the custom button graphic that appears when the chat button is available for customers to request new chats.
Custom Chat Page	Replaces the standard Live Agent chat window with a custom chat window page that you've developed. Use this option only to use a chat window other than the default chat window that Live Agent provides.

Setting	What It Does
Pre-Chat Form Page	Directs Live Agent to the Force.com page that hosts your customized pre-chat form that customers see before they begin a chat with an agent.
Pre-Chat Form URL	Directs Live Agent to the URL of the Web page that hosts your pre-chat form.
Post-Chat Page	Directs Live Agent to your customized post-chat page that customers see after they complete a chat.
Post-Chat Page URL	Directs Live Agent to the URL of the Web page that hosts your post-chat page.

Chat Routing Options

Routing options in Live Agent enable you to specify how incoming chat requests are directed to agents.

Routing Option	Description
Choice	Incoming chat requests are added to the queue in Live Agent in the Salesforce console and are available to any agent with the required skill.
Least Active	Incoming chats are routed to the agent with the required skill who has the fewest active chats. This option is a push option, which means that incoming chats are routed, or “pushed,” to agents. You can specify the amount of time that an agent has to answer a chat request before it’s routed to the next available, qualified agent.
Most Available	Incoming chats are routed to the agent with the required skill and the greatest difference between chat capacity and active chat sessions. For example, if Agent A and Agent B each have a chat capacity of five, and Agent A has three active chat sessions while Agent B has one, incoming chats will be routed to Agent B. This option is a push option, which means that incoming chats are routed, or “pushed,” to agents. You can specify the amount of time that an agent has to answer a chat request before it’s routed to the next available, qualified agent.
Omni	Incoming chats are routed to agents using Omni-Channel queues.

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Chat Queuing Options

Queuing options in Live Agent let you control how incoming chat requests are handled when no agents are available.

For each Live Agent chat button or invitation that you create, you can enable queuing to put incoming chat requests on hold if no agents with the required skills are available to accept the requests. You can also specify the maximum number of requests in a queue. By enabling queues and setting limits for them, you can control how incoming chat requests are handled, which helps agents manage chat backlogs.

With queuing enabled, your company can accept incoming chat requests even when agents are at capacity, and you can specify the maximum number of requests to accept. This helps agents work effectively and limits the amount of time that customers spend waiting to chat.

The way that chat queuing works is determined by chat routing options. Routing options are set through your chat button or automated invitation. See [Chat Routing Options](#) to learn more about how you can route chats to the right agents.

Let's look at how queuing and routing options work together:

Queuing Option	With This Routing Option	Results
Queuing is not enabled	Choice	<ul style="list-style-type: none"> Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill who are available or all online agents have reached capacity. Incoming chat requests are added to the Live Agent widget. When agents have capacity for new chat sessions, they can select incoming requests from the list.
Queuing is not enabled	Least Active or Most Available	<ul style="list-style-type: none"> Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill who are available or all online agents have reached capacity. When agents have the capacity for new chat

Queuing Option	With This Routing Option	Results
Queuing is enabled without a per-agent or overall limit	Choice	<p>sessions, requests are routed to them.</p> <ul style="list-style-type: none"> • Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill who are available. • Incoming chat requests are added to the Chat Requests list. • When agents have capacity for new chat sessions, they can accept incoming requests from the list.
Queuing is enabled without a per-agent or overall limit	Least Active or Most Available	<ul style="list-style-type: none"> • Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill who are available. • When agents have the capacity for new chat sessions, requests are routed to them.
Queuing is enabled with a per-agent or overall limit defined	Choice	<ul style="list-style-type: none"> • Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill who are available or until the queue limit is reached. Users then see the offline version of the button until older chat sessions have ended. • Incoming chat requests are added to the queue until the per-agent or overall limit is reached, at which point no new requests are accepted until older chat sessions have ended. • When agents have capacity for new chat sessions, they can accept incoming requests from the list.
Queuing is enabled with a per-agent or overall limit defined	Least Active or Most Available	<ul style="list-style-type: none"> • Users see the online version of your chat button and can submit new requests unless there aren't any available agents with the required skill, or until the queue limit is reached. In those cases, users see the offline version of the button until older chat sessions have ended and an agent is available.

Queuing Option**With This Routing Option****Results**

- Incoming chat requests are added to the queue until the per-agent or overall limit is reached, at which point no new requests are accepted until older chat sessions have ended.
- When agents have the capacity for new chat sessions, requests are routed to them.

Customize Your Live Agent Branding with Force.com Sites

To customize your Live Agent implementation with branding images, use a Force.com site to upload the images for your chat window and chat buttons.

To customize your chat window and chat buttons, you need to create one or more Force.com sites and then upload the images that you want to use as static resources. Static resources enable you to upload content that you can reference in a Visualforce page. Each static resource has its own URL that Salesforce uses to access the images when the chat window loads.

1. Create a Force.com site to host your images.

When you create a Force.com site for your Live Agent deployment, you need to provide only the following information.

- A site label and site name
- A site contact
- The active site's home page
- A site template

2. Upload your branding images as static resources.

 **Note:** The maximum size for a standard chat window images is 50 pixels.

Customize Your Live Agent Implementation

After you set up your basic Live Agent implementation, customize it with solutions that are appropriate for your agents, supervisors, and customers. Live Agent offers several options for customizing your implementation declaratively, which means that no coding is required.

[Create Live Agent Objects](#)

The first step towards getting your Live Agent implementation up and running is to create the necessary objects in Salesforce.

[Set Visibility for Live Agent Users](#)

Choose how your Live Agent users can view the Supervisor Tab and Live Agent Sessions using Profiles and Permission Sets.

[Set Privacy Options for Live Agent Users](#)

Protect your agents and the customers they assist by blocking sensitive data and unwanted visitors.

Create Live Agent Objects

The first step towards getting your Live Agent implementation up and running is to create the necessary objects in Salesforce.

[Create Automated Chat Invitations](#)

Set up automated chat invitations that appear as animated pop-ups on your website to invite customers to chat with an agent.

[Pre-Chat Forms and Post-Chat Pages](#)

Pre-chat forms and post-chat pages in Live Agent enable you to exchange information with customers who contact your company through chat.

[Create Quick Text Messages](#)

Quick Text messages enable agents to include standardized notes with case updates and to send common responses to customers without having to type the responses each time. Create custom messages for your agents to use when they email and chat with customers.

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Create Automated Chat Invitations

Set up automated chat invitations that appear as animated pop-ups on your website to invite customers to chat with an agent.

Before you create automated invitations, you need to:

- Create skills. Each chat button is associated with a particular skill or set of skills so that chats that are initiated from the button are routed to the appropriate agents.
- Create a Force.com site and static resources to use custom images for the online and offline versions of your button. If you don't have a Force.com site, you can specify online and offline button images or text by modifying the code that's generated when you create a button.

Automated invitations can be set to trigger based on certain criteria, such as whether a customer remains on a Web page for more than a specified amount of time. Invitations can be associated with specific skills, which ensures that customers will be routed to the appropriate agent when they accept an invitation to chat.

1. From Setup, enter *Chat Buttons & Invitations* in the **Quick Find** box, then select **Chat Buttons & Invitations**.
2. Click **New**.
3. Under **Type**, select Automated Invitation.
4. Click **Save**.
5. Copy the invitation code, and then paste it on each Web page where you've deployed Live Agent. Make sure that you paste the code in the area on the page where you want the invitation to appear.

 **Tip:** Because the code changes with each modification, remember to copy and paste the code each time that you update the invitation.

[Automated Invitation Settings](#)

Automated invitation settings control the behavior of the invitations that are sent to your customers to prompt them to chat with agents while they visit your website.

EDITIONS

Available in: **Salesforce Classic**

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Automated Invitation Settings

Automated invitation settings control the behavior of the invitations that are sent to your customers to prompt them to chat with agents while they visit your website.

Apply settings when you create or edit a Live Agent automated invitation.

Basic Information

Configure the basic functionality that's available on a particular Live Agent chat button.

Setting	What It Does
Type	<p>Determines whether to create a chat button or automated invitation.</p> <p> Warning: When creating an automated chat invitation, you must set this option to Automated Invitation.</p>
Active	Determines whether the automated invitation is "active" or can automatically be sent to customers.
Name	<p>Names the invitation.</p> <p>This invitation name, or a version of it, automatically becomes the Developer Name.</p>
Developer Name	Sets the API name for the invitation.
Deployments	Allows you to choose the deployments where this invitation appears.
Language	Sets the default language for text in the chat window.
Enable Customer Time-Out	Indicates whether chats are ended if the customer doesn't respond within a specified period.
Customer Time-Out (seconds)	Sets the amount of time that a customer has to respond to an agent message before the session ends. The timer stops when the customer sends a message. The timer resets to 0 each time the agent sends a message.
Customer Time-Out Warning (seconds)	Sets the amount of time that a customer has to respond to an agent message before a warning appears and a timer begins a countdown. The warning disappears (and the timer stops) each time the customer sends a message. The warning disappears (and the timer resets to 0) each time the agent sends message. The

EDITIONS

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Setting	What It Does
	warning value must be shorter than the time-out value (we recommend at least 30 seconds).
Custom Agent Name	Sets the agent's name as it appears to customers in the chat window.
Auto Greeting	<p>Sets a customized greeting message that the customer receives automatically when an agent accepts the customer's chat request from an invitation.</p> <p>Optionally, use merge fields to customize the information in your greeting by using the Available Merge Fields tool. For example, you can personalize the chat experience by using merge fields to include the customer's name in the greeting.</p> <p> Note: If you specify an automatic greeting message in your Live Agent configuration and in an invitation, the message that's associated with your invitation will override the message that's associated with your configuration.</p>

Routing Information

Specify how this invitation routes chats to the best-fit agent.

Setting	What It Does
Routing Type	Determines how incoming chat requests that originate from the invitation are routed to agents with the appropriate skills.
Skills	Associates skills with the invitation. Incoming chat requests that originate from the invitation are routed to agents with ALL the skills that you specify.
Queue	Selects the queue for this invitation.
Enable Queue	Indicates that queuing is enabled, allowing incoming chat requests to wait in a queue until an agent with the appropriate skills is available to accept the chat.
Queue Size Per Agent	Determines the queue's capacity to hold chat requests per available agent. For Live Agent routing or when chats have a size of 1, this is the number of chats allowed to queue for each agent.
Overall Queue Size	Determines the queue's capacity to hold chat requests. For Live Agent routing or when chats have a size of 1, this is the maximum number of chats allowed to queue.

Invitation Animation

Customize your invitation's animations to determine how the animation will appear to customers.

Setting	What It Does
Display Time	Determines how long the invitation will be displayed to customers before it disappears.
Allow invitation to be triggered again after accepting	Indicates whether the invitation can be sent to the customer again after the customer has accepted a previous invitation.
Allow invitation to be triggered again after rejecting	Indicates whether the invitation can be sent to the customer again after the customer has rejected a previous invitation.
Animation	<p>Determines the type of animation for your invitation. Depending on which animation you choose, you'll be prompted to select the positions where the invitation will appear on-screen to customers.</p> <p> Note: Animations won't render for agents using Internet Explorer versions 9 and below.</p>

Invitation Customization

You can optionally customize your invitation with custom images by associating your deployment with a Force.com site and its static resources.

Setting	What It Does
Site for Resources	Determines the Force.com site that's associated with the invitation. By associating your invitation with a Force.com site, you can customize the invitation with branding images. Store your branding images as static resources with your Force.com site.
Invitation Image	Sets the custom button graphic that appears for this invitation.
Custom Chat Page	Replaces the standard Live Agent chat window with a custom chat window page that you've developed. Use this option only to use a chat window other than the default chat window that Live Agent provides.
Pre-Chat Form Page	Directs Live Agent to the Force.com page that hosts your customized pre-chat form that customers see before they begin a chat with an agent.
Pre-Chat Form URL	Directs Live Agent to the URL of the Web page that hosts your pre-chat form.
Post-Chat Page	Directs Live Agent to your customized post-chat page that customers see after they complete a chat.
Post-Chat Page URL	Directs Live Agent to the URL of the Web page that hosts your post-chat page.

Sending Rule

Create sending rules for your invitation to determine when to trigger and send the invitation to customers. You can include multiple criteria in your sending rule. Additionally, if your sending rule requires more complicated logic, you can apply Boolean operators to your sending rule.

Setting	What It Does
Criteria	Sets the criteria to be evaluated by the sending rule. For example, you can create a rule that sends the invitation based on how many seconds a customer has been viewing a Web page.
Operator	Sets the operator to evaluate your criteria. For example, you can create a rule that sends the invitation when a customer has been on a page for more than a specified number of seconds.
Value	Sets the value to evaluate the formula against. For example, you can create a rule that sends the invitation when a customer has been on a page for more than 30 seconds.

Pre-Chat Forms and Post-Chat Pages

Pre-chat forms and post-chat pages in Live Agent enable you to exchange information with customers who contact your company through chat.

Pre-chat forms and post-chat pages offer a standardized way of collecting information from customers who contact your company through chat. These forms and pages also offer a standardized way of sharing information with customers after their chat sessions are finished. In addition, by using these forms and pages, you can customize the chat experience for your users.

By using pre-chat forms, you can collect information from a customer, such as a name or a description of a problem, after the customer requests to chat with an agent. This information can help direct chat requests efficiently and can reduce the amount of time that agents need to spend collecting information before beginning a chat session. You can also use this information to customize a customer's experience while the customer chats with an agent, such as including the customer's first name in the chat window.

By using post-chat pages, you can share information with customers at the end of a chat session. For example, you can direct your customers to another Web page after they complete a chat with an agent, and you can forward them to a survey about their chat experience.

You have to create pre-chat forms and post-chat pages programmatically, using Live Agent's APIs. For information on creating customized pre-chat forms and post-chat pages, see the [Live Agent Developer's Guide](#) (English only).

Create Quick Text Messages

Quick Text messages enable agents to include standardized notes with case updates and to send common responses to customers without having to type the responses each time. Create custom messages for your agents to use when they email and chat with customers.

1. Click the **Quick Text** tab.
2. Click **New**.
3. If you have more than one Quick Text record type, select a record type for the new message, and then click **Continue**.
4. Type a message name.
5. Type the message.
It can include line breaks, lists, and special characters and can be up to 4,096 characters.
6. Click **Available Merge Fields** to display the merge field selector.
7. Select the channels in which you want the message to be available.
Depending on which features are enabled in your organization, these channels might be available.
 - **Email**—the Case Feed Email action
 - **Live Agent**—Live Agent in the Salesforce console
 - **Portal**—a community or a customer portal
 - **Phone**—the Case Feed Log a Call action
 - **Internal**—the Case Feed Change Status action
8. Select a category.
9. Optionally, select a subcategory.
10. Click **Save**.

Tip: Click **Test and Verify Merge Fields** to view a sample of the quick text, populated with data from records that you choose.

Block Sensitive Data in Chats

Sensitive data rules let you block specific patterns, such as credit card, Social Security, phone and account numbers, or even profanity. You can choose to remove the text or replace it with your preferred characters.

1. In Setup, enter *Sensitive Data* in the **Quick Find** box, then select **Sensitive Data Rules**.
2. Click **New**.
3. Write each pattern as a JavaScript regular expression (regex), and choose your preferred settings. The regex is case-sensitive.
4. Click **Test Your Pattern**.
5. Enter some text in the format of the data you want to block, such as 123-45-6789 for a Social Security number.
6. Preview your results to ensure that the rule is working correctly.
7. Select the roles for which you want to enforce this rule.
8. Click **Save**.

You can block the text from agents, supervisors, customers, or all of these. When a rule is triggered, it logs one or more of these chat transcript events:

- Sensitive data blocked (Agent)
- Sensitive data blocked (Supervisor)
- Sensitive data blocked (Visitor)

 **Note:** Sensitive data is visible while someone's typing, but it is masked when the person sends it. So if you want to mask customer information from agents, we recommend disabling Agent Sneak Peek (under **Setup > Customize > Live Agent > Live Agent Configurations**).

Sensitive data rules apply to the auto-greeting and any quick text that you have enabled. They don't apply to the agent name or other standard text in the chat window.

Let Your Agents Block Visitors by IP Address

Help your agents avoid troublesome customers by blocking chats from specified IP addresses.

You can enable your agents to block chat requests from specified IP addresses while they work in the console. For example, if a customer is using abusive language or sending spam messages, the agent can block that user from starting a new chat.

An agent action blocks chats from an individual IP address.

Blocked visitors will see a message indicating that chat isn't available.

If a customer attempts to request a chat from a blocked IP address, the chat won't enter a queue, nor will it be routed to agents. In addition, you can modify or delete blocking rules.

1. In Setup, enter *Live Agent Configurations* in the **Quick Find** box, then select **Live Agent Configurations**.
2. Click **Edit** next to the configuration that you want to modify.
3. Under **Basic Information**, select **Visitor Blocking Enabled**.
4. Click **Save**.

As a Salesforce admin, you can also block individual IP addresses. Or, if your Salesforce org is receiving spam chats from a particular region, you can block entire IP ranges. See [Create an IP Blocking Rule](#) for more information.

Add Live Agent to the Salesforce Console in Salesforce Classic

Adding Live Agent to the Salesforce console enables agents and supervisors to chat with customers and access other customer service tools in one place.

Before you add Live Agent to a Salesforce console app, you need to create a Salesforce console app if you don't have one set up.

After you set up Live Agent, add it to a Salesforce console app. After Live Agent is set up in the console, your agents can interact with chat customers. With the Salesforce console, your agents and supervisors can access Live Agent and other Service Cloud products in one place to provide customers fast and efficient customer service.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the name of the Salesforce console app in which you want to set up Live Agent.
3. Select *Include Live Agent in this App*.
4. Choose the records or pages that you want to open as subtabs of chat sessions in the chat workspace.
5. Optionally, if your Salesforce org has Knowledge enabled, select *Include Suggested Articles from Knowledge in Live Agent* to display the Knowledge One widget in the chat workspace.
6. Click **Save**.

You can run multiple Salesforce apps at the same time. However, if you log in to another Salesforce app while you're logged in to a Salesforce console app, you can't accept new chat requests.

USER PERMISSIONS

To add Live Agent to the Salesforce console:

- "Customize Application"

Set Up Chat Answers from Knowledge Articles

If your organization uses Salesforce Knowledge, you can enable your agents to answer customer questions by using information from your knowledge base. Set up chat answers on articles so that agents can search for articles from Live Agent in the Salesforce console and include the information in chats.

To give support agents the ability to include information from Knowledge articles in chat sessions by using the Knowledge One widget, you need to add a custom field that's called "Chat Answer" to article types. This field stores information from the article that's appropriate to share with customers during a live chat. Using this field can be helpful for articles that are too long for an agent to include easily in a response.

Create the custom field as a Text, Text Area, or Text Area (Long). The Rich Text Field option is not supported. You need to add this custom field to each article type that contains information that you want operators to access from the Knowledge One widget.

1. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Create or edit an article type.
3. Click **New** in the Fields related list.
4. Select **Text**, **Text Area**, or **Text Area (Long)**.
Don't select **Text Area (Rich)**.
5. Click **Next**.
6. Enter *Chat Answer* in Field Label.
Make sure that Field Name is populated automatically with Chat_Answer. (You can use a different name for the Field Label.)
7. Click **Next**.
8. Specify security settings, and then click **Next**.
Make the Chat Answer field visible to authors, editors, and live chat agents. Hide it from portal users or other users who don't need access to it.
9. Select **Yes**, add this custom field to the layout, and then click **Save**.

Add a Console Sidebar Lookup Component for Chats Routed with Omni-Channel

Provide agents with a sidebar lookup component in their Salesforce console so they can quickly look up or create associated records for chats. This component is only for chats using Omni-Channel routing (Beta).

Before you add a sidebar component to the Salesforce console app, you need:

- A Salesforce console app with Live Agent and Omni-Channel added to it.
 - At least one chat button that uses the routing option **Omni**.
 - Edit access for Live Chat Transcript granted to agents handling chats routed through Omni-Channel.
1. From Setup, enter *Live Agent* in the *Quick Find* box, then select **Live Chat Transcripts > Page Layouts**.
 2. Click **Edit** next to the Live Chat Transcript (In Progress) Page Layout.
 3. Click **Custom Console Components**.

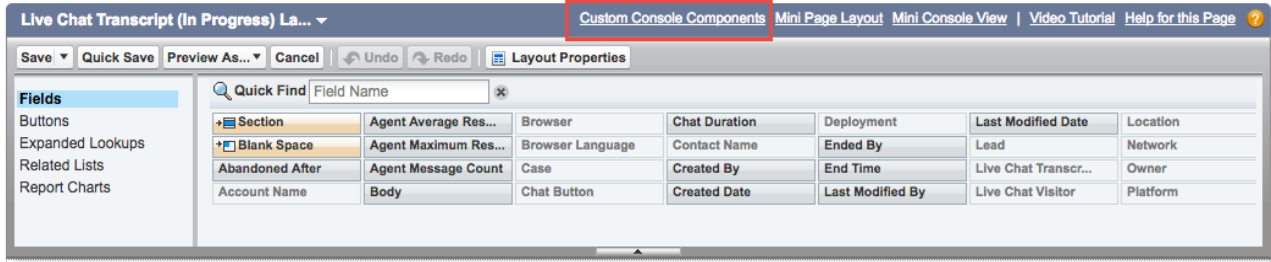

EDITIONS

Available in: Salesforce Classic

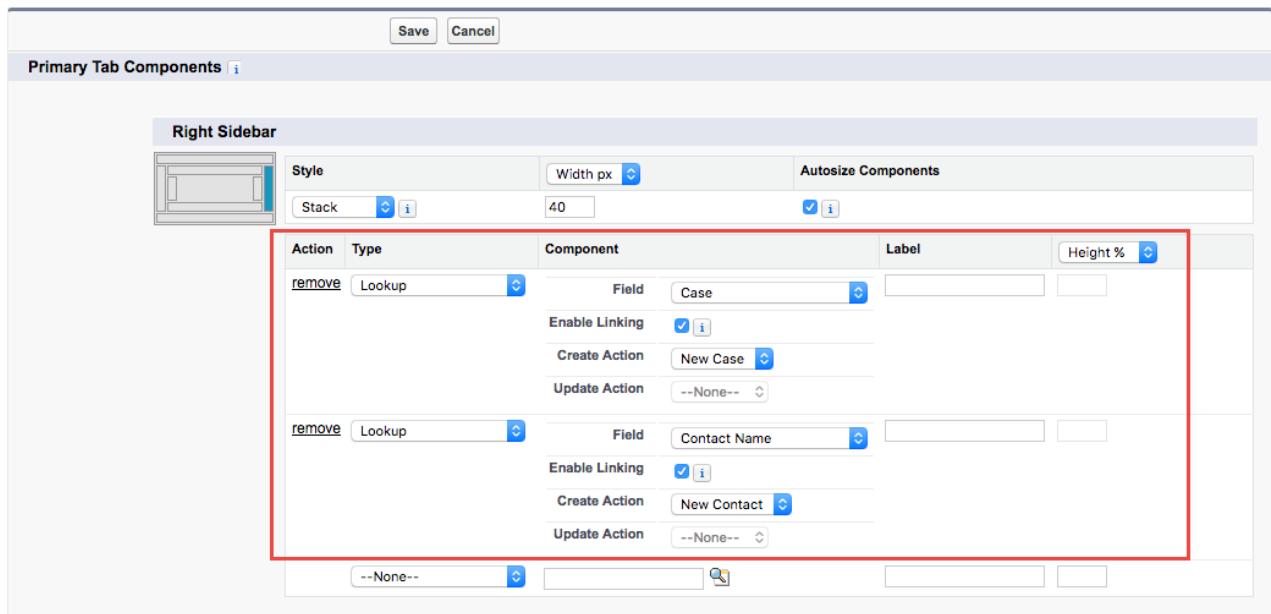

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

- Under Primary Tab Components, adjust your objects and other settings. Don't move the component to the left sidebar, as chats appear on the left side.

- Click **Save**. Agents can now link and unlink records using the sidebar component.

Sidebar Lookup Component with No Linked Records

The screenshot shows the Salesforce Live Chat Transcript interface for transcript ID 00000192. The main content area displays transcript details, custom details, attached records, visitor details, and recently viewed pages. On the right sidebar, there are three lookup components: 'Contact Lookup', 'Widget Lookup', and 'Case Lookup'. Each component shows 'No [Type] Is Linked' and a search input field. The 'Omni-Channel' status is visible at the bottom right.

Sidebar Lookup Component with Linked Contact Record

The screenshot shows the Salesforce Live Chat Transcript interface for transcript ID 00000192. The main content area is identical to the previous screenshot. On the right sidebar, the 'Contact Lookup' component is now populated with a record: Name 'Mr. Harry Potter' and Account Name. The 'Case Lookup' component has 'Cancel' and 'Save' buttons. The 'Omni-Channel' status is visible at the bottom right.

Use Omni-Channel with Your Existing Live Agent Implementation

Are you loving Live Agent and want to add Omni-Channel to the mix? Here's what changes for you and your organization (and not for your agents!).

So, you've decided to take your customer service to the next level by using Live Agent and Omni-Channel in tandem. That's great! Once everything's set up, you'll find that the two work together in perfect harmony.

Live Agent is powered by Live Agent Configurations, which control the behaviors and settings that are available to Live Agent users. Similarly, Omni-Channel uses Presence Configurations to control the behaviors and settings that are available to Omni-Channel users. You can integrate Live Agent with Omni-Channel so chats are routed just like other work items, and you can even use Omni-Channel routing for your chats. Whichever way you use Omni-Channel with Live Agent, your agents are then able to accept or reject chat requests right from the Omni-Channel widget.

When you integrate Live Agent and Omni-Channel, your Live Agent users also become Omni-Channel users, so your chat agents need to be associated with both a Live Agent Configuration and a Presence Configuration. Luckily, Salesforce does some of the heavy lifting for you when you enable Omni-Channel with your current Live Agent implementation.

For each Live Agent Configuration that you already have in your org, Salesforce:

- Creates a corresponding Presence Configuration for each of your Live Agent Configurations
- Sets the chat capacity for each Presence Configuration to what's set in its corresponding Live Agent Configuration
- Assigns your chat agents to the new corresponding Presence Configurations

If you have Live Agent enabled but don't have an implementation, when you enable Omni-Channel, Salesforce creates a Live Agent Service Channel.

Salesforce does all this automatically so there's no disruption to your agents' workflow. They can start accepting chats through the Omni-Channel widget in the console. The only difference they see is that they now use the Omni-Channel widget in the console to set their status and accept chat notifications. They may also see a change in their status options, as Omni-Channel Presence Statuses are configurable.

[Compare Live Agent and Omni-Channel Routing for Chats](#)

Compare Live Agent and Omni-Channel Routing for Chats

See the benefits and limitations of using Omni-Channel routing for chats (beta) or keeping Live Agent routing for chats.

There's a lot to keep in mind as you decide whether to try Omni-Channel routing for chats (beta). Omni-Channel routing for chats is enabled when you enable Live Agent for the first time, or when you create a chat button that uses the routing option **Omni**.

Let's compare the two routing model options when using Live Agent and Omni-Channel together.

Live Agent Routing	Omni-Channel Routing
Agents use the Omni-Channel widget to handle their work.	Agents use the Omni-Channel widget to handle their work.
Agents use Omni-Channel Presence, including its configurable statuses.	Agents use Omni-Channel Presence, including its configurable statuses.
Use Omni-Channel sound notifications in the Presence Configuration for chats.	Use Omni-Channel sound notifications in the Presence Configuration for chats.
Agent capacity is set and consumed by Omni-Channel.	Agent capacity is set and consumed by Omni-Channel.
Chats are routed to agents using Skills.	Chats are routed to agents using Omni-Channel queues.
Chats can't be prioritized with Omni-Channel work, or relative to each other. Un-routed Omni-Channel items are always routed ahead of chats.	Chats are prioritized with Omni-Channel work, and can be prioritized relative to each other using queues.
Chats always have the size 1.	Chat size is configurable by queue.
Chat supervisors use the Live Agent Supervisor Panel to observe chats and assist agents with their chats.	Chat supervisors use Omni-Channel Supervisor to see agent activity and real-time data.
Reports and data for chats are separate from Omni-Channel data.	Chat data is included in Agent Work reports in addition to Live Agent reports.
The Live Chat Transcript is created when the chat ends.	The Live Chat Transcript is created when the chat is requested.
You can customize the Live Chat Transcript page layout for Ended chats.	You can customize the Live Chat Transcript page layout for Waiting, In Progress, and Ended chats.
Live Chat Transcripts aren't created for missed chats, so your reports don't include missed chats.	Live Chat Transcripts are created for missed chats, so your reports include missed chats.
Agents associate records with the chat transcript only after the chat has ended.	Agents can associate records with the chat transcript during the chat. They have the option to do this on the chat transcript itself or use a console sidebar lookup component.

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Live Agent Routing	Omni-Channel Routing
Uses the Console Integration Toolkit Methods for Live Agent .	Uses the Console Integration Toolkit Methods for Omni-Channel .

However, there are a few limitations to using Omni-Channel routing for chats:

- You can't transfer a chat from a button using Live Agent routing to a button using Omni-Channel routing.
- You can't use direct-to-agent routing with chats routed by Omni-Channel.
- You can't use chat conferencing with chats routed by Omni-Channel.
- Queues with multiple object types can cause problems when using Omni-Channel routing for chats. We recommend creating a queue for each object type, such as Chats, Cases, and Leads, instead of setting queues to handle multiple object types.
- Chats routed with Omni-Channel can't use supervisor whisper messages and assistance flags with Omni-Channel Supervisor.
- When an agent uses "Transfer to Agent" for a chat routed with Omni-Channel and the receiving agent has an admin profile, the agent who initiated the transfer can lose visibility of the chat transcript until the receiving agent accepts the chat request. This is because Omni-Channel changes ownership of the chat transcript when the transfer is initiated, before the chat is accepted by the next agent.

Adding Snap-ins Chat to Your Website

Snap-ins Chat

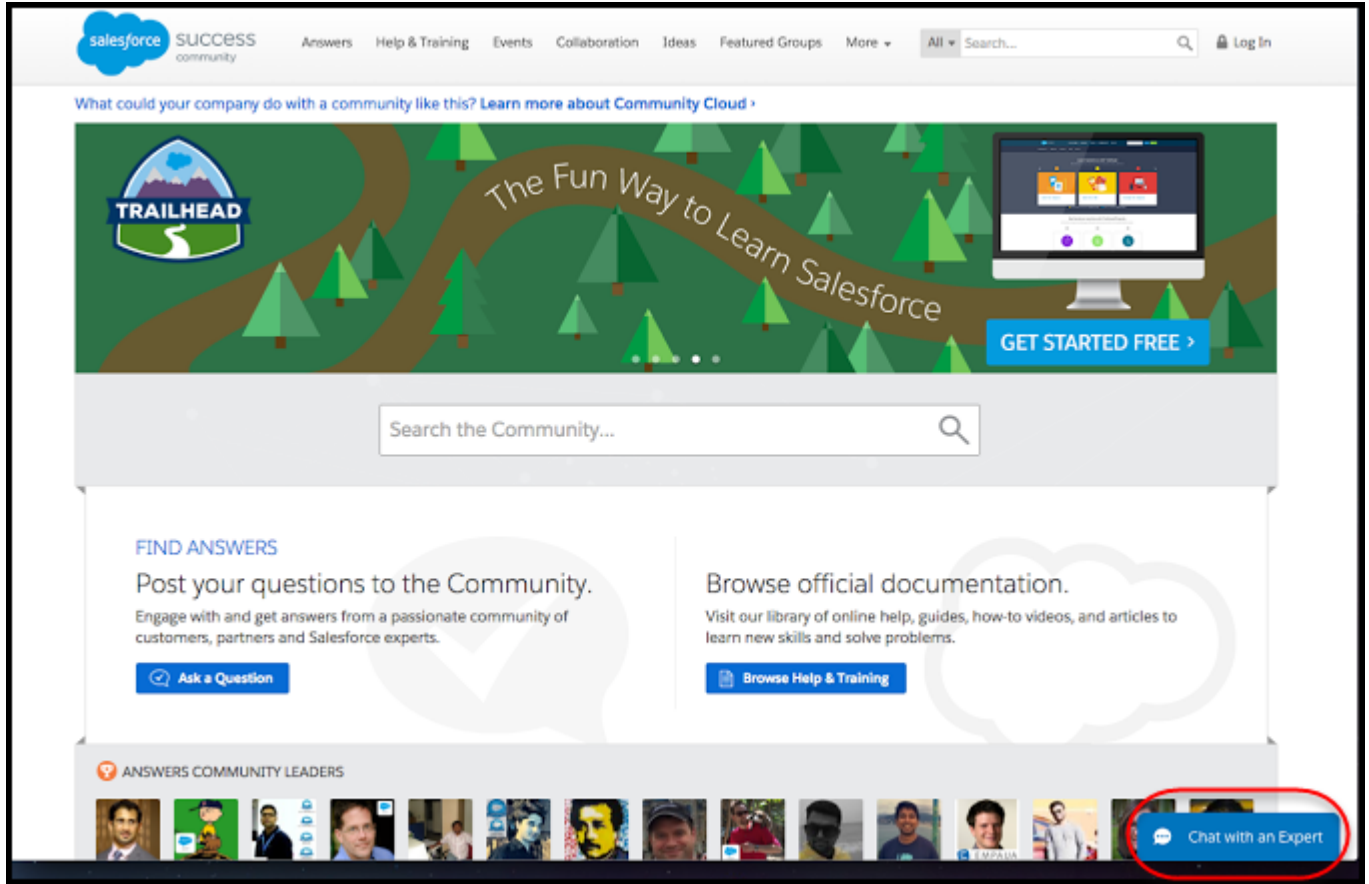

Add the Snap-ins chat widget to your website so customers can quickly get answers to their questions by chatting with an agent while browsing your site. Snap-ins chat uses Live Agent, but with a simpler setup, to power your chats.

The chat widget button sits unobtrusively on the web page. When customers want to chat, they just click the button to launch the chat.

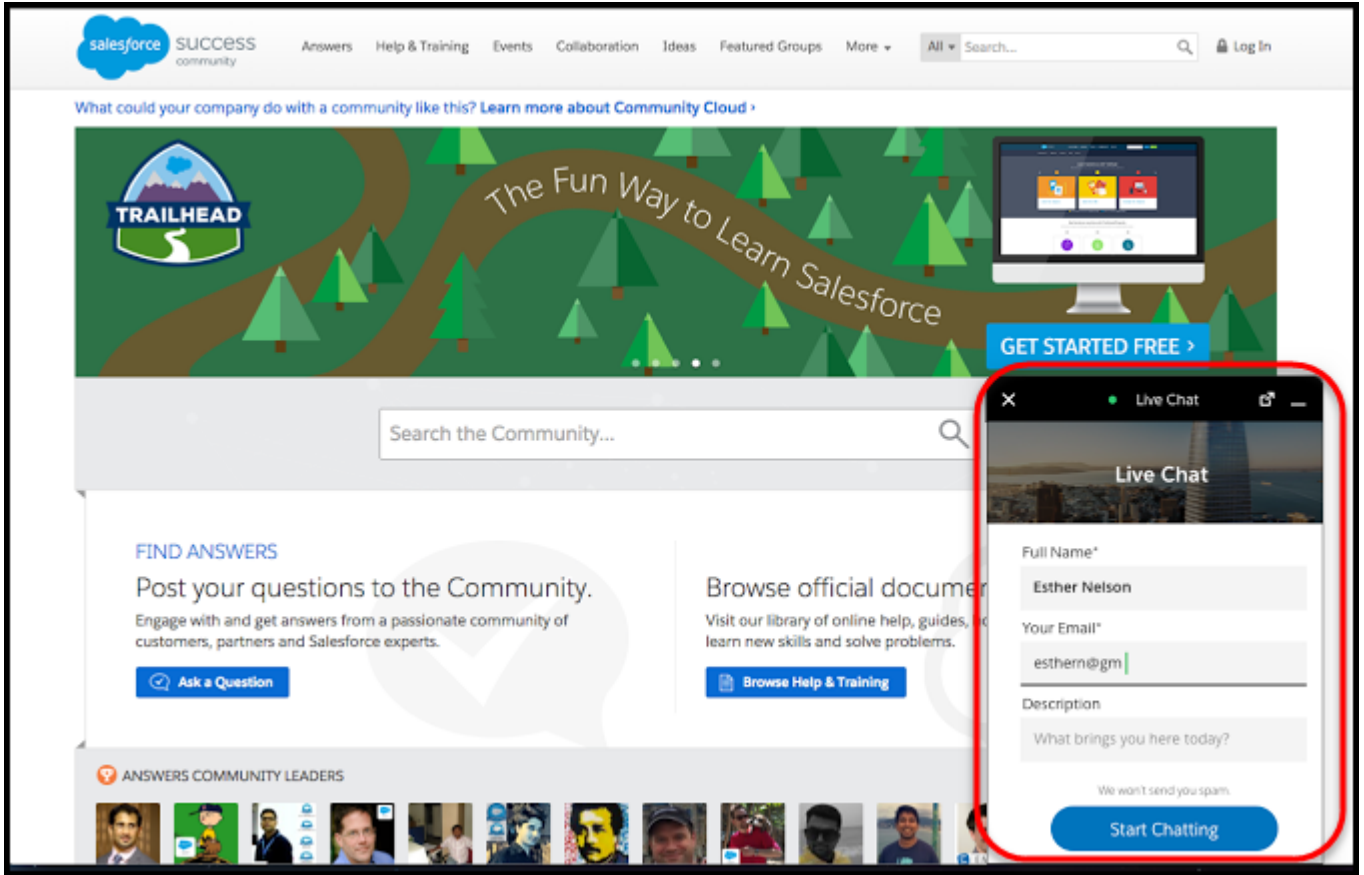

EDITIONS

Snap-ins setup node is available in: Lightning Experience

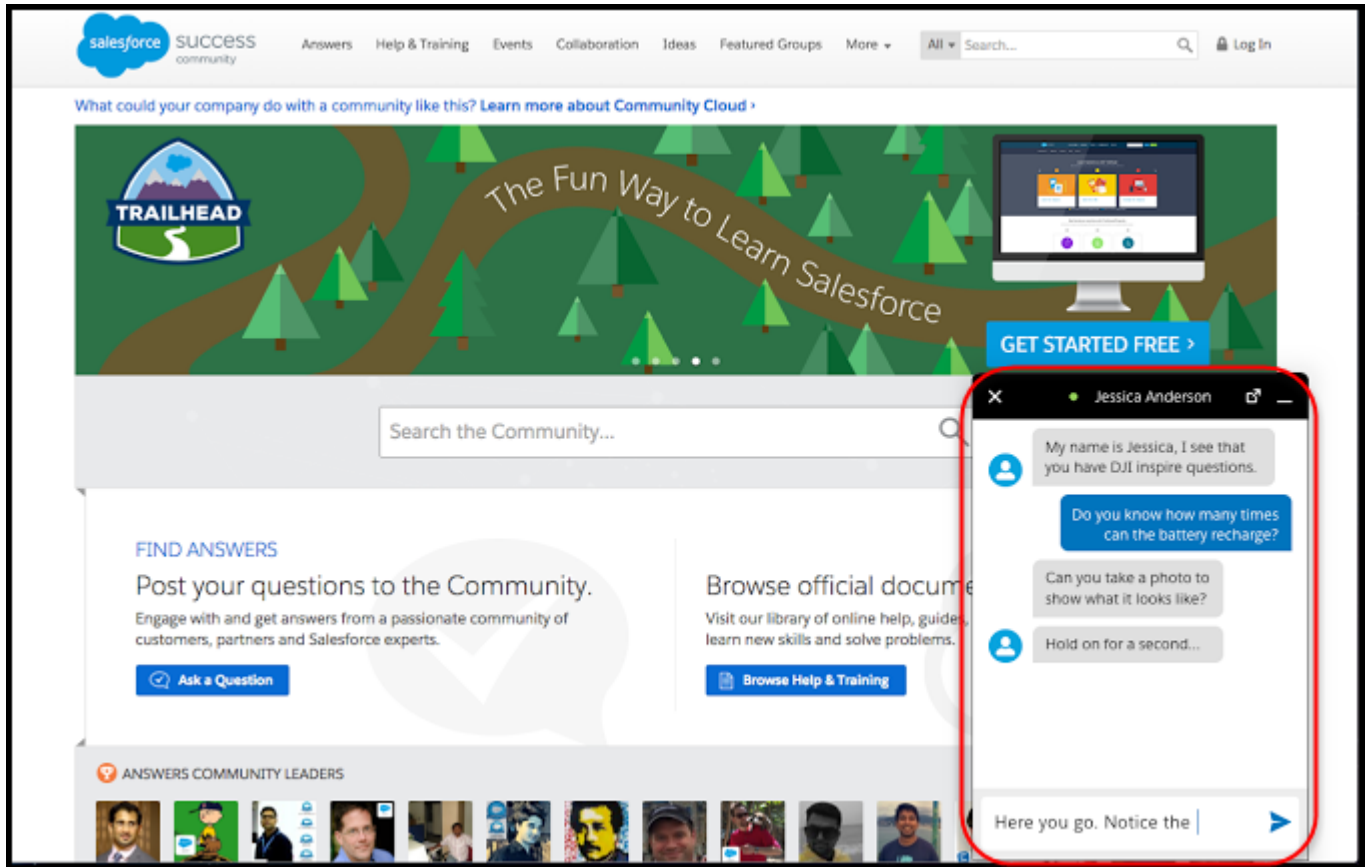

Available in: **Enterprise**, **Professional**, **Unlimited**, and **Developer** Editions

Customers fill out the brief pre-chat form, which helps agents gather basic information about the customer, like their contact information, and their needs.

Customers can start chatting while viewing your web page and can minimize the chat window as they browse, so it's not in their way. The chat widget persists across your web pages, so customers can continue browsing other pages on your site while chatting with an agent.

Snap-ins Chat uses a lightweight Live Agent deployment that you can quickly configure and simply add the chat code to the web pages where you want the chat widget to be available. When agents chat with customers via snap-in chat, the agents use Live Agent.

SEE ALSO:

- [Set Up Snap-ins Chat for Your Website](#)
- [Snap-ins Chat Limitations](#)

Set Up Snap-ins Chat for Your Website

Ensure that your org meets the following prerequisites before starting to set up Snap-ins Chat. Follow these steps to configure the Snap-ins chat widget and add it to your web pages. The setup node for Snap-ins chat is available only in Lightning Experience.

To set up snap-ins chat, your org must meet these prerequisites:

- [Lightning Experience must be enabled](#) to set up snap-ins
- Service Cloud License
- Live Agent License
- [Live Agent must be enabled](#) in your org
- A Live Agent chat button and a Live Agent deployment must be set up and available in your org
- A [Salesforce Community](#) on page 3348 (preferable) or a [Force.com site](#) on page 5520 must be set up on your org and available for guest user access

EDITIONS

Snap-ins setup node is available in: Lightning Experience

Available in: **Enterprise**, **Professional**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To set up Snap-ins Chat:

- "Customize Application"

 **Note:** Administrators must use Lightning Experience to access the Snap-ins setup pages. However, other users in the org aren't required to have access to or use Lightning Experience with Snap-ins.

To set up Snap-ins Chat, follow these steps:

1. [Add Your Website to the CORS Whitelist](#)

Add the URLs of the web pages where you intend to add the Snap-ins chat widget to the CORS whitelist in your org. The web page where you add the Snap-ins Chat is the page that customers use to access chat.

2. [Create a Snap-ins Deployment](#)

Create a Snap-in deployment for each Snap-in widget that you're using. The setup node for Snap-ins chat is available only in Lightning Experience.

3. [Specify the Live Agent Settings for Your Snap-ins Chat Deployment](#)

The Snap-ins chat widget uses a Live Agent deployment ID and button so customers can chat with your agents. The Live Agent details that you provide are used to generate the chat widget code that you add to your web pages.

4. [Customize the Branding and Appearance of Your Snap-ins Chat Widget](#)

Select the colors and font used in the Snap-ins chat widget to reflect your company's brand identity.

5. [Customize the Pre-Chat Form](#)

Gather contact information from your customers and find out about their needs using a pre-chat form. You can create a pre-chat form that addresses different business needs and associates customer information with Salesforce records like leads, cases, and contacts. You can also customize the fields used on the form.

6. [Copy the Snap-ins Chat Code Snippets and Paste the Code into Your Web Pages](#)

Salesforce generates a unique code snippet based on the information you provided during the Snap-ins Chat setup. Copy and paste the chat code snippet so you can add the Snap-ins chat widget to your web pages. Copy and paste the optional meta tag code snippet to make your web pages responsive to different form factors such as mobile and desktop.

7. [Customize the Snap-ins Chat Widget Code](#)

Use a text or HTML editor to customize the optional parameters in the chat widget code snippet.

8. [Customizable Parameters in the Snap-ins Chat Code](#)

You can customize certain parameters that affect the appearance and behavior of the Snap-ins chat widget so that the chat experience reflects your company's branding. Use these parameters to customize the pre-chat banner image, logo, waiting state image, and your agent's avatar picture. You also can customize the wording that appears on the chat button and on the chat widget when the chat is loading, when agents are online, when agents are offline.

9. [Test the Snap-ins Chat Experience](#)

Now that you've add Snap-ins Chat in your web pages, it's time to test it out.

SEE ALSO:

[Turn on Lightning Experience for Your Org](#)

[Supported Browsers for Lightning Experience](#)

Add Your Website to the CORS Whitelist

Add the URLs of the web pages where you intend to add the Snap-ins chat widget to the CORS whitelist in your org. The web page where you add the Snap-ins Chat is the page that customers use to access chat.

You can use HTTP and HTTPS domains with Snap-ins Chat.

1. From Setup, enter *CORS* in the *Quick Find* box, then select **CORS**.
2. Select **New**.
3. Enter an origin URL pattern.

The origin URL pattern must include the HTTP or HTTPS protocol and a domain name. The origin URL pattern can include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, `https://*.example.com` adds all subdomains of `example.com` to the whitelist.

The origin URL pattern can be an IP address. However, an IP address and a domain that resolve to the same address are not the same origin, and you must add them to the CORS whitelist as separate entries.

SEE ALSO:

[Create a Snap-ins Deployment](#)

Create a Snap-ins Deployment

Create a Snap-in deployment for each Snap-in widget that you're using. The setup node for Snap-ins chat is available only in Lightning Experience.

The Snap-ins Chat setup uses a Salesforce Community or Force.com site, so that you can associate users with a guest user profile. Check if you already have any communities or sites that you can use. If a site is already available, you can use that as your endpoint. Otherwise, create a site for this purpose.

1. From Setup, enter *Snap-ins* in the *Quick Find* box, then select **Snap-ins**.
2. In the Snap-ins configuration page, click **New Deployment**.
The snap-ins deployment page is displayed.
3. In the *Snap-in Deployment Name* field, enter a name for your snap-in.
The deployment name is shown in the list of snap-ins on the Snap-in page. If you have several snap-in deployments, use a descriptive name so it's easy to distinguish this snap-in from other snap-ins.
4. The *API Name* field is automatically populated.
5. In the *Site Endpoint* menu, select a Salesforce community or Force.com site from the dropdown list.
If nothing appears in the menu, it's because there aren't any communities or sites configured in your org.
6. Click **Create**.
The snap-in deployment is created.

[Specify the Live Agent Settings for Your Snap-ins Chat Deployment](#)

Specify the Live Agent Settings for Your Snap-ins Chat Deployment

The Snap-ins chat widget uses a Live Agent deployment ID and button so customers can chat with your agents. The Live Agent details that you provide are used to generate the chat widget code that you add to your web pages.

Before you specify the Live Agent settings, ensure that you have a Live Agent deployment and a Live Agent chat button available to use with the Snap-ins chat widget.

1. From Setup, enter *Snap-ins* in the **Quick Find** box, then select **Snap-ins**.
2. Select the snap-in deployment that you want to work with.
3. In the Snap-ins configuration page, go to the **Live Agent Basic Settings** section and click **Start**.
4. In the **Live Agent Deployment** menu, select the Live Agent configuration that you want to use with snap-in chat from the dropdown list.
5. In the **Live Agent Button** menu, select the Live Agent button that you want to use with the snap-in chat widget from the dropdown list.
6. Click **Save**.

After you've provided the Live Agent settings, get the code to add the Snap-ins chat widget to your web pages.

SEE ALSO:

[Copy the Snap-ins Chat Code Snippets and Paste the Code into Your Web Pages](#)

Customize the Branding and Appearance of Your Snap-ins Chat Widget

Select the colors and font used in the Snap-ins chat widget to reflect your company's brand identity.

Before you start, talk with the team that maintains your website to get the color codes for your company's brand. You can specify branding colors by entering their hex code or RGB code, or by selecting a color in the color palette.

The screenshots show how the branding elements appear in the chat widget.

Brand Element	Description
Brand Primary	<p>Sets the color of the:</p> <ul style="list-style-type: none"> • Pre-chat image backdrop • Pop message outlines • Loading balls • Loading balls when chat is minimized <p>By default, the color is set to hex #222222 (Night Black).</p> <p>In the screenshots, brand primary elements are indicated by [1].</p>
Brand Secondary	<p>Sets the color of the:</p> <ul style="list-style-type: none"> • Call to Action buttons, such as “Start Chat” or “Chat with an Expert” • Input field focus • Send button • Guest message chat payload • Secondary buttons • Chat when it is minimized and there’s a new message <p>By default, the color is set to #005290 (Nimbostratus Blue).</p> <p>In the screenshots, brand secondary elements are indicated by [2].</p>
Contrast Primary	<p>Sets the color of the:</p> <ul style="list-style-type: none"> • Chat body text • Chat input text <p>By default, the color is set to #333333 (dark gray).</p>

Brand Element	Description
	<p>The background color is white.</p> <p>In the screenshots, contrast primary elements are indicated by [3].</p>
Nav Bar	<p>Sets the color of the:</p> <ul style="list-style-type: none"> • Chat widget’s navigation bar • Chat button when the chat is minimized <p>By default, the color is set to hex #222222 (Night Black).</p> <p>In the screenshots, the nav bar element is indicated by [4].</p>
Font	<p>Sets the font used in the chat widget.</p> <p> Note: Some fonts aren’t supported on mobile browsers. If you select a font that isn’t available for a chat visitor’s mobile browser, the browser’s default font is displayed.</p> <p>The following fonts are supported in mobile browsers for both iOS and Android:</p> <ul style="list-style-type: none"> • Georgia • Times New Roman • Arial • Courier New <p>The following fonts are supported in mobile browsers for iOS only:</p> <ul style="list-style-type: none"> • Trebuchet MS • Verdana • Lucida Console

To customize the branding of the chat widget:

1. From Setup, enter *snap-ins* in the **Quick Find** box, then select **Snap-ins**.
2. Select the snap-in deployment that you want to work with.
3. In the Snap-ins configuration page, go to the Branding section and click **Edit**.
4. Select the colors that you want to show in the chat widget.

Enter the color using the hex code. To enter an RGB code or to select a color from the palette, open the color palette by clicking the down arrow in the color field.
5. Click **Done**.
6. Repeat steps 4–5 for the remaining brand colors.
7. Select the font that you want to use in the Snap-ins chat widget.
8. Click **Finish**.

Important: Changing the branding of an existing chat widget changes the code snippet for the chat widget. If you update the branding for an existing chat widget, you must update the code snippet on your webpages. If you customized the code snippet, you must add those customizations to the new code snippet.

[Customize the Snap-ins Chat Widget Code](#)

Customize the Pre-Chat Form

Gather contact information from your customers and find out about their needs using a pre-chat form. You can create a pre-chat form that addresses different business needs and associates customer information with Salesforce records like leads, cases, and contacts. You can also customize the fields used on the form.

EDITIONS

Snap-ins setup node is available in: Lightning Experience

Available in: **Enterprise, Professional, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up Snap-ins Chat:

- “Customize Application”

When you design your pre-chat form, you can select a use case scenario that automatically associates information from the form with Salesforce records. When a customer enters their name or email address into the form, Salesforce matches the information with a Salesforce contact record or lead record. If no match is found, Salesforce creates a record.

For example, if you select the Service scenario, Salesforce relates the customer’s information with Case and Contact records.

Table 45: Use Cases for Associating Pre-Chat Information with Salesforce Records

If you select:	Then Salesforce associates the pre-chat information with these record types:
Sales	Lead records
Service	Contact records Case records
Basic	Contact records

You can select the fields that are shown on the pre-chat form, change the order of the fields, and make fields required. To make the form more user-friendly to customers, add up to four fields.

To set up the pre-chat form:

1. From Setup, enter *snap-ins* in the **Quick Find** box, then select **Snap-ins**.
2. Select the snap-in deployment that you want to work with.
3. In the Snap-ins configuration page, go to the Pre-chat section and move the radio button to **Active**.
4. Click **Edit**.
5. Select the use case for the pre-chat form.
 - a. Select the main reason that customers use chat. The reason that you select affects the type of Salesforce record that's created from the information that customers enter into the pre-chat form.
 - b. Select the record type that's created from the pre-chat form. The drop-down menu shows record types that are available on the object.
 - c. Click **Next**.
6. Select the fields shown on the pre-chat form.
 - a. To change the order of the fields, use the up arrow and down arrow.
 -  **Note:** For the Service scenario, fields are grouped by object. Contact fields always appear above Case fields.
 - b. To add a field, click **+**. You can add only fields that are available on the object.
 - c. To remove a field, click **X**.
 - d. To require customers to fill out a field, select **Required** next to the field.
 - e. Click **Save**.

Copy the Snap-ins Chat Code Snippets and Paste the Code into Your Web Pages

Salesforce generates a unique code snippet based on the information you provided during the Snap-ins Chat setup. Copy and paste the chat code snippet so you can add the Snap-ins chat widget to your web pages. Copy and paste the optional meta tag code snippet to make your web pages responsive to different form factors such as mobile and desktop.

Ensure that you have access to the web pages where you want to add the chat widget. You might need to work with your company's webmaster.

When you add the chat code snippet to your web pages, customers can see and use the Snap-ins chat widget. If you're not ready for customers to access the chat yet, add the code snippets to a private web page.

You can customize the code to change certain aspects of chat widget's appearance.

The `<meta>` tag code makes your web page responsive, so that the web page and the chat widget look good and perform well on different devices. For example, if a customer is looking at your web page and chat widget on a mobile phone, then the page and chat are resized to accommodate the smaller form factor.

This tag is the recommended `<meta>` tag for proper code snippet responsiveness. If your page is already responsive, then you might not need to add this snippet or change your `<meta>` tag. If you see issues with behavior on other devices, you can try updating your `<meta>` tag to code snippet that's provided. This tag is added to the head section of every page where the snap-in chat widget is used. If you don't include an appropriate `<meta>` tag, then the snap-in chat widget appears as it does on a desktop, regardless of the device used to access the page.

1. From Setup, enter *Snap-ins* in the **Quick Find** box, then select **Snap-ins**.
2. Select the snap-in deployment that you want to work with.
3. In the Snap-ins configuration page, go to the **Snap-in Code Snippets** section and click **Get Code**.
4. Copy the chat code snippet and paste it immediately above the closing `</body>` tag on your web page to add the Snap-ins chat widget to the page.
Paste the chat code snippet into every web page where you want the chat widget to appear. Optionally, customize the chat code snippet.
5. Optionally, copy and paste the meta code snippet into the `<meta>` tag head section in every web page where you want the chat widget to appear.
6. Click **Done**.
The code snippets page closes.

Customize the Snap-ins Chat Widget Code

Use a text or HTML editor to customize the optional parameters in the chat widget code snippet. You can customize certain [parameters](#) that affect the appearance and behavior of the snap-ins chat widget.

1. From Setup, enter `snap-ins` in the `Quick Find` box, then select **Snap-ins**.
2. Select the snap-in deployment that you want to work with.
3. In the Snap-ins configuration page, go to the `Snap-in Code Snippets` section and click **Get Code**.
4. Copy the chat code snippet to a text editor or HTML editor.
5. In the text editor or HTML editor, specify the image URLs for the chat widget parameters.
6. Save your changes.

After modifying the chat code snippet, [add the code](#) to every web page where you want the Snap-ins chat widget to appear.

SEE ALSO:

- [Copy the Snap-ins Chat Code Snippets and Paste the Code into Your Web Pages](#)
- [Customizable Parameters in the Snap-ins Chat Code](#)

Customizable Parameters in the Snap-ins Chat Code

You can customize certain parameters that affect the appearance and behavior of the Snap-ins chat widget so that the chat experience reflects your company's branding. Use these parameters to customize the pre-chat banner image, logo, waiting state image, and your agent's avatar picture. You also can customize the wording that appears on the chat button and on the chat widget when the chat is loading, when agents are online, when agents are offline.

Customize Images Used in the Snap-ins Chat Widget

If the images are hosted in the same repository as the web page where you plan to add the chat widget, you can use either relative URL paths and names or full URLs. If the images are hosted elsewhere, use the full URLs for the images.

Before customizing the code, upload the image files that you want to use in the chat widget.

To customize this image:	Set this parameter:	Description
Pre-chat banner image	<code>embedded_svc.settings.prechatBackgroundImgURL = "..."</code>	Specify a URL to set the image shown in the pre-chat form between the greeting (for example, "Hello Guest!") and the subtext (for example, "An agent is on the way."). The recommended image size is 320x100 pixels.

EDITIONS

Snap-ins setup node is available in: Lightning Experience

Available in: **Enterprise**, **Professional**, **Unlimited**, and **Developer** Editions

To customize this image:	Set this parameter:	Description
Logo for minimized waiting state	<code>embedded_svc.settings.smallCompanyLogoImgURL = "..."</code>	Specify a URL to set the logo shown when the chat is minimized. The recommended image size is 25x25 pixels.
Waiting state image	<code>embedded_svc.settings.waitingStateBackgroundImgURL = "..."</code>	Specify a URL to set the background image when the chat is in a waiting state. The recommended image size is 200x60 pixels.
Agent avatar	<code>embedded_svc.settings.avatarImgURL = "..."</code>	Specify a URL to set the image of the agent that appears when the agent is chatting. The recommended image size is 40x40 pixels.

Create your images in .png format and use the following sizes to ensure that the images don't become distorted during the snap-in chat experience.

Customize the Default Chat Button Used in the Snap-ins Chat Widget

Parameter	Description
<code>embedded_svc.settings.displayHelpButton =</code>	To show the default chat button that connects your customers to the chat widget, set the <code>displayHelpButton = true;</code> . The chat button lets your customers start a chat from your web page. Valid values are <code>true</code> <code>false</code> .

Customize Whether the Prechat Form Appears in the Snap-ins Chat Widget

Parameter	Description
<code>embedded_svc.settings.initialInteractionState = "..."</code>	<p>To specify whether the pre-chat form appears when a customer initiates a chat, set <code>initialInteractionState = "PRECHAT";</code>.</p> <p>Valid values are <code>PRECHAT</code> <code>WAITING</code>.</p> <p> Note: These values are case-sensitive.</p> <p>By default, the parameter is set to show the pre-chat form. If you set it to <code>WAITING</code>, then the chat widget doesn't show the pre-chat form and immediately opens a chat window.</p>

Customize Wording Used in the Snap-ins Chat Widget

Parameter	Description
<code>embedded_svc.settings.onlineText = "..."</code>	<p>To customize the text that appears in the chat button when agents are online, set the parameter <code>onlineText = "..."</code> to whatever text you want to show.</p> <p>If you don't specify a value, the default text shown is "Chat with an Expert."</p>
<code>embedded_svc.settings.offlineText = "..."</code>	<p>To customize the text that appears in the chat button when agents are offline, set the parameter <code>offlineText = "..."</code> to whatever text you want to show.</p> <p>If you don't specify a value, the default text shown is "Agent Offline."</p>
<code>embedded_svc.settings.onlineLoadingText = "..."</code>	<p>To customize the text that appears in the chat button when the chat window is loading, set the parameter <code>onlineLoadingText = "..."</code> to whatever text you want to show.</p> <p>If you don't specify a value, the default text shown is "Loading."</p>

[Copy the Snap-ins Chat Code Snippets and Paste the Code into Your Web Pages](#)

[Customize the Snap-ins Chat Widget Code](#)

Test the Snap-ins Chat Experience

Now that you've add Snap-ins Chat in your web pages, it's time to test it out.

To test the snap-in chat from the agent's perspective, log in to Salesforce as a Live Agent user with all the [Live Agent support agent permissions](#) on page 2586.

1. Log in to Service Cloud and go online as the agent assigned to the appropriate button.
2. Test the chat from the customer's perspective. In another window in the same browser, initiate a chat by navigating to a web page where you've placed the code snippet and starting the chat.

The chat should be available.

3. On the customer side (that is, on your web page), verify that:
 - Pre-chat form looks how you expected
 - Chat window looks how you expected
4. On the agent side (that is, in the Salesforce Console for Service), verify that:
 - You receive a chat request when the chat is initiated

If the chat widget and experience appears as you expected, your customers can start using embedded chat to communicate with your agents.

SEE ALSO:

[Permissions for Live Agent Support Agents](#)

Localization and Translation for Snap-ins Chat

The primary language for a Snap-ins chat is set differently when Translation Workbench is enabled or disabled.

If you're using Translation Workbench:

- The language set in the visitor's Accept-Language HTTP header for their browser is used when it matches a language in the list of active Translation Workbench languages. When the visitor has multiple languages set for their browser, the highest-ranked language that matches a language in the list of active Translation Workbench languages is used.
- When there's no match, the language specified for the Site Guest User of the Site associated with your Snap-ins deployment is used.

If Translation Workbench is disabled, the language specified for the Site Guest User of the Site associated with your Snap-ins deployment is used.

Snap-ins Chat Limitations

Snap-ins Chat has the following limitations.

The setup node for Snap-ins chat is available only in Lightning Experience.

The following Live Agent features aren't supported in Snap-ins Chat. When you enable any of these settings in the Live Agent Configuration, Button, or Deployment that you use with Snap-ins Chat, agents can't use them.

- Agent File Transfer
- Customer Idle Time-outs
- Chat Transfers
- Save Transcripts for Visitors
- Sensitive Data Rules
- Visitor Blocking

The Snap-ins chat window title shows the agent's name instead of the Live Agent Chat Window Title setting. When you enable this setting in the Live Agent Configuration, it doesn't work in the Snap-ins Chat.

Other usage limitations for Snap-ins Chat:

- Visitors can't chat with an agent if they're using private browsing mode on iOS.
- You can't embed Snap-ins Chat into Lightning components. Use a Visualforce page, Community, or web property only.
- Field-level validation rules aren't supported with Snap-ins Chat.
- When you host your Snap-ins Chat deployment on a Visualforce page, you must access the page using HTTPS. If you use HTTP, the chat widget doesn't load.

Live Agent Console

The Live Agent console is a legacy feature that agents could use to chat with customers before Spring '13. Salesforce no longer supports the Live Agent console. If your support organization still uses it, we recommend migrating to Live Agent in the Salesforce console as soon as possible, because the Live Agent console will eventually be discontinued.

To upgrade to Live Agent in the Salesforce console, see [Live Agent for Administrators](#). The Salesforce Help walks you through the end-to-end process of setting up Live Agent in the Salesforce console, including implementing and customizing it for your Salesforce org.

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Live Agent Console Limitations

The Live Agent console provides only limited access to some features and doesn't include Live Agent features that were released after Spring '13.

To upgrade to Live Agent in the Salesforce console, see [Live Agent for Administrators](#). The Salesforce Help walks you through the end-to-end process of setting up Live Agent in the Salesforce console, including implementing and customizing it for your Salesforce org.

Agent Features

The Live Agent console doesn't provide support for some of the agent features that agents use during chats in the Salesforce console.

Feature	Supported?	Notes
Attaching articles to chats	Yes	None
Attaching records to transcripts	Yes	This feature is supported with the CRM chatlet, a legacy plug-in for the Live Agent console.
Quick Text	Yes	None
Transferring chat requests	Yes	None
Chat conferencing	No	None
Critical wait alert times	No	None
Knowledge chat answers	No	None
Transferring files	No	None
Autogreetings	Limited	The Live Agent console supports autogreetings that are specified in Live Agent configurations only; it doesn't support autogreetings that are specified in your chat button settings.
Custom agent names	Limited	The Live Agent console supports custom agent names that are specified in Live Agent configurations only; it doesn't support custom agent names that are specified in your chat button settings.

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Supervisor Features

The Live Agent console was originally designed only for agents' interactions with customers. As a result, the Live Agent console doesn't support any supervisor features that are supported in the Salesforce console.

Set Up Omni-Channel

Omni-Channel for Administrators

Omni-Channel is a comprehensive customer service solution that lets your call center route any type of incoming work item—including cases, chats, or leads—to the most qualified, available agents in your organization. Omni-Channel integrates seamlessly into the Salesforce console.

Omni-Channel is a flexible, customizable feature, and you can configure it declaratively—that is, without writing code. Use Omni-Channel to manage the priority of work items, which makes it a cinch to route important work items to agents quickly. Manage your agents' capacity to take on work items so that they're given only the number of assignments that they can handle. You can also define which agents can work on different types of assignments. For example, you can create one group of agents to respond to leads and sales inquiries, and another group that helps customers with support questions.

Best of all, Omni-Channel routes all these assignments to the correct agents automatically. Agents no longer have to pick and choose work assignments manually from a queue, which saves everyone in your call center time, effort, and brainpower. Because it's easier for agents to work on their assignments, they can assist your customers faster and more effectively and close assignments more quickly.

Let's get started!

Create Omni-Channel Objects

The first step towards getting your Omni-Channel implementation up and running is to create the necessary objects in Salesforce.

[Enable Omni-Channel](#)

Enable Omni-Channel to gain access to the objects that you'll need to set up the feature in your organization.

[Create Service Channels](#)

Service channels let you turn nearly any Salesforce object such as a case, lead, SOS session, or even a custom object into a work record. Omni-Channel then plucks these work items from their queues like flowers from the garden of agent productivity and routes them to your agents in real time.

[Create Routing Configurations](#)

Routing configurations determine how work items are routed to agents. Use them to prioritize the relative importance and size of work items from your queues. That way, the most important work items are handled accordingly, and work is evenly distributed to your agents. To start routing work items to agents, create routing configurations and assign them to queues.

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up Omni-Channel:

- "Customize Application"

To modify permission sets and profiles:

- "Manage Profiles and Permission Sets"

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

[Associate Routing Configurations and Agents with Queues](#)

Queues are a classic element of Salesforce that help your teams manage leads, cases, and custom objects. Omni-Channel supercharges your queues to be able to route work items to your agents in real time. Agents don't have to select work items manually from queues because Omni-Channel routes work items to agents automatically and in real time!

[Create Presence Configurations](#)

Let's focus on agents for a minute. Presence configurations determine how much work agents can take on and what Omni-Channel behaviors they can access while they assist customers. Your organization can have multiple configurations for different groups of agents who support different channels.

[Create Presence Statuses](#)

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline.

Enable Omni-Channel

Enable Omni-Channel to gain access to the objects that you'll need to set up the feature in your organization.

1. From Setup, enter *Omni-Channel Settings* in the Quick Find box, then select **Omni-Channel Settings**.
2. Select **Enable Omni-Channel**.
3. Click **Save**.

Create Service Channels

Service channels let you turn nearly any Salesforce object such as a case, lead, SOS session, or even a custom object into a work record. Omni-Channel then plucks these work items from their queues like flowers from the garden of agent productivity and routes them to your agents in real time.

Service channels let you manage sources of work and their priority compared to other work items. After you create service channels, you'll associate them with queues, which determine how work items are routed to your agents. You can create service channels for support channels, such as cases or SOS calls, or for sales channels, such as leads.

1. In Setup, enter *Service Channels* in the Quick Find box, select **Service Channels**, then click **New**.
2. Specify the settings for your service channel.
3. Click **Save**.

[Service Channel Settings](#)

Customize your service channel settings to define how your organization receives work from various sources, such as chat, email, SOS calls, or social channels.

Supported Objects for Omni-Channel

Omni-Channel turbocharges your agents' productivity by assigning records to them in real time. But which objects and records does Omni-Channel support?

Service Channel Settings

Customize your service channel settings to define how your organization receives work from various sources, such as chat, email, SOS calls, or social channels.

Setting	What It Does
Service Channel Name	Names the service channel. This service channel name, or a version of it, automatically becomes the API Name.
API Name	Sets the API name for the service channel.
Salesforce Object	The type of Salesforce standard or custom object that's associated with this service channel. For example, if you have a service channel for Web cases set the Related Object Type to <i>Case</i> . For a complete list of objects that service channels support, see Supported Objects for Omni-Channel .
Custom Console Footer Component	(Optional) Opens the specified custom console footer component when an agent accepts a work item request. For example, open a marketing campaign widget when an agent accepts a lead.

Supported Objects for Omni-Channel

Omni-Channel turbocharges your agents' productivity by assigning records to them in real time. But which objects and records does Omni-Channel support?

Omni-Channel currently supports routing for the following objects and records.

- Cases
- Chats
- SOS video calls
- Social posts
- Orders
- Leads
- Custom objects

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Routing Configurations

Routing configurations determine how work items are routed to agents. Use them to prioritize the relative importance and size of work items from your queues. That way, the most important work items are handled accordingly, and work is evenly distributed to your agents. To start routing work items to agents, create routing configurations and assign them to queues.

Create a routing configuration for each service channel in your organization. After you create routing configurations, associate them with queues so your agents can receive work after we get Omni-Channel set up.

1. In Setup, enter *Routing* in the **Quick Find** box, select **Routing Configurations**, then click **New**.
2. Specify the settings for your routing configuration.
3. Click **Save**.

[Routing Configuration Settings](#)

Customize your routing configuration settings to define how work items are pushed to agents.

[Omni-Channel Routing Model Options](#)

Specify how incoming work items are directed to agents using Omni-Channel.

Routing Configuration Settings

Customize your routing configuration settings to define how work items are pushed to agents.

Basic Information

Setting	What It Does
Routing Configuration Name	Names the service routing configuration. This routing configuration name, or a version of it, automatically becomes the <code>Developer Name</code> .
Developer Name	Sets the API name for the service channel.
Overflow Assignee	Sets the user or queue that Omni-Channel routes items to when your org reaches Omni-Channel limits. Ensure that you: <ul style="list-style-type: none"> • Select a user or queue that has access to the objects that the queue(s) using this routing configuration handles • Assign a routing configuration with an overflow assignee to all Omni-Channel queues involved in a bulk operation, such as changing the status or owner for multiple requests

Routing Settings

Setting	What It Does
Routing Priority	<p>The order in which work items from the queue that are associated with this routing configuration are routed to agents. Objects in queues with a lower number are routed to agents first.</p> <p>For example, if you set the priority for highly qualified leads to <code>1</code> and the priority for less qualified leads to <code>2</code>, highly qualified leads are routed and assigned to agents before less qualified leads.</p> <p>On the backend, we identify agents with available capacity; then we assign work to them based on this priority order:</p> <ol style="list-style-type: none"> 1. The priority of the queue from which the work item came 2. The amount of time that the work item has been waiting in the queue 3. Members of the queue who are available to receive new work items from the queue <p>When the work item is assigned to an agent, the owner of the object changes from the queue to the agent. If an agent declines the work item, we reassign it back to the queue with its original age so that it can be properly rerouted.</p>
Routing Model	Determines how incoming work items are routed to agents who are assigned to the configuration's service channel.
Push Time-Out (seconds)	Sets a time limit for an agent to respond to an item before it's pushed to another agent.

Work Item Size

Setting	What It Does
Units of Capacity	<p>Indicates the amount of an agent's overall capacity that's consumed when the agent is assigned a work item from queues that are associated with this configuration.</p> <p>The <code>Capacity</code> setting in the presence configuration the agent is assigned to determines the agent's overall capacity. When the agent is assigned a work item from the queue that's associated with this configuration, the <code>Capacity Weight</code> is subtracted from the agent's overall capacity. Agents can be assigned work items until their overall capacity reaches 0.</p> <p>You can select a <code>Capacity Weight</code> or a <code>Capacity Percentage</code>, but not both.</p>

Setting	What It Does
Percentage of Capacity	<p>The percentage of an agent’s overall capacity that’s consumed when the agent is assigned a work item from queues that are associated with this configuration.</p> <p>The agent’s overall capacity is determined by the <code>Capacity</code> setting in the presence configuration that the agent is assigned to. When the agent is assigned a work item from the queue that’s associated with this configuration, the <code>Capacity Percentage</code> is deducted from the agent’s overall capacity until the agent has 0% capacity remaining.</p> <p>You can select a <code>Capacity Weight</code> or a <code>Capacity Percentage</code>, but not both.</p>

Omni-Channel Routing Model Options

Specify how incoming work items are directed to agents using Omni-Channel.

In Omni-Channel, work items are automatically routed or “pushed” to agents who are assigned to the appropriate queue.

Routing Option	Description	Example
Least Active	Incoming work items are routed to the agent with the least amount of open work. When work items all consume 1 capacity, the agent with the lowest number of work items receives incoming work. The example presents a scenario in which agents have work with varying capacity impacts.	<ul style="list-style-type: none"> Agent A and Agent B each have an overall capacity of 5. Agent A has 3 active work items with capacity impact of 1. Agent B has 1 active work item with capacity impact of 4. Because Agent A has a lower capacity impact than Agent B, incoming work items are routed to Agent A.
Most Available	Incoming work items are routed to the agent with the greatest difference between work item capacity and open work items. Capacity is determined by the presence configuration that the agent is assigned to.	<ul style="list-style-type: none"> Agent A and Agent B each have an overall capacity of 5. Agent A has 3 active work items while Agent B has 1. Because Agent B has the most open capacity, incoming work items are routed to Agent B.

Associate Routing Configurations and Agents with Queues

Queues are a classic element of Salesforce that help your teams manage leads, cases, and custom objects. Omni-Channel supercharges your queues to be able to route work items to your agents in real time. Agents don't have to select work items manually from queues because Omni-Channel routes work items to agents automatically and in real time!

The work items in the queue are assigned the priority that you specified in the routing configuration that you created earlier. If your organization already uses them, you can reuse queues that are available in your organization. That way, you can route work items in real time to the agents who are assigned to those queues.

If your organization doesn't use queues, create at least one to integrate with Omni-Channel. You can also create multiple queues to handle the different types of work items. For example, you might create one queue for incoming cases and another queue for incoming leads.

For routing to work correctly, assign each of your agents to the queue from which they are receiving work items.

For more information about queues, see "Queues Overview" in the Salesforce Help.

1. In Setup, enter *Queues* in the **Quick Find** box, then select **Queues**.
2. Create a queue or edit an existing one.
3. In the **Routing Configuration** field, look up the routing configuration that you want to associate with the queue.
4. In the Queue Members section, add agents to the **Selected Users** field.
These agents will receive work items from this queue.
5. Click **Save**.

Create Presence Configurations

Let's focus on agents for a minute. Presence configurations determine how much work agents can take on and what Omni-Channel behaviors they can access while they assist customers. Your organization can have multiple configurations for different groups of agents who support different channels.

When you enable Omni-Channel in your organization, Salesforce creates a presence configuration for you, called the Default Presence Configuration. All your agents are assigned to that configuration automatically. However, you can create a presence configuration and assign individual agents to it to customize Omni-Channel settings for a subset of your agents. If you reassign agents to a custom presence configuration, they're excluded from the Default Presence Configuration.

1. In Setup, enter *Presence* in the **Quick Find** box, select **Presence Configurations**, then click **New**.
2. Choose the settings for your presence configuration.
3. Click **Save**.

Presence Configuration Settings

Customize your presence configuration settings to define the Omni-Channel settings that are assigned to agents.

Basic Information

These settings configure the basic functionality that's available to agents when they're signed in to Omni-Channel.

Setting	What It Does
Presence Configuration Name	Names the presence configuration. This configuration name, or a version of it, automatically becomes the Developer Name.
Developer Name	Sets the API name for the configuration.
Capacity	Determines the agent's maximum capacity for work. The size of the work item that you specified in the routing configuration consumes the agent's capacity.
Automatically Accept Requests	Automatically accepts work assignments that are pushed to an agent. These work items open automatically in the agent's workspace, so the agent doesn't have to accept these work items manually from the Omni-Channel footer widget. If <code>Allow Agents to Decline Requests</code> is enabled, you can't use this setting.
Allow Agents to Decline Requests	Allows agents to decline incoming work items. If <code>Automatically Accept Requests</code> is enabled, agents can't decline requests.
Update Status on Decline	Automatically changes the agent's status to the status that you specify when the agent declines a work item. This setting is available only if <code>Allow Agents to Decline Requests</code> is enabled.
Allow Agents to Choose a Decline Reason	Allows agents to choose a reason when declining work assignments. This setting is available only if <code>Allow Agents to Decline Requests</code> is enabled.

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Setting	What It Does
Update Status on Push Time-Out	Automatically changes the agent's status when a work assignment that's been pushed to them times out. This setting is available only if Push Time-Out is enabled.
Request Sound Enabled	Plays a sound in the agent's widget when a work request is received.
Disconnect Sound Enabled	Plays a sound in the agent's widget when the agent loses connection with Omni-Channel.

Assign Decline Reasons

These settings appear when Allow Agents to Decline Requests and Allow Agents to Choose a Decline Reason are selected.

Setting	What It Does
Available Decline Reasons	Indicates the decline reasons that are eligible to be assigned to the configuration.
Selected Decline Reasons	Indicates the decline reasons that are assigned to the configuration.

Assign Users

Assign eligible users to the configuration to give them access to Omni-Channel functionality. Later, you'll see that you can also assign profiles to a configuration. If a user is assigned a configuration at the profile and user levels, the user-level configuration overrides the configuration that's assigned to the user's profile.

 **Warning:** Users can be assigned to only one presence configuration at a time. If you assign the same user to a second presence configuration, the system removes that user from the first presence configuration without warning you. So make sure that you know which presence configuration assignment is required for each user!

For example, let's say that User A is assigned to Presence Configuration A. Then, you create Presence Configuration B and assign User A to it without realizing that the user was assigned to another presence configuration. Salesforce removes User A from Presence Configuration A and reassigns the user to Presence Configuration B without notifying you.

Setting	What It Does
Available Users	Indicates the users who are eligible to be assigned to the configuration.
Selected Users	Indicates the users who are assigned to the configuration.

Assign Profiles

Assign eligible profiles to the configuration to give users who are associated with the profiles access to Omni-Channel functionality. If a user is assigned a configuration at the profile and user levels, the user-level configuration overrides the configuration that's assigned to the user's profile.

Setting	What It Does
Available Profiles	Indicates the user profiles that are eligible to be assigned to the configuration.
Selected Profiles	Indicates the user profiles that are assigned to the configuration.

Create Presence Statuses

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline.

A presence status can encompass one or more channels of work items. For example, you might create a presence status called "Available for Web Support" that includes service channels for chats and emails. When agents are signed in to that presence status, they can receive incoming chats and emails. Genius!

1. In Setup, enter *Presence* in the **Quick Find** box, select **Presence Statuses**, then click **New**.
2. Choose the settings for your presence status.
3. Click **Save**.

[Presence Status Settings](#)

Customize your presence status settings to define which service channels are assigned to difference statuses. Agents can sign in to Omni-Channel with different statuses depending on the types of work that they're available to receive.

Presence Status Settings

Customize your presence status settings to define which service channels are assigned to difference statuses. Agents can sign in to Omni-Channel with different statuses depending on the types of work that they're available to receive.

Basic Information

Use these settings to name your presence status.

Setting	What It Does
Status Name	Names the presence status. This presence status name, or a version of it, automatically becomes the API Name .
API Name	Sets the API name for the presence status.

Status Options

These settings indicate whether agents are online or busy when they use this status.

Setting	What It Does
Online	Lets agents who use this status receive new work items.
Busy	Lets agents who use this status appear away and indicates that they're unable to receive new work items.

Service Channels

Assign service channels to your presence status. Agents who sign in with this presence status can receive work items from the channels that you select.

Setting	What It Does
Available Channels	Indicates the service channels that are eligible to be assigned to the presence status.
Selected Channels	Indicates the service channels that are assigned to the presence status.

Set Access to Presence Statuses

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. Once you've created your Presence Statuses for Omni-Channel, you need to set up how your users will access them. You can set access through permission sets or profiles.

[Give Users Access to Presence Statuses with Permission Sets](#)

Make presence statuses available to agents who are assigned to certain permission sets.

[Give Users Access to Presence Statuses with Profiles](#)

Give Users Access to Presence Statuses with Permission Sets

Make presence statuses available to agents who are assigned to certain permission sets.

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. You can give users access to presence statuses through permission sets, or alternatively, through profiles.

1. In Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click the name of the permission set to which you want to give access to statuses.
3. Click **Service Presence Statuses Access**.
4. Click **Edit**.
5. Select the presence statuses that you want to associate with the permission set.
Agents who are assigned to this permission set can sign in to Omni-Channel with any of the presence statuses that you make available to them.
6. Click **Save**.

Give Users Access to Presence Statuses with Profiles

Make presence statuses available to agents who are assigned to certain profiles.

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. You can give users access to presence statuses through profiles, or alternatively, through permission sets.

1. In Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the name of the profile to which you want to give access to statuses.
Don't click **Edit** next to the profile name. If you do, you won't see the correct page section where you can enable statuses.
3. In the Enabled Service Presence Status Access section, click **Edit**.
4. Select the presence statuses that you want to associate with the profile.
Agents who are assigned to this profile can sign in to Omni-Channel with any of the presence statuses that you make available to them.
5. Click **Save**.

Add the Omni-Channel Widget to the Salesforce Console

After you get Omni-Channel all set up for your organization, it's time to add the Omni-Channel widget to the Salesforce console so that your agents can start receiving work.

The Omni-Channel widget appears in the bottom right corner of the Salesforce console. From there, agents can change their presence status and triage their incoming work assignments.

 **Note:** If your organization uses Live Agent to manage chats, you can either use the Live Agent widget or the Omni-Channel widget to manage chats, but not both. To learn more about managing Live Agent, see [Use Omni-Channel with Your Existing Live Agent Implementation](#).

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the Salesforce console app that you want to add the Omni-Channel widget to.
3. In the Choose Console Components section, add Omni-Channel to your list of selected items.
4. Click **Save**.

[Control Visible Work Item Details in the Omni-Channel Widget with Compact Layouts](#)

Ever wanted to customize the information that your agents see when they get a new work item in the Omni-Channel widget? You can! Just customize primary compact layout for that work item's object.

Control Visible Work Item Details in the Omni-Channel Widget with Compact Layouts

Ever wanted to customize the information that your agents see when they get a new work item in the Omni-Channel widget? You can! Just customize primary compact layout for that work item's object.

If you look closely, you'll notice that a few fields are visible by default on new work item requests. For example, if your agent receives a request to manage a case, the request features the case's priority, status, and case number by default. An object's primary compact layout controls all of the visible fields in the Omni-Channel widget. But what if you want to see more information, such as the case's owner or its subject? Just edit the primary compact layout so that it includes the fields that you want to appear in the widget.

 **Tip:** The Omni-Channel widget is, well, compact, so there's only so much room to display fields on work item requests. While you can technically put up to 10 fields on a compact layout, the Omni-Channel widget will only display 4 fields. As a best practice, select up to 4 of the most important fields that you want to expose on work item requests, then add those to your compact layout.

1. Decide which object's compact layout you want to edit.
2. From the management settings for the object whose work item you want to edit, select **Compact Layouts**, and then select **New**. For example, to edit the compact layout for cases, go to the object management settings for cases, select **Compact Layouts**, then select **New**.
3. Select the settings for your compact layout, including the fields that you want it to include. The fields that you pick appear in the Omni-Channel widget when an agent receives a request.
4. Click **Save**.
5. Change the primary compact layout to your new layout by clicking **Compact Layout Assignment > Edit Assignment**.

6. Select your new compact layout from the Primary Compact Layout drop-down list.
7. Click **Save**.

Test Your Omni-Channel Implementation

Now that you've got Omni-Channel set up and enabled, test your implementation to make sure it's working correctly.

To test your implementation, route a work item to yourself through the Salesforce console.

1. Log in to the Salesforce console.
Make sure that you log in as a user who's enabled to use Omni-Channel. For the sake of testing the feature, make sure that you're the only agent who's signed in to Omni-Channel.
2. In the Omni-Channel widget, change your status so that you can receive incoming work items.
3. In the console, navigate to the record that corresponds to your current presence status's channels.
For example, if you're logged in with a status that's called "Available for Cases," navigate to a list of your open cases in the console. We'll assume that your "Available for Cases" status is associated with a cases service channel. After all, it wouldn't make much sense if your "Available for Cases" status made you available for, say, leads, would it?
4. Select the checkbox next to the record that you want to route to yourself.
5. Click **Change Owner**.
You'll be redirected to the Change Case Owner page.
6. Select *Queue* from the *Owner* list.
7. Enter the name of the queue that you associated with your routing configuration.

Sit back and relax. You'll see an incoming request notification in the Omni-Channel widget within a few seconds.

Use Omni-Channel with Your Existing Live Agent Implementation

Are you loving Live Agent and want to add Omni-Channel to the mix? Here's what changes for you and your organization (and not for your agents!).

So, you've decided to take your customer service to the next level by using Live Agent and Omni-Channel in tandem. That's great! Once everything's set up, you'll find that the two work together in perfect harmony.

Live Agent is powered by Live Agent Configurations, which control the behaviors and settings that are available to Live Agent users. Similarly, Omni-Channel uses Presence Configurations to control the behaviors and settings that are available to Omni-Channel users. You can integrate Live Agent with Omni-Channel so chats are routed just like other work items, and you can even use Omni-Channel routing for your chats. Whichever way you use Omni-Channel with Live Agent, your agents are then able to accept or reject chat requests right from the Omni-Channel widget.

When you integrate Live Agent and Omni-Channel, your Live Agent users also become Omni-Channel users, so your chat agents need to be associated with both a Live Agent Configuration and a Presence Configuration. Luckily, Salesforce does some of the heavy lifting for you when you enable Omni-Channel with your current Live Agent implementation.

For each Live Agent Configuration that you already have in your org, Salesforce:

- Creates a corresponding Presence Configuration for each of your Live Agent Configurations
- Sets the chat capacity for each Presence Configuration to what's set in its corresponding Live Agent Configuration
- Assigns your chat agents to the new corresponding Presence Configurations

If you have Live Agent enabled but don't have an implementation, when you enable Omni-Channel, Salesforce creates a Live Agent Service Channel.

Salesforce does all this automatically so there's no disruption to your agents' workflow. They can start accepting chats through the Omni-Channel widget in the console. The only difference they see is that they now use the Omni-Channel widget in the console to set their status and accept chat notifications. They may also see a change in their status options, as Omni-Channel Presence Statuses are configurable.

[Compare Live Agent and Omni-Channel Routing for Chats](#)

Compare Live Agent and Omni-Channel Routing for Chats

See the benefits and limitations of using Omni-Channel routing for chats (beta) or keeping Live Agent routing for chats.

There's a lot to keep in mind as you decide whether to try Omni-Channel routing for chats (beta). Omni-Channel routing for chats is enabled when you enable Live Agent for the first time, or when you create a chat button that uses the routing option **Omni**.

Let's compare the two routing model options when using Live Agent and Omni-Channel together.

Live Agent Routing	Omni-Channel Routing
Agents use the Omni-Channel widget to handle their work.	Agents use the Omni-Channel widget to handle their work.
Agents use Omni-Channel Presence, including its configurable statuses.	Agents use Omni-Channel Presence, including its configurable statuses.
Use Omni-Channel sound notifications in the Presence Configuration for chats.	Use Omni-Channel sound notifications in the Presence Configuration for chats.
Agent capacity is set and consumed by Omni-Channel.	Agent capacity is set and consumed by Omni-Channel.
Chats are routed to agents using Skills.	Chats are routed to agents using Omni-Channel queues.
Chats can't be prioritized with Omni-Channel work, or relative to each other. Un-routed Omni-Channel items are always routed ahead of chats.	Chats are prioritized with Omni-Channel work, and can be prioritized relative to each other using queues.
Chats always have the size 1.	Chat size is configurable by queue.
Chat supervisors use the Live Agent Supervisor Panel to observe chats and assist agents with their chats.	Chat supervisors use Omni-Channel Supervisor to see agent activity and real-time data.
Reports and data for chats are separate from Omni-Channel data.	Chat data is included in Agent Work reports in addition to Live Agent reports.
The Live Chat Transcript is created when the chat ends.	The Live Chat Transcript is created when the chat is requested.
You can customize the Live Chat Transcript page layout for Ended chats.	You can customize the Live Chat Transcript page layout for Waiting, In Progress, and Ended chats.
Live Chat Transcripts aren't created for missed chats, so your reports don't include missed chats.	Live Chat Transcripts are created for missed chats, so your reports include missed chats.
Agents associate records with the chat transcript only after the chat has ended.	Agents can associate records with the chat transcript during the chat. They have the option to do this on the chat transcript itself or use a console sidebar lookup component.

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Live Agent Routing	Omni-Channel Routing
Uses the Console Integration Toolkit Methods for Live Agent .	Uses the Console Integration Toolkit Methods for Omni-Channel .

However, there are a few limitations to using Omni-Channel routing for chats:

- You can't transfer a chat from a button using Live Agent routing to a button using Omni-Channel routing.
- You can't use direct-to-agent routing with chats routed by Omni-Channel.
- You can't use chat conferencing with chats routed by Omni-Channel.
- Queues with multiple object types can cause problems when using Omni-Channel routing for chats. We recommend creating a queue for each object type, such as Chats, Cases, and Leads, instead of setting queues to handle multiple object types.
- Chats routed with Omni-Channel can't use supervisor whisper messages and assistance flags with Omni-Channel Supervisor.
- When an agent uses "Transfer to Agent" for a chat routed with Omni-Channel and the receiving agent has an admin profile, the agent who initiated the transfer can lose visibility of the chat transcript until the receiving agent accepts the chat request. This is because Omni-Channel changes ownership of the chat transcript when the transfer is initiated, before the chat is accepted by the next agent.

Reference

How Does Omni-Channel Routing Work?

Do data models make your heart skip a beat? Want to understand the ins and outs of how Omni-Channel routes work items to your agents? Then we have a treat for you. Omni-Channel pushes work items to the right agent at the right time so that your support team can efficiently help customers with their problems. But how does routing work under the hood? Let's dive in.

Omni-Channel routes work through two separate processes.

- First, when a new work item is assigned to an Omni-Channel queue, Omni-Channel attempts to route it to an agent. Omni-Channel routes work items by the priority of the queue that they're assigned to, so the most important work items are pushed to agents first. Next, items are routed based on how long they've been sitting in the queue. The oldest work items are pushed to agents before more recent ones. (We'll get into the details of how that happens in a minute.)
- Second, when an agent's ability to receive work changes (perhaps they come back from "away" status, or they finish another work item), Omni-Channel tries to find a work item that can be routed to that agent.

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Routing New Work Items

When a work item is created, it gets assigned to a queue. If that queue is associated with a Routing Configuration, it's added to a list of items that are still waiting to be routed to agents.

Then Omni-Channel determines which agents are available and how much work each agent is currently working on. This information comes from the UserServicePresence API object, which tracks an agent's current capacity for work items.

Routing Pending Work Items

When a new work item is added to the list of pending items, Omni-Channel determines whether it can immediately route the work item to an agent.

First, we identify if any agents are online with a Presence Status that's linked to the correct Service Channel. Let's say your organization receives a new case that's assigned to an Omni-Channel queue. Omni-Channel determines if there's a Service Channel for cases. Then we check which agents are online with a status that lets them receive new cases.

Scenario	What Happens
No agents are available.	If there isn't an agent online who has the right status, we keep our work item in the list of items that need to be assigned to an agent.
Agents are available, but don't have capacity for new work.	If there are one or more agents who are available, we check to see if any of those agents have the capacity to take on a new work item. If there are no agents with enough capacity for more work, we leave the work item in the list.
Agents are available and have capacity for more work.	<p>If there are agents that 1) are available and 2) have capacity to work on the item, we check which agent is going to be the proud parent of the work item based on your organization's routing settings.</p> <p>If your routing configuration uses the Least Active routing model, we look for the agent who currently has the least amount of work compared to other agents who could take on the work item. We then route the work item to that agent.</p> <p>If your routing configuration uses the Most Available routing model, we look for the agent who has the largest gap between the maximum amount of work that they can handle and the amount of work that they are working on. We then route the work item to that agent.</p> <p>But what if there's a tie between two or more agents? In that case, to the agent who has been waiting the longest amount of time for a new work item. After all, we wouldn't want anyone on our support staff getting lazy.</p>

When an Agent's Ability to Receive Work Changes

When an agent logs in to Omni-Channel, finishes a work item, or changes status, Omni-Channel checks to see if there is any work that those agents can take on.

Scenario	What Happens
The agent is away.	We move on with our lives without performing any more checks.
The agent is available, but doesn't have capacity for work.	We quit while we're ahead.
The agent is available and has capacity for more work	We look at the list of work items that are waiting to be routed to an agent. We check to see if the agent is qualified to work on any of the objects, based on how much of the agent's capacity the objects will take up, and the service channel that's associated with the agent's status. For example, if the agent is online with a status that makes them available for cases, we check to see if there are any cases in our list.

Scenario	What Happens
	If the list has work items that the agent is qualified to work on, the item with the highest priority is routed to the agent. If two or more items have the same priority, the oldest one is routed.

Rerouting a Work Item

Sometimes an agent declines a work item or becomes unavailable before the agent can start working on it. In that case, the work item is rerouted until it finds a safe and loving home in the arms of a capable, qualified agent.

First, Salesforce automatically changes the owner of the work item to the queue from which the object was originally routed. We then try to route the work item to a different agent (Agent B) than the agent who declined it (Agent A). However, the work item can be routed to Agent A again if Agent A changes his or her status, or if we attempted to route the work item to Agent B at least once. We do this until our work item finds a safe and loving home in the arms of a capable, qualified agent.

And our agents, their work items, and your customers, live happily ever after.

Fields for Agent Work Records

Every time an object is routed to an agent through Omni-Channel, Salesforce creates an Agent Work record that logs information about the work assignment and how it's routed. Agent Work records contain fields that help you track information about the assignments your agents are working on. If the same work item is routed multiple times, that work item is associated with multiple Agent Work records.

An Agent Work record has the following fields, listed in alphabetical order.

Field	Definition
Accept Date	The date and time that the work item was accepted by an agent.
Active Time	The amount of time an agent actively worked on the work item. It tracks when the item is open and in focus in the agent's console.
Agent Capacity when Declined	The amount of an agent's capacity that was available when the agent declined the work item.
Agent Work ID	The Salesforce ID of the Agent Work record.
Assign Date	The date and time that the work item was assigned to an agent and pushed to the agent's Omni-Channel widget.
Cancel Date	The date and time that the work item was canceled.
Close Date	The date and time that the agent closed the console tab associated with the work item, setting the Agent Work record's status to "Closed."
Created By	The name of the agent who accepted the work item.
Created Date	The date that the work item was created.
Decline Date	The date that an agent declined the work item request.
Decline Reason	The provided reason for why an agent declined the work request.

Field	Definition
Handle Time	The amount of time an agent has the work item open, from the accepted time to the closed time.
Last Modified By	The name of the user who last modified the work item.
Last Modified Date	The date the work item was last modified.
Live Agent Session ID	The session ID for Live Agent chats routed with Omni-Channel.
Name	The unique, Salesforce-generated number of the Agent Work record.
Percentage of Capacity	The percentage of capacity that the work item consumes of the agent's total, possible capacity.
Push Time-Out	The number of seconds set for push time-out. 0 is returned when push time-out isn't enabled.
Push Time-Out Date	The date and time when push time-out occurred.
Queue	The Salesforce queue from which the work item was routed.
Request Date	The date and time that the Salesforce object was assigned to the queue, creating the associated work item.
Service Channel	The Service Channel that's associated with the work item.
Speed to Answer	The amount of time in seconds between the time the work item was created (the Request Date) and the time the work item was accepted by an agent (the Accept Date).
Status	<p>The status of the Agent Work record. Valid values are:</p> <ul style="list-style-type: none"> Assigned – The item is assigned to the agent but hasn't been opened. Opened – The item was opened by the agent. Unavailable – The item was assigned to the agent but the agent became unavailable (went offline or lost connection). Declined – The item was assigned to the agent but the agent explicitly declined it. DeclinedOnPushTimeout – The item was declined because push time-out is enabled and the item request timed out with the agent. Closed – The item is closed. Canceled – The item no longer needs to be routed. For example: a chat visitor cancels their Omni-Channel routed chat request before it reaches an agent.
Units of Capacity	The number of units of an agent's capacity that the work item consumes of the agent's total, possible capacity.
User	The name of the agent to whom the work item was routed.

Field	Definition
Work Item	The name of the work item that's associated with the Agent Work record—for example, "Case 123456."

Fields for User Presence Records

Every time agents change their Presence Statuses in Omni-Channel, Salesforce creates a User Presence record to log all of the agents' activities while they're signed logged in with that status. User Presence records contain fields that help you track information about your agents' availability.

A User Service Presence record has the following fields, listed in alphabetical order. Depending on your field-level security settings, some fields might not be visible or editable.

Field	Definition
At Capacity Duration	The amount of time in seconds that the agent was working at 100% of the agent's capacity, as indicated in the agent's Presence Configuration.
Configured Capacity	The agent's overall capacity, as indicated in the agent's Presence Configuration.
Created By	The name of the agent who set the Presence Status in Omni-Channel.
Created Date	The date when the User Presence record was created.
Idle Duration	The amount of time in seconds that the agent was assigned no work items.
Is Away	Indicates whether the agent's status is a "busy" status.
Is Current Status	Indicates whether the agent's Presence Status in the Service Presence Status field is the agent's current Presence Status.
Last Modified Date	The date the User Presence record was last modified.
Service Presence Status	The API name of the Presence Status the agent used to log in to Omni-Channel.
Status Duration	The amount of time in seconds that the agent's status was set to the Presence Status indicated by the Status Name field.
Status End Date	The date and time that the agent logged out of Omni-Channel or changed to another Presence Status.
Status Start Date	The date and time that the agent set the Presence Status.

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Definition
User	The name of the agent who is signed in to Omni-Channel.
User Presence ID	The autogenerated Salesforce ID of the User Presence record.
Alias	The agent's custom name.
Username	The agent's Salesforce username.
Status Name	The name of the Presence Status the agents used to log in to Omni-Channel.

Omni-Channel Supervisor

Access real-time operational intelligence with Omni-Channel Supervisor.

With Omni-Channel Supervisor, real-time information about your Omni-Channel agents, queues, and work are streamed live into the panel. Yes, you read that right: live. You'll see waiting times, open work, and more with real-time updates. Omni-Channel Supervisor updates continuously to reflect the most up-to-date data so you'll always know how your agents are doing.

Monitor Omni-Channel activity for agents, queues, and work with intuitive tab views that show you the big picture of how your agents are doing. Take advantage of filtering and sorting to help you find what you need, and seamlessly drill down to see details for specific agents, queues, or work items. The best part? You never have to leave the console.

So, what are you waiting for? Let's get Omni-Channel Supervisor up and running!

[Add Omni-Channel Supervisor to the Salesforce Console](#)

Add Omni-Channel Supervisor to the console to get your supervisors up and running.

[Get to Know the Omni-Channel Supervisor Tabs](#)

Supervisors can check the health of their call center in real time using the Agents, Queues, and Work tabs in Omni-Channel Supervisor. These tabs let supervisors survey the landscape and see what's open and active, who's assigned to what, and other details such as open capacities and average wait times for customers.

[Sort and Filter in Omni-Channel Supervisor](#)

Organize and focus your real-time data in Omni-Channel Supervisor to effortlessly find the information you need.

Add Omni-Channel Supervisor to the Salesforce Console

Add Omni-Channel Supervisor to the console to get your supervisors up and running.

Before adding Omni-Channel Supervisor to the console:

- Make sure you have Omni-Channel enabled and ready-to-go with agents and queues running.
 - Make sure you have a working console app.
1. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
 2. Click **Edit** next to the Salesforce console app that you want to add Omni-Channel Supervisor to. Or, create a new console app. We recommend creating a profile for your supervisors so you can customize a console just for them.
 3. In the Choose Navigation Tab Items section, add *Omni Supervisor* to the Selected Items list.
 4. Select the profiles you want to assign to this Supervisor-enabled console. The users in the selected profiles must have tab visibility in order to view Omni-Channel Supervisor in their console.
 5. Click **Save**.

Verify that Omni-Channel Supervisor is in the console by opening the console and viewing the tab selections. You should see the option **Omni Supervisor**.

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Agents Tab

See who's working, who's available, and who's busy with the Omni-Channel Supervisor Agents tab.

The Agents tab is a simple way to keep up with your agents' presence statuses, channels, assigned queues, and open capacity. You can even see how long your agents have been logged in and when they last accepted new work.

There are two views in the Agents tab: All Agents and Agents by Queue. All Agents lets you see the big picture of your agents' availability, capabilities, capacity, and workload. It's the default for the Agents tab because it provides the best overall picture of how your agents are doing. Agents logged in through the Omni-Channel widget appear in rows, where you can see their status, channels, queues, workload, and capacity.

Here, you can also change an agent's status using the Action column. If you select Offline, keep in mind that the agent's work won't be tracked anymore.

Select an agent to see Agent Detail and the Agent Timeline to see more nuanced information about how the agent is doing. Agent Detail provides detail on the agent’s activity and timestamps, while the Agent Timeline displays the agent’s status changes and work via an intuitive calendar view.

Agent Detail view

Agent Timeline

Agents by Queue provides information about how well your queues are covered. Every queue that has at least one agent that’s Online or Away is shown. You can see how many agents are assigned to the queue and how many of them are online, away, or idle. This lets you see if you need to rearrange any agents to make sure your incoming work is covered.

The screenshot shows the Salesforce interface for the Omni-Channel Supervisor Agents tab. The 'Agent Summary' section is active, displaying a table with columns for Queue, Total, # Online, % Online, # Away, # At Capacity, % At Capacity, # Idle, % Idle, and Avg Capacity. The data is as follows:

QUEUE	TOTAL	# ONLINE	% ONLINE	# AWAY	# AT CAPACITY	% AT CAPACITY	# IDLE	% IDLE	AVG CAPACITY
Case Lead Queue	2	2	100%	0	0	0%	1	50%	10%
Case Queue	1	1	100%	0	1	100%	0	0%	100%
Hybrid Queue	1	1	100%	0	0	0%	0	0%	20%
Order Queue	2	2	100%	0	0	0%	1	50%	10%

Agents Tab Fields

Fields for the Omni-Channel Supervisor Agents tab.

Agents Tab Fields

Fields for the Omni-Channel Supervisor Agents tab.

All Agents Fields

The All Agents view in the Agents tab contains fields with information that lets you know how your agents are doing.

Column	Description
Agent	The first and last name of the agent.
Status	The agent's current presence status, as set in the Omni-Channel widget.
Action	Allows you to change an agent's status.
Time in State	Amount of time the agent has been in the current presence status.
Time Since Login	Amount of time the agent has been logged into an online or busy Omni-Channel status. This reflects the duration of the agent's entire Omni-Channel session, which ends when the agent goes offline in Omni-Channel or closes their browser.
Time Since Last Accept	Amount of time since the agent last accepted a work item, either explicitly or through auto-accept.
Channels	The agent's associated Service Channels (for agents in an online status), so you know what types of work the available agent can handle.

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Column	Description
Assigned Queues	Omni-Channel-enabled Salesforce queues that the agent can receive work through in Omni-Channel.
Work Items	All Omni-Channel work currently assigned or open with the agent. You can get an overview of the work items with popup details. <ul style="list-style-type: none"> Assigned work items are in the agent's widget and waiting for acknowledgment Open work items have been accepted and the work's tab is open in the agent's Console
Workload	The total size of all assigned and open work with the agent compared to the agent's overall capacity as set through the Presence Configuration. Work is sized through the Routing Configuration associated with the Omni-Channel-enabled queue that's used to route the work to the agent.
Capacity	Percentage calculated from the Workload column. <ul style="list-style-type: none"> 0-50% capacity is shown with a green icon 51-80% capacity is shown with a yellow icon 81-100% capacity is shown with a red icon

Agent Detail Fields

The All Agents view in the Agents tab contains fields that provide information about the particular agent's current work.

Column	Description
Type	Salesforce object type for the work, such as Lead, Case, SOS, etc.
Details	Information from the object's primary compact layout to provide more context about the work item.
Queue	The Omni-Channel-enabled queue used to assign and route the work to the agent.
Work Size	Size of the Omni-Channel work based on the routing configuration associated with the queue.
Status	Omni-Channel work status. It includes: <ul style="list-style-type: none"> Assigned work items in the agent's widget waiting for acknowledgment Open work items that are assigned to an agent and have an open work tab in the agent's console
Requested Time	Datetime the item was assigned to the Omni-Channel-enabled queue, which triggers the routing.

Column	Description
Assigned Time	Datetime when Omni-Channel pushed and assigned the item into the agent's Omni-Channel widget.
Accepted Time	Datetime the item was accepted, either explicitly or through auto-accept. Accepted items are opened in the agent's console.
Handle Time	How long the item has been open with the agent. It's calculated using the difference between "now" and when the agent accepted the work.
Speed to Answer	How quickly the agent responds to work requests. It's calculated using the difference between when the work was requested and when the agent accepted it.

Agents by Queue Fields

The Agents by Queue view in the Agents tab contains fields with information about the work agents are doing in your Omni-Channel queues.

Column	Description
Queue	The name of the Omni-Channel queue used to assign and route the work to the agent. Only queues containing at least one agent in an Online or Away state are displayed.
Total	Total number of agents in the queue.
# Online	Number of agents with an Online status.
% Online	Percentage of agents in the queue who have an online status.
# Away	Number of agents with an Away status.
# At Capacity	Number of agents who are at capacity.
% At Capacity	Percentage of Agents in the queue who are at capacity.
# Idle	Number of agents who are idle. Idle agents have no current work, with 0% capacity consumed.
% Idle	Percentage of agents in the queue who are idle.
Average Capacity	Average capacity among the online and away agents in the queue.

Queues Tab

Gauge your backlog with the Omni-Channel Supervisor Queues tab.

Spend some time catching up on the activity in your Omni-Channel queues using the Queues Summary view in the Queues tab. You can see your queues' priority, configured work size, type, and wait times. This high-level information can give you an idea of how efficiently work moves through the queue and to your agents, so you can determine which queues are doing well and which could use a few more agents on board.

Work Detail Fields

The Work Details view in the Work tab contains fields that provide information about the work items in the queue.

Column	Description
Type	Salesforce object type for the work, such as Lead, Case, SOS, etc.
Details	Information from the object's primary compact layout to provide more context about the work item.
Agent	The name of the agent assigned to the work.
Requested Time	Datetime the item was assigned to the queue.

Column	Description
Assigned Time	Datetime when Omni-Channel pushed and assigned the item into the agent’s Omni-Channel widget.
Handle Time	Amount of time the item has been open with the agent. It’s calculated using the difference between “now” and when the agent accepted the work.
Speed to Answer	How quickly the agent opened the assigned item. It’s calculated as the amount of time between when the work was requested and when the agent accepted it.

Sort and Filter in Omni-Channel Supervisor

Organize and focus your real-time data in Omni-Channel Supervisor to effortlessly find the information you need.

Now that we’ve seen what Omni-Channel Supervisor has to offer, we’ll show you how to optimize all this great data so you can quickly find what you’re looking for. Filter the tables to display particular agents, queues, work types, capacity percentages, etc. and group that information with sorting.

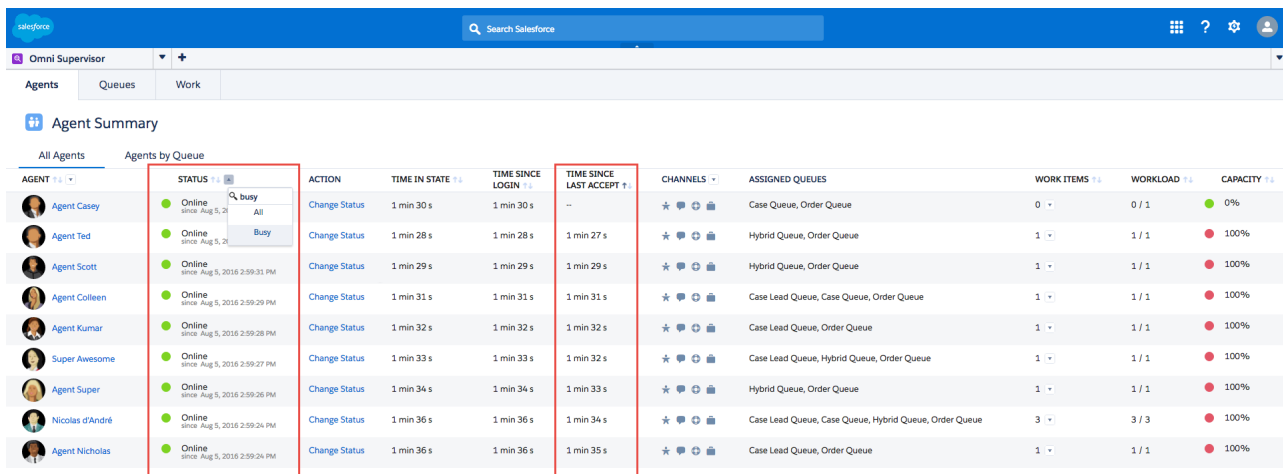

Use filtering to pare down what’s on your screen and get what you need faster. For example, if you want to see information about one particular team of agents, go to the All Agents view and select just those agents in the filter. You can apply multiple filters to the same grid, too. Hop seamlessly from an agent’s open Leads to the Tier One Queue’s open Cases with a Wait Time over 5 minutes.

Use sorting to organize columns as ascending or descending. For example, if you want to see which online agents most recently accepted work, filter the All Agents view to show only agents with an Online status, and sort the Time Since Last Accept column in ascending order.

EDITIONS

Available in: Salesforce Classic

Omni-Channel is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

The online agents who most recently accepted work are at the top of the screen. The possibilities are as endless as your curiosity.

Set Up SOS Video Chat and Screen-Sharing

Want to connect with your customers in a whole new way? SOS is the Service Cloud's mobile support solution. With SOS, you can add a help button to your native iOS or Android mobile application so your customers can connect with agents over a one-way video and two-way audio chat.

Gone are the days when your customers had to connect with a nameless, faceless agent over the phone. With one click, your customers can video chat with agents who provide personalized, in-app guidance with screen-sharing and annotations.

EDITIONS

Available in: Salesforce Classic

SOS is available for an additional cost in: **Enterprise, Performance, Unlimited, and Developer Editions**

SOS is integrated into the Salesforce console for the Service Cloud. Your agents can access cases, account records, and customer information quickly and easily during their video calls. Agents can also draw on customers' screens during an SOS session, giving your customers in-app guidance to solve their problems. Your customers get a comprehensive, personal support experience, and your agents have the information they need in the console to solve customer issues.

Even better, SOS is fully integrated into Omni-Channel, the Service Cloud's routing engine. Use Omni-Channel to customize how work items—including SOS video calls—are routed to your agents. Route SOS calls to the most available, capable agents in your organization in real time.—no third-party routing engine required!

For more information on integrating SOS into your mobile applications, see [Snap-ins for iOS](#) and [Snap-ins for Android](#).

Before you set up SOS, [enable Omni-Channel in your organization](#).

1. [Assign SOS Licenses to Agents](#)

Each agent who uses SOS must have an SOS license and be part of a permission set that enables the SOS license.

2. [Enable the SOS License](#)

Use a permission set to enable the SOS license for your users.

3. [Create an SOS Presence Status](#)

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. Create a presence status that lets your agents indicate that they're online and available to receive SOS calls.

4. [Give Users Access to SOS Presence Statuses with Permission Sets](#)

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. Give SOS agents access to the SOS presence status so they can start receiving SOS calls.

5. [Give Users Access to Your SOS Presence Statuses with Profiles](#)

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. Give SOS agents access to the SOS presence status so they can start receiving SOS calls.

6. [Create an SOS Routing Configurations](#)

Routing configurations determine how work items are routed to agents. They let you prioritize the relative importance and size of work items from your queues. That way, the most important work items are handled accordingly, and work is evenly distributed to your agents. Create an SOS routing configuration to determine how SOS calls are dispersed to your agents.

7. [Create an SOS Queue](#)

Queues are a classic element of Salesforce that help your teams manage leads, cases, service contracts, and custom objects. Omni-Channel supercharges queues to route work items to agents in real time. Create an SOS queue to funnel SOS calls to SOS agents. We'll associate the SOS queue with the SOS routing configuration we created earlier.

8. [Update Your Salesforce Console Settings](#)

After you get SOS all set up for your organization, it's time to a few settings in your Salesforce console so that your agents can start receiving work.

9. [Create an SOS Deployment](#)

Create an SOS deployment to integrate your SOS settings from Salesforce into your mobile application.

Assign SOS Licenses to Agents

Each agent who uses SOS must have an SOS license and be part of a permission set that enables the SOS license.

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Select the user that you want to assign an SOS license to.
3. Click **Permission Set License Assignments**.
4. Click **Edit Assignments**.
5. Check the **Enabled** checkbox for **SOS User**.
6. Click **Save**.

Enable the SOS License

Use a permission set to enable the SOS license for your users.

You can add only [users who have been assigned the SOS license to the permission set](#).

1. From Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
2. Select the SOS permission set.
If you don't have an SOS permission set, create one. For *User License*, select *None*.
3. Click **App Permissions**.
4. Click **Edit**.
5. Select **Enable SOS Licenses**.
6. Click **Save**.

Create an SOS Presence Status

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. Create a presence status that lets your agents indicate that they're online and available to receive SOS calls.

A presence status can be associated with one or more channels of work items. Associate the SOS presence status with the SOS service channel. That way, your agents can receive SOS calls when they're signed in with the SOS presence status.

1. From Setup, enter *Presence* in the *Quick Find* box, select **Presence Statuses**, then click **New**.
2. Name your status.
Let's call our status "Available for SOS." A version of that name becomes the Developer Name automatically.
3. In the Status Options section, select **Online**.
4. In the Service Channels section, add SOS to the Selected Channel list.
5. Click **Save**.

Give Users Access to SOS Presence Statuses with Permission Sets

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. Give SOS agents access to the SOS presence status so they can start receiving SOS calls.

Alternatively, you can give users access to presence statuses through profiles.

1. From Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
2. Click the name of the permission set that contains your SOS agents.
3. Click **Service Presence Statuses Access**.
4. Click **Edit**.
5. Select the SOS presence status that we created earlier, "Available for SOS."
6. Click **Save**.

- "Manage Profiles and Permission Sets"

Give Users Access to Your SOS Presence Statuses with Profiles

Presence statuses indicate whether an agent is online and available to receive incoming work items, or whether the agent is away or offline. Give SOS agents access to the SOS presence status so they can start receiving SOS calls.

Alternatively, you can give users access to presence statuses through permission sets.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the name of the profile that contains your SOS agents.
Don't click **Edit** next to the profile name. If you do, you won't see the correct page section where you can enable statuses.
3. In the Enabled Service Presence Status Access section, click **Edit**.
4. Select your SOS presence status, "Available for SOS," to associate it with the profile.
5. Click **Save**.

Create an SOS Routing Configurations

Routing configurations determine how work items are routed to agents. They let you prioritize the relative importance and size of work items from your queues. That way, the most important work items are handled accordingly, and work is evenly distributed to your agents. Create an SOS routing configuration to determine how SOS calls are dispersed to your agents.

After you create this configuration, we'll create an SOS queue for your SOS calls. Then, we'll associate our routing configuration with our SOS queue so that your agents can receive calls after we get SOS set up.

1. From Setup, enter *Routing* in the **Quick Find** box, select **Routing Configurations**, then click **New**.
2. Name your routing configuration.
Let's call our routing configuration "SOS Routing Configuration." A version of that name becomes the Developer Name automatically.
3. Set your routing priority.
If SOS calls are the most important or the only work items your agents handle, set your routing priority to *1*. That priority ensures that SOS calls are routed to your agents before other types of work items.
4. Select your **routing model**.
5. Set the value of the **Percentage of Capacity** field to *100*.
Agents can accept only one SOS call at a time, so SOS calls take 100% of an agent's capacity.
6. Click **Save**.

Create an SOS Queue

Queues are a classic element of Salesforce that help your teams manage leads, cases, service contracts, and custom objects. Omni-Channel supercharges queues to route work items to agents in real time. Create an SOS queue to funnel SOS calls to SOS agents. We'll associate the SOS queue with the SOS routing configuration we created earlier.

The work items in the SOS queue are assigned the priority that you specified in the SOS routing configuration that you created earlier.

For routing to work correctly, assign each of your agents to a queue from which they'll be receiving work items.

For more information about queues, see "Queues Overview" in the Salesforce Help.

1. From Setup, enter *Queues* in the *Quick Find* box, then select **Queues**.
2. Click **New**.
3. In the *Label* field, name your queue.
Let's call our queue "SOS Queue." A version of this name becomes the *Queue Name* automatically.
4. In the *Routing Configuration* field, look up and select the routing configuration that you created earlier, "SOS Routing Configuration."
5. In the Supported Objects section, add *SOS Session* to the list of selected objects.
6. In the Queue Members section, add each of the agents to whom you want to route SOS calls to the *Selected Users* field.
7. Click **Save**.

Update Your Salesforce Console Settings

After you get SOS all set up for your organization, it's time to a few settings in your Salesforce console so that your agents can start receiving work.

You need to add the Omni-Channel and SOS widgets to your console, as well as whitelist the URL *salesforceliveagent.com*.

The SOS and Omni-Channel widgets appear in the footer of the Salesforce console. From the Omni-Channel widget, agents can change their presence status and triage their incoming work assignments, including SOS calls. When an agent accepts an SOS call, the call opens in the SOS widget, where agents can view the customer's screen.

You also need to whitelist the URL *salesforceliveagent.com* to make sure your calls aren't blocked by your company's firewalls. This ensures that all of your customers' SOS calls make it safely to your agents.

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the Salesforce console app that you want to add the Omni-Channel and SOS widgets to.
3. In the Choose Console Components section, add Omni-Channel and SOS to your list of selected items.
4. In the *Whitelist Domain* field, add *salesforceliveagent.com* to the list of whitelisted domains.
5. Click **Save**.

Create an SOS Deployment

Create an SOS deployment to integrate your SOS settings from Salesforce into your mobile application.

When you create an SOS deployment, your deployment is assigned a unique ID number. Your mobile developers use this deployment ID to integrate your SOS settings in Salesforce into SOS in your mobile application.

1. From Setup, enter *SOS Deployments* in the **Quick Find** box, then select **SOS Deployments**.
2. Click **New**.
3. Choose the settings for your deployment.
4. Click **Save**.
5. Copy the SOS Deployment ID from the detail page and send it to your mobile developers. To integrate the SOS deployment with a mobile application, mobile developers use the *SOS iOS SDK*.

[SOS Deployment Settings](#)

SOS deployment settings control how your Salesforce SOS settings integrate into your mobile application.

SOS Deployment Settings

SOS deployment settings control how your Salesforce SOS settings integrate into your mobile application.

Apply settings when you create or edit an SOS deployment.

Setting	What It Does
SOS Deployment Name	Names the deployment. This deployment name, or a version of it, automatically becomes the API Name.
API Name	Sets the API name for the Live Agent deployment.
Activate Deployment	Activates the deployment so customers can request SOS calls when SOS is deployed in your mobile application.
Voice-Only Mode	Disables video functionality and allows agents and customers to communicate with audio only.
Enable Backward-Facing Camera	Allows the customer to relay video from the customer's backward-facing mobile camera to agents.
Queue	Determines the queue that you want to route incoming SOS calls to.

Setting	What It Does
Session Recording Enabled	Automatically records SOS sessions.
Session Recording Storage Provider	Determines the data storage provider that stores your SOS session recordings. Available only if session recording is enabled.
Session Recording Storage Provider API Key	The ID of the access key that's associated with your Amazon S3 storage account. Available only if session recording is enabled.
Session Recording Storage Provider API Secret	The ID of the access secret that's associated with your Amazon S3 storage account. Available only if session recording is enabled.
Session Recording Storage Provider Bucket	The name of the Amazon S3 bucket where you want to store your SOS session recordings. Available only if session recording is enabled.

Setting Up Agent Console in the Console Tab

Setting up the Agent Console

Get started with the Agent console quickly.

 **Note:** As of the Spring '15 release, Agent console is not available to new organizations.

The newer Salesforce console improves the Agent console by providing you with more options and more advanced technologies. See [Salesforce Console](#).

You can quickly set up the Agent console so that users have all the information they need on one screen when working with Salesforce. To set up the Agent console:

1. [Create console layouts](#) to define what objects are available to users in the console's list view frame.
2. [Choose the related objects](#) to show in the mini view.
3. [Define mini page layouts](#) to customize the fields and related lists of the objects that display in the console's mini view.
4. [Assign profiles](#) to a console layout to provide users access to specific objects in the console's list view.
5. Add the Agent console to custom apps so that users can access the console from specific apps.

 **Note:** You can't add the Agent console to partner portals or customer portals.

Visualforce pages might not display properly in the Agent console, as there is no cross-domain communication between Salesforce and Visualforce domains.

Create Agent Console Layouts

 **Note:** As of the Spring '15 release, Agent console is not available to new organizations.

The newer Salesforce console improves the Agent console by providing you with more options and more advanced technologies. See [Salesforce Console](#).

To create a layout for the Agent console:

1. From Setup, enter *Console Layouts* in the **Quick Find** box, then select **Console Layouts**.
2. Click **New** and optionally choose an existing layout to clone.
3. Enter a name for the new layout.
4. Click **Save**.
5. Click **Edit** in the Selected List Views section.
6. To add or remove objects to the layout, select an object, and click the **Add** or **Remove** arrow.
To change the order of the objects as they appear in the console's list view frame, select an object in the Selected List box, and click the **Up** or **Down** arrow.
A user can only view objects in the console's list view frame if those objects are added to the console layout to which their profile is assigned.
7. Click **Save**.
8. Next, [choose the related objects](#) to show in the mini view of the console.

SEE ALSO:

[Managing Console Layouts for the Agent Console](#)

Customizing Agent Console Layouts

To customize layouts for the Agent console:

1. From Setup, enter *Console Layouts* in the **Quick Find** box, then select **Console Layouts**.
2. Select a layout name.
3. To modify the **Name** or **Description** of the layout, click **Edit** in the Console Layout Detail section.
4. To add or remove objects to the layout, click **Edit** in the Selected List Views section, select an object, and click the **Add** or **Remove** arrow.
To change the order of the objects as they will appear in the console's list view frame, select an object in the Selected List box, and click the **Up** or **Down** arrow.
A user can only view objects in the console's list view frame if those objects are added to the console layout to which their profile is assigned.
5. Click **Save** to finish.

- "Customize Application"

Deleting Agent Console Layouts

To delete a layout for the Agent console:

1. From Setup, enter *Console Layouts* in the **Quick Find** box, then select **Console Layouts**.
2. Click **Del** next to the console layout name.

 **Note:** You cannot delete a [console layout that is assigned to a profile](#). You must first reassign the profile to another console layout or no console layout.

SEE ALSO:

[Managing Console Layouts for the Agent Console](#)

Managing Console Layouts for the Agent Console

Console layouts define what objects are available to users in the Agent console's list view frame. For example, if you want users to see list views of cases and contacts in the console, then you would add both cases and contacts to a console layout, and then assign that console layout to the appropriate user profiles. A user can only view objects in the console's list view frame if those objects are added to the console layout to which their profile is assigned.

From the console layouts list page, accessed in Setup by entering *Console Layouts* in the **Quick Find** box, then selecting **Console Layouts**, you can:

- Click **New** to [create layouts](#).
- Click **Edit** to [modify a layout](#).
- Click **Del** to [delete a layout](#).
- Click **Console Layout Assignment** to [assign console layouts to profiles](#).

USER PERMISSIONS

To create, edit, delete, and assign Agent console layouts:

- "Customize Application"

Choose Related Objects for the Agent Console's Mini View

While you can choose which related objects appear in the Agent console's mini view, you can only choose objects with a lookup or master-detail relationship on the primary object. For example, from the cases object, you can choose account and contact because cases have account and contact lookup fields.

1. From the object management settings for the object whose page layout you want to edit, go to Page Layouts.

The standard or custom object you choose in this step represents the record in the detail view of the console, and the related objects in the mini view will be records associated with it.

2. Next to a page layout name, click **Edit**.
3. In the page layout header, click **Mini Console View**.
4. To select which related objects will be displayed in the mini view, select a field name, and click **Add** or **Remove**. You can select objects only if they are defined as lookup relationships and those lookup fields are included on the page layout. To change the order of the related objects in the mini view, select a field name in Selected Relationship Fields, and click **Up** or **Down**. Click **Save** when finished.
5. Click **Save**.
6. Next, [define mini page layouts](#) to specify the fields and related lists to show for the related objects in the mini view.

Tip: The fewer related objects you add to the Agent console's mini view, the easier it is for users to read the information displayed. The console can also process data faster when fewer related objects are added to the mini view.

Note: You cannot choose related objects for the Close Case Layout or the Log a Case Page and View Cases Page layouts on the Self-Service Portal.

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To set up the Agent console:

- "Customize Application"

Define Mini Page Layouts for the Agent Console

You can define mini page layouts for the records that appear in the mini view of the Agent console, hover details, and event overlays. A mini page layout contains a subset of the items in an existing page layout. Mini page layouts inherit record type and profile associations, related lists, fields, and field access settings from their associated page layout. The visible fields and related lists of the mini page layout can be further customized, but the other items inherited from the associated page layout can't be changed on the mini page layout itself.

The event mini page layout is used for the event detail and edit overlays, not the Console tab. Related lists on mini page layouts only display in the Console tab, not hover details.

1. From the object management settings for the object whose page layout you want to edit, go to Page Layouts.
2. Next to a page layout name, click **Edit**.
3. In the page layout header, click **Mini Page Layout**.
4. Select which fields and related lists will be displayed for this type of record in the mini view. For each related list you select, choose which fields to display in that related list.
 - You can select all of the available fields and up to five related lists to display in the console; however, it is recommended that you only select a few so that users do not have to scroll to find information.
 - Selected fields and related lists display in the console even when they do not contain content.
 - Fields marked `Always Displayed` or `Always on Layout` on page layouts are automatically included on the mini page layout and cannot be removed unless they are removed from the page layout.
 - Field properties on the page layout determine field properties on the mini page layout. For example, if a field is read-only on the page layout, that same field will be read-only on the mini page layout. To change the field properties of fields on the mini page layout, you must change the field properties of fields on the page layout. Note that the console respects field-level security in organizations where it is available.
 - To add or remove fields, select a field name, and click **Add** or **Remove**. To change the order of the fields, select a field name in Selected, and click **Up** or **Down**. Click **Save** when finished.
 - The order of related lists on the page layout determines the order of related lists on the mini page layout. To change the order of related lists on the mini page layout, you must change the order of related lists on the page layout, then select the mini page layout and click **Save**.
5. Click **Save**.

 **Note:** You can't define mini page layouts for the Close Case Layout or the Log a Case Page and View Cases Page layouts on the Self-Service Portal.

You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won't display in the Agent console.

Setting Up Case Feed

Set Up Cases for Salesforce Classic

Follow these high-level steps to set up Case Feed in Salesforce Classic.

Prerequisites and Basic Setup

Before you enable and customize Case Feed:

- Decide which actions and tools you need:
 - To use the Email action, [set up Email-to-Case](#).
 - To use the articles tool, [set up Salesforce Knowledge](#).
- [Review how cases are upgraded and know what to expect](#) when you enable Case Feed actions and feed items.

When you're ready, [enable Case Feed actions and feed items](#).

-  **Note:** In organizations created before Winter '14, you also need to:
- Enable Chatter and actions in the publisher.
 - Enable feed tracking on cases. On the feed tracking page, turn off tracking for the Status field. Turning off tracking for the Status field prevents duplicate feed items when agents update a case's status using the Change Status action.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up and customize Case Feed:

- “Manage Cases”
- AND
- “Customize Application”

Customizing Page Layouts

Choose what you want to appear on Case Feed page layouts based on your company's needs and how your support agents work.

- [Create layouts for case detail and close case pages](#) and [highlights panels](#).
- [Create layouts for feed view pages](#) to specify which actions, fields, and tools agents see when they're working with cases.

Giving Users Access

The easiest way to give users access to Case Feed is to assign them to profiles that use the feed-based case page layouts you create.

In organizations created before Spring '14, you may also be able to give users access in two other ways:

- [By creating permission sets](#) and [assigning them to users](#)
- [Through custom profiles](#)

Setting Up Case Feed: Adding More Functionality

Follow these optional steps to add more functionality to Case Feed.

- To let agents include short, pre-written messages in their emails, [set up Quick Text](#) and [create Quick Text messages](#).
- To give agents the option of emailing customers to let them know when questions they've posted to a portal have been answered, [enable portal email notifications](#).
- To allow agents to save email messages as drafts before sending them, and to make it possible to create approval actions for email, [enable email drafts](#).
- To help agents save time and increase consistency when sending emails to customers, create text, HTML, or Visualforce [email templates](#) on page 1614.
- To let agents automate repetitive tasks, [add the macros browser](#) on page 4645 to the console and give agents permission to use macros.
- To give agents access to more functionality, [create and add custom actions](#).

SEE ALSO:

[Chatter Settings](#)

[Enable Actions in the Chatter Publisher](#)

[Assign Page Layouts from a Customize Page Layout or Record Type Page](#)

Enable Case Feed Actions and Feed Items

Enabling Case Feed actions and feed items gives your users access to some standard actions they'll need when working with cases, such as Email and Change Status, and to feed items related to those actions.

 **Note:** In Salesforce orgs created before the Winter '14 release, you must enable feed tracking on Cases before you can enable the Case Feed actions and feed items. If feed tracking isn't enabled, then the `Enable Case Feed Actions and Feed Items` isn't visible.

In Salesforce organizations created after the Winter '14 release, feed tracking on cases and Case Feed actions and feed items are automatically enabled.

1. From Setup, enter `Support Settings` in the `Quick Find` box, then select **Support Settings**.
2. Click **Edit**.
3. Select `Enable Case Feed Actions and Feed Items`.
4. Click **Save**.

Once you enable Case Feed actions and feed items, your cases are upgraded to the new user interface automatically. We recommend that you wait until this upgrade process is finished before giving users access to Case Feed.

SEE ALSO:

- [Set Up Cases for Salesforce Classic](#)
- [Case Feed Upgrade Results](#)
- [Assign Case Feed to Users](#)
- [Enable Feed Updates for Related Records](#)

Create Permission Sets for Case Feed

After you enable Case Feed for your organization, create a permission set to give users access to it.

 **Note:** The Use Case Feed permission is available only on orgs created before Winter '14 that haven't enabled feed-based layouts. Case Feed is automatically enabled and assigned to all standard profiles in Salesforce organizations created after the Winter '14 release.

1. Create a permission set for Case Feed.

[Walk Through It](#)

2. On the Permission Set page, click **App Permissions**.
3. Select `Use Case Feed`. Optionally, select any other permissions you want to include in the set.
4. Click **Save**.

EDITIONS

USER PERMISSIONS

To create permission sets:

- "Manage Profiles and Permission Sets"

 **Tip:** If you have an existing permission set, you can edit it to include the `Use Case Feed` permission.

SEE ALSO:

[Set Up Cases for Salesforce Classic](#)

[Assign Case Feed to Users](#)

Assign Case Feed to Users

After you've enabled Case Feed in your organization and created a permission set that includes it, assign that permission set to users.

1. From Setup, enter `Users` in the `Quick Find` box, then select **Users**.
2. Select a user's name.
3. In the Permission Set Assignments list, click **Edit Assignments**.
4. Select the permission set you want in the `Available Permission Sets` list, and then click **Add**.
5. Click **Save**.

SEE ALSO:

[Set Up Cases for Salesforce Classic](#)

[Create Permission Sets for Case Feed](#)

Give Users Access to Case Feed Through Custom Profiles

Instead of giving users access to Case Feed through permission sets, you can create a custom profile that includes the `Use Case Feed` user permission.

 **Note:** The `Use Case Feed` permission is available only on orgs created before Winter '14 that haven't enabled feed-based layouts. Case Feed is automatically enabled and assigned to all standard profiles in Salesforce organizations created after the Winter '14 release.

1. Create a profile.
2. On the Profile page, click **Edit**.
3. In General User Permissions, select `Use Case Feed`.
4. Click **Save**.
5. Assign users to the profile.

Case Feed Upgrade Results

When you enable Case Feed for your organization, an upgrade process converts active cases to the new interface and creates feed items for activity on those cases.

During the upgrade process, users won't notice anything different. After the process is complete, users for whom you've enabled Case Feed see existing and new cases in the new interface, while users without Case Feed continue to see traditional cases.

Here's what happens when cases are upgraded to the new interface:

- The 5000 most recent, active cases in your organization are converted to the Case Feed interface. How long this takes varies depending on the number of cases being converted and the complexity of the data they contain. For example, cases with multiple email messages or other attachments may take longer to convert than other cases.
- Older cases are also upgraded if they have comments, emails, or logged calls that were added to the case within the date range that applies to the original 5000 converted cases. You can have up to 500 cases with current comments, up to 500 with current emails, and up to 500 with current logged calls for a total of 1500 additional converted cases.
- The following items are added to the feed for each case:
 - Up to 60 email messages.
 - Up to 60 private and public comments. These are converted from comments to Chatter posts during the upgrade.
 - Up to 60 logged calls. Some logged calls that were created before you upgraded to Case Feed may appear in the feed as tasks.
- The Case Feed interface is enabled for all new cases, giving users access to the publisher and feed.
- The Case Detail view becomes available, and contains additional information about the case, including items that remain in their current related lists.

You'll receive an email message once the upgrade process has finished.

Best Practices

- For the smoothest upgrade experience, we recommend enabling Case Feed in a full-copy sandbox organization before you enable it in your production organization. This helps you determine how long the case conversion process takes and lets you review some sample cases in the new user interface.
- After you enable Case Feed in your production organization, wait until the upgrade process has finished to give users access. We recommend first assigning Case Feed to a single user, who can review some of the converted cases to be sure the upgrade process was successful, and then making it available to other users.

[Enable Case Feed Actions and Feed Items](#)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Enable Portal Reply Email Notifications in Case Feed

If your organization uses a portal or community, support agents can use the Community action in Case Feed to respond to customers. Enabling portal reply email notifications gives agents access to the `Send Email` option in the Community action.

1. From Setup, enter `Support Settings` in the `Quick Find` box, then select **Support Settings**.
2. Click **Edit**.
3. Select `Enable Case Comment Notification to Contacts`.
4. Select a template for email notifications.
5. Click **Save**.

Emails sent to external users include a link to the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

[Set Up Cases for Salesforce Classic](#)

Highlight Externally Visible Feed Items in Case Feed

You can highlight feed items in Case Feed that are visible to external users. Now support agents can easily distinguish between feed items that are visible only to internal users and items that are visible to external users.

By default, Case Feed doesn't distinguish feed items according to who can see them.

Enable both the `Enable Community Case Feed` and `Highlight Externally Visible Feed Items` settings for the highlighting to work properly.

When the `Enable Community Case Feed` and `Highlight Externally Visible Feed Items` settings are enabled, the following feed items are highlighted in the case feed:

- Public emails sent to or received from the email address for contact person on a case
- Public case comments
- All social posts (such as Facebook posts)
- Questions escalated from Communities
- Tasks that have the All with Access or Public settings
- Events that have the All with Access or Public settings
- Chatter posts that have the All with Access or Public settings

When only `Highlight Externally Visible Feed Items` is enabled, then the following feed items are highlighted in the case feed:

- Incoming and outgoing email feed items that are sent to, or received from, the email address for the contact person on a case

When only `Enable Community Case Feed` is enabled, then no feed items are highlighted.

This setting is only available for compact feed.

"Customize Application"

1. Feed items that are highlighted in orange are visible to external users, such as customers.
 2. Feed items that are not highlighted are visible only to internal users, such as support agents.
1. Enable the `Highlight Externally Visible Feed Items` setting.
 - a. From your object management settings for cases, go to `Page Layouts`.
 - b. Select the feed-based page layout that you want to edit, and click **Edit**.
 - c. Scroll to the `Feed View` settings and select `Highlight Externally Visible Feed Items`.
 2. Enabled the `Enable Community Case Feed` setting.
 - a. From your object management settings for cases, go to `Support Settings`.
 - b. Select `Enable Community Case Feed`.

Enable Email Drafts in Case Feed

Draft emails let support agents who use Case Feed write and save messages without having to send them immediately. This option also makes it possible to implement approval processes so messages can be reviewed by supervisors or senior agents before they're sent to customers.

Before enabling draft emails, [set up Email-to-Case](#) and [Case Feed](#).

1. From Setup, enter `Support Settings` in the `Quick Find` box, then select **Support Settings**.
2. Click **Edit**.
3. Select `Enable Email Drafts`.
4. Click **Save**.

- [Set Up Cases for Salesforce Classic](#)
- [Create Approval Processes for Email Drafts](#)

Add Custom Components to Case Feed

Use Visualforce pages as custom components in Case Feed to give support agents easy access to special tools or functionality while they're working with cases.

For example, you might create a map component that lets agents see where a customer is located, or a tool agents can use to look up the products related to cases they're working on. You can use any Visualforce page that includes the standard case controller as a custom component.

Once you've created a Visualforce page to use as a custom component, add it to the Case Feed layout.

1. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose `edit feed view`. (This section appears only for organizations created before Spring '14.)
2. In the Other Tools and Components section, click **+ Add a Visualforce page** and choose the page you want.

The width of the component is determined by the width of the column it's in. To make the component look best, we recommend setting the width of the Visualforce page to 100%.
3. Set the height of the component.
4. Choose where you want the component to appear on the page.

-  **Tip:** Components in the right column are hidden when agents view the Case Detail page, so use the left column for any components you want to be accessible all the time.

USER PERMISSIONS

To change Case Feed settings:

- "Manage Cases"
- AND
- "Customize Application"

Add Custom Actions in Case Feed

Include custom actions in the Case Feed publisher to give support agents easy access to the additional tools and functionality they need when working with cases.

Actions in Case Feed let support agents perform tasks like emailing customers, writing case notes, and changing the status of a case. Using Visualforce pages, you can create custom actions that offer agents more functionality. For example, you might create a Map and Local Search action that lets agents look up the customer's location and find nearby service centers.

You can use any Visualforce page that uses the standard case controller as a custom action.

 **Note:** If you've opted to use the advanced page layout editor to configure the publisher for a Case Feed layout, see [Configure the Case Feed Publisher with the Enhanced Page Layout Editor](#) for instructions on adding actions.

1. From the object management settings for cases, go to Page Layouts.
2. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose `edit feed view`. (This section appears only for organizations created before Spring '14.)
3. Click **+ Add a Visualforce Page** in the list of custom actions.
4. Select the page you want to add as an action.
5. Specify the height of the action in pixels.
6. Click **Save**.

To add custom actions to Case Feed:

- "Customize Application"

Create Custom Feed Filters for Case Feed

Custom feed filters help support agents focus on the items that are most relevant for them.

1. From Setup, enter *Cases* in the **Quick Find** box, then select **Feed Filters**.
2. Click **New**.
3. In the Feed Filter Information section, enter the filter label, name, and description.
4. In the Feed Filter Criteria section, define how to populate this filter. You can create more refined filters using the OR function.

Field	Description
Feed Item Type	Specifies the feed type to include in the filter. For example, the Created Record feed item type shows feed items about new records.
Related Object	Specifies the object associated with the selected feed item. The list includes all objects related to the Case object. The objects in the list vary depending on how your organization is set up. For example, if you selected Created Record as the feed item type, you might select Case as the related object. This filter then shows new Cases.
Visibility	Specifies whether to include a feed item in the filter based on the feed item's visibility. The visibility depends on the security and sharing settings for the related object. Visibility can include either All Users or Internal Users. For example, suppose that you selected Case Comment Feed as the feed item type and Internal Users as the visibility. This feed filter then shows case comments made by internal users.

5. Click **Save**.
6. After you define your custom feed filters, add the filters to the list of selected filters in the Feed Filter Options section of the page layout's Feed View settings.

Example: To create a filter that shows interactions with a customer, you could define a filter named Customer Interaction that uses the following criteria.

- Criterion 1: Case Comment feed item type with visibility set to All Users
- Criterion 2: Email Message feed item type with visibility set to All Users
- Criterion 3: Chatter post feed item type with visibility set to All Users

When an agent applies this filter, the case feed shows only Case Comment, Email Message, and Chatter feed items that are visible to both external and internal users. Everything else is filtered out.

Case Feed Page Layouts Overview

When support agents work with cases in Case Feed, they use the case page layout. To specify the fields, tools, and functionality that support agents see when working with open cases, customize the feed view, detail view, highlights panel in the case page. When agents close a case, they see the close case page layout, where agents can enter information about the case resolution. You also can customize the close case page layout.

You can customize different parts of the case page layout in Case Feed:

- Highlights panels, which appear at the top of both feeds and case detail pages. The highlights panel shows key information about a case so that the most important information is immediately visible to agents.
- Feed views, which agents see when managing and interacting with cases. The feed view shows the case history using a Chatter-like feed, so that agents can see what's happened in a case in context.
- Detail views, which agents see when they click **View Case Details**. The detail view shows useful information about the case, such as a description of the contact's company, the account's address, and related lists.

You also can customize the close case page layout in Case Feed:

- Close case pages, which appear when agents close cases. The close case page lets agents enter information about the case resolution.

From the object management settings for cases, you can create, edit, and assign all four types of layouts by going to Page Layouts.

Create and Edit Feed Layouts in Case Feed

Feed view page layouts determine which actions, fields, and tools users see when they're working with cases in Case Feed. You can create different layouts and assign them to different user profiles. For example, you might have one layout for agents and another for supervisors.

 **Note:** Before creating a new feed view page layout, you need to create a new case detail page layout.

1. From the object management settings for cases, go to Page Layouts.
2. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose `Edit feed view`. (This section appears only for organizations created before Spring '14.)

If you've already opted to use the advanced page layout editor to configure the publisher for a layout, choose `Edit detail view` to add, change, or remove actions.
3. [Choose the tools, components, and options for your feed view page.](#)
4. Click **Save**.

Once you've created or edited feed view page layouts, assign them to profiles.

Settings for Feed Views in Case Feed

Use Case Feed settings to customize the feature according to your support department's processes and business needs.

Apply these settings when you [create or update feed views for Case Feed](#).

Feed View Options

Option	Use It to...	Notes
Enable Full-Width Feed View in the Console	Expand the width of the feed to take up all available space when agents view cases in Salesforce console tabs or subtabs.	<p>The portion of the page the feed takes up with this setting enabled depends on whether you have tools or components in the right column of the Case Feed layout, and whether you have console sidebar components.</p> <p>This setting is automatically enabled in organizations created after Summer '14.</p>

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create and edit page layouts:

- "Customize Application"

To assign page layouts:

- "Manage Users"

Option	Use It to...	Notes
Enable Compact Feed View in the Console	Update the overall look and feel of the feed view and compress feed items when agents view cases in Salesforce console tabs or subtabs.	Compact feed lets agents see more information about a case with much less scrolling than they need to do when working with cases in the standard feed view. This option is only available if you have Actions in the Publisher and Use Page Layout Editor to Configure Actions enabled.
Highlight Externally Visible Feed Items	Indicate which feed items are visible to external users by changing the background color of the feed item to orange.	This option is only available for compact feed. When this setting and the Enable Community Case Feed setting are both enabled, the following feed items are highlighted in the case feed: <ul style="list-style-type: none"> • Public emails sent to or received from the email address for contact person on a case • Public case comments • All social posts • Questions escalated from Communities • Tasks that have the All with Access/Public setting • Events that have the All with Access/Public setting • Chatter posts that have the All with Access/Public setting See also Set Up the Community Case Feed .

Publisher Options

Option	Use It to...	Notes
Use Page Layout Editor to Configure Actions	Make the advanced page layout editor the default for choosing the actions that appear in the Case Feed publisher.	This setting appears only if your organization has Actions in the Publisher enabled.
Automatically Collapse Publisher	Automatically reduce the height of the publisher when it's not in use, showing more of the feed below. The publisher expands to its normal height as soon as an agent clicks inside it.	This setting is automatically enabled in organizations created after Summer '14 and is only available if you have Actions in the Publisher and Use Page Layout Editor to Configure Actions enabled.

Choosing and Configuring Actions

Option	Use It to...	Notes
Menu Placement	Choose whether you want the publisher menu to appear in the center column or the left column.	This setting appears only if you <i>haven't</i> selected Use Page Layout Editor to Configure Actions .

Option	Use It to...	Notes
Custom Actions	Select up to 10 custom Visualforce pages to add to the publisher as actions. Pages must use the standard case controller.	This setting appears only if you <i>haven't</i> selected Use Page Layout Editor to Configure Actions.
Select Action	Select actions to include in the Case Feed publisher, and choose the order in which the actions appear.	This setting appears only if you <i>haven't</i> selected Use Page Layout Editor to Configure Actions.

Log a Call Action

Option	Use It to...	Notes
Select Action Fields	Select fields to include in the Log a Call action.	Log a Call automatically includes the Customer Name field. You can't include rich text area fields in Case Feed actions.

Change Status Action

Option	Use It to...	Notes
Select Action Fields	Select fields to include in the Change Status action.	The Change Status action automatically includes the Current Status and Change to fields. If you add the Status field to the action, it will automatically replace these two fields. You can't include rich text area fields in Case Feed actions.

Email Action

Option	Use It to...	Notes
Select Action Fields	Select fields to include in the Email action.	Any fields you add appear below the email body field in the action. You can't include rich text area fields in Case Feed actions.
Select Header Fields	Select fields to include in the header of the Email action.	The Email header automatically includes the From, To, Bcc, and Subject fields.
Select Email Tools	Choose the tools to make available to agents when they use the Email action.	The Templates, File Attachments, and Address Lookup Buttons tools are included automatically.

Option	Use It to...	Notes
Enable Rich Text Editor	Make the rich text editor available to agents so they can include formatting, such as bolded or underlined text, bulleted or numbered lists, links, and inline images in their email messages.	Agents can click  in the editor's menu bar to switch to plain text mode.
Require Use of Rich Text Editor	Prevent agents from switching to plain text mode when they write email.	This setting helps ensure that agents write and send only formatted emails, not plain text messages.
Specify From Address(es)	Automatically include specific email addresses in the From field.	To use multiple addresses, separate them with commas. They'll appear as a picklist in the Email action header. You can use only Salesforce-validated email addresses as From addresses.
Allow Collapsible Body Field	Automatically collapse the email body field until an agent clicks inside it. Having the body collapsed by default makes it easier for agents to see more of what's below the email action on the page.	Once an agent expands the email body, it will stay expanded until the page is reloaded, even if the agent clicks on other actions or elsewhere on the page.
Allow Collapsible Email Header	Automatically collapse the email header until an agent clicks  to expand it.	With this setting enabled, agents can expand and collapse the header as needed while they work.
Exclude Email Thread from Drafts	Exclude the previous emails in the thread when composing emails in the feed.	This prevents the previous emails in the thread from being incorporated in the outbound email message.
Replace Send Email Button with	Choose a button to replace the standard Send Email button. This can be useful if you want to label the button something else, change how it looks, or include custom functionality, such as triggering a workflow when an agent sends a message.	You can use any custom button you've created for cases, except those that have s-controls as content sources.

Case Feed Tools

Option	Use It to...	Notes
Select Case Feed Tools	Choose which tools to make available to agents when they use Case Feed.	The Articles tool is included by default, but it won't appear on the Case Feed page unless your organization uses Salesforce Knowledge.

Articles Tool

Option	Use It to...	Notes
Enable Email PDF Attachments	Give agents the ability to attach Knowledge articles to email messages as PDFs.	This setting appears only if your organization uses Salesforce Knowledge. If you use Knowledge and <i>don't</i> enable this setting, agents will be able to attach articles only to cases, not to email messages.
Use Case Feed Articles Tool in the Console	Replace the Knowledge sidebar in the Salesforce console with the Case Feed articles tool.	This setting appears only if your organization uses Salesforce Knowledge. If you use Knowledge and <i>don't</i> enable this setting, we recommend hiding either the Case Feed articles tool or the Knowledge sidebar in the Salesforce console so agents see only one of those tools when they're working with cases in the console.

Other Tools and Components

Option	Use It to...	Notes
Custom Components	Select up to 10 custom Visualforce pages to add as components. You can use as a custom component any Visualforce page that uses the standard case controller.	Once you add a Visualforce page, you can specify its height and choose where on the page you want it to appear.
Choose Placement	Specify where on the page you want tools and components like custom buttons, custom links, and the followers list to appear. You can also choose to hide anything your agents don't need access to.	<p>Custom links and buttons are only available as right sidebar components on the feed view page layout if you've added them to the related case detail page layout.</p> <p>The Milestone Tracker is available only if you've enabled entitlement management in your organization.</p> <p>The Topics list is available only if you've enabled topics on cases.</p>

Filter Options

Option	Use It to...	Notes
Filters Appear	Specify where and how feed filters appears: <ul style="list-style-type: none"> As a fixed list in the left column As a floating list in the left column As a drop-down list in the center column 	Choose "As a floating list in the left column" if you want the feed filters list to remain visible as users scroll down the page. This can be useful with long feeds, as it lets agents quickly filter case activities from anywhere on the page, without having to scroll to the top.

Option	Use It to...	Notes
Select Filters	Choose the filters to include in the feed filters list, and specify the order of the list.	We recommend putting the filters agents are likely to use most often at the top of the list.

SEE ALSO:

[Configure the Case Feed Publisher with the Enhanced Page Layout Editor](#)

Add the Attachment Component to Case Feed

Add the attachment component to the Case Feed page so your support agents can quickly view and manage all of the files associated with a case.

Access to all of the files associated with a case is critical to support agents when they're helping your customers. The attachment component lets agents view and manage all of the Chatter files, attachments from emails, and case attachment related list files for a case, all on the Case Feed page. Using the attachment component, agents can quickly attach a file to an email and download a file.

Agents can toggle between a view of the most recent attachments for a case across all sources and a view of all of the files associated with a case sorted by their creation date.

1. From the object management settings for cases, go to Page Layouts.
2. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose **Edit feed view**. (This section appears only for organizations created before Spring '14.)
3. In the Other Tools and Components section, select **Files**, and specify where on the page you want it to appear.
4. Click **Save**.

Add the attachment component to your custom pages by including the `<support:caseUnifiedFiles>` component in a Visualforce page, or [add it as a Salesforce console component](#) to make it available to agents without having to take up space on a Case Feed page.

Add the Case Experts Component (Pilot) to Case Feed

Easily identify the experts on case topics so agents can collaborate to solve customer issues quickly.

 **Note:** Case Experts is currently available through a pilot program. For information on enabling Case Experts for your organization, contact salesforce.com.

Using the power of topics on cases, support agents can be endorsed as experts on specific topics. Agents endorsed as experts can help other agents who might be less knowledgeable on the topic. To establish case experts in your organization, you must have Chatter and topics for cases enabled.

To enable Case Experts, display the Experts component on Case Feed.

1. From the object management settings for cases, go to Page Layouts.
2. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose `Edit feed view`. (This section appears only for organizations created before Spring '14.)
3. In the Other Tools and Components section, select **Case Experts**, and specify where on the page you want it to appear.
4. Click **Save**.

Add the experts component to your custom pages by including the `<apex: support : caseExperts>` component in a Visualforce page.

Configure the Case Feed Publisher with the Enhanced Page Layout Editor

If your organization uses the actions in the publisher feature, you can use the enhanced page layout editor to choose the actions that appear in the Case Feed publisher.

 **Note:** This option is selected by default for new Salesforce organizations that use Case Feed, and for organizations that enable Case Feed after the Summer '13 release.

1. From the object management settings for cases, go to Page Layouts.
2. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose `Edit feed view`. (This section appears only for organizations created before Spring '14.)
3. Select `Use Page Layout Editor to Configure Actions`.
4. Click **Save**.
5. To access the page layout editor:
 - For a layout in the Case Page Layouts section, click **Edit**.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose `Edit detail view`. (This section appears only for organizations created before Spring '14.)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To configure the Case Feed publisher:

- "Customize Application"

6. In the page layout editor, click  in the Quick Actions in the Salesforce Classic Publisher section.
7. In the palette, click **Quick Actions**.
8. Drag the actions you want to the Quick Actions in the Salesforce Classic Publisher section. You can also drag actions to change the order in which they appear and drag off actions you don't want.
On the Case Feed page, up to approximately five or six actions are displayed in the publisher; the rest are included in the More drop-down list.
9. Click **Save**.

If you've previously used the Case Feed Settings page to configure the publisher, you see these differences when you switch to the enhanced page layout editor:

- The actions list appears at the top of the publisher. You can no longer position the actions list to the left of the publisher.
- The Answer Customer action has been divided into its two component actions: Email and Portal.
- The actions list looks more like the Chatter publisher on other pages.
- The standard Chatter actions—Post, File, Link, Poll, Question, and Thanks—automatically appear in the publisher layout, and they replace the Write Case Note action. You can change the sequence of these actions and remove any you don't need.
- The Feed View/Details drop-down list replaces the View Case Detail action.
- Custom actions you previously added to the Case Feed publisher aren't available. Create new custom actions and add them to the publisher. These new actions must use `publisher.js` rather than `interaction.js`.
- The Case Detail page expands to full width, making it easier to see all of your related lists and other information.

Convert Page Layouts for Case Feed Users to Case Page Layouts

As of Spring '14, we've made creating and customizing case layouts easier by replacing page layouts for Case Feed users with feed-based layouts for case pages. By converting your older page layouts, you can use the advanced page layout editor to manage them and can assign Case Feed to users more easily.

 **Note:** Page layouts for Case Feed users are available only in organizations created prior to Spring '14.

Feed-based case layouts include the same features as page layouts for Case Feed users: a feed, which includes a publisher with actions, feed filters, tools such as an articles tool, and sidebar components such as custom buttons and links; a highlights panel; and a detail page, with related lists and other in-depth information about the case. You can use the standard page layout assignment tool to assign feed-based case page layouts to users, which means you no longer have to use permission sets or custom profiles to give users access to Case Feed.

To convert page layouts for Case Feed users to feed-based case layouts:

1. From the object management settings for cases, go to Page Layouts.
2. Click  next to a layout in the Page Layouts for Case Feed Users list and choose `Convert to case page layout`.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create and edit page layouts:

- "Customize Application"

To assign page layouts:

- "Manage Users"

We recommend using this option so you can review the converted layout before you delete the original, but to save time, you can choose `Convert to page layout and delete`.

3. The converted layout appears in the Case Page Layouts list with the prefix `Converted:`. Click **Edit** next to it.
4. In the page layout editor, confirm that the layout includes the elements you want. To see and edit what's included in the feed view, including feed filters and sidebar components, click **Feed View**.
5. Once you're happy with the case page layout, click **Page Layout Assignment** in the Case Page Layouts list to assign it to the appropriate user profiles.

 **Note:** For custom profiles with the `Use Case Feed` permission, or profiles with permission sets that include `Use Case Feed`, these page assignments won't take effect until you remove the permission or permission set. If your organization was created between Winter '14 and Spring '14, you can't remove `Use Case Feed` from standard profiles, so these assignments won't take effect until you delete all of your page layouts for Case Feed users.

6. Click  next to the older version of the layout in the Page Layouts for Case Feed Users list and choose **Delete**. In the confirmation that appears, click **OK**.
7. If there are users assigned to the layout you delete, you're prompted to choose another layout as a replacement. This is only a formality: Once you assign users to a case page layout, that's what they'll see.

If you have multiple layouts for Case Feed users, we recommend converting and deleting them all at the same time. Once you delete the last of your older layouts, the Page Layouts for Case Feed Users list will disappear.

Add Global Actions and Custom Quick Actions as Components to the Console Sidebar

You can add global actions and custom quick actions as components to the Service Console sidebar, so agents can create records, update case info, search for related info, and link to parent records—all without ever leaving the current tab. You can use quick actions to replace the Case Detail Page, so agents can see case-related information, such as contacts and assets, in their main workflow.

1. Create the global action (for the Create action) and the custom quick action (for the Update action).

Create actions must be global quick actions. Update actions must be object-specific quick actions that are based on the lookup field object type. For example, to update a contact lookup field, you must have a contact-specific update action.
2. Add the actions as components to the case page layouts so that the quick actions are available for your agents to use.
 - a. From Setup, enter "Case" in the Quick Find box, then select **Page Layouts**.
 - b. Select the page to which you want to add the quick actions and click **Edit**.
 - c. In the Case Layout page, select **Custom Console Components**.
 - d. Go to the Sidebar section where you want to add the component (for example, go to the Left Sidebar section).
 - e. For `Type`, select **Lookup**.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** with a Service Cloud license

USER PERMISSIONS

To create actions:

- "Customize Application"

To add custom console components:

- "Customize Application"

- f. For `Field`, select the related field that the quick action acts on.
- g. Select **Enable Linking** to allow support agents search for a record and link it to a related record. For example, a support agent can link a contact name to a case.
- h. For `Create Action`, select the global action that creates a record. For example, a global action can create a contact.
- i. For `Update Action`, select the quick action the updates a record. For example, a quick action can update a field on the contact.
- j. Click **Save**.

Enable Default Email Templates in Case Feed

Use default email templates in Case Feed to give support agents easy access to the templates they need based on the types of cases they're working on.

Before you can enable default email templates, you need to create text, HTML, or Visualforce templates, and create an Apex class that contains template selection logic.

Default email templates make it easy for support agents to respond to customers more quickly, more accurately, and with greater consistency. The email templates are preloaded, so agents don't need to browse for the templates they need before writing email. You can create as many templates as needed and assign them based on your company's needs. For example, if your support center handles issues related to multiple products, you can create a specific template for each product and preload the appropriate template based on a case's origin, subject, or other criteria.

To enable default email templates:

1. From Setup, enter *Support Settings* in the `Quick Find` box, then select **Support Settings**.
2. Click **Edit**.
3. Select `Enable default email templates`.
4. Choose the Apex class that contains your template selection logic.
5. Click **Save**.

Create Send Actions for Email Approval Processes

Use send actions to save your support agents time by ensuring that email messages are sent automatically at the end of an approval process.

 **Note:** Send actions are available only in organizations that have email drafts enabled.

1. From Setup, enter *Send Actions* in the **Quick Find** box, then select **Send Actions**.
2. Click **New Send Action**.
3. Select Email Message from the object drop-down list.
4. Enter a unique name for the action.
5. Optionally, enter a description for the action.
6. Click **Save**.

After you create a send action, create an approval process that includes it.

Rename Actions and Feed Filters in Case Feed

Rename Case Feed actions and feed filters so they match the terms your company uses.

For example, if your company refers to your portal as a customer community, you might rename the Portal action “Customer Community.”

1. From Setup, enter *Rename Tabs and Labels* in the Quick Find box, then select **Rename Tabs and Labels**.
2. Click **Edit** next to Cases in the list of standard tabs.
3. Click **Next**.
4. Find the label you want to change in the Other Labels list.
5. Type the new name for the label in the text box next to it.
6. If the new label begins with a vowel sound, check *Starts with vowel sound*.
7. Click **Save**.

Set Up Cases for Lightning Experience

Before you can use case feed in Lightning Experience, recreate standard publishers with quick actions.

Quick actions appear on mobile devices, whereas standard case feed publishers do not. To use the feed-first design on cases, recreate these publishers as quick actions.

Create a Send Email Quick Action for Cases

Create a Send Email quick action to let agents send emails from the case feed in Lightning Experience and Salesforce1.

You must have Email-to-Case enabled to use the Send Email quick action on the Cases object.

The Send Email quick action is created by default when you enable Email-to-Case on new orgs. If your org was created before Spring '17, or if you enabled Email-to-Case before Spring '17, create a Send Email quick action.

1. Create the Send Email quick action.
 - a. From Setup, enter “Case” in the Quick Find box, then select **Buttons, Links, and Actions**.
 - b. Click **New Action**.
 - c. In the **Action Type** picklist, select **Send Email**.
 - d. In the **Standard Label Type** field, select a label for this action. When you add the action to the case page layout, this label is displayed in the actions bar.
 - e. The **Name** field is automatically populated. This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.
 - f. In the **Description** field, describe what this quick action does. The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page. The description isn't visible to your users. If you're creating several actions on the same object, we recommend using a detailed description, such as “Send Email quick action for Cases.”

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create and modify the Send Email quick action:

- “Manage Cases” AND “Customize Application”

To edit a page layout:

- “Customize Application”

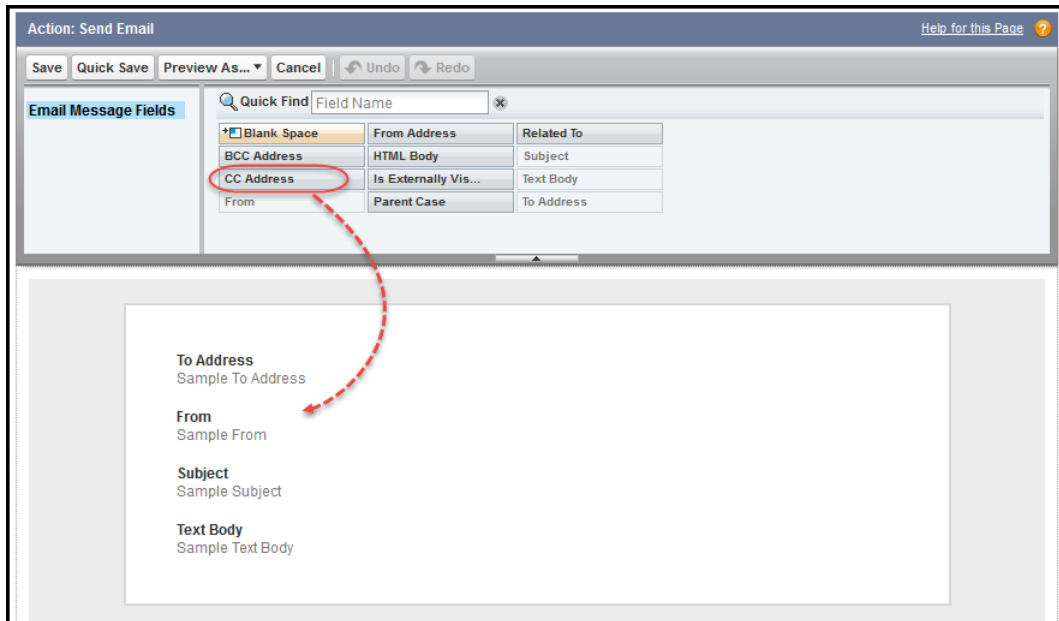

The screenshot shows the 'New Action' configuration page in Salesforce. The form is titled 'Case Actions' and 'New Action'. It contains the following fields:

- Object Name:** Case
- Action Type:** Send Email
- Default Email Template:** (empty)
- Don't Apply Template Subject:** (checkbox)
- Standard Label Type:** Send Email
- Name:** Send_Email
- Description:** Send Email quick action for Cases
- Icon:** Change Icon

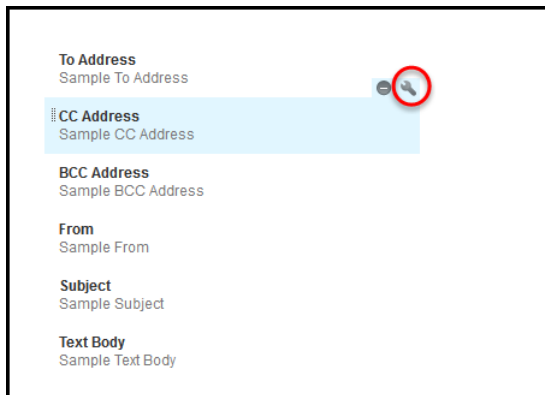

There are 'Save' and 'Cancel' buttons at the top and bottom of the form.

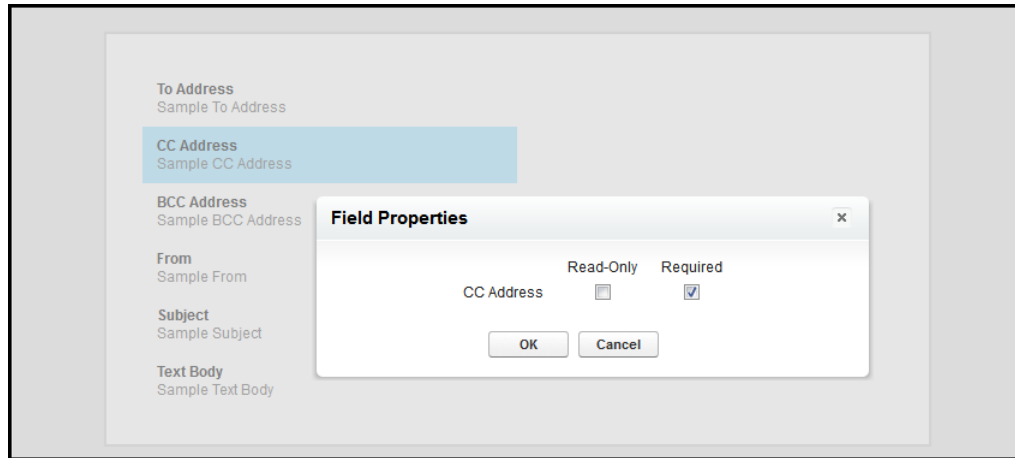

- g. Click **Save**.
The email layout page opens, where you can specify the fields shown in the email action.
2. Arrange the email fields in the order that you want. When an agent selects the quick action, the email fields are displayed in this order.
 - a. From the Email Message Fields menu, drag fields into the email layout. To remove fields, drag them from the email layout to the Email Message Fields section.

The To Address, From picklist, Subject, and Text Body fields are added by default. For information about the fields, see Fields Available on the Send Email Quick Action

- b. To make a field read-only or required, click the wrench icon and specify the field properties.

- c. To save the field properties, click **OK**.
- d. Click **Save**.

After you define the Send Email quick action, [add it to the case page layout](#) so it's available for agents to use.

SEE ALSO:

Apply a Default Email Template Using the Send Email Quick Action

Help agents incorporate branding and ensure consistency when writing emails to customers in Lightning Experience and Salesforce1 by using default email templates. Email templates help ensure that agents include common information, such as greetings, announcements, disclaimers, and company contact information, in customer emails.

You must have Email-to-Case enabled to use the Send Email quick action on the Cases object.

Before creating a Send Email quick action that specifies a default email template, create an email template of the type Custom. Only Custom type templates are supported. Attachments specified on an email template aren't supported. However, agents can manually add attachments when they use the email quick action.

1. Create a Send Email quick action or modify an existing Send Email quick action.
 - a. From Setup, enter "Case" in the Quick Find box, then select **Buttons, Links, and Actions**.
 - b. Click **New Action**, or select the quick action that you want to change.
 - c. In the **Action Type** picklist, select **Send Email**.
 - d. In the **Default Email Template** field, click the lookup button and select a template. Only email templates of the type Custom are shown in the lookup menu.
 - e. Optionally, select **Don't Apply Template Subject** to ignore the email template subject.

By default, the Send Email quick action applies the subject specified in the default email template. For example, if the template's subject line is "Thanks for your email," then that subject is applied when the agent uses the email action to write or reply to an email. If **Don't Apply Template Subject** is selected, then the subject defined in the email isn't applied in the email. For example,

EDITIONS

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create and modify the Send Email quick action:

- "Manage Cases" AND "Customize Application"

To edit a page layout:

- "Customize Application"

if a customer sends an email with the subject “Please help,” the agent can use the default email template to reply but keep the customer’s subject line.

- f. Specify a label for the action. You can use a standard label type, which supplies a default label, or you can select *None* in the `Standard Label Type` field, and specify your own label. When you add the action to the case page layout, this label is displayed in the actions bar.
- g. The `Name` field is automatically populated. This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can’t end with an underscore or have two consecutive underscores. Unless you’re familiar with working with the API, we suggest not editing this field.
- h. In the `Description` field, describe what this quick action does. The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page. The description isn’t visible to your users. If you’re creating several actions on the same object, we recommend using a detailed description, such as “Send Email to Customer with Holiday Branding.”
- i. Click **Save**.
The email layout page opens, where you can specify the fields shown in the email action.

2. Check that you have the appropriate email body field for your template.

The `Text Body` field is added to the Send Email quick action layout by default. If your email template uses images or HTML formatting, remove the `Text Body` field and add the `HTML Body` field to the email layout.

3. Click **Save**.

After you define the Send Email quick action, [add it to the case page layout](#) so it’s available for agents to use.

Fields Available on the Send Email Quick Action

You can drag fields from the Email Message Fields palette to the email layout.

Table 46: Fields Available on the Send Email Quick Action

Field	Description
Blank Space	Adds empty space to the email layout. This field can be used multiple times within the email layout.
BCC Address	Email header field where agents can enter BCC addresses. If <code>BCC Address</code> is added to an email layout that includes the <code>To Address</code> field, the <code>BCC Address</code> field is collapsed and appears as a link in the email layout on the case page layout. When an agent clicks the BCC link, the field expands and doesn’t collapse again. If the field is required, a red line appears next to it and the field is always expanded.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Field	Description
CC Address	<p>Email header field where agents can enter CC addresses.</p> <p>If <code>CC Address</code> is added to an email layout that includes the <code>To Address</code> field, the <code>CC Address</code> field is collapsed and appears as a link in the email layout on the case page layout. When an agent clicks the CC link, the field expands and doesn't collapse again. If the field is required, a red line appears next to it and the field is always expanded.</p>
From	<p>Email header field where agents can enter a From email address from a picklist (dropdown list).</p> <p>Agents can select from org-wide email addresses, Email-to-Case email addresses, and the agent's own email address.</p> <p>The <code>From</code> picklist is added by default in the Send Email action in new orgs created in Winter 17 or later. If you create a Send Email action after Winter 17, then the <code>From</code> picklist is added to the email layout by default.</p>
From Address	<p>Email header field where agents can enter a From email address. The <code>From Address</code> field is a text field.</p>
HTML Body	<p>Email body field that supports HTML formatting and images.</p> <p>If you set a default email template that contains HTML formatting on the Send Email quick action, then add the <code>HTML Body</code> field to the email layout.</p>
Is Externally Visible	<p>If the community case feed is enabled, <code>IsExternallyVisible</code> controls the external visibility of emails in communities.</p> <p>For more information, see <code>EmailMessage</code> in the API Guide.</p>
Parent Case	<p>Field for the parent case record ID.</p>
Related To	<p>Field for the record ID of related objects, such as accounts, opportunities, campaigns, cases, or custom objects.</p> <p>For more information, see <code>EmailMessage</code> in the API Guide.</p>
Subject	<p>Email header field where agents can enter a subject.</p>
Text Body	<p>Email body field that supports only plain text.</p>

Field	Description
To Address	Email header field where agents can enter To email addresses.

Create a Quick Action to Change the Case Owner

Make it simpler for agents to reassign cases in Lightning Experience by adding an Update a Record quick action to the case page layout.

Cases can be reassigned to the following:

- Community partner user
- Community portal user
- Queue
- User

 **Note:** When you use a quick action to change the Case Owner, only the owner of the case is changed. The owner of related activities, notes, and tasks that are attached to the case isn't changed.

- From Setup, enter "Case" in the Quick Find box, then select **Buttons, Links, and Actions**.
- Click **New Action**.
- In the **Action Type** picklist, select **Update a Record**.
- In the **Standard Label Type** picklist, select *None*.
- In the **Label** field, enter a name for this action. When you add the action to the case page layout, this label is displayed in the actions bar.
For example, *Transfer Case* or *Update Case Owner*.
- The **Name** field is automatically populated. This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.
- In the **Description** field, describe what this quick action does. The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page. The description isn't visible to your users. If you're creating several actions on the same object, we recommend using a detailed description.
- Click **Save**.
The action layout page opens, where you can specify the fields shown in the quick action.
- In the action layout, drag the **Case Owner** field from the palette into the quick action layout.
To make a field read-only or required, click the wrench icon and specify the field properties.
- Click **Save**.

After you define the update quick action, [add it to the case page layout](#) so it's available for agents to use.

Add Quick Actions to the Case Page Layout for Lightning Experience

Make actions available to your agents by adding them to the Salesforce1 and Lightning Experience Actions section in the case page layout.

You can add standard actions and custom actions to the page layout. When you create a custom action, it appears in the palette.

You can drag and drop actions from the palette to the page layout.

1. Add quick actions to the case page layout.
 - a. From Setup, enter “Case” in the Quick Find box, then select **Page Layouts**.
 - b. Select the page layout that you want to add the action to, and click **Edit**.
 - c. Click **Salesforce1 & Lightning Actions**.
 - d. Drag the action into the Salesforce1 and Lightning Experience Actions section, and place the action where you want it to appear.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To edit a page layout:

- “Customize Application”

The screenshot shows the Salesforce Page Layout Editor interface. At the top, there's a 'Case Layout' dropdown and a search bar for 'Salesforce1 Action Name'. Below this is a grid of available actions. The 'Log a Call' action is circled in red. A red dashed line indicates it is being dragged from the grid to the 'Salesforce1 and Lightning Experience Actions' section at the bottom of the page layout, which is also circled in red. The page layout includes sections for 'Case Sample', 'Highlights Panel', 'Quick Actions in the Salesforce Classic', and 'Salesforce1 and Lightning Experience Actions'.

Automating Contact Centers

Set Up Customer Support

If your organization uses cases and solutions, set up automated support features to make your support processes more efficient.

From Setup:

- Enter *Business Hours* in the **Quick Find** box, then select **Business Hours** to set your organization's support hours.
- Enter *Assignment Rules* in the **Quick Find** box, then select **Case Assignment Rules** to create rules for automatically routing cases.
- Enter *Escalation Rules* in the **Quick Find** box, then select **Escalation Rules** to create rules for automatically escalating cases.
- Enter *Support Settings* in the **Quick Find** box, then select **Support Settings** to customize email templates and defaults for automated support features.
- Enter *Auto-Response Rules* in the **Quick Find** box, then select **Case Auto-Response Rules** to set up rules that send email to customers when they submit cases from one of the following.
 - A Web-to-Case form
 - An Email-to-Case message
 - An On-Demand Email-to-Case message
 - A Customer Portal
 - A Self-Service portal
- Enter *Email-to-Case* in the **Quick Find** box, then select **Email-to-Case** to set up the ability to capture customer emails as cases. The setup specifies how the content of each customer email automatically populates case fields.

For support features related to solutions, from Setup, enter *Solution* in the **Quick Find** box, then:

- Select **Solution Categories** to set up categories so your users can categorize the solutions they create.
- Select **Solution Settings** to enable specific options for solutions.

For additional support features, from Setup, enter *Self-Service* in the **Quick Find** box, then:

- Select **Public Solutions** to set up public solutions for your customers to use when searching for solutions.
- Select **Web-to-Case** to set up the ability to capture cases from your website.
- Select **Settings** under Self-Service Portal to set up your organization's web portal for your customers to log cases and search for solutions.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

For support features related to a Salesforce Customer Portal, from Setup, enter *Customer Portal* in the **Quick Find** box, then:

- Select **Customer Portal Settings** to set up your organization's Customer Portal so that your customers can log cases, search for solutions, and access any custom objects you may have created for them.

For support features related to [Salesforce CRM Call Center](#), from Setup, enter *Call Center* in the **Quick Find** box, then:

- Select **Call Centers** to set up new call centers and manage the users who are assigned to them.
- Select **Directory Numbers** to set up additional phone numbers that can be searched in a call center user's phone directory.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The available support setup options vary according to which Salesforce Edition you have.

- Select **SoftPhone Layouts** to set up the layouts that are used to display call information in a call center user's SoftPhone.

To create support queues for cases or custom objects, from Setup, enter *Queues* in the *Quick Find* box, then select **Queues**.

The support features include the ability to notify customers when their case is created manually or via the web, or when their case is resolved. You can also automatically notify users when a case is escalated, created, or reassigned. To use notification emails, you must create email templates for each type of notification.

Case Assigned Template	<p>The template used to notify users that a case was manually assigned to them by an administrator or another user. The notification is optional; it's triggered by a checkbox on the Change Case Owner page. This template must be <code>Available for Use</code>.</p>
Case Close Template	<p>The template used to notify contacts that a case has been closed. The notification is optional; it's triggered by a checkbox on the Close Case page. This template must be <code>Available for Use</code>.</p>
New Cases Visible in Portal	<p>Automatically selects the <code>Visible in Self-Service Portal</code> checkbox for all new cases, including cases created via Web-to-Case, Email-to-Case, and On-Demand Email-to-Case.</p> <p>Regardless of this default, users creating new cases can manually set the <code>Visible in Self-Service Portal</code> checkbox.</p> <p>If you're using Salesforce Communities, this setting does not apply for partner or customer users viewing cases in communities. New case visibility in communities is controlled by sharing rules.</p>
Enable Case Comment Notification to Contacts	<p>Select this checkbox to notify contacts who aren't Self-Service portal users when a case comment has been modified or added to a case. If you select this setting, click <code>Case Comment Template</code> and choose the email template to use for these notifications. This template must be <code>Available for Use</code>.</p>
Notify Case Owner of New Case Comments	<p>Select this checkbox to notify the case owner when a user adds a public or private comment to a case. If you select this setting, case owners can't opt out of receiving these notices. (Notices aren't sent to inactive case owners.)</p>

Field	Description
Early Triggers Enabled	<p>Select this checkbox to enable early triggers for escalation rules and their actions.</p> <p>You can set up an escalation rule to perform an action when a case has been unresolved for a specific number of hours. The <code>Age Over</code> hour you specify determines when Salesforce performs the escalation action. Enable early triggers to ensure that your escalation actions are triggered before the <code>Age Over</code> hour you specify.</p>
Enable Suggested Solutions	<p>Select this checkbox to enable the Suggested Solutions button on case detail pages so agents can propose specific solutions to help resolve cases.</p>
Enable Suggested Articles	<p>Select this option to provide suggested articles on the Articles related list. You can make suggested articles available in all Salesforce Knowledge channels except the public knowledge base.</p>
Send Case Notifications from System Address	<p>Select this checkbox to specify that case comment, attachment, and assignment notifications sent to case owners are sent from a system address, rather than the address of the user who updated the case.</p> <p>System notifications display a "From" email address of "noreply@salesforce.com", and an email "Name" related to the message, such as "Case Comment Notification".</p> <p>You can select this checkbox to prevent Self-Service or Customer Portal users who update their cases from receiving "out-of-office" emails from case owners.</p>
Notify Case Owners when Case Ownership Changes	<p>Select this checkbox to automatically select <code>Send Notification Email</code> on cases when users change a case owner to another user. This helps prevent users from forgetting to notify other users that they're the new owner of a case.</p> <p>Selecting this setting <i>doesn't</i> automatically select <code>Send Notification Email</code> when users change a case owner to a queue.</p>
Show Closed Statuses in Case Status Field	<p>Select this checkbox to add closed statuses to the <code>Status</code> field on cases so agents can close cases without having to click the Close Case button and update information on close case page layouts.</p> <p>Selecting <code>Show Closed Statuses in Case Status Field</code> doesn't remove the Close button from case list views. Instead, it adds <code>Closed</code> to the list of statuses available for users to choose from when they select multiple cases and click Change Status on case list views.</p>

Field	Description
Hide Save & Close Button and CIs Links	After selecting <code>Show Closed Statuses in Case Status Field</code> as described above, you can select this checkbox so that the <code>Save & Close</code> button on case edit pages and CIs links on Cases related lists don't display unnecessarily. Instead, users close cases via the <code>Status</code> field and Save button.
Enable Case Feed Actions and Feed Items	Use this setting to turn on Case Feed-specific actions and feed items. When you select this option, existing cases are upgraded to the Case Feed user interface.
Size of Email Feed Item Body	Control the size of email feed items by setting a character limit on the email feed item body. You can set the character limit to: <ul style="list-style-type: none"> • Small = 400 characters (default) • Medium = 1200 characters • Large = 5000 characters • Custom = a value between 400 and 5000 characters If an email feed item body exceeds the character limit, users can click More to see the rest of the email feed item body.
Blank Lines in Email Feed Item Body	Select this checkbox to save space in Case Feed by removing blank lines in the body of email feed items.
Collapse Previous Emails in Email Feed Item Body	Select this checkbox to show only the most recent email in the email feed item body. Users can click More to see previous emails in the thread.
Enable Default Email Templates or the Default Handler for Email Action	Select this checkbox to specify an Apex class that loads a default email template in the Case Feed. Or, you can select this checkbox to specify the default values for the email fields that the Case Feed can automatically populate in emails.
Enable Email Drafts	Use this setting to enable email draft functionality.
Enable Question-to-Case in Salesforce	Let moderators create cases from Chatter questions in your organization.
Create Auto-Response Record After Customer's First Email	Change the order of case feed items and records, so feed items that are automatically generated appear after the customer's first email to your support center.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

Set Business Hours

Specify the hours when your support team is available to serve customers. This helps make your department's processes, such as escalations and milestones, more accurate.

Setting business hours lets you apply specific time zones and locations to:

- Milestones in entitlement processes
- Entitlement processes
- Cases
- Case escalation rules

You can also make the `Business Hours` field available on the Case Layout page so that your support agents can set the times a support team is available to work on the case. By default, business hours are set 24 hours, seven days a week in the default time zone specified in your organization's profile.

Additionally, users with the "Customize Application" permission can add business hours to escalation rules so that when the details of a case match the criteria of an escalation rule, the case is automatically updated and escalated with the times and location on the rule. For example, a case updated with Los Angeles business hours escalates only when a support team in Los Angeles is available.

To set business hours:

1. From Setup, enter `Business Hours` in the `Quick Find` box, then select **Business Hours**.
2. Click **New Business Hours**.
3. Type a name for the business hours.

We recommend using a name that will remind users of a location or time zone when they view business hours on a case, entitlement process, or milestone. For example, if your business hours are for a support center in San Francisco, you could use the name `San Francisco Business Hours`.

4. Click `Active` to allow users to associate the business hours with cases, escalation rules, milestones, and entitlement processes.
5. Optionally, click `Use these business hours as the default` to set the business hours as the default business hours on all new cases.

Default business hours on cases can be updated with business hours on escalation rules if the cases match escalation rule criteria and the rule is set to override business hours.

6. Choose a time zone to associate with the business hours in the `Time Zone` drop-down list.
7. Set your business hours for each day of the week.
 - If your support team is available during the entire day every day of the week, select the `24 hours` checkbox.
 - Choose the start and end times for the business hours. If the time you want isn't available, click the field and type it in.
 - Leave the business hours start and end times blank and the `24 hours` checkbox deselected to indicate that the support team is not available at all that day.

8. Click **Save**.

After you have set business hours, you can associate them with:

- Escalation rules, so that when the details of a case match the criteria of an escalation rule, the case is updated and escalated with the business hours on the rule.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Entitlements and milestones available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud

USER PERMISSIONS

To set business hours:

- "Manage Business Hours Holidays"

- Holidays, so that business hours and any escalation rules associated with business hours are suspended during the dates and times specified in holidays.
- Milestones, in entitlement processes so that business hours can change with the severity of a case.
- Entitlement processes, so that you can use the same entitlement process for cases with different business hours.

 **Note:** All users, even those without the “View Setup and Configuration” user permission, can view business hours via the API.

[Set Up Support Holidays](#)

[Set Up Customer Support](#)

Guidelines for Setting Business Hours

To make your support processes more accurate, define when your support team is available to help customers. There are a few guidelines to keep in mind as you set business hours.

- After you set business hours, add the `Business Hours` lookup field to case layouts and set field-level security on the `Business Hours` field. This lets users view and update the business hours on a case.
- Business hours on a case are automatically set to your organization's default business hours, unless the case matches the criteria on an escalation rule associated with different business hours.
- Salesforce automatically calculates daylight savings times for the time zones available for business hours, so you don't have to configure rules to account for time zones.
- Business hours on a case include hours, minutes, and seconds. However, if business hours are less than 24 hours, the system ignores the seconds for the last minute before business hours end. For example, suppose it is 4:30 PM now, and business hours end at 5:00 PM. If you have a milestone with a 30-minute target, it's more common to say that the target is 5:00 PM, not 4:59 PM. To accommodate this, the system stops counting seconds after 5:00. If seconds were counted from 5:00:00-5:00:59, the 30-minute target would occur after the 5:00:00 PM target cut-off and would roll over to the next day.
- Escalation rules only run during the business hours they're associated with.
- You can update cases associated with business hours that are no longer active. without having to reactivate business hours.
- You can't include the `Business Hours` field in list views or reports.
- You can create multiple business hours for support teams that operate in the same time zone but at different hours.
- For simplicity, we recommend that you create one set of business hours per support center.
- You can't deactivate business hours that are included in escalation rules. You must first remove them from the escalation rules.
- You can associate up to 1000 holidays with each set of business hours.
- On cases that include entitlements, business hours are applied according to a hierarchy. For details, see [How Business Hours Work in Entitlement Management](#).

[Set Up Support Holidays](#)

Set Up Support Holidays

Holidays let you specify the dates and times your customer support team is unavailable. After you create a holiday, you can associate it with business hours to suspend business hours and escalation rules during holiday dates and times.

For example, you could create a holiday called New Year’s Day that begins at 8 p.m. on December 31 and ends at 9 a.m. on January 2. Escalation rules and entitlement milestones wouldn’t apply during the holiday.

1. From Setup, enter *Holidays* in the **Quick Find** box, then select **Holidays**.

2. Click **New**, or click **Clone** next to the name of an elapsed holiday.

You can only clone elapsed holidays.

3. Type a name for the holiday.

4. Type a date for the holiday.

If you want the holiday to span more than one day:

- a. Select the **Recurring Holiday** checkbox.
- b. Enter the first day of the holiday in the **Start Date** field.
- c. Deselect the **No End Date** checkbox in the **End Date** field.
- d. Enter the last day of the holiday in the **End Date** field.

5. Optionally, you can:

- Specify the exact times at which the holiday takes place by deselecting the **All Day** checkbox next to the **Time** field and entering the exact times.
- Select the **Recurring Holiday** checkbox to schedule the holiday to recur during specific dates and times:
 - In the **Frequency** field, select the frequency at which the holiday recurs. When you click the **Daily**, **Weekly**, or **Monthly** fields, more options display that allow you to refine frequency criteria.
 - In the **Start Date** and **End Date** fields, specify the dates during which you wish the holiday to recur.

The following error message displays if you select a start date and end date that does not correspond with the frequency you selected: *The recurring holiday has no occurrence.*

6. Click **Save**.

7. Click **Add/Remove** on the Business Hours related list.

8. Use the **Add** and **Remove** to choose the business hours you want to associate with the holiday. You can associate the holiday with multiple business hours.

[Set Up Customer Support](#)

Guidelines for Creating Support Holidays

Holidays let you specify the dates and times your customer support team is unavailable. There are a few guidelines to keep in mind as you set up and work with holidays.

- You can associate up to 1000 holidays with each set of business hours.
- Holidays automatically acquire the time zone of the business hours with which they are associated. For example if you associate a holiday to business hours that are in Pacific Standard Time, the holiday will take effect for those business hours in Pacific Standard Time
- You can only add business hours marked as `Active` to holidays.
- Holiday names don't need to be unique. For example, you could create multiple holidays named *New Year's Day*.
- Currently, report results do *not* take holidays into account.
- If you schedule a holiday to recur on a specific day of every month, the holiday will only recur on months that have that specific day. For example, if you schedule a holiday on the 31st day of every month, then the holiday will only recur on months that have 31 days. If you want a holiday to recur on the last day of every month, choose last from the `On day of every month` drop-down list.
- All users, even those without the “View Setup and Configuration” user permission, can view holidays via the API.

Set Up Assignment Rules

Define conditions that determine how leads or cases are processed.

1. From Setup, enter *Assignment Rules* in the **Quick Find** box, then select either **Lead Assignment Rules** or **Case Assignment Rules**.
2. Choose **New**, and then give the rule a name. Specify whether you want this to be the active rule for leads or cases created manually and via the web and email. Then click **Save**.
3. To create the rule entries, click **New**. For each entry, you can specify:

Field	Description
Order	<p>Sets the order in which the entry will be processed in the rule, for example, 1, 2, 3.</p> <p>Salesforce evaluates each entry in order and tries to match the criteria of the entry. As soon as a match is found, Salesforce processes the item and stops evaluating the rule entries for that item. If no match is found, the item is reassigned to either the default Web-to-Lead owner, the administrator doing a lead import, or the default case owner.</p>
Criteria	<p>Specifies conditions that the lead or case must match for it to be assigned. Enter your rule criteria.</p> <ul style="list-style-type: none"> • Choose <code>criteria are met</code> and select the filter criteria that a record must meet to trigger the rule. For example, set a case filter to <code>Priority equals High</code> if you want case records with the <code>Priority</code> field marked High to trigger the rule. <p>If your organization uses multiple languages, enter filter values in your organization's default language. You can add up to 25 filter criteria, of up to 255 characters each.</p> <p>When you use picklists to specify filter criteria, the selected values are stored in the organization's default language. If you edit or clone existing filter criteria, first set the <code>Default Language</code> on the <code>Company Information</code> page to the same language that was used to set the original filter criteria. Otherwise, the filter criteria may not be evaluated as expected.</p> <ul style="list-style-type: none"> • Choose <code>formula evaluates to true</code> and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True." For example, the formula <code>AND (ISCHANGED (Priority), ISPICKVAL (Priority, "High"))</code> triggers a rule that changes the owner of a case when the <code>Priority</code> field is changed to High. <p>If your condition uses a custom field, the rule entry will be deleted automatically if the custom field is deleted.</p>

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Lead Assignment Rules available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Case Assignment Rules available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create assignment rules:

- "Customize Application"

Field	Description
User	<p>Specifies the user or queue to which the lead or case will be assigned if it matches the condition. Users specified here cannot be marked “inactive” and they must have “Read” permission on leads or cases.</p> <p> Note: You can't revoke the “Read” permission on leads or cases for users assigned to a rule.</p> <p>If your organization uses divisions, leads are assigned to the default division of the user or queue specified in this field. Cases inherit the division of the contact to which they are related, or are assigned to the default global division if no contact is specified.</p>
Do Not Reassign Owner	<p>Specifies that the current owner on a lead or case will not be reassigned to the lead or case when it is updated.</p>
Email Template	<p>Specifies the template to use for the email that is automatically sent to the new owner. If no template is specified, no email will be sent. When assigning a lead or case to a queue, the notification goes to the <code>Queue Email</code> address specified for the queue and all queue members.</p>
Predefined Case Teams	<p>Specifies the predefined case team(s) to add to a case when it matches the condition. Case teams help groups of people work together to solve a case, such as a support agent, support manager, and a product manager.</p> <p>Click the Lookup icon () to select a predefined case team to add to the assignment rule. To add more predefined case teams, click Add Row to add a new row with which you can add a predefined case team.</p>
Replace any existing predefined case teams on the case	<p>Specifies that any existing predefined case teams on the case are replaced with the predefined case teams on the condition, when a case matches the condition.</p>

After creating the entry, click **Save**, or **Save & New** to save the entry and create more entries.

 **Tip:** Create an error-proof rule by always creating the last rule entry with no criteria. This rule entry catches any leads or cases that the previous rule entries didn't assign.

Managing Assignment Rules

Create assignment rules to automate your organization's lead generation and support processes.

- **Lead Assignment Rules**—Specify how leads are assigned to users or queues as they are created manually, captured from the web, or imported via the Data Import Wizard.
- **Case Assignment Rules**—Determine how cases are assigned to users or put into queues as they are created manually, using Web-to-Case, Email-to-Case, On-Demand Email-to-Case, the Self-Service portal, the Customer Portal, Outlook, or Lotus Notes.

Typically, your organization will have one rule for each overall purpose—for example, one lead assignment rule for importing and a different lead assignment rule for web-generated leads; or one case assignment rule for standard use and one case assignment rule for holiday use. For each rule type, only one rule can be in effect at any time.

Each rule consists of multiple rule entries that specify exactly how the leads or cases are assigned. For example, your standard case assignment rule may have two entries: cases with "Type equals Gold" are assigned to "Gold Service" queue, and cases with "Type equals Silver" are assigned to "Silver Service" queue.

To create an assignment rule, from Setup, enter *Assignment Rules* in the Quick Find box, then select **Lead Assignment Rules** or **Case Assignment Rules**.

Sample Assignment Rule

The following case assignment rule assigns a case to a specific queue based on the account rating:

Rule Name — *Hot Account Assignment*

Rule Entries:

Order	Criteria	Assign To
1	<code>ISPICKVAL(Account.Rating, "Hot")</code>	<i>Tier 1 Support Queue</i>
2	<code>OR(ISPICKVAL(Account.Rating, "Warm") , ISPICKVAL(Account.Rating, "Cold"))</code>	<i>Tier 2 Support Queue</i>

- "Customize Application"

Set Up Auto-Response Rules

Send automatic email responses to lead or case submissions based on the record's attributes. Set up auto-response rules to send quick replies to customers to let them know someone at your company received their inquiry or details about their issue.

Create auto-response rules for leads captured through a Web-to-Lead form and for cases submitted through a:

- Self-Service portal
- Customer Portal
- Web-to-Case form
- Email-to-Case message
- On-Demand Email-to-Case message

Create as many response rules as you like based on any attribute of the incoming lead or case. Keep in mind that you can activate only one rule for leads and one for cases at a time. Sales and service reps can find the email responses in the Activity History related list of the lead or contact and in the Email related list on cases.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create auto-response rules:

- "Customize Application"

Creating Auto-Response Rules

To create a Web-to-Lead response rule, from Setup, enter *Auto-Response Rules* in the **Quick Find** box, then select **Lead Auto-Response Rules**. To create a response rule for cases, from Setup, enter *Auto-Response Rules* in the **Quick Find** box, then select **Case Auto-Response Rules**. On the Auto-Response Rules page:

1. Click **New**.
2. Enter the rule name.
3. Check the active box to make this rule the only one activated.
4. Click **Save**.
5. Create rule entries.

Creating Response Rule Entries

1. Click **New** from the rule detail page.
2. Enter a number to specify the order this entry should be processed.

The rule processes entries in this order and stops processing at the first matching entry and then sends the email using the specified email template. If no response rules apply, the rule uses the default template you specify on the Web-to-Case or Web-to-Lead Settings page.

Note: To create an error-proof rule, always create the last rule entry with no criteria. This rule entry will catch any leads or cases that the previous rule entries did not. This is especially important for Email-to-Case and On-Demand Email-to-Case which don't have default templates.

3. Enter your rule criteria:
 - Choose *criteria are met* and select the filter criteria that a record must meet to trigger the rule. For example, set a case filter to *Priority equals High* if you want case records with the *Priority* field marked High to trigger the rule.

If your organization uses multiple languages, enter filter values in your organization's default language. You can add up to 25 filter criteria, of up to 255 characters each.

When you use picklists to specify filter criteria, the selected values are stored in the organization's default language. If you edit or clone existing filter criteria, first set the `Default Language` on the Company Information page to the same language that was used to set the original filter criteria. Otherwise, the filter criteria may not be evaluated as expected.

- Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True." For example, the formula `AND (ISPICKVAL (Priority, "High"), Version < 4.0)` triggers a rule that automatically responds with the selected template if the `Priority` field on a case is set to High and the value of a custom field named `Version` on the case is less than four.
4. Enter the name to include on the From line of the auto-response message.
 5. Enter the email address to include on the From line of the auto-response message. This must be either one of your verified organization-wide email addresses or the email address in your Salesforce user profile, and must be different from the routing addresses you use for Email-to-Case.
 6. If you want, enter a reply-to address.
 7. Select an email template.
 8. If you're creating a response rule entry for Email-to-Case, select `Send response to all recipients` to send auto-response messages to anyone included in the `To` and `Cc` fields in the original message.
 9. Save your work.

[Set Up Auto-Response Rules](#)

Set Up Escalation Rules

Escalation rules automatically escalate cases when the case meets the criteria defined in the rule entry. You can create rule entries, which define criteria for escalating a case, and escalation actions, which define what happens when a case escalates.

Before you get started:

- If you want to assign cases to queues, create [queues](#).
- If you want to send notification emails when a case escalates, create [email templates](#).

When Salesforce applies an escalation rule to a case, it inspects the case and compares the case to the criteria in the rule entry. If the case matches the criteria defined in the rule entry, Salesforce runs the escalation actions.

Orgs typically use one escalation rule that consists of multiple rule entries. For example, your standard case escalation rule could have two entries: cases with `Type` set to Gold are escalated within two hours, and cases with `Type` set to Silver are escalated within eight hours.

1. From Setup, enter *Escalation Rules* in the **Quick Find** box, then select **Escalation Rules**.
2. Create the escalation rule.
 - a. Click **New** and name the rule. Specify whether you want this rule to be the active escalation rule. You can have only one active escalation rule at a time.
 - b. Click **Save**.
3. On the Case Escalation Rules page, select the rule that you want to work with. The rule detail page is displayed.
4. Create the rule entries. Rule entries define the criteria used to escalate the case.
 - a. In the Rule Entries section, click **New**. For each rule entry, you can specify:
 - Order in which rule entries are evaluated
 - Criteria for escalating a case
 - How business hours affect when cases escalate
 - How escalation times are determined
 - b. Click **Save**. The Escalation Actions page is displayed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or edit escalation rules:

- "Customize Application"

5. Define the escalation actions. Escalation actions specify when the case escalates and what happens when the case escalates. You can add up to five actions for each rule entry to escalate the case over increasing periods of time.
 - a. In the Escalation Actions section, click **New**. For each escalation action, you can:
 - Specify when the case escalates: In the `Age Over` field, enter the number of hours after which a case escalates if it hasn't been closed. You can enter the number of hours and either 0 minutes or 30 minutes. For example, 1 hour and 0 minutes or 1 hour and 30 minutes.
 - Reassign the case to another user or queue, and select an email template that sends the new assignee (the new case owner) a notification email.
 - Send notification emails to other users, the current case owner, or other recipients.
 - b. Click **Save**.

Step 3: Specify the business hours criteria for this escalation rule

Ignore business hours
 Use business hours specified on case 3
 Set business hours

Step 4: Specify how escalation times are set 4

Based on when the case is created
 Based on when the case is created, and disable after the case is first modified
 Based on last modification time of the case

Save Save & New Cancel

Step 1: Rule Entry Order

The `Sort Order` determines the sequence in which Salesforce evaluates rule entries [1]. Typically, orgs use one escalation rule that's made up of several rule entries.

Tip: As a best practice, put the most complex rule entries at the beginning of the sort order. Put more generic rule entries at the end of the sort order.

Suppose that you have five rule entries. Salesforce looks at the first rule entry to see if its criteria matches the case. If the criteria matches, then Salesforce stops evaluating and escalates the case. If the criteria doesn't match, then Salesforce looks at the second rule entry to see if it matches, and so on, until it finds a match.

If the first rule entry is generic, then Salesforce finds a match and escalates the case without continuing to evaluate later rule entries.

It's a good practice to put a generic "catch-all" rule entry at the end of the rule entry order. The catch-all rule entry is designed to escalate cases that don't meet the criteria specified in the other rule entries. For example, perhaps you want to escalate cases that have been open for more than 48 hours. Create a rule entry that contains no criteria so that it catches all remaining cases, and specify that cases escalate 48 hours after they were created.

Step 2: Rule Entry Criteria

The rule entry criteria define the case field values that trigger an escalation. When Salesforce evaluates the rule entry, it looks at the criteria and sees if the criteria match the field values set on the case. If the criteria match, the case is escalated.

Run this rule if the criteria are met

You can define escalation criteria using field values by selecting **criteria are met** [2.1].

Select the field, select the operator, and select the value [2.2]. For example, suppose that we want to escalate cases that are high priority and from our two biggest customers, Acme and Global Media. We can create a

rule entry that escalates cases where the Priority field equals *High* and the Account: Account Name field equals *Acme* or *Global Media*.

You can specify more field values by filling out the rows.

 **Tip:** By default, the filter concatenates the rows using AND. However, if you want to use a different filter operator, click **Add Filter Logic** [2.3]. You can refine the filter using parentheses, AND, and OR. For example, (1 AND 2) or (3 AND 4).

Run this rule if the criteria are met

You can define escalation criteria using a formula by selecting **formula evaluates to true**.

Enter a formula that returns a value of True or False. Salesforce triggers the rule if the formula returns "True."

Step 3: Business Hours Criteria

Business hours let you specify when your support team is available [3]. If business hours are specified on the escalation rule, then escalation actions occur only during business hours.

Let's look at some examples. Let's say that your support team is based in San Francisco and works from 9 AM-5 PM Monday-Friday, Pacific time.

Ignore business hours

If you don't want to use business hours when calculating when cases are escalated, select **Ignore business hours**. In this situation, a case is escalated without consideration of the support team's business hours or the case's business hours. For example, a case might escalate at 3 AM Pacific time, even though the support team isn't available.

Use business hours specified on the case

A case might have different business hours than your support team. If business hours are specified on the case, then the case escalates during the case's business hours.

Suppose that your support team is located in San Francisco and works 9-5 Pacific time, but your customer is located in New York and operates on Eastern time. You could specify Eastern business hours on the case, so that your support team knows to contact the customer during Eastern business hours. If **Use business hours specified on the case** is selected, then the case escalates during East Coast business hours. So, a case could escalate at 6 AM Pacific, because that's within Eastern business hours (9 AM -5 PM Eastern, which is 6 AM-2 PM Pacific).

Set business hours

Use the lookup to select the business hours that are defined for your company. If you select this option, then cases are escalated during these hours. Perhaps you've defined business hours as 9 AM-5 PM Pacific time. If you select the 9-5 Pacific time business hours, then cases would only be escalated during that time period.

Step 4: How Escalation Times Are Set

Specify when the escalation clock starts ticking by specifying how escalation times are set [4]. Your selection here affects when the time period specified in the **Age Over** field begins to run. You can set the **Age Over** field on the Escalation Actions page.

When case is created

The escalation clock starts ticking when the case is created, and the case escalates when the time period set in the **Age Over** field expires.

If **Age Over** is set to 5 hours, then the case escalates five hours after the case is created. If the case is created at 9 AM on Monday morning, it would escalate at 2 PM on Monday afternoon.

When case is created, and disable after case is first modified

The escalation clock starts ticking when the case is created but stops when the case is modified, provided that the case is modified before the Age Over time period expires.

If `Age Over` is set to 5 hours, then the case escalates five hours after the case is created unless the case is modified before five hours elapse. If the case is created at 9 AM on Monday morning and isn't modified within the five-hour period, then the case would escalate at 2 PM on Monday afternoon. However, if the case is created at 9 AM on Monday and a support agent modifies the case at 10 AM, then the case wouldn't escalate.

Based on last modification time

The escalation clock starts ticking when the case is modified.

If `Age Over` is set to 5 hours, then the case escalates five hours after the case is last modified. Suppose that the case is created at 9 AM on Monday morning and an agent modifies the case at 10 AM. The case would escalate at 3 PM on Monday afternoon, which is five hours after the 10 AM modification.

[Set Up Escalation Rules](#)

[Escalation Actions](#)

Escalation Actions

Escalation actions specify when the case escalates and what happens when the case escalates. An escalation rule can reassign the case to another support agent (user) or support queue (queue). An escalation rule also can send notification emails to the new assignee, to the current case owner, and to other recipients.

Let's break down the parts of an escalation action and go over best practices for each step:

Age Over

Salesforce escalates the case if the case hasn't been closed within this time period [1]. For example, escalate the case if it hasn't been closed within five hours.

This time is calculated from the date field set in the `Specify how escalation times are set` field in the rule entry. No two escalation actions can have the same number in this field.

The `Age Over` field is required, because escalation rules are time-based.

Auto-Reassign Cases

When a case escalates, Salesforce can reassign the case to a different user or queue [2].

- `Queue` or `User`—Select a user or queue to reassign the case to. When a case is reassigned, the queue or user becomes the new case owner. Companies typically reassign cases to a queue instead of a specific user. For example, if Level 1 support doesn't resolve a case within 24 hours, the case is reassigned to the Level 2 support queue.
- `Notification Template`—Select a notification template to use to send a notification email to the assignee.

If you select a `Notification Template`, then Salesforce sends a notification email to the new case owner. The template controls which fields are included in the notification email. For example, the email template might include the case number, case contact, account name, and case reason so that the new case owner can quickly understand the situation.

Notify Users

When a case escalates, Salesforce can send a notification email so that a user, the current case owner, or other email recipients know that the case is escalating [3].

- `Notify This User`—Select a user to notify. For example, you might want to notify the support manager.

- **Notify Case Owner**—Send an email to the current case owner to remind them that the case is escalating. Select this checkbox when you want to notify the case owner but haven't reassigned the case.
- **Additional Emails**—You can send notification emails to other people when a case is escalated. Enter up to five email addresses, each on a separate line. For example, you can set up an escalation rule to notify support managers or executives so that they know that a case is escalating.
- **Notification Template**—If you select **Notify This User**, **Notify Case Owner**, or **Additional Emails**, then you must select a notification template to send a notification email to the user, case owner, or additional recipients. The template controls which fields are included in the notification email.

Monitoring Support Processes

Monitor Automated Article Process Actions

Salesforce Knowledge users can schedule articles to be published or archived on a specific date. Use the automated-process actions queue to view these pending actions and cancel them if necessary.

1. From Setup, enter *Automated Process Actions* in the **Quick Find** box, then select **Automated Process Actions**.
2. Click **Search** to view all pending actions for any article, or set the filter criteria and click **Search** to view only the pending actions that match the criteria.

The filter options are:

Process Definition

The process that is triggering the action. This value is always "KBWorkflow."

Object

The object that triggered the pending action. This value is always "Knowledge Article."

Scheduled Date

The date the pending actions are scheduled to occur.

Create Date

The date the article that triggered the pending action was created.

Created By

The user who created the article that triggered the pending action.

Record Name

The name of the article that triggered the pending action.

The filter is not case-sensitive.

To cancel pending actions, select the box next to the pending actions you want to cancel and click **Delete**.

Monitor the Case Escalation Rule Queue

When Salesforce triggers a case escalation rule that has time-dependent actions, use the escalation rule queue to view pending actions and cancel them if necessary.

To view pending actions:

1. From Setup, enter *Case Escalations* in the **Quick Find** box, then select **Case Escalations**.
2. Click **Search** to view all pending actions for any active case escalation rule, or set the filter criteria and click **Search** to view only the pending actions that match the criteria. The filter options are:

Case To Escalate

The **Case Number** of the escalated case. The **Case Number** is a unique, automatically generated number used for identifying the case.

Escalation Rule

The name of the rule used to escalate the case.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Rule Entry

The order in which the rule entry will be processed. A rule entry is a condition that determines how a case escalation rule is processed. Each escalation rule can have a maximum of 3000 rule entries.

Escalation Action

The time criteria specified for the case to escalate as defined in the rule entry.

Ignore Business Hours

Indicates if the `Ignore Business Hours` checkbox is selected on the rule entry, meaning that the rule entry is in effect at all times and ignores your organization's business hours.

Escalate At

The date and time at which the case will escalate as defined in the rule entry. Dates and times display in the time zone of the user viewing the escalation rule queue.

Added Date

The date and time at which the case was added to the queue. Dates and times display in the time zone of the user viewing the escalation rule queue.

The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click **Delete**. Salesforce cancels the pending action.

[Escalation Rule Examples and Best Practices](#)

Monitor the Entitlement Process Queue

When Salesforce triggers an entitlement process that has time-dependent milestone actions, use the entitlement process queue to view pending actions and cancel them, if necessary.

To view pending actions:

1. From Setup, enter *Entitlement Processes* in the `Quick Find` box, then select **Entitlement Processes**.
2. Click **Search** to view all pending actions for any active workflow rules, or set the filter criteria and click **Search** to view only the pending actions that match the criteria. The filter options are:

Entitlement Process Name

The entitlement process.

Case Number

The case's automatically generated identifying number.

Milestone Name

The milestone that triggered the action.

Evaluation Date

The date the evaluated actions are scheduled to occur.

Created Date

The creation date of the case that triggered the entitlement process.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Entitlement process monitoring is not available in Professional Edition orgs.

USER PERMISSIONS

To manage the entitlement process queue:

- "Modify All Data"

Username

The user who updated the case to trigger an entitlement process.

The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click **Delete**.

Adding Entitlements and Service Agreements

What Is Entitlement Management?

Entitlement management helps you provide the correct support to your customers. It includes a variety of features that let you define, enforce, and track service levels as part of your support management process.

Entitlement management features include:

- *Entitlements*, which let support agents determine whether a customer is eligible for support.
- *Entitlement processes*, which let you design timelines that include all the steps that your support team must complete to resolve support records like cases or work orders.
- *Service contracts*, which let you represent different kinds of customer support agreements like warranties, subscriptions, or maintenance agreements. You can restrict service contracts to cover specific products.
- *Community access to entitlements*, which lets community users view entitlements and service contracts and create support records from them.
- *Reporting on entitlement management*, which lets you track the way entitlements are used in your Salesforce org and whether service contract terms are being met.

Because entitlement management is highly customizable, you have full control of which features you use and how you set them up to reflect your customer support model. We'll walk you through important planning decisions and setup steps to help you make the most of entitlement management. To get started, we recommend that you check out the Entitlement Management Trailhead module: [Entitlement Management](#).

 **Important:** Only users in orgs with the Service Cloud can enable, create, and update entitlement management items.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Planning for Entitlement Management

Entitlement management is highly customizable, which means you have many choices during setup. Before you begin the setup process, it's essential to choose an entitlement management model.

Choose What Determines Support Eligibility

You can set up entitlement management so customers are eligible for support based on one or several of the following types of records:

- *Accounts*: Any contact on the account is eligible for support.
- *Contacts*: Specific contacts are eligible for support.
- *Assets*: Specific assets (purchased products) are eligible for support.
- *Service contracts*: Customers are eligible for support based on a specific service contract.
- *Contract line items*: Specific products covered by a service contract are eligible for support.

Your approach depends on how detailed you want your support process to be. If you prefer to keep it simple, just have your support agents determine support eligibility based on accounts. Here's what this approach looks like:

Choose a Setup Model

There are three general ways to set up entitlement management. Once you've decided what should determine support eligibility, review the three models and select the one that best meets your business needs. You can always change which model you're using.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Entitlement model	What determines support eligibility	Use this model if
Entitlements only (simplest option)	Support agents determine whether a customer is eligible for support at the account, contact, or asset level.	<ul style="list-style-type: none"> • There's no need to manage your customers' entitlements as part of a service contract • Your entitlements don't have a renewal process • Entitlements aren't purchased by your customers; they're bundled with products (warranties) • Your customers' entitlements are short term and managed independently of each other
Entitlements + service contracts	Support agents determine whether a customer is eligible for support based on their service contract.	<ul style="list-style-type: none"> • Entitlements are purchased and managed separately from the products they cover and are part of a service contract • Your customers' entitlements are renewed at a contract level • You use Salesforce for customer support but not necessarily for service contract management
Entitlements + service contracts + contract line items (most complex option)	Support agents determine whether a customer is eligible for support based on the products covered in their service contract.	<ul style="list-style-type: none"> • You use Salesforce for customer support and to manage your customers' service contracts • Your support team manages service contract transactions, such as transfers, mergers, and renewals • Warranties, subscriptions, or other support products appear as line items on your sales orders and map to one or more entitlements • Entitlements are created and updated through an integration with your order management system

Regardless of the setup model you choose, you can enhance your support process with other entitlement management features. For example, you can:

- Create entitlement processes to enforce required, time-dependent steps in your support process
- Use entitlement versioning to create and maintain multiple versions of entitlement processes
- Add entitlements to communities
- Report on entitlements

After you select a setup model, head to the invaluable [Entitlement Management Setup Checklist](#).

<input type="checkbox"/> Report on Entitlements	You want to view and share data on entitlements and service contracts.
<input type="checkbox"/> Give your support team entitlement management guidelines.	You want your support team to understand: <ul style="list-style-type: none"> • How to verify that a customer is entitled to support • How to link cases or work orders to entitlements

Step	Complete if...
	<ul style="list-style-type: none"> How entitlement processes affect the way they resolve cases or work orders

SEE ALSO:

[Planning for Entitlement Management](#)

Entitlement Management Limitations

The following limitations apply to entitlements and their related features.

Entitlement Limitations

- Every entitlement must be associated with an account.
- You can't share entitlements. Entitlements inherit their parent account's sharing settings.
- If you're using entitlement processes, manage customers' work orders and cases on separate entitlements. This is because an entitlement process only runs on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process only runs on cases associated with the entitlement. If a work order is also associated with the entitlement, the process won't run on the work order.
- Merge fields for entitlements on cases aren't supported. For example, if you add the `Entitlement Name {!Case.Entitlement}` merge field to an email template, the field is not populated on the template.
- Entitlement contacts don't have page layouts, search layouts, buttons, links, or record types.
- Entitlements don't automatically apply to cases created with Web-to-Case or Email-to-Case. If needed, you can add entitlements to these features using Apex code. For a sample trigger, see [Automatically Add Entitlements to Cases from Web, Email, and Communities](#).

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Milestone Limitations

- You can't add milestones to support records without using entitlement processes. Entitlement processes apply milestones to support records.
- An org can have up to 1,000 entitlement processes, with up to 10 milestones per process. If your org was created before Summer '13, its maximum number of entitlement processes may be lower, but you can ask Salesforce to increase it.
- Milestones aren't marked completed automatically. If you'd like, you can set up automation to auto-complete milestones on support records that match unique criteria. To learn more, see [Auto-Complete Case Milestones](#).
- After an entitlement process is activated, you can't delete its milestones or create milestone actions. However, you can create versions of entitlement processes with different milestone settings and apply the new version to existing entitlements.
- Only one instance of a milestone can count down on a record at a time. For example, if a Response Time milestone begins counting down on a case, a second Response Time milestone can't be created until the first is completed.
- Business hours on entitlement processes aren't supported in change sets. To transfer an entitlement process with business hours from one Salesforce org to another, use one of these approaches:
 - Create the entitlement process from scratch in the new org
 - Use an alternative method to transfer the entitlement process, such as the Force.com Migration Tool
 - Remove the business hours from the entitlement process before adding it to a change set

Contract Line Item Limitations

- You can only use contract line items if your org uses the Product object.
- You can't create list views for contract line items.
- You can't share contract line items. Contract line items inherit their parent service contract's sharing settings. For example, users with the "Read" permission on service contracts inherit the "Read" permission on contract line items.

Set Up Entitlements

Entitlements are units of customer support in Salesforce, such as "phone support" or "web support". Set up entitlements in your Salesforce org to help support agents determine whether a customer is eligible for support.

1. [Enable Entitlements](#)
Enable entitlements in your Salesforce org to help support agents deliver the correct service level to your customers.
2. [Customize Entitlements](#)
Customize entitlement fields and page layouts based on your business needs and how your agents work.
3. [Set Up Entitlement and Asset Lookup Filters on Cases](#)
Set up lookup filters on entitlement-related case fields to restrict the entitlements that users can select on a case.
4. [Give Users Access to Entitlement Management](#)
After you set up entitlement management, make sure that users have the appropriate user permissions, field access, and tab access.
5. [Set Up an Entitlement Template](#)
Entitlement templates let you predefine terms of support that users can add to products.
6. [Automatically Add Entitlements to Cases from Web, Email, and Communities](#)
Entitlements don't automatically apply to cases created using Web-to-Case, Email-to-Case, or communities. However, you can add entitlements to these features using Apex code.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Enable Entitlements

Enable entitlements in your Salesforce org to help support agents deliver the correct service level to your customers.

1. From Setup, enter *Entitlement Settings* in the Quick Find box, then select **Entitlement Settings**.
2. Select **Enable Entitlement Management**.
3. Click **Save**. This takes you to a page where you can customize entitlement management settings. You'll come back to those settings later on in the entitlement management setup process.

Customize Entitlements

Customize entitlement fields and page layouts based on your business needs and how your agents work.

1. Customize entitlements fields.

This lets you control what information users add to entitlements.

Tip: Create custom entitlement fields that are specific to your industry or your support processes. For example:

- Customize the values for the **Type** field to match the types of entitlements your team provides or sells, like online support or online training.
- If your business charges for entitlement renewals, create a currency field on entitlements named **Cost to Renew**.

2. Customize entitlement page layouts.

This lets you specify which fields and related lists users see on entitlements. Consider making the following customizations:

- Add the **Status Icon** field so users can easily see whether the entitlement is active, expired, or inactive.
- Add the Cases, Contacts, and Work Orders related lists so users can:
 - View cases, contacts, and work orders associated with entitlements
 - Create cases or work orders automatically associated with the correct entitlements
 - Add contacts to entitlements

3. Set field history tracking on entitlements.

This lets you see when field values were changed. Changes are listed in the Entitlement History related list on entitlements. From the object management settings for entitlements, go to the fields section and click **Set History Tracking**.

4. Customize other objects' page layouts.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To enable entitlements:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To edit page layouts and set field history tracking:

- "Customize Application"

- Add the `Entitlement Name` lookup field to case and work order page layouts. This lets users add entitlements to cases or work orders.
-  **Important:** To let a user create cases from entitlements or change a case's assigned entitlement, make the `Entitlement Name` field on cases editable for their profile.
- Add the Entitlements related list to other objects' page layouts:

Add the Entitlements related list to this object's page layouts...	So users can view and create entitlements when...
Accounts	Any contact on the account is eligible for support
Contacts	Specific contacts are eligible for support
Assets	Specific assets (purchased products) are eligible for support

5. Make the Entitlements tab visible in Salesforce and any custom apps.

The Entitlements tab is where users create and edit entitlements. Add the tab to an app or instruct your users to add it to an existing tab set in Salesforce. Users need the "Read" permission on entitlements to see the Entitlements tab.

Set Up Entitlement and Asset Lookup Filters on Cases

Set up lookup filters on entitlement-related case fields to restrict the entitlements that users can select on a case.

For example, when community users create a case and use the lookup on the `Entitlement Name` field, you can set up lookup filters so they can choose only entitlements registered to their account or contact.

1. From Setup, enter *Entitlement Settings* in the Quick Find box, then select **Entitlement Settings**.
2. Choose the item(s) you'd like returned in the lookup fields.

Lookup Field on Cases	Click...	To Return...
Asset	Same account on the case	Assets registered to the account on the case.
		 Tip: If you want the lookup field to return all assets that share an account with the case, select only this option.
	Same contact on the case	Assets registered to the contact on the case.
	Entitlements on the case's account	Assets associated with entitlements that belong to the case's account.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To set up entitlement-related lookups on cases: "Manage Entitlements"

- "Manage Entitlements"

Lookup Field on Cases	Click...	To Return...
	Entitlements on the case's contact	Assets associated with entitlements related to the case's contact.
Entitlement	Active status	Entitlements with an Active Status.
	Same account on the case	Entitlements associated with the account on the case.
	Same asset on the case	Entitlements associated with the asset on the case.
	Same contact on the case	Entitlements associated with the contact on the case.

Choosing multiple items acts as an AND function, so the more items you select, the more it restricts the options returned. For example, choosing `Same account on the case` and `Same contact on the case` means the `Asset` lookup field only returns assets registered to both the account and the contact on the case.

 **Tip:** Choose items that match the way your support agents verify support eligibility. For example, choose the account-related items if your support agents verify support eligibility based on accounts.

3. Click **Save**.

 **Note:** Equivalent lookup filters aren't available for work orders.

Give Users Access to Entitlement Management

After you set up entitlement management, make sure that users have the appropriate user permissions, field access, and tab access.

1. Assign entitlement management permissions to users.

Users Who Will	Need These Permissions	Permissions Are Auto-Enabled on These Standard Profiles
Set up entitlement management, including milestones, entitlement processes, and entitlement templates	"Manage Entitlements" AND "Customize Application"	System Administrator
Provide entitlement management to a community	"Customize Application" AND "Create and Set Up Communities"	System Administrator

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create and edit users:

- "Manage Internal Users"

Users Who Will	Need These Permissions	Permissions Are Auto-Enabled on These Standard Profiles
Create or update custom report types that include entitlement management	"Manage Custom Report Types"	System Administrator
Create and run reports based on entitlement management custom report types	"Create and Customize Reports"	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create cases with entitlements	"Create" on cases AND "Read" on entitlements	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Change a case's entitlement	"Edit" on cases AND "Read" on entitlements	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create work orders with entitlements	"Create" on work orders AND "Read" on entitlements	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Change a work order's entitlement	"Edit" on work orders AND "Read" on entitlements	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Verify or view entitlements	"Read" on entitlements	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create entitlements	"Create" on entitlements	None: enable the permission in a permission set or custom profile
Change entitlements	"Edit" on entitlements	None: enable the permission in a permission set or custom profile
View entitlement contacts	"Read" on entitlement contacts	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Change entitlement contacts	"Create" on entitlement contacts AND "Delete" on entitlement contacts	None: enable the permissions in a permission set or custom profile
Verify or view service contracts	"Read" on service contracts	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator

Users Who Will	Need These Permissions	Permissions Are Auto-Enabled on These Standard Profiles
Create service contracts	"Create" on service contracts	None: enable the permission in a permission set or custom profile
Change service contracts	"Edit" on service contracts	None: enable the permission in a permission set or custom profile
Verify or view contract line items	"Read" on contract line items	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Add contract line items to service contracts	"Edit" on service contracts AND "Create" on contract line items and "Read" on products and price books	None: enable the permissions in a permission set or custom profile
Change contract line items on service contracts	"Edit" on service contracts AND "Edit" on contract line items and "Read" on products and price books	None: enable the permissions in a permission set or custom profile

Tip: If a standard profile doesn't include a certain user permission, you can create a permission set and enable the permission in it. Or, clone the standard profile and enable the permission in the custom profile.

2. Set field-level security.

Choose which entitlement management fields users can view and edit. Field-level security settings let you specify users' access to fields in several areas of the user interface:

- Detail and edit pages
- Related lists
- List views
- Reports
- Search results
- Email and mail merge templates
- Communities

You can set field-level security from a permission set, profile, or a particular field.

Important: To let a user create cases from entitlements or change a case's assigned entitlement, make the `EntitlementName` field on cases editable for their profile.

Set Up an Entitlement Template

Entitlement templates let you predefine terms of support that users can add to products.

You can create entitlement templates for specific products so support agents can quickly add the right entitlement whenever a customer purchases the product. For example, you can create entitlement templates for web or phone support so agents can easily add entitlements to products offered to customers.

Purchased or installed products are represented in Salesforce as assets. That means:

- A *product* (for example, “Laser Scanner”) is linked to an entitlement template
- A corresponding *asset* (for example, the laser scanner purchased by ABC Labs) is linked to an entitlement that was created from the entitlement template

 **Note:** Entitlement templates are only available if entitlements and products are enabled in your org.

 **Tip:** The Entitlement Management Trailhead module introduces you to common terms and walks you through the process of creating an entitlement template. And, it’s fun! To get started, see [Entitlement Management](#).

1. Add the Entitlement Templates related list to product page layouts.
2. Optionally, add the `Type` and `Business Hours` fields to the Entitlement Templates related list. This lets users view the type of entitlement, such as Web or phone support, and any business hours that apply to the entitlement.
3. Create an entitlement template.
 - a. From Setup, enter `Templates` in the Quick Find box, then select **Entitlement Templates**.
 - b. Click **New Template**.
 - c. Enter any details:

Field	Description
Entitlement Template Name	The name of the entitlement template. Use a descriptive name, like <code>Phone Support</code> . This helps users better understand entitlement templates when they see them on related lists for products.
Term (Days)	The number of days the entitlement is in effect. For example, if you want the entitlement template to entitle all customers who purchase this product to 90 days of phone support, enter <code>90</code> .
Entitlement Process	The entitlement process associated with the entitlement.
Per Incident	Lets you limit the number of cases the entitlement supports. The admin determines whether this field is visible.
Cases Per Entitlement	The total number of cases the entitlement supports. This field is only available if <code>Per Incident</code> is selected.
Business Hours	The entitlement’s supported business hours.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To create entitlement templates:

- “Manage Entitlements”

Field	Description
Type	The type of entitlement, such as Web or phone support. Admins can customize this field's values.

4. Click **Save**.
5. Add the entitlement template to a product.
 - a. Go to the product detail page.
 - b. Click **Add Entitlement Template** on the Entitlement Templates related list.
 - c. Select the entitlement template.
 - d. Click **Insert Selected**.
 - e. Click **Done**.

Now when a user creates an asset and links it to that product, the Entitlements related list on the asset includes an entitlement created from the entitlement template. That way, support agents responding to a call about the asset can quickly see what kind of support the customer is entitled to receive.

 **Note:** All users, even those without the “View Setup and Configuration” user permission, can view entitlement templates via the API.

Automatically Add Entitlements to Cases from Web, Email, and Communities

Entitlements don't automatically apply to cases created using Web-to-Case, Email-to-Case, or communities. However, you can add entitlements to these features using Apex code.

When a case is created via Web-to-Case, Email-to-Case, or a community, it isn't automatically associated with an entitlement. When a case's `Entitlement` field is empty, this sample trigger checks whether the case contact has an active entitlement. If the contact has an active entitlement, the entitlement is added to the case. If the contact doesn't have an active entitlement, the trigger then checks whether the case account has an active entitlement. If the case account has an active entitlement, the entitlement is added to the case. The trigger helps ensure that cases are resolved according to your customer support agreements.

To define this case trigger in your Salesforce org:

1. From Setup, enter *Case Triggers* in the Quick Find box, then select **Case Triggers**.
2. Click **New**.
3. Copy the text below and paste it in the text field.
4. Click **Save**.

```
trigger DefaultEntitlement on Case (Before Insert, Before Update) {
    List <EntitlementContact> entlContacts =
        [Select e.EntitlementId,e.ContactId,e.Entitlement.AssetId
        From EntitlementContact e
        Where e.ContactId in :contactIds
        And e.Entitlement.EndDate >= Today
        And e.Entitlement.StartDate <= Today];
```

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To define Apex triggers:

- “Author Apex”

```

if(entlContacts.isEmpty()==false){
    for(Case c : Trigger.new){
        if(c.EntitlementId == null && c.ContactId != null){
            for(EntitlementContact ec:entlContacts){
                if(ec.ContactId==c.ContactId){
                    c.EntitlementId = ec.EntitlementId;
                    if(c.AssetId==null && ec.Entitlement.AssetId!=null)
                        c.AssetId=ec.Entitlement.AssetId;
                    break;
                }
            }
        }
    }
} else{
    List <Entitlement> entls = [Select e.StartDate, e.Id, e.EndDate,
        e.AccountId, e.AssetId
        From Entitlement e
        Where e.AccountId in :acctIds And e.EndDate >= Today
        And e.StartDate <= Today];
    if(entls.isEmpty()==false){
        for(Case c : Trigger.new){
            if(c.EntitlementId == null && c.AccountId != null){
                for(Entitlement e:entls){
                    if(e.AccountId==c.AccountId){
                        c.EntitlementId = e.Id;
                        if(c.AssetId==null && e.AssetId!=null)
                            c.AssetId=e.AssetId;
                        break;
                    }
                }
            }
        }
    }
}
}
}
}

```

[Set Up an Entitlement Process](#)

Milestones

Milestones represent required, time-dependent steps in your support process, like first response or case resolution times. Milestones are added to entitlement processes to ensure that agents resolve support records correctly and on time.

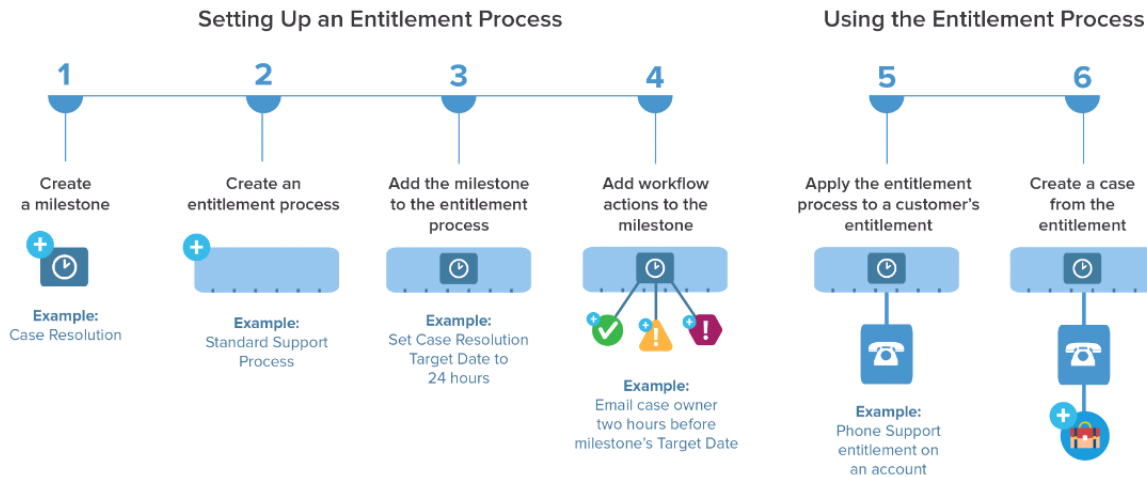

An entitlement process can have up to 10 milestones. You can set up a milestone to occur once in an entitlement process, or to recur until the entitlement process exits.

Here's how milestones fit into your support process:

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

View existing milestones in your org on the Milestones page under Entitlement Management in Setup. The Milestones related list on entitlements and entitlement processes also lists associated milestones.

Tip: There are several ways that you can view a list of records with milestones in your org:

- To view work orders with milestones, create a work order report using the Object Milestones custom report type
- To view cases with milestones, create a case report using the Cases with Milestones custom report type
- Create list views that filter on milestone fields

Before using milestones in your support process, review [Milestone Limitations](#) on page 2753.

Tip: The Entitlement Management Trailhead module introduces you to common terms and walks you through the process of creating milestones. And, it's fun! To get started, see [Entitlement Management](#).

SEE ALSO:

- [Set Up Milestones](#)
- [Milestone Statuses](#)
- [Milestone Recurrence Types](#)
- [Milestone Actions](#)

Milestone Statuses

Milestones on support records display one of three statuses.

Status	What It Means	Example
Compliant	Milestones on the record are either complete or not in violation. Important: New records display as compliant because they're not in violation.	The first response on a case is complete or not in violation.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Status	What It Means	Example
 Open Violation	One or more milestones on the record have been violated, and steps in the support process are incomplete.	The assigned agent didn't complete the first response on a case before the milestone expired.
 Closed Violation	One or more milestones on the record were violated, but the steps in the support process were still completed.	The assigned agent completed the first response on a case after the milestone expired.

SEE ALSO:

[Entitlement Processes](#)[Add a Milestone to an Entitlement Process](#)[Milestone Actions](#)

Milestone Actions

Milestone actions are time-dependent workflow actions that occur on milestones in an entitlement process. Actions can be added to milestones after the milestone is added to an entitlement process.

For example, you can create a milestone action that:

- Sends an email alert to certain users an hour before a First Response milestone is near violation
- Updates certain fields on a case one minute after a First Response milestone successfully completes

You can add three types of actions to milestones:

Action Type	Description
 Success Actions	The actions to take when a milestone successfully completes. Success actions still fire on milestones that are closed late.
 Warning Actions	The actions to take when a milestone is near violation.
 Violation Actions	The actions to take when a milestone is violated.

You can automate the following actions for each action type:

Workflow Action	What It Does	Example
New Task	Create a workflow task	Create a task for a support agent to call a customer when a First Response milestone is violated.
New Email	Create an email alert	Notify case owners when a First Response milestone on their case is near violation.
New Field Update	Define a field update	Update the case Priority field to High when a First Response milestone is near violation.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Workflow Action	What It Does	Example
New Outbound Message	Define an outbound message	Send data about parts or services to an external system after a First Response milestone is completed.
Select Existing Action	Select an existing action	Use an existing email alert to notify a case owner when their case is near violation of a first response.

SEE ALSO:

[Add a Milestone Action to an Entitlement Process](#)

[Entitlement Processes](#)

[How a Record Moves Through an Entitlement Process](#)

Milestone Recurrence Types

When you create a milestone, you must choose its recurrence type. Learn what each recurrence type means and when to use it.

There are three milestone recurrence types in Salesforce:

Recurrence Type	What It Means	How the Start Date is Determined	Examples
No Recurrence	The milestone only occurs once on the support record*.	The Start Date is the time when the milestone criteria are met on the record.	"First Response" "Resolution Time"
Independent	The milestone occurs whenever the milestone criteria match the record criteria.  Note: Only one occurrence of an independently recurring milestone can be active at a time.	The Start Date is the time when the milestone criteria are met on the record, regardless of when the previous occurrence was completed.	"Response Time"
Sequential	The milestone occurs on repeat whenever the milestone criteria	For the first occurrence, the Start Date is the time when the milestone criteria are met on the case.	"Customer Contact Made"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Recurrence Type	What It Means	How the Start Date is Determined	Examples
	<p>match the record criteria.</p> <p> Note: Only one occurrence of a sequentially recurring milestone can be active at a time.</p>	<p>For future occurrences:</p> <ul style="list-style-type: none"> The Start Date is the time when the milestone criteria are met on the record, as long as it's later than the previous occurrence's Target Date. If an occurrence is completed <i>before</i> its Target Date and the milestone criteria are met on the record again, the next occurrence starts at the previous occurrence's Target Date. If an occurrence is completed <i>after</i> its Target Date, the next occurrence's Start Date is the time when the milestone criteria are met on the record. 	

*In these definitions, a support record includes cases and work orders.

 **Example:**

No Recurrence Type

A milestone named "Resolution Time" is set up to ensure that cases are resolved within 4 hours. The milestone has one criterion: *Case: Status EQUALS New, Working, Escalated*.

Here's how this milestone can be used:

- At 10 a.m., a case is created whose Status is *New*, causing the milestone criteria to match the case criteria.
- The "Resolution Time" milestone is automatically created with these settings:
 - Start Date = 10 a.m. (the current time)
 - Target Date = 2 p.m. (4 hours from the Start Date)
- At 1 p.m., the support agent resolves the customer's issue and closes the case, and the milestone is marked complete.

Independent

A milestone named "Engineer Solution Proposed" is set up to track case escalation to Engineering. When this milestone occurs, the support agent expects a proposed solution from Engineering within 4 hours. The milestone has one criterion: *Case: Status EQUALS Waiting on Engineer* (a custom status).

Here's how this milestone can be used:

- At 10 a.m., the support agent escalates a case to Engineering, causing the milestone criteria to match the case criteria.
- An occurrence of the "Engineer Solution Proposed" milestone is automatically created with these settings:

- Start Date = 10 a.m. (the current time)
 - Target Date = 2 p.m. (4 hours after the Start Date)
3. At 11 a.m., well before the Target Date, an engineer proposes a solution that's sent to the customer. The milestone is marked complete manually or via a workflow.

If the proposed solution works, there may be no other occurrences of the "Engineer Solution Proposed" milestone on the case. However, if the solution doesn't solve the customer's issue, another occurrence would be created:

1. At 1 p.m., the support agent re-escalates the case to Engineering, causing the milestone criteria to match the case criteria.
2. A second occurrence of the "Engineer Solution Proposed" milestone is created with these settings:
 - Start Date = 1 p.m. (the current time)
 - Target Date = 5 p.m. (4 hours after the Start Date)

The case now has two "Engineer Solution Proposed" milestones:

- One completed milestone that started at 10 a.m.
- One incomplete milestone that started at 1 p.m. and has a Target Date of 5 p.m.

The milestone can recur as many times as necessary until the entitlement process is completed.

Sequential

A milestone named "Customer Contact Made" is set up to track daily contact with a customer as part of an SLA. When this milestone occurs, the support agent has 24 hours to communicate with the customer.

Here's how this milestone can be used:

1. At 10 a.m. on Monday, a case is created whose entitlement process includes the "Customer Contact Made" milestone. The milestone has these settings:
 - Start Date = 10 a.m. Monday (the current time)
 - Target Date = 10 a.m. Tuesday (24 hours after the Start Date)
2. At 11 a.m. on Monday, the support agent communicates with the customer. This means that the milestone can be marked complete, and milestone's second occurrence is created. However, because the previous occurrence's Target Date is still in the future, the Start Date of the second occurrence is 10 a.m. Tuesday.

The case now has two "Customer Contact Made" milestones:

- One completed milestone that started at 10 a.m. Monday
- One incomplete milestone that is scheduled to start at 10 a.m. Tuesday with a Target Date of 10 a.m. Wednesday

If the support agent communicates with the customer multiple times on Monday, it doesn't affect the Tuesday milestone.

[Entitlement Processes](#)

[Add a Milestone to an Entitlement Process](#)

Milestones: Supported Objects

Milestones represent required support steps that your team must complete to resolve a customer issue. Find out where you can use milestones in Salesforce.

What types of records can I add milestones to?

- Cases
- Work orders

How do I add milestones to a record?

Here are the general steps you'll follow:

1. Create "master" milestones in Setup that represent required steps in your support process.
2. Add the milestones to an entitlement process, which is a customizable timeline of milestones.
3. Apply the entitlement process to a customer entitlement.

When you link a support record, such as a work order, to an entitlement that includes an entitlement process, the process—with its milestones—is automatically applied to the record. To learn more, see [Set Up Milestones](#).

Can I use the same entitlement for work orders and cases?

If the entitlement has an entitlement process associated with it, don't use the entitlement for multiple types of support records. Every entitlement process has a type—Case or Work Order—and a process only works on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process runs only on cases associated with the entitlement. If a work order is also associated with the entitlement, the process doesn't run on the work order.

When I create a milestone, can I add it to both types of entitlement processes?

Yes. For example, if you create a First Response milestone in Setup, you can add it to both Case and Work Order entitlement processes.

How do I set the type of an entitlement process?

You select the type when you create the entitlement process. Entitlement processes created before Summer '16 use the Case type. You can see an entitlement process's type on its detail page.

Can I change the type of an entitlement process?

No. Once an entitlement process is created, all its versions must use the same type. Want to make the most of a particularly awesome entitlement process? Remember that you can easily create a similar process of a different type using the same milestones.

Are milestones supported in Lightning Experience?

Case milestones aren't supported in Lightning Experience. Milestones on work orders are available in Lightning Experience with some limitations:

- The Object Milestones related list and milestone tracker are not available on work orders in Lightning Experience
- Updates to entitlement processes and milestones must be made in Salesforce Classic
- Clicking a milestone-related feed item on a work order in Lightning Experience redirects you to Salesforce Classic

Where do I manage milestones in my org?

- View and create milestones from the Milestones node in Setup under Entitlement Management
- Manage **case** milestone page layouts and validations rules from the Case Milestones node in Setup
- Manage **work order** milestone page layouts and validation rules from the Object Milestones node in Setup

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Set Up Milestones

Milestones represent required steps in your support management process, like first response times. Set up and customize milestones in your org so they can be added to entitlement processes and applied to support records like cases and work orders.

1. [Customize Milestone Page Layouts](#)

Milestones appear in the Case Milestones related list on cases, and the Object Milestones related list on work orders. Customize your page layouts to help support agents and supervisors track support progress.

2. [Enable Milestone Feed Items](#)

Help support agents monitor support activity by enabling milestone feed items. This option posts a notification to the feed and the record owner's profile page when a milestone is completed or violated.

3. [Set Up the Milestone Tracker](#)

The milestone tracker gives support agents a complete view of upcoming and closed milestones, and displays countdowns for active and overdue milestones. Add it to the case feed, work order feed, a custom page, or the service console.

4. [Limit User Updates to Milestones](#)

Add validation rules to milestones to prevent users from updating milestones unless certain criteria are met.

5. [Create a Milestone](#)

Milestones represent required steps in your support process, such as case resolution time and first response time. You'll create "master" milestones in your org, then add them to entitlement processes to enforce different service levels on support records like cases and work orders.

6. [Auto-Complete Case Milestones](#)

Create an Apex trigger that automatically marks milestones Completed on cases that match unique criteria. In your trigger, define which events and related case criteria must be satisfied for a milestone to be marked Completed. You can implement a similar trigger to auto-complete work order milestones.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Customize Milestone Page Layouts

Milestones appear in the Case Milestones related list on cases, and the Object Milestones related list on work orders. Customize your page layouts to help support agents and supervisors track support progress.

1. Add any of the following fields to case and object milestone detail pages.
 - To edit case milestone detail page layouts, from Setup, enter *Case Milestones* in the Quick Find box, then click **Page Layouts** under Case Milestones.
 - To edit object milestone detail page layouts (which apply to work order milestones), from Setup, enter *Object Milestones* in the Quick Find box, then click **Page Layouts** under Object Milestones.

Field	Description
Actual Elapsed Time	<p>The amount of time that it took to complete a milestone.</p> <p>$(\text{Elapsed Time}) - (\text{Stopped Time}) = (\text{Actual Elapsed Time})$</p> <p> Note: If you want to be able to display this field, Enable stopped time and actual elapsed time must be selected on the Entitlement Settings page.</p>
Completed	Icon (✓) that indicates a milestone completion.
Completion Date	The date and time the milestone was completed.
Elapsed Time	The time it took to complete a milestone. Automatically calculated to include any business hours on the support record. Elapsed time is calculated only after the Completion Date field is populated.
Entitlement Process	The entitlement process that is being used for the record. Entitlement processes are optional.
Start Date	The date and time that the milestone tracking started.
Stopped Time	<p>How long an agent has been blocked from completing a milestone. For example, an agent might wait for a customer to reply with more information.</p> <p> Note: Enable stopped time and actual elapsed time must be selected on the Entitlement Settings page.</p>
Target Date	The date and time to complete the milestone.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To create and edit page layouts:

- “Customize Application”

To create milestones:

- “Manage Entitlements”
- AND
- “Customize Application”

To enable the “Stopped Time” and “Actual Elapsed Time” fields:

- “Manage Entitlements”

Field	Description
Target Response	The time to complete the milestone. Automatically calculated to include any business hours on the support record.
Time Remaining	The time that remains before a milestone violation. Automatically calculated to include any business hours on the support record.
Time Since Target	The time that has elapsed since a milestone violation. Automatically calculated to include any business hours on the support record.
Violation	Icon (🚫) that indicates a milestone violation.

2. Add milestone elements to case and work order page layouts:

a. Add milestone fields:

Field	Description
Milestone Status	The milestone's status.
Milestone Status Icon	An icon that corresponds to the milestone status: <ul style="list-style-type: none"> •  Compliant •  Open Violation •  Closed Violation
Entitlement Process Start Time	The time the record enters the entitlement process.
Entitlement Process End Time	The time the record exits the entitlement process.

b. Add the Case Milestones or Object Milestones related list to display the record's milestones.

Enable Milestone Feed Items

Help support agents monitor support activity by enabling milestone feed items. This option posts a notification to the feed and the record owner's profile page when a milestone is completed or violated.

Important:

- Chatter and entitlements must be enabled in your org.
 - Enabling milestone feed items doesn't create feed items for milestones that have already been completed or violated.
 - If you add entitlement management to a community, enabling milestone feed items also makes feed items visible to community users.
1. From Setup, enter *Entitlement Settings* in the Quick Find box, then select **Entitlement Settings**.
 2. Select **Enable milestone feed items**. This enables feed items for both cases and work orders.

Set Up the Milestone Tracker

The milestone tracker gives support agents a complete view of upcoming and closed milestones, and displays countdowns for active and overdue milestones. Add it to the case feed, work order feed, a custom page, or the service console.

Often, support agents' performance is measured by how often they meet milestones. The milestone tracker helps agents be prepared for support deadlines by showing them:

- The time remaining until an active milestone reaches its Target Date
- The time passed since an overdue milestone's Target Date
- A list of upcoming milestones
- A list of closed milestones

When a milestone is in progress, the milestone is represented by a green circle. The circle winds down clockwise as time elapses. The remaining time is shown in the center of the circle. When the time to complete the milestone expires, the circle turns red. The amount of time that the milestone is overdue is shown in the center of the circle.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To enable milestone feed items:

- "Manage Entitlements"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To create and edit page layouts:

- "Customize Application"

To assign page layouts:

- "Manage Users"

To set how time displays in the milestone tracker:

- "Manage Entitlements"

If more than 24 hours remain on a milestone, the countdown displays in days (for example, 1d). When fewer than 24 hours remain, the countdown format switches to hours/minutes/seconds.

1. Expose the milestone tracker to support agents.

You can expose the tracker in one of three ways:

- Add it to the case feed. If you plan to use milestones on work orders, follow the same steps to add the tracker to the work order feed.
 - a. From the object management settings for cases, go to Page Layouts.
 - b. In the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - c. In the Other Tools and Components section, select the Milestone Tracker and specify where on the page you want it to appear.
 - d. Click **Save**.
- Add it to a custom Visualforce page using the `<apex:milestoneTracker>` component.
- Add it as a component to the service console.

2. Set how the milestone tracker displays time remaining or time overdue on milestones.

By default, the tracker uses actual hours. To make it display time remaining or time overdue in business hours, follow these steps.

- a. From Setup, enter *Entitlement Settings* in the Quick Find box, then select **Entitlement Settings**.
- b. In the Milestone Tracker section, deselect **Show the time remaining in actual hours, not business hours**.
- c. Click **Save**.

Example: Suppose an active milestone's business hours are 9 a.m. to 5 p.m. Right now, it's 4:30 p.m. and the milestone's Target Date is 11:00 a.m. tomorrow.

- If the milestone tracker shows the remaining time in **business hours** (the default setting), it displays a countdown of 2 hours and 30 minutes (4:30 to 5 p.m. today and 9 to 11 a.m. tomorrow).
- If the milestone tracker shows the remaining time in **actual hours**, it displays a countdown of 18 hours and 30 minutes (4:30 p.m. today to 11:00 a.m. tomorrow).

Limit User Updates to Milestones

Add validation rules to milestones to prevent users from updating milestones unless certain criteria are met.

1. From the object management settings for case milestones, go to Validation Rules.
2. Click **New**.
3. Enter the rule details.
4. Save your changes.

Example: This validation rule prevents users from selecting milestone completion dates that are earlier than the case creation date. You can create a similar validation rule for work orders from the object management settings for Object Milestones in Setup.

Field	Value
Rule Name	<code>milestone_completion_date</code>
Description	<i>A milestone's completion date must be later than the case creation date.</i>
Error Condition Formula	<code>CompletionDate < Case.CreatedDate</code>
Error Message	<i>Error: The milestone completion date must be later than the case creation date.</i>
Error Location	<i>Top of Page</i>

Create a Milestone

Milestones represent required steps in your support process, such as case resolution time and first response time. You'll create "master" milestones in your org, then add them to entitlement processes to enforce different service levels on support records like cases and work orders.

Follow these steps to create a milestone.

[Walk Through It: Create a Milestone.](#)

 **Tip:** The Entitlement Management Trailhead module introduces you to common terms and walks you through the process of creating milestones. And, it's fun! To get started, see [Entitlement Management](#).

1. From Setup, enter *Milestones* in the Quick Find box, then select **Milestones** under Entitlement Management.
2. Click **New Milestone**.
3. Enter a name and description. Try to name milestones after common support tasks, like "First Response Time" or "Resolution Time". Descriptive names help users understand milestones when they see them on cases, work orders, or entitlement processes.
4. Select a recurrence type.

Recurrence Type	Description	Example
No Recurrence	The milestone occurs only once on the record.	"First Response" "Resolution Time"
Independent	The milestone occurs whenever the milestone criteria are met on the record.	"Response Time"
Sequential	The milestone occurs <i>on repeat</i> whenever the milestone criteria are met on the record.	"Customer Contact Made"

5. Click **Save**.

You can't apply milestones to a record by themselves; they must be part of an entitlement process. So after you create your milestone, [add it to an entitlement process](#).

 **Tip:** You can add validation rules to milestones so users can only update a milestone if it meets specific standards. For details, see [Limit User Updates to Milestones](#).

Auto-Complete Case Milestones

Create an Apex trigger that automatically marks milestones Completed on cases that match unique criteria. In your trigger, define which events and related case criteria must be satisfied for a milestone to be marked Completed. You can implement a similar trigger to auto-complete work order milestones.

The following triggers mark specific types of milestones Completed when the case they are on meets unique criteria. We've also provided a milestone utility Apex class and accompanying unit tests. Define the milestone utility class before you use any of the triggers.

Milestone Utility Apex Class

Apex classes reduce the size of your triggers and make it easier to reuse and maintain Apex code. To define this Apex class in your org:

1. From Setup, enter *Apex Classes* in the Quick Find box, then click **Apex Classes**.
2. Click **New**.
3. Copy the class text and paste it into the text field.
4. Click **Save**.

```
public class MilestoneUtils {
    public static void completeMilestone(List<Id> caseIds,
        String milestoneName, DateTime complDate) {
        List<CaseMilestone> cmsToUpdate = [select Id, completionDate
            from CaseMilestone cm
            where caseId in :caseIds and cm.MilestoneType.Name=:milestoneName
            and completionDate = null limit 1];
        if (cmsToUpdate.isEmpty() == false){
            for (CaseMilestone cm : cmsToUpdate){
                cm.completionDate = complDate;
            }
            update cmsToUpdate;
        }
    }
}
```

Apex Class Unit Test

You can set up Apex unit tests in the developer console to scan your code for any issues.

```
/**
 * This class contains unit tests for validating the behavior of Apex classes
 * and triggers.
 *
 * Unit tests are class methods that verify whether a particular piece
 * of code is working properly. Unit test methods take no arguments,
 * commit no data to the database, and are flagged with the testMethod
 * keyword in the method definition.
 *
 * All test methods in an organization are executed whenever Apex code is deployed
 * to a production organization to confirm correctness, ensure code
 * coverage, and prevent regressions. All Apex classes are
 * required to have at least 75% code coverage in order to be deployed
 * to a production organization. In addition, all triggers must have some code coverage.
 */
```

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To define Apex triggers and classes:

- "Author Apex"

```

* The @isTest class annotation indicates this class only contains test
* methods. Classes defined with the @isTest annotation do not count against
* the organization size limit for all Apex scripts.
*
* See the Apex Language Reference for more information about Testing and Code Coverage.
*/
@isTest
private class MilestoneTest {

    static testMethod void TestCompleteMilestoneCase(){

        List<Account> acts = new List<Account>();
        Account myAcc = new Account(Name='TestAct', phone='1001231234');
        acts.add(myAcc);

        Account busAcc = new Account(Name = 'TestForMS', phone='4567890999');
        acts.add(busAcc);
        insert acts;
        Contact cont = new Contact(FirstName = 'Test', LastName = 'LastName', phone='4567890999',
            accountid = busAcc.id);
        insert(cont);

        Id contactId = cont.Id;

        Entitlement entl = new Entitlement(Name='TestEntitlement', AccountId=busAcc.Id);
        insert entl;

        String entlId;
        if (entl != null)
            entlId = entl.Id;

        List<Case> cases = new List<Case>{};
        if (entlId != null){
            Case c = new Case(Subject = 'Test Case with Entitlement ',
                EntitlementId = entlId, ContactId = contactId);
            cases.add(c);
        }
        if (cases.isEmpty()==false){
            insert cases;
            List<Id> caseIds = new List<Id>();
            for (Case cL : cases){
                caseIds.add(cL.Id);
            }
            milestoneUtils.completeMilestone(caseIds, 'First Response', System.now());
        }
    }

    static testMethod void testCompleteMilestoneViaCase(){

        List<Account> acts = new List<Account>();
        Account myAcc = new Account(Name='TestAct', phone='1001231234');
        acts.add(myAcc);

        Account busAcc = new Account(Name = 'TestForMS', phone='4567890999');

```

```

acts.add(busAcc);
insert acts;
Contact cont = new Contact(FirstName = 'Test', LastName = 'LastName', phone='4567890999',
    accountid = busAcc.id);
insert(cont);

Id contactId = cont.Id;

Entitlement entl = new Entitlement(Name='TestEntitlement', AccountId=busAcc.Id);
insert entl;

String entlId;
if (entl != null)
entlId = entl.Id;

List<Case> cases = new List<Case>{};
for(Integer i = 0; i < 1; i++){
Case c = new Case(Subject = 'Test Case ' + i);
cases.add(c);
if (entlId != null){
c = new Case(Subject = 'Test Case with Entitlement ' + i,
EntitlementId = entlId);
cases.add(c);
}
}

```

Sample Trigger 1

You can create a milestone named Resolution Time that requires cases to be closed within a certain length of time. It's a great way to enforce case resolution terms in SLAs. This sample case trigger marks each Resolution Time milestone Completed when its case is closed. This way, the support agent doesn't have to manually mark the milestone completed after closing the case.

 **Note:** This trigger references the milestone utility test class, so be sure to define the test class first.

To define this trigger in your org:

1. From Setup, enter *Case Triggers* in the Quick Find box, then click **Case Triggers**.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```

trigger CompleteResolutionTimeMilestone on Case (after update) {
    if (UserInfo.getUserType() == 'Standard'){
        DateTime completionDate = System.now();
        List<Id> updateCases = new List<Id>();
        for (Case c : Trigger.new){
            if (((c.isClosed == true) || (c.Status == 'Closed')) && ((c.SlaStartDate
                <= completionDate) && (c.SlaExitDate == null)))
                updateCases.add(c.Id);
        }
        if (updateCases.isEmpty() == false)
            milestoneUtils.completeMilestone(updateCases, 'Resolution Time', completionDate);
    }
}

```

```

    }
}

```

Sample Trigger 2

You can create a milestone named First Response that requires agents to get in touch with a case contact within X minutes or hours of the case's creation. It's a nice way to ensure that your support team is communicating with case contacts as soon as possible. This sample email trigger marks a First Response milestone Completed when an email is sent to the case contact. That way, the support agent doesn't have to manually mark the First Response milestone Completed after they email the case contact.

 **Note:** This trigger references the milestone utility test class, so be sure to define the test class first.

To define this trigger in your org:

1. From Setup, enter *Email Triggers* in the Quick Find box, then click **Email Triggers**.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```

trigger CompleteFirstResponseEmail on EmailMessage (after insert) {
    if (UserInfo.getUserType() == 'Standard'){
        DateTime completionDate = System.now();
        Map<Id, String> emIds = new Map<Id, String>();
        for (EmailMessage em : Trigger.new){
            if(em.Incoming == false)
                emIds.put(em.ParentId, em.ToAddress);
        }
        if (emIds.isEmpty() == false){
            Set <Id> emCaseIds = new Set<Id>();
            emCaseIds = emIds.keySet();
            List<Case> caseList = [Select c.Id, c.ContactId, c.Contact.Email,
                c.OwnerId, c.Status,
                c.EntitlementId,
                c.SlaStartDate, c.SlaExitDate
                From Case c where c.Id IN :emCaseIds];
            if (caseList.isEmpty()==false){
                List<Id> updateCases = new List<Id>();
                for (Case caseObj:caseList) {
                    if ((emIds.get(caseObj.Id)==caseObj.Contact.Email)&&
                        (caseObj.Status == 'In Progress')&&
                        (caseObj.EntitlementId != null)&&
                        (caseObj.SlaStartDate <= completionDate)&&
                        (caseObj.SlaStartDate != null)&&
                        (caseObj.SlaExitDate == null))
                        updateCases.add(caseObj.Id);
                }
                if(updateCases.isEmpty() == false)
                    milestoneUtils.completeMilestone(updateCases,
                        'First Response', completionDate);
            }
        }
    }
}

```

Sample Trigger 3

While the previous trigger dealt with email messages, this sample case comment trigger marks a First Response milestone Completed when a public comment is made on the case. You can use it if a public case comment is a valid first response in your support terms.

 **Note:** This trigger references the milestone utility test class, so be sure to define the test class first.

To define this trigger in your org:

1. From Setup, enter *Case Comment Triggers* in the Quick Find box, then click **Case Comment Triggers**.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```
trigger CompleteFirstResponseCaseComment on CaseComment (after insert) {
    if (UserInfo.getUserType() == 'Standard'){
        DateTime completionDate = System.now();
        List<Id> caseIds = new List<Id>();
        for (CaseComment cc : Trigger.new){
            if(cc.IsPublished == true)
                caseIds.add(cc.ParentId);
        }
        if (caseIds.isEmpty() == false){
            List<Case> caseList = [Select c.Id, c.ContactId, c.Contact.Email,
                c.OwnerId, c.Status,
                c.EntitlementId, c.SlaStartDate,
                c.SlaExitDate
                From Case c
                Where c.Id IN :caseIds];
            if (caseList.isEmpty() == false){
                List<Id> updateCases = new List<Id>();
                for (Case caseObj:caseList) {
                    if ((caseObj.Status == 'In Progress')&&
                        (caseObj.EntitlementId != null)&&
                        (caseObj.SlaStartDate <= completionDate)&&
                        (caseObj.SlaStartDate != null)&&
                        (caseObj.SlaExitDate == null))
                        updateCases.add(caseObj.Id);
                }
                if(updateCases.isEmpty() == false)
                    milestoneUtils.completeMilestone(updateCases,
                        'First Response', completionDate);
            }
        }
    }
}
```

Entitlement Processes

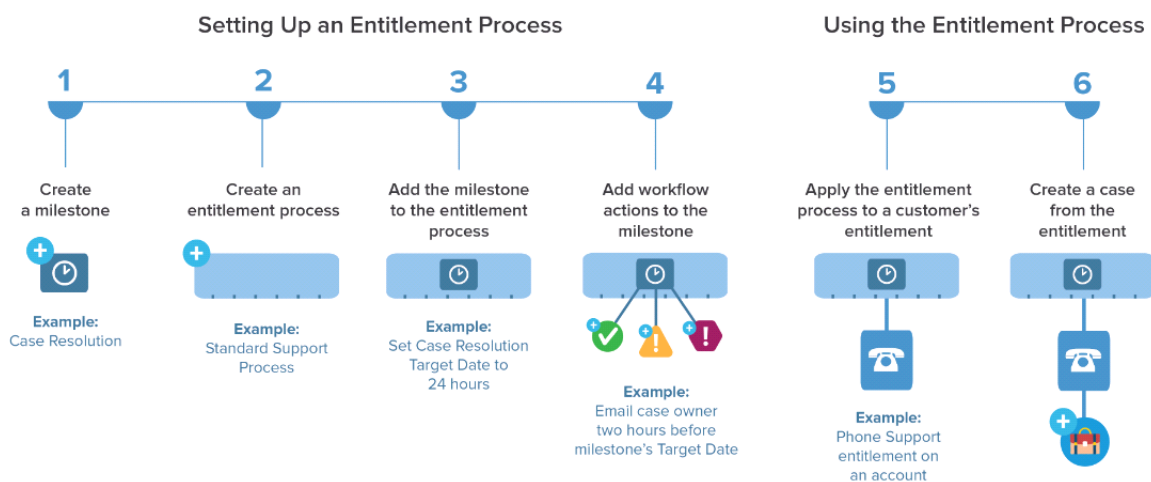

Entitlement processes are timelines that include all the steps (or milestones) that your support team must complete to resolve support records like cases or work orders. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

Not all entitlements require entitlement processes. For example, an entitlement might just state that a customer is eligible for phone support and business hours define phone support to be 24/7. If you need to add more to that definition—for example, if certain people must be emailed after a customer's case goes unresolved for two hours—use an entitlement process.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

You can create up to 1,000 entitlement processes total, with up to 10 milestones per process. If your org was created before Summer '13, its maximum entitlement processes can be lower. Contact Salesforce to increase it.

Note: If you're using entitlement processes, manage customers' work orders and cases on separate entitlements. This is because an entitlement process only runs on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process only runs on cases associated with the entitlement. If a work order is also associated with the entitlement, the process won't run on the work order.

To view or cancel active entitlement processes, from Setup, enter *Entitlement Processes* in the **Quick Find** box, then select **Entitlement Processes**. You can also use the entitlement process queue to view or cancel active entitlement process actions. (Entitlement process monitoring isn't available in Professional Edition orgs.)

Tip: Entitlement process versioning lets you update existing entitlement processes, even if they're assigned to active entitlements and cases. This can be useful if the business rules behind your entitlement processes change, for example, or if you need to create multiple versions of the same entitlement process that have only minor differences.

 **Note:** All users, even those without the “View Setup and Configuration” user permission, can view entitlement processes via the API.

SEE ALSO:

- [Set Up an Entitlement Process](#)
- [Updating an Entitlement Process](#)
- [How a Record Moves Through an Entitlement Process](#)

Set Up an Entitlement Process

Entitlement processes are timelines that include all of the steps (milestones) that your support team must complete to resolve cases or work orders. Set up an entitlement process to apply to entitlements in your Salesforce org.

1. [Create an Entitlement Process](#)

Create an entitlement process to give support agents a timeline of required steps to follow when solving support records. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

2. [Customize Entitlement Process Fields](#)

If you intend to use entitlement processes in your Salesforce org, customize page layouts to ensure that support agents can see and interact with entitlement processes.

3. [Add a Milestone to an Entitlement Process](#)

Add milestones to entitlement processes to define required steps in your support process.

4. [Add a Milestone Action to an Entitlement Process](#)

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. After you create an entitlement process and add milestones to it, add milestone actions to the milestones.

5. [Apply an Entitlement Process to an Entitlement](#)

You've created an entitlement process; now it's time to use it! Apply an entitlement process to a customer's entitlement so all support records linked to the entitlement use that process.

SEE ALSO:

- [Entitlement Management Setup Checklist](#)

EDITIONS

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Create an Entitlement Process

Create an entitlement process to give support agents a timeline of required steps to follow when solving support records. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

 **Note:** You must create milestones before you create an entitlement process.

 **Tip:** The Entitlement Management Trailhead module introduces you to common terms and walks you through creating an entitlement process. And, it's fun! To get started, see [Entitlement Management](#).

1. From Setup, enter *Entitlement Processes* in the **Quick Find** box, then select **Entitlement Processes** under Entitlement Management.
2. Click **New Entitlement Process**.
3. Select an entitlement process type. If you intend to use the process to enforce milestones on cases, select **Case**. If you intend to use the process to enforce milestones on work orders, select **Work Order**. (If work orders aren't enabled in your org, you only see the **Case** option.)

 **Note:** If you're using entitlement processes, manage customers' work orders and cases on separate entitlements. This is because an entitlement process only runs on records that match its type. For example, when a **Case** entitlement process is applied to an entitlement, the process only runs on cases associated with the entitlement. If a work order is also associated with the entitlement, the process won't run on the work order.

4. Enter a name—for example, *Standard Support Process*—and a description.
5. If you want to enable the process, select **Active**.

 **Tip:** We recommend waiting to activate an entitlement process until you add milestone actions to it. You can't update or delete milestone actions on a process after it's activated and applied to a record.

6. Optionally, if entitlement versioning is enabled, select **Default Version** to make this version of the entitlement process the default.
7. Choose the criteria for records to enter and exit the entitlement process.

Field	Description	More Actions to Take?
Record* enters the process	<p>Based on record created date</p> <p>Select if records should enter the process when they're created.</p>	No
	<p>Based on a custom date/time field on the record</p> <p>Select if you want the value of a custom date/time field on the record to determine when the record enters the process.</p>	Yes, a drop-down list displays for selecting the custom date/time. You can only choose a custom date/time, not a custom date.
Record exits the process	<p>Based on when record is closed</p> <p>Select if records should exit the process when they're closed.</p>	No

To create and update entitlement processes:

- "Manage Entitlements"

Field	Description	More Actions to Take?
	<p>Based on custom criteria</p> <p>Select if records should exit the process based on criteria you define.</p>	<p>Yes, select one of the following:</p> <ul style="list-style-type: none"> Choose <code>criteria are met</code> and select the filter criteria that a record must meet for it to exit the process. For example, set a case filter to <code>Priority equals Low</code> if you want cases with the <code>Priority</code> field marked Low to exit the process. Choose <code>formula evaluates to true</code> and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True." Choose <code>formula evaluates to true</code> and enter a formula that returns a value of "True" or "False." Records exit the process if the formula returns "True." For example, the formula <code>(Case: Priority equals Low) AND (Case: Case Origin equals Email, Web)</code> moves cases out of the process if their <code>Priority</code> field is Low and the <code>Case Origin</code> field is marked Email or Web.

*The field names you see will reflect the entitlement process type you selected.

- Optionally, choose the business hours you'd like to apply to the entitlement process. The business hours you set here calculate the Target Date for all the milestones on this entitlement process. To learn more, see [How Business Hours Work in Entitlement Management](#).
- Save your changes.

Customize Entitlement Process Fields

If you intend to use entitlement processes in your Salesforce org, customize page layouts to ensure that support agents can see and interact with entitlement processes.

1. Add these fields to case and work order page layouts:

Field	Description
Timeline (available only on case page layouts)	<p>How far along a case is to reaching an entitlement process's milestones. You can click or hover your mouse pointer over each milestone to view its details. These icons represent milestones:</p> <ul style="list-style-type: none"> •  Completed milestone •  Violated milestone <p>You can drag the Handle icon () along the Timeline Zoom tool to view past and future milestones. If an entitlement process applies to the case, this field appears.</p>
Stopped	Lets you stop an entitlement process on a record, which might be necessary if you're waiting for a customer's reponse.
Stopped Since	The date and time the entitlement process was stopped on the record.

2. Save your changes.

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To edit page layouts:

- "Customize Application"

Add a Milestone to an Entitlement Process

Add milestones to entitlement processes to define required steps in your support process.

1. From Setup, enter *Entitlement Processes* in the Quick Find box, then select **Entitlement Processes**.
2. Click the name of an entitlement process.
3. If you're using versioning, click the name of the entitlement process again under Entitlement Process Versions.
4. Click **New** on the Milestones related list.
5. Choose the milestone.
6. In **Time Trigger (Minutes)**, enter the number of minutes in which users must complete the milestone before it triggers an action.

Or, if you'd like the trigger time for the milestone to be calculated dynamically based on the milestone type and properties of the case or work order, click **Enable Apex Class for the Time Trigger (Minutes)**.

 **Note:** You must have a custom Apex class that implements the `Support.MilestoneTriggerTimeCalculator` Apex interface to use this option.

7. If you selected **Enable Apex Class for the Time Trigger (Minutes)**, use the lookup to specify an Apex class for the dynamically calculated milestone.
8. Choose when the milestone starts:

Select	To	Use If
Milestone Criteria	Calculate the milestone Target Date when the milestone is applied to a support record (matches the record criteria).	A milestone's Target Date is based on when it's applied to a record. Use if the milestone is recurring.  Note: An entitlement process usually starts when the record is created, but its milestones aren't always applied right away.
Entitlement Process	Calculate the milestone Target Date when the entitlement process starts (by default, when a support record is created).	A milestone's Target Date is based on the start of the entitlement process. For example, first response and resolution times on a case always calculate their Target Date when the entitlement process starts.

9. Optionally, select the business hours that you want to apply to the Target Date calculation for this milestone. If you don't specify business hours for the milestone, then the Entitlement Process business hours are used. If neither are specified, then the business hours on the case or work order are used.
10. Specify the order in which Salesforce should process the milestones. This applies to situations where a support record matches the criteria of multiple milestones at the same time.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To add milestones to entitlement processes:

- "Manage Entitlements"

11. Enter the criteria a record must match for the milestone to apply to it:

- Choose `criteria are met` and select the filter criteria that a record must meet for a milestone to apply to it. For example, set a case filter to `Priority equals High` if you want the milestone to apply to cases with the `Priority` field marked High.

Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True."

- Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." The milestone applies to records if the formula returns "True." For example, the formula `(Case: Priority equals High) AND (Case: Case Origin equals Email, Web)` applies the milestone to cases where the `Priority` field is High and the `Case Origin` field is marked Email or Web. You can't use the `Case Owner` field in formulas.

12. Click **Save**.

-  **Note:** Milestones are measured in minutes and seconds, but their start and end times are only accurate to the minute. For example, suppose a milestone is triggered at 11:10:40 a.m. and the time to complete the milestone is 10 minutes. In this case, the milestone target time is 11:20:00 am, not 11:20:40. As a result, the remaining time for the agent to complete the milestone is 9 minutes and 20 seconds, not the full 10 minutes.

[Milestone Statuses](#)

[Milestone Actions](#)

Add a Milestone Action to an Entitlement Process

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. After you create an entitlement process and add milestones to it, add milestone actions to the milestones.

- From Setup, enter `Entitlement Processes` in the `Quick Find` box, then select **Entitlement Processes**.
- Click the name of an entitlement process.
- Click the name of a milestone on the Milestones related list.
- If you want to add a warning or violation action, add a time trigger first. After you add a trigger, the option to add a workflow action appears. Success actions use the milestone's time trigger.

-  **Tip:** If you want a violation action to fire immediately after the milestone is violated, set the time trigger to 0 minutes.

- Click **Add Workflow Action** and select an option.

Workflow Action	What It Does	Example
New Task	Create a workflow task	Create a task for a support agent to call a customer when a First Response milestone is violated.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To add milestone actions to entitlement processes:

- "Manage Entitlements"
- AND
- "Customize Application"

Workflow Action	What It Does	Example
New Email	Create an email alert	Notify case owners when a First Response milestone on their case is near violation.
New Field Update	Define a field update	Update the case Priority field to <code>High</code> when a First Response milestone is near violation.
New Outbound Message	Define an outbound message	Send data about parts or services to an external system after a First Response milestone is completed.
Select Existing Action	Select an existing action	Use an existing email alert to notify a case owner when their case is near violation of a first response.

 **Note:** Time-triggered actions only occur during your Salesforce org's business hours. You can add up to 10 actions and 10 time triggers to each type of milestone action.

SEE ALSO:

[Milestone Actions](#)

Apply an Entitlement Process to an Entitlement

You've created an entitlement process; now it's time to use it! Apply an entitlement process to a customer's entitlement so all support records linked to the entitlement use that process.

1. Go to the entitlement.
2. In the `Entitlement Process` lookup field, select the process you want to apply.

 **Important:** If you're using entitlement processes, manage customers' work orders and cases on separate entitlements. This is because an entitlement process only runs on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process only runs on cases associated with the entitlement. If a work order is also associated with the entitlement, the process won't run on the work order.

3. Click **Save**.

 **Tip:** If you've set up entitlement templates, you can associate an entitlement process with a template so all entitlements created using that template automatically use the selected entitlement process.

- "Edit" on entitlements

How a Record Moves Through an Entitlement Process

When an entitlement process is applied to an entitlement, the entitlement process runs on all support records linked to the entitlement. Learn how support records like cases and work orders move through an entitlement process.

1. A support agent linked a record to an entitlement that has an entitlement process. This can be done in several ways:
 - The support agent creates the record from the Cases or Work Orders related list on the entitlement.
 - The support agent creates the record, then uses the Entitlement lookup field on the record to select the proper entitlement.
2. The record enters the process based on its creation date or a custom date/time field. A custom date/time field lets users edit a date on the record to trigger when it enters the process.
3. Salesforce assigns milestones with matching criteria to the record. For example, if a milestone's criteria is *Priority equals High*, and a case has a Priority of *High*, Salesforce assigns it to the *Priority equals High* milestone. A record associates with one milestone at a time. It can associate with many milestones as it moves through the process.
4. Milestone actions determine when and if warning, violation, or success workflow actions fire for the record.
5. A support agent updates the record to complete a milestone action.
6. After a record is updated, it cycles through the entitlement process and initiates any milestones that match its criteria.
7. The record exits the process based on custom criteria or when it's closed.

You can view records with assigned entitlements by creating case or work order list views that filter on entitlement process fields.

 **Important:** Milestones are not automatically marked Completed when a record exits an entitlement process. To write an Apex trigger that auto-completes milestones that meet unique criteria, see [Auto-Complete Case Milestones](#).

Report on Entitlements

Use custom report types to define report criteria that users can use to run and create reports on entitlements, service contracts, and contract line items.

After you set up entitlement management, your Salesforce org automatically includes the following custom report types:

Custom Report Type	Description	Report Type Location
Accounts with entitlements with contacts	Lists accounts with entitlements that include contacts (named callers).	Accounts & Contacts
Service contracts with contract line items	Lists service contracts with contract line items (products).	Customer Support Reports
Service contracts with entitlements	Lists service contracts with entitlements.	Customer Support Reports
Cases with milestones	Lists cases with milestones.  Note: This report type can't be customized.	Customer Support Reports

To customize entitlement management custom report types:

1. From Setup, enter *Report Types* in the Quick Find box, then select **Report Types**.
2. From the All Custom Report Types page, you can:
 - Define a new custom report type. You can't select entitlements as a primary object.
 - Update a custom report type's name, description, report type category, and deployment status.
 - Delete a custom report type.

 **Important:** When you delete a custom report type, all the data stored in the custom report type is deleted and cannot be restored from the Recycle Bin.

 **Tip:** If you want to view a list of work orders with milestones in your org, use the Object Milestones custom report type to create a work order report.

How Business Hours Work in Entitlement Management

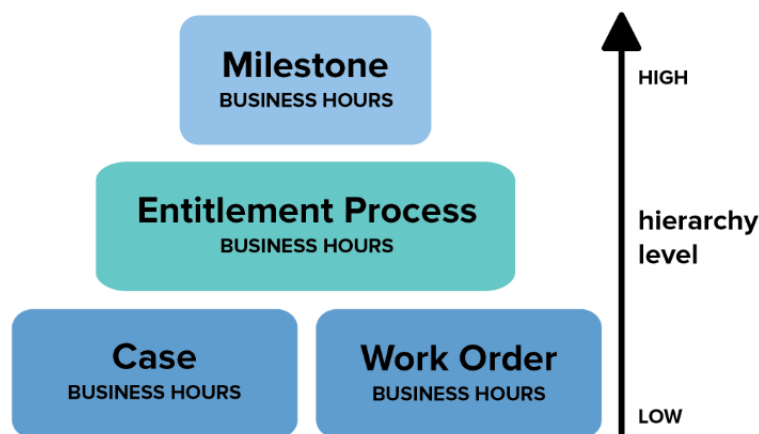

When a support record is linked to an entitlement, the record, its milestones, its entitlement process, and the entitlement itself can each use different business hours. Learn how Salesforce approaches business hours in these situations.

On records that include entitlement processes, business hours are applied according to a hierarchy. Salesforce uses the business hours specified at the highest level.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

So a milestone’s business hours override the entitlement process’ business hours, which override the case or work order’s business hours. If no business hours are set on the milestone, then the entitlement process business hours are used. And if business hours aren’t specified on the milestone or the entitlement process, the case or work order business hours are used.

You can also set business hours on entitlements. If you create a record from an entitlement, it inherits the entitlement’s business hours. However, if the entitlement is part of an entitlement process, we recommend leaving the entitlement’s business hours field blank. Related records automatically use the entitlement process’ business hours.

When setting business hours, follow these best practices:

- If you want to use the same entitlement process for records that have different business hours, set business hours at the entitlement process level. For example, suppose that you set the business hours on an entitlement process to weekdays from 9 to 5. If a customer requests evening and weekend updates to their case, you can create an “Update Customer” milestone with its own 24/7 business hours.
- If you want to use different business hours for different severity levels, set business hours at the milestone level. For example, if the severity level of a case increases, the customer may need to be contacted more frequently. You can create a “Last Touch” milestone that changes business hours according to severity level while the other milestones in the entitlement process remain unchanged.

[Set Up an Entitlement Process](#)

Updating an Entitlement Process

Entitlement versioning lets you create multiple versions of an entitlement process, even if it's assigned to active entitlements and support records.

 [Watch a Demo](#) (2:20 minutes)

Use entitlement versioning if:

- You want to make several versions of an entitlement process that have minor differences
- You want to update an entitlement process to reflect changes in your business processes

You might find that an entitlement process needs to be updated seasonally, or that you need to roll back to a previous version.

 **Note:** To create multiple versions of entitlement processes, entitlement versioning must be enabled in your org. Select **Enable Entitlement Versioning** on the Entitlement Settings page in Setup.

When you create versions of entitlement processes with the same name, the version number and notes help you differentiate between versions. Salesforce prevents you from disabling entitlement versioning so you always know which version you're working with.

When you create a new version of an entitlement process, you can change any of the following:

- Name
- Description
- Whether the process is active
- Whether the version is the default
- Entry criteria
- Exit criteria

You can also add notes about the version. This makes it easy to differentiate between multiple versions of the same process, especially if they have the same name.

On new versions of entitlement processes that are currently in use, you can add new milestones, but you can't edit existing ones. On new versions of processes that aren't currently in use, you can both add new milestones and edit existing ones.

Once you create a new version of an entitlement process, you can choose to apply it to all entitlements and support records assigned to the previously used version, or only to new entitlements and support records. All versions of an entitlement process must be the same type: Case or Work Order.

Create a New Version of an Entitlement Process

Entitlement versioning lets you create multiple versions of an entitlement process, even if it's assigned to active entitlements and support records. You can use multiple versions of an entitlement process at the same time in your Salesforce org.

 [Watch a Demo](#) (2:20 minutes)

 **Note:** To create multiple versions of entitlement processes, entitlement versioning must be enabled in your org. Select **Enable Entitlement Versioning** on the Entitlement Settings page in Setup.

When you create versions of entitlement processes with the same name, the version number and notes help you differentiate between versions. Salesforce prevents you from disabling entitlement versioning so you always know which version you're working with.

1. From Setup, enter *Entitlement Processes* in the **Quick Find** box, then select **Entitlement Processes**.
2. Click the name of the entitlement process for which you want to create a new version.
3. In the Entitlement Process Versions list, click the version of the process from which you want to create a new version.
4. On the Entitlement Process Detail page, click **Create New Version**.
5. Add details about the new version. Follow these best practices:
 - Use the **Version Notes** field to explain what makes the version you're creating different from others. This makes it easier to differentiate between multiple versions of the same entitlement process.
 - Leave the name as is.
 - Click **Active** to be able to use the new version.
 - Click **Default** if you want to make the new version the default version of the process. This makes it easier to find in lookup field searches.
6. Click **Save**.
After saving, you can modify the entitlement process' milestones if needed.

 **Important:**

- On new versions of entitlement processes that are currently in use, you can add new milestones, but you can't edit existing ones. On new versions of processes that aren't currently in use, you can both add new milestones and edit existing ones.
- All versions of an entitlement process must be the same type.

When you create a new version of an entitlement process, it isn't automatically applied to entitlements that were using the previous version. To learn how to apply a new version of an entitlement process to existing and new entitlements, see [Use a New Version of an Entitlement Process](#).

SEE ALSO:

[Updating an Entitlement Process](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions** with the Service Cloud

USER PERMISSIONS

To create and update entitlement processes:

- "Manage Entitlements"

Use a New Version of an Entitlement Process

After you create a new version of an entitlement process, you can choose to apply it to all entitlements assigned to the previous version, or only to new entitlements. When you apply an entitlement process to an entitlement, it also applies the process to that entitlement's active support records.

 [Watch a Demo](#) (2:20 minutes)

 **Note:** To create multiple versions of entitlement processes, entitlement versioning must be enabled in your org. Select **Enable Entitlement Versioning** on the Entitlement Settings page in Setup.

When you create versions of entitlement processes with the same name, the version number and notes help you differentiate between versions. Salesforce prevents you from disabling entitlement versioning so you always know which version you're working with.

Applying an Entitlement Process to a New Entitlement

Scenario: You're creating an entitlement and want to apply a particular version of an entitlement process to it.

1. Choose the entitlement process you want in the Entitlement Process lookup field on the entitlement.

 **Tip:** After you click the lookup icon on the Entitlement Process field, select "All Versions" in the lookup dialog box. Otherwise, you can only choose from the default versions of existing entitlement processes.

Applying an Entitlement Process to an Existing Entitlement

Scenario: You made a new version of an entitlement process, and you want to switch all the entitlements that were using the previous version over to your new version.

1. From Setup, enter *Entitlement Processes* in the **Quick Find** box, then select **Entitlement Processes**.
2. Click the name of the entitlement process you want to work with.
The list on the main Entitlement Processes page shows the default version of each process. Click the name of a process to see a list of all available versions of it.
3. On the detail page for the entitlement process, click the name of the new version that you want to apply to existing entitlements (and by default, to cases or work orders linked to those entitlements).
4. Click **New Update Rule**.
5. Choose the version of the entitlement process you want to update from.
You can update from any other version of the process, whether or not it's active.
6. Depending on the differences between the old and new versions of the entitlement process, updating an entitlement to the new version can trigger milestone warning and violation actions on that entitlement's support records (such as cases or work orders). To avoid such warnings and violation actions, select **Don't Trigger New Milestone Warnings and Violations**. We recommend selecting this so you don't trigger violation warnings on old entitlements and support records.
7. Click **Save**.
The update rule detail page shows the estimated number of entitlements and support records that will be updated to use the new process.
8. Click **Start** to begin the update process.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create and update entitlement processes:

- "Manage Entitlements"

Usually the update process completes within an hour, but it depends on the number of entitlements and records being updated. Throughout the update process, the update rule detail page refreshes periodically to show the number of entitlements and records processed. To stop the update at any time, click **Stop**.

When the update rule displays a `Completed` status, all related entitlements and support records have been updated to use the new version of the entitlement process. If the status is `Completed With Exceptions`, some records couldn't be updated to the new version because of errors. To find out which records weren't updated and why, contact Salesforce Support.

SEE ALSO:

- [Set Up an Entitlement Process](#)
- [Updating an Entitlement Process](#)
- [Create a New Version of an Entitlement Process](#)

Set Up Service Contracts

Service contracts are agreements between you and your customers for a type of customer support. Service contracts can represent different kinds of customer support, such as warranties, subscriptions, or service level agreements (SLAs).

 **Note:** Entitlements must be enabled in your org for you to set up service contracts.

From the object management settings for service contracts:

1. Customize service contract fields.

This lets you control what information users add to service contracts. You can create custom service contract fields that are specific to your industry or support process.

2. Customize service contract page layouts.

This lets you specify which fields and related lists users see on service contracts. Consider making the following customizations:

- Add the `Status Icon` field so users can easily see whether the service contract is active, expired, or inactive.
- To let users make one service contract the parent of another, add the `Parent Service Contract` field and `Child Service Contracts` related list. You can also add the read-only `Root Service Contract` field so users can see the top-level service contract in a service contract hierarchy. A service contract hierarchy can contain up to 10,000 service contracts.

3. Set field-level security on service contract fields.

This lets you choose which service contract fields users can access.

4. Set field history tracking on service contracts.

This lets you see when field values were changed. Changes are listed in the `Service Contract History` related list on service contracts. From the object management settings for service contracts, go to the fields section, and then click **Set History Tracking**.

5. Make the Service Contracts tab visible in Salesforce and any custom apps.

The `Service Contracts` tab is where users create and edit service contracts and contract line items. Add the tab to an app or instruct your users to add it to an existing tab set in Salesforce. Users need the "Read" permission on service contracts to see the `Service Contracts` tab.

6. Add the Service Contracts related list to account and contact page layouts.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions** with the Service Cloud

USER PERMISSIONS

To set up service contracts:

- "Manage Entitlements"
- AND
- "Customize Application"

This lets users create, update, and verify service contracts from accounts and contacts.

SEE ALSO:

[Entitlement Management Setup Checklist](#)

[Set Up Contract Line Items](#)

Set Up Contract Line Items

Set up contract line items to be able to specify which products a service contract covers. Contract line items only display to users on the Contract Line Items related list on service contracts (not on contracts!). You can only use contract line items if your Salesforce org uses products.

Note: Entitlements must be enabled in your org for you to set up contract line items.

From the object management settings for contract line items:

1. Customize contract line item fields.

This lets you control what information users add to contract line items. You can create custom contract line item fields that are specific to your industry or support process.

2. Customize contract line item page layouts.

This lets you specify which fields and related lists users see on contract line items. Consider making the following customizations:

- Add the `Status Icon` field so users can easily see whether the line item is active, expired, or inactive.
- To let users make one line item the parent of another, add the `Parent Contract Line Item` field and `Child Contract Line Items` related list. You can also add the read-only `Root Contract Line Item` field, which lists the top-level line item in a contract line item hierarchy. A contract line item hierarchy can contain up to 10,000 line items.

3. Customize other objects' page layouts.

This lets you choose how users can associate contract line items with other records. Consider making the following customizations:

- (Required) Add the `Contract Line Items` related list to service contract page layouts. This lets users create, edit, and delete contract line items from service contracts.
- Add the `Contract Line Items` related list to asset layouts. This lets users view and change associations between assets and contract line items.
- Add the `Contract Line Item` lookup field to entitlement page layouts. This lets users associate a line item with a particular entitlement.

4. Set field-level security on contract line items.

This lets you choose which contract line item fields users can access.

5. Set field history tracking on contract line items.

This lets you see when field values were changed. Changes are listed in the `Contract Line Item History` related list on contract line items. From the object management settings for contract line items, go to the fields section, and then click **Set History Tracking**.

EDITIONS

USER PERMISSIONS

To set up service contracts and contract line items with entitlements:

- "Manage Entitlements"
- AND
- "Customize Application"

 **Note:** Schedules aren't available for contract line items, and community users can't access them.

SEE ALSO:

[Entitlement Management Setup Checklist](#)

Set Up Entitlement Management in Communities

Add entitlement management to your communities to let customers or partners view their entitlements and service contracts. Contract line items don't display in communities.

Follow these steps to expose entitlements and/or service contracts in a community.

1. Update user profiles.
 - a. Clone the Customer Community User, Customer Community Plus User, or Partner Community User profiles and enable the "Read" permission on entitlements and/or service contracts.

 **Note:** Remember to click **Edit Profiles** at the bottom of the detail page to activate the new profiles.
 - b. Optionally, on the profiles of delegated community moderators, enable the "Create" and "Delete" permissions on entitlement contacts. This lets moderators update entitlement contacts.
 - c. Verify that the tab visibility for the Entitlements and/or Service Contracts tabs is Default On.
2. Add the Entitlements and/or Service Contracts tabs to the community.
3. Add the `Entitlement Name` field to case and work order page layouts assigned to community users. This lets users add entitlements to cases and work orders. Work orders are not available in communities built using the self-service community templates.

 **Note:** To avoid exposing your internal support processes, we recommend **not** adding the following fields to case and work order page layouts for community users:

 - `Entitlement Process Start Time`
 - `Entitlement Process End Time`
 - `Stopped`
 - `Stopped Since`
4. Optionally, add the Entitlements related list to account and contact page layouts assigned to community moderators. This lets moderators create cases automatically associated with the right entitlements.

Field Service Lightning

Want to manage your field service in one place? Field Service Lightning is a powerful set of features that lets you set up and customize a field service hub in Salesforce.

Field Service Lightning includes the following features, which you can pick and choose from to fit your business needs.

- The Field Service Lightning **standard features** are available when Field Service Lightning is enabled in your org. The standard features offer:
 - **Work order management:** *Work orders* represent tasks to be performed for your customers. You can attach Knowledge articles to work orders, split them into sub-tasks called *work order line items*, and track terms in service-level agreements using milestones. *Service appointments* can be associated with work orders and work order line items, and include details about the appointment schedule. And, time-saving templates called *work types* help you standardize your work orders.
 - **Resource management:** *Service resources* are users who can perform field service work. You can assign service resources to service appointments and specify each resource's skills, service territory, and hours of operation. *Service territories* represent regions in which field service work can be performed. You can assign service resources to a territory and create territory hierarchies.
 - **Schedule management:** *Operating hours* let you define when your service resources are available to work, and when work can be performed in service territories. You can also track service resource absences.
- The Field Service Lightning **managed package** builds on the standard features and include:
 - A scheduling optimizer that allocates resources to appointments in the most efficient way possible by accounting for technician skill level, travel time, location, and other factors
 - A dynamic scheduling console that gives dispatchers and supervisors a bird's-eye view of all scheduled service appointments
 - A robust toolbox of work rules and scheduling policies that help you define your ideal scheduling model
 - Out-of-the-box triggers that make it easy to customize your scheduling and display preferences

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Field Service Lightning features and managed package are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud. Work orders are also available in **Professional** Edition.

Field Service Lightning gives you the tools to plan, perform, and track all your field service work, from installations to repairs and maintenance. Let's get started!

[Planning for Field Service Lightning](#)

[Set Up Field Service Lightning](#)

[Field Service Lightning Considerations](#)

Planning for Field Service Lightning

Field Service Lightning is a powerful set of features which you can customize to meet your own unique field service needs. Before setting up Field Service Lightning, consider these essential planning questions.

What types of field service tasks do you want to track?

If many of your business's appointments involve similar tasks, it's a good idea to create work order templates, known as *work types*. On each work type, you can specify how long each type of appointment takes and which skills are required to complete it. Then, you can quickly create work orders or work order line items that inherit their settings from the work type. Work types save you time and help you standardize your field service work.

How do you want to track technicians' skills?

You can assign skills to all service resources in your org to indicate their certifications and areas of expertise. You can also specify each resource's skill level from 0 to 99.99. For example, you can assign Maria the "Welding" skill, level 50. In addition, you can add required skills to work types, work orders, and work order line items to let dispatchers know which skills are required to complete the job.

If you intend to use the skills feature, decide which skills you want to track and how skill level is to be determined. For example, you may want the skill level to reflect years of experience, certification levels, or license classes.

How do you want to model territories?

You can create *service territories* in your org to represent the geographical regions in which your team works. Territories have their own operating hours and child territories, and service resources can be assigned to territories as members. Depending on how your business works, you can create territories based on cities, counties, or other factors.

Service Territories represent where your Service Resources work and operating hours represent when they work. Service Territories typically represent geographical areas since resources are based near the locations they service. However, depending on how your business works, you may decide to create territories based on other factors, such as your business units or departments like field sales vs field service. Further, Service Territories can be organized into hierarchies, to reflect parent and child relationships.

Operating Hours indicate when appointments can take place in the territory. Service Resources assigned to the territory inherit the territory's operating hours by default. Put simply, this means resources operate the same hours as their Service Territory. If desired, you can define different hours for the territories' resources.

How do you manage your team's calendars?

A service resource has *operating hours* for each service territory they belong to which indicate when they're available to work in that territory. Similarly, a service territory's operating hours indicate when appointments can take place in the territory. If a resource's operating hours aren't defined for a territory, they inherit their service territory's operating hours. Resource absences are tracked in the Absences related list on their detail page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Field Service Lightning features and managed package are available in **Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud. Work orders are also available in **Professional Edition**.

While you can assess a service resource's schedule by reviewing their scheduled service appointments, absences, and operating hours, a calendar view isn't available for individual service resources, unless you're using the Field Service Lightning managed package.

Do you want a customizable dispatcher console and automatic scheduling optimization?

If so, consider using the Field Service Lightning managed package.

 **Note:** Sharing must be enabled to install the managed package guide.

Do you want to give your customers a way to track their service progress?

If so, you can add standard Field Service Lightning objects like work orders to your communities built using the Salesforce Tabs + Visualforce template. Only work orders, work order line items, and service appointments are available in communities built on the Customer Service (Napili) template. Make sure to double-check which fields are visible in your communities so customers only see the information you want them to see.

[Field Service Lightning Considerations](#)

[Set Up Field Service Lightning](#)

Set Up Field Service Lightning

Set up Field Service Lightning in a way that fits your business needs.

 **Important:** Before you get started, get informed! We recommend reading:

- [Planning for Field Service Lightning](#)
- [Field Service Lightning Considerations](#)

1. [Enable Field Service Lightning](#)

Enable Field Service Lightning to start using field service features like work orders, service appointments, and more.

2. [Assign Field Service Lightning Permission Sets](#)

To give your team access to Field Service Lightning features, assign the necessary object permissions to users with the help of permission set licenses.

3. [Set Up the Field Service Lightning Managed Package](#)

The Field Service Lightning managed package builds on Salesforce's standard field service features to deliver a rich, highly customizable experience for dispatchers and technicians.

4. [Set Up Service Territories](#)

A service territory represents a region in which field service can be performed. Learn how to configure service territory settings and create territories that fit your business processes.

5. [Create Operating Hours](#)

Define operating hours and assign them to service territories, service territory members, or accounts to indicate their field service hours.

6. [Set Up Service Resources](#)

A service resource represents a Salesforce user who can perform field service work. Learn how to create service resources and track their skills and availability.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Field Service Lightning features and managed package are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud. Work orders are also available in **Professional** Edition.

7. [Set Up Skills for Field Service](#)
Assign skills to service resources to indicate the type of work that they can perform. You can also add required skills to work orders and work types so only resources with certain skills can be assigned to complete the work.
8. [Set Up Work Orders](#)
A work order represents work to be performed on your customers' products. Learn how to configure work order settings and create time-saving templates called work types.
9. [Set Up Locations for Field Service](#)
For Field Service, your locations can be vans, warehouses, customer sites, or whatever suits your organization. Learn how to create service locations and track their consumption and availability.
10. [Set Up Parts and Van Stock](#)
Parts and van stock represent a list of items necessary to complete work orders. Learn how to create parts and van stock and track their consumption and availability.
11. [Set Up Customer Service Reports](#)
Make your customers happy with fast field service reports delivered to their inboxes. Your technicians and dispatchers can create reports for work orders, work order line items, and service appointments and email them directly to the customer. You can use standard templates or create variations of your own.
12. [Create Field Service Lightning Reports](#)
Create report types to track field service progress in your org.

SEE ALSO:

[Field Service Lightning Guidelines](#)[Field Service Lightning](#)

Enable Field Service Lightning

Enable Field Service Lightning to start using field service features like work orders, service appointments, and more.

1. From Setup, enter *Field Service Settings* in the Quick Find box, then select **Field Service Settings**.
2. Click **Enable Field Service Lightning**.
3. If you want, select the option to turn on in-app notifications for Salesforce1 and Lightning Experience users when any of the following actions occurs on a work order or work order line item that they own or follow:
 - A text or file post is added
 - A tracked field is updated
 - The record owner changes
 - The resource assignments change on a related service appointment

 **Note:** If the option to track all related objects is selected in your feed tracking settings for work orders, users are also notified when child records of work orders—such as service appointments—are created or deleted.
4. When you set up work types, which are templates for work orders, you can opt to automatically add a service appointment to new work orders or work order line items associated with a work

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Field Service Lightning features and managed package are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud. Work orders are also available in **Professional** Edition.

USER PERMISSIONS

To enable Field Service Lightning:

- “Customize Application”

type. Optionally, configure the Due Date on auto-created service appointments by indicating how many days past the created date it should fall.

Enabling Field Service Lightning makes the following tabs available in Salesforce:

- **Work Orders:** A basic Field Service Lightning feature, available whether or not Field Service Lightning is enabled.
- **Service Appointments:** Appointments to perform field service work for customers. You can specify the number of resources needed to complete an appointment, the skills required, and the appointment schedule.
- **Service Resources:** Users who can perform field service work. You can assign resources to service appointments and specify each resource's skills, service territory, and more.
- **Skills:** Capabilities needed to perform tasks.
- **Work Types:** Templates that help you standardize your work orders.
- **Service Territories:** Regions in which field service can be performed. You can assign resources to a territory and create territory hierarchies.
- **Operating Hours:** Field service hours that you can define for service territories, service resources, and accounts.
- **Products:** A Salesforce feature, available whether or not Field Service Lightning is enabled.
- **Locations:** A Salesforce feature, available whether or not Field Service Lightning is enabled.
- **Product Items:** A basic Field Service Lightning feature, is available whether or not Field Service Lightning is enabled.

Enabling Field Service Lightning also turns on geocoding (location data) for supported features. To learn more, see [Location Tracking in Field Service Lightning](#) on page 2830.

Note:

- The Field Service Lightning managed package includes scheduling optimization, an interactive dispatcher console, and more.

Assign Field Service Lightning Permission Sets

To give your team access to Field Service Lightning features, assign the necessary object permissions to users with the help of permission set licenses.

Field Service users must have a Service Cloud license, a Field Service license and a Field Service permission set license.

 **Important:** Before you can create a permission set for your Field Service users, verify that your org has Field Service Lightning enabled. From Setup, enter *Field Service* in the Quick Find box, then select **Field Service Settings**. Verify that Field Service Lightning is enabled.

Create a permission set for each needed [Field Service Lightning license](#). Creating a permission set gives the object permissions to users with the license.

- Administrators in the Field Service Standard license.
 - Dispatchers need the Field Service Dispatcher permission set licenses.
 - Technicians need the Field Service Scheduling and Field Service Mobile permission set licenses.
1. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** under *Manage Users*.
 2. Click **New**.
 3. Enter a label, API name, and description for your permission set.

To keep it simple, we suggest using the same name as the [permission set license](#) you plan to associate it with.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To assign a permission set license:

- "Manage Users"

To create a permission set:

- "Manage Profiles and Permission Sets"

4. Under **Select the type of users who will use this permission set**, select the corresponding Field Service Lightning permission set license.
 5. Click **Save**.
 6. On the permission set overview page, under **System**, click **System Permissions**.
 7. Click **Edit**.
 8. Enable the corresponding Field Service Lightning permission set license.
 9. Click **Save**.
 10. On the permission set overview page, under **Apps**, click **Object Settings** and ensure that your permission set license gives access to Field Service objects that they need Create, Read, Edit, and Delete access to.
Typically, users need, at minimum, access to Work Orders, Service Resources, and Service Appointments.
 11. On the permission set overview page, click **Manage Assignments** at the top of the page.
 12. Click **Add Assignments**.
 13. Select the users who need the permission set.
Assigning a permission set automatically assigns the associated permission set license to the user.
 14. Click **Assign**.
 15. Repeat the previous steps until you have create a permission set for each Field Service Lightning permission set license.
1. [Field Service Permission Sets Licenses](#)
These are the available Field Service Lightning permission set licenses.

Field Service Permission Sets Licenses

These are the available Field Service Lightning permission set licenses.

License Name	Object Permissions Included
Field Service Standard	"Read," "Edit," "Create," and "Delete" on: <ul style="list-style-type: none"> • Service Appointments • Service Resources • Service Territories • Product Items • Operating Hours • Work Types
Field Service Dispatcher	"Read," "Edit," "Create," and "Delete" on: <ul style="list-style-type: none"> • Service Appointments • Service Resources • Service Territories • Product Items • Operating Hours • Work Types

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

License Name	Object Permissions Included
Field Service Scheduling	<p>If the Field Service Lightning managed package is installed, users with this permission set license have access to the dispatcher console.</p> <p>“Read,” “Edit,” “Create,” and “Delete” on:</p> <ul style="list-style-type: none"> • Service Appointments • Service Resources • Service Territories • Product Items • Operating Hours • Work Types <p>If the Field Service Lightning managed package is installed, users with this permission set license are included in scheduling optimization.</p>
Field Service Mobile	<p>“Read,” “Edit,” “Create,” and “Delete” on:</p> <ul style="list-style-type: none"> • Service Appointments • Service Resources • Service Territories • Product Items • Operating Hours • Work Types <p>If the Field Service Lightning managed package is installed, users with this permission set license are included in scheduling optimization.</p>

Set Up the Field Service Lightning Managed Package

The Field Service Lightning managed package builds on Salesforce’s standard field service features to deliver a rich, highly customizable experience for dispatchers and technicians.

When you implement Field Service Lightning, you select which features to use. Most features are available when Field Service Lightning is enabled in your org, but you can also install the Field Service Lightning managed package, see the Field Service Lightning Managed Package Guide that comes with the installation link.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Set Up Service Territories

A service territory represents a region in which field service can be performed. Learn how to configure service territory settings and create territories that fit your business processes.

1. [Configure Service Territory Settings](#)
Control how your users work with service territories.
2. [Create Service Territories](#)
Create service territories to track your field service work and ensure that service resources are assigned to service appointments near their home base.

Configure Service Territory Settings

Control how your users work with service territories.

 **Note:** Field Service Lightning must be enabled in your org.

1. Assign user permissions.

Users Who Will...	Need These Permissions
Enable Field Service Lightning	"Customize Application"
View the Service Territories tab and service territories	"Read" on service territories
Create or clone service territories	"Create" on service territories
Edit service territories	"Edit" on service territories
Delete service territories	"Delete" on service territories
Create service territory members	"Edit" on service resources

2. Make the Service Territories tab visible to your users.
Users create and manage service territories from the Service Territories tab. You can add the tab to a custom app or instruct users to add the tab in Salesforce.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To edit page layouts and set field history tracking:

- "Customize Application"

To create and edit users:

- "Manage Internal Users"

Create Service Territories

Create service territories to track your field service work and ensure that service resources are assigned to service appointments near their home base.

 **Tip:** If you plan to build out a hierarchy of service territories, create the highest-level territories first.

1. From the Service Territories tab, click **New**.
2. Select **Active** if you want to be able to add members to the territory or associate it with work orders, work order line items, or service appointments.
3. Enter a name and description for your territory.
The name you select depends on how your field service business is organized. For example, it might be the name of a particular county or district.
4. Optionally, enter an address.
You may want to enter the address of the territory's headquarters.
5. If your territory is part of a larger territory, select a parent territory.

 **Note:** A hierarchy of service territories can have up to 500 territories total.

6. Select operating hours for the territory, which indicate when service appointments within the territory should take place.
To create operating hours, see [Guidelines for Using Service Resources](#) on page 2808.
7. Click **Save**.
8. Optionally, assign service resources to your territory via the Service Territory Members related list.

Service territory members are resources who are available to work within the territory. If you haven't created service resource yet, know that you can also define a service resource's territories from the resource's detail page.

When you add a member, indicate whether this territory is the member's primary, secondary, or relocation territory. The primary territory is typically the territory where they work most often—for instance, near their home base—while secondary territories are territories where they can be assigned to appointments if needed. Relocation territories represent temporary moves.

 **Example:** You can create a hierarchy of territories to represent the areas where your team works in California. Include a top-level territory named *California*, three child territories named *Northern California*, *Central California*, and *Southern California*, and a series of third-level territories corresponding to California counties. Assign service resources to each county territory to indicate who is available to work in that county.

[Guidelines for Using Service Territories](#)

[Service Territory Fields](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create service territories:

- "Create" on service territories

Create Operating Hours

Define operating hours and assign them to service territories, service territory members, or accounts to indicate their field service hours.

Note:

- By default, only System Administrators can view, create, and assign operating hours.
- Service resource detail pages don't list operating hours because a service resource's hours can vary depending on which territory they're working in. To view a service resource's operating hours for a particular territory, navigate to their Service Territories related list and click the Member Number for the territory. This takes you to the service territory member detail page, which lists the member's operating hours and dates during which they belong to the territory.
- If you're using the Field Service Lightning managed package, the scheduling optimizer only assigns service resources to service appointments that fall within the operating hours listed on the resource's territory member record. If you're not using the managed package, operating hours serve as a suggestion rather than a rule.

1. Click the Operating Hours tab, then click **New**.
2. Enter a name, description, and time zone.
3. Click **Save**.
4. In the Time Slots related list on the operating hours, create time slots for each day. For example, if the operating hours should be 8 AM to 5 PM Monday through Friday, create five time slots, one per day. To reflect breaks such as lunch hours, create multiple time slots in a day: for example, *Monday 8:00 AM - 12:00 PM* and *Monday 1:00 PM - 5:00 PM*. To establish 24/7 operating hours, create a time slot for each day of the week that starts at 12:00 AM and ends at 11:59 PM.

 **Tip:** Time slots don't come with any built-in rules, but you can create Apex triggers that limit time slot settings in your org. For example, you may want to restrict the start and end times on time slots to half-hour increments, or to prohibit end times later than 8 PM.

5. Assign the operating hours to one or more service territories.
 - a. Navigate to the service territory's detail page.
 - b. Select the desired hours in the `Operating Hours` lookup field on the territory detail page, and save your changes.

6. If needed, assign different operating hours to one or more service territory members.

Service territory members—which are service resources who can work in the territory—automatically use their service territory's operating hours. If a resource needs different operating hours than their territory, create separate operating hours for them from the Operating Hours tab. Then, select the desired hours in the `Operating Hours` lookup field on the service territory member detail page.

 **Note:** If a resource's operating hours are similar to their territory's hours, the resource's operating hours only need time slots for the days that differ from the territory's hours. For example, suppose a resource's territory's hours are 8:00 AM to 5:00 PM Monday through Friday, but the resource works 10:00 AM to 7:00 PM on Fridays. When you create operating hours for the resource, create only one time slot: *Friday 10:00 AM to 7:00 PM*. The resource automatically uses its territory's time slots for Monday through Thursday, then uses its own special time slot on Fridays.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create operating hours:

- "Create" on operating hours

To assign operating hours to service resources:

- "Edit" on service resources

To assign operating hours to service territories:

- "Edit" on service territories

To assign operating hours to accounts:

- "Edit" on accounts

- Optionally, assign operating hours to one or more accounts via the `Operating Hours` lookup field on the account detail page. An account's operating hours help dispatchers know when to schedule service appointments for the account. For example, if ABC Labs only allows technicians to visit their office Monday through Friday from 8 AM to noon, you can create operating hours for them that reflect this preference.

SEE ALSO:

[Operating Hours Fields](#)

Set Up Service Resources

A service resource represents a Salesforce user who can perform field service work. Learn how to create service resources and track their skills and availability.

- [Configure Service Resource Settings](#)
Set up service resource settings and user permissions in your org.
- [Create Service Resources](#)
Service resources are users who can perform field service work. Create service resources so you can assign them to service appointments.

Configure Service Resource Settings

Set up service resource settings and user permissions in your org.

 **Note:** Field Service Lightning must be enabled in your org.

- Customize page layouts.
 - Decide which related lists to include on the service resource detail page layout. The following related lists are specific to field service:
 - Absences:** View and manage the service resource's absences.
 - Capacities:** View and manage the service resource's capacity, or how much they can work in a specified time period.
 - Service Appointments:** View and manage the service appointments assigned to the service resource.
 - Service Territories:** View and manage the service territories where the service resource is available to work.
 - Skills:** View and manage the service resource's skills, which represent certifications and areas of expertise.
 - Decide which fields to include on service resource page layouts. The following fields can be removed from the layouts if desired:
 - Active:** When selected, this option means that the resource can be assigned to work orders. For service tracking purposes, resources can't be deleted, so deactivating a resource is the best way to send them into retirement.
 - Capacity-Based:** Capacity-based resources are limited to a certain number of hours or appointments in a specified time period. A resource's capacity is defined in the Capacities related list.
 - Description:** A description of the resource.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To edit page layouts and set field history tracking:

- "Customize Application"

To create and edit users:

- "Manage Internal Users"

- **Include in Scheduling Optimization:** When selected, this option means that the service scheduling optimizer can assign this resource to work orders during the optimization process. Use only if the Field Service Lightning managed package is installed.

2. Assign user permissions.

Users Who Will...	Need These Permissions
Enable Field Service Lightning	"Customize Application"
View the Service Resources tab and service resources	"Read" on service resources
Create service resources	"Create" on service resources
Edit or deactivate service resources	"Edit" on service resources

3. Make the Service Resources tab visible to your users.

Users create and manage service resources from the Service Resources tab. You can add the tab to a custom app or instruct users to add the tab in Salesforce.

Create Service Resources

Service resources are users who can perform field service work. Create service resources so you can assign them to service appointments.

1. From the Service Resources tab, click **New**.
2. Enter a name and description.
You may want the name to be the name or title of the associated user.
3. If you want to assign the resource to service appointments, select **Active**.
4. Select **Capacity-Based** if the resource is limited to working a certain number of hours or appointments in a specified time period.
Contractors would likely be capacity-based.
5. If you're using the Field Service Lightning managed package with scheduling optimization, select **Include in Scheduling Optimization** to allow the scheduling optimizer to assign the resource to service appointments during the optimization process.
Only users with the Field Service Scheduling permission set license can be included in scheduling optimization.
6. Select the user that the resource is associated with.
7. Indicate whether the resource is a technician or dispatcher.
Resources who are dispatchers can't be capacity-based or included in scheduling optimization. Only users with the Field Service Dispatcher permission set license can be dispatchers.

 **Note:** If a user is both a technician and a dispatcher, you can create two service resource records for them.

8. Click **Save**.

Once a resource is created, add information about their capabilities.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create service resources:

- "Create" on service resources

1. In the Service Territories related list, select the territories where the resource is available to work.

Indicate whether each territory is the resource's primary, secondary, or relocation territory. The primary territory is typically the territory where they work most often—for instance, near their home base—while secondary territories are territories where they can be assigned to appointments if needed. Relocation territories represent temporary moves.

For example, a service resource might have the following territories:

- Primary territory: *West Chicago*
 - Secondary territories:
 - *East Chicago*
 - *South Chicago*
 - Relocation territory: *Manhattan*, for a three-month period
2. If the resource is capacity-based, define their capacity.
 - a. In the Capacity related list, click **New Resource Capacity**.
 - b. Enter a start date and an end date to indicate when the capacity is in effect for the resource. For example, if the capacity represents a six-month contract, enter the contract's start and end dates.
 - c. Specify how much the resource can work:
 - Select the **Time Period** that the capacity is based on: hours, days, or months. For example, if the resource can work 80 hours per month, select **Month**.
 - If you want the resource's capacity to be based on the number of hours worked, fill out **Hours per Time Period**. For example, if the resource can work 80 hours per month, enter *80*.
 - If you want the resource's capacity to be based on the number of service appointments they are assigned to, fill out **Work Items per Time Period**. For example, if the resource can complete 20 appointments per month, enter *20*.
 -  **Note:** If you're using the Field Service Lightning managed package and would like to measure capacity both in hours and in number of work items, enter a value for both. The resource is considered to reach their capacity based on whichever term is met first—hours or number of work items.
 - d. Click **Save**. You can set multiple capacities for a resource as long as their start and end dates do not overlap.
 3. In the Skills related list, assign skills to indicate the resource's areas of expertise. For details, see [Assign Skills to Service Resources](#).

SEE ALSO:

[Guidelines for Using Service Resources](#)

[Service Resource Fields](#)

Set Up Skills for Field Service

Assign skills to service resources to indicate the type of work that they can perform. You can also add required skills to work orders and work types so only resources with certain skills can be assigned to complete the work.

1. [Configure Skill Settings](#)

Before you create skills, add skill related lists to field service page layouts and specify who can view and create skills.

2. [Create Skills](#)

To get started with skills, create basic skills in your org. When you assign skills to service resources or mark them as required on work orders and work types, you can add details like skill level and duration.

3. [Assign Skills to Service Resources](#)

Assign skills to service resources to represent their certifications and areas of expertise.

4. [Add Required Skills to Work Orders or Work Types](#)

Add required skills to work orders, work order line items, or work types to ensure that the assigned service resources possess the right skills.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Configure Skill Settings

Before you create skills, add skill related lists to field service page layouts and specify who can view and create skills.

 **Note:** Field Service Lightning must be enabled in your org.

1. Customize page layouts.

- a. To be able to specify required skills on work types, add the Skill Requirements related list to work type page layouts.
- b. To be able to specify required skills on work orders, add the Skill Requirements related list to work order page layouts.
- c. To be able to specify required skills on work order line items, add the Skill Requirements related list to work order line item page layouts.
- d. To be able to assign skills to service resources, add the Skills related list to service resource page layouts.

2. Assign user permissions.

Users Who Will...	Need These Permissions
Enable Field Service Lightning	"Customize Application"
Create, update, and delete skills in Setup	"Customize Application"
Assign skills to service resources	"Edit" on service resources
View resources' skills	"Read" on service resources

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To edit page layouts:

- "Customize Application"

To create and edit users:

- "Manage Internal Users"

Users Who Will...	Need These Permissions
Add required skills to work orders, work order line items, or work types	"Edit" on work orders, work order line items, or work types
View required skills on work orders, work order line items, or work types	"Read" on work orders, work order line items, or work types

3. Decide how skill levels should be determined.

Skills assigned to a service resource or to a work order, work order line item, or work type can have a skill level from 0 to 99.99. For example, you can:

- Use the `Skill Level` field to indicate years of experience.
- Create a matrix that corresponds professional license classes to skill level numbers.

Tip:

- If you'd like to limit potential skill level values, create a validation rule that, for example, only allows multiples of 10.
- Create field-level help that lets your users know how skill level is determined.

Create Skills

To get started with skills, create basic skills in your org. When you assign skills to service resources or mark them as required on work orders and work types, you can add details like skill level and duration.

1. From Setup, enter `Skills` in the Quick Find box, then select **Skills** under Field Service.
2. Enter a name. For example, *Electrician Certification*.
3. Enter a description.
4. Skip the "Assign Users" and "Assign Profiles" sections, which are specific to Live Agent.
5. Click **Save**.

You can now assign the skill to service resources or list it as required on work types, work orders, and work order line items.

USER PERMISSIONS

To create skills:

- "Customize Application"

Assign Skills to Service Resources

Assign skills to service resources to represent their certifications and areas of expertise.

1. Navigate to the resource that needs a skill assigned.
2. In the Skills related list, click **New Service Resource Skill**.
3. Select a skill. Skills must be created before they can be assigned to a resource; to learn how, see [Create Skills](#).
4. Enter a skill level from 0 to 99.99 based on how your business measures skill level.
5. Enter a start date and, if needed, an end date. For example, if a technician must be recertified in a particular skill every six months, you can enter an end date that's six months later than the start date.
6. Click **Save**. The resource's skill now appears in their Skills related list.

Tip: To make it easier to track a resource's abilities, upload photos of licenses and certifications in the Files section on the resource's detail page.

SEE ALSO:

[Skill Fields for Field Service](#)

Add Required Skills to Work Orders or Work Types

Add required skills to work orders, work order line items, or work types to ensure that the assigned service resources possess the right skills.

If a work order or work order line item can only be completed by a service resource with a particular set of skills, add *required skills* to the record. Required skills help dispatchers assign the record to a service resource with the proper expertise. You can still assign a work order, work order line item, or related service appointment to a service resource that does *not* possess the required skills, so required skills serve more as a suggestion than a rule.

Note: If you're using the Field Service Lightning managed package, you can use matching rules to ensure that appointments are only assigned to service resources who possess the required skills listed on the parent work order.

If many of your work orders require the same skills, we recommend adding required skills to *work types* to save yourself some time and keep your processes consistent. When you add a required skill to a work type, work orders and work order line items that use that type automatically inherit the required skill. For example, if you know that all annual maintenance visits for your Classic Refrigerator product require a Refrigerator Maintenance skill level of at least 50, you can add that required skill to the Annual Maintenance Visit work type. When it's time to create a work order for a customer's annual fridge maintenance, adding that work type to the work order adds the required skill as well.

Note:

- When you create a work order from a work type, it inherits the work type's required skills, but you can then add or remove required skills on the work order.
- Changing the required skills on a work type doesn't affect the required skills on work orders that were created from that work type.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To assign skills to resources:

- "Edit" on service resources

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To add required skills to work orders, work order line items, or work types:

- "Edit" on work orders, work order line items, or work types

- If you add a work type to an existing work order, the work order only inherits the work type's required skills if the work order didn't yet have required skills. The same is true for work order line items.
- Work order line items don't inherit their parent work order's required skills.

To add a required skill to a work order, work order line item, or work type:

1. Navigate to the record that needs required skills.
2. In the Skill Requirements related list, click **New Skill Requirement**.
3. Select a skill. Skills must be created before they can be added as a requirement; to learn how, see [Create Skills](#).
4. Enter a skill level from 0 to 99. 99 based on how your business measures skill level.
5. Click **Save**. The skill now appears in the Skill Requirements related list on the record.

Set Up Work Orders

A work order represents work to be performed on your customers' products. Learn how to configure work order settings and create time-saving templates called work types.

1. [Configure Work Order Settings](#)
Control how your users work with work orders by customizing page layouts, user permissions, and more.
2. [Create Work Types](#)
Chances are, your business performs the same tasks for multiple customers. Work types are work order templates that save you time and make it easier to standardize your field service work.
3. [Create Work Orders](#)
Create work orders to track work to be performed for a customer.
4. [Choose Preferred Service Resources on Work Orders](#)
You can designate certain service resources as preferred, required, or excluded on specific accounts or work orders. Work orders inherit their associated account's resource preferences.
5. [Create Service Appointments](#)
Service appointments help you track field service work to be performed for customers. You can associate them with several types of records.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Configure Work Order Settings

Control how your users work with work orders by customizing page layouts, user permissions, and more.

1. Customize page layouts.

- a. To let users view and create work orders that are related to other records, add the Work Orders related list to other objects' page layouts. These objects' page layouts can include the related list:
 - Account
 - Asset
 - Case
 - Contact
 - Entitlement
 - Service Contract
 - Custom objects
- b. To let users view work order line items that are associated with a particular asset, add the Work Order Line Items related list to Asset page layouts.
- c. To let users make one work order the parent of another, add the `Parent Work Order` field and Child Work Orders related list to work order page layouts. To let users see the top-level work order in a work order hierarchy, you can also add the read-only `Root Work Order` field.
- d. To let users make one work order line item the parent of another line item, add the `Parent Work Order Line Item` field and Child Work Order Line Items related list to work order line item page layouts. To let users see the top-level line item in a work order line item hierarchy, you can also add the read-only `Root Work Order Line Item` field.
- e. If you want to be able to designate certain service resources as preferred, required, or excluded on a work order, add the Resource Preferences related list to work order page layouts. You can also establish resource preferences on accounts so every work order associated with the account inherits its resource preferences. To do so, add the Resource Preferences related list to account page layouts as well.

2. Assign user permissions.

Users Who Will...	Need These Permissions	Permissions Are Auto-Enabled on These Standard Profiles
Enable Field Service Lightning	"Customize Application"	System Administrator
View the Work Orders tab, work orders, and work order line items	"Read" on work orders	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create or clone work orders	"Create" on work orders	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Edit work orders	"Edit" on work orders	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Delete work orders	"Delete" on work orders	System Administrator

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To edit page layouts and set field history tracking:

- "Customize Application"

To create and edit users:

- "Manage Internal Users"

Users Who Will...	Need These Permissions	Permissions Are Auto-Enabled on These Standard Profiles
Create, clone, edit, or delete work order line items	"Edit" on work orders	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator

3. Make the Work Orders tab visible to your users.

Users create and manage work orders from the Work Orders tab. You can add the tab to a custom app or instruct users to add the tab in Salesforce.

 **Note:** The Work Orders tab is default ON for the following user profiles: Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator.

4. Optionally, add work orders as a navigation tab item in the service console.

5. If your org was created before Summer '16 and you want to use milestones on work orders, set field-level security on the following work order fields to expose them to specific user profiles:

- Business Hours
- Entitlement Process End Time
- Entitlement Process Start Time
- Is Closed
- Milestone Status
- Milestone Status Icon
- Stopped
- Stopped Since

 **Tip:** To set field-level security, from Setup, enter *Field Accessibility* in the Quick Find box, then click **Field Accessibility**. Click **Work Order**, then click **View by Fields** and select a field. Click **Hidden** next to a profile to view and update the field visibility settings.

6. Optionally, add your own custom values to the `status` picklist field on work orders or work order line items.

The Status field comes with these default values:

- New
- In Progress
- On Hold
- Completed
- Cannot Complete
- Closed
- Canceled

When you create a custom value, select a status category that the value falls into. The available status categories match the default status values. For example, if you create a `Waiting for Response` value, you may decide that it belongs in the `On Hold` category.

The `Status Category` field can be useful to reference in custom apps, triggers, and validation rules. Status categories let you extend and customize the work life cycle while still maintaining a consistent work classification for tracking, reporting, and business process management.

- If you want your team to be able to attach Knowledge articles to work orders or work order line items, add the Articles related list and the Knowledge One console component to your layouts.

Note: Knowledge must already be set up in your org.

- To let users view and modify linked articles from the console, navigate to work order page layouts in Setup. In the layout editor, select Custom Console Components and add the Knowledge One widget to the console sidebar (recommended).
- To let users view and modify linked articles from a work order's detail page, add the Articles related list to the work order detail page layout (recommended).
- To let users attach Knowledge articles to work order line items, follow the previous two steps for work order line items layouts.

Create Work Types

Chances are, your business performs the same tasks for multiple customers. Work types are work order templates that save you time and make it easier to standardize your field service work.

- From the Work Types tab, click **New**.
- Enter a name and description. Try to use a name that helps users quickly understand the type of work orders that can be created from the work type. For example, *Annual Refrigerator Maintenance or Valve Replacement*.
- Add an `Estimated Duration`, which is how long the work is estimated to take, and a `Duration Type` of Minutes or Hours.
- If you'd like a service appointment to be automatically created on work orders and work order line items that use the work type, select **Auto-Create Service Appointment**.

Note: By default, the Due Date on auto-created service appointments is seven days after the created date. Admins can adjust this offset from the Field Service Settings page in Setup.

- Click **Save**.
- If the task represented by the work type requires certain skills or certifications, define them in the Skill Requirements related list.
 - In the related list, click **New Skill Requirement**.
 - Select a skill. Skills must be created before they can be added as a required skill; to learn how, see [Create Skills](#).
 - Enter a skill level from 0 to 99.99 based on how your business measures skill level.
 - Click **Save**. Now, any work orders or work order line items linked to the work type inherits these required skills.
- To apply a work type to a work order or work order line item, select the work type in the `Work Type` lookup field on the record. When you add a work type, the work order or work order line item inherits the work type's duration values and required skills.

Note:

- If needed, you can update the duration values and required skills on a work order or work order line item after they're inherited from the work type.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create work types:

- "Create" on work types

To apply work types to work orders or work order line items:

- "Edit" on work orders

- If a work order or work order line item already has required skills, associating it with a work type doesn't cause it to inherit the work type's required skills.
- Customizations to required skills, such as validation rules or Apex triggers, are not carried over from work types to work orders and work order line items.

Example: Suppose you own a window company that often installs windows. Your window installations typically last 90 minutes. You can create a work type with the following settings:

- Name: *Window Installation*
- Description: *Standard installation of single- or double-paned windows*
- Estimated Duration: *90*
- Duration Type: *Minutes*
- Skill Requirements:
 - “Window Installation” with a skill level of 50
 - “Window Cleaning” with a skill level of 10
- The option to auto-create a service appointment is selected

When a customer needs a window installed, create a work order for them and select the *Window Installation* work type in the `Work Type` lookup field. This auto-populates the work order's duration and skill values and automatically creates a service appointment on the work order. High-five for efficiency!

[Guidelines for Using Work Orders](#)

[Work Type Fields](#)

Create Work Orders

Create work orders to track work to be performed for a customer.

You can create and edit work orders from the Work Orders tab or the Work Orders related list on supported objects. Some of the following settings may not be available to you depending on your page layouts and field-level security settings.

1. From the Work Orders tab or the Work Orders related list on a record, click **New**.
2. Optionally, select a work type. Work types are templates that auto-populate the work order's `Duration` and `Duration Type` fields and Skill Requirements related list.
3. Enter the address where the work order is taking place. Work orders inherit their address from the associated account. The work order's service appointments and line items inherit its address, though the address on line items can be updated.
4. Select an associated account and contact.
5. If applicable, select a parent work order.
6. If applicable, select an associated case.
7. Optionally, select a price book. This lets you select a corresponding price book entry (product) for each work order line item.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To create or clone work orders:

- “Create” on work orders

To create work order line items:

- “Edit” on work orders

8. If you're tracking pricing on work orders, enter the tax amount. For example, in a work order whose total price is \$200, enter *20* to apply a 10 percent tax. You can enter a number with or without the currency symbol and you can use up to two decimal places.
 9. Select a priority level.
 10. Select the service territory where the work order is taking place.
 11. Enter a duration and select a duration type. A duration of *3* and a duration type of *HOURS* means the work order is expected to be completed in 3 hours.
 12. If the work order involves a customer's asset, add it in the `ASSET` field.
 13. Add a subject and description. Try to describe the nature and purpose of the work to be completed.
 14. Click **Save**.
 15. Optionally, add further details in the work order's related lists.
 - a. Create line items via the Work Order Line Items related list. Work order line items represent specific tasks that a technician must perform to complete the work order. They can be marked as completed one by one, and can each have their own active service appointment. Pricing details like discounts and unit price are set at the line item level on work orders.
 - b. Specify which skills are required to complete the work order via the Skill Requirements related list. For details, see [Add Required Skills to Work Orders or Work Types](#).
 - c. Create a service appointment via the Service Appointments related list. Service appointments are where you assign service resources and add scheduling details. Work orders and work order line items can have multiple service appointments.
-  **Note:** If **Auto-Complete Service Appointment** is selected on the associated work type, a service appointment is automatically created when you create the work order.

Choose Preferred Service Resources on Work Orders

You can designate certain service resources as preferred, required, or excluded on specific accounts or work orders. Work orders inherit their associated account's resource preferences.

Add preferences to an account or work order via the Resource Preferences related list. Simply select the service resource, select a preference level, and save your changes.

 **Note:** You can't add preferences for service resources who are inactive or dispatchers.

Resource preferences serve more as a suggestion than a requirement. You can still assign a service appointment to any resource regardless of the related work order's resource preferences.

If you don't want to establish resource preferences at the account level, you can also create them on individual work orders if needed.

Example:

- If your customer, ABC Labs, has had positive experiences with Alicia, a service resource, you can create a resource preference on the ABC Labs account that designates Alicia as "Preferred"
- If ABC Labs had a bad experience with Nigel, a service resource, you can create a resource preference on the ABC Labs account that designates Nigel as "Excluded"
- If ABC Labs purchased a challenging piece of equipment which was installed by Evan, a service resource, you can create a resource preference on the ABC Labs account that designates Evan as "Required"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create resource preferences on accounts:

- "Edit" on accounts

To create resource preferences on work orders:

- "Edit" on work orders

When a work order is created for ABC Labs, it automatically lists those three preferences. When the time comes to schedule the work order, the dispatcher knows to assign the corresponding service appointment to Evan and, if a second technician is needed, to Alicia if she is available. The dispatcher also knows *never* to assign the account's service appointments to Nigel.

Create Service Appointments

Service appointments help you track field service work to be performed for customers. You can associate them with several types of records.

Service appointments can be added to work orders, work order line items, opportunities, accounts, or assets. To create a service appointment:

1. Navigate to the record that the appointment is associated with.
2. In the Service Appointments related list, click **New Service Appointment**.
3. Fill out the General Information section:
 - a. Add an appointment subject and description.
 - b. If needed, update the duration. If the parent record is work order or work order line item, the appointment inherits its duration from its parent.
 - c. Fill out the `Earliest Start Permitted` and `Due Date` fields, which together represent the window during which the appointment must be completed. These fields typically represent terms in the customer's service-level agreement.
4. Fill out the Scheduled Times section:
 - a. Add scheduled start and end times. If you're using the Field Service Lightning managed package with the scheduling optimizer, these fields are populated when the appointment is scheduled.
 - b. Define an arrival window, which is the window of time when the technician is expected to arrive at the site. This window is typically larger than the scheduled start and end window to allow time for delays and scheduling changes. You may choose to share the arrival window start and end with the customer, but keep the scheduled start and end internal-only.
5. Assign service resources to the appointment in the Assigned Resources related list. If the parent record is a work order, work order line item, or account, check the parent for any resource preferences.

 **Note:** Service resource who are dispatchers can't be assigned to service appointments.

6. When the technician completes the appointment, have them fill out the Actual Times section to indicate when the appointment started and ended. In addition, they can enter the number of minutes it took to travel to the appointment in the `Actual Travel Time` field on their assigned resource record.

 **Note:** You can also create service appointments from the Service Appointments tab.

Configure Field Service Location Settings

Control how your users work with Field Service locations.

 **Note:** Field Service Lightning must be enabled in your org.

Your service locations can be as large as a warehouse or as small as a tool box. They can be your client sites or your service vans. They vary in size, location, and what they contain, and they are unique to your company. Salesforce Field Service lets you create locations to fit your needs.

1. Assign [user permissions](#) on page 526.

Users Who Will...	Need These Permissions
Enable Field Service Lightning	"Customize Application"
View the Locations tab	"Read" on Locations
Create or clone locations	"Create" on Locations
Edit service locations	"Edit" on Locations
Delete service locations	"Delete" on Locations

2. Customize the Addresses page layout.

Addresses allow you to set up multiple addresses and address types. For example, a customer's shipping address may be different from the physical address.

- a. From Setup enter *Addresses* in the Quick Find box, then select **Page Layouts** under Addresses.
- b. Click **Edit** next to a layout you want to change or click **New** to create one.
- c. Select and arrange the [fields](#) on page 2863 on the addresses related list.
- d. Click **Save**.

3. Customize the *Associated Locations* page layout.

Associated locations allow you to set up associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

- a. From Setup enter *Associated Locations* in the Quick Find box, then select **Page Layouts** under Associated Locations.

USER PERMISSIONS

To edit page layouts and set field history tracking:

- "Customize Application"

To create and edit users:

- "Manage Internal Users"

- b. Click **Edit** next to a layout you want to change or click **New** to create one.
 - c. Select and arrange the [fields](#) on page 2863 on the associated locations related list.
 - d. Click **Save**.
4. Customize the Locations page layout.
 - a. From Setup enter *Locations* in the Quick Find box, then select **Page Layouts** under Locations.
 - b. Click **Edit** next to a layout you want to change or click **New** to create one.
 - c. Select and arrange the [fields](#) on the Locations page layout.
 - d. Add the *Product Items*, *Addresses*, and *Associated Locations* related lists to the Locations page layout.
 - e. Click **Save**.
5. Make the Locations tab visible to your users.

Users create and manage service locations from the Locations tab. You can add the tabs to a custom app or instruct users to add them in Salesforce.

Create Field Service Locations

Create inventory locations so you can track the parts stored there and restock when necessary.

 **Note:** Field Service Lightning must be enabled in your org.

1. From the Locations tab, click **New** or to change an existing location, click its name.
2. Enter a location name.
3. Select a [Location type](#).
4. To use this product item with Field Service, check *Inventory Location*.
5. If this location is a mobile, like a van or tool box, check *Mobile Location*.
6. Complete any other fields as appropriate.

Depending on the page layout, there might be other fields that are not required for Field Service but are helpful.
7. Click **Save**.

Set Up Parts and Van Stock

Parts and van stock represent a list of items necessary to complete work orders. Learn how to create parts and van stock and track their consumption and availability.

[Configure Parts and Van Stock Settings](#)

Control how your users work with parts and van stock.

Set Up Customer Service Reports

Make your customers happy with fast field service reports delivered to their inboxes. Your technicians and dispatchers can create reports for work orders, work order line items, and service appointments and email them directly to the customer. You can use standard templates or create variations of your own.

[Configure Customer Service Report Settings](#)

Control what information your customer service reports contain.

[Create a Customer Service Report](#)

Create customer service reports and provide detailed information on each work order, work order line item, and service appointment.

Configure Customer Service Report Settings

Control what information your customer service reports contain.

 **Note:** Field Service Lightning must be enabled in your org.

1. From Setup enter *Service Report* in the Quick Find box, then click **Service Report Templates** under Field Service.
2. Click **New** or **Edit** next to a report template you'd like to adjust.
3. If you are creating a template, select an existing template as its base and give it a name.
4. On the Service Report Template create page, add the [fields](#) on page 2869 to the appropriate sections.

You can change templates and their related objects. However, when you change templates without saving, you lose your changes.

 **Note:** Related Templates are

- Service Appointment for Work Order
- Service Appointment for Work Order Line Item
- Work Order
- Work Order Line Item

5. Click **Save**.

 **Note:** When you preview the report template, it shows the system administrator profile view. Depending on field-level security settings, other profiles may not see all fields. The data shown is simulated, except for images and rich text.

6. On the page layouts of Work Orders, Work Order Line Items, and Service Appointments, add the button **Create Service Report**.

Create a Customer Service Report

Create customer service reports and provide detailed information on each work order, work order line item, and service appointment.

 **Note:** Field Service Lightning must be enabled in your org.

1. From a work order, work order line item, or service appointment, click **Create Service Report**.
2. Use the lookup to find the template you'd like to use.
3. Click **Create Service Report**.
The service report preview displays.
4. To save the service report to the object, click **Create Service Report**. To save the report to the object and send a copy to the customer, click **Create and Send Service Report**.
The service report is saved in the Service Reports related list on its object (work order, work order line item, or service appointment).
5. To send the service report to the customer, fill out the Send Email information as appropriate, and click **Send**.

Create Field Service Lightning Reports

Create report types to track field service progress in your org.

You can create a variety of custom report types to stay informed about field service records.

1. From Setup, enter *Report Types* in the Quick Find box, then select **Report Types** and click **New Custom Report Type**.
2. In the Primary Object drop-down menu, select the field service object you want to report on:

Primary Object	Description	Available Secondary Objects
Operating Hours	View the operating hours of service territories and their members.	Service Territories Time Slots
Service Appointments	Compare the differences between scheduled and actual appointment times, and analyze trends in resource assignment on appointments.	Assigned Resources
Service Resources	Compare service resources' capacities, absences, and skills, and view the territories they belong to and service appointments they are assigned to. And, see which accounts or work orders list resources as preferred.	Assigned Resources Resource Absences Resource Capacities Resource Preferences Service Resource Skills Service Territory Members

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create service reports:

- "Create" on Service Report

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Field Service Lightning features and managed package are available in **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud. Work orders are also available in **Professional** Edition.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

Primary Object	Description	Available Secondary Objects
Service Territories	Compare the number and types of service appointments, work orders, and work order line items across service territories, and view the service resources who belong to each territory.	Service Appointments Service Territory Members Work Orders Work Order Line Items
Work Orders	Compare information such as the number of appointments or line items per work order, or work order service territories. And, analyze how resource preferences and skill requirements vary between work orders.	Resource Preferences Service Appointments Skill Requirements Work Order Line Items
Work Order Line Items	Compare information such as work order line items' owners, duration, and subject, and view service appointments and skill requirements associated with work order line items.	Service Appointments Skill Requirements
Work Types	Compare information such as work type duration and skill requirements.	Skill Requirements
Accounts	Compare accounts' resource preferences and work orders.	<i>Field service objects:</i> Resource Preferences Work Orders
Assets	Compare the number and characteristics of work orders associated with assets.	<i>Field service objects:</i> Work Orders
Cases	Compare the number and characteristics of work orders associated with cases.	<i>Field service objects:</i> Work Orders
Contacts	Analyze the service appointments and work orders associated with contacts.	<i>Field service objects:</i> Service Appointments Work Orders
Entitlements	Compare the number and characteristics of work orders associated with entitlements.	<i>Field service objects:</i> Work Orders
Service Contracts	Compare the number and characteristics of work orders associated with service contracts.	<i>Field service objects:</i> Work Orders

3. Complete the required fields and click **Next**.

 **Tip:** In the `Store in Category` drop-down menu, we recommend choosing **Customer Support Reports** or **Other Reports**. This is the category where users find the custom report type on the Reports tab. You can also create your own field service report folder. Make your choices on the Define Report Records Set page.

4. Click **Save**.
5. As needed, remove and rearrange fields from your report layout.

Field Service Lightning Considerations

Before you set up Field Service Lightning, review these important considerations about its features.

[Field Service Lightning Limits and Limitations](#)

Learn about the limits and limitations that exist for Field Service Lightning.

[Location Tracking in Field Service Lightning](#)

When you add a street address to certain types of field service records, Salesforce calculates the address's latitude, longitude, and location accuracy. You can reference this data, which is visible only in the API, in any custom field service applications.

[Considerations for Using Work Orders](#)

Gain insight into the ways you can and should use work orders to make your business run smoothly.

Field Service Lightning Limits and Limitations

Learn about the limits and limitations that exist for Field Service Lightning.

Linked Articles

Linked articles are Knowledge articles attached to work orders or work order line items. They include the following limitations.

- The Article widget and Feed Articles Tool aren't available in the feed view.
- Quick actions and global actions aren't supported for linked articles.
- The Article Toolbar on the Knowledge home page doesn't include the option to attach articles to work orders or work order line items.
- The Linked Work Orders and Linked Work Order Line Items related lists on articles aren't available in Lightning Experience or Salesforce1.
- Linked articles are view-only in Lightning Experience and Salesforce1.
- In Lightning Experience, clicking an article link in a feed item redirects you to the article page in Salesforce Classic. In Salesforce1, linked articles can't be accessed from feed items.

Operating Hours

You can't create custom fields on operating hours or time slots.

Service Territories

- A service territory hierarchy can contain up to 500 territories.

Work Orders

- A work order hierarchy can have up to 10,000 work orders.
- A work order line item hierarchy can have up to 10,000 work order line items.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Field Service Lightning features and managed package are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud. Work orders are also available in **Professional** Edition.

Salesforce1

The Field Service Lightning standard features and managed package are available in all versions of the Salesforce1 mobile app. They include the following limitations:

- In the Salesforce1 downloadable app for iOS:
 - You can't create service appointments, and the Recent related list isn't available.
 - You can't create new service resources or absences, and the Recent related list isn't available on service resources or absences.
- On field service records created via a related list, the field that lists the parent record doesn't populate until you save the record. This issue applies to all versions of Salesforce1. For example, when you create a service appointment from the Service Appointments related list on a work order, the `ParentRecord` field is blank until you tap **Save**. Once the record is created, the parent record field lists the parent work order as expected.
- The dispatcher console, which is part of the managed package, isn't available in Salesforce1.

Location Tracking in Field Service Lightning

When you add a street address to certain types of field service records, Salesforce calculates the address's latitude, longitude, and location accuracy. You can reference this data, which is visible only in the API, in any custom field service applications.

This location data feature, known as "geocoding", is enabled for all supported field service objects when you enable Field Service Lightning. In the API, you'll notice values in the following three fields on work orders, work order line items, service appointments, service territories, resource absences, and service territory members:

Field Name	Description
<code>Latitude</code>	The latitude of the street address.
<code>Longitude</code>	The longitude of the street address.
<code>GeocodeAccuracy</code>	<p>The accuracy of the latitude and longitude. This field contains one of the following values, listed in order from most to least accurate:</p> <ul style="list-style-type: none"> • <code>Address</code>—In the same building • <code>NearAddress</code>—Near the address • <code>Block</code>—Midway point of the block • <code>Street</code>—Midway point of the street • <code>ExtendedZip</code>—Center of the extended zip code area • <code>Zip</code>—Center of the zip code area • <code>Neighborhood</code>—Center of the neighborhood • <code>City</code>—Center of the city • <code>County</code>—Center of the county • <code>State</code>—Center of the state • <code>Unknown</code>—No match for the address was found (for instance, the address is invalid)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Keeping Geocoding Data Current

Salesforce periodically refreshes these three geocoding fields to ensure their accuracy. The refreshes are managed by a feature known as “clean rules” (because they keep your data clean and current!). A record’s geocoding fields are refreshed when:

- The record is created or updated
- The record type’s clean rule is deactivated and reactivated

Note:

- Allow some time for the geocoding fields to refresh. The amount of processing time varies based on how many records are being updated at once.
- If bulk geocoding is turned off for a clean rule, deactivating or reactivating the rule does not refresh the geocoding fields. Bulk geocoding is enabled by default.

You can keep an eye on the status of a record’s geocoding data in several ways.

- *If you’re using Salesforce Classic:*

Add the Clean This Record with Data.com related list to the detail page layout of the records you’d like to track. The related list includes:

- The time the record’s geocoding data was last refreshed.
- The record’s geocoding status. To learn what each status means, see [Data.com Clean Statuses](#). The `In Sync` status means that your geocoding data is current.
- A **Clean** link which lets you manually run an instant refresh.

- *If you’re using Lightning Experience*

On the record, select **Check Clean Status** in the action drop-down menu to view its geocoding status.

Turn Off GPS Tracking for Individual Users

If your org has tracking turned on at the org level, but a few technicians need it off, add the `Exclude Technician from Geolocation Tracking` permission on their user profile.

How to Opt Out

If you’re already using another geocoding service and prefer not to use this feature, you can opt out of Field Service Lightning geocoding.

1. From Setup, enter `Data.com` in the Quick Find box, then select **Clean Rules** under Data.com Administration.
2. Find the entries for Field Service Lightning and click **Deactivate** next to each rule:
 - Geocodes for Work Order Address
 - Geocodes for Work Order Line Item Address
 - Geocodes for Service Appointment Address
 - Geocodes for Service Territory Address

- Geocodes for Service Territory Member Address
- Geocodes for Resource Absence Address

 **Note:**

- If you're using the Field Service Lightning managed package, opting out of geocoding means that latitude, longitude, and geocode accuracy are no longer calculated for field service records. Without this geocoding data, the scheduling optimizer doesn't function properly.
- If you were using work orders before Winter '17, enabling Field Service Lightning automatically turns on geocoding for all existing work orders in your org and populates their geocoding fields. If you don't enable Field Service Lightning, the geocoding feature isn't available for work orders.

Considerations for Using Work Orders

Gain insight into the ways you can and should use work orders to make your business run smoothly.

[How Work Orders Fit Into Your Support Process](#)

Work orders are a handy support tool, particularly if you offer field service. You can incorporate work orders into your support process in several ways.

[How Pricing Works on Work Orders](#)

Work orders and work order line items have several price-related fields. Find out how they interact and how to use them.

[Apex Code Samples for Work Orders](#)

Use these Apex samples to customize and automate the role of work orders in your support process.

How Work Orders Fit Into Your Support Process

Work orders are a handy support tool, particularly if you offer field service. You can incorporate work orders into your support process in several ways.

Here are some recommended approaches:

Situation	How to Use Work Orders to Address the Situation
<p>Fixing a broken asset: A customer purchases an asset (like a car) from you. They experience a problem with the asset, so they call you to report the problem. An agent creates a case from the call, and determines that a technician must be sent to the customer to repair the asset.</p>	<ol style="list-style-type: none"> 1. The agent creates a "Repair Asset" work order for the asset with a brief description of the problem. 2. The agent creates a service appointment on the work order and assigns it to an available service resource. 3. The service resource is dispatched to repair the asset.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Situation	How to Use Work Orders to Address the Situation
	<ol style="list-style-type: none"> 4. The service resource learns that a crucial replacement part is missing. She changes the status of the service appointment to <i>Completed</i> and creates a second service appointment on the work order to install the replacement part. 5. When the part is installed and the second appointment is completed, the assigned service resource changes the status on both the service appointment and its parent work order to <i>Completed</i>. 6. The agent closes the case.
<p>Performing preventive maintenance: A customer purchases an asset from you and covers it with a five-year preventive maintenance contract. The contract entitles the customer to one preventive maintenance checkup each year. The annual maintenance checkup is represented in Salesforce by an entitlement that’s linked to the asset record.</p>	<ol style="list-style-type: none"> 1. A service agent creates an “Annual Maintenance Checkup” work order on the asset. 2. The agent adds line items to the work order which represent the maintenance tasks that the technician must complete. 3. The agent creates a service appointment on the work order and assigns it to a service resource. 4. The service resource is dispatched to complete the maintenance check. 5. As each line item on the work order is completed, the resource changes the line item status to <i>Completed</i>. When all line items are complete, the resource changes the status of both the service appointment and its parent work order to <i>Completed</i>. 6. For the following annual maintenance on the asset, the agent can quickly create a clone of this work order.

While these approaches reflect typical uses of work orders, there are many ways to customize the way you use work orders. Here are some examples.

- Create a “New Work Order” quick action on assets, cases, and accounts.
-  **Note:** Entitlements and service contracts don’t support quick actions.
- Set up a quick action on work orders that automatically updates new work orders’ account, asset, and contact fields to match their parent record.
- If your org uses hierarchical assets, track specific subtasks more accurately by associating work order line items with different assets. For example, a work order linked to the “automobile” asset can have a line item linked to the child “headlight” asset. You can add the Work Order Line Items related list to asset page layouts to let users view all line items associated with an asset.

For Apex code samples that you can use to customize work orders in your org, see [Apex Code Samples for Work Orders](#).

SEE ALSO:

- [Guidelines for Using Work Orders](#)
- [Set Up Work Orders](#)

How Pricing Works on Work Orders

Work orders and work order line items have several price-related fields. Find out how they interact and how to use them.

Work orders contain the following price-related fields. If you intend to use these fields, add them to work order page layouts.

Work Order Field	What It Represents
Discount	(Read only) The weighted average of the discounts on all line items on the work order. It can be any positive number up to 100.
Subtotal	(Read only) The total of the work order line items before discounts and taxes are applied.
Total Price	(Read only) The total of the work order line items' price after discounts but before tax is added.
Grand Total	(Read only) The total price of the work order with tax added.
Price Book	The price book associated with the work order. Adding a price book to the work order lets you link each work order line item to a product included in the price book.
Tax	The total tax on the work order in a currency format. (Do not enter a percentage.) For example, in a work order whose total price is \$100, enter \$10 to apply a 10 percent tax. You can enter a number with or without the currency symbol and you can use up to two decimal places.

And *work order line items* contain these price-related fields. If you intend to use these fields, add them to work order line item page layouts.

Work Order Line Item Field	What It Represents
Discount	The percent discount to be applied to the line item's subtotal. You can enter a number with or without the percent symbol and you can use up to two decimal places.
Subtotal	(Read only) The line item's unit price multiplied by the quantity.
Total Price	(Read only) The line item's subtotal with discounts applied. This field is blank until you add a unit price and save the line item.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Work Order Line Item Field	What It Represents
List Price	<p>(Read only) The price of the line item (product) as listed in its corresponding price book entry. If a product isn't selected, the list price defaults to zero.</p> <p> Note: When you select a product to link to the line item, you can see the product's list price next to its name and ID in the lookup window. The list price field populates when you save the line item.</p>
Product	<p>The name of the product associated with the line item. The lookup only lists products that are included in the parent work order's price book. When you select a product and save the line item, the following fields are populated on the line item:</p> <ul style="list-style-type: none"> • List Price • Unit Price • Subtotal • Total Price <p> Note: Inline editing isn't supported on the Product field. To change the product on a line item, click Edit. Adding a product updates the list price, unit price, subtotal, and total price based on the related entry in the work order's price book.</p>
Unit Price	<p>By default, the unit price for a work order line item is the line item's list price from the price book, but you can change it.</p>

When filling out price fields on work orders and their line items, keep these guidelines in mind:

- To apply a discount to a work order, apply the discount at the line item level. If your work order doesn't have line items, its discount is zero.
- When filling out price fields on a work order, just fill out the `Price Book` and `Tax` fields. The `Discount`, `Subtotal`, `Total Price`, and `Grand Total` fields are all automatically calculated based on line item fields.
- When filling out price fields on a work order line item, just fill out the `Product` and `Discount` fields. The `Subtotal`, `Total Price`, `List Price`, and `Unit Price` fields are all automatically calculated based on other line item fields.
- Work order line items don't have to be linked to a product. For example, you might prefer to use work order line items to track tasks. Just keep in mind that if the `Product` field is blank, you can't use the `List Price`, `Unit Price`, `Discount`, `Quantity`, `Subtotal`, or `Total Price` fields.

 **Note:**

- You can't delete a price book that's linked to a work order.
- You can't delete a product that's linked to a work order line item.
- You can't delete a price book entry that's linked to a work order line item. Price book entries are linked to work order line items via the `Product` lookup field.
- You can't remove a price book from a work order if its line items are linked to products from that price book.

- Products cannot be added to work order line items in Lightning Experience. Use Salesforce Classic or the API. If a work order line item was created in Salesforce Classic and includes a product, the quantity and unit price can be updated in Lightning Experience, but the product can't be updated.

[Work Order Fields](#)

[Work Order Line Item Fields](#)

[Set Up Work Orders](#)

Apex Code Samples for Work Orders

Use these Apex samples to customize and automate the role of work orders in your support process.

Tip: New to Apex? Check out the [Force.com Apex Code Developer's Guide](#).

Sample Trigger 1

This trigger prevents users from closing a work order unless all its line items have been closed. It's a good way to ensure that all scheduled tasks are completed.

To define a work order trigger in your org:

1. From Setup, enter *work orders* in the Quick Find box, then click **Triggers** under Work Orders.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```
trigger ValidateWorkOrderLineItem on WorkOrder (before update) {
    for(WorkOrder w : Trigger.New) {
        if(w.Status == 'Closed'){
            List<WorkOrderLineItem> woLineItemList = [Select wo.Status
                From WorkOrderLineItem wo where wo.WorkOrderId=:w.Id];
            if(woLineItemList.isEmpty()==false){
                for(WorkOrderLineItem woLineItem : woLineItemList){
                    if(woLineItem.Status != 'Closed'){
                        w.addError('You cannot close a work order until all of its
line items are closed.');
```

Sample Trigger 2

This trigger automatically closes a case when a work order on the case is marked Closed. If a case has multiple work orders, the trigger fires when the first work order is marked Closed. That way, the support agent doesn't have to manually close the case after the related work is complete.

```
trigger CloseCaseWhenWoId on WorkOrder (after update) {
    for (WorkOrder wo: Trigger.new) {
```

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

```

        try {
            if (wo.Status == 'closed') {
                Case ca = [SELECT Status from case where id = :wo.CaseId];
                ca.Status = 'closed';
                update ca;
            }
        } catch (Exception e) {

        }
    }
}

```

Trigger 2 Unit Test

You can set up Apex unit tests in the developer console to scan your code for any issues. To keep things running smoothly, Salesforce requires at least three-quarters of your Apex code lines to be covered by tests. This unit test applies to Sample Trigger 2.

```

@isTest
private class WOTriggerTest {
    static testMethod void validateWO() {
        Case ca = new Case();
        ca.Origin = 'Phone';
        ca.Status = 'new';
        insert(ca);
        WorkOrder wo = new WorkOrder();
        wo.Subject = 'test';
        wo.Status = 'closed';
        wo.CaseId = ca.Id;
        insert(wo);
        update(wo);
        Case cal = [SELECT Status from Case where id= :ca.Id];
        System.assertEquals('Closed', cal.Status);
    }
}

```

Work Order Apex Class

Apex classes reduce the size of your triggers and make it easier to reuse and maintain Apex code. This class, which you can reference in triggers, creates a work order with one line item.

```

public class CreateWorkOrderLineItem{
    public WorkOrderLineItem createWorkOrderLineItem(){
        WorkOrder wo = new WorkOrder();
        wo.subject = 'title';
        insert wo;
        WorkOrderLineItem woli = new WorkOrderLineItem();
        woli.workOrderId = wo.Id;
        woli.description = 'abcd';
        return woli;
    }
}

```

Work Order Apex Class Unit Test

This unit test applies to the Work Order Apex Class.

```

@isTest
public class TestWorkOrderLineItem {

```

```
static testMethod void testCreateWorkOrderLineItem()  
{  
    CreateWorkOrderLineItem cwoLi = new CreateWorkOrderLineItem();  
    cwoLi.createWorkOrderLineItem();  
}  
}
```

[Guidelines for Using Knowledge with Work Orders](#)

You can attach Knowledge articles to work orders and work order line items to help technicians in the field access important procedural info, guidelines, specs, and more.

Guidelines for Using Service Territories

Service territories represent regions in which your team performs field service work. Learn how to create and manage service territories.

Viewing Service Territories

View service territories on the Service Territories tab. You can also view a service resource's territories on the Service Territories related list on the resource detail page.

Creating Service Territories

If you want to use service territories, determine which territories you need to create. Depending on how your business works, you may decide to create territories based on cities, counties, or other factors. If you plan to build out a hierarchy of service territories, create the highest-level territories first. Service territory hierarchies can contain up to 500 territories.

Create service territories from the Service Territories tab in Salesforce. After you create a territory, you can add members to it via the Service Territory Members related list. Service territory members are resources who work within the territory, and associating them with a territory ensures that they're assigned to appointments near their home base.

Assigning Service Territories to Service Resources

You can link a service resource to multiple territories to indicate where they are available to work. Assign territories to a resource via the Service Territories related list on the resource detail page, or via the Service Territory Members related list on the territory detail page.

When you assign a territory to a resource, use the `Type` field to indicate whether the territory is a primary, secondary, or relocation territory for the resource.

- The *primary* territory is typically the territory where the resource works most often—for instance, near their home base. Resources can have only one primary territory.
- *Secondary* territories are territories where the resource can be assigned to appointments if needed. A resource can have more than one secondary territory.
- *Relocation* territories represent temporary moves. If you're using the Field Service Lightning managed package with the scheduling optimizer, resources with relocation territories are always assigned to services within their relocation territories during the specified relocation dates. If they don't have a relocation territory, the primary territories are favored over the secondary.

Deleting Service Territories

You can't delete a service territory with service appointments. If you try to delete it, you're prompted to assign the appointments to a different territory.

If you delete a service territory with members, the resources who were members no longer have any connection to the territory.

SEE ALSO:

[Set Up Service Territories](#)

[Service Territory Fields](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To view service territories:

- "Read" on service territories

To create service territories:

- "Create" on service territories

To delete service territories:

- "Delete" on service territories

To assign service resources to service territories:

- "Edit" on service territories

Guidelines for Using Service Resources

Service resources are users who can perform field service work. Learn how to create and manage service resources.

Viewing Service Resources

View service resources on the Service Resources tab. In addition:

- Resources that are assigned to a service appointment appear in the Assigned Resources related list on the appointment detail page
- Resources that belong to a service territory appear in the Service Territory Members related list on the territory detail page

Creating Service Resources

Create service resources from the Service Resources tab. A user can have up to two associated service resource records if each record is a different Resource Type (Technician or Dispatcher)/

Assigning Service Resources to Service Appointments

Assign a resource to a service appointment via the Assigned Resources related list on the appointment detail page. If needed, you can modify the related list layout from the Assigned Resources node in Setup. You can assign multiple resources to an appointment.

Deactivating Service Resources

For tracking purposes, resources can only be deactivated, not deleted. To deactivate a user, deselect **Active** on their detail page.

Deactivating a user deactivates the related service resource. You can't create a service resource that is linked to an inactive user.

Viewing Service Resource Schedules

The Service Appointments related list shows all appointments that a resource is assigned to, while the Absences related list on a resource lets you define periods of time when a resource is unavailable to work. Unless you're using the Field Service Lightning managed package with the scheduling optimizer, resources can still be assigned appointments that conflict with their absences.

 **Tip:** Create a trigger that sends an approval request to a supervisor when a resource creates an absence.

If you're not using the Field Service Lightning managed package, a calendar view isn't available for individual service resources.

Adding Preferred Service Resources to Accounts

See [Guidelines for Using Service Resources](#) on page 2840.

Work orders help you track tasks to be performed on a product. Learn how to create and manage work orders.

Viewing Work Orders

Work orders can be associated with accounts, assets, cases, contacts, entitlements, service appointments, service contracts, and other work orders. View work orders on the Work Orders tab. The Work Orders related list on the following record detail pages also lists the work orders associated with a record:

- Accounts
- Assets
- Cases
- Contacts
- Entitlements
- Service contracts

 **Tip:** If your Salesforce admin has set up the console to include work orders, click the Console tab to view and edit work orders and their associated records in one place.

Creating Work Orders

You can create and edit work orders from the Work Orders tab or the Work Orders related list on supported objects. Depending on how work orders are set up in your organization, this related list may not be available on some records.

 **Tip:** When you create a work order, add *line items* to the work order via the Work Order Line Items related list. Work order line items represent specific tasks that a technician must perform to complete the work order. They can be marked as completed one by one, and make it easier to track and improve field service processes. Pricing details like discounts and unit price are set at the line item level on work orders.

Deleting Work Orders

Delete work orders on the work order's detail page or the Work Orders related list. Deleting a work order moves it to the Recycle Bin. Any notes, attachments, activities, line items, and service appointments associated with the work order are also deleted. If you undelete the work order, the associated items are undeleted.

Work Order and Work Order Line Item Status

Work orders and their line items have a status to track progress towards completing the tasks or activities.

Picklist Status	Status Category	Description
None	None	Default value

Picklist Status	Status Category	Description
New	New	New work order, no activity has started
Canceled	Canceled	Work is canceled, typically before any work is started
In Progress	In Progress	Work has started
On Hold	On Hold	Temporary pause in work
Completed	Completed	Work completed successfully
Cannot Complete	Cannot Complete	Work couldn't be completed successfully
Closed	Closed	All work and associated activity is finished

Customizing Work Order Status Values

In orgs created during or after Winter '17, the default status values on both work orders and work order line items are automatically assigned to their corresponding status category. For example, the `New` status has a status category of `New`. However, if work orders were enabled in your org before Winter '17, existing status values have a status category of `None` which can't be updated. If you want to change the status category from `None` for an existing status value, a little housekeeping in Setup is necessary. These steps apply to status values on both work orders and work order line items.

Step	Example
<p>Step 1. Ensure you have all original seven status categories</p>	<p>If you have deleted or changed the original status values, recreate status until you have all seven:</p> <ul style="list-style-type: none"> • <code>New</code>—Work order was created, but there hasn't yet been any activity. • <code>In Progress</code>—Work has begun. • <code>On Hold</code>—Work is paused. • <code>Completed</code>—Work is complete. • <code>Cannot Complete</code>—Work could not be completed. • <code>Closed</code>—All work and associated activity is complete. • <code>Canceled</code>—Work is canceled, typically before any work began. <p> Note: Your default setup may have hidden status categories. You must also create new status values for those status categories.</p>
<p>Step 2. For each status value, create a new "dummy" status value with a modified name and an appropriate status category.</p>	<p>If you have a status value of <code>Completed</code>, create an additional status value with these settings:</p> <ul style="list-style-type: none"> • Name: <code>Completed_1</code> • Status Category: <code>Completed</code>

Step	Example
	 Note: Your default setup may have hidden status categories. You must also create new status values for those status categories.
Step 3. Edit the status category of the original status value that your dummy value was based on.	Edit the <code>Completed</code> status value so its status category is <code>Completed</code> .
Step 4. To keep things tidy, delete the dummy value.	Delete the <code>Completed_1</code> value that you created.

Parent and Child Work Orders

Child work orders are complete work orders. They are simply related to each other in hierarchy of parent and related child records. Use child work orders when you want to manage each one of them as individual entities. Child Work Orders can be scheduled, given statuses, and assigned. They can each have their own set of work order line items to describe the tasks required to perform the work. Cancellations are a common reason to use parent and child work orders. When work is canceled, you can use the work order status to indicate it's been canceled and create a new related child work order. This allows your company to track first-time rates and analyze cancellations reasons.

Sharing Work Orders

You may be able to grant extra access to work orders beyond what your org's default sharing model allows. However, you can't make the sharing model more restrictive than the default.

To see who has access to a work order, click **Sharing** on the work order's detail page. Work order line items inherit their parent work order's sharing settings.

To learn how to set up sharing rules to control work order sharing, see [Create Work Order Sharing Rules](#).

How Work Orders and Service Appointments Work Together

Service appointments on work orders and work order line items offer a more detailed view of the work being performed. While work orders and work order line items let you enter general information about a task, service appointments track the details about the site visits and work performed.

Service appointments have a parent record. Field Service Lightning is optimized to use work orders and work order line items as the parent records of Service Appointments. Work orders and work order line items provide important capabilities such as relationships to pricebooks and Salesforce Knowledge. The technician experience in the Field Service Lightning mobile app is also optimized for service appointments with work orders or work order line items as the parent record.

How Work Orders and Assets Work Together

Linking work orders to assets helps you track the work that is performed on the asset, whether it's installation, repair, or preventive maintenance. You can link a work order to an asset via the Work Orders related list on the asset detail page or the Asset lookup field on the work order. When you're linking work orders to assets, follow these guidelines:

- If a work order is related to a particular asset, link the work order to the asset in Salesforce so you can easily track the work.
- If a case is opened because a customer experiences a problem with an asset, you may need to create a work order to inspect or repair the asset. Link the work order to the case so the case owner can track its progress.
- If you need to track periodic standard maintenance on assets, link the related work order to the entitlement or service contract that accounts for the maintenance.

Reporting on Work Orders

Create custom report types to keep track of work orders in your org. For details, see [Create Field Service Lightning Reports](#).

 **Note:** You can also use the Object Milestones custom report type to view work orders with milestones in your org. The `Milestone Status` and `Milestone Status Icon` fields are not available in work order reports.

Attaching Knowledge Articles to Work Orders

You can attach Knowledge articles to work orders and work order line items so field technicians can quickly access product specs, instructions, and more. To learn more, see [Guidelines for Using Knowledge with Work Orders](#).

[Considerations for Using Work Orders](#)

[Work Order Fields](#)

Guidelines for Using Service Appointments

A service appointment is an appointment for a field service technician to perform work for a customer. Learn how to create and manage service appointments.

Viewing Service Appointments

View service appointments on the Service Appointments tab. Service appointments also appear on several record detail pages:

- A service resource's assigned appointments appear in the Service Appointments related list on the resource detail page.
- A record's related service appointments appear in the Service Appointments related list on the record detail page. Accounts, assets, opportunities, work orders, and work order line items can have service appointments.

Creating Service Appointments

Create service appointments via the Service Appointments tab or from the Service Appointments related list on a supported record. You can't create service appointments from the Service Appointments related list on a service resource, but you can assign the resource to existing service appointments.

Deleting Service Appointments

You can delete a service appointment to indicate that it has been canceled. Deleting a record deletes its child service appointments.

Associating Service Appointments with Other Records

Service appointments always have a parent record, which can be a work order, work order line item, opportunity, account, or asset. The type of parent record tells you about the nature of the service appointment:

- Service appointments on *work orders* and *work order line items* offer a more detailed view of the work being performed. While work orders and work order line items let you enter general information about a task, service appointments are where you add the details about scheduling and ownership.
- Service appointments on *assets* represent work being performed on the asset.
- Service appointments on *accounts* represent work being performed for the account.
- Service appointments on *opportunities* represent work that is related to the opportunity.

For example, suppose you create a work order to track a customer's annual refrigerator maintenance. In the Service Appointments related list on the work order, you create an Annual Maintenance appointment.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To view service appointments:

- "Read" on service appointments

To create service appointments:

- "Create" on service appointments

To delete service appointments:

- "Delete" on service appointments

To assign service resources to service appointments:

- "Edit" on service appointment AND "View" on service resources

During the appointment, the technician completes most of the maintenance but determines that a replacement part must be ordered and installed. The technician changes the appointment status to `Cannot Complete`, and a second service appointment is created on the work order to track the installation. When the second appointment is completed and it is determined that the fridge is fully repaired, the second appointment and the work order can then be closed. Easy as pie!

[Service Appointment Fields](#)

Guidelines for Using Knowledge with Work Orders

You can attach Knowledge articles to work orders and work order line items to help technicians in the field access important procedural info, guidelines, specs, and more.

Suggesting an Article

From the Field Service Settings page, you can set which fields on work orders and work order line items are used to suggest relevant articles.

1. From Setup enter *Field Service* in the Quick Find box, then select **Field Service Settings** under Field Service.
2. In the work order and work order line item field lists, select which fields you want the search engine to use when suggesting relevant articles from your knowledge base.
3. Click **Save**.

Attaching an Article

You can attach an article to a work order or work order line item in two ways:

- Navigate to the record to which you want to attach the article. In the Knowledge One widget in the console, search for an article. In the article's action menu, click **Attach to Work Order** or **Attach to Work Order Line Item**.
- Navigate to the record to which you want to attach the article. In the Articles related list, click **Find Articles**. Use the search to locate your article, then click **Attach to Work Order** or **Attach to Work Order Line Item** in the article's action menu.

Viewing an Attached Article

Articles attached to a work order or work order line item appear in the Knowledge One widget and the Articles related list on the record. View an article by clicking its title. You can also navigate to attached articles from the feed of a work order or work order line item if feed tracking for related lists is enabled.

On article detail pages, the Linked Work Orders and Linked Work Order Line Items related lists show which records an article is attached to.

Detaching an Article

You can detach an article from a work order or work order line item in two ways:

- Navigate to the record that the article is attached to. In the Knowledge One widget in the console, click **Detach from Work Order** or **Detach from Work Order Line Item** in the article's action menu.
- Navigate to the record that the article is attached to. In the Articles related list, click **Detach** next to the article.

Updating an Attached Article

If an article is out of date, you can publish a new version by navigating to the article and clicking **Edit**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To attach or detach an article on a work order or work order line item:

- "Read" on work orders AND "Read" on the article type AND Knowledge enabled

To edit page layouts:

- "Customize Application"

To edit console layouts:

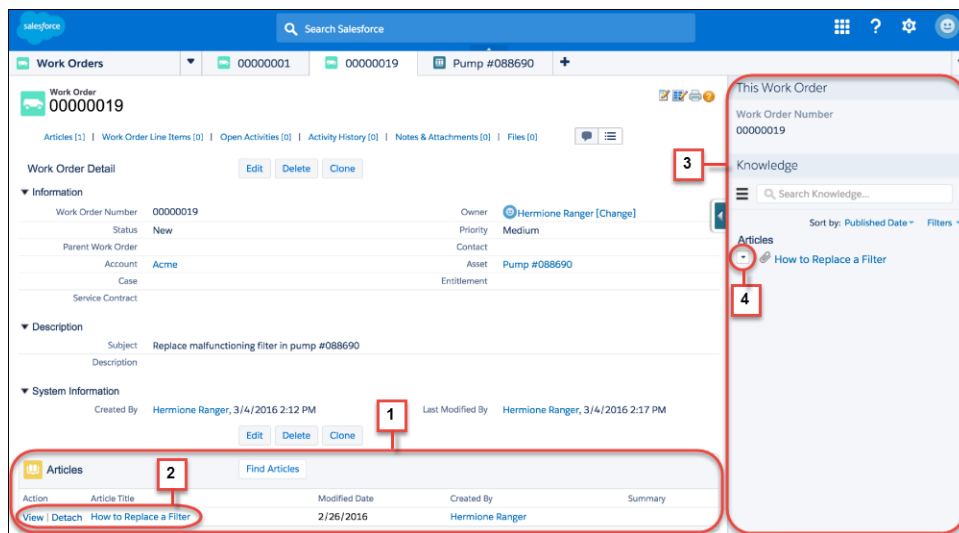

- "Customize Application" AND "Service Cloud User"

When you attach an article to a record, that version of the article stays associated with the record even if later versions are published. If needed, you can detach and reattach an article to a record to ensure that the record is linked to the latest version of the article. The `Linked Article Version` field on the linked article detail page leads to the attached version.

Managing Linked Articles

Customize linked articles' page layouts, fields, validation rules, and more from the Linked Articles node in Setup under Knowledge.

To learn how to configure your console and page layouts so articles can be attached to work orders and work order line items, see [Set Up Work Orders](#).

- (1) View and change the articles attached to a record from the Articles related list.
- (2) View an article's properties by clicking **View**, or view the article itself by clicking its title. Click **Detach** to remove the article from the record.
- (3) The Knowledge One widget in the console sidebar lets you manage attached articles, view suggested articles, and search the Knowledge base.
- (4) Each article's action menu contains the option to attach or detach it.

Warning:

- The Article widget and Feed Articles Tool aren't available in the feed view.
- Quick actions and global actions aren't supported for linked articles.
- In the Article Toolbar on the Knowledge home page, you can't attach an article to a work order or work order line item.
- The Linked Work Orders and Linked Work Order Line Items related lists on articles aren't available in Lightning Experience or Salesforce1.
- Linked articles are view-only in Lightning Experience and Salesforce1.
- In Lightning Experience, clicking an article link in a feed item redirects you to the article page in Salesforce Classic. In Salesforce1, linked articles can't be accessed from feed items.

Field Service Lightning Object Fields

Learn about the fields available on Field Service Lightning standard objects.

[Service Territory Fields](#)

Service territories and service territory members have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Operating Hours Fields](#)

Operating hours and time slots have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Service Resource Fields](#)

Service resources and their related objects have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Skill Fields for Field Service](#)

Skills represent certifications and areas of expertise in your field service workforce. Skills and their related objects have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Work Order Fields](#)

Work orders have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Work Order Line Item Fields](#)

Work order line items have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Work Type Fields](#)

Work types have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Location Fields](#)

Locations, Addresses, and Associated Locations have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Parts and Van Stock Fields](#)

Product Items, Products Required, Products Consumed, and Product Item Transactions have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Service Appointment Fields](#)

Service appointments have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Customer Service Report Fields](#)

Service Reports can have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

[Linked Article Fields](#)

A linked article is a Knowledge article that is attached to a work order or work order line item. Linked articles have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Service Territory Fields

Service territories and service territory members have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Service territories represent regions in which field service work can be performed. They have the following fields.

Field Name	Description
Active	Indicates whether the service territory is meant to be used. If a territory is inactive, you can't add members to it or link it to work orders, work order line items, or service appointments.
Address	An address to associate with the territory. You may want to list the address of the territory's headquarters.
Description	The description of the territory.
Name	The name of the territory.
Operating Hours	The territory's operating hours, which indicate when service appointments within the territory should occur. Service resources who are members of a territory automatically inherit the territory's operating hours unless different hours are specified on the service territory member record.
Parent Territory	The territory's parent service territory, if it has one. For example, a <i>Northern California</i> territory can have a <i>State of California</i> territory as its parent.
Top-Level Territory	(Read only) The top-level territory in a hierarchy of service territories. Depending on where a territory lies in the hierarchy, its top-level territory might be the same as its parent.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Service territory members are service resources who are available to work in the service territory. They have the following fields.

Field Name	Description
Address	The member's address. You may want to list the related service resource's address in this field.
End Date	The date when the service resource is no longer a member of the territory. If the resource will be working in the territory for the foreseeable future, leave this field blank. This field is mainly useful for indicating when a temporary relocation ends.

Field Name	Description
Member Number	(Read only) An auto-generated number identifying the service territory member.
Operating Hours	The member's operating hours, which are inherited from the service territory.
Service Resource	The service resource assigned to the service territory.
Service Territory	The service territory that the service resource is assigned to.
Start Date	The date when the service resource becomes a member of the service territory.
Territory Type	<p>Primary, Secondary, or Relocation.</p> <ul style="list-style-type: none"> The primary territory is typically the territory where the resource works most often—for example, near their home base. Service resources can only have one primary territory. Secondary territories are territories where the resource can be assigned to appointments if needed. Service resources can have multiple secondary territories. Relocation territories represent temporary moves for service resources. If you're using the Field Service Lightning managed package with the scheduling optimizer, resources with relocation territories are always assigned to services within their relocation territories during the specified relocation dates; if they don't have a relocation territory, the primary territories are favored over the secondary. <p>For example, a service resource might have the following territories:</p> <ul style="list-style-type: none"> Primary territory: <i>West Chicago</i> Secondary territories: <ul style="list-style-type: none"> – <i>East Chicago</i> – <i>South Chicago</i> Relocation territory: <i>Manhattan</i>, for a three-month period

SEE ALSO:

[Set Up Service Territories](#)

[Guidelines for Using Service Territories](#)

Operating Hours Fields

Operating hours and time slots have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Operating hours can be assigned to service territories, service territory members, and accounts to indicate when they are available for field service work. Create operating hours via the Operating Hours tab in Salesforce. Operating hours have the following fields.

Field Name	Description
Description	The description of the operating hours. Add any details that aren't included in the name.
Name	The name of the operating hours. For example: <i>Summer Hours, Winter Hours, Peak Season Hours.</i>
Time Zone	The time zone that the operating hours fall within.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Time slots represent a time period within a day when field service work can be completed. After you create operating hours, create time slots for each day via the Time Slots related list. Time slots have the following fields.

Field Name	Description
Day of Week	The day of the week when the time slot takes place.
End Time	The time when the time slot ends.
Name	The name of the time slot. The name is auto-populated to a day and time format—for example, <i>Monday 9:00 AM - 10:00 PM</i> —but you can manually update it if you wish.
Operating Hours	The operating hours that the time slot belongs to. An operating hours' time slots appear in the Operating Hours related list.
Start Time	The time when the time slot starts.
Type	The type of time slot. Possible values are <i>Normal</i> and <i>Extended</i> . You may choose to use <i>Extended</i> to represent overtime shifts.

 **Note:** You can't create custom fields on operating hours or time slots.

SEE ALSO:

[Create Operating Hours](#)

Service Resource Fields

Service resources and their related objects have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Service resources are users who can complete field service work. They have the following fields.

Field Name	Description
Active	When selected, this option means that the resource can be assigned to work orders. For service tracking purposes, resources can't be deleted, so deactivating a resource is the best way to send them into retirement.
Capacity-Based	Capacity-based resources are limited to a certain number of hours or appointments in a specified time period.  Tip: The Capacities related list shows a resource's capacity.
Description	The description of the resource.
Include in Scheduling Optimization	When selected, this option means that the service scheduling optimizer can assign this resource to work orders during the optimization process. Use only if the Field Service Lightning managed package is installed. Only users with the "Field Service Scheduling" permission set license can be included in scheduling optimization.
Name	The resource's name. You'll likely want this to be the name or title of the associated user.
Resource Type	Indicates whether a resource is a technician or a dispatcher. Resources who are dispatchers can't be capacity-based or included in scheduling optimization. Only users with the "Field Service Dispatcher" permission set license can be dispatchers.  Note: You can't add additional resource types.
User	The associated user.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Resource absences are periods of time in which a service resource isn't available to work. They have the following fields.

Field Name	Description
Absence ID	(Read only) An auto-generated number identifying the absence.
Absence Type	The type of absence: <i>Meeting, Training, Medical, or Vacation</i> . You can add custom values if needed.
Address	The address associated with the absence.
Description	The description of the absence.
End Time	The date and time when the absence ends.
Resource Name	The absent service resource.
Start Time	The date and time when the absence begins.

A service resource's *capacity* indicates how much work the resource can perform in a specified time period. Capacity records have the following fields.

Field Name	Description
End Date	The date the capacity ends; for example, the end date of a contract.
Name	(Read only) An auto-generated number identifying the capacity record.
Hours per Time Period	The number of hours that the resource can work per time period.
Service Resource	The associated resource.
Start Date	The date the capacity goes into effect.
Time Period	Days, Hours, or Months. For example, if a resource can work 80 hours per month, the capacity's <i>Time Period</i> would be <i>Month</i> and <i>Hours per Time Period</i> would be <i>80</i> .
Work Items per Time Period	The total number of service appointments that the resource can complete per time period.

[Guidelines for Using Service Resources](#)

Skill Fields for Field Service

Skills represent certifications and areas of expertise in your field service workforce. Skills and their related objects have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Skills represent a certification or area of expertise. They are created in Setup, and have the following fields.

Field Name	Description
Name	The name of the skill.
Description	The description of the skill.
Developer Name	The unique name of the skill in the API.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Note: When you create a skill, leave the “Assign Users” and “Assign Profiles” sections blank. They are specific to Live Agent, which also uses skills.

Service resource skills are a skill that is assigned to a service resource. They appear in the Skills related list on service resource detail pages, and have the following fields.

Field Name	Description
End Date	The date when the skill expires. For example, if a resource must be re-certified after six months, the end date would be the date their certification expires.
Service Resource	The resource who possesses the skill.
Skill	The skill the resource possesses.
Skill Level	The resource’s skill level. Skill level can range from zero to 99.99. For tips on how to define skill level, see Configure Skill Settings on page 2812.
Start Date	The date when the resource gains the skill. For example, if the skill represents a certification, the start date would be the date of certification.

Skill requirements are skills that a resource needs to complete a task. They appear in the Skill Requirements related list on work type, work order, and work order line item detail pages, and have the following fields.

Field Name	Description
Related Record	The work order, work order line item, or work type that the skill is required on.
Skill	The required skill.

Field Name	Description
Skill Level	The required skill level. Skill level can range from zero to 99.99.

SEE ALSO:

[Set Up Skills for Field Service](#)

Work Order Fields

Work orders have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Field	Description
Account	The account associated with the work order.
Address	The compound form of the address where the work order is completed. The work order inherits its address from the associated account. The work order's service appointments and line items inherit its address, though the address on line items can be updated.
Asset	The asset associated with the work order.
Business Hours	The business hours associated with the work order.
Case	The case associated with the work order.
City	The city where the work order is completed. Maximum length is 40 characters.
Contact	The contact associated with the work order.
Country	The country where the work order is completed. Maximum length is 80 characters.
Currency ISO Code	The ISO code for any currency allowed by the organization. Available only for orgs with the multicurrency feature enabled.
Description	The description of the work order. We recommend describing the steps a user must complete to mark the work order <i>Completed</i> .
Discount	(Read Only) The weighted average of the discounts on all line items on the work order. It can be any positive number up to 100.
Duration	The estimated time required to complete the work order. Specify the duration unit in the <code>Duration Type</code> field.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Field	Description
Duration Type	The unit of the duration: Minutes or Hours.
End Date	The date when the work order is completed. This field is blank unless you set up automation to configure it. For a sample workflow rule that configures the <code>Start Date</code> field (a similar field), see below.
Entitlement	The entitlement associated with the work order.
Entitlement Process End Time	The time the work order exits an entitlement process. If an entitlement process applies to a work order, this field appears.
Entitlement Process Start Time	The time the work order entered an entitlement process. If an entitlement process applies to a work order, this field appears.
Geocode Accuracy	The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates.
Grand Total	(Read Only) The total price of the work order with tax added.
Is Closed	Indicates whether the work order is closed.  Tip: Use this field to report on closed versus open work orders.
Last Modified Date	The date when the work order was last modified.
Last Viewed Date	The date when the work order was last viewed.
Latitude	Used with <code>Longitude</code> to specify the precise geolocation of the address where the work order is completed. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.
Line Items	(Read Only) The number of work order line items on the work order.
Longitude	Used with <code>Latitude</code> to specify the precise geolocation of the address where the work order is completed. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.
Milestone Status	A milestone is a step in an entitlement process. It can have one of three statuses: Compliant, Open Violation, and Closed Violation. If an entitlement process applies to a work order, this field appears. To learn more, see Milestone Statuses .
Milestone Status Icon	An icon that corresponds to the milestone status. <ul style="list-style-type: none"> •  Compliant •  Open Violation •  Closed Violation
Owner	The work order's assigned owner.

Field	Description
Parent Work Order	<p>The work order's parent work order, if it has one.</p> <p> Tip: View, create, and delete a work order's child work orders in the Child Work Orders related list.</p>
Postal Code	<p>The postal code where the work order is completed. Maximum length is 20 characters.</p>
Price Book	<p>The price book associated with the work order. Adding a price book to the work order lets you assign different price book entries (products) to the work order's line items. This field is only available if products are enabled.</p>
Priority	<p>The priority of the work order. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i> • <i>Critical</i>
Root Work Order	<p>(Read Only) The top-level work order in a work order hierarchy. Depending on where a work order lies in the hierarchy, its root might be the same as its parent.</p>
Service Contract	<p>The service contract associated with the work order.</p>
Service Territory	<p>The service territory where the work order is taking place.</p>
Start Date	<p>The date when the work order goes into effect. This field is blank unless you set up automation to populate it. For a sample workflow rule that configures this field, see below.</p>
State	<p>The state where the work order is completed. Maximum length is 80 characters.</p>
Status	<p>The status of the work order. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • <i>New</i>—Work order was created, but there hasn't yet been any activity. • <i>In Progress</i>—Work has begun. • <i>On Hold</i>—Work is paused. • <i>Completed</i>—Work is complete. • <i>Cannot Complete</i>—Work could not be completed. • <i>Closed</i>—All work and associated activity is complete. • <i>Canceled</i>—Work is canceled, typically before any work began. <p>Changing a work order's status does not affect the status of its work order line items or associated service appointments.</p>

Field	Description
Status Category	<p>The category that each status value falls into. The Status Category field has eight default values: seven values which are identical to the default Status values, and a None value for statuses without a status category.</p> <p>If you create custom Status values, you must indicate which category it belongs to. For example, if you create a Waiting for Response value, you may decide that it belongs in the On Hold category.</p> <p>The Status Category field can be useful to reference in custom apps, triggers, and validation rules. Status categories let you extend and customize the work life cycle while still maintaining a consistent work classification for tracking, reporting, and business process management.</p>
Street	The street number and name where the work order is completed.
Subject	The subject of the work order. Try to describe the nature and purpose of the job to be completed. For example, "Annual on-site well maintenance." The maximum length is 255 characters.
Subtotal	(Read Only) The total of the work order line items' subtotals before discounts and taxes are applied.
Tax	The total tax on the work order. For example, in a work order whose total price is \$100, enter \$10 to apply a 10 percent tax. You can enter a number with or without the currency symbol and you can use up to two decimal places.
Total Price	(Read Only) The total of the work order line items' price after discounts but before tax is added.
Work Order Number	An auto-generated number that identifies the work order.
Work Type	The work type associated with the work order. When a work type is selected, the work order automatically inherits the work type's Duration, Duration Type, and required skills.

Example: The Start Date and End Date fields are blank by default, but you can set up workflow rules to configure them. The following rule populates the Start Date field with the current date and time when the Status field is changed to *In Progress*:

1. Create a workflow rule on the Work Order object:
 - Under Evaluation criteria, select **Created**.
 - Under Rule Criteria, enter *Work Order: Status EQUALS In Progress*.
2. Add a New Field Update workflow action:
 - Under Field to Update, select **Start Date**.
 - Under Date Options, select the option to use a formula and enter the formula *NOW ()*.

3. Save and activate your rule.

Work Order Line Item Fields

Work order line items have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Field	Description
Address	The address of the line item. The line item inherits its address from its parent work order, but it can also be updated manually.
Asset	The asset associated with the line item. If your org uses hierarchical assets (available after Spring '16), you may want to link a work order's line items with different assets. For this reason, line items do not automatically inherit their parent work order's asset value.
Currency ISO Code	The ISO code for any currency allowed by the organization. Available only for orgs with the multicurrency feature enabled.
Description	The description of the line item. We recommend describing the steps a user must follow to mark the line item <i>Completed</i> .
Discount	The percent discount to be applied to the line item. You can enter a number with or without the percent symbol and you can use up to two decimal places.
Duration	The estimated time required to complete the line item. Specify the duration unit in the <i>Duration Type</i> field.
Duration Type	The unit of the duration: Minutes or Hours.
End Date	The date when the line item is completed.
Geocode Accuracy	The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Field	Description
	based on the address's latitude and longitude coordinates.
Is Closed	Indicates whether the line item has been closed. Changing the line item's status to <code>Closed</code> causes this checkbox to be selected in the user interface.
Latitude	Used with <code>Longitude</code> to specify the precise geolocation of the address where the work order is completed. Acceptable values are numbers between <code>-90</code> and <code>90</code> with up to 15 decimal places.
Line Item Number	An auto-generated number that identifies the line item.
List Price	The price of the line item (product) as listed in its corresponding price book entry. If a product isn't specified, the list price defaults to zero. (Read only)
Longitude	Used with <code>Latitude</code> to specify the precise geolocation of the address where the work order is completed. Acceptable values are numbers between <code>-180</code> and <code>180</code> with up to 15 decimal places.
Order	The order associated with the line item. For example, you may need to order replacement parts before you can complete the line item.
Parent Work Order Line Item	The line item's parent line item, if it has one.  Tip: View, create, and delete a line item's child line items in the Child Work Order Line Items related list.
Priority	The priority of the work order. The picklist includes the following values, which can be customized: <ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i> • <i>Critical</i>
Product	The product (price book entry) associated with the line item. This field's lookup search only returns products that are included in the work order's price book.
Quantity	The line item's quantity.
Root Work Order Line Item	The top-level line item in a line item hierarchy. Depending on where a line item lies in the hierarchy, its root might be the same as its parent. (Read only)
Service Territory	The service territory where the line item work is taking place.
Start Date	The date when the line item goes into effect.

Field	Description
Status	<p>The status of the line item. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • New—Line item was created, but there hasn't yet been any activity. • In Progress—Work has begun. • On Hold—Work is paused. • Completed—Work is complete. • Cannot Complete—Work could not be completed. • Closed—All work and associated activity is complete. • Canceled—Work is canceled, typically before any work began.
Status Category	<p>The category that each status value falls into. The Status Category field has eight default values: seven values which are identical to the default Status values, and a None value for statuses without a status category.</p> <p>If you create custom Status values, you must indicate which category it belongs to. For example, if you create a Waiting for Response value, you may decide that it belongs in the On Hold category.</p> <p>The Status Category field can be useful to reference in custom apps, triggers, and validation rules. Status categories let you extend and customize the work life cycle while still maintaining a consistent work classification for tracking, reporting, and business process management.</p>
Subject	The line item's subject. For example, "Tire Check."
Subtotal	The line item's unit price multiplied by the quantity. (Read only)
Total Price	The line item's subtotal with discounts applied. (Read only)
Unit Price	By default, the unit price for a line item is the product's list price from the price book, but you can change it.
Work Order	The parent work order of the line item. Because work order line items must be associated with a work order, this field is required.
Work Order Line Item Number	An auto-generated number that identifies the work order line item.

Field	Description
Work Type	The work type associated with the line item. When a work type is selected, the work order line item automatically inherits the work type's Duration, Duration Type, and required skills.

Work Type Fields

Work types have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Field Name	Description
Description	The description of the work type. Try to add details about the task or tasks that this work type represents.
Duration Type	The unit of the Estimated Duration: Minutes or Hours.
Estimated Duration	The estimated length of the work. The estimated duration is in minutes or hours based on the value selected in the Duration Type field.
Name	The name of the work type. Try to use a name that helps users quickly understand the type of work orders that can be created from the work type. For example, "Annual Refrigerator Maintenance" or "Valve Replacement."

Location Fields

Locations, Addresses, and Associated Locations have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Locations

Field Service Locations can be associated with Products Items to track quantities at the location. They have the following fields.

Field Name	Description
Close Date	Date the location closed, went out of service
Construction End Date	Date construction ended at the location
Construction Start Date	Date construction began at the location
Description	A brief description of the location
Driving Directions	Directions to the location
Inventory Location	Identifies if the location stores parts  Note: This field must be present and checked to associate the location with product items.
Location	The geographic location
Location Type	Picklist of location types, the values are: <ul style="list-style-type: none"> • Warehouse <i>default</i> • Site • Van • Plant
Mobile Location	Identifies if the location moves, for example a truck or tool box.
Name	Location name
Open Date	Date the location opened, came into service
Owner Name	The location's owner or driver
Parent Location	The location's parent location, for example if vans are stored at a warehouse when not in service, the warehouse is the parent location
Owner Name	The location's owner or driver
Possession Date	The date the location was purchased
Remodel End Date	Date construction ended at the location

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Field Name	Description
Remodel Start Date	Date construction ended at the location
Time Zone	Picklist of available time zones
Vistor Address	Lookup to an account's or client's address

Addresses

Addresses allow you to set up multiple addresses and address types. They have the following fields.

Field Name	Description
Address	Name for the address
Address Type	Picklist of address types, the values are: <ul style="list-style-type: none"> • Mailing • Shipping • Billing • Home
Description	A brief description of the address
Driving Directions	Directions to the address
Location Type	Picklist of location types, the values are: <ul style="list-style-type: none"> • Warehouse <i>default</i> • Site • Van • Plant
Parent	A lookup field to the parent address, for example if the billing address might be the parent warehouse addresses
Time Zone	Picklist of available time zones

Associated Locations

Associated locations allow you to set up associate multiple accounts with one location. They have the following fields.

Field Name	Description
Active From	Date and time the associated location is active
Active To	Date and time the associated location is inactive
Created By	(Read Only) User who created the associated location
Created Date	(Read Only) Date the associated location was created

Field Name	Description
Last Modified By	(Read Only) User who modified the associated location last
Last Modified Date	(Read Only) Date the associated location was last modified
Location	A lookup field to a the associated location
Name	Auto-generated number for the association
Parent Record	A lookup field to the parent account.
Type	Picklist of address types, the values are: <ul style="list-style-type: none"> • Bill To • Ship To

Parts and Van Stock Fields

Product Items, Products Required, Products Consumed, and Product Item Transactions have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Product Items

Product Items are products associated with a location. They have the following fields.

Field Name	Description
Created By	(Read Only) User who created the product item
Created Date	(Read Only) Date the product item was created
Last Modified By	(Read Only) User who modified the product item last
Last Modified Date	(Read Only) Date the product item was last modified
Location	Location associated with the product item
Owner	The product item's owner
Product Item Number	(Read Only) Auto-generated number identifying the product item.
Product Name	Product associated with the product item
Quantity On Hand	The amount at the location  Note: To add a serial number this value must be 1.
Quantity Unit of Measure	Units of the product item, for example, grams, liters, or units.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Field Name	Description
Serial Number	A unique number for identification purposes.  Note: To enter a serial number, quantity on hand must be 1.

Products Required

Products Required is a related list of products required for a work order or work order line item. It has the following fields.

Field Name	Description
Created By	(Read Only) User who created the required product
Created Date	(Read Only) Date the required product was created
Last Modified By	(Read Only) User who modified the required product last
Last Modified Date	(Read Only) Date the required product was last modified
Parent Record	Associated work order or work order line item.
Parent Record Type	Identifies if the parent record is a work order or a work order line item.
Product Required	Name of the required product
Quantity Required	Amount required of the product
Quantity Unit of Measure	Units of the required product, for example, grams, liters, or units.

Products Consumed

Products Consumed is a related list of products consumed for a work order or work order line item. It has the following fields.

Field Name	Description
Created By	(Read Only) User who created the consumed product
Created Date	(Read Only) Date the consumed product was created
Description	A description of the consumed product
Last Modified By	(Read Only) User who modified the consumed product last
Last Modified Date	(Read Only) Date the consumed product was last modified
Price Book Entry	Price book associated with the consumed product
Product	Product associated with the consumed product
Product Consumed Number	(Read Only) Auto-generated number identifying the consumed product.

Field Name	Description
Product Item	Product item associated with the consumed product
Quantity Consumed	The amount of consumed product
Quantity Unit of Measure	Units of the consumed item, for example, grams, liters, or units.
Unit Price	The price per unit of the consumed product
Work Order	Work order associated with the consumed product
Work Order Line Item	Work order line item associated with the consumed product

Product Item Transactions

Product Item Transactions is a related list of actions taken on the product item. It has the following fields.

Field Name	Description
Created By	(Read Only) User who created the product item transaction
Created Date	(Read Only) Date the product item transaction was created
Description	A description of the transaction
Last Modified By	(Read Only) User who modified the product item transaction last
Last Modified Date	(Read Only) Date the product item transaction was last modified
Product Item	
Product Item Transaction Number	(Read Only) Auto-generated number identifying the product item transaction.
Quantity	Amount consumed
Related Record	Work order or work order line item associate with the consumed product
Transaction Type	<ul style="list-style-type: none"> • Replenished: When the quantity of the part is stocked at its location. • Consumed: When parts are consumed to complete a work order or work order line item. The technician updates the products consumed related list on the work order or work order line item. • Adjusted: When there is a discrepancy. Adjustments are made by editing the product item quantity on hand.

Service Appointment Fields

Service appointments have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Field Name	Description
Account	(Read only) The account associated with the appointment. If the parent record is a work order or work order line item, this field's value is inherited from the parent. Otherwise, it remains blank.
Actual Duration (Minutes)	The number of minutes that it took the resource to complete the appointment after arriving at the address. When values are first added to the Actual Start and Actual End fields, the Actual Duration is automatically populated to list the difference between the Actual Start and Actual End. If the Actual Start and Actual End fields are subsequently updated, the Actual Duration field doesn't re-update, but you can manually update it.
Actual End	The actual date and time the appointment ended.
Actual Start	The actual date and time the appointment started.
Address	The address where the appointment is taking place. The address is inherited from the parent record if the parent record lists an address.
Appointment Number	An auto-assigned number that identifies the appointment.
Arrival Window End	The end of the window of time in which the technician is scheduled to arrive at the site. This window is typically larger than the Scheduled Start and End window to allow time for delays and scheduling changes. You may choose to share the Arrival Window Start and End with the customer, but keep the Scheduled Start and End internal-only.
Arrival Window Start	The beginning of the window of time in which the technician is scheduled to arrive at the site. This window is typically larger than the Scheduled Start and End window to allow time for delays and scheduling changes. You may choose to share the Arrival Window Start and

EDITIONS

Field Name	Description
	End with the customer, but keep the Scheduled Start and End internal-only.
Contact	The contact associated with the appointment. If the parent record is a work order or work order line item, this field's value is inherited from the parent.
Description	The description of the appointment.
Due Date	The date by which the appointment must be completed. <code>Earliest Start Permitted</code> and <code>Due Date</code> typically reflect terms in the customer's service-level agreement.
Duration	The estimated length of the appointment. If the parent record is work order or work order line item, the appointment inherits its parent's duration, but it can be manually updated. The duration is in minutes or hours based on the value selected in the <code>Duration Type</code> field.
Duration Type	The unit of the duration: Minutes or Hours.
Earliest Start Permitted	The date after which the appointment must be completed. <code>Earliest Start Permitted</code> and <code>Due Date</code> typically reflect terms in the customer's service-level agreement.
Parent Record	The parent record associated with the appointment.
Parent Record Status Category	(Read only) The Status Category of the parent record. If the parent record is a work order or work order line item, this field is populated; otherwise, it remains blank.
Parent Record Type	(Read only) The type of parent record: Account, Asset, Opportunity, Work Order, or Work Order Line Item.
Scheduled End	The time at which the appointment is scheduled to end. If you are using the Field Service Lightning managed package with the scheduling optimizer, this field is populated once the appointment is assigned to a resource. <code>Scheduled End - Scheduled Start = Estimated Duration</code> .
Scheduled Start	The time at which the appointment is scheduled to start. If you are using the Field Service Lightning managed package with the scheduling optimizer, this field is populated once the appointment is assigned to a resource.
Service Territory	The service territory associated with the appointment. If the parent record is a work order or work order line item, the appointment inherits its parent's service territory.
Status	The status of the appointment. The picklist includes the following values, which can be customized: <ul style="list-style-type: none"> • None—Default value.

Field Name	Description
	<ul style="list-style-type: none"> • <code>Not Scheduled</code>—The service appointment isn't scheduled. • <code>Scheduled</code>—The service appointment is scheduled. • <code>Dispatched</code>—The service resource is in route.. • <code>In Progress</code>—The service resource started work. • <code>Completed</code>—The service resource completed work. • <code>Canceled</code>—The service appointment has been canceled. • <code>Missed</code>—The service resource didn't make it to the location. • <code>Running Long</code>—The service resource started the job but didn't complete it by the scheduled end time. • <code>Late</code>—The service resource didn't start the job by the scheduled start time.
Status Category	<p>The category that each <code>Status</code> value falls into. The <code>Status Category</code> field has seven values which are identical to the default <code>Status</code> values.</p> <p>If you create custom <code>Status</code> values, you must indicate which category it belongs to. For example, if you create a <code>Customer Absent</code> value, you may decide that it belongs in the <code>Missed</code> category.</p> <p>The <code>Status Category</code> field can be useful to reference in custom apps, triggers, and validation rules. Status categories let you extend and customize the work life cycle while still maintaining a consistent work classification for tracking, reporting, and business process management.</p>
Subject	A short phrase describing the appointment.

Work Order Customer Report Fields

Field	Description
Account	The account associated with the work order.
Address	The compound form of the address where the work order is completed. The work order inherits its address from the associated account. The work order's service appointments and line items inherit its address, though the address on line items can be updated.
Asset	The asset associated with the work order.
Business Hours	The business hours associated with the work order.
Case	The case associated with the work order.
Contact	The contact associated with the work order.
Created By	User who created the work order.
Created Date	Date the work order was created.
Description	The description of the work order. We recommend describing the steps a user must complete to mark the work order <i>Completed</i> .
Discount	The weighted average of the discounts on all line items on the work order. It can be any positive number up to 100.
Duration	The estimated time required to complete the work order. Specify the duration unit in the <code>Duration Type</code> field.
Duration Type	The unit of the duration: Minutes or Hours.
End Date	The date when the work order is completed. This field is blank unless you set up automation to configure it. For a sample workflow rule that configures the <code>Start Date</code> field (a similar field), see below.
Grand Total	The total price of the work order with tax added.
Is Closed	Indicates whether the work order is closed.  Tip: Use this field to report on closed versus open work orders.
Last Modified By	The user who modified the work order last.
Last Modified Date	The date when the work order was last modified.
Line Items	The number of work order line items on the work order.
Location	Location associated with the work order.
Owner	The work order's assigned owner.

Field	Description
Parent Work Order	<p>The work order's parent work order, if it has one.</p> <p> Tip: View, create, and delete a work order's child work orders in the Child Work Orders related list.</p>
Price Book	<p>The price book associated with the work order. Adding a price book to the work order lets you assign different price book entries (products) to the work order's line items. This field is only available if products are enabled.</p>
Priority	<p>The priority of the work order. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i> • <i>Critical</i>
Root Work Order	<p>The top-level work order in a work order hierarchy. Depending on where a work order lies in the hierarchy, its root might be the same as its parent.</p>
Service Appointment Count	<p>The number for service appointments to date for this work order.</p>
Service Appointment (Create Date)	<p>The date the service appointment was created or scheduled.</p>
Service Territory	<p>The service territory where the work order is taking place.</p>
Start Date	<p>The date when the work order goes into effect. This field is blank unless you set up automation to populate it. For a sample workflow rule that configures this field, see below.</p>
Status	<p>The status of the work order. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • <i>New</i>—Work order was created, but there hasn't yet been any activity. • <i>In Progress</i>—Work has begun. • <i>On Hold</i>—Work is paused. • <i>Completed</i>—Work is complete. • <i>Cannot Complete</i>—Work could not be completed. • <i>Closed</i>—All work and associated activity is complete. • <i>Canceled</i>—Work is canceled, typically before any work began. <p>Changing a work order's status does not affect the status of its work order line items or associated service appointments.</p>
Status Category	<p>The category that each status value falls into. The Status Category field has eight default values: seven values which are identical to</p>

Field	Description
	<p>the default <code>Status</code> values, and a <code>None</code> value for statuses without a status category.</p> <p>If you create custom <code>Status</code> values, you must indicate which category it belongs to. For example, if you create a <code>Waiting for Response</code> value, you may decide that it belongs in the <code>On Hold</code> category.</p> <p>The <code>Status Category</code> field can be useful to reference in custom apps, triggers, and validation rules. Status categories let you extend and customize the work life cycle while still maintaining a consistent work classification for tracking, reporting, and business process management.</p>
Subject	The subject of the work order. Try to describe the nature and purpose of the job to be completed. For example, "Annual on-site well maintenance." The maximum length is 255 characters.
Subtotal	The total of the work order line items' subtotals before discounts and taxes are applied.
Tax	The total tax on the work order. For example, in a work order whose total price is \$100, enter \$10 to apply a 10 percent tax. You can enter a number with or without the currency symbol and you can use up to two decimal places.
Total Price	The total of the work order line items' price after discounts but before tax is added.
Work Order Number	An auto-generated number that identifies the work order.
Work Type	The work type associated with the work order. When a work type is selected, the work order automatically inherits the work type's <code>Duration</code> , <code>Duration Type</code> , and required skills.

Work Order Line Item Customer Report Fields

Field	Description
Address	The address of the line item. The line item inherits its address from its parent work order, but it can also be updated manually.
Asset	<p>The asset associated with the line item.</p> <p>If your org uses hierarchical assets (available after Spring '16), you may want to link a work order's line items with different assets. For this reason, line items do not automatically inherit their parent work order's asset value.</p>
Created By	User who created the work order line item.

Field	Description
Created Date	Date the work order line item was created.
Description	The description of the line item. We recommend describing the steps a user must follow to mark the line item <i>Completed</i> .
Discount	The percent discount to be applied to the line item. You can enter a number with or without the percent symbol and you can use up to two decimal places.
Duration	The estimated time required to complete the line item. Specify the duration unit in the <code>Duration Type</code> field.
Duration Type	The unit of the duration: Minutes or Hours.
End Date	The date when the line item is completed.
Is Closed	Indicates whether the line item has been closed. Changing the line item's status to <code>Closed</code> causes this checkbox to be selected in the user interface.
Last Modified By	The user who modified the work order line item last.
Last Modified Date	The date when the work order line item was last modified.
List Price	The price of the line item (product) as listed in its corresponding price book entry. If a product isn't specified, the list price defaults to zero.
Location	Location associated with the work order line item.
Order	The order associated with the line item. For example, you may need to order replacement parts before you can complete the line item.
Parent Work Order Line Item	The line item's parent line item, if it has one.  Tip: View, create, and delete a line item's child line items in the Child Work Order Line Items related list.
Priority	The priority of the work order. The picklist includes the following values, which can be customized: <ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i> • <i>Critical</i>
Product	The product (price book entry) associated with the line item. This field's lookup search only returns products that are included in the work order's price book.
Quantity	The line item's quantity.

Field	Description
Root Work Order Line Item	The top-level line item in a line item hierarchy. Depending on where a line item lies in the hierarchy, its root might be the same as its parent.
Service Appointment Count	The number for service appointments to date for this work order.
Service Report (Create Date)	The date the service appointment was created or scheduled.
Service Territory	The service territory where the line item work is taking place.
Start Date	The date when the line item goes into effect.
Status	<p>The status of the line item. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • New—Line item was created, but there hasn't yet been any activity. • In Progress—Work has begun. • On Hold—Work is paused. • Completed—Work is complete. • Cannot Complete—Work could not be completed. • Closed—All work and associated activity is complete. • Canceled—Work is canceled, typically before any work began.
Status Category	<p>The category that each status value falls into. The Status Category field has eight default values: seven values which are identical to the default Status values, and a None value for statuses without a status category.</p> <p>If you create custom Status values, you must indicate which category it belongs to. For example, if you create a Waiting for Response value, you may decide that it belongs in the On Hold category.</p> <p>The Status Category field can be useful to reference in custom apps, triggers, and validation rules. Status categories let you extend and customize the work life cycle while still maintaining a consistent work classification for tracking, reporting, and business process management.</p>
Subject	The line item's subject. For example, "Tire Check."
Subtotal	The line item's unit price multiplied by the quantity.
Total Price	The line item's subtotal with discounts applied.
Unit Price	By default, the unit price for a line item is the product's list price from the price book, but you can change it.
Work Order	The parent work order of the line item.

Field	Description
Work Order Line Item Number	An auto-generated number that identifies the work order line item.
Work Type	The work type associated with the line item. When a work type is selected, the work order line item automatically inherits the work type's Duration, Duration Type, and required skills.

Service Appointment Customer Report Fields

These fields are for service appointment customer reports for both work orders and work order line items.

Field Name	Description
Account	The account associated with the appointment. If the parent record is a work order or work order line item, this field's value is inherited from the parent. Otherwise, it remains blank.
Actual Duration (Minutes)	The number of minutes that it took the resource to complete the appointment after arriving at the address. When values are first added to the Actual Start and Actual End fields, the Actual Duration is automatically populated to list the difference between the Actual Start and Actual End. If the Actual Start and Actual End fields are subsequently updated, the Actual Duration field doesn't re-update, but you can manually update it.
Actual End	The actual date and time the appointment ended.
Actual Start	The actual date and time the appointment started.
Address	The address where the appointment is taking place. The address is inherited from the parent record if the parent record lists an address.
Appointment Number	An auto-assigned number that identifies the appointment.
Arrival Window End	The end of the window of time in which the technician is scheduled to arrive at the site. This window is typically larger than the Scheduled Start and End window to allow time for delays and scheduling changes. You may choose to share the Arrival Window Start and End with the customer, but keep the Scheduled Start and End internal-only. This window is typically larger than the Scheduled Start and End window to allow time for delays and scheduling changes. You may choose to share the Arrival Window Start and End with the customer, but keep the Scheduled Start and End internal-only.
Arrival Window Start	The beginning of the window of time in which the technician is scheduled to arrive at the site. This window is typically larger than the Scheduled Start and End window to allow time for delays and scheduling changes. You may choose to share the Arrival Window

Field Name	Description
	Start and End with the customer, but keep the Scheduled Start and End internal-only.
Contact	The contact associated with the appointment. If the parent record is a work order or work order line item, this field's value is inherited from the parent.
Created By	User who created the service appointment.
Created Date	Date the service appointment was created.
Description	The description of the appointment.
Due Date	The date by which the appointment must be completed. <code>Earliest Start Permitted</code> and <code>Due Date</code> typically reflect terms in the customer's service-level agreement.
Duration	The estimated length of the appointment. If the parent record is work order or work order line item, the appointment inherits its parent's duration, but it can be manually updated. The duration is in minutes or hours based on the value selected in the <code>Duration Type</code> field.
Duration Type	The unit of the duration: Minutes or Hours.
Earliest Start Permitted	The date after which the appointment must be completed. <code>Earliest Start Permitted</code> and <code>Due Date</code> typically reflect terms in the customer's service-level agreement.
Last Modified By	The user who modified the service appointment last.
Last Modified Date	The date when the work order was last modified.
Owner	The service appointment's assigned owner.
Parent Record	The parent record associated with the appointment.
Parent Record Status Category	(Read only) The Status Category of the parent record. If the parent record is a work order or work order line item, this field is populated; otherwise, it remains blank.
Parent Record Type	(Read only) The type of parent record: Account, Asset, Opportunity, Work Order, or Work Order Line Item.
Scheduled End	The time at which the appointment is scheduled to end. If you are using the Field Service Lightning managed package with the scheduling optimizer, this field is populated once the appointment is assigned to a resource. <code>Scheduled End - Scheduled Start = Estimated Duration</code> .
Scheduled Start	The time at which the appointment is scheduled to start. If you are using the Field Service Lightning managed package with the scheduling optimizer, this field is populated once the appointment is assigned to a resource.

Field Name	Description
Service Note	Any notes about the service.
Service Report (Create Date)	The date the service appointment was created or scheduled.
Service Territory	The service territory associated with the appointment. If the parent record is a work order or work order line item, the appointment inherits its parent's service territory.
Status	<p>The status of the appointment. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • <code>None</code>—Default value. • <code>Not Scheduled</code>—The service appointment isn't scheduled. • <code>Scheduled</code>—The service appointment is scheduled. • <code>Dispatched</code>—The service resource is in route.. • <code>In Progress</code>—The service resource started work. • <code>Completed</code>—The service resource completed work. • <code>Canceled</code>—The service appointment has been canceled. • <code>Missed</code>—The service resource didn't make it to the location. • <code>Running Long</code>—The service resource started the job but didn't complete it by the scheduled end time. • <code>Late</code>—The service resource didn't start the job by the scheduled start time.
Status Category	<p>The category that each <code>Status</code> value falls into. The <code>Status Category</code> field has seven values which are identical to the default <code>Status</code> values.</p> <p>If you create custom <code>Status</code> values, you must indicate which category it belongs to. For example, if you create a <code>Customer Absent</code> value, you may decide that it belongs in the <code>Missed</code> category.</p> <p>The <code>Status Category</code> field can be useful to reference in custom apps, triggers, and validation rules. Status categories let you extend and customize the work life cycle while still maintaining a consistent work classification for tracking, reporting, and business process management.</p>
Subject	A short phrase describing the appointment.

Linked Article Fields

A linked article is a Knowledge article that is attached to a work order or work order line item. Linked articles have the following fields. Some fields may not be visible or editable depending on your page layout and field-level security settings.

Field	Description
Article ID	The ID of the linked article record, which is created when an article is attached to a record.
Article Title	The title of the attached article.
Article Version	<p>The version of the article that is attached to the record. This field displays the title of the attached version, and links to the version.</p> <p>When you attach an article to a work order, that version of the article stays associated with the work order, even if later versions are published. If needed, you can detach and reattach an article to a work order to link the latest version.</p> <p>For example, if an article was entitled "How to Replace a Filter" when it was attached to the record, this field displays that title and links to the attached version.</p>
Knowledge Article ID	The ID of the article that is attached to the record.
Last Viewed	The date the article was last viewed.
Linked Object Type	(Read only) The type of record that the article is attached to. For example, if the article is attached to a work order, this field displays "Work Order."
Linked Record ID	The ID of the record that the article is attached to. For example, if the article is attached to a work order, this field displays the ID of the work order.
Record Type ID	The record type of the linked article. This field is populated only if record types are used.

The Field Service Lightning Mobile App

The Field Service Lightning mobile app is an all-in-one tool for field service technicians on the go. This enterprise-class mobile experience leverages Salesforce in a lightweight design optimized for a modern mobile workforce. Offline capability means that users can keep working without internet connectivity and know that all their changes are saved. And the app is highly customizable, letting you tailor the Field Service Lightning mobile app to meet your business' unique needs!

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Important: Before you get started, get informed! If you do not have an existing field service operation on your org, we recommend reading the Field Service Lightning documentation:

- [Planning for Field Service Lightning](#)
- [Field Service Lightning Consideration](#)

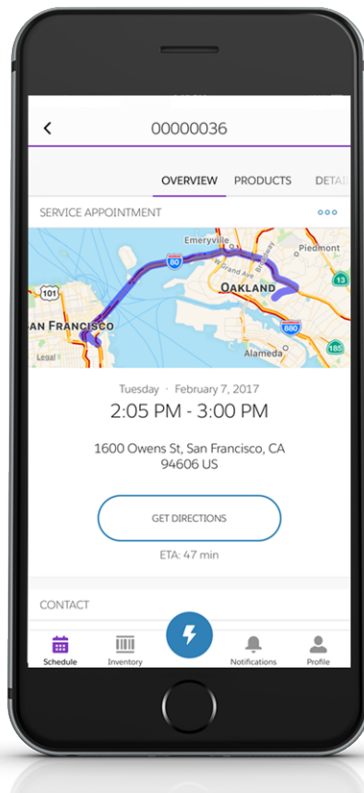

Table 47: Main Features of The Field Service Lightning Mobile App

Feature	Description
Offline Capable	The app works offline, so technicians can always complete their work, even with limited or no network connectivity.

Feature	Description
Configurable Quick Actions, Workflows, and Field Service App Extensions	<p>The Field Service Lightning mobile app lets you create actions to meet the unique needs of your mobile work force.</p> <ol style="list-style-type: none"> 1. Quick Actions let users take actions such as creating or updating a record. 2. Visual Workflow lets you easily build and manage workflows which can guide users through screens that collect and display information, create and update Salesforce records, and execute logic based on user input. Administrators design and build flows using the Flow Designer's simple drag-and-drop user interface, then activate, manage, and maintain them. 3. Field Service App Extensions let you pass record data from the Field Service Lightning mobile app and connect it to other apps such as Salesforce1.
Salesforce Knowledge	Integration with Salesforce Knowledge lets admins provide useful information to your mobile work force. Create Knowledge Articles with vital information like product manuals and step-by-step instructions.
Signature Capture	Capture signatures from customers for completed work.
Chatter	Communicate with dispatchers, partners and customers using Chatter.
Geolocation Tracking	Keep tabs on service resources with resource geolocation tracking.
Custom Branding	Brand the app to give it your company's look and feel!
Configurable Layouts	Flexible layouts let you choose what record information to display to your users. Prioritize information so users can easily find what they need.

Learn about the device, edition, license, and connectivity requirements for using the Field Service Lightning mobile app.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Supported Devices

App Name	Supported Devices	Supported Mobile OS
Field Service Lightning iOS Mobile App	<ul style="list-style-type: none"> iPhone 5c/5s or later models iPad 4 or later models (including iPad Air 2 and iPad Pro) 	iOS 9.3 or later

For optimal performance, keep your mobile devices' operating systems updated and upgrade to the latest model of devices as allowed by your mobile plan. Future versions of the Field Service mobile app may require removing support for older operating systems, and sometimes newer operating systems don't perform well on older devices.

Salesforce Editions and Licenses

These Salesforce editions and user license types allow the use of the Field Service Lightning mobile app.

<p>Salesforce Editions</p> <p>Field Service Lightning features are available in Enterprise, Performance, Unlimited, and Developer Editions with the Service Cloud.</p>
<p>User License Types</p> <p>These user license types can access the Field Service Lightning mobile app:</p> <ul style="list-style-type: none"> Field Service Mobile

Wireless Connection

The Mobile Field Service app is optimized for offline performance, but a Wi-Fi® or cellular network connection is needed for the app to communicate with Salesforce. For cellular connections, a 3G network or faster is required. For the best performance, we recommend using Wi-Fi or LTE.

Prepare for the Field Service Lightning Mobile App

Install the managed package and prepare your org for the Field Service Lightning mobile app. Create permission set licenses for your Field Service Lightning mobile app users.

Download the Managed Package

You must first install the managed package for the Field Service Lightning mobile app. To install the package, open the following link in your browser:

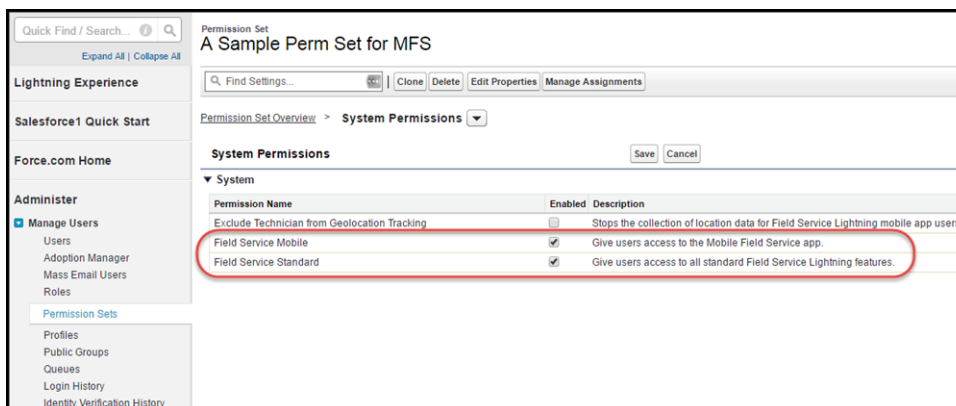

- <https://sfdc.co/MobileFieldServicePackage>

Verify Licenses and Permissions

Ensure that your users have a permission set with the necessary Field Service Mobile license and the required system permissions, object permissions, and field permissions.

1. From Setup, type *Permission Sets* into the Quick Find box, then select **Manage Users > Permission Sets**.
2. Create a **New** permission set license.
3. Select the Field Service Mobile license from the picklist.
4. Click **Save**.
5. Ensure that your permission set includes the system permissions **Field Service Standard** and **Field Service Mobile**. Click **System Permissions** and then click **Edit**.
6. Check the boxes for the **Field Service Standard** and **Field Service Mobile** system permissions, then **Save**.

Important: Field Service Lightning mobile app users must have the system permissions *View Setup and Configuration* and *API Enabled*. An admin can assign these permissions either through a permission set or user profile.

7. The object settings you choose for this permission set license can vary. However, Field Service Lightning mobile app users need access to the objects and fields in the following table:

Table 48: Object Permissions

Object Names	Object Permission Needed	Field Permission Needed
Contact	Read	Email, Name, Phone, Title
Resource Absence	Read, Create, Edit	Absence Number, End Time, Start Time, Resource, Type

Object Names	Object Permission Needed	Field Permission Needed
Service Appointment	Read, Edit	Address, Appointment Number, Contact, Created By, Created Date, Owner, Parent Record, Parent Record Type, Parent Record Status, Category, Scheduled Start, Scheduled End, Status
Service Resource	Read, Edit	Active, User
Work Order	Read, Create, Edit	

Ensure that your users have access to these objects by clicking **Object Settings** and consulting the object settings for each object.

Also check the box for field permissions you would like your users to have access to with this permission set. For each object's settings, click **Save** after you have finished assigning the object and field permissions.

Tip: The Field Service Lightning mobile app can present information about asset service history, contacts that are associated with appointments, and products consumed. Depending on your use cases, it may make sense for your users to have additional object permissions. Consider giving Technicians access to objects such as Product Item, Account and Asset as well.

8. Assign this permission set to your Field Service Lightning mobile app users by clicking **Manage Assignments**, then **Add Assignments**.
9. Check the box next to each user you wish to have access to the app with this permission set, and then click **Assign**.

Associate an Active Service Resource With Your User

You must have an active service resource associated with your account to be able to access the mobile app.

1. Go to the Service Resources tab.
2. Create a **New** service resource.
3. Associate the service resource with the appropriate user.
4. Make the service resource **Active**.
5. Click **Save**.

Add Service Report to Service Appointment Page Layout

1. From Setup, type *Service Appointment* into the Quick Find box, then select **Service Appointments > Page Layouts**.
2. **Edit** the service appointment layout.
3. From the layout editor, select **Related Lists**.
4. Drag and drop the **Service Reports** related list onto the page layout.
5. Click **Save**.

Get the Field Service Lightning Mobile App

Download and install the Field Service Lightning mobile app on your mobile device from the App Store.

-  **Note:** The Field Service Lightning mobile app is only available for supported iOS devices to users with the Field Service Mobile user license. For more information on the requirements, read [Field Service Lightning Mobile App Requirements](#).

Download the App From the App Store

1. From your iOS mobile device, tap on the **App Store** icon.
2. Search for *Field Service Lightning* from the search tab.
3. Tap on *Field Service Lightning* by Salesforce.
4. Tap **+GET**, then tap **INSTALL**. Depending on the speed of your network connection, the app may take a few moments to download and install.

Launch the App for the First Time

When launching the Field Service Lightning mobile app for the first time, you are prompted to give the app various device permissions, including location services, notifications, and the device's microphone and camera.

1. Tap on the Field Service Lightning mobile app to launch it.
2. Tap **Get Started**.
3. Scroll through the onboarding screens to see demonstrations of the app's key features.
4. Tap **Log In**. Depending on how your Salesforce org is configured, you may need to tap **Use Custom Domain** and enter your org's URL. Alternatively, click on the gear widget in the top right of the login screen to specify production or sandbox org, or press **+** to enter a custom domain. Otherwise, simply enter your user name and password and tap **Log In**.
5. When prompted to give the app access to basic information, tap **Allow**.
6. If prompted, create a passcode for an added level of security then click **Next**. Confirm your password then press **Done**.
7. Tap **Turn on Location Services**.
8. Tap **Turn on Notifications**.
9. Tap **Enable Camera Access**.
10. You will see three prompts to confirm these decisions. Click **Allow** for all three prompts.

-  **Tip:** You can change the device permissions that your device gives the Field Service Lightning mobile app at any time. To do so, click on your device's **Settings**, then locate the Field Service Lightning mobile app and tap on it. From this page, you can change any of the device permissions given to the app.

The app is now ready to launch!

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Customize the Field Service Lightning Mobile App

Learn how to customize the Field Service Lightning mobile app to meet your technicians' unique field service needs.

[Control the Service Appointment Schedule Screen](#)

Learn how to control which service appointments show up on the schedule screen for your technicians.

[Set Up Field Service App Extensions for the Field Service Lightning Mobile App](#)

Learn about connecting to other apps from Field Service Lightning mobile app. The Field Service Lightning Mobile App currently supports app extensions of the following types: iOS, Android, Workflow, Lightning Apps (S1), and web apps.

[Empower Technicians with Custom Tailored Workflows](#)

Learn how to use Visual Workflow with the Field Service Lightning mobile app. Visual Workflow lets you easily build and manage flows which can guide users through screens that collect and display information, create and update Salesforce records, and execute logic based on user input. Admins design and build flows using the Flow Designer's simple drag-and-drop user interface, then activate, manage, and maintain them. After setting up a flow, admins can connect flows to the Field Service Lightning mobile app for their technicians to use.

[Provide Knowledge Articles to Technicians](#)

Learn how to attach Salesforce Knowledge articles to work orders to provide useful information like product manuals and step-by-step instructions to your technicians.

[Brand the Field Service Lightning Mobile App](#)

Learn how to give the Field Service Lightning mobile app your company's look and feel by coloring the user interface. Apply your company colors to the interface, or, alternatively, optimize the color scheme to compensate for the relative brightness or darkness of your technicians' work environments.

[Set the Company Image on the Profile Screen](#)

Upload a company image, such as a logo, to display as the background of the user profile page of the Field Service Lightning mobile app.

[Track Work with the Chatter Feed](#)

Integrate Chatter into the Field Service mobile app. The Chatter feed gives field service workers, dispatchers, and customers a place for text and content posts.

[Geolocation and Other Field Service Lightning Mobile App Settings](#)

Learn about the various Field Service Lightning mobile app setting that you can modify in your org. Track your assigned resources with geolocation bread crumbs or, alternatively, learn how to exclude a service resource from geolocation tracking. Control how frequently record data and metadata automatically refreshes.

[Prominently Display Key Information with Layouts](#)

Use layouts to control how information is displayed in the Field Service Lightning mobile app. Set compact and search layouts to preview and prominently anchor key fields. Use page layouts to control which cards are found on the appointment overview screen.

[Inventory Management with the Field Service Lightning Mobile App](#)

Learn about the inventory management system for the Field Service Lightning mobile app. Create locations for tracking products and associate them with service resources. Add products required to work orders to represent the products your technicians need to complete jobs. Track the products consumed by your technicians.

[Empower Users with Quick Actions](#)

Add quick actions to an object's page layouts so technicians can create and edit records on the go, quickly send messages to contacts, and more.

Control the Service Appointment Schedule Screen

Learn how to control which service appointments show up on the schedule screen for your technicians.

The Field Service Lightning mobile app loads service appointments that are assigned to the current user. These appointments are first surfaced in the app from the main schedule screen. Depending on what your technicians' needs are, you can use a listview to control which of their assigned appointments are loaded into the schedule screen. If you choose not to set up a service appointment listview, the Field Service Lightning mobile app by default loads the users schedule of service appointments for a 15 day range. This range includes 7 days into the past, the present day, and 7 days into the future.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud.

1. Navigate to the **Service Appointments** tab. If you do not see this tab on the top navigation bar, click the + button at the far right of the top bar, and then select **Service Appointments**.
2. Next to the **View** dropdown list, click **Create New View**.
3. Enter a name for your new listview, like *FieldServiceMobile*. Note the **View Unique Name** because you need to use this name to connect this listview with the Field Service Lightning mobile app.
4. Configure the criteria for your service appointment listview under **Specify Filter Criteria**. For **Filter By Owner**, select **Assigned to me**.
5. Under **Filter By Additional Fields (Optional)** you can use filter logic to control which records show up on your listview. Consider using the fields *Scheduled Start* and *Schedule End* in your filter criteria.
6. Under **Restrict Visibility**, select **Visible to all users**.
7. Click **Save**.
8. From **Setup** enter *Field Service Mobile* into the Quick Find box.
9. Click **Edit**.
10. Locate the setting **Default ListView Developer Name**. Enter the **View Unique Name** of your recently created list view.
11. Click **Save**.

If the Scheduled Start Date field is not part of your filter criteria, users cannot use the date-picker from the schedule screen in the Field Service Lightning mobile app. Instead, users see a single schedule screen which is populated and ordered with service appointments based off of your filter criteria. If your filter criteria does contain Scheduled Start Date as part of the filter criteria, the date picker will have a range from 45 days into the past to 45 days into the future.

Set Up Field Service App Extensions for the Field Service Lightning Mobile App

Learn about connecting to other apps from Field Service Lightning mobile app. The Field Service Lightning Mobile App currently supports app extensions of the following types: iOS, Android, Workflow, Lightning Apps (S1), and web apps.

You can create app extensions to allow users to pass data from the Field Service Lightning mobile app to another program. App extensions can be created and configured in Setup by selecting the connected app that you wish to make the extension for. App Extensions have the following fields:

- **Name:** The name of the extension.
- **Label:** The label as it appears to users in the app.
- **Type:** A picklist of types of app extensions: iOS, Android, Workflow, and Lightning Apps.
- **Scoped To Object Types:** This field determines from which records a user can activate an app extension. Scoping an app extension to an object allows users to activate that app extension from records of the specified type. The object names are entered as comma separated values and must have no spaces. For example, to scope an extension to the Work Order object and the Service Appointment object, you would enter *WorkOrder, ServiceAppointment*.

 **Note:** To create a global app extension, leave the Scoped To Object Types field blank. This allows users to activate it from anywhere.

- **Launch Value:** This is a free text field which has similar format to a URL with the option to specify place holder tokens that the Field Service Lightning mobile app inserts. This field directs the app to the appropriate app extension. Read the proceeding section for more information on properly using this field.

Passing Tokens Into the Launch Value

The launch value supports static URLs for web addresses as well as dynamic values that you can represent with certain tokens. These tokens can pass field information from the record that the user is currently viewing. For example, if the user is viewing a service appointment, the tokens can be used to pass the data from any field on that service appointment to the app extension. The basic format for these tokens is based on the names of the field, like so: **{!\$Name}**.

 **Tip:** The following example uses a token to dynamically pass the name of the user to a Google search. The token is written in bold for clarity: [https://www.google.com/#q={!\\$User.userName}](https://www.google.com/#q={!$User.userName})

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud.

USER PERMISSIONS

To create and modify App Extensions:

- “Customize Application”

Table 49: Dynamic Value Tokens for App Extension Launch Value

Dynamic Value Tokens	Description
{!\$Organization.Id}	The org id.
{!\$User.userId}	The object id for the user.
{!\$User.orgId}	The org id of the user.
{!\$User.userName}	The username of the user.
{!\$User.nickName}	The nick name of the user.
{!\$User.displayName}	The display name of the user.
{!\$User.email}	The email address of the user.
{!\$User.firstName}	The first name of the user.
{!\$User.lastName}	The last name of the user.

Dynamic Value Tokens	Description
{!\$User.language}	The localization of the user.
{!\$User.locale}	The geographic area of the user.

Configuring Lightning App Extensions

You can find all the lightning apps that are configured in your org from inside Setup. Once you have found the name of the lightning app that you wish to connect to Field Service Lightning mobile app, you can create your app extension by using the name of a lightning app on this list as the launch value of your lightning app extension.

1. From Setup, type *Salesforce1* into the Quick Find box, and select **Salesforce1 Navigation**.
2. Note the exact name of the Lightning App from the list of Available and Selected apps. You will need to use this name as the Launch Value when creating your lightning app extension for the Field Service Lightning mobile app.

Empower Technicians with Custom Tailored Workflows

Learn how to use Visual Workflow with the Field Service Lightning mobile app. Visual Workflow lets you easily build and manage flows which can guide users through screens that collect and display information, create and update Salesforce records, and execute logic based on user input. Admins design and build flows using the Flow Designer's simple drag-and-drop user interface, then activate, manage, and maintain them. After setting up a flow, admins can connect flows to the Field Service Lightning mobile app for their technicians to use.

 **Important:** The Field Service Lightning mobile app supports only flows that have the type Field Service Mobile. Additionally, the following flow features are not supported by the Field Service Lightning mobile app:

- Resources of the type Text Formula
- Screens with prespecified validation rules
- Actions cannot rely on the output parameters of any action
- Returning to a previous screen is not allowed during a flow when a loop or subflow is used in the flow
- Dynamic hide/show fields are not supported for field rules on flow screens
- The *wasSelected* operator cannot be used in decisions

 **Tip:** To learn more about creating flows refer to the help article [Workflow](#).

Connect A Flow As An App Extension

1. From Setup, type *Field Service Mobile* into the Quick Find box, and click **Field Service Mobile Settings**.
2. **Add** a new App Extension.
3. Enter a label for your app extension. This label field corresponds to the label that your technicians see in the app's user interface.
4. From the **Type** picklist, select *Flow*.
5. Enter a **Name** that expresses the purpose of the flow.

 **Important:** As an admin, you can specify a special type of workflow for wrapping up an appointment. This special Workflow appends a final step to capture a customer's signature. To specify this special Workflow, set the **Name** field to be *Service_Report_Flow*; this flow **must** be scoped to the Service Appointment object to trigger service closure.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

USER PERMISSIONS

To create workflows:

- "Customize Application"

- The field **Scoped to Object Types** controls where users can find and activate the workflow. For example, setting the Scoped to Object Types to Contacts means users can activate that flow from the detail page of a contact record. To create an unscoped workflow action, simply leave the field blank. Unscoped actions allow users to activate the flow from various pages, and not simply when viewing a record to which the flow is scoped to.

 **Tip:** To scope a flow to multiple objects, enter the API names of the scoped to objects separated by commas.

- Set the **Launch Value** to equal the unique name of your workflow.
- Click **Save**.

Flow Considerations

- When the Field Service Lightning mobile app loads a user's schedule data, it will also download global flows and any flows that are scoped to records in their schedule data. Pulling down on the screen to sync with Salesforce also causes the app to reload flow metadata.
- When the Field Service Lightning mobile app launches into a flow, it passes the following input parameters:
 - Id:** The record ID of the record that the workflow is launched from.
 - ParentId:** The record ID of the parent record that the workflow is launched from. For example, if a workflow is launched from a service appointment, this will be the ID of the parent work order or work order line item.
 - Userid:** The ID of the current user.

Flow Best Practices

In order to make your flow actions easy and useful for your technicians, consider the following best practices when creating a new flow:

- Supply help text on each screen to guide your users and to make clear what is expected of them on each screen.
- Avoid asking more than a single question per screen in your flows, especially if your screens involve picklists.

Provide Knowledge Articles to Technicians

Learn how to attach Salesforce Knowledge articles to work orders to provide useful information like product manuals and step-by-step instructions to your technicians.

Salesforce Knowledge lets you create articles to address questions your users may run into. Integration with the Field Service Lightning mobile app enables admins to serve custom created content to your technicians based on the unique needs of your field service operation. Salesforce Knowledge must be set up before Knowledge articles can be added as a related list to work order and work order line item page layouts. To learn more about implementing Salesforce Knowledge refer to the [Salesforce Knowledge Implementation Guide](#).

 **Tip:** The Field Service Lightning mobile app does not support inline images in Knowledge Articles. As an alternative we recommend using an image link instead for your users to open themselves.

Add Articles to the Work Order Page Layout

- From Setup, enter *Work Orders* in the Quick Find box and click **Work Orders > Page Layouts**.
- Edit** the Work Order Layout.
- On the layout editor, select **Related Lists**.
- Drag and drop Articles to the page layout.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

USER PERMISSIONS

To customize page layouts:

- "Customize Application"

5. Click **Save** on the layout editor.

Brand the Field Service Lightning Mobile App

Learn how to give the Field Service Lightning mobile app your company's look and feel by coloring the user interface. Apply your company colors to the interface, or, alternatively, optimize the color scheme to compensate for the relative brightness or darkness of your technicians' work environments.

The Field Service Lightning mobile app lets you change the color of various parts of the app's user interface. Consult the branding table to learn which settings control which UI elements within the app.

1. From Setup, type *Field Service Mobile Settings* into the Quick Find box, then select **Field Service Mobile Settings**.
2. **Edit** the Field Service Mobile Settings Detail.
3. Enter color hex-codes into the **Brand Colors** settings to replace the default values. consult the branding table below for more details.

 **Important:** Enter color hex-code values with the format of the default values in the table below, including the # symbol before hex-code.

 **Note:** Users that enable the Dark Theme from the Field Service Lightning mobile app settings will override custom colors settings for most UI elements. This setting only effects devices that enable Dark Theme and has no impact on other users.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

USER PERMISSIONS

To customize branding colors:

- "Customize Application"

Table 50: Branding Table

Token Name	Description	Default Value
Navbar Background Color	The color of the top bar in the app.	#FCFCFC
Brand Inverted Color	The color of toasts and the contrast color for the floating action button.	#FFFFFF
Feedback Primary Color	The color of error messages.	#C23934
Feedback Secondary Color	The color of success messages.	#007FAA
Primary Brand Color	The main branding color used throughout the UI.	#803ABE
Secondary Brand Color	The color of action buttons.	#2F81B7
Contrast Primary Color	The color of primary text.	#000000
Contrast Secondary Color	The color of secondary text.	#444444
Contrast Tertiary Color	The color of the icons on the settings screen and of primary lines that delineate different areas of the UI.	#9FAAB5
Contrast Quaternary Color	The color of secondary lines that delineate different areas of the UI.	#E6E6EB
Contrast Quinary Color	The color of primary backgrounds in the UI.	#F8F8F8

Token Name	Description	Default Value
Contrast Inverted Color	The color of secondary backgrounds in the UI.	#FFFFFF

Customize your app's branding tokens in Setup using hex-code colors.

1. From Setup, enter *Field Service Mobile* in the Quick Find box, and select **Field Service Mobile Settings**.
2. **Edit** the Field Service Mobile Settings Detail.
3. For each branding token, enter the desired color in the form of a hex-code preceded with a #.
4. When you have entered values for every token you wish to modify, click **Save**.

 **Example:** To set a branding token to the color black, enter the value `#FFFFFF`.

Set the Company Image on the Profile Screen

Upload a company image, such as a logo, to display as the background of the user profile page of the Field Service Lightning mobile app.

Upload an image to use as the profile background.

1. From Setup, enter *Static Resources* into the Quick Find box and click **Static Resources**.
2. Create a **New** static resource.
3. Give the static resource a name. Remember the name you give your static resource. You need to use it in a later step.
4. Select an image file for upload. We recommend using an image sized at 3072x819 for best results on large displays such as iPads in landscape mode. Alternatively, consider using a smaller image size to make the image easier to download for users with slower mobile networks.
5. Click **Save**.

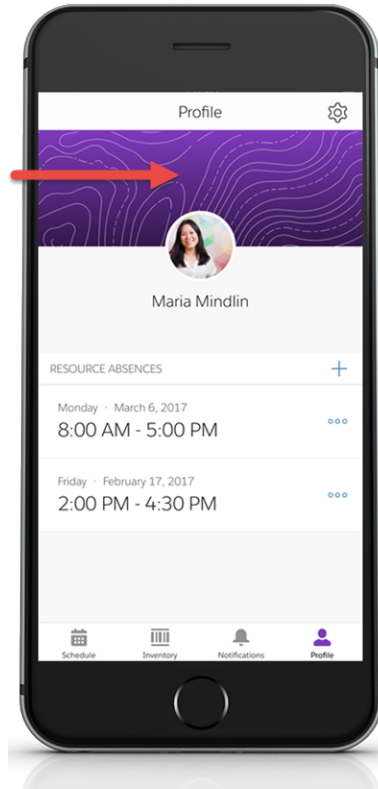

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud.

USER PERMISSIONS

To set the company profile image:

- "Customize Application"

Create a custom attribute to use the static resource as your company image on the user profile screen.

1. From Setup, enter *Connected Apps* into the Quick Find box, and select **Connected Apps**.
2. Select **Salesforce Field Service for iOS**.
3. Scroll down to the list Custom Attributes and click **New**.
4. For the attribute key, enter *COMPANY_PROFILE_IMAGE_RESOURCE_NAME*.
5. For the attribute value, enter the name of the static resource you created in the previous section, except you must wrap the name with quotation marks.

 **Tip:** If you named your static resource *Example_static_resource* then your attribute value should be "*Example_static_resource*".

6. Click **Save**.

Track Work with the Chatter Feed

Integrate Chatter into the Field Service mobile app. The Chatter feed gives field service workers, dispatchers, and customers a place for text and content posts.

Enable feed tracking on work orders.

1. From Setup, enter *Chatter* into the Quick Find box and select **Feed Tracking**.
2. Select **Work Order** from the object list.
3. Check **Enable Feed Tracking**.
4. Click **Save**.

Chatter Limitations

The Field Service Lightning mobile app supports only limited Chatter functionality. Users are able to make and receive text posts and content posts. However, the app does not yet support @mentioning people, or displaying the feed-tracked changes for records.

EDITIONS

Field Service Lightning features are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud.

USER PERMISSIONS

To customize fields tracked in feeds:

- “Customize Application”

To view the field tracking setup page:

- “View Setup and Configuration”

Geolocation and Other Field Service Lightning Mobile App Settings

Learn about the various Field Service Lightning mobile app setting that you can modify in your org. Track your assigned resources with geolocation bread crumbs or, alternatively, learn how to exclude a service resource from geolocation tracking. Control how frequently record data and metadata automatically refreshes.

Configure service resource tracking to have the Field Service Lightning mobile app upload the geolocation of your technicians at regular intervals.

1. From Setup, enter *Field Service* in the Quick Find box, and select **Field Service Mobile Settings**.
2. Click **Edit**.
3. Click Send Location History to enable geolocation tracking for service resources.
4. Enter the Minimum Update Frequency of Geo Location in Minutes to control how often geolocation is polled.
5. Enter the Record Data Cache Time in Minutes. We highly recommend setting this to *240* minutes or more to limit the frequency of server queries the Field Service Lightning app makes automatically.
6. Enter the Update Schedule Time in Minutes. This controls how frequently the Field Service Lightning mobile app checks for updates to users' schedule of assigned service appointments.
7. Set the Geo Location Accuracy to control how accurate the geolocation data is. Higher precision required additional battery power on mobile devices.
8. Set the Time Interval Setup in Minutes. This controls the interval when selecting time values from a picklist in the app.
9. Enter the Metadata Cache Time in Days. This controls how long metadata, such as page layouts, is stored in memory for Field Service Lightning mobile app users.
10. Enable Show Edit Full Record. This gives users the ability to use the full edit action on records that they have access to.
11. Click **Save**.

Excluding Individuals From Geolocation Tracking

You can exclude individuals from geolocation tracking even if geolocation tracking is enabled in your org.

1. From Setup, enter *Permission Sets* into the Quick Find box and select **Manage Users > Permission Sets**.
2. Create a separate permission set for users that you wish to exclude from geolocation tracking. You can do this by cloning your Field Service Standard permission set and giving it a new name.
3. Click your newly created permission set to edit it.
4. Click **System Permissions**
5. Click **Edit** and enable the permission called **Exclude Technician from Geolocation Tracking**.
6. Click **Save**.
7. Click **Manage Assignments**, then apply this permission set to the users you wish to exclude from geolocation tracking by checking the box next to the names of each user. Then click **Add Assignment**.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

USER PERMISSIONS

To configure resource tracking:

- "Customize Application"

Prominently Display Key Information with Layouts

Use layouts to control how information is displayed in the Field Service Lightning mobile app. Set compact and search layouts to preview and prominently anchor key fields. Use page layouts to control which cards are found on the appointment overview screen.

Control Record Highlights with Compact Layouts

Use compact layout settings to control record highlights in the Field Service Lightning mobile app.

Control the Appointment Overview Screen with Page Layouts

Use page layout settings for Work Orders and Work Order Line Items to control which “cards” are presented to the user on the appointment overview screen. The cards are discrete sections in the user interface for different types of records.

Control the Schedule Screen with Search Layouts

Control the main schedule screen of the Field Service Lightning mobile app by changing the search layout settings of the service appointment object.

Control Record Highlights with Compact Layouts

Use compact layout settings to control record highlights in the Field Service Lightning mobile app.

When a record is presented as a record highlight (showing a preview of the record) the display is driven by the compact layout settings of that record. The top-most field in a record’s compact layout is displayed prominently, while the remaining fields are displayed underneath it. Consider what fields your users will want to be displayed most prominently before modifying an object’s compact layout.

1. From Setup, enter the object name that you wish to modify in the Quick Find box and select **Compact Layouts**.
2. **Edit** the compact layout.
3. Select the field you wish to add from either the Available Fields list or Selected Fields list.
4. **Add** the field you wish to prominently display to the Selected Fields list if it isn’t already.
5. Use the **Up** and **Down** buttons to order the Selected Fields so that the desired field is at the top of the Selected Fields list.
6. Click **Save**.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud.

USER PERMISSIONS

To modify page layouts, search layouts, and compact layouts:

Control the Appointment Overview Screen with Page Layouts

Use page layout settings for Work Orders and Work Order Line Items to control which “cards” are presented to the user on the appointment overview screen. The cards are discrete sections in the user interface for different types of records.

When a user selects a service appointment from the schedule screen, they are taken to the appointment overview screen. On this screen, the Field Service Lightning mobile app displays information in spaces called cards. These cards are discrete spaces for different kinds of records or other information like chatter posts. Adding or removing a field will add or remove the corresponding card. Refer to the table below for details on all the possible cards that can be added to the appointment overview screen. Think carefully about which cards your users will want to access from the appointment overview screen.

Table 51: Possible Cards on the Appointment Overview Screen

Cards	Description
Address Card	Shows a map and the option to navigate to the address of the appointment. If the address is not set, the card instead presents the user with the option to set the address, and then activate navigation.
Contact Card	Shows the contact’s name and photo and gives the option to call, SMS or email the contact.
Asset Card	Provides context about the maintenance history of an asset. It shows the asset that is associated with the current work order and a list of work orders associated with that asset.
Work Order Line Item Card	Shows the progress of a parent work order or work order line item record and its children work order line item records. Can be configured to let users create new child line items as discussed in Empower Users to Create Child Work Order Line Items.
Knowledge Card	Presents the user with knowledge articles that are associated with the work order or work order line item.

1. From Setup, type *Work Orders* into the Quick Find box and select **Work Orders > Page Layouts**.
2. Use the page layout editor at the top of your screen to add or remove fields from the Work Order page layout.
3. Click **Save** on the layout editor.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

USER PERMISSIONS

To modify page layouts:

- “Customize Application”

Control the Schedule Screen with Search Layouts

Control the main schedule screen of the Field Service Lightning mobile app by changing the search layout settings of the service appointment object.

The Field Service Lightning mobile app displays a list of service appointments that are assigned to the user on the schedule screen. The app prominently displays the top two fields of the service appointment search layout. Consider which fields your technicians want to see from this screen. For example, in the screenshot, the service appointment's ID and status are set to the first and second fields respectively. Many technicians, for example, may be more interested in seeing the subject field instead of the record ID.

 **Note:** The app displays the scheduled start time and the address in the same location regardless of the Service Appointment search layout settings.

1. From Setup, enter *Service Appointments* in the Quick Find box and select **Search Layouts**.
2. **Edit** the Search Results search layout.
3. Select the field you wish to add from either the Available Fields list or Selected Fields list.
4. **Add** the field to the Selected Fields list if it isn't already.
5. Use the **Up** and **Down** buttons to order the Selected Fields so that the desired two fields are at the top of the Selected Fields list.
6. Click **Save**.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud.

Inventory Management with the Field Service Lightning Mobile App

Learn about the inventory management system for the Field Service Lightning mobile app. Create locations for tracking products and associate them with service resources. Add products required to work orders to represent the products your technicians need to complete jobs. Track the products consumed by your technicians.

[Configure Locations to Track Your Technicians' Inventory](#)

Learn about tracking products with van locations.

[Use Products Required So Technicians Know What They Need to Complete Work](#)

Learn how to add products required to work orders so technicians know what they need to bring with them to complete their work in the field.

[Track the Products Your Technicians Consume While on the Job](#)

Learn how to record the products consumed by your technicians from completing work orders.

Configure Locations to Track Your Technicians' Inventory

Learn about tracking products with van locations.

Locations are used to represent physical areas where products are stored. Because field service technicians typically bring products with them in their vehicle, you can create a special type of location to represent the van stock of your technicians.

Create a Location To Represent the Van Stock Of a Technician

As an admin, you can represent your technicians' van stock by creating a location of the location type Van. You can then associate this location with the Service Resource of the technician who drives the van.

1. From Salesforce select the **Locations** tab. If you do not have Locations added on your navigation bar, instead click the **+** and then select **Locations**.
2. Create **New** location.
3. If you are creating a location record to represent van stock for your technicians, be sure to select the **Mobile Location** and **Inventory Location** options.
4. Associate the van location with the service resource who uses the vehicle for field service. Select the **Service Resource** tab or press the **+** in the navigation bar and then select **Service Resource**.
5. Select the service resource associated with your technician, then use the location field to associate the newly created van location with the service resource.

Add Product Items To Represent Van Stock

Once you have created a van location, you are ready to track individual product items. Product items are actual quantities of products that are represented by a product record. Establishing the exact quantity of parts in a van stock allows your technicians to decrement their van stock when they consume parts, as well as to keep track of the parts that are required to complete future work.

1. In Salesforce Classic, click the **+** button to show a list of all available tabs, then click **Product Items**.
2. Create a **New** product item.
3. Use the product name lookup field to select the product that this product item is an instance of.
4. Use the location lookup field to select the van location of your service resource.
5. Enter the quantity that the user has in their van stock in the quantity on hand field.
6. From the quantity unit of measure picklist, select **Each** if the product comes in discrete units. Or, if the product item is used in non-discrete units, such as lengths of tape, select the value **None** from the picklist.

With mobile van locations associated with your service resources, your technicians can now keep track of their van stock from the **Inventory** tab in the Field Service Lightning mobile app.

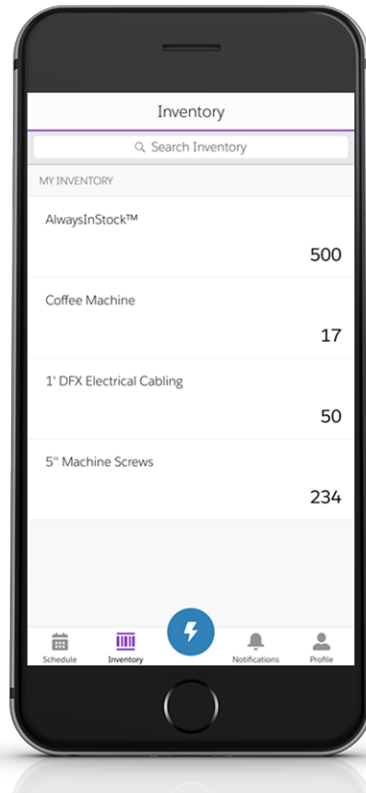

EDITIONS

Field Service Lightning features are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud.

USER PERMISSIONS

To configure locations:

- "Customize Application"

Using Pricebooks To Track Products

It may make sense to add a price book to certain work orders, especially if your field service operation employs contractors as technicians. The pricebook gives users the ability to search through the pricebook for products and log the use or sale of products throughout completing a work order.

1. From Setup, enter *work orders* in the Quick Find box, and select **Work Orders > Page Layouts**.
2. From the layout editor at the top, drag the Price Book field into the Work Order detail section.
3. Click **Save**.

Use Products Required So Technicians Know What They Need to Complete Work

Learn how to add products required to work orders so technicians know what they need to bring with them to complete their work in the field.

Products required can be added as a related list to work order and work order line items. The products required represent the product items that a technician needs to have in stock to finish a particular job. The user sees a visual indicator on the work order if a technician has insufficient product items to complete the service appointment they are viewing.

1. From Setup, type *Work Order* into the Quick Find box, and then select **Work Orders > Page Layouts**.
2. From the layout editor, add the **Products Required** related list to the work order page layout.
3. Click **Save**.

When creating work orders for your technicians, you can add Products Required from the related list. Setting up van locations for your technicians, as discussed in [Configure Locations to Track Your Technicians' Inventory](#), allows your technicians to check their van stock against the products required to complete the work order. The Field Service Lightning mobile app displays a visual indicator when your technicians' van stock has insufficient products to complete the appointment.

Track the Products Your Technicians Consume While on the Job

Learn how to record the products consumed by your technicians from completing work orders.

Before you can track products consumed by your technicians, you must first associate your service resources with a location. Locations are areas where products can be stored. Mobile locations can be configured to represent the vehicle that technicians use to store and transport the tools and supplies they need to finish their work. To learn more about setting up van locations, refer to [Configure Locations to Track Your Technicians' Inventory](#).

Add Products Consumed To Work Orders

1. From Setup, type *Work Orders* into the Quick Find box, then select **Work Orders > Page Layout**.
2. From the layout editor, add the **Products Consumed** to the related lists on the work order page layout.
3. Click **Save**.

With products consumed added to the work order page layout, your technicians can use the Field Service Lightning mobile app to log products consumed and have it decrement those products from their van stock.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud.

Empower Users with Quick Actions

Add quick actions to an object's page layouts so technicians can create and edit records on the go, quickly send messages to contacts, and more.

When a user is viewing a record, they can use the quick actions on that record's page layout by pressing the action button. The action button lets users take actions that are assigned to the page layout of whatever record is currently opened. For example, adding a Create Opportunity action to the page layout of contacts will let the user create a new opportunity from any contact record detail page in the app. Think carefully about which object-specific quick actions to create for your users.

Unlike other records which only let you take quick actions that are on the page layout of that record, the service appointment overview screen has a consolidated action list for service appointments, work orders, and work order line items. This means that when a user clicks the action button from the service appointment overview screen, they will see a list of actions that include the following:

- Create Service Report, a hardcoded action that triggers the job wrap-up process. This action is only available if the work order is assigned to user, and an alternate service closure flow is not configured
- Field Service App Extensions for Service Appointments
- Field Service App Extensions for Work Orders
- Quick Actions for Service Appointments
- Quick Actions for Work Orders or Work Order Line Items (depending on if the parent record is a work order or a work order line item)
- Edit Work Order / Work Order Line Item (depending on if the parent record is a work order or a work order line item)
- Open in Salesforce1 (This option only appears if Salesforce1 is installed on the mobile device)

 **Important:** The supports quick actions of the types Create Record and Update Record. VisualForce, Lightning Component, and Custom Override actions are not supported.

Create a Quick Action for the Appointment Overview Screen

The appointment overview screen shows technicians information from the work order or work order line item associated with their current service appointment.

1. From Setup, enter *Work Orders* in the Quick Find box and select **Work Orders > Buttons, Links, and Actions**.
2. Click **New Action**.
3. Configure the action to either create a record or edit a record. Lightning Component, VisualForce, and custom override actions are not supported.
4. From Setup, enter *Work Orders* in the Quick Find box and select **Work Orders > Page Layouts**.
5. **Edit** the Work Order Layout.
6. From the layout editor, select **Quick Actions** then drag and drop your newly created action into the Quick Actions in the Salesforce Classic Publisher.
7. Click **Save** on the layout editor.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

USER PERMISSIONS

To create quick actions and add them to page layouts:

- "Customize Application"

[Configure the Work Order Line Item Card to Manage Complex Jobs](#)

Learn how to configure the work order line item card. If children work order line items are added to a work order or work order line item, technicians can see the work order line item card on the appointment overview screen. The work order line item card displays the progress of a parent work order or line item as well as its child work order line item from the appointment overview screen. This can be useful for tracking complex jobs that are broken up into multiple work order line items.

SEE ALSO:

[Object-Specific Actions](#)

Configure the Work Order Line Item Card to Manage Complex Jobs

Learn how to configure the work order line item card. If children work order line items are added to a work order or work order line item, technicians can see the work order line item card on the appointment overview screen. The work order line item card displays the progress of a parent work order or line item as well as its child work order line item from the appointment overview screen. This can be useful for tracking complex jobs that are broken up into multiple work order line items.

Empower Users to Create Child Work Order Line Items From the Work Order Line Item Card

1. From Setup, enter Work Orders into the Quick Find box and select **Work Order > Buttons, Links, and Actions**.
2. Click **New Action**.
3. Select the action type **Create a Record**.
4. Select the target object **Work Order Line Item**.
5. Select the standard label type **New Child [Record]**.
6. Input a label. This also automatically generates the API name.
7. Enter the action description.
8. Select whether or not to create a Chatter feed post with the action.
9. Click **Save**.
10. From Setup, enter *work orders* into the Quick Find box and select **Work Orders > Page Layouts**. **Edit** the Work Order Layout.
11. From the layout editor select **Quick Actions**.
12. Drag and drop your newly created action into the **Quick Actions in the Salesforce Classic Publisher**.
13. Click **Save**.

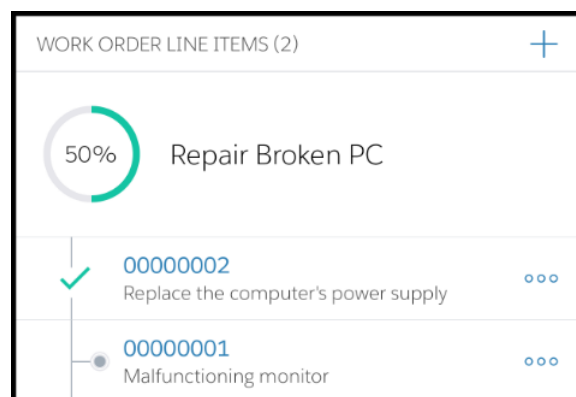

EDITIONS

Field Service Lightning features are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud.

USER PERMISSIONS

To create quick actions and add them to work order line item page layouts:

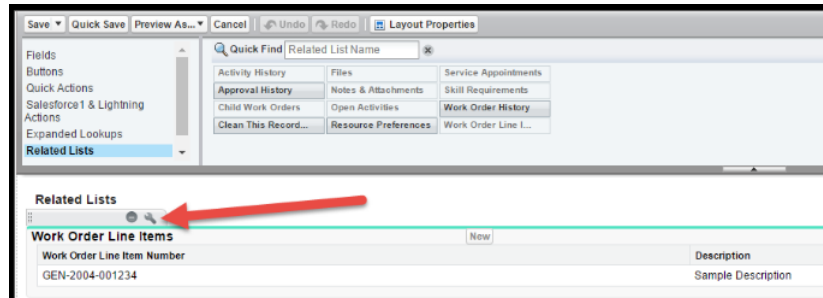

- "Customize Application"

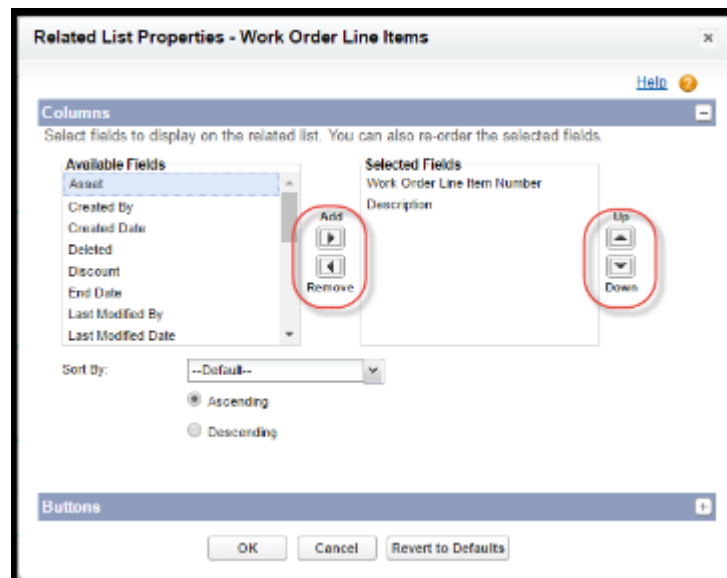

Control Which Fields Are Previewed in the Work Order Line Item Card

The work order line item card displays two fields for each line item. You can control these fields through the page layout settings of Work Orders by modifying the Work Order Line Item related list properties.

1. From Setup, enter Work Orders in the Quick Find box and select **Work Orders > Page Layouts**.
2. If the work order line item related list is not added to the page layout, do so now by clicking **Related Lists** in the layout editor and dragging **Work Order Line Items** onto the page layout.
3. **Edit** the Work Order Line Items related list by clicking the wrench icon.

4. Add your desired field to be one of the top two fields in the Selected Fields column. You will see a list of available fields and select fields. Move fields into the select fields column with the **Add** arrow, or out with the **Remove** arrow. Sort the order of the selected fields with the **Up** and **Down** arrows.
5. Click **Save**.

Push Notifications for the Field Service Lightning Mobile App

Push notifications for Field Service Lightning are a useful way of informing technicians when there are changes to his or her schedule and work.

You need Field Service notifications enabled and the Field Service Lightning iOS Mobile App connected app installed for mobile app users to receive push notifications. You can download the connected app by pasting the following link into your browser:

- <https://sfdc.co/MobileFieldServicePackage>

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Notification Triggers

Field Service Lightning mobile app users receive notifications when one of the following triggers occur:

- There is a Chatter text or file post to a Work Order you follow
- A feed-tracked change is posted to a Work Order or Service Appointment you follow
- There is an assignment change that affects you, either because a service appointment is assigned to you or assigned away from you.

Known Limitations

Field Service Lightning does not currently have out-of-the-box functionality to automatically make your technicians followers on work order and service appointment records. You may want to create your own Apex triggers on service resource object to make this happen when a technician is assigned to and away from a service appointment.

[Enable Notifications for the Field Service Lightning Mobile App](#)

Learn how to enable notifications in your org so technicians always work with the latest information.

Enable Notifications for the Field Service Lightning Mobile App

Learn how to enable notifications in your org so technicians always work with the latest information.

You can enable notifications in your org settings so Salesforce sends notifications to relevant users in the Field Service Lightning mobile app, Salesforce1, and Lightning Experience. In the Field Service Lightning mobile app notifications are sent as push notifications while the app is running in the background. When the app is in the foreground notifications are tracked on their own tab with a badge showing the number of notifications.

Enable Field Service Notifications

1. From Setup, enter *Field Service Settings* in the Quick Find box, then select **Field Service Settings**.
2. Select **Notify relevant users in Salesforce1 and Lightning Experience about updates to work orders and service appointments**.

 **Note:** Selecting this option also enables notifications for relevant users in Salesforce1 and Lightning Experience.

3. Click **Save**.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Field Service Lightning Mobile App Limits and Limitations

Learn about the limits and limitations of the Field Service Lightning mobile app.

The Field Service Lightning mobile app has the following limits and limitations:

- Flow has the following limitations:
 - Resources of the type Text Formula
 - Screens with prespecified validation rules
 - Actions cannot rely on the output parameters of any action
 - Returning to a previous screen is not allowed during a flow when a loop or subflow is used in the flow
 - Dynamic hide/show fields are not supported for field rules on flow screens
 - The `wasSelected` operator cannot be used in decisions
- Quick Actions have the following limitations:
 - Custom override on actions is unsupported, including custom override on lookup logic
 - Only plain text is supported for rich text fields
 - Default values are not available in offline mode
- Dependent Picklists are not supported.
- The barcode scanner is compatible with 1D serial barcodes and 2D QR codes only.
- Users are able to make and receive text posts as well as content posts. However, the app does not yet support @mentioning people, or displaying the feed-tracked changes for records.
- Knowledge Articles viewed in the app do not support inline images. As an alternative we recommend using an image link instead for your users to open themselves.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Working Offline With the Field Service Lightning Mobile App

[Offline-Mode Considerations and Limitations](#)

Learn about the offline capabilities of the Field Service Lightning mobile app and considerations for working in offline mode.

[Offline Data Limitations For The Field Service Lightning Mobile App](#)

Learn about the data priming rules for working without network connectivity in the Field Service Lightning mobile app.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Offline-Mode Considerations and Limitations

Learn about the offline capabilities of the Field Service Lightning mobile app and considerations for working in offline mode.

As an admin, you can control which records appear on your users' schedules by creating a default service appointment listview and linking it to the Field Service Lightning mobile app. Otherwise the app instead loads the user's schedule of work orders for a 15 day range. This range includes seven days into the past, the present day, and seven days into the future.

Offline-Mode Limitations

- You cannot sync data with Salesforce while offline. This means you cannot receive updates to records or page layouts.
- Updating records and creating new records adds these changes to a queue. This queue uploads the changes to Salesforce when internet access is restored. You can review and even cancel all pending uploads from the pending upload queue in the app's settings.
- Navigation services are disabled while offline.
- Service resource geolocation tracking is disabled while offline.
- The default values for lookup fields are not populated while offline.
- Record data and metadata is deleted after 60 days of not being read or edited.

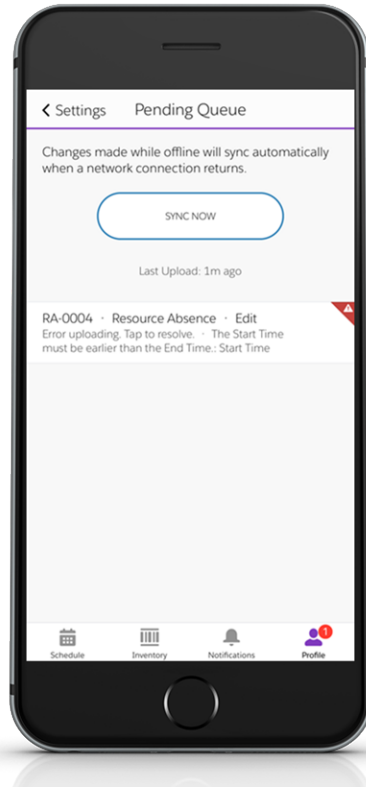

Offline-Mode Considerations

If your technicians sometimes work without internet access for a prolonged period, here are some useful tips to consider.

- Set the calendar range for your users to include the entire schedule of work that your technicians need while offline.
- When working offline, sometimes a data conflict can occur. Manual conflict resolution is required if Salesforce rejects data uploads for any reason. You can resolve conflicts from the pending upload queue by fixing the conflict then syncing with Salesforce.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud.

Offline Data Limitations For The Field Service Lightning Mobile App

Learn about the data priming rules for working without network connectivity in the Field Service Lightning mobile app.

Data Accessibility From Offline Mode

The Field Service Lightning mobile app can be used without network connectivity with almost complete functionality. However, the app first needs to load record data to cache for the user to work from while they are in offline-mode. The process of caching this data for use from offline-mode is called data priming, and is done automatically when a user logs in to the app with a network connection.

The data that is primed to a user's device is determined by the records that are on their schedule. A user's schedule is defined either by a listview or the calendar range of the user's schedule, as determined by your admin. Since Field Service Lightning is built around the Work Order object, these records have the most robust offline functionality, while other records have certain limitations while working from offline mode.

EDITIONS

Field Service Lightning features are available in **Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud.

Table 52: Offline Data Priming By Object (Record Type)

Objects	The Field Data of the Record	The Field Data of Associated Records	Quick Actions	Related Lists	Related Files	Chatter Feed
Work Order & Work Order Line Item	Yes	Yes	Yes	Yes	Only Metadata ¹	Yes
Service Appointment	Yes	Yes	Yes	Yes	No	No
Case	No ²	No	Yes	No	Yes	Yes
Any Other Record	No ²	No	Yes	No	No	No

¹ While data refers to the information stored in the fields of a record, metadata contains data about the record itself such as its page layout, search layout, relevant workflow rules.

² The data for other records isn't primed unless the records are associated with a Work Order, Work Order Line Item, or Service Appointment, or case that is also primed.

Adding a Knowledge Base

Adding Salesforce Knowledge

Welcome to Salesforce Knowledge

Build your knowledge base and give your website visitors, clients, partners, and service agents the ultimate in support. Salesforce Knowledge lets you create and manage your company information and securely share it when and where it is needed.

Your Salesforce Knowledge base is built from knowledge articles, which are documents of information. Articles can include information on process, like how to reset your product to its defaults, or frequently asked questions, like how much storage your product supports.

Experienced service agents and internal writers write the articles. The articles are then published to a range of channels: Internal App, customer and partner communities, or public websites. Where and what information is published is based on the article layout profile and the field level security.

As of Spring '17, Knowledge is available in both Salesforce Classic and Lightning Experience. Currently, Lightning Knowledge (Beta) is recommended for orgs new to Knowledge, or for existing orgs that can easily consolidate to one article type, have few data categories, and use single-language mode.

Note: This release contains a beta version of Lightning Knowledge, which means it's a high-quality feature with [known limitations](#) on page 2992. Lightning Knowledge isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular

Plan Your Knowledge Base

It's important that you consider your individual company's needs while you develop a strategy for capturing and publishing your support team's expertise. With a robust knowledge base, customers receive service faster or even solve their own problems themselves.

Setting up Salesforce Knowledge is a "choose your own adventure" procedure. There are many features and options and it's up to you to decide which ones are right for your enterprise.

Consideration	Further Information
What information do you need to publish?	Article Types
Who can provide the information?	Knowledge User License, User Setup
Who can approve and manage the information?	Knowledge Management, Validation Rules
Do you need workflow or approval processes to manage article creation and publication?	Workflow and Approvals for Articles
Do you have an existing Knowledge base or documentation that you need to import?	Import Existing Information into Salesforce Knowledge
Who needs to read what information and where?	Knowledge Article Access, Create Public Groups for Knowledge, Assign Article Actions to Public Groups
Do you need to categorize your information?	Data Categories in Salesforce.com
Who has access to which categories?	Data Category Visibility
Are you supporting more than one language?	Support a Multilingual Knowledge Base
Do you need agents to search for articles while working on a case?	Attach PDF versions of articles to case emails.View a list of suggested articles based on case information., Set Up the Knowledge One Widget
Do you need agents to follow articles in Chatter?	Feed Tracking
Do you need to share your knowledge base externally?	Public Knowledge for Mobile, Web, and Facebook
Do you need to enhance searchability?	Improve the Article Search Experience
Do you need guidelines, resources, and current discussions on the evolving world of knowledge base orientated service?	Salesforce Knowledge is "KCS Verified" by the Consortium for Service Innovation, which recognizes best practices in customer support methodologies. By implementing Knowledge-Centered Support (KCS) features, you can create more efficient collaboration within your team and provide pertinent and accurate information to your customers.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Consider the following tips when planning and using Salesforce Knowledge:

- Create [synonym groups](#) in Salesforce Knowledge. Synonyms are words or phrases that are treated as equivalent in article searches, letting you optimize search results.
- Before setting up data categories, carefully plan your category groups and their hierarchies. Also, consider how your category hierarchy maps to your role hierarchy. For more information, see [Data Category Visibility](#).
- Create [custom reports](#) on your Salesforce Knowledge data. You can also install the *Knowledge Base Dashboards and Reports* app from the AppExchange to receive over two dozen helpful reports.
- Multiple agents can edit the same article at the same time. If that occurs, your changes can be overwritten by a colleague without warning, even if you save your work frequently. To avoid accidental data loss, instruct all users who edit articles to edit only the articles they're assigned.
- Know the maximum [limits for articles](#), article types, and data categories.
- Review your usage regularly to avoid storage shortages: from Setup, enter *Storage Usage* in the **Quick Find** box, then select **Storage Usage**.
- Public knowledge base users cannot rate articles.
- The [File custom field type](#) allows agents to attach documents to articles.
- You will lose your data if you convert a custom field on an article type into any other field type. Do not convert custom fields unless no data exists for the field.
- When renaming Salesforce Knowledge labels note that standard field names, like title and type, are fixed. These fields do not change the labels on the article create and edit pages. If the organization is set to another language, these fields remain in the fixed label for that language.
- The Salesforce Knowledge search engine supports lemmatization, which is the process of reducing a word to its root form. With lemmatization, a search can match expanded forms of a search term. For example, a search for *running* matches items that contain *run*, *running*, and *ran*.
- Make sure that you have a clear understanding of the type of articles your organization needs, and how agents interact with these article types. This determines the article type permissions and article actions that you need to assign to Salesforce Knowledge users, which you can then use to create the set of profiles or permission sets required by your organization. For more information, see [Knowledge Article Access](#) on page 2955.
- Determine if you need to create workflow rules for some of your article types. For example, you can create a rule that sends an email to an article manager when an agent creates an article upon closing a case.
- Determine if you need to create approval processes for some of your article types. For example, if you have a type of article that must have legal and management approval before it can be published externally, create an approval process for the article type.

Salesforce Knowledge Limits

Limits for Salesforce Knowledge per edition.

Salesforce Knowledge is a knowledge base for creating and managing content. If Salesforce Knowledge is enabled in Communities (Classic Knowledge only), customers and partners can access articles.

Note: The following limits are default limits. Some limits can be expanded. Contact Salesforce to request limit increases.

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
Maximum number of articles	50,000 articles	50,000 articles
Maximum number of article types	100 article types	N/A
Maximum number of custom fields per article type	Enterprise, Developer, and Unlimited editions: 500 custom fields per article type Performance editions: 800 custom fields per article type	N/A
Maximum file fields	5 file fields	N/A
Maximum file size	File fields are counted as attachments and can be up to 25 MB.	Files can be up to 25 MB.
Maximum rich text area size	131072 characters	131072 characters
Maximum size of all rich text area fields on an article	1638400 characters	1638400 characters
Maximum unique article references (links) in a rich text area field	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.
Article history tracking	Article events are tracked for up to 18 months.	Article events are tracked up to 18 months.
Maximum number of supported languages	16 supported languages	N/A
Article import	The import .zip file must meet the following requirements: <ul style="list-style-type: none"> • There can only be one .csv file and one .properties file. • The .csv file and the .properties file must be in the root directory. • The compression process must preserve the folder and subfolder structure. • The .zip file name can't contain special characters. • The .zip file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB. • .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations. • .csv file rows can't exceed 400,000 characters. • .csv file cells can't exceed 32 KB. 	N/A

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
	<ul style="list-style-type: none"> Each article in the .csv file can't have more than 49 translations. 	
Maximum number of data category groups and active data category groups	5 category groups, with 3 groups active at a time	5 category groups, with 3 groups active at a time
Maximum number of categories per data category group	100 categories in a data category group	100 categories in a data category group
Maximum number of levels in data category group hierarchy	5 levels in a data category group hierarchy	5 levels in a data category group hierarchy
Maximum number of data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article
Maximum number of promoted search terms	Your organization can create a maximum of 2,000 promoted terms.	N/A

Build Your Knowledge Base

If your organization has Knowledge User licenses and one is assigned to you, you are ready to build your knowledge base.

To ensure that your organization has Knowledge User licenses, from Setup, enter *Company* in the Quick Find box, then select **Company Information**. Knowledge User licenses are listed near the bottom of the page, in the Feature Licenses related list.

To ensure that you are a Salesforce Knowledge user, from your personal settings, enter *Personal* in the Quick Find box, then select **Personal Information**. The Knowledge User checkbox is in the second column of the User Detail section.

To enable Salesforce Knowledge, from Setup, enter *Knowledge* in the Quick Find box, then select **Knowledge Settings**. Confirm that you want to enable Salesforce Knowledge and click **Enable Knowledge**. If your org doesn't have an article type, a default article type is created.

-  **Note:** If you enabled Knowledge before Spring '16 you must create an article type first. After the Spring '16 release, you no longer need to create an article type first.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To enable Salesforce Knowledge:

- “Customize Application”

Enable Salesforce Knowledge

From the Knowledge Settings page, you can create a Knowledge Base experience for your support agents, partners, and customers.

To set up or edit your knowledge Base, from Setup, enter *Knowledge Settings* in the *Quick Find* box, select **Knowledge Settings**, then click **Edit**.

Feature or Option	Description
General Settings	
Allow agents to create and edit articles from the Article or Knowledge tab	Enables agents to edit articles without going to the Article Management tab. Agents can click Edit to open the article edit page. If a published version of the article exists, they can view the published version or edit the current version. If a draft version exists, they can continue with editing the existing draft, but must carefully review the draft so that they don't overwrite unpublished changes.
Activate Validation Status field	Adds a Validation Status on page 3002 field to all Salesforce Knowledge articles. Agents can select values to show whether the content of the article has been validated or not.
Allow agents to add external multimedia content to HTML in the standard editor	Allows <iframe> elements in the standard editor to embed multimedia content from the Dailymotion, Vimeo, and YouTube websites. Agents can simply cut and paste <iframe> HTML into the editor.
Enable Lightning Knowledge (Beta)	Enables Lightning Knowledge (Beta). After you enable Lightning Knowledge, you can't disable it.
Article Summaries	
Show article summaries in article list views	For each channel, decide whether an article's summary details display beneath the article's title in search results.
Knowledge One	
Switch from the Articles tab to the Knowledge Tab	Enable Knowledge One with Profiles Enable Knowledge One with Permission Sets
Suggest related articles on cases	Search on the Knowledge tab suggests articles based on their content similarity and their links to similar cases. If no articles are linked to similar cases, suggested articles have similar titles as the case or have keywords in common with admin-selected case fields. Suggested articles

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Feature or Option	Description
	<p>are available in the Salesforce Console for Service and your portals when viewing existing cases and creating ones. Finally, if the suggested articles aren't suitable, the user working the case initiates a search with specific keywords, which may result in different articles.</p> <p> Note: By default, the Subject field is selected. Choose up to five of the available short text fields that include a description of the issue, the affected product, or the case topic. We recommend choosing short text fields to return more relevant results. Only the first 100 characters of the content from all admin-selected fields are searched. The Description field is always taken into account when suggesting articles for cases and does not count toward the character limit.</p>
Highlight relevant article text within search results	Search on the Knowledge tab generates a snippet of the relevant article text with the search terms bolded. See Search Highlights and Snippets .
Auto-complete keyword search	<p>Search on the Knowledge tab suggests the three most popular keyword searches performed on the Knowledge tab. Suggestions are based on the channel (internal, customer, partner, or public) the reader is searching.</p> <p> Note: Keyword search history is refreshed once a day.</p>
Auto-complete title search	Search on the Knowledge tab suggests up to 3 articles with matching titles.
Language Settings	
Default Knowledge Base Language	The primary language used for writing articles. It defaults to your organization's language. We recommend that your Default Knowledge Base Language and your organization's language are the same.
Single or Multiple Language	<p>If you support more than one language, select Multiple Languages and choose the translation settings. For instructions, see Support a Multilingual Knowledge Base.</p> <p> Important: If you enable Multiple Languages, you can't revert to a single language knowledge base. You also can't enable and use Lightning Knowledge (Beta).</p>
Case Settings	

Feature or Option	Description
Allow agents to create an article from a case	<p>If this checkbox is selected, agents can create a draft article that is attached to the case when the article is published using one of the following options.</p> <ul style="list-style-type: none"> • Create articles using the simple editor only when closing cases. • Create articles using the standard editor any time an agent creates an article. Make sure that users have “Manage Articles,” “Read,” and “Create” permissions. Designate the following: <ul style="list-style-type: none"> – The default article type, from the drop-down list – For articles created when closing a case, assign the article to a user. – Help agents create articles fast by Selecting an Apex class that pre-populates any of the fields on the draft. By default, the Title field in all draft articles contains the case subject. <p> Note: If you enable this option, also click Layout Properties on each case-close page layout and select “Enable submissions during case close and Submit Articles.”</p>
Use a profile to create article PDFs	<p>By default, when a user creates an article PDF directly from a case, the PDF includes all the article fields visible to that user. If you want PDFs generated according to a different profile, for example, a profile that hides certain fields from customers, select Use a profile to create customer-ready article PDFs on cases and choose the profile that determines field visibility.</p>
Enable list of cases linked to an article	<p>Agents and Salesforce Knowledge managers can see a list of cases an article is attached to. This helps validate if the article is the right solution for a case and shows which articles are used most, without running a report. The Linked Cases related list:</p> <ul style="list-style-type: none"> • Is visible on the detail or preview page of any article that has been published at least once. • Shows a maximum of 200 cases • Is sorted in descending order by the date the article was linked to the case. The sort order can’t be changed. • Doesn’t appear on archived articles or a translation’s edit and detail pages. • Doesn’t appear for external users such as portal or communities users or on Salesforce1.
Share Article via URL Settings	
Allow agents to share articles via public URLs	<p>You can share an article that is available on a public knowledge base with a URL. In the Available Sites list, select the sites you want to allow your agents to send URLs from and add them to the</p>

Feature or Option	Description
	Selected Sites list. Agents can then email customer service clients with a URL to link directly to the article in your public knowledge base.
Answers Settings	
Allow agents to create an article from a reply	If this checkbox is selected, members of an answers community or Chatter Answers community can convert helpful replies into articles. The article type you select determines which fields appear on the draft article. However, on all articles the Title contains the question and the Summary contains the reply. After a reply is promoted to an article, the original reply has a status message indicating its association with the draft article. When the article is published, the message on the reply includes a link to the article.
Chatter Questions Settings	
Display relevant articles as users ask questions in Chatter (also applies to communities with Chatter)	Shows similar questions and relevant Salesforce Knowledge articles when a user enters a question in the Search field.
Knowledge Statistics Settings	
Enable thumbs up or down voting for article	With this option, the article VoteStat report (which by default only contains totals for star ratings) includes totals for the thumbs up or down ratings.

Enable Knowledge One with Permission Sets

To switch users from the Articles tab to the Knowledge tab, add the `Knowledge One` permission to their permission sets.

To add the `Knowledge One` permission to a permission set:

1. From Setup, enter `Permission Sets` in the `Quick Find` box, then select **Permission Sets**.
2. Click the permission set you want to add the Knowledge One permission to.
3. In the  `Find Settings...` box, enter `Knowledge`.
4. Select **Knowledge One** from the list of suggestions.
5. Click **Edit**.
6. Under `Knowledge Management`, check the Enabled check box for `Knowledge One`.
7. Click **Save**.
8. Ensure each user has at least a Read permission on at least one article type.

Once Knowledge One is available for your users, define your [external data sources](#). Your external data sources appear under your articles both in the search results and the left-side panel.

USER PERMISSIONS

To create or edit profiles:

- "Manage Profiles and Permission Sets"

To create and edit external data sources:

- "Customize Application"

Example Apex for Submitting Articles from Cases

If your organization allows customer-support agents to create Salesforce Knowledge articles while closing a case, you can use Apex to pre-populate fields on draft articles. To do so, create an Apex class and assign it to the case article type using the example below as a guide.

For more information on the syntax and use of Apex, see the [Force.com Apex Code Developer's Guide](#).

Set up the example by creating the following article type, field, and data categories. Do not change the default `API Name` assigned to each new object.

1. Create an article type called `FAQ`.
 2. Create a text custom field called `Details`.
 3. Create a category group called `Geography` and assign it a category called `USA`.
 4. Create a category group called `Topics` and assign it a category called `Maintenance`.
- Now, create and assign the Apex class.
5. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes** and click **New**.
 6. To specify the version of Apex and the API used with this class, click **Version Settings**.

If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.

7. In the `Apex Class` text box enter the following script and click **Save**:

```
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController
    as an argument
    public
    AgentContributionArticleController(ApexPages.KnowledgeArticleVersionStandardController
    ctl) {
        SObject article = ctl.getRecord(); //this is the SObject for the new article.

        //It can optionally be cast to the proper
        article type, e.g. FAQ__kav article = (FAQ__kav) ctl.getRecord();

        String sourceId = ctl.getSourceId(); //this returns the id of the case that was
        closed.
        Case c = [select subject, description from Case where id=:sourceId];

        article.put('title', 'From Case: '+c.subject); //this overrides the default
        behavior of pre-filling the title of the article with the subject of the closed case.
        article.put('Details__c',c.description);

        ctl.selectDataCategory('Geography','USA'); //Only one category per category
        group can be specified.
        ctl.selectDataCategory('Topics','Maintenance');
    }
}
```

8. From Setup, enter `Knowledge Settings` in the `Quick Find` box, then select **Knowledge Settings** and click **Edit**.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To edit Salesforce Knowledge settings:

- "Customize Application"

To create an Apex class:

- "Author Apex"

9. Verify the [case settings](#); using our example, the **Default article type** should be FAQ.
10. From the Use Apex Customization menu, select **AgentContributionArticleController** and click **Save**.

As a result of this example, when agents create an article from the case-close screen:

- The data from the `Description` field on the case appears in the `Details` field of the article.
- The title of the article contains `From Case:` and the case subject.
- The article is automatically assigned to the `USA` data category and the `Maintenance` data category.

SEE ALSO:

[Build Your Knowledge Base](#)

[Salesforce Knowledge Documentation Overview](#)

[Complete Guide to Salesforce Knowledge](#)

Use Videos from Any Provider with a Custom Visualforce Page

Using a custom Visualforce page and the HTML editor, you can insert videos from any provider into your Salesforce Knowledge articles.

For example, create a Visualforce page:

```
<apex:page showHeader="false" showChat="false" sidebar="false">
  <iframe width="560" height="315"
    src="http://myvideo.provider.com/embed/{!$CurrentPage.parameters.VideoID}"
    frameborder="0" allowfullscreen="true">
  </iframe>
</apex:page>
```

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create a Visualforce page

- "Customize Application"

To create articles:

- "Manage Articles"

AND

"Read" and "Create" on the article type

To edit draft articles:

- "Manage Articles"

AND

"Read" and "Edit" on the article type

To edit published or archived articles:

- "Manage Articles"

AND

"Create," "Read," and "Edit" on the article type

Then, with the HTML editor, authors can reference videos using this code:

```
<iframe frameborder="0" height="315"
  src="https://<salesforce_instance>/apex/Video?videoID=12345"
  width="560">
</iframe>
```

Knowledge Article Types

Article types, such as FAQs and Tutorials, provide the format and structure to control how an article displays for each audience, known as a channel. For each article type you can create custom fields, customize the layout by adding or removing sections and fields, and choose a template for each channel. You can also create workflow rules and approval processes to help your organization track and manage article creation and publication.

SEE ALSO:

- [Create Article Types](#)
- [Salesforce Knowledge Documentation Overview](#)
- [Complete Guide to Salesforce Knowledge](#)

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Create Article Types

An article type controls how an article displays and what type of information of fields are included.

 **Note:** Before agents can access article types, you must set object permissions for article types.

1. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Click **New Article Type** or edit an existing article type.
3. Enter the article types details

Field	Description
Label	A name used to refer to the article type in any user interface pages.
Plural Label	The plural name of the object. If you create a tab for this object, this name is used for the tab.
Gender	If it is appropriate for your organization's default language, specify the gender of the label. This field appears if the organization-wide default language expects gender. Your personal language preference setting does not affect whether the field appears. For example, if the organization's default language is English and your personal language is French, you are not prompted for gender when creating an article type.
Starts with a vowel sound	If it is appropriate for your organization's default language, check if your label should be preceded by "an" instead of "a".
Object Name	(Read only) A unique name used to refer to the article type when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	An optional description of the article type. A meaningful description helps you remember the differences between your article types when you are viewing them in a list.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, or delete article types:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Field	Description
Track Field History	Select this option to track the full history of an article and its versions. The system records and displays field updates, publishing workflow events, and language versions for the master article and any translations.
Deployment Status	Indicates whether the article type is visible outside Setup. In Development means that article managers can't choose this article type when creating articles. Only select Deployed after you are done creating the article type.

4. Click **Save**.

On the article type detail page,

- In the Fields related list, [create or modify custom fields](#) as needed.
- In the Fields related list, [edit the article-type layout](#) as needed to rearrange fields and create sections.
- In the Channel Displays related list, [choose a template](#) for the Internal App, Partner, Customer, and Public Knowledge Base.

SEE ALSO:

[Add Custom Fields to Article Types](#)

[Article Type Page Layouts](#)

[Knowledge Article Types](#)

[Salesforce Knowledge Documentation Overview](#)

[Complete Guide to Salesforce Knowledge](#)

Add Custom Fields to Article Types

Create custom fields to store information that is important to your articles. The only standard fields provided on article types are: Article Number, Summary, Title, and URL Name. At minimum, you want to create a field where authors can write the body of the article.

Before you begin, determine the [type of custom field](#) you want to create.

-  **Note:** Authors can view the `URL Name` when they create or edit an article. The `URL Name` does not appear to end users viewing published articles.
- 1. From Setup, enter *Knowledge Article Types* in the `Quick Find` box, then select **Knowledge Article Types**.
- 2. Select an article type.
- 3. Click **New** in the Fields related list.
- 4. Choose the type of field to create, and click **Next**.
- 5. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
- 6. Enter any field attributes, such as `Description`, and click **Next** to continue.
 -  **Note:** You cannot enter a default value for any custom field.
- 7. Set the [field-level security](#) to determine whether the field is visible and editable or read only for specific profiles, and click **Next**. Field-level security allows you to control which fields are visible in different channels.
- 8. If you do not want the field to be added automatically to the article-type layout, uncheck `Yes, add this custom field to the layout`.
- 9. Click **Save** to finish or **Save & New** to create more custom fields.
- 10. Optionally [rearrange your custom fields](#) on the article-type layout.
-  **Note:** Creating fields can require changing many records at once. To process these changes efficiently, Salesforce might queue your request and send an email notification when the process has completed.
-  **Warning:** You lose your data if you convert a custom field on an [article type](#) into any other field type. Do not convert a custom field on an article type unless no data exists for the field.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or change custom fields:

- “Customize Application”
AND
“Manage Salesforce Knowledge”

Custom Fields on Articles

The first step in creating a custom field for articles is choosing the field type. This table describes all available custom field types.

Field Type	Description
Article Currency	In a multiple currency organization, an article can have an article currency field to set the article's currency ISO code.
Currency	<p>Allows agents to enter a currency amount. The system automatically formats the field as a currency amount. This can be useful if you export data to a spreadsheet application. You can make this field required so an agent must enter a value before saving an article.</p> <p> Note: Salesforce uses the round-half-to-even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, -22.5 becomes -22, and -23.5 becomes -24. Values lose precision after 15 decimal places.</p>
Date	Allows agents to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field. You can make this field required so an agent must enter a value before saving an article.
Date/Time	Allows agents to enter a date or pick a date from a popup calendar, and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field. You can make this field required so an agent must enter a value before saving an article.
Email	Allows agents to enter an email address, which is validated to ensure proper format. Character limit is 80. If this field is specified for contacts or leads, agents can choose the address when clicking Send an Email . You can't use custom email addresses for mass emails. You can make this field required so an agent must enter a value before saving an article.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Field Type**Description**

File

Allows agents to upload and attach a file to an article. You can make this field required so an agent must enter a value before saving an article. Note the following caveats about File fields:

- The maximum attachment size is 25 MB.
- You can add up to 5 File fields to each article type; contact Salesforce to increase these limits.
- If the `Disallow HTML documents and attachments` security setting is enabled, File fields do not support HTML files.
- Text content in a File field attachment is searchable. You can search up to 25 MB of attached files on an article. For example, if an article has six 5-MB file attachments, the first 4.16 MB of each file is searchable.
- You cannot attach Salesforce CRM Content files using the File field.
- The File field type is not supported in Developer edition.
- The filename cannot exceed 40 characters.
- You cannot convert a File field type into any other data type.

Formula

Allows agents to automatically calculate values based on other values or fields such as merge fields.

 **Note:** Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34.

In Database.com, the Formula editor does not provide a **Check Syntax** button. Syntax checking occurs when the agent attempts to save the formula.

Lookup Relationship

Creates a relationship between two records so you can associate them with each other. For example, opportunities have a lookup relationship with cases that lets you associate a particular case with an opportunity. A lookup relationship creates a field that allows agents to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all the records that are linked to it. You can create lookup relationship fields that link to users, standard objects, or custom objects. If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship. You can make this field required so an agent must enter a value before saving an article.

Lookup relationship fields are not available in Personal Edition.

Field Type	Description
Number	<p>Lookup relationship fields to campaign members are not available; however, lookup relationship fields from campaign members to other objects are available.</p> <p>Allows agents to enter any number. This entry is treated as a real number and any leading zeros are removed. You can make this field required so an agent must enter a value before saving an article.</p> <p> Note: Salesforce uses the round half up tie-breaking rule for number fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34. Salesforce rounds numbers referenced in merge fields according to the user's locale, not the number of decimal spaces specified in the number field configuration.</p>
Percent	<p>Allows agents to enter a percentage number, for example, '10'. The system automatically adds the percent sign to the number. You can make this field required so an agent must enter a value before saving an article.</p> <p> Note: If the decimal value is greater than 15, and you add a percent sign to the number, a runtime error occurs. Values lose precision after 15 decimal places.</p>
Phone	<p>Allows agents to enter any phone number. Character limit is 40. You can make this field required so an agent must enter a value before saving an article.</p> <p>Salesforce automatically formats it as a phone number.</p>
Picklist	<p>Allows agents to select a value from a list you define.</p>
Picklist (Dependent)	<p>Allows agents to select a value from a list dependent on the value of another field.</p>
Picklist (Multi-select)	<p>Allows agents to select more than one picklist value from a list you define. These fields display each value separated by a semicolon.</p>
Text	<p>Allows agents to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters. You can make this field required so an agent must enter a value before saving an article.</p>
Text Area	<p>Allows agents to enter up to 255 characters that display on separate lines similar to a <code>Description</code> field. You can make this field required so an agent must enter a value before saving an article.</p>
Text Area (Long)	<p>Allows agents to enter up to 131,072 characters that display on separate lines similar to a <code>Description</code> field. You can set the length of this field type to a lower limit, if desired. Any length from</p>

Field Type**Description**

	<p>256 to 131,072 characters is allowed. The default is 32,768 characters. Every time a agents presses <code>Enter</code> within a long text area field, a line break and a return character are added, both count toward the character limit. Also, smart links add more characters than what is displayed.</p> <p> Note: If you lower the character limit and you have articles that surpass the new limit. Those articles can't be edited until the limit is reset higher than their character counts.</p>
Text Area (Rich)	<p>Allows agents to enter up to 131,072 characters of HTML-supported text including code samples () and smart links between Salesforce Knowledge articles.</p> <p>There are two ways to create smart links:</p> <ul style="list-style-type: none"> • Search for the article. • Enter the article URL. <p> Note:</p> <ul style="list-style-type: none"> • You can have up to 100 links to different Salesforce Knowledge articles in one rich text field. • When you convert a text area (rich) field to a text area (long) field, links are displayed as link reference numbers, not URLs. • The upgraded editor doesn't support Internet Explorer version 7 or version 8 in compatibility mode. If you are using these browsers, you use the older editor.
URL	<p>Allows agents to enter up to 255 characters of any valid website address. When agents click the field, the URL opens in a separate browser window. Only the first 50 characters are displayed on the record detail pages. You can make this field required so an agent must enter a value before saving an article.</p>

Field-Level Security on Articles

Field-level security lets administrators restrict readers' access to specific fields on detail and edit pages. For example, you can make a "Comment" field in an article visible for Internal App profiles but not for public Community profiles.

If using both [article-type layout](#) and field-level security to define field visibility, the most restrictive field access setting always applies. For example, if a field is hidden in the article-type layout, but visible in the field-level security settings, the layout overrides security settings and the field aren't visible. Some user permissions override both page layouts and field-level security settings. For example, users with the "Edit Read Only Fields" permission can always edit read-only fields regardless of any other settings.

 **Important:** Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

You can define security via a permission set, profile, or field.

Define field-level security via permission sets or profiles

- For permission sets or profiles, from Setup, either:
 - Enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, or
 - Enter *Profiles* in the **Quick Find** box, then select **Profiles**
- Select a permission set or profile.
- Depending on which interface you're using, do one of the following:
 - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the object you want and select it from the list. Click **Edit**, then scroll to the Field Permissions section.
 - Original profile user interface—In the Field-Level Security section, click **View** next to the object you want to modify, and then click **Edit**.
- Specify the field's access level.

 **Note:** These field access settings override any less-restrictive field access settings on the article-type layouts.
- Click **Save**.

Define field-level security via fields

- For fields, from Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
- Select the article type that contains the field to modify.
- Select the field and click **Set Field-Level Security**.
- Specify the field's access level.

 **Note:** These field access settings override any less-restrictive field access settings on the article-type layouts.
- Click **Save**.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

After setting field-level security, you can [modify the article-type layouts](#) to organize the fields on detail and edit pages.

SEE ALSO:

[Add Custom Fields to Article Types](#)

[Salesforce Knowledge Documentation Overview](#)

[Complete Guide to Salesforce Knowledge](#)

Article Type Page Layouts

Article-type layouts determine which fields agents can view and edit when entering data for an article. They also determine which sections appear when users view articles. The article-type template defines the format of the article, for example whether layout sections display as subtabs or as a single page with links. You can apply a layout per profile per article type. Therefore, you can display more sensitive fields of the same article to only those agents with the correct profile.

 **Tip:** You can also use [field-level security](#) to hide fields on article types. For example, if you publish the same article in the internal app and in a community, you can use field-level security to hide a custom field such as `Internal Comments` from external community users.

1. From Setup, enter *Knowledge Article Types* in the `Quick Find` box, then select **Knowledge Article Types**.
2. Click the article type.
3. Scroll down to the Page Layouts related list or click the Page Layouts link at the top of the page.
4. To create a page layout, click **New** and follow the prompts. To edit an existing layout, click **Edit** and make your changes.

Make your changes. The layout editor consists of two parts: a palette on the upper portion of the screen and the layout on the lower portion of the screen. The palette contains the available fields and a section element. The layout contains an Information section and space for you to add sections. By default, all custom fields are included in the Information section.

 **Important:** If you navigate away from your article-type layout before clicking save, your changes are lost.

 **Note:** The `Article Number`, `Summary`, `Title`, and `URL Name` standard fields do not display in the layout. `Article Number` and `Summary` appear in a read-only Properties section at the top of the published article. Also included in this header are the `First Published`, `Last Modified`, and `Last Published` fields.

Task	Description
Add a section	Drag and drop the section element into the palette.
Change the name of a section	Click its title. You cannot rename the Information section.
Remove a field from a section	Drag it to the right side of the palette or click the  icon next to the field.
Remove a section from the article-type layout	Click the  icon next to the section name.
Save your changes and continue editing the article type layout	Click Quick Save .

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To customize the article-type layout:

- “Customize Application”

 **Tip:**

- Use the undo and redo buttons to step backwards and forwards, respectively.
- Use the following keyboard shortcuts:
 - Undo = CTRL+Z
 - Redo = CTRL+Y
 - Quick Save = CTRL+S
- To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.
- To quickly locate any item in the palette, use the Quick Find box. The Quick Find box is especially useful for article-type layouts that have large numbers of items available in the palette.

5. To assign various layouts to the article type based on a user profile, click **Page Layout Assignments**.

6. Click **Edit Assignment**.

7. Select the profile, or profiles (using SHIFT), you want to change and select the layout from the **Page Layout To Use** drop-down.

When creating multiple article type page layouts, consider the following limitations and functionality changes.

- When creating page layouts, some fields are hidden based on the agent's license. Out of Date, Translation Completed Date, and Translation Exported Date are hidden from users who do not have a Knowledge User license or who are customer portal or partner portal users. In addition, Archived By and Is Latest Version are hidden from customer portal and partner portal users.
- Before Spring '16, preview pages showed the Summary field in the API that contained text values, even if they were not in the page layout. To continue displaying summary fields on preview pages, manually update your page layouts to include them.
- If you want to attach articles as PDFs to emails when solving cases, add **File Attachments** to the `Selected Email Tools` in the Feed View for the article type layout.
- The article edit page only shows the standard fields (Article Number, Title, URL Name, and Summary) and all the custom fields added to the layout, including the side bar fields. Other standard fields added on the page layout are ignored because they are not editable, and the custom fields are displayed in the order specified in the page layout.
- If an article type page layout doesn't include a field with a [validation rule](#), you can't create or edit an article of that article type. Make sure all page layouts assigned to the article type by profile include all fields with validation rules.
- The Communication channel layout doesn't use the page layout to determine which Article fields are inserted into a case email. The fields that are inserted include the fields selected in the Communication Channel mapping.
- You can set up a specific profile to generate a PDF file. When sending articles as PDFs, the pdf is generated based on the sender's profile. Therefore, the receiver might get fields they are not meant to see. Use the `Use a profile to create customer-ready article PDFs on cases` setting on the Knowledge settings page so the fields in PDFs come from the page layout assigned to the configured profile. Also, Field Level Security of both the sender profile and the configured profile are applied.
- Salesforce Mobile Classic actions and related lists are not available on article page layouts in the desktop Salesforce user interface, with the exception of actions on the article feed.

[Complete Guide to Salesforce Knowledge](#)

Send Article Content in Email (Beta)

When using Knowledge One, agents can send an email with an article's contents embedded in the body of the email.

 **Note:** Sending article content via email is available through a beta program for articles published on external channels (public knowledge bases, portals, or communities) and is not supported on Internet Explorer 7. For new organizations, the user permission off on all standard profiles but on for the System Administrator profile. For existing organizations, contact your Salesforce representative to enable the permission on the standard System Administrator profile.

Agents can send article content within an email rather than just sending a URL. Your customers can access the information without going to a website. Your agents send articles that are not published publicly without rewriting or copy and pasting an internal article. Administrators can assign permission to only those agents with a good knowledge of what is acceptable for an external audience.

To enable and setup which article fields go into emails for each article type.

1. From the object management settings for cases, go to Page Layouts.
2. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose **Edit feed view**. (This section appears only for organizations created before Spring '14.)

If you've already opted to use the advanced page layout editor to configure the publisher for a layout, choose **Edit detail view** to add, change, or remove actions.
3. Under **Articles Tool Settings**, check **Enable attaching articles inline**.
4. Click **Save**.
5. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
6. Click the label or name of the article type you'd like to share via email.
7. Under **Communication Channel Mappings**, click **New** or **Edit**.
8. Enter a Label and Name.
9. Select and add **Email** to the Selected Channels list.
10. Select and add the fields you'd like included in the body of an email.

 **Note:** Smart links can't be included in the email and the following fields are not supported:

- ArticleType
- isDeleted
- Language
- MultiPicklist
- Picklist
- Publish Status
- Source

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To administer Salesforce Knowledge and create, edit, and delete page layouts:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

- Validation Status

11. Click **Save**.

 **Example:** While solving customer cases, agents with the permission can insert article content into the body of an email. Anywhere agents can attach articles to cases, such as the Knowledge One sidebar in the Salesforce Console, the Articles list in the case feed, the Article widget, or the suggested articles in a Knowledge One search, they can email any article of that type within the body of an email by selecting **Email article with HTML** in the action drop-down. The article content is inserted at top of email thread or wherever the agent left their cursor. Once an article has been emailed, an envelope icon appears to the left of the title. When the article has files that exceed the 10-mb attachment limit, agents are asked to select which files to attach and retry sending the email.

 **Note:** If rich text is not enabled on your case feed layout for the article type, only article text is embedded into the email and the action changes to **Email article text only**.

SEE ALSO:

[Article Type Page Layouts](#)

[Salesforce Knowledge Documentation Overview](#)

[Complete Guide to Salesforce Knowledge](#)

Post Site and Community Article URLs

In the Service Console, agents can insert Site or Community URLs for articles into the case feed via the email, community, or social publishers.

To post Site or Community URLs for articles into the case feed, you must have the [Knowledge sidebar enabled in the Service Console](#) and either a [Force.com Site](#) or [Community](#) setup.

1. From Setup, enter *Knowledge* in the *Quick Find* box, then select **Knowledge Settings**.
2. Click **Edit**.
3. In the *Share Article via URL Settings* section, enable **Allow users to share articles via public URLs**.
4. In the *Available Sites* list, select from which sites or communities you want agents to share article URLs and add them to the *Selected Sites* list.
5. Click **Save**.

Your agents can now select **Attach and share article** link from selected sites in the Knowledge sidebar of the console. Email is the default action but agents can change to the Social or Community action in the case feed before they insert the URL.

Important:

- Articles must be published. Draft articles don't show the insert URL option.
- Articles must be shared publicly, meaning their Channel must be Public Knowledge Base, Customer, or Partner.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To administer Salesforce Knowledge:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

- All enabled URLs show **Attach and share article** link, even if the article is not visible in that site or community. The agent must confirm that the article is available in the site or community before sharing it with the customer.

[Complete Guide to Salesforce Knowledge](#)

Control Data Integrity with Validation Rules

Ensure that your article content is compliant with your company standards. Create validation rules for each article type to check whether required fields have the appropriate values based on the article's status.

1. From Setup, enter *Article Types* in the Quick Find box, then select **Knowledge Article Types**.
2. Click the article type.
3. Scroll down to the Validation Rules related list or click the **Validation Rules** link at the top of the page.
4. To create a validation rule, click **New**. To edit an existing rule, click **Edit**.
5. Name the rule.
6. Make the rule active.
7. Optionally, describe what you want to control on articles of this type.
8. Specify an error condition formula and a corresponding error message.

The error condition is written as a Boolean formula expression that returns true or false. When true, the article is not saved, and an error message displays. The author can correct the error and try again. For information on validation rules, see [Define Validation Rules](#) on page 4866.

 **Note:** Knowledge article errors always display at the top of the page, not next to the field. Write your errors descriptively so that authors know how to satisfy the validation rule. For example, identify which field is causing the error.

9. Click **Save**.

When creating validation rules on article types, consider the following limitations and functionality changes.

- If an article type page layout doesn't include a field with a validation rule, you can't create or edit an article of that article type. Make sure all [page layouts assigned to the article type by profile](#) include all fields with validation rules.
- The Article Currency field and the VLOOKUP function don't support validation rules.
- When importing articles, if the import data file has a valid article with an invalid translation, the translation is created, but its translated content isn't imported.
- Only the first validation rule error displays at the top of the page and in the import article log. If multiple errors exist but are not fixed, they are displayed on subsequent saves or imports.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or edit validation rules for article types:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

- In the API, KA fields, such as Case Association Count and Archived Date, don't support validation rules. Only KAV (article version) fields are supported in validation rules.

[Knowledge Article Types](#)

[Salesforce Knowledge Documentation Overview](#)

[Complete Guide to Salesforce Knowledge](#)

Article History Tracking

You can track the history of certain fields in articles. If you have history tracking enabled, open an article of that type and click **Version** to see a version history list. You can also set tracking for the article type and track the full history of an article and its versions. Article events are tracked for up to 18 months.

The system records and displays field updates, publishing workflow events, and language versions for the master article and any translations. When you track old and new values, the system records both values as well as the date, time, nature of the change, and the user who made the change. When you track only the changed values, the system marks the changed field as having been edited; it doesn't record the old and new field values. This information is available in the Version History list and the fields are available in the Article Version History report.

Article history respects field, entity, and record-level security. You must have at least "Read" permission on the article type or the field to access its history. For data category security, Salesforce determines access based on the categorization of the online version of an article. If there is no online version, then security is applied based on the archived version, followed by the security of the draft version.

1. From Setup, enter *Knowledge* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Create an article type or edit one from the Article Types list.
3. Click **Set History Tracking**.
4. Choose the fields you want to track.
Salesforce begins tracking history from that date and time. Changes made before that date and time are not tracked.
5. Click **Save**.

USER PERMISSIONS

To create, edit, or delete article types:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Article Type Templates

Article types in Salesforce Knowledge require a template for each channel. The standard article-type templates—Tab and Table of Contents—specify how the sections in the article-type layout appear in the published article. For example, if you choose the Tab template, the sections defined in the layout appear as tabs when users view an article. With the Table of Contents template, sections appear on a single page with hyperlinks to each section. You can also create a custom template using Visualforce. Custom templates are not associated with the article-type layout.

1. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Click an article type name.
 - If you are using a default template, continue with Step 12.
 - If you are creating a custom template, make note of the article type's **API Name**. You need this value when you create the Visualforce page.
3. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.
4. Click **New**.
5. In the **Name** text box, enter the text that appears in the URL as the page name.
This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. In the **Label** text box, enter the text that users see when choosing this template from the Channel Displays related list on the article type detail page.
7. Add your Visualforce markup.

The only requirement for custom article-type templates is that the standard controller is equal to the **API Name** of the article type. For example, if the **API Name** of the article type is *Offer__kav*, your markup would be:

```
<apex:page standardController="Offer__kav">
    ... page content here ...
</apex:page>
```

Note: Click **Component Reference** for a list of the Visualforce components, such as `knowledge:articleRendererToolbar` and `knowledge:articleCaseToolbar`, available for use in custom article-type templates.

8. If your article type has a **File field**, you can allow users to download the field's content.

In the following example, the article type is *Offer*, the name of the File field is *my_file*, and the text that appears as a link is *Click me*:

```
<apex:outputLink value="{!URLFOR($Action.Offer__kav.FileFieldDownload,
Offer__kav.id, ['field'=$ObjectType.Offer__kav.fields.my_file__Body__s.name])}">Click
me</apex:outputLink>
```

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, or delete article-type templates:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

 **Note:** If the File field is empty (meaning the author didn't upload a file), the link still appears on the published article but has no function. If you do not want the link to appear when the File field is empty, replace *Click me* in the example with the name of the file. For example, `{!Offer__kav.my_file__Name__s}`.

9. Click **Save**.

Your custom template can now be assigned to any channel on the article type.

10. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**

11. Click an article type name.

12. For each channel, specify the template.

- For Internal App, Customer and Partner, **Tab** is the default template.
- For Public Knowledge Base, **Table of Contents** is the default template.
- If you created a custom template for this article type, it also appears in the drop-down menu.

13. Click **Save**.

 **Example:** If you choose the Tab template, the sections you defined in the layout appear as tabs when users view an article.

Published Article Using the Tab Article-Type Template

If you choose the Table of Contents template, the sections you defined in the layout appear on one page with hyperlinks to each section title.

Published Article Using the Table of Contents Article-Type Template

[Complete Guide to Salesforce Knowledge](#)

Example Apex for Submitting Articles from Cases

If your organization allows customer-support agents to create Salesforce Knowledge articles while closing a case, you can use Apex to pre-populate fields on draft articles. To do so, create an Apex class and assign it to the case article type using the example below as a guide.

For more information on the syntax and use of Apex, see the [Force.com Apex Code Developer's Guide](#).

Set up the example by creating the following article type, field, and data categories. Do not change the default `API Name` assigned to each new object.

1. [Create an article type](#) called `FAQ`.
2. [Create a text custom field](#) called `Details`.
3. [Create a category group](#) called `Geography` and [assign it a category](#) called `USA`.
4. [Create a category group](#) called `Topics` and [assign it a category](#) called `Maintenance`.

Now, create and assign the Apex class.

5. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes** and click **New**.
6. To specify the version of Apex and the API used with this class, click **Version Settings**.

If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.

7. In the `Apex Class` text box enter the following script and click **Save**:

```
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController
    as an argument
}
```

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To edit Salesforce Knowledge settings:

- "Customize Application"

To create an Apex class:

- "Author Apex"

```

    public
    AgentContributionArticleController(ApexPages.KnowledgeArticleVersionStandardController
    ctl) {
        SObject article = ctl.getRecord(); //this is the SObject for the new article.

        //It can optionally be cast to the proper
        article type, e.g. FAQ__kav article = (FAQ__kav) ctl.getRecord();

        String sourceId = ctl.getSourceId(); //this returns the id of the case that was
        closed.
        Case c = [select subject, description from Case where id=:sourceId];

        article.put('title', 'From Case: '+c.subject); //this overrides the default
        behavior of pre-filling the title of the article with the subject of the closed case.
        article.put('Details__c',c.description);

        ctl.selectDataCategory('Geography','USA'); //Only one category per category
        group can be specified.
        ctl.selectDataCategory('Topics','Maintenance');
    }

```

8. From Setup, enter *Knowledge Settings* in the Quick Find box, then select **Knowledge Settings** and click **Edit**.
9. Verify the [case settings](#); using our example, the **Default article type** should be FAQ.
10. From the Use Apex Customization menu, select **AgentContributionArticleController** and click **Save**.

As a result of this example, when agents create an article from the case-close screen:

- The data from the *Description* field on the case appears in the *Details* field of the article.
- The title of the article contains *From Case:* and the case subject.
- The article is automatically assigned to the *USA* data category and the *Maintenance* data category.

Delete an Article Type

Deleting article types can result in errors and lost data. Read this entire topic carefully before deleting article types.

1. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Next to the article type, click **Del**.
3. Confirm that you want to delete the article type.

Notes on Deleting Article Types

- If your organization has only article type, you cannot delete it. Every Salesforce Knowledge org requires at least one deployed article type. Create an article type and then delete the old one.
- Any articles associated with a deleted article type are automatically removed from all channels, including draft, published, and archived articles.
- Salesforce does not display deleted article types in the Recycle Bin with other deleted records. Instead, deleted article types appear in the Deleted Article Types list on the article list view page for 15 days. During this time, you can restore the article type and its articles, or permanently erase the article type and its articles. After 15 days, the article type and its articles are permanently erased.
- If a reader clicks a bookmark to a deleted article's URL, an Insufficient Privileges message displays.

Import Existing Information into Salesforce Knowledge

You can import your existing articles or information database into Salesforce Knowledge. This importer is for articles and translations you currently have outside Salesforce Knowledge

-  **Note:** If you are looking for instructions on importing translated articles that you've sent to a localization vendor, see [Import Translated Articles](#) on page 2974.

1. [Prepare Articles for Import to Salesforce Knowledge](#)
Each import file must have articles of the same type and columns corresponding to the fields in the article.
2. [Create a .csv File for Article Import](#)
Each .csv file imports articles into one article type and maps the imported articles' content with the article type's fields. For example, a .csv file might map articles' titles with the standard field `title` in an article type, meaning that each article's title is imported into the `title` field.

[Complete Guide to Salesforce Knowledge](#)

Prepare Articles for Import to Salesforce Knowledge

Each import file must have articles of the same type and columns corresponding to the fields in the article.

 **Tip:** Test your import using a small set of articles.

1. Sort your existing articles by information type.
For example: FAQ, product information, or offer.
2. Ensure that each information type has a corresponding [Salesforce Knowledge article type](#) that matches its structure and content.

For example, if you are importing FAQs, ensure that Salesforce Knowledge has an FAQ article type with enough question and answer fields to accommodate the largest FAQ article.

If your articles contain .html files, use an article type that contains a rich text area field and ensure that the HTML is compliant with the tags and attributes supported in the rich text area field.

 **Note:** The article importer does not support subfields. If you have fields within fields, adjust your structure and content before importing into Salesforce Knowledge.

3. Verify that the article's [field-level security settings](#) allow you to edit the fields.

For each article type, [create a cvs file](#) to import.

USER PERMISSIONS

To import articles:

- "Manage Salesforce Knowledge "

AND

"Manage Articles"

AND

"Manage Knowledge Article Import/Export"

AND

"Read," "Create," "Edit," and "Delete" on the article type

Create a .csv File for Article Import

Each .csv file imports articles into one article type and maps the imported articles' content with the article type's fields. For example, a .csv file might map articles' titles with the standard field `Title` in an article type, meaning that each article's title is imported into the `Title` field.

1. Create one .csv file per article type.
 - There can only be one .csv file and one .properties file.
 - The .csv file and the .properties file must be in the root directory.
 - The compression process must preserve the folder and subfolder structure.
 - The .zip file name can't contain special characters.
 - The .zip file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB.
 - .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
 - .csv file rows can't exceed 400,000 characters.
 - .csv file cells can't exceed 32 KB.
 - Each article in the .csv file can't have more than 49 translations.
2. In the first row, specify the article type's fields and metadata, such as language [data categories](#) or channels.

Enter one item in each column. You can use the following fields and metadata to import content.

Field or data	Description
<code>isMasterLanguage</code>	Identifies the article as a master (1) or translation (0). Required to import articles with translations, however, it can't be in a .csv file to import articles without translations. Translations must follow their master articles so that they are associated with the master article preceding it
<code>Title</code>	The article or translation's title. Required for all imports.
Standard and custom fields	Refer to an article type's standard fields using field names and refer to custom fields using API names. Leaving a row cell empty may cause your articles to be skipped if the related article type field is mandatory.
Rich text area field	Use the rich text area custom fields to import .html files or images. Refer to an article type's rich text area field using its API name.
File field	Use the file custom fields to import any file type (.doc, .pdf, .txt, etc.). Refer to an article type's file field using its API name.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To import articles:

- "Manage Salesforce Knowledge "
- AND
- "Manage Articles"
- AND
- "Manage Knowledge Article Import/Export"
- AND
- "Read," "Create," "Edit," and "Delete" on the article type

Field or data	Description
Data category groups	To categorize the imported articles, use category groups; refer to a category group using its unique name prefixed with <code>datacategorygroup.</code> . For example, use <code>datacategorygroup.Products</code> to specify the category group <code>Products</code> .
Channel	To specify where the imported articles are available, use the keyword <code>Channels</code> .
Language	Specify the articles' language. Required to import articles with translations. Optional to import articles without translations. If you don't include this column, the articles automatically belong to the default knowledge base language and you can't import translations along with the master articles.

3. In subsequent rows, specify the articles you want to import.

Use one row per article and enter the appropriate information in each field or metadata column.

 **Important:** All file names are case sensitive and must match what is in the .csv file exactly.

Consideration	Notes
Standard or custom fields	<p>Enter the articles' data for each field, except for rich text area fields where you must enter the relative path to the corresponding .html file in your .zip file.</p> <p> Note: The article importer does not support subfields. If you have fields within fields, adjust your structure and content before importing into Salesforce Knowledge.</p>
Rich text area field	<p>Always enter the .html file path relative to the location of the .csv file. Never enter raw text. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing HTML and images.</p> <ul style="list-style-type: none"> • We recommend that you create separate folders for the .html files (for example, <code>/data</code>) and the images (for example, <code>data/images</code>). • To import images, include the images in an .html file using the <code></code> tag and <code>src</code> attribute. Ensure that the <code>src</code> value is a relative path from the .html file to the image folder. • Images must be <code>.png</code>, <code>.gif</code>, or <code>.jpeg</code> files. • Each image file can't exceed 1 MB. • .html files can't exceed the maximum size for their field. • If a date doesn't match the date format specified in the property file, the related article isn't imported.

Consideration	Notes
	<ul style="list-style-type: none"> • If an .html file references a file that isn't allowed, the related article isn't imported. • If an .html file references an image that's missing, the related article is imported without the image.
File field	<p>Enter the path relative to the file's location. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing files.</p> <ul style="list-style-type: none"> • We recommend that you create a folder for your files (for example, /files). • Each file must not exceed 5 MB.
Category groups	<p>Use category unique names to categorize articles. Use the plus symbol (+) to specify more than one category. For example, Laptop+Desktop. Note the following information about data category groups.</p> <ul style="list-style-type: none"> • Leaving the cell row empty causes your article to be set to No Categories. • If you specify a category and its parent (for example, Europe+France) the import process skips the child category France and keeps the parent category Europe, because application of a parent category implicitly includes the category's children. • When importing articles with translations and associated data categories, only the master article retains the data categories. The article translations have no associated data category upon import.
Channels	<p>Specify articles' channels using the keywords.</p> <ul style="list-style-type: none"> • <code>application</code> for Internal App. If you don't specify a channel, <code>application</code> is the default. • <code>sites</code> for Public Knowledge Base. • <code>csp</code> for Customer. • <code>prm</code> for Partner. <p>Use the plus (+) symbol to specify more than one channel (for example, <code>application+sites+csp</code> to make an article available in all channels).</p> <p> Note: When importing articles with translations and associated channels, only the master article retains the channels. The article translations have no associated channels upon import.</p>

 **Example:** The following example .csv files import articles in a Product Offer article type. The first example is for imports of articles without translations. The second is for imports with translations. The .csv files contain titles, summaries, and descriptions. They also classify the articles in the category group Products and make them available for specific channels. The `description__c` field is a rich text area and only supports paths to .html files. The `summary__c` field is a text field and only supports raw text. The “Best Desktop Computer Deals” article has no summary; the cell is left blank because the `summary__c` field is not mandatory.

Title	summary__c	description__c	datacategorygroup .Products	Channels
Free Digital Camera Offer	Get the new Digital Camera.	data/freecam.html	Consumer_Electronics	application+csp
Best Desktop Computer Deals		data/bestdeals.html	Desktop	application+csp
Free Shipping on Laptop and Desktops		data/freeship.html	Laptop+Desktops	application+csp

Example `articlesimport.csv` file:

```
Title,summary__c,description__c,datacategorygroup.Products,Channels
Free Digital Camera Offer, Get the new Digital
Camera.,data/freecam.html,Consumer_Electronics,application+csp
Best Desktop Computer Deals,,data/bestdeals.html,Desktop,application+csp

```

Specify your [import parameters](#) in a property file using key names and corresponding values.

SEE ALSO:

- [Set Article Import Parameters](#)
- [Import Existing Information into Salesforce Knowledge](#)
- [Salesforce Knowledge Documentation Overview](#)
- [Complete Guide to Salesforce Knowledge](#)

Set Article Import Parameters

Specify import parameters in a property file using key names and corresponding values. For example, use the key `DateFormat` to specify that a date custom field appears in the `DateFormat=dd/MM/YYYY` format or specify the character encoding to be used for the import.

1. Create a file with required parameters, as described in this table.

Key	Description	Default Value
<code>DateFormat</code>	Format of the date to read in the .csv file	<code>yyyy-MM-dd</code>
<code>DateTimeFormat</code>	Format of the date and time to read in the .csv file	<code>yyyy-MM-dd HH:mm:ss</code>
<code>CSVEncoding</code>	Character encoding used to read the .csv file	<code>ISO8859_15_FDIS</code>
<code>CSVSeparator</code>	.csv file separator	<code>,</code>
<code>RTAEncoding</code>	Default encoding used for the HTML files (if not specified in the <code>charset</code> attribute from the HTML <code>meta</code> tag).	<code>ISO8859_15_FDIS</code>

 **Note:** Salesforce does not support UTF-32 character encoding. We recommend using UTF-8. If you use specify UTF-16 character encoding, ensure that your HTML files specify the right byte-order mark.

 **Note:** Specify only Java date formats. Make sure the date format is not misleading. For example, if you choose the format `yyyy-M-d`, a date entered as 2011111 can be interpreted as 2011-01-11 or 2011-11-01. Specify at least:

- Two digits for month and day format (MM, dd)
- Four digits for year format (yyyy)

If a date in the .csv file does not match the date format specified in the property file, the related article is not imported.

2. Save the file with the `.properties`.

 **Example:** Example `offerarticlesimport.properties` property file:

```
DateFormat=yyyy-MM-dd
DateTimeFormat=yyyy-MM-dd HH:mm:ss
CSVEncoding=ISO8859_15_FDIS
```

Create an Article .zip File for Import

To complete your article import, create a .zip file with your `.parameters`, `.csv`, and `.html` files, and upload them into Salesforce Knowledge.

1. Create a .zip file containing:

- The `.csv` file.
- The folder containing the `.html` files to import.
- The folder containing the image files referenced in the `.html` files.
- The `.properties` file.

 **Important:** The import .zip file must meet the following requirements:

- There can only be one `.csv` file and one `.properties` file.
- The `.csv` file and the `.properties` file must be in the root directory.
- The compression process must preserve the folder and subfolder structure.
- The .zip file name can't contain special characters.
- The .zip file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB.
- `.csv` files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
- `.csv` file rows can't exceed 400,000 characters.
- `.csv` file cells can't exceed 32 KB.
- Each article in the `.csv` file can't have more than 49 translations.

2. From Setup, enter *Import Articles* in the *Quick Find* box, then select **Import Articles**.

3. Select the appropriate **Article Type** for the imported articles.

4. To select the .zip file, click **Browse**, and then click **OK**.

5. If your import contains translations, select the *Contains translations?* checkbox.

 **Note:** If this checkbox is selected, your `.csv` file must contain the `isMasterLanguage`, `Title`, and `Language` columns. If this checkbox is not selected, your `csv` file can't contain the

Article and Translation Import and Export Status

Find the status of your article imports and exports on the Article Imports page in Setup.

To check the status of your imports and exports, from Setup, enter *Article Imports* in the **Quick Find** box, then select **Article Imports**. If you've enabled multiple languages for Salesforce Knowledge, you see two tables: one for article and translation imports and another for exports for translation.

Import information includes:

- Possible actions
- .Zip file names
- Who submitted it and when
- Status
- Started and completed dates
- Article types

Export information includes:

- Possible actions
- Zip file names
- Who submitted it and when
- Status
- Started and completed dates

Status descriptions are as follows:

Status	Description	Possible Action
Pending	The import or export will start as soon as the previous pending import or export completes.	You can click Cancel to cancel the import or export.
Processing	The import or export is processing.	If you want to stop the process, or if the process has been stopped, call Salesforce Support. Salesforce may stop an import or

Knowledge Article Access

Give your knowledge agents access to articles. Specify which agents in your company are Salesforce Knowledge users, those who can create, edit, archive, and delete articles. Create user profiles with the appropriate user permissions, and then assign users to these profiles.

By default all internal users can read articles. However some licenses like the Knowledge Only User licenses, require the "AllowViewKnowledge" permission on the user's profile. To give a user the "AllowViewKnowledge" permission on their profile, activate the permission on a cloned profile and assign the cloned profile to the user.

 **Note:** To do more than read articles, agents need the Knowledge User license.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click **Edit** next to the user's name or click **New** to create a user.
3. If you are creating a user, complete all the required fields.
4. Select the **Knowledge User** checkbox.
5. Click **Save**.

See

User permissions control access to different tasks Salesforce Knowledge. We recommend using permission sets or custom profiles to grant users the permissions they need. For example, you can create a permission set called "Article Manager" that includes the permissions to create, edit, publish, and assign articles.

Refer to this table for details on permissions associated with Salesforce Knowledge tasks.

Salesforce Knowledge Task	User Permissions Needed
To create article types:	"Manage Salesforce Knowledge" (This permission is on by default in the System Administrator profile.)
To manage article actions:	"Manage Salesforce Knowledge" This permission is on by default in the System Administrator profile.
To create articles from cases using the simple editor:	"Read" and "Create" on the article type
To create articles from cases using the standard editor:	"Manage Articles" (This permission is on by default in the System Administrator profile.) AND "Read" and "Create" on the article type
To search articles from cases and attach articles to cases:	"Read" on the article type
To create articles from answers:	"Read" and "Create" on the article type

To import and export translated articles:	<p>“Manage Salesforce Knowledge” (This permission is on by default in the System Administrator profile.)</p> <p>AND</p> <p>“Manage Articles” (This permission is on by default in the System Administrator profile.)</p> <p>AND</p> <p>“Manage Knowledge Article Import/Export” (This permission is on by default in the System Administrator profile.)</p> <p>AND</p> <p>“Read”, “Create”, “Edit”, and “Delete” on the article type</p>
To create data categories	<p>“Manage Data Categories” permission. This permission is on by default in the System Administrator profile.</p>

To enable agents to perform their specific tasks, create [public groups](#) for each role and assign only the necessary [article actions](#) to those groups.

Example: Your Salesforce Knowledge agents are a mixture of different levels of job experience and expertise in the products and services your company offers. These examples outline four basic types of users and some of the permissions they need to perform their jobs.

Scott: The Reader

Scott Jackson is relatively new to the company, so he’s a basic agent of the knowledge base. Currently, he has read-only access to articles, so he can search and view articles. Readers don’t author or publish, so he won’t belong to a public group or need to submit articles for approval. He needs the following permissions to perform his job.

Scott	Permission	Article Type-Specific Permissions			
		Read	Create	Edit	Delete
Salesforce Knowledge Functionality	Manage Articles				
Search articles from and attach articles to cases		✓			
Search for and read articles from the Articles tab		✓			

Amber: The Candidate

Amber Delaney is a candidate-level agent and can create and publish articles with statuses of either `Work in Progress` or `Not Validated`. If Amber works on an article with a different validation status, she must send it to a queue for approval before it’s published.

Amber is part of the KCS Candidate public group and submits the articles she can't publish to the Publishing External queue. She needs the following permissions to perform her job duties.

Amber	Permission	Article Type-Specific Permissions				
		Manage Articles	Read	Create	Edit	Delete
Search articles from and attach articles to cases			✓			
Search for and read articles from the Articles tab			✓			
Create or edit article from the Article Management tab	✓	✓	✓	✓	✓	
Edit draft articles from the Article Management tab	✓	✓			✓	
Edit published or archived articles	✓	✓	✓	✓	✓	

Anne: The Contributor

As a contributor, Anne Murphy is a more advanced Knowledge user. She understands the standards for articles in the organization and can create articles and publish articles with `Validated Internal` status. She can also work on articles authored by other users if they have either `Work in Progress` or `Not Validated` statuses, and can change them to `Validated Internal`. Since she doesn't have permission to publish articles to an external audience, she must submit those customer-facing articles to the Publishing External queue.

 **Note:** Article approvers require the "Manage Articles" permission and at least the "Read" permission on the article type associated with articles they review. These permissions let them access the article in a draft state. Without these permissions, approvers can reassign but not approve articles.

Anne is a member of the Contributor public group and she needs the following permissions to perform her job duties.

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions				
		Manage Articles	Read	Create	Edit	Delete
Create articles from cases using the simple editor			✓	✓		
Create articles from cases using the standard editor	✓	✓	✓	✓		
Search articles from and attach articles to cases			✓			
Create articles from answers			✓	✓		
Search for and read articles from the Articles tab			✓			

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions			
	Manage Articles	Read	Create	Edit	Delete
Create or edit article from the Article Management tab	✓	✓	✓	✓	
Edit draft articles from the Article Management tab	✓	✓		✓	
Delete articles (version or entire) from Article Management tab	✓	✓		✓	✓
Assign articles from Article Management tab	✓	✓		✓	
Edit published or archived articles	✓	✓	✓	✓	
Archive articles from the Article Management tab	✓	✓	✓	✓	✓

Pat: The Publisher

Pat Brown is Knowledge domain expert and is responsible for reviewing and publishing articles to an external audience. He is a member of the Publisher public group. Pat also belongs to the Publishing External queue. He needs the following permissions to perform his job duties.

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions			
	Manage Articles	Read	Create	Edit	Delete
Create articles from cases using the simple editor		✓	✓		
Create articles from cases using the standard editor	✓	✓	✓		
Search articles from and attach articles to cases		✓			
Create articles from answers		✓	✓		
Search for and read articles from the Articles tab		✓			
Create or edit article from the Article Management tab	✓	✓	✓	✓	
Edit draft articles from the Article Management tab	✓	✓		✓	
Delete articles (version or entire) from Article Management tab	✓	✓		✓	✓
Publish article from Article Management tab	✓	✓	✓	✓	✓

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions			
	Manage Articles	Read	Create	Edit	Delete
Assign articles from Article Management tab	✓	✓		✓	
Edit published or archived articles	✓	✓	✓	✓	
Archive articles from the Article Management tab	✓	✓	✓	✓	✓

How they all work together

Each user profile defines an agent's permission to perform different job duties and functions. To enable agents to perform these functions, you create [public groups](#) for each role and assign only the necessary [article actions](#) to that group. The criteria you create in the [approval process](#) defines which [validation status](#) can be automatically approved and published and which article must be approved and published by a domain expert.

For example, Anne, the Contributor, can create a `Validated External` article, but based on the article actions assigned to her public group, the approval process sends her article to Pat, the Publisher, to be published. Pat, as a Publisher, can publish his own articles without submitting them to a queue.

The following table lists the job functions that each role needs to perform on articles in the organization

Job Function	Reader	Candidate	Contributor	Publisher
Create and publish Work in Progress	No	Automatically approved and published	Automatically approved and published	Yes
Create and publish Not Validated	No	Automatically approved and published	Automatically approved and published	Yes
Create and publish Validated Internal	No	Needs approval	Automatically approved and published	Yes
Create and publish Validated External	No	Needs approval	Needs approval	Yes
Update and publish Work in Progress	No	No	Automatically approved and published	Yes
Update and publish Not Validated	No	No	Automatically approved and published	Yes
Update and publish Validated Internal	No	No	Automatically approved and published	Yes

Job Function	Reader	Candidate	Contributor	Publisher
Update and publish Validated External	No	No	Needs approval	Yes

- [Complete Guide to Salesforce Knowledge](#)

Create Public Groups for Knowledge

Salesforce Knowledge uses public groups as a way to assign users to specific tasks related to articles. When you assign article actions to a public group, you can grant users in that group the ability to do things like publish articles with a specified validation status. Public groups are also used in approval processes to manage the publishing workflow.

For example, when a member of the [Candidate](#) public group submits an article with the status `Work in Progress` for approval, it is automatically approved and published. If the same agent submits an article with `Validated Internal` status, it moves to the Publishing External queue to be reviewed before being published.

- From Setup, enter `Public Groups` in the `Quick Find` box, then select **Public Groups**.
- Click **New**, or click **Edit** next to the group you want to edit.
- Enter the following information:

Field	Description
Label	The name used to refer to the group in any user interface pages.
Group Name (public groups only)	The unique name used by the API and managed packages.
Grant Access Using Hierarchies (public groups only)	<p>Select Grant Access Using Hierarchies to allow automatic access to records using your role hierarchies. When selected, any records shared with users in this group are also shared with users higher in the hierarchy.</p> <p>Deselect Grant Access Using Hierarchies if you're creating a public group with All Internal Users as members, which optimizes performance for sharing records with groups.</p>

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or edit a public group:

- "Manage Users"

To create or edit another user's personal group:

- "Manage Users"

 **Note:** If **Grant Access Using Hierarchies** is deselected, users that are higher in the role hierarchy don't receive automatic access. However, some users—such as those with the “View All” and “Modify All” object permissions and the “View All Data” and “Modify All Data” system permissions—can still access records they don't own.

Search	From the <code>Search</code> drop-down list, select the type of member to add. If you don't see the member you want to add, enter keywords in the search box and click Find .  Note: For account owners to see child records owned by high-volume portal users, they must be members of any portal share groups with access to the portal users' data.
Selected Members	Select members from the Available Members box, and click Add to add them to the group.
Selected Delegated Groups	In this list, specify any delegated administration groups whose members can add or remove members from this public group. Select groups from the Available Delegated Groups box, and then click Add . This list appears only in public groups.

4. Click **Save**.

 **Note:** When you edit groups, sharing rules are automatically reevaluated to add or remove access as needed. If these changes affect too many records at once, a message appears warning that the sharing rules aren't automatically reevaluated, and you must manually recalculate them.

Now [assign only the necessary actions](#) to your groups so the selected members can perform their tasks while keeping the integrity of your knowledge base.

Create Knowledge Actions

Knowledge actions are templates that link a workflow action to an article type. When knowledge actions are enabled, you can use them to link article types to specific workflow article actions, such as publishing. For example, if you want to have each FAQ published as a new version each time it completes the approval process, you can create a knowledge action that links the FAQ article type to the `Publish as New` action. Then, when you create an approval process for FAQs, select the new Knowledge Action.

! **Important:** When you create the approval process, make sure to change the final approval action to `Unlock the record for editing` to let users publish the article.

1. From Setup, enter `Knowledge Action` in the Quick Find box, then select **Knowledge Action**.
2. Click **New Knowledge Action**.
3. Select the article type for the action. The workflow rules and approval process that you associate with the action must belong to the same article type.
4. Enter a unique name for the knowledge action.
5. Select the type of action you want to apply to the article type. For example, `Publish as New` publishes the article as a new version.
6. Enter a description.
7. Click **Save**.
The Knowledge Action detail page appears showing you the rules and approval processes that use the knowledge action.
8. When you're ready to use the knowledge action in an approval or workflow process, click **Activate** on the Knowledge Action detail page.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To enable Salesforce Knowledge Actions:

- "Customize Application"

Assign Article Actions to Public Groups

Article actions allow agents to participate in the article publishing process. By default, all article actions are assigned to users with the “Manage Articles” user permission. Agents can complete an action as long as they have the correct article type permission. You can control article action access by assigning public groups to article actions and adding agents the relevant public groups. To further restrict actions like publishing, you can create approval processes that allow agents to publish only those articles that have specific validation statuses. For example, many contributors can write many articles but you can create an approval process so no articles are published until they are reviewed and validated by a qualified author.

 **Note:** Although you can add any user to a public group, only agents with the “Manage Articles” user permission and the appropriate object permissions can perform article actions.

This table summarizes the article type permissions that are required for each article action.

Article Action	Create	Read	Edit	Delete
Publish Articles				
Archive Articles				
Delete Articles				
Edit Published and Archived Articles				
Submit Articles for Translation				
Publish Translation				
Edit Translation				

1. From Setup, enter *Knowledge Article Actions* in the Quick Find box, then select **Knowledge Article Actions**.
2. Click **Edit**.
3. For the action you want to assign, select the appropriate radio button and choose a public group.
If you don't modify an article action, all agents with the “Manage Articles” permission can perform that action.
4. Click **OK** and then click **Save**.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create public groups and assign them to article actions:

- “Customize Application”
AND
“Manage Users”
AND
“Manage Salesforce Knowledge”

Define Validation Status Picklist Values

When the `Validation Status` field is enabled on the Knowledge Settings page, you can create picklist values that show the state of the article. For example, values could be `Validated`, `Not Validated`, or `Needs Review`.

 **Note:** In Salesforce Classic, validation status picklist values aren't retained when you export articles for translation. Articles with picklist values can be imported, however, and their values are retained as long as the values exist in your organization.

1. From Salesforce Classic Setup, enter `Validation Statuses` in the `Quick Find` box, then select **Validation Statuses**.
2. On the picklist edit page, click **New** to add new values to the validation status field. You can also edit, delete, reorder, and replace picklist values.
When you replace a picklist value, the system replaces it in all versions of the article, including any archived versions.
3. Add one or more picklist values (one per line) in the text area.
4. To set the value as the default for the picklist, be sure to select the `Default` checkbox.
5. Click **Save**.

USER PERMISSIONS

To create or change validation status picklist values:

- "Customize Application"

Workflow and Approvals for Articles

Ensuring that the content in your articles is accurate and helpful is foundational to getting accurate information to those who need it most. Creating processes where Knowledge experts review, validate, and approve articles for publication is critical to creating a trustworthy knowledge base. Implementing approval processes with Salesforce Knowledge gives you additional control over the content and publication of your articles.

Creating workflow rules and approval processes lets your organization automate many of the tasks involved with managing its knowledge base. When implementing Salesforce Knowledge, you can create workflow rules and approval processes for some or all the article types used by your organization.

Workflow rules let you create email alerts, update fields, or send outbound API messages when an article meets certain criteria. For example, you could create a workflow rule that sends an email alert to the article owner when a new article is created from a case. Tasks are not supported by article type workflow.

Approval processes automate the approval of articles. When implemented with Salesforce Knowledge, approval processes give you additional control over the content of your articles and the process used to approve them. For example, you can create a process that requires legal and management teams to approve articles containing sensitive information.

 **Note:** Tasks aren't available for article type workflow rules. For more information about creating workflow rules, see [Set the Criteria for Your Workflow Rule](#) on page 5242. For more information about creating an approval process, see [Create an Approval Process with the Standard Wizard](#) on page 5269.

1. From Setup, enter *Workflow Rules* in the **Quick Find** box, then select **Workflow Rules** to access the workflow rules list page.
2. On the workflow rules list page, click **New Rule**.
3. Select the article type from the **Select object** drop-down list.
4. Click **Next**.
5. Enter a rule name. Optionally, enter a description for the rule.
6. Select the evaluation criteria and choose how criteria are met.
7. Enter criteria for the rule.
8. Click **Save & Next**.
9. Click **Add Workflow Action**, select the type of action for the rule, and enter the information required by the action.
10. Click **Save**.
11. Optionally, add a time-dependent workflow action by clicking **Add Time Trigger**. Provide time trigger information and then click **Save**.
12. Click **Done**.
13. From Setup, enter *Approval Processes* in the **Quick Find** box, then select **Approval Processes**.
14. Choose the Approval Process Wizard.

Two wizards are available to help you through the approval setup process. Choose the one that better meets your requirements. See [Choose the Right Wizard to Create an Approval Process](#) on page 5267.
15. Provide a name, unique name, and description for the process.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To view workflow rules and approval processes:

- "View Setup and Configuration"

To create or change workflow rules and approval processes:

- "Customize Application"

16. Specify criteria for entering the process.

For example, you could specify that if the article is published on a public site it requires approval: *Visible on public site equals True*.

17. Specify approvers for the process.**Let the submitter choose the approver manually. (default)**

Prompts the user to select the next approver.

Automatically assign an approver using a standard or custom hierarchy field.

Assigns the approval request to the user in the field displayed next to this option. You select this field when you configure the approval process.

Automatically assign to a queue.

Available only for objects that support queues. Assigns approval requests to a queue.

Automatically assign to approver(s).

Assigns the approval request to one or more specific users, specific queues, or users related to the submitted record. You can add up to 25 per step.

18. Select the email template that the process uses to notify approvers.

When an approval process assigns an approval request to a user, Salesforce automatically sends the user an approval request email. The email contains a link to the approval page in Salesforce, where the agent can approve or reject the request and add comments.

19. Configure the approval request page layout.

The approver approves or rejects the article from this page. You can add as many fields to this page as you think your agents need to reasonably assess an article's content. For example, you might choose to include information such as a summary of the article's content, the product discussed, and the author's name.

20. Specify which users are allowed to submit articles for approval.

For example, for articles that require editing before approval, you could create a public group containing editors, and then specify that only members of that group can submit articles for approval.

21. Activate the approval process.

 **Example:** When an approval process is associated with an article type, agents with the "Manage Articles" permission might see both the **Publish...** and **Submit for Approval** buttons from an article's detail page. Which buttons they see is determined by both permissions and article actions. These agents can publish an article without submitting it for approval. To limit this ability to certain users, assign the "Publish Articles" article action to a select group of users instead of giving it to all users with the "Manage Articles" permission. The ability to publish articles without prior approval is governed by an approval process that is specific to each user's public group.

Keep the following in mind when creating approval processes for article types.

- Adding an approval process to an article type lets your organization ensure that the required reviewers approve the article before it's published. When an approval process is enabled for an article's article type, the Approval History related list displays on the article details page.
- When creating an approval process, change the final approval action to "Unlock the record for editing" to allow agents to publish the article.
- Articles aren't published automatically at the end of an approval process. Agents must click **Publish...** to make the article available in the publishing channels.
- When an approval process is associated with an article type, agents with the "Manage Articles" permission might see both the **Publish...** and the **Submit for Approval** buttons on an article's detail page. (Which buttons they see is determined by both permissions and article actions). These agents can publish an article without submitting it for approval. To prevent this from affecting

many users, assign the “Publish Articles” article action to a limited group of users instead of giving it to all users with the “Manage Articles” permission. For more information, see [Assign Article Actions to Public Groups](#) on page 2965. You still need to make sure that the users with direct publishing capability know which articles need approval before publication.

- Article approvers require the “Manage Articles” permission and at least the “Read” permission on the article type associated with articles they review. These permissions let them access the article in a draft state. Without these permissions, approvers can reassign but not approve articles.
- Workflow rules and approval processes apply to the “Draft to Publication” portion of the article publishing cycle. Workflow rules aren’t available for archiving. Approval processes aren’t available for translation or archiving.

Note: When an article is published from the edit page, the article is first saved and then published. Workflow rules apply to the saved draft article but not the published article.

- A user who only has read access to an article type can publish a draft article of that type if there is an approval process associated to the article type and the approval process is complete (all the approvers have approved) but the article has not been published.

Modify Default Category Group Assignments for Articles

Salesforce Knowledge uses data categories to classify articles. Data categories are organized in category group. After creating category groups, admins decide which groups to use for Salesforce Knowledge articles. For example, if your org uses both the Answers and Salesforce Knowledge, you might want one category group to be used by the answers community and two other category groups for articles. Answers and articles can use the same category group. Authors can assign up to eight data categories from one category group to an article so that users searching for articles can find and filter by category. By default, all the category groups you create are assigned to Salesforce Knowledge

1. From Setup, enter *Data Category Assignments* in the Quick Find box, then select **Data Category Assignments** under Knowledge.

A list of all category groups appears.

2. Click **Edit** and move any category groups that you don't want available for articles from the Selected Category Groups list to the Available Category Groups list.

Later, you can choose to make a hidden category group visible.

Note: The order of category groups is not preserved from the edit page to the data category assignment page.

3. Click **Save**.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To modify category groups assignments in Salesforce Knowledge:

- “Customize Application”
AND
“Manage Salesforce Knowledge”

You receive an email after the save process completes. Authors can now assign categories in the selected groups to articles on the Article Management tab. Authors can only access categories if the category group is active and the author's [data category visibility settings](#) provide access to the category.

SEE ALSO:

[Salesforce Knowledge Documentation Overview](#)
[Complete Guide to Salesforce Knowledge](#)

Filter Articles with Data Category Mapping

Make suggested articles more relevant when solving cases. Map case fields to data categories to filter for articles assigned to those data categories. For example, cases with a field for which product they are about can be mapped to the data category of that product. Articles assigned that category or product, are filtered to the top of the suggested article list.

Important:

- Filtering articles based on case information is only supported in text and picklist fields.
- Filters are applied to Knowledge results after the case has been saved.
- Filters are applied after a Knowledge search and only to the articles returned in the search.
- Using Filters does not return a list of all articles that match the filter criteria. Instead, the filters are applied to the initial pool of article results returned.
- Results may be filtered after a search.
- A category group can only be used once in a data category mapping.
- Suggested articles are returned if `Suggest articles for cases considering case content` is enabled. When suggested articles is disabled, search uses data category mappings. Case subject fields are used when there are no data category mappings.

To implement data category mapping, select which case fields map to which data categories and set a default data category for cases that have no value for the mapped fields.

For information on data categories, see [Data Categories in Salesforce.com](#) on page 3037.

1. From Setup, enter `Data Category Mappings` in the `Quick Find` box, then select **Data Category Mappings**.
2. In the `Case Field` column, use the drop-down list to add a field.
3. In the `Data Category Group` column, use the drop-down list to map the information from the lookup field to a data category.
4. In the `Default Data Category` column, use the drop-down list to assign a data category when the field value does not match any categories from the category group.
5. Click **Add**.

Support Articles in Multiple Languages

With multiple languages for Salesforce Knowledge, you can lower support costs by translating articles into the languages your audience prefers. After selecting your language settings, two translation methods are available: translating articles in-house using the editing tool in the knowledge base, or sending articles to a localization vendor. Different languages can use different methods. For example, you may want to export articles to a vendor for French translations, but assign articles to an internal Knowledge user for Spanish translations.

- Before you add languages to your knowledge base, decide for each language whether you want to translate articles directly in Salesforce or export articles to a translation vendor. Communicate your decision to the people involved in the translation process (authors, reviewers, translation managers, publishers).
- When adding a language to your knowledge base, keep in mind that it can't be deleted; however, you can hide a language by making it inactive. Deactivating a language means it no longer appears as a choice in the New Article dialog or the Submit for Translation dialog. Also, if articles are already published in the language, those articles are no longer visible to readers when the language is deactivated.
- You can only add languages supported by Salesforce to your knowledge base.
- To hide translated articles for a specific language, deactivate the language by unchecking `Active` on the Settings page.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Support a Multilingual Knowledge Base

Reach a global audience by offering your knowledge base in multiple languages.

1. In Setup, enter *Knowledge Settings* in the Quick Find box, then select **Knowledge Settings**.
2. Click **Edit**.
3. Select **Multiple Languages** and add the languages you want to include in your knowledge base.
 -  **Important:** You can add the languages that your instance of Salesforce supports. But you can't remove any languages that have been added to your knowledge base.
4. Choose which settings you want to apply to language.

Setting	Description
Active	Active languages appear in the New Article and Submit for Translation dialog boxes. The active/inactive status determines whether a published article is visible. For example, if Spanish articles are published to your partner portal and then you make Spanish an inactive language, the articles no longer appear.
Default Assignee	The default assignee is automatically assigned articles submitted for translation. The default assignee can be either an individual person or a queue.
Default Reviewer	The default reviewer is automatically assigned finished translations that are ready to be reviewed or published. The default reviewer can be either an individual person or a queue.

5. Save your changes.
6. If you want, create queues to distribute and assign articles to groups of people who can either translate them or review the finished translations. When setting up queues, use the Knowledge Article Version object.

USER PERMISSIONS

To set up multiple languages for Salesforce Knowledge:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Export Articles for Translation

If your organization sends Salesforce Knowledge articles to a vendor for translation, use the Export Articles for Translation feature in Setup.

Place the articles to be translated in a translation queue. To enable the article export feature, create one or more queues; authors and reviewers select the queue when they submit an article for translation. Make sure that they know which queue to choose for which language.

 **Note:** You can have up to 50 exports in 24 hours and a maximum of 15 pending exports (exports that have not entered a final state such as Completed, Failed, or Canceled).

1. Create a [translation queue](#) with articles for translation.
2. On the Article Management tab, select the articles you want to translate, and click **Submit for Translation**.
3. In the dialog box, indicate which languages to translate the articles into and assign the translations to their corresponding language translation queue.
4. From Setup, enter *Export Articles for Translation* in the Quick Find box, then select **Export Articles for Translation**.
5. Select the queue that contains the articles you're exporting.
6. Select either:
 - **All articles** to export every article in the queue.
 - **Updated articles** to only export articles that have been modified or added.
7. Click **Continue**.
8. Select the source and target language pairs you want to export.

 **Important:** Salesforce creates a separate .zip file for every article type in each language pair. You must retain the .zip file structure for a successful import. For more information, see [Import Translated Articles](#) on page 2974.

9. To have the files reviewed or published after being translated, select a user or a queue.
10. Select the file character encoding.
 - ISO-8859-1 (General US & Western European, ISO-LATIN-1)
 - Unicode
 - Unicode (UTF-8) *default*
 - Japanese (Windows)
 - Japanese (Shift_JIS)
 - Chinese National Standard (GB18030)
 - Chinese Simplified (GB2312)
 - Chinese Traditional (Big5)
 - Korean
 - Unicode (UTF-16, Big Endian)
11. Select the delimiter for the .csv files.

The delimiter is the separator for columns when the file is converted to table form. Your options are tab (default) or comma.

12. Click **Export Now**.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To export articles:

- "Manage Salesforce Knowledge"
- AND
- "Manage Articles"
- AND
- "Manage Knowledge Article Import/Export"

To view articles:

- "Read" on the article type

To create articles:

- "Read" and "Create" on the article type

You're notified by email when your export is complete. You can also check the status of your export by viewing the Article Import and Export Queue. From Setup, enter *Article Imports and Exports* in the Quick Find box, then select **Article Imports and Exports**.

Unzip the exported files, but retain the file structure for a successful import.

SEE ALSO:

- [Complete Guide to Salesforce Knowledge](#)

Import Translated Articles

If your organization sends Salesforce Knowledge articles to a vendor for translation, use the Import Article Translations feature in Setup. You can only import articles that have been exported from the same Salesforce organization. For example, you can't export articles from your test or sandbox organization and import them into your production organization.

1. From Setup, enter *Import Article Translations* in the Quick Find box, then select **Import Article Translations**.
2. Choose how Salesforce handles translations after they're imported.

Option	Description
Review imported translations on the Article Management tab before publishing	Add imported translations to a queue from which agents can review them.
Publish translations immediately on import	Publish imported translations without reviews.

3. Select the language of the articles you're importing.
4. If you chose to have articles reviewed before publishing, select to send the files to a user or a queue.
5. Click **Browse**, choose the translation .zip file to upload, and click **Open**.
You must place all the translation files (meaning, those exported from Salesforce and translated by your vendor) in a folder whose name is the same as the language code. For example, put French articles in an *fr* folder. Zip up this folder to create your import file.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To export articles:

- "Manage Salesforce Knowledge"
- AND
- "Manage Articles"
- AND
- "Manage Knowledge Article Import/Export"

To view articles:

- "Read" on the article type

To create articles:

- "Read" and "Create" on the article type

Important: To import translated articles successfully, verify that the file structure and their extensions match the file structure and extensions of files exported from Salesforce Knowledge for translation. For example, if the target language is French, the file structure begins as follows:

```
import.properties
-fr
--articletypearticlename_kav
---articlename.csv
---[Article collateral, html, images, etc.]
```

6. Click Import Now.

If you have more translated articles to upload, repeat steps four through six.

7. Click Finish.

An email notification is sent to you when your import finishes. You can view the status of your import from Setup by entering *Article Imports and Exports* in the Quick Find box, then selecting **Article Imports and Exports**.

Improve the Article Search Experience

Enable search highlights and snippets, synonyms, promoted terms, topics, and keywords from cases to improve your article search.

[Search Highlights and Snippets](#)

Quickly identify the best article and see how articles match your search terms with relevant text and highlighted search terms in the search results.

[Search Synonyms for Articles](#)

Create synonyms so words or phrases are treated as equivalents in searches. When searching Salesforce Knowledge articles, users can enter search terms that don't match any terms in those items but are synonymous with the terms.

[Manage Promoted Search Terms](#)

View, edit, and delete—from a single page—all the promoted search terms that are associated with Salesforce Knowledge articles.

[Enable Topics for Articles](#)

With topics on articles, you can classify and search articles by assigning topics. Topics can be added from the article view and detail pages. Suggested topics, which are only supported in English, are terms extracted from the article, so that they are more concrete and precise than a data category assignment. When searching, topics can be used to index the article, so the matched articles are more relevant to keyword searches.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

[Use More Case Keywords to Find Articles](#)

When searching articles from a case, by default, only the case title is used in the search. Often, you want to use information from the case for more accurate search results, or create a custom search button.

SEE ALSO:

[Search Highlights and Snippets](#)[Search Synonyms for Articles](#)[Manage Promoted Search Terms](#)[Enable Topics for Articles](#)[Use More Case Keywords to Find Articles](#)[Salesforce Knowledge Documentation Overview](#)[Complete Guide to Salesforce Knowledge](#)

Search Highlights and Snippets

Quickly identify the best article and see how articles match your search terms with relevant text and highlighted search terms in the search results.

Search highlights and snippets give your agents and users context as to why the particular result matched their search query. The relevant text appears below the title with the search terms in bold. You can enable search highlights and snippets on the [Salesforce Knowledge Settings page](#) on page 2916.

Note: Search highlights and snippets are not generated for searches with wildcards.

Search highlights and snippets are generated from the following fields:

- Email
- Long text area
- Rich text area
- Text area

Search highlights and snippets aren't generated from the following fields:

- Checkbox
- Currency
- Date
- Date Time
- File
- Formula
- Lookup
- Multi-picklist
- Number
- Percent
- Phone
- Picklist
- URL

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

 **Note:** If a snippet is not generated, the article's summary field is shown instead.

SEE ALSO:

- [Complete Guide to Salesforce Knowledge](#)

Search Synonyms for Articles

Create synonyms so words or phrases are treated as equivalents in searches. When searching Salesforce Knowledge articles, users can enter search terms that don't match any terms in those items but are synonymous with the terms.

To create synonyms and synonym groups, from Setup, enter *Synonyms* in the **Quick Find** box, then select **Synonyms** under **Customize > Search**. An org can create up to 10,000 synonym groups

A search for one term in synonym group returns results for all terms in the group. For example, if you define a synonym group with these synonyms:

CRM, customer relationship management, Salesforce

then a search for *customer relationship management* matches articles that contain *customer relationship management* and articles that contain *CRM* or *Salesforce*.

Synonyms affect search behavior in the following ways:

Priority

If a search term is part of a synonym group, the search results list items that contain the search term, followed by items that contain other terms in the synonym group.

For example, if this synonym group is defined:

fruit, oranges

Then a search for *oranges* matches a list of items containing *oranges*, followed by items containing *fruit*.

 **Note:** In the Article Management tab, if you sort the list by clicking a column header, the sort order, not priority, persists in the current and additional searches.

Wildcards

If a wildcard is used in a search, the wildcard expands the search term, but the search doesn't match any synonyms, even if the search phrase contains a defined synonym.

For example, if these synonym groups are defined:

fruit, oranges, apples

cabbage, lettuce

Then a search for *orang* lettuce* matches items that contain *orange* and *oranges*, but doesn't match items that contain *fruit*, *apples*, and *cabbage*.

Operators

If a search phrase contains an operator (**AND/OR/AND NOT**), synonym matches are returned only if the entire search phrase is a defined synonym.

For example, if these synonym groups are defined:

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

fruit, oranges and apples

vegetables, carrots

Then a search for *oranges and apples* returns matches for all items that contain the literal string *oranges and apples* and items that contain the term *fruit*.

However, if the search phrase is *fruit and vegetables*, which is not a defined synonym, the search matches only those items that contain both the terms, *fruit* and *vegetables*.

In this case, AND functions as an operator and synonym matches are not returned in the search results. In terms of this example, items that contain a synonym of either *fruit* or *vegetables* (items that contain the term *carrots* or the phrase *oranges and apples*) are not returned.

Exact phrase matches

If a defined synonym is only a part of a longer exact phrase search, the search doesn't treat it as a synonym.

For example, if this synonym group is defined:

oranges apples, fruit

Then an exact phrase search for "*raspberries oranges apples*" doesn't match items that contain the word *fruit*.

Lemmatization

Synonyms do not under go lemmatization in search results; rather, they are matched as an exact phrase. However, the search term does under go lemmatization.

For example, if this synonym group is defined:

quench, drink orange juice

Then a search for *quench* matches items that contain *quench*, *quenched*, *quenching*, and *drink orange juice*, but doesn't match items that contain *drinking orange juice*.

Ignored words

Words that are normally ignored in searches, such as *the*, *to*, and *for*, are matched if the word is part of a defined synonym.

For example, if this synonym group is defined:

peel the orange, cut the apple

Then a search for *peel the orange* matches items that contain the exact string *peel the orange*.

Overlapping synonyms

If a search term consists of overlapping synonyms from different groups, the search matches synonyms in all the overlapping synonym groups.

For example, if these synonym groups are defined:

- *orange marmalade, citrus*
- *marmalade recipe, sugar*

Then a search for *orange marmalade recipe* matches items that contain *orange marmalade*, *citrus*, *marmalade recipe*, and *sugar*.

Subsets

If one synonym group includes a synonym that is a subset of a synonym in another group, a search for the subset term doesn't match items that contain synonyms from the subset synonym group.

For example, if these synonym groups are defined:

- *orange, apple*
- *orange marmalade, citrus*
- *marmalade, jam*

Then a search for *orange marmalade* matches items that contain *orange marmalade* and *citrus*, but doesn't match items that contain *apple* or *jam*.

Manage Promoted Search Terms

View, edit, and delete—from a single page—all the promoted search terms that are associated with Salesforce Knowledge articles.

You can [add promoted search terms to articles](#) on the article's detail page in the Promoted Search Terms related list.

1. From Setup, enter *Promoted Search Terms* in the **Quick Find** box, then select **Promoted Search Terms** under **CustomizeSearch**.
2. To view which terms are assigned to an article, sort by the Article column.
3. To edit a term, click **Edit** in its row.
You can only change the term from this page, not the article it is assigned to.
4. To delete a term, click **Delete** in its row.
The term is only deleted from the article associated with this row, not from other articles.
5. Remember to save your changes.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, and delete promoted search terms:

- "Manage Promoted Search Terms"

Enable Topics for Articles

With topics on articles, you can classify and search articles by assigning topics. Topics can be added from the article view and detail pages. Suggested topics, which are only supported in English, are terms extracted from the article, so that they are more concrete and precise than a data category assignment. When searching, topics can be used to index the article, so the matched articles are more relevant to keyword searches.

 **Note:** Contrary to data categories, topics added to an article are not transferred to the same article in another language.

Topics for articles are enabled for each article type.

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**.
2. Click the article type name where you want to enable topics.
3. Check **Enable topics**.
4. Select which fields you want to use for suggestions.
5. Click **Save**.
6. Via profile or permission set, under System Permissions, define which agents can assign, create, delete, and edit topics.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To enable topics:

- “Customize Application”

Use More Case Keywords to Find Articles

When searching articles from a case, by default, only the case title is used in the search. Often, you want to use information from the case for more accurate search results, or create a custom search button.

Luckily, Salesforce Knowledge search pages accept other parameters:

- **id=<case id>**: The ID of the current case.
- **search=<keywords>**: The keywords to be searched.
- **articleType_<article type dev name>=on**: multiple parameters possible, article types to select (if no article type is selected, then all article types are selected)
- **ct_<data category group internal name>=<data category internal name>**: multiple parameters possible, filter pre-selection

To take advantage of those parameters, add a custom button to the case detail page containing a few lines of javascript that extract keywords from the case and hide the default article search button.

 **Note:** You can also create a custom article widget with `support:caseArticle`.

1. From the object management settings for cases, go to Buttons, Links, and Actions.
2. Click **New Button or Link**.
3. Enter a unique Label, Name, and Description.
4. Select **Detail Page Button** for Display Type.
5. Select **Execute JavaScript** in the Behavior drop-down.
6. Select **OnClick JavaScript** in the Content Source drop-down.
7. Enter code for extracting case data and setting up parameters for the article search page.

For example:

```
// article search page URL
var url = '/knowledge/knowledgeHome.apexp';

// ID of the current case
url += '?id={!Case.Id}';

// use the case subject as the search keywords
url += '&search={!Case.Subject}';

// read case attributes
var caseType = '{!Case.Type}';
var caseProduct = '{!Case.Product__c}';

// if the case is of a certain type, select only 2 of the article types available
// in other cases, we keep the default behavior (all article types selected)

if (caseType=='Problem' || caseType=='Question') {
    url += '&articleType_FAQ_kav=on';
    url += '&articleType_How_To_kav=on';
}

// preselect a data category for search results based on the category
```

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or change custom buttons or links and create a Visualforce page:

- "Customize Application"

```
var product = '';
if (caseProduct=='Home')
    product = 'Home';
if (caseProduct=='SMB')
    product = 'Small_and_Medium_Business';
if (caseProduct=='Large enterprise')
    product = 'Large_Enterprise';

if (product.length>0)
    url += '&ct_Products2=' + product;

// once the logic is executed, we go to the article search page
window.location = url;
```

8. Click **Save**.
9. From the object management settings for cases, go to Page Layouts.
10. Click **Edit** next to Case Layout.
11. Drag your custom button for article search into the case layout.
12. Click **Save**.
13. Create a Visualforce page named *CaseDetailsWithoutStandardKBSearchButton* with the following code:

```
<apex:page standardController="Case">
  <style type="text/css">
    div.knowledgeBlock input {display: none}
  </style>
  <apex:detail/>
</apex:page>
```

14. Back in the Buttons, Links, and Actions area for cases, click **Edit** next to View.
15. Select **Visualforce Page** in Override with.
16. Select **CaseDetailsWithoutStandardKBSearchButton** from the drop-down.
17. Click **Save**.

Set Up the Knowledge One Widget

Knowledge One is available as a widget you can plug in to the Salesforce Console for Service or Salesforce Console for Sales. If you are using the Knowledge tab, you get the same easy-to-use interface for articles and external sources on cases and within the Salesforce Console for Service. You can search, send, and create articles, all without leaving the case.

Of [all the Salesforce Knowledge article widgets](#), the Knowledge One widget lets you:

- Attach a published Salesforce Knowledge article to the case in one click.
- Share an article as a URL, if it is shared on a public channel.
- Email an article as a PDF, if it is shared on a public channel.
- Create and manage articles.
- Make adjustments based on your window width. In the console, in windows smaller than 600 pixels, the searchable objects are displayed in a drop-down menu.

 **Note:** The article widget in a case feed search doesn't necessarily use the agent's language. If the agent's language isn't a Salesforce Knowledge supported language but their locale language is, the locale language is the search language. If neither the agent's language nor local language are supported, the search language is the default Salesforce Knowledge language, which you can find and set on the Knowledge Settings page.

1. From the object management settings for cases, go to Page Layouts and open your case page layout for edit.
2. Ensure the Email quick action is in the case page layout.
Without the Email quick action, you can't send articles via email.
 - a. Select **Quick Actions** in the left-hand menu.
 - b. Drag **Email** to the **Quick Actions** in the **Salesforce Classic Publisher** line.
3. Disable previous article sidebar components.
 - To disable the Knowledge sidebar, click **Layout Properties** and ensure **Knowledge Sidebar** is unchecked.
 - To disable the case feed article tool, click **Feed View** and ensure **Use Case Feed Article Tool in the Console** is unchecked.
4. In the page layout editor, click **Custom Console Components**.
5. In the sidebar where you want the Knowledge One widget, select **Knowledge One** in the Type drop down and set the sidebar parameters.

Email quick action to be added to the Case page layout in order to show up

 **Tip:** If you can't see the Knowledge One sidebar, increase its width to 250 (height to 150) in the page layout. These are the minimum measurements for the Knowledge One sidebar to display properly.

Welcome to Salesforce Knowledge

Build your knowledge base and give your website visitors, clients, partners, and service agents the ultimate in support. Salesforce Knowledge lets you create and manage your company information and securely share it when and where it is needed.

Your Salesforce Knowledge base is built from knowledge articles, which are documents of information. Articles can include information on process, like how to reset your product to its defaults, or frequently asked questions, like how much storage your product supports.

Experienced service agents and internal writers write the articles. The articles are then published to a range of channels: Internal App, customer and partner communities, or public websites. Where and what information is published is based on the article layout profile and the field level security.

As of Spring '17, Knowledge is available in both Salesforce Classic and Lightning Experience. Currently, Lightning Knowledge (Beta) is recommended for orgs new to Knowledge, or for existing orgs that can easily consolidate to one article type, have few data categories, and use single-language mode.

 **Note:** This release contains a beta version of Lightning Knowledge, which means it's a high-quality feature with [known limitations](#) on page 2992. Lightning Knowledge isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce Knowledge Limits

Limits for Salesforce Knowledge per edition.

Salesforce Knowledge is a knowledge base for creating and managing content. If Salesforce Knowledge is enabled in Communities (Classic Knowledge only), customers and partners can access articles.

 **Note:** The following limits are default limits. Some limits can be expanded. Contact Salesforce to request limit increases.

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
Maximum number of articles	50,000 articles	50,000 articles
Maximum number of article types	100 article types	N/A
Maximum number of custom fields per article type	Enterprise, Developer, and Unlimited editions: 500 custom fields per article type Performance editions: 800 custom fields per article type	N/A
Maximum file fields	5 file fields	N/A
Maximum file size	File fields are counted as attachments and can be up to 25 MB.	Files can be up to 25 MB.
Maximum rich text area size	131072 characters	131072 characters
Maximum size of all rich text area fields on an article	1638400 characters	1638400 characters

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
Maximum unique article references (links) in a rich text area field	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.
Article history tracking	Article events are tracked for up to 18 months.	Article events are tracked up to 18 months.
Maximum number of supported languages	16 supported languages	N/A
Article import	<p>The import .zip file must meet the following requirements:</p> <ul style="list-style-type: none"> • There can only be one .csv file and one .properties file. • The .csv file and the .properties file must be in the root directory. • The compression process must preserve the folder and subfolder structure. • The .zip file name can't contain special characters. • The .zip file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB. • .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations. • .csv file rows can't exceed 400,000 characters. • .csv file cells can't exceed 32 KB. • Each article in the .csv file can't have more than 49 translations. 	N/A
Maximum number of data category groups and active data category groups	5 category groups, with 3 groups active at a time	5 category groups, with 3 groups active at a time
Maximum number of categories per data category group	100 categories in a data category group	100 categories in a data category group
Maximum number of levels in data category group hierarchy	5 levels in a data category group hierarchy	5 levels in a data category group hierarchy
Maximum number of data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article

Salesforce Knowledge Limits	Details for Classic Knowledge	Details for Lightning Knowledge
Maximum number of promoted search terms	Your organization can create a maximum of 2,000 promoted terms.	N/A

Compare Salesforce Knowledge in Salesforce Classic and Lightning Experience

As of Spring '17, Knowledge is available in both Salesforce Classic and Lightning Experience. Compare Lightning Knowledge with Classic Knowledge and decide if you're ready to enable Lightning Knowledge in your org.

Lightning Knowledge has changed the way Knowledge works in Salesforce. For example, standard record types replace article types, and the Knowledge sidebar for Lightning Service Console replaces Knowledge One for the Service Console in Salesforce Classic.

Lightning Knowledge works differently than Classic Knowledge, but currently has limitations. Let's compare Knowledge in Salesforce Classic and Lightning Experience.

Feature	Classic Knowledge	Lightning Knowledge
Setup	Salesforce Classic Setup	Switch to Salesforce Classic Setup
Types of articles	Article Types	Standard Record Types
Languages	Multiple Languages mode and translation available	Single Language mode only
Use Knowledge in the console	Add Knowledge One to the Service Console	Add the Knowledge Sidebar to the Lightning Service Console (can be used with cases only)
Page layouts	Fields only, per article type and user profile	Fields, actions, and related lists, per record type and user profile
Record home (articles)	Custom record home	Standard record home
Object home	Knowledge One and Article Management tab	Knowledge home page with list views
Access and permissions	CRUD, profile permissions, page layouts, and custom article actions per public group	CRUD, profile permissions, and page layouts

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Lightning Knowledge Limitations

There are some limitations to keep in mind when making the switch to Lightning Knowledge.

Consider the following when using Lightning Knowledge.

Important considerations before enabling Lightning Knowledge

- After you enable Lightning Knowledge, you can't disable it. We recommend testing Lightning Knowledge in your Sandbox org first.
- You can have only one article type when enabling Lightning Knowledge. Currently, there are no migration tools to assist in merging your article types. To enable Lightning Knowledge, migrate your articles to one article type and disable or delete your other article types.
- Lightning Knowledge currently doesn't support multiple language mode or translation.
- We recommend using Lightning Knowledge only if you have fewer than 300 data categories. If you have more than 300 data categories, you may experience slower performance.
- For articles with more than 30 versions, the versions above 30 will show in Salesforce Classic, but not in Lightning Experience.
- Setup for Lightning Knowledge remains in Salesforce Classic. After Lightning Knowledge is enabled, a new setup node Knowledge Object Setup appears to manage Knowledge record types, fields, page layouts, and validation rules.
- After you enable Lightning Knowledge, the 'ArticleType' field is no longer accessible via SOQL (or the API). This can impact custom code that queries for the 'ArticleType' field.

General usage limitations for Lightning Knowledge

- You currently can't import or export with record types.
- You can't currently assign articles or delete archived articles in Lightning Knowledge.
- You can't use article actions with public groups when Lightning Knowledge is enabled. This is replaced by new user profile permissions.
- You currently can't remove a published article while editing it. Instead, the article remains published while you edit the new version as a draft.
- You can't use mass actions (such as mass archiving and mass publishing) with Lightning Knowledge.
- For list views, you must specify one language and one publishing status on all Knowledge list views, otherwise you won't see any records in your list view. We don't support multiple-selection on PublishStatus or Language, or the "IN" and "OR" operators in list view filters.
- Data categories can't be shown in Knowledge list views.
- The customized record home flexipage isn't supported with Lightning Knowledge.
- We don't support external data sources in Knowledge search in Lightning Knowledge.
- You can't see vote information in the new ratings component unless there's an online version for the article. This affects article drafts and archived articles, because all online versions are removed when an article is archived.
- Most Knowledge actions aren't available in the Lightning Process Builder.

Console limitations for Lightning Knowledge

- The Knowledge footer is not in the Lightning Service Console.
- The following actions aren't available in the Knowledge Sidebar for the Lightning Service Console: attach as a PDF, attach as a PDF to case email, insert article contents to case email, insert Article Community URL, and insert article URL to case publishers. Standard article actions including editing, publishing, and archiving, are also not available.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Limitations in Salesforce Classic after enabling Lightning Knowledge

- Multiple Languages mode can't be enabled after Lightning Knowledge is enabled.
- Page Layouts selections for Actions and Related lists don't reflect in Salesforce Classic.
- Page Layouts don't display in 2 columns in Salesforce Classic.
- Some actions, such as Change Record Type, aren't available in Salesforce Classic.
- Knowledge list views aren't available in Salesforce Classic.
- You can't perform a search by Knowledge record type in Salesforce Classic.
- You can't perform a search by archived articles in Salesforce Classic, except in Article Management.
- Files in Lightning Experience don't display in Salesforce Classic, and files in Salesforce Classic don't display in Lightning Experience.

Limitations for using Lightning Knowledge with other Salesforce products

- File attachments in your Classic Knowledge implementation don't transfer to Lightning Knowledge. After migrating your articles to Lightning Knowledge, add the Files related list to your page layout and use the Files related list on each article to migrate your files.
- You can't detach or remove a file from the Files component after it has been associated with an Article. When the file is shared with a record via the record feed, the workaround is to delete the feed post. Read [Delete Files and Links from Feeds](#) on page 3189 to learn more about removing files.
- Currently, the only way to remove an attached file from an article is to delete the file from File home.
- Reporting with record types is not currently supported in Lightning Knowledge.
- All rich text editors are currently disabled when LockerService is enabled. If you're using Lightning Knowledge in Sandbox or a Developer Edition org, we recommend turning off LockerService in Lightning Experience. If you're using Lightning Knowledge in your production org, we recommend that you don't enable LockerService in Lightning Experience.
- The rich text editor is limited for Lightning Knowledge. The following rich text editor features aren't currently supported in Lightning Knowledge: smart links, tables, show source, anchors, videos, and fonts are limited.
- Lightning Knowledge isn't currently supported with Communities.
- Lightning Knowledge isn't currently supported with Salesforce1.

Set up Lightning Knowledge

Enable Lightning Knowledge, create Knowledge record types, customize your record type page layouts, set access for Knowledge users, and create a Lightning Knowledge process.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Enable Lightning Knowledge

Enable Lightning Knowledge to use your Knowledge base in Lightning Experience. After you enable Lightning Knowledge, you can't disable it.

1. From Salesforce Classic Setup, enter *Knowledge* in the **Quick Find** box and click **Knowledge Settings**.
2. If you're new to Knowledge, enable Knowledge in Salesforce Classic by selecting **Yes** and clicking **Enable Salesforce Knowledge**.
3. On the Knowledge Settings page, click **Edit**.
4. Select **Enable Lightning Knowledge**.
5. Click **Save**.

After Lightning Knowledge is enabled, the node **Knowledge Object Setup** appears. This is where you control your Lightning Knowledge settings and page layouts. All setup for Lightning Knowledge remains in Salesforce Classic.

Whenever you change the name and API name of your Knowledge Base in **Knowledge Object Setup**, we recommend you do a hard refresh of your browser to avoid server errors.

Create Lightning Knowledge Record Types

Create record types to distinguish types of Knowledge articles. In Lightning Knowledge, standard record types replace custom article types.

Different content has different needs. For example, your FAQ pages are different from your tutorials, which are different from your policy statements. Record types let you control the content and layout for each type of article.

1. From Salesforce Classic Setup, go to **Build > Knowledge > Knowledge Object Setup**.
2. Under Record Types, click **New**.
3. Select an existing record type to use as a template. The new record type includes all picklist values from the existing record type that you select.
4. Enter a label for your record type.
5. If desired, enter a description.
6. Select **Active** if you want this record type to be usable immediately.
7. Select the profile access for this record type.
8. Click **Next**.
9. Select the page layout that users with this profile see for record with this record type.
10. Click **Save**.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Customize Your Lightning Knowledge Record Type Page Layouts

For each record type you create, you can customize the page layout. You can control the form and structure for each type of article you have in your Lightning Knowledge base.

Record type layouts determine which fields agents can view and edit when entering data for an article. They also determine which sections appear when users view articles. You can customize the fields, actions, and related lists for each record type and user profile.

For example, you might customize page layouts by user profile when sensitive data is involved. By assigning a page layout by user profiles, you can display more sensitive fields of the same article to only the agents who need to access them.

1. From Salesforce Classic Setup, enter *Knowledge* in the **Quick Find** box, then select **Knowledge Object Setup**.
2. Scroll down to the Page Layouts related list or click the Page Layouts link at the top of the page.
3. To create a page layout, click **New** and follow the prompts. To edit an existing layout, click **Edit** and make your changes.

Make your changes. The layout editor consists of two parts: a palette on the upper portion of the screen and the layout on the lower portion of the screen. The palette contains the available fields and a section element. The layout contains an Information section and space for you to add sections. By default, all custom fields are included in the Information section.

 **Important:** If you navigate away from your record-type layout before clicking save, your changes are lost.

 **Note:** The **Title** and **URL Name** standard fields are required.

Task	Description
Add a section	Drag and drop the section element into the palette.
Change the name of a section	Click its title. You cannot rename the Information section.
Specify 1 or 2 columns	Select 1 or 2 columns for this layout. For 2-column layouts, you can set the navigation flow direction (up-down or left-right).
Remove a field from a section	Drag it to the right side of the palette or click the  icon next to the field.
Remove a section from the article-type layout	Click the  icon next to the section name.
Save your changes and continue editing the article type layout	Click Quick Save .

Tip:

- Use the undo and redo buttons to step backwards and forwards, respectively.
- Use the following keyboard shortcuts:
 - Undo = CTRL+Z
 - Redo = CTRL+Y
 - Quick Save = CTRL+S
- To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To customize the record-type layout:

- “Customize Application”

- To quickly locate any item in the palette, use the Quick Find box. The Quick Find box is especially useful for article-type layouts that have large numbers of items available in the palette.

4. To assign various layouts to the article type based on a user profile, click **Page Layout Assignments**.
5. Click **Edit Assignment**.
6. Select the profile, or profiles (using SHIFT), you want to change and select the layout from the **Page Layout To Use** drop-down.

Create Lightning Knowledge Home

Create the Lightning Knowledge home page to access Knowledge in Lightning Experience. For orgs created in Spring '17 or later, the Lightning Knowledge home page is created for you.

Everything you need, all in one place. Search, view, author, and manage articles on a single Knowledge home page in Lightning Experience. Plus, you can do a number of authoring actions without leaving Knowledge home.

For published articles, you can:

- Create a new article
- Archive a published article
- Edit a published article as a new draft

For article drafts, you can:

- Create a new article
- Publish a draft article
- Delete a draft article
- Edit a draft article

For archived articles, you can:

- Create a new article
- Restore an archived article

Allow other users to access these actions using standard user permissions. You can also make these actions available on the record home with page layouts.

Lightning Knowledge home uses the same list views you enjoy elsewhere in Salesforce. By default, you have list views for drafts, published articles, and archived articles. Don't forget to customize your list views to select which fields you want to display and sort with. For custom list views, keep in mind that you can't choose fields that aren't on the article record. This means that data categories, ratings, view count, and cases aren't available fields for your list views.

 **Important:** You must specify one language and one publishing status on all Knowledge list views, otherwise you won't see any records in your list view. We don't support multiple-selection on PublishStatus or Language, or the "IN" and "OR" operators in list view filters.

1. From Salesforce Classic Setup, go to **Build > Create > Tabs**.
2. Under Custom Object Tabs, click **New**.
3. Select **Knowledge** as the object.
4. Choose a tab style.
5. If desired, choose a splash page custom link and enter a description.
6. Click **Next**.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

7. Choose the custom user profiles for which this tab will be available.
8. Click **Next**.
9. Choose the custom apps for which this tab will be available.
10. Click **Save**.

When you switch to Lightning Experience, the Knowledge home page is now available.

Set Access for Lightning Knowledge

Give your knowledge agents access to articles in Lightning Knowledge. Specify which agents in your company are Salesforce Knowledge users, those who can create, edit, archive, and delete articles. Create user profiles with the appropriate user permissions, and then assign users to these profiles.

Lightning Knowledge uses new user profile permissions instead of public groups to give agents access to article actions. By default, all internal users can read articles. However, you need to assign permissions to agents who are publishing, archiving, deleting, and managing articles.

 **Note:** To do more than read articles, agents need the Knowledge User license.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click **Edit** next to the user's name or click **New** to create a user.
3. If you are creating a user, complete all the required fields.
4. Select the **Knowledge User** checkbox.
5. Click **Save**.

User permissions control access to different tasks. We recommend using permission sets or custom profiles to grant users the permissions they need. For example, you can create a permission set called "Article Manager" that includes the permissions to create, edit, publish, assign, delete, and archive articles.

Refer to this table for details on permissions associated with Salesforce Knowledge tasks.

Lightning Knowledge Task	User Permissions Needed
To manage record types:	"Manage Salesforce Knowledge" (This permission is on by default in the System Administrator profile.) AND "Create", "Edit", and "Delete" on Knowledge
To manage article actions:	"Manage Salesforce Knowledge" (This permission is on by default in the System Administrator profile.)
To search for and read articles:	"Read" on Knowledge
To search articles on cases and attach articles to cases:	"Read" on Knowledge

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or edit users:

- "Manage Internal Users"

To create article types and article actions (Classic Knowledge only):

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

To create record types and article actions (Lightning Knowledge only)

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"
- AND
- Create, Edit, and Delete on Knowledge

Lightning Knowledge Task**User Permissions Needed**

To create articles:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read” and “Create” on Knowledge

To edit draft articles:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read” and “Edit” on Knowledge

To delete draft articles:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read”, “Edit”, and “Delete” on Knowledge

To publish articles:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read”, “Create”, “Edit”, and “Delete” on Knowledge

AND

“Publish Articles” (New in Lightning Knowledge)

To change the record type of a draft article:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read” and “Edit” on Knowledge

To archive published articles:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read”, “Edit”, and “Delete” on Knowledge

AND

“Archive Articles” (New in Lightning Knowledge)

To create a new draft of a published article:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read”, “Create”, “Edit”, and “Delete” on Knowledge

Lightning Knowledge Task**User Permissions Needed**

To restore an archived article as a new draft:

“Manage Articles” (This permission is on by default in the System Administrator profile.)

AND

“Read”, “Create”, “Edit”, and “Delete” on Knowledge

AND

“Archive Articles” (New in Lightning Knowledge)

To create data categories

“Manage Data Categories” permission. (This permission is on by default in the System Administrator profile.)

To enable agents to perform their specific tasks, create [public groups](#) for each role and assign only the necessary [article actions](#) to those groups.

Example: Your Salesforce Knowledge agents are a mixture of different levels of job experience and expertise in the products and services your company offers. These examples outline four basic types of users and some of the permissions they need to perform their jobs.

Scott: The Reader

Scott Jackson is relatively new to the company, so he’s a basic agent of the knowledge base. Currently, he has read-only access to articles, so he can search and view articles. Readers don’t author or publish, so he won’t belong to a public group or need to submit articles for approval. He needs the following permissions to perform his job.

Scott	Permission	Knowledge Permissions			
		Read	Create	Edit	Delete
Salesforce Knowledge Functionality	Manage Articles				
Search articles from and attach articles to cases		✓			
Search for and read articles		✓			

Amber: The Candidate

Amber Delaney is a candidate-level agent and can create and publish articles with statuses of either `Work in Progress` or `Not Validated`. If Amber works on an article with a different validation status, she must send it to a queue for approval before it’s published.

Amber is part of the KCS Candidate public group and submits the articles she can’t publish to the Publishing External queue. She needs the following permissions to perform her job duties.

Amber	Permission	Knowledge Permissions			
		Read	Create	Edit	Delete
Salesforce Knowledge Functionality	Manage Articles				
Search articles from and attach articles to cases		✓			
Search for and read articles		✓			

Amber	Permission		Knowledge Permissions			
	Salesforce Knowledge Functionality	Manage Articles	Read	Create	Edit	Delete
	Create or edit article	✓	✓	✓	✓	
	Edit draft articles	✓	✓		✓	
	Edit a published article as a new draft or restore an archived article as a new draft	✓	✓	✓	✓	✓

Anne: The Contributor

As a contributor, Anne Murphy is a more advanced Knowledge user. She understands the standards for articles in the organization and can create articles and publish articles with `Validated Internal` status. She can also work on articles authored by other users if they have either `Work in Progress` or `Not Validated` statuses, and can change them to `Validated Internal`. Since she doesn't have permission to publish articles to an external audience, she must submit those customer-facing articles to the Publishing External queue.

 **Note:** Article approvers require the "Manage Articles" permission and at least the "Read" permission on the article type associated with articles they review. These permissions let them access the article in a draft state. Without these permissions, approvers can reassign but not approve articles.

Anne is a member of the Contributor public group and she needs the following permissions to perform her job duties.

Salesforce Knowledge Functionality	Permission		Knowledge Permissions		
	Manage Articles	Read	Create	Edit	Delete
	Create articles	✓	✓	✓	
	Search articles from and attach articles to cases		✓		
	Search for and read articles		✓		
	Edit draft articles	✓	✓	✓	
	Delete articles (version or entire)	✓	✓	✓	✓
	Archive articles	✓	✓	✓	✓

Pat: The Publisher

Pat Brown is Knowledge domain expert and is responsible for reviewing and publishing articles to an external audience. He is a member of the Publisher public group. Pat also belongs to the Publishing External queue. He needs the following permissions to perform his job duties.

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions			
	Manage Articles	Read	Create	Edit	Delete
Search articles from and attach articles to cases		✓			
Create and edit articles	✓	✓	✓	✓	
Edit draft articles	✓	✓		✓	
Delete articles (version or entire)	✓	✓		✓	✓
Publish articles	✓	✓	✓	✓	✓
Edit a published article as a new draft or restore an archived article as a new draft	✓	✓	✓	✓	
Archive articles	✓	✓		✓	✓

How they all work together

Each user profile defines an agent's permission to perform different job duties and functions. To enable agents to perform these functions, you create a user profile for each role and assign only the necessary permissions to that group.

The following table lists the job functions that each role needs to perform on articles in the organization

Job Function	Reader	Candidate	Contributor	Publisher
Create and publish Work in Progress	No	Automatically approved and published	Automatically approved and published	Yes
Create and publish Not Validated	No	Automatically approved and published	Automatically approved and published	Yes
Create and publish Validated Internal	No	Needs approval	Automatically approved and published	Yes
Create and publish Validated External	No	Needs approval	Needs approval	Yes
Update and publish Work in Progress	No	No	Automatically approved and published	Yes
Update and publish Not Validated	No	No	Automatically approved and published	Yes

Job Function	Reader	Candidate	Contributor	Publisher
Update and publish Validated Internal	No	No	Automatically approved and published	Yes
Update and publish Validated External	No	No	Needs approval	Yes

Define Validation Status Picklist Values

When the `Validation Status` field is enabled on the Knowledge Settings page, you can create picklist values that show the state of the article. For example, values could be `Validated`, `Not Validated`, or `Needs Review`.

 **Note:** In Salesforce Classic, validation status picklist values aren't retained when you export articles for translation. Articles with picklist values can be imported, however, and their values are retained as long as the values exist in your organization.

1. From Salesforce Classic Setup, enter `Validation Statures` in the `Quick Find` box, then select **Validation Statures**.
2. On the picklist edit page, click **New** to add new values to the validation status field. You can also edit, delete, reorder, and replace picklist values.
When you replace a picklist value, the system replaces it in all versions of the article, including any archived versions.
3. Add one or more picklist values (one per line) in the text area.
4. To set the value as the default for the picklist, be sure to select the `Default` checkbox.
5. Click **Save**.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or change validation status picklist values:

- "Customize Application"

Use Your Lightning Knowledge Base

Search articles, author and manage articles, use the Knowledge sidebar in the Lightning Service Console, and create Knowledge reports.

Search Articles in the Main Search Box and the Knowledge Sidebar

Perform a Knowledge search in the main search box at the top of every page, and in the Knowledge sidebar for the Lightning Service Console.

In Lightning Experience, Knowledge search is available in both the main search box and the Knowledge sidebar. The advanced search option lets you pre-filter your results by language, publishing status, validation status, record type, or data category group.

1. In the main search box, begin typing *knowledge*. Search starts recommending content and options for scoping search to specific objects.
2. Select **Limit search to Knowledge**.
3. Optionally, click **Advanced Search** to pre-filter your results by language, publishing status, validation status, record type, or data category group. Filters you've selected appear in the search box.
4. Enter your search terms.

 **Note:** You can enter up to 100 characters. If you enter more than 100 characters, only the first 100 characters are used when you run the search.

5. Press *Enter* to run the search.

 **Note:** You can also search Knowledge using the Knowledge sidebar for the Lightning Service Console. Use **Advanced Search** to add pre-filters, enter your search terms, and run the search.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Authoring Actions in Lightning Knowledge

Manage Knowledge articles from Knowledge home and the article record home in Lightning Experience.

Quickly access authoring actions in Knowledge home and the article record home using the drop-down next to each article. Administrators, agents, and internal employees with the correct profile permissions can perform these actions.

On the published articles list view in Knowledge Home, you can:

- Create an article
- Archive an article
- Edit an article as a new draft

On the article drafts list view in Knowledge Home, you can:

- Create an article
- Publish a draft
- Delete an article
- Edit an article

On the archived articles list view in Knowledge Home, you can:

- Create an article
- Restore an archived article

For the article record home, you can control the available authoring actions with record type page layouts. Additionally, you can add the following components to your record home:

- Ratings: Automatically enabled.
- Files: Add the Files related list in your record type page layout.
- Versions: Select Track Field History and Set History Tracking in Knowledge Object Setup. These options make the article version history and field changes available for Knowledge users to view in the versions component.
- Data Category Viewer and Chooser: Give the correct Knowledge users "Edit" access on Knowledge, and they can view and change an article's data categories.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Use the Knowledge Sidebar in the Lightning Service Console

The Knowledge sidebar keeps agents connected to your Knowledge base while they're working in the console. Agents can see suggested articles for the case they're viewing, or perform a search to find more articles. They can use the sidebar to attach an article to (or remove an article from) a case, follow and unfollow articles, and search within Knowledge.

The Knowledge sidebar helps agents quickly find relevant Knowledge articles for their cases and perform some basic actions, such as attaching an article to a case.

Suggested Articles

Suggested articles are delivered right to the Knowledge sidebar, so agents can find relevant articles without running a search. Suggested articles are automatically enabled when Lightning Knowledge is enabled.

Search and Sort Your Results

Use the search box in the sidebar to perform a Knowledge search. If you'd like, use Advanced Search for pre-filtering to narrow the search results you see.

To sort your search results, click the sort icon and select a sort option from the list. You can sort your search results by relevance, publish date (for published articles), last modified date (for article drafts), A to Z, and Z to A. Sorting doesn't apply to suggested articles.

By default, articles are sorted by relevance. If you go back to suggested articles or go to a new case, the sort order is reset to relevance.

Attach and Remove Articles in the Sidebar

Agents can attach Knowledge articles to cases and remove articles from cases using the drop-down next to any article.

Follow and Unfollow with the Sidebar

Agents can follow and unfollow an article from the sidebar using the drop-down next to the article. Following articles helps agents save articles that they want to read later.

Administrators, agents, and internal employees with read access to Knowledge can follow articles, and they can follow articles in any state, such as published or draft. To let Knowledge users follow and unfollow articles, enable feed tracking in **Setup > Chatter >**

Feed Tracking.

The Knowledge sidebar is automatically added to your sample Lightning Service Console. To add the Knowledge sidebar to a custom Lightning Service Console, add Knowledge to your selected items in the Lightning App Builder.

Tip: The Knowledge Sidebar isn't limited to the console. You can add it to the Lightning Case record home using the Lightning App Builder.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Report on Salesforce Knowledge Articles

Use Salesforce Knowledge custom reports to track how articles are created, maintained, and delivered.

As an administrator, you can create custom report types so agents can create reports on Salesforce Knowledge articles. Custom report types are the only way to make reports about articles available for your readers. Salesforce does not provide sample article reports or a standard report folder for articles.

 **Tip:** The *Knowledge Base Dashboards and Reports* AppExchange package provides over two dozen reports that help you monitor the knowledge base and analyze usage metrics.

1. [Create a Folder for Article Reports](#)
Create a public folder where you can store article reports for your users.
2. [Article Reports](#)
Create a custom report type to report on Salesforce Knowledge article data.
3. [Create an Article Report](#)
Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.
4. [Fields Available on Salesforce Knowledge Reports](#)
The fields you can use in a knowledge report depend on the type of information you are reporting on.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

Create a Folder for Article Reports

Create a public folder where you can store article reports for your users.

1. In the Report Folder section of the Reports tab, click **Create New Folder**.
2. Enter *Article Reports* in the `Folder Label` field.
3. Optionally, modify the `Group Unique Name`.
4. Choose a `Public Folder Access` option.
Select read/write if you want users to be able to add and remove reports.
5. Choose a folder visibility option.
6. Click **Save**.

Reports you store in this folder are available on the Reports tab.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

Article Reports

Create a custom report type to report on Salesforce Knowledge article data.

To create a custom report:

1. From Setup, enter *Report Types* in the *Quick Find* box, then select **Report Types** and click **New Custom Report Type**.
See [Create a Custom Report Type](#) on page 411
2. In the Primary Object drop-down menu, select the article-related object you want to report on:

Primary Object	Description
Article types (Classic Knowledge only)	Compare information such as creation dates, published channels, and number of associated cases for your custom article type, such as an FAQ. To access any history and custom fields for the custom article type, add the article type's version as a secondary object.
Knowledge Articles	Compare information about individual articles, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics. In reports using the Knowledge Articles primary object, each article has five records (rows): one for each channel (All Channels, Internal App, Customer, Partner, and Public Knowledge Base).
Knowledge Article Searches	Analyze the number of searches per day, month, or year for each channel and role.
Knowledge Article Version	Compare information about individual translations, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics.
Article Version History	Compare information about individual article versions, such as their creation dates, published channels, and number of associated cases.
Knowledge Article Views	Analyze the number of views per day, month, or year for each channel and role.
Knowledge Article Votes	Analyze the number of votes per day, month, or year for each channel and role.
Knowledge Keyword Search	See which keywords users are looking for in your knowledge base.
Knowledge Search Activity	<ul style="list-style-type: none"> • Analyze the number of searches per day, month, or year for each channel and language. • For each search, see the: <ul style="list-style-type: none"> – Date – ID and title of the article that was clicked

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

- See which keywords users are looking for in your knowledge base.
- For each keyword, see the average number of:
 - Results
 - Articles that appear in the search results
- For each article, see the average number of:
 - Clicks
 - Unique users who clicked it

3. Complete the required fields and click **Save**.

In the Store in Category drop-down menu, we recommend choosing **Customer Support Reports** or **Other Reports**. This is the category where users find the custom report type on the Reports tab.

4. Make your choices on the Define Report Records Set page.

Primary Object	Available Secondary Objects
Article types (Classic Knowledge only)	Article type Versions
Knowledge Articles	Article View Statistics, Article Vote Statistics, Case Article
Knowledge Article Searches	None
Knowledge Article Version	Article View Statistics, Article Vote Statistics
Article Version History	None
Knowledge Article Views	None
Knowledge Article Votes	None
Knowledge Keyword Search	None
Knowledge Search Activity	None

5. Click **Save**.

6. As needed, remove and rearrange fields from your report layout.

To learn which fields are available on each primary object, see [Fields Available on Salesforce Knowledge Reports](#) on page 4403.

 **Note:** An article's score is calculated slightly differently in the API than it is in a custom report. We recommend standardizing on one or the other and not attempting to use both.

Create an Article Report

Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.

Using your [custom report types](#), create article reports and save them to your [article reports folder](#).

1. On the Reports tab, click **New Report**.
2. Choose the category where your custom report types are stored; for example, **Customer Support Reports** or **Other Reports**.
The Cases with Articles report is available by default in the Customer Support Reports folder.
3. Find your report type and click **Create**.
4. When viewing your report, click **Save As** and save it in the new Article Reports folder to make the report available to other users.

Note:

- In reports using the Knowledge Article custom report type, there are at least five rows per article (one for each channel, including "All Channels").
- Daily values are reported independently for the last 90 days and monthly values for the last 18 months. After those time periods, use the monthly aggregate and yearly aggregate values, respectively.
- In reports using the Knowledge Article Votes, Knowledge Article Views, or Knowledge Article Searches custom report types, each row represents a day, channel, and role combination. For example, if a user with the Kingmaker role views articles in the internal app and the next day the same reader views more articles in the internal app, the Article Views report has two rows: one for each unique date.
- In reports using Knowledge Article Version (KAV), except Knowledge Article Version History, you can filter by data category. You can add up to four filters and set their logic to AT, ABOVE, BELOW, or ABOVE OR BELOW. The logic between filters is OR. You can use the same category group multiple times, however, you must use the same operator each time.
- To report on Approval Processes for Knowledge Articles, use **Process Instance** and **Process Instance Node** when creating a custom report type. Then filter the report on object type, which is the article type.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

Fields Available on Salesforce Knowledge Reports

The fields you can use in a knowledge report depend on the type of information you are reporting on.

The following tables list the available fields by primary object for Salesforce Knowledge reports.

Fields Available on Article types (Classic Knowledge only) Reports

The Article Type primary object allows you to add a secondary object of the article type version.

Table 53: Article Type Report Primary Object Fields

Field	Description
Archived By	User who archived the article.
Archived Date	Date the article was archived.
Article Number	Unique number automatically assigned to the article.
Article Type ID	The ID associated with the article type.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
Custom fields	Any custom fields created on the article types. Add the article type's version as a secondary object to access any custom fields for the article type.
First Published Date	Date the article was originally published.
Knowledge Article Version	The article's version number.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Last Published Date	Date the article was last published.
Master Language	The original language of the article.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

 **Note:** Currently you can't use Knowledge Article Version and Last Modified Date in the same report.

Table 54: Article Type Report Secondary Object Fields

Field	Description
Archived By	User who archived the article.
Article Type	The article type associated with the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
Custom fields	Any custom fields created on the article types. Add the article type's version as a secondary object to access any custom fields for the article type.
Is Latest Version	Indicates if the article is the most recent version.
Is Master Language	Indicates that the article is not a translation, but the original article.
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Language	The article's language.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Out of Date	Indicates that the master article has been updated since this translation was published.
Publication Status	Indicates whether the article or translation is in progress (draft), published, or archived.
Summary	Description of the article provided by the author.
Title	The article's title.
Translation Completed Date	Date the translation was completed.
Translation Exported Date	Date the article was exported for translation.
Translation Imported Date	Date the translation was imported.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.

Field	Description
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).
Visible in Partner	Indicates that the article is published in the partner portal.
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Articles Reports

Field	Description
Article Number	Unique number automatically assigned to the article.
Article Type	The article type associated with the article.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
First Published Date	Date the article was originally published.
Is Latest Version	Indicates if the article is the most recent version.
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Last Published Date	Date the article was last published.
Summary	Description of the article provided by the author.
Title	The article's title.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).

Field	Description
Visible in Partner	Indicates that the article is published in the partner portal.
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Article Searches Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Count	The number of article searches applicable to the duration shown (day, month, or year).
Cumulative Count	The total number of article searches for the history of the record.
Date	Last date on which an article search took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record. Each row in the report represents searches per channel per role.

Fields Available on Knowledge Article Version Reports

Field	Description
Archived By	User who archived the article.
Archived Date	Date the article was archived.
Article Number	Unique number automatically assigned to the article.
Article Type	The article type associated with the article.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (<code>__ka</code>) and Knowledge Article Version (<code>__kav</code>) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
First Published Date	Date the article was originally published.
Is Latest Version	Indicates if the article is the most recent version.

Field	Description
Is Master Language	Indicates that the article is not a translation, but the original article.
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Language	The article's language.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Date the article was last published.	Date the article was last published.
Master Language	The original language of the article.
Out of Date	Indicates that the master article has been updated since this translation was published.
Publication Status	Indicates whether the article or translation is in progress (draft), published, or archived.
Summary	Description of the article provided by the author.
Title	The article's title.
Translation Completed Date	Date the translation was completed.
Translation Exported Date	Date the article was exported for translation.
Translation Imported Date	Date the translation was imported.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).
Visible in Partner	Indicates that the article is published in the partner portal.
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Article Views Reports

You can add up to 6 of the 8 fields below.

Field	Description
Channel	The channel that's applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.
Count	The number of article views applicable to the duration shown (day, month, year).
Cumulative Count	The total number of article views for the history of the record.
Date	Last date on which an article view took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record.
Score	Article's average view rating. Scoresake into account a half-life calculation. Every 15 days, if an article has not been viewed its average rating moves up or down. This calculation ensures that over time, older or outdated articles don't maintain artificially high or low ratings compared to newer, more frequently viewed articles.
Total Views	Number of times a published article has been viewed.

Fields Available on Knowledge Article Votes Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.
Count	The number of article votes applicable to the duration shown (day, month, year).
Cumulative Count	The total number of article votes for the history of the record.
Date	Last date on which an article vote took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record.

Fields Available on Knowledge Keyword Search Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.

Field	Description
Count	The number of keyword searches applicable to the duration shown (day, month, year).
Date	Last date on which a keyword search took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Found	Indicates whether the keyword shown was found during a search of the knowledge base.
Keyword	Search term used to search published articles in the knowledge base.

Fields Available on Knowledge Search Activity Reports

Field	Description
Average Click Rank	The order in which the article appeared in search results when results are sorted by relevance and when readers clicked it from the list of results.
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Clicked Article Title	The title of the clicked article taken when the search results are sorted by relevance by the reader.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
	 Note: Activity totals are collected nightly and aren't in real time.
Language	The language filter that's applied to the reader's search.
Number of Results	The number of search results that were returned for the search term. If Duration is also included, this value is aggregated based on the time period specified.
Number of Searches	The number of searches for the duration that's shown (day, month, or year).
Number of Users	The number of individual users who clicked the article.
Search Date	The date of the search.
Search Term	The first 100 characters of the search term that was used to search published articles in the knowledge base.

Define Data Categories for Your Lightning Knowledge Articles

Create data categories and data category groups to help Knowledge users and customers find what they need. Some data category information doesn't apply to Lightning Knowledge.

Data Categories in Salesforce.com

Data categories are used in Salesforce Knowledge (articles and article translations), Ideas, Answers, and Chatter Answers to help classify and find articles, questions, or ideas. You can use data categories to control access to a particular set of articles, questions or ideas.

Salesforce Knowledge uses data categories to classify articles and make them easier to find. For example, to classify articles by sales regions and products, create two category groups: Sales Regions and Products. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level and North America, Europe, and Asia at the second level. The Products group could have All Products as the top level and Phones, Computers, and Printers at the second.

Data Category Limits	Details	
Maximum number of data category groups and active data category groups	5 category groups, with 3 groups active at a time	5 category groups, with 3 groups active at a time
Maximum number of categories per data category group	100 categories in a data category group	100 categories in a data category group
Maximum number of levels in data category group hierarchy	5 levels in a data category group hierarchy	5 levels in a data category group hierarchy
Maximum number of data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article

In an answers zone, data categories help organize questions for easy browsing. Each answers zone supports one category group. For example, if you're a computer manufacturer you might create a Products category group that has four sibling categories: Performance

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. On the Answers tab, zone members can assign one of the four categories to each question and then browse these categories for answers to specific questions.

Example:

Logical Classification of Articles

As a knowledge base administrator, you can organize your knowledge base articles into a logical hierarchy and tag articles with the attributes that are significant to your business.

Easy Access to Questions

As an answers administrator, you can choose which data categories are visible on the Answers tab. Zone members can tag a question with a category, which makes finding questions and answers easier for other members.

Control of Article and Question Visibility

As a knowledge base or answers community administrator, you can centrally control the visibility articles or questions by mapping roles, permission sets, or profiles to categories in the category groups. When an article or question is categorized, users with visibility can automatically see it.

Article Filtering

As a support agent, when articles are classified into logical categories, you can quickly and easily locate the article you need by filtering your organization's knowledge base. To ensure you see all relevant articles, filtering by category has expansive results that include a category's upward and downward relatives in the category hierarchy. For example, if your category hierarchy for products has the levels All Products > Computers > Laptops > Gaming Laptops and you are helping a customer with a laptop problem, filtering by Laptops returns articles classified with Laptops as well as articles classified with Computers, All Products, or Gaming Laptops. Effectively, you are made aware of useful related articles like a free shipping offer for all products or an upgrade offer for gaming laptops. (To prevent irrelevant results, category filtering doesn't return nonlinear relatives like siblings and cousins. Articles about Desktops, a sibling of Laptops, would not display.)

Article and Question Navigation

As an end user, you can navigate the categories on the Articles tab or Answers tab to find the information you need to solve your problem.

Managing Category Groups for Articles and Questions

If your organization has Salesforce Knowledge and an answers community, you can create separate category groups or use the same category group for articles and questions.

Data Categories in Articles

A category group is the container for a set of categories. In Salesforce Knowledge it corresponds to the name of the category drop-down menus. For example, if you use the Data Categories page in Setup, (enter *Data Category* in the *Quick Find* box, then select **Data Category Setup**) to create and activate a category group called Products, a Products menu displays on the Article Management tab, the article edit page, the Articles tab in all channels, and the public knowledge base.

As an illustration, the figure below shows a knowledge base administrator's view of an article about laptop deals; using the article edit page, the administrator has classified the article with Laptops in the Products category group, and USA in the Geography category group.

An Article About Laptop Deals on the Article Management Tab

The next figure now illustrates an agent finding that same article published on the Articles tab; the agent has selected Laptops and USA respectively in the Products and Geography drop-down menus to retrieve an article that is classified with both Laptops and USA.

An Article About Laptop Deals on the Articles Tab

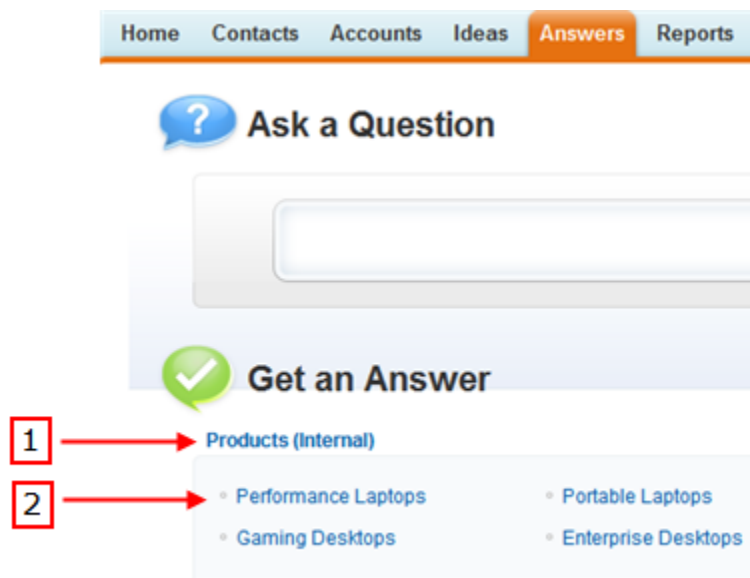

When you add categories to a category group, you build a hierarchy that can contain up to five levels of depth and up to 100 categories total. Each category can have one parent, many siblings, and many children. A robust and well-organized category hierarchy helps users find the articles that are relevant to them quickly and easily.

By default, all Salesforce Knowledge users have access to all categories; however, you can [restrict category visibility by role, permission set, or profile](#).

Data Categories in Answers Zones

An answers zone supports one category group, and members can assign one category to each question. Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. The categories within the group display on the Answers tab below the zone name.

Answers tab displaying categories

By default, all zone members have access to all categories; however, you can [specify category visibility](#).

Data Category Implementation Tips

Consider the following information when planning and implementing data categories for your organization:

- You can create up to three category groups with a maximum of five hierarchy levels in each group. Each category group can contain a total of 100 categories.
- If you want to use data categories with Answers, after creating your category group you must assign it from Setup by entering *Data Category Assignments* in the **Quick Find** box, then selecting **Data Category Assignments** under Answers. You can only assign one category group to an answers community. Salesforce Knowledge supports multiple category groups.
- Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. Salesforce Knowledge supports a hierarchy of data categories.
- Category groups are hidden from users until they are activated. Do not activate a category group until you have finished defining its categories and their access settings, including their visibility.
- When assigning categories to articles, you can choose up to eight categories in a category group.
- If an article has no categories, it displays only when you choose the **No Filter** option in the category drop-down menu.
- When searching for articles or article translations, selecting a category automatically includes the parent and children of that category and any grandparents, up to and including the top level. Sibling categories are not included. For example, if a category hierarchy has the levels All Products, Switches, Optical Networks, and Metro Core, selecting "Optical Networks" from the category drop-down menu returns articles assigned to any of the four categories. However, if the Switches category has a sibling category called Routers, selecting "Optical Networks" does not return articles classified within Routers. Category visibility settings may limit the specific articles you can find.
- Once [visibility settings](#) have been chosen for the categories:
 - Users who are not assigned visibility can only see uncategorized articles and questions unless [default category visibility](#) has been set up.
 - For role-based visibility, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers by default. You can [change the category group visibility settings](#) for each portal role.
 - If you only have access to one category in a category group, the category drop-down menu for that category group does not display on the Articles tab.
- Deleting a category:
 - Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
 - Permanently deletes its child categories.
 - As applicable, removes the category and its children from the Answers, Article Management, and Knowledge tabs in all channels, and your company's public knowledge base.
 - Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
 - Removes its mapping to visibility. Readers lose their visibility to articles and answers associated with the deleted category.
- Deleting a category group:

- Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15-day holding period, you can either restore a category group, or permanently erase it immediately.
 - Deletes all categories within that group.
 - Removes all associations between the group's categories and articles or questions.
 - Removes all associations between the group's categories and visibility.
 - As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.
- You can translate the labels of categories and category groups using the Translation Workbench.

Best Practices for Data Categories

Consider the following tips when using data categories:

- To quickly manage data categories, use [keyboard shortcuts](#).
- After creating or updating categories, set up [category group visibility rules](#).
- Save your changes frequently. The more actions you perform before clicking Save, the longer it takes to save.

Create and Modify Category Groups

Category groups are used by Salesforce Knowledge (articles), answers (questions), or ideas. In all cases, category groups are containers for individual data categories. For example, a Contracts category group might contain Fixed Price, Cost Reimbursement, and Indefinite Delivery categories.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. To create a category group, click **New** in the Category Groups section.
By default, you can create a maximum of five category groups and three active category groups. To edit an existing category group, hover your cursor over the category group name and then click the **Edit Category Group** icon ().
3. Specify the **Group Name** up to a maximum of 80 characters. This name appears as the title of the category drop-down menu on the Article Management and Articles tabs, and, if applicable, in the public knowledge base. The **Group Name** does not appear on the Answers tab.
4. Optionally, modify the **Group Unique Name** (the unique name used to identify the category group in the SOAP API).
5. Optionally, enter a description of the category group.
6. Click **Save**.
You receive an email after the save process completes.

Activating Category Groups

When you add a category group, it's deactivated by default and only displays on the administrative setup pages for Data Categories, Roles, Permission Sets, and Profiles. Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community. In addition to activating the category group, for answers communities you must assign the category group to a zone before the categories are visible on the Answers tab.

To activate a category group so it is available to users, move the mouse pointer over the name of the category group and click the **Activate Category Group** icon ().

You can now [add categories](#) to your category group. When you create a category group, Salesforce automatically creates a top-level category in the group named **A11**. Optionally, double-click **A11** to rename it.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Add Data Categories to Category Groups

Once you have category groups, you can add data categories to help agents classify and find articles, questions, or ideas.

Administrators can create data categories for Salesforce Knowledge articles, questions in a zone, or ideas to classify and find articles, questions, or ideas. You can also use data categories to control access to articles, questions, and ideas.

By default, you can create up to 100 categories in a data category group and have up to 5 levels in a data category group hierarchy. To request more categories or hierarchy levels, contact Salesforce.

 **Note:** On the Answers tab, only first-level data categories display. Therefore, when creating data categories for a portal or community, ensure that the categories you want visible have a sibling relationship and not a parent-child relationship.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click the category group name.
3. Click a category that is directly above where you want to add a category (a parent), or at the same level (a sibling).
4. Click **Actions**, then select an action: **Add Child Category** or **Add Sibling Category**.
5. Enter a category name up to a maximum of 40 characters.
If possible, Salesforce automatically reuses the name you entered as the **Category Unique Name**, a system field which the SOAP API requires.
6. Click **Add**. Alternatively, press Enter.
7. Click **Save**.

Save your changes frequently. The more actions you perform before clicking Save, the longer it takes to save.

 **Tip:** By default, all Salesforce Knowledge users and zone members can see all categories within an active category group. You can [restrict category visibility](#) after you have set up your data categories to ensure that users only access articles and questions that you want them to see.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To view the Data Categories page:

- “View Data Categories”

To create, edit, or delete data categories:

- “Manage Data Categories”

Filter Articles with Data Category Mapping

Make suggested articles more relevant when solving cases. Map case fields to data categories to filter for articles assigned to those data categories. For example, cases with a field for which product they are about can be mapped to the data category of that product. Articles assigned that category or product, are filtered to the top of the suggested article list.

Important:

- Filtering articles based on case information is only supported in text and picklist fields.
- Filters are applied to Knowledge results after the case has been saved.
- Filters are applied after a Knowledge search and only to the articles returned in the search.
- Using Filters does not return a list of all articles that match the filter criteria. Instead, the filters are applied to the initial pool of article results returned.
- Results may be filtered after a search.
- A category group can only be used once in a data category mapping.
- Suggested articles are returned if `Suggest articles for cases considering case content` is enabled. When suggested articles is disabled, search uses data category mappings. Case subject fields are used when there are no data category mappings.

To implement data category mapping, select which case fields map to which data categories and set a default data category for cases that have no value for the mapped fields.

For information on data categories, see [Data Categories in Salesforce.com](#) on page 3037.

1. From Setup, enter *Data Category Mappings* in the `Quick Find` box, then select **Data Category Mappings**.
2. In the `Case Field` column, use the drop-down list to add a field.
3. In the `Data Category Group` column, use the drop-down list to map the information from the lookup field to a data category.
4. In the `Default Data Category` column, use the drop-down list to assign a data category when the field value does not match any categories from the category group.
5. Click **Add**.

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

Adding Solutions

HTML Solutions Overview

HTML solutions provide a more flexible way to create solutions, by allowing you to easily format paragraphs, and insert images and links. Using HTML solutions, you create solutions with an HTML editor and display those solutions to users in Salesforce, the Self-Service portal, the Customer Portal, and as public solutions.

Using the HTML editor, you can:

- Change fonts
- Increase or decrease font sizes
- Insert images from the Documents tab
- Set text color
- Set the background color of text
- Insert hyperlinks
- Change paragraph alignment
- Create bulleted and numbered lists

 **Note:** By default, solutions are created and displayed in text format. Your administrator must enable HTML solutions.

Before you begin creating HTML solutions for your organization, review the following implementation tips and best practices.

Implementation Tips

- Once you enable HTML solutions, you cannot disable it.
- If you open a text solution with the HTML editor and save it, the solution becomes an HTML solution.
- HTML solutions are presented as such to Self-Service portal, public solutions, Customer Portal, and Salesforce users.
- Any HTML tags entered into the HTML editor will display to users as text when the solution is saved.
- When the HTML solution detail is displayed in list views and search results, only the first 255 characters are displayed. This number includes HTML tags and images that are removed.
- Each HTML solution can contain up to 32000 characters, including HTML tags.
- HTML formatting is preserved in the printable view of a solution.
- Hyperlinks in HTML solutions open in a new browser window when users click on them.
- All images that you want to include in your HTML solutions must be uploaded to the Documents tab. Images in HTML solution details don't show up in list views and reports.
- HTML solutions can be created in any of the languages supported by Salesforce.

Best Practices

The following HTML tags are allowed in HTML solutions imported into Salesforce:

<a>	<dt>	<q>
<abbr>		<samp>
<acronym>		<small>

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create solutions:

- "Create" on solutions

<address>	<h1>	
	<h2>	<strike>
<bdo>	<h3>	
<big>	<h4>	<sub>
<blockquote>	<h5>	<sup>
 	<h6>	<table>
<caption>	<hr>	<tbody>
<cite>	<i>	<td>
<code>		<tfoot>
<col>	<ins>	<th>
<colgroup>	<kbd>	<thead>
<dd>		<tr>
		<tt>
<dfn>	<p>	
<div>	<pre>	<var>
<dl>		

Within the above tags, you can include the following attributes:

alt	face	size
background	height	src
border	href	style
class	name	target
colspan	rowspan	width

The above attributes that can include a URL are limited to URLs that begin with the following:

- http:
- https:
- file:
- ftp:
- mailto:
- #

- / for relative links

[Creating Solutions](#)

Multilingual Solutions Overview

The multilingual solutions feature helps you translate solutions and solution categories into the languages supported by Salesforce so that customers and support reps can find answers to inquiries in the language with which they are most comfortable.

Multilingual solutions can lower support costs by:

- Improving customer satisfaction by answering inquiries in the languages preferred by customers
- Deflecting unnecessary incoming calls by providing solutions in languages that are the most useful for customers
- Managing inquiries in multiple languages from one location, anytime and anywhere

Review the following key terms for multilingual solutions:

Master Solution

A solution created in any language supported by Salesforce. A master solution can have zero or more translations associated with it; it cannot be linked to another master solution.

Translated Solution

A solution translated into another language supported by Salesforce and associated with exactly one master solution. A translated solution cannot have the same language as its master solution or any other translated solutions associated with that master solution. A translated solution cannot have other translated solutions associated with it. Translated solutions are represented by the  icon on solution detail pages, solution edit pages, solution list views, and solution search results.

You can work with multilingual solutions from the following:

Solutions Tab

When creating a new solution, users can choose a language in which to write the solution from the `Language` picklist field. Once the solution is saved, it becomes a master solution. Users can then create a translated solution by clicking **New** on the Translated Solutions related list of the master solution detail page. When a master solution is modified, users can adjust the statuses of its translated solutions to indicate that they may need translating.

Cases Tab

When users search for relevant solutions on a case by entering keywords in the Solutions related list and clicking **Find Solution**, search results include solutions in all languages that have matching keywords. Alternatively, if suggested solutions is enabled for cases, users can click **View Suggested Solutions** to find relevant solutions in multiple languages if they share common words with the case.

Self-Service Portal

If multilingual solution search is enabled for your Self-Service portal, customers automatically view solution search results in their preferred language as specified in their Self-Service user information settings. Customers can also choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, the Login Page of your Self-Service portal displays in your organization's language.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Public Solutions

If multilingual solution search is enabled for your public solutions, customers can choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, public solutions display in your organization's language.

Solution Categories

Users with the "Manage Translation" permission can use the translation workbench to translate solution categories so that they display in the language of each user on the Solutions tab and in the preferred language of each customer on the Self-Service portal as specified in the customer's user settings. Solution categories are not translated for public solutions.

Reports

You can track translated solutions marked `Out of Date` by choosing the Translated Solutions report. Running this report also lists the title and details of translated solutions. You can also create a custom report for multilingual solutions using the Master and Translated Solutions report type.

List Views

You can see which translated solutions are marked `Out of Date` and may need translating by creating a custom list view on the Solutions tab and entering the following search criteria: "Out of Date equals True".

Import

The Data Import Wizard includes options to import master and translated solutions and associate them with each other.

To learn more about enabling multilingual solutions, see [Enable Multilingual Solutions](#) on page 3034.

SEE ALSO:

[Enable Multilingual Solutions](#)

[Categorizing Solutions](#)

[Creating Solutions](#)

Suggested Solutions Overview

The suggested solutions feature displays up to ten relevant solutions that may help users and customers solve a particular case from the case detail page, Salesforce Customer Portal, or the Self-Service portal.

Suggested solutions can lower support costs by:

- Reducing the time it takes for customer support reps to solve cases
- Improving customer support reps' productivity by offering them proactive access to all solutions for any case
- Enabling customers to solve and close their own cases

The solutions displayed are not simply found via a keyword search. Rather, the following variables are entered into a formula that automatically scores the relevancy of each solution to the particular case:

- Word frequency in all solutions
- Word frequency in similar cases with related solutions
- Proximity of the keywords within the solutions
- Word similarities to self-closed cases and solutions rated useful by Self-Service users
- The number of additional cases associated with a solution

You can enable suggested solutions for the following:

Cases tab

Users can click **View Suggested Solutions** from the case detail page to view a list of solutions relevant to their case. If multilingual solutions is enabled for your organization, search results return solutions in all languages that have matching keywords. However, search results across all languages might not be reliable because terms searched from one language to another are processed differently.

Customer Portal and Self-Service portal

Customers can view solutions relevant to their case when they submit a case or view cases online.

Customers can self-close their cases using suggested solutions.

When customers log new cases or click the **View Suggested Solutions** button on an existing case in the Customer Portal or Self-Service portal, a list of suggested solutions is displayed, including solutions in multiple languages for organizations with multilingual solutions enabled. When customers select a solution from the list, they can click **Yes** after **Does this Solution help you answer your question?** and then select a reason as to why they closed their case. The case will close with an indication on the `Closed by Self-Service User` case field. If the customer clicks **No**, they will be returned to the list of suggested solutions. If no suggested solutions are found, the Suggested Solutions Page is bypassed, and the customer is directed to their case.

Case auto-response rules and emails

Your support team can help customers solve their own cases without the assistance of customer support reps. Simply create email auto-responses for cases submitted via email, Web-to-Case, or the Self-Service portal. Within the auto-response email template, include the suggested solutions merge field, `{!Case_Suggested_Solutions}`, which provides outbound emails with direct links to the subject and description of each solution that may help customers answer their inquiries.

 **Note:** Sending mass emails using templates with the suggested solutions merge field can take several minutes and isn't recommended.

The `Closed by Self-Service User` field, along with a `Closed When Created` field, can be added to case [page layouts](#). These fields are automatically set by Salesforce and can't be modified. You can run reports on the `Closed by Self-Service User` and `Closed When Created` fields to see how cases have been closed.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable suggested solutions:

- "Customize Application"

To modify Self-Service pages:

- "Manage Self-Service Portal"

AND

"Customize Application"

- Report on the `Closed by Self-Service User` field to see how many cases have been closed by users via suggested solutions on the Self-Service portal
- Report on the `Closed When Created` field to see how many cases have been immediately saved and closed upon creation by support reps.

 **Note:**

- Suggested solutions don't display [Salesforce Knowledge](#) articles.
- Suggested solutions isn't available for the public solutions because public solutions users don't have an authenticated login that allows them to create or access cases.

SEE ALSO:

[Customize Support Settings](#)

[Multilingual Solutions Overview](#)

Customizing Solution Settings

To customize solution settings:

1. From Setup, enter `Solution Settings` in the `Quick Find` box, then select **Solution Settings**.
2. Click **Edit**.
3. Select `Enable Solution Browsing` to turn on the ability to browse for and find solutions by category.

This setting enables solution browsing on the Solutions tab, Customer Portal, and when solving a case.

4. Select `Enable Multilingual Solutions` to turn on the ability for users to [translate solutions](#) into multiple languages.

You can deselect the `Enable Multilingual Solutions` checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the `Enable Multilingual Solution Search in Self-Service Portal` and `Enable Multilingual Solution Search for Public Solutions` settings. If you select the `Enable Multilingual Solutions` checkbox again, the associations between master and translated solutions are restored.

5. Select `Enable Multilingual Solution Search in Self-Service Portal` to add a language drop-down list to the Self-Service portal that automatically restricts search results to solutions that match the Self-Service portal user's language. From the language drop-down list, Self-Service portal users can choose whether to search for solutions in a specific language or any language supported by Salesforce.

Deselecting this checkbox removes the language drop-down list from the Self-Service portal, and search results include solutions in all languages, regardless of the Self-Service portal user's language.

6. Select `Enable Multilingual Solution Search for Public Solutions` to add a language drop-down list to public solutions so that public solutions users can choose which language to search for solutions. From the language drop-down list, public solutions users can choose whether to search for solutions in a specific language or any language supported by Salesforce. Deselecting this checkbox removes the language drop-down list from public solutions, and search results include solutions in all languages.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To change solution settings:

- "Customize Application"

7. Select **Enable HTML Solutions** to create and display solutions in HTML. When enabled, solutions appear in HTML in Salesforce, public solutions, Self-Service portal, and Salesforce Customer Portal. Using [HTML Solutions](#) allows users to easily format solution details by changing fonts and colors, and adding images and hyperlinks.

 **Warning:** Once you select **Enable HTML Solutions**, you cannot disable it.

8. Select **Solution Summary** to display up to 150 characters of the solution details in the solution search results. Deselecting this checkbox removes the solution summary from the results.
9. Select **Inline Category Breadcrumbs** to display up to 150 characters of the breadcrumb trail of categories to which the solution belongs in the search results. Deselecting this checkbox removes the breadcrumbs from the results.
10. Click **Save**.
11. To enable solution browsing by customers in public solutions or your Self-Service portal, see [Enabling Public Solutions](#) on page 3036 and [Enable Self-Service Features and Settings](#) on page 2497.

In addition, you can customize the top-level category accessible by public solutions and Self-Service users. You do not need to modify this setting if you want customers to view all categories and all solutions that are visible in the Self-Service portal or visible in public solutions.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

SEE ALSO:

[Categorizing Solutions](#)

[Managing Solution Categories](#)

[Enable Multilingual Solutions](#)

Getting Started with Categories

Follow these steps to ensure a successful rollout of solutions:

1. Plan which categories your support team needs.

Keep in mind that you can also allow customers to find solutions by category in public solutions and your Self-Service portal. You can specify that customers can view only solutions in a particular category and all of its subcategories.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

2. Define your categories; see [Defining Solution Categories](#) on page 3033.
3. Categorize your solutions; see [Categorizing Solutions](#) on page 2406. Administrators, and users with the "Manage Categories" permission, can categorize solutions prior to enabling solution categories for the entire organization.
4. Create a custom report of type Solution Categories to verify that all solutions are categorized appropriately. To find any uncategorized solutions, use the advanced report filters; choose the **Category Name** field and the "equals" operator, and leave the third field blank. Administrators, and users with the "Manage Categories" permission, can create solution category reports prior to enabling solution categories for the entire organization.
5. Enable solution category browsing for the Solutions tab; see [Customizing Solution Settings](#) on page 3031.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or change solution categories:

- "Manage Categories"

6. Enable solution category browsing for customers using public solutions and your Self-Service portal. See [Enabling Public Solutions](#) on page 3036 and [Enable Self-Service Features and Settings](#) on page 2497.
7. Specify the top-level category accessible by customers using public solutions and your Self-Service portal. This is useful if you want to have certain categories available only to internal staff.

Leave this blank if you want customers to view all categories and all solutions that are visible in Self-Service portal or visible in public solutions.

SEE ALSO:

[Managing Solution Categories](#)

Defining Solution Categories

Begin by creating your solution categories. The All Solutions category is automatically created for you as the top of your solution hierarchy. Users cannot add solutions to this category or translate it.

1. From Setup, enter *Solution Categories* in the Quick Find box, then select **Solution Categories**.
2. Click **Add Category** to create a subcategory below a specific category.
3. Enter the category name. Category names cannot include the backslash “\” character.
4. Select a different parent category, if desired. The parent category is the category directly above this category in the hierarchy.
5. Select a sort order for any subcategories you create under this category.
 - Choose Alphabetical Order to sort subcategories alphabetically.
 - Choose Custom Order to sort subcategories in the order you specify; see [Adding and Sorting Subcategories](#) on page 3033.
6. Click **Save**.
7. After creating categories, categorize your solutions. See [Categorizing Solutions](#) on page 2406. Administrators, and users with the “Manage Categories” permission, can categorize solutions prior to enabling solution categories for the entire organization.
8. Then, after categorizing solutions, turn on solution category browsing on the Solutions tab. See [Customizing Solution Settings](#) on page 3031.
9. To enable solution category browsing for the public knowledge base or your Self-Service portal, see [Enabling Public Solutions](#) on page 3036.

Editing and Deleting Categories

From the list of solution categories, you can:

- Click **Edit** to modify the category name, parent category, or sort order.
- Click **Del** to delete the category. The solutions associated with the category are not deleted.

Note: You cannot delete a category in use by a Salesforce Customer Portal. For more information, see [Enable Customer Portal Login and Settings](#) on page 2444.

- Click the category name to view the category details.

Adding and Sorting Subcategories

From a category detail page, you can:

- Click **New** to add a subcategory below the category.

- Enter a custom sort order for the subcategories.
 1. Edit the category to set the `Subcategory Sort Order` to Custom Order.
 2. Enter numbers in the Order column to specify the order of the subcategories.
 3. Click **Reorder**.

SEE ALSO:

[Categorizing Solutions](#)

Managing Solution Categories

Create solution categories so that users can group similar solutions together. Once your solutions are categorized, users can browse for and find solutions by category from the Solutions tab or when solving a case. Customers can also browse solutions by category in public solutions, the Self-Service portal, and the Customer Portal.

- **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

SEE ALSO:

[Getting Started with Categories](#)

[Defining Solution Categories](#)

Enable Multilingual Solutions

You can turn on multilingual solutions so users have the ability to translate solutions into multiple languages.

Preparing for Multilingual Solutions

Before you enable multilingual solutions:

- Run solution reports to locate any existing solutions that are already translated and will need to be converted to translated solutions after you enable multilingual solutions.

When multilingual solutions is enabled for the first time, all existing solutions automatically become master solutions. You can create translated solutions from master solutions by associating a master solution without any translated solutions with a master solution of a different language via the `Master Solution` lookup field.

- Translate any existing solution categories.

Translated solutions inherit the solution categories of their master solution. We recommend that you translate your solution categories before enabling multilingual solutions and then associate solutions with each other. This will help you associate solutions with the correct categories.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or change solution categories:

- "Manage Categories"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable multilingual solutions:

- "Customize Application"

Enabling Multilingual Solutions

To enable multilingual solutions:

1. From Setup, enter *Solution Settings* in the Quick Find box, then select **Solution Settings**.
2. Click **Edit**.
3. Select **Enable Multilingual Solutions**.

Optionally, select **Enable Multilingual Solution Search in Self-Service Portal** and **Enable Multilingual Solution Search for Public Knowledge Base** to allow customers to view solution search results in a specific language or all supported languages via a language drop-down list.

4. Click **Save**.
5. Customize solution page layouts to include the **Master Solution Title** field, **Master Solution Details** field, **Out-of-Date** field, and the Translated Solutions related list. The **Language** picklist and **Master Solution** lookup fields are automatically added to solution page layouts when you enable multilingual solutions.

 **Tip:** You can make solution edit pages easier for users to translate multilingual solutions by setting the Detail Information section to two columns and placing the **Master Solution Title** and **Master Solution Details** fields alongside each other. Underneath those fields, place the **Solution Title** and **Solution Details** fields alongside each other so that users can effortlessly compare the master and translated solutions. Note that the **Master Solution Title** and **Master Solution Details** fields display only on the translated solution edit page.

6. Set the field-level security settings of the **Master Solution** lookup field to editable for profiles or permission sets with the "Create" and "Edit" permissions on solutions.

When the **Master Solution** lookup field is editable, users can associate translated solutions with master solutions.

Field-level security is available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.

7. Set the field-level security settings of the **Out of Date** checkbox field to visible for all profiles or permission sets with the "Read" permission on solutions.

Field-level security is available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.

8. As a best practice, add a long text area custom field to solutions called **Translation Comments** and include it on solution page layouts so that users can add any comments regarding the translation of the solution. Users should include a date with their comments so that other users can see when each comment was added.

-  **Note:** You can deselect the **Enable Multilingual Solutions** checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the **Enable Multilingual Solution Search in Self Service Portal** and **Enable Multilingual Solution Search for Public Solutions** settings. If you select the **Enable Multilingual Solutions** checkbox again, the associations between master and translated solutions are restored.

Rolling Out Multilingual Solutions

After enabling multilingual solutions:

- Associate any existing translated solutions with the appropriate master solutions.

You can do this manually using the **Master Solution** lookup field, or you can export a report of existing translated solutions and then import those solutions to associate them with a master solution. For each translated solution you import, include the 15 to 18 character **Solution ID** field of its master solution in a master solution column on your import file. To view the **Solution**

ID field for master solutions, run the Translated Solution report. If you import solutions by mistake, you can use mass delete to remove them from your organization.

SEE ALSO:

- [Multilingual Solutions Overview](#)
- [Support a Multilingual Knowledge Base](#)
- [Categorizing Solutions](#)

Enabling Public Solutions

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

Using the Solutions tab, your customer support team can create solutions that people outside of your organization may find helpful. Using HTML code supplied by Salesforce, and with the help of your website administrator, you can add a search box and button to your website that allows your customers to search for solutions. This functionality is known as Public Solutions.

With public solutions, your customers can find answers to frequently asked questions without having to call your customer support center. All solutions with a `Status` of Reviewed and the `Visible in Public Knowledge Base` field checked will be available as public solutions, including any solution attachments.

Public solutions are different from the Self-Service portal and Salesforce Customer Portal because users are not required to log in, and they can only search for solutions, not submit cases. For more information about the Self-Service and Customer Portal, see [Setting Up Self-Service](#) on page 2496 and [Setting Up Your Customer Portal](#) on page 2436.

 **Note:**

- The search box and button are displayed in a frame; your website must support frames in order for the solution search feature to work.
- Suggested solutions don't display [Salesforce Knowledge](#) articles.

To enable Web access to solutions:

1. From Setup, enter `Public Solutions` in the `Quick Find` box, then select **Public Solutions**.
2. Click **Edit**.
3. Check `Public Solutions Enabled`.
4. If your organization uses solution categories, check `Enable Solution Browsing` to allow customers to browse solutions by category. Solution categories cannot be translated into other languages for public solutions.

If multilingual solutions is enabled for your organization, you can add a language drop-down list to public solutions so that customers can choose which language to search for solutions. For more information, see [Customizing Solution Settings](#) on page 3031.
5. If solution category browsing is enabled, select the `Top-Level Category` accessible by customers in public solutions. Customers can view all solutions in this category and its subcategories if they are marked `Visible in Public Knowledge Base`. Leave `Top-Level Category` blank if you want customers to view all solutions in all categories when they are visible as public solutions.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To enable web access to solutions:

- "Customize Application"

6. If desired, you can change the appearance of the frame on your website by specifying the `Maximum Page Width` and `Minimum Page Height`.
7. Provide the URL of your CSS page in `Style Sheet URL`. The CSS file does not have to exist yet; you can download a sample file as a starting point later, or use your own file.
8. You can change the word or phrase that is used to describe solutions in the frame in `Alternative Term`. Provide singular and plural versions of the term.
9. Click **Save**.
10. If desired, click **Download Sample CSS File** to get the Salesforce style sheet.
11. Click **Generate HTML**.
12. Copy the resulting HTML code and click **Finished**.
13. Send the HTML (and the CSS file, if you downloaded it) to your website administrator to be added to your site as follows:
 - Add the HTML to your Web page.
 - Customize the downloaded style sheet.
 - Host the style sheet in a publicly accessible location on your Web server.

Organizing Articles, Answers, and Ideas into Categories

Data Categories in Salesforce.com

Data categories are used in Salesforce Knowledge (articles and article translations), Ideas, Answers, and Chatter Answers to help classify and find articles, questions, or ideas. You can use data categories to control access to a particular set of articles, questions or ideas.

Salesforce Knowledge uses data categories to classify articles and make them easier to find. For example, to classify articles by sales regions and products, create two category groups: Sales Regions and Products. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level and North America, Europe, and Asia at the second level. The Products group could have All Products as the top level and Phones, Computers, and Printers at the second.

Data Category Limits	Details	
Maximum number of data category groups and active data category groups	5 category groups, with 3 groups active at a time	5 category groups, with 3 groups active at a time
Maximum number of categories per data category group	100 categories in a data category group	100 categories in a data category group
Maximum number of levels in data category group hierarchy	5 levels in a data category group hierarchy	5 levels in a data category group hierarchy
Maximum number of data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

In an answers zone, data categories help organize questions for easy browsing. Each answers zone supports one category group. For example, if you're a computer manufacturer you might create a Products category group that has four sibling categories: Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. On the Answers tab, zone members can assign one of the four categories to each question and then browse these categories for answers to specific questions.

 **Example:**

Logical Classification of Articles

As a knowledge base administrator, you can organize your knowledge base articles into a logical hierarchy and tag articles with the attributes that are significant to your business.

Easy Access to Questions

As an answers administrator, you can choose which data categories are visible on the Answers tab. Zone members can tag a question with a category, which makes finding questions and answers easier for other members.

Control of Article and Question Visibility

As a knowledge base or answers community administrator, you can centrally control the visibility articles or questions by mapping roles, permission sets, or profiles to categories in the category groups. When an article or question is categorized, users with visibility can automatically see it.

Article Filtering

As a support agent, when articles are classified into logical categories, you can quickly and easily locate the article you need by filtering your organization's knowledge base. To ensure you see all relevant articles, filtering by category has expansive results that include a category's upward and downward relatives in the category hierarchy. For example, if your category hierarchy for products has the levels All Products > Computers > Laptops > Gaming Laptops and you are helping a customer with a laptop problem, filtering by Laptops returns articles classified with Laptops as well as articles classified with Computers, All Products, or Gaming Laptops. Effectively, you are made aware of useful related articles like a free shipping offer for all products or an upgrade offer for gaming laptops. (To prevent irrelevant results, category filtering doesn't return nonlinear relatives like siblings and cousins. Articles about Desktops, a sibling of Laptops, would not display.)

Article and Question Navigation

As an end user, you can navigate the categories on the Articles tab or Answers tab to find the information you need to solve your problem.

Managing Category Groups for Articles and Questions

If your organization has Salesforce Knowledge and an answers community, you can create separate category groups or use the same category group for articles and questions.

Data Categories in Articles

A category group is the container for a set of categories. In Salesforce Knowledge it corresponds to the name of the category drop-down menus. For example, if you use the Data Categories page in Setup, (enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**) to create and activate a category group called Products, a Products menu displays on the Article Management tab, the article edit page, the Articles tab in all channels, and the public knowledge base.

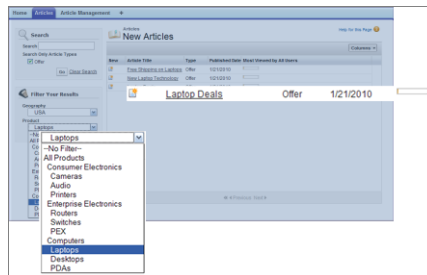

As an illustration, the figure below shows a knowledge base administrator's view of an article about laptop deals; using the article edit page, the administrator has classified the article with Laptops in the Products category group, and USA in the Geography category group.

An Article About Laptop Deals on the Article Management Tab

The next figure now illustrates an agent finding that same article published on the Articles tab; the agent has selected Laptops and USA respectively in the Products and Geography drop-down menus to retrieve an article that is classified with both Laptops and USA.

An Article About Laptop Deals on the Articles Tab

When you add categories to a category group, you build a hierarchy that can contain up to five levels of depth and up to 100 categories total. Each category can have one parent, many siblings, and many children. A robust and well-organized category hierarchy helps users find the articles that are relevant to them quickly and easily.

By default, all Salesforce Knowledge users have access to all categories; however, you can [restrict category visibility by role, permission set, or profile](#).

Data Categories in Answers Zones

An answers zone supports one category group, and members can assign one category to each question. Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. The categories within the group display on the Answers tab below the zone name.

Answers tab displaying categories

By default, all zone members have access to all categories; however, you can [specify category visibility](#).

Data Category Implementation Tips

Consider the following information when planning and implementing data categories for your organization:

- You can create up to three category groups with a maximum of five hierarchy levels in each group. Each category group can contain a total of 100 categories.
- If you want to use data categories with Answers, after creating your category group you must assign it from Setup by entering *Data Category Assignments* in the Quick Find box, then selecting **Data Category Assignments** under Answers. You can only assign one category group to an answers community. Salesforce Knowledge supports multiple category groups.
- Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. Salesforce Knowledge supports a hierarchy of data categories.
- Category groups are hidden from users until they are activated. Do not activate a category group until you have finished defining its categories and their access settings, including their visibility.
- When assigning categories to articles, you can choose up to eight categories in a category group.
- If an article has no categories, it displays only when you choose the *No Filter* option in the category drop-down menu.
- When searching for articles or article translations, selecting a category automatically includes the parent and children of that category and any grandparents, up to and including the top level. Sibling categories are not included. For example, if a category hierarchy has the levels All Products, Switches, Optical Networks, and Metro Core, selecting "Optical Networks" from the category drop-down menu returns articles assigned to any of the four categories. However, if the Switches category has a sibling category called Routers, selecting "Optical Networks" does not return articles classified within Routers. Category visibility settings may limit the specific articles you can find.
- Once [visibility settings](#) have been chosen for the categories:

- Users who are not assigned visibility can only see uncategorized articles and questions unless [default category visibility](#) has been set up.
- For role-based visibility, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers by default. You can [change the category group visibility settings](#) for each portal role.
- If you only have access to one category in a category group, the category drop-down menu for that category group does not display on the Articles tab.
- Deleting a category:
 - Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
 - Permanently deletes its child categories.
 - As applicable, removes the category and its children from the Answers, Article Management, and Knowledge tabs in all channels, and your company's public knowledge base.
 - Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
 - Removes its mapping to visibility. Readers lose their visibility to articles and answers associated with the deleted category.
- Deleting a category group:
 - Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15-day holding period, you can either restore a category group, or permanently erase it immediately.
 - Deletes all categories within that group.
 - Removes all associations between the group's categories and articles or questions.
 - Removes all associations between the group's categories and visibility.
 - As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.
- You can translate the labels of categories and category groups using the Translation Workbench.

Best Practices for Data Categories

Consider the following tips when using data categories:

- To quickly manage data categories, use [keyboard shortcuts](#).
- After creating or updating categories, set up [category group visibility rules](#).
- Save your changes frequently. The more actions you perform before clicking Save, the longer it takes to save.

Data Category Shortcuts

Use keyboard shortcuts to work quickly with data categories.

Task	Action	Keyboard Shortcut
Adding a category	Add a sibling to the selected category	ENTER
	Add a child to the selected category	ENTER+TAB
	Close the Add Category field	ESC
	Save changes in the Add Category field	ENTER
Modifying a category	Open the Edit Category field for the selected category	SPACEBAR
	Close the Edit Category field	ESC
	Save changes in the Edit Category field	ENTER
Demoting or promoting a category	Demote a category down one level, as a child of the sibling currently above it	TAB
	Promote a category up one level, as a sibling to its current parent	SHIFT+TAB
Deleting a category	Delete the selected category and its children	DELETE
Navigating in the category hierarchy	Move the focus up in the category hierarchy	UP ARROW
	Move the focus down in the category hierarchy	DOWN ARROW
	Collapse children in a parent category	LEFT ARROW
	Expand children in a parent category	RIGHT ARROW
Canceling or repeating an action	Undo the last action	CTRL+Z
	Redo the last action	CTRL+Y
Saving the changes	Save the last changes in the category hierarchy	CTRL+S

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional, Enterprise, and Unlimited** Editions.

Create and Modify Category Groups

Category groups are used by Salesforce Knowledge (articles), answers (questions), or ideas. In all cases, category groups are containers for individual data categories. For example, a Contracts category group might contain Fixed Price, Cost Reimbursement, and Indefinite Delivery categories.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. To create a category group, click **New** in the Category Groups section.
By default, you can create a maximum of five category groups and three active category groups. To edit an existing category group, hover your cursor over the category group name and then click the **Edit Category Group** icon ().
3. Specify the **Group Name** up to a maximum of 80 characters. This name appears as the title of the category drop-down menu on the Article Management and Articles tabs, and, if applicable, in the public knowledge base. The **Group Name** does not appear on the Answers tab.
4. Optionally, modify the **Group Unique Name** (the unique name used to identify the category group in the SOAP API).
5. Optionally, enter a description of the category group.
6. Click **Save**.
You receive an email after the save process completes.

Activating Category Groups

When you add a category group, it's deactivated by default and only displays on the administrative setup pages for Data Categories, Roles, Permission Sets, and Profiles. Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community. In addition to activating the category group, for answers communities you must assign the category group to a zone before the categories are visible on the Answers tab.

To activate a category group so it is available to users, move the mouse pointer over the name of the category group and click the **Activate Category Group** icon ().

You can now [add categories](#) to your category group. When you create a category group, Salesforce automatically creates a top-level category in the group named **All**. Optionally, double-click **All** to rename it.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance and Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional, Enterprise, and Unlimited** Editions.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Delete and Undelete Category Groups

Deleting a category group deletes all of its categories and removes all associations between the categories and articles or questions. Read this entire topic carefully to understand the consequences of deleting category groups.

1. From Setup, enter *Data Category* in the *Quick Find* box, then select **Data Category Setup**.

2. Hover your cursor over the category group name.

3. Click the *Delete Category Group* icon ().

4. Select the checkbox in the confirmation dialog, then click **OK**.

The data category group is deleted. Continue to step 5 if you wish to restore the data category group.

5. In the *Removed Category Groups* section, hover your cursor over the category group name.

6. Click the *Undelete Category Group* icon ().

The category group moves to the *Category Groups* section as an inactive category group, and associations with articles, questions, and visibility are restored.

Example: Deleting a category group:

- Moves it to the *Deleted Category Groups* section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15-day holding period, you can either restore a category group, or permanently erase it immediately.
- Deletes all categories within that group.
- Removes all associations between the group's categories and articles or questions.
- Removes all associations between the group's categories and visibility.
- As applicable, removes the category drop-down menu from the *Articles* tab in all channels, the *Article Management* tab, and your company's public knowledge base.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional, Enterprise, and Unlimited** Editions.

USER PERMISSIONS

To view the *Data Categories* page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Add Data Categories to Category Groups

Once you have category groups, you can add data categories to help agents classify and find articles, questions, or ideas.

Administrators can create data categories for Salesforce Knowledge articles, questions in a zone, or ideas to classify and find articles, questions, or ideas. You can also use data categories to control access to articles, questions, and ideas.

By default, you can create up to 100 categories in a data category group and have up to 5 levels in a data category group hierarchy. To request more categories or hierarchy levels, contact Salesforce.

 **Note:** On the Answers tab, only first-level data categories display. Therefore, when creating data categories for a portal or community, ensure that the categories you want visible have a sibling relationship and not a parent-child relationship.

1. From Setup, enter *Data Category* in the *Quick Find* box, then select **Data Category Setup**.
2. Click the category group name.
3. Click a category that is directly above where you want to add a category (a parent), or at the same level (a sibling).
4. Click **Actions**, then select an action: **Add Child Category** or **Add Sibling Category**.
5. Enter a category name up to a maximum of 40 characters.

If possible, Salesforce automatically reuses the name you entered as the *Category Unique Name*, a system field which the SOAP API requires.

6. Click **Add**. Alternatively, press Enter.
7. Click **Save**.

Save your changes frequently. The more actions you perform before clicking **Save**, the longer it takes to save.

 **Tip:** By default, all Salesforce Knowledge users and zone members can see all categories within an active category group. You can [restrict category visibility](#) after you have set up your data categories to ensure that users only access articles and questions that you want them to see.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Modify and Arrange Data Categories

Modifying and arranging categories can result in long processing times, changes to the visibility and categorization of articles, and other significant consequences. Read this entire topic carefully before modifying categories.

Important: Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it might take a long time to complete. During processing, agents might experience performance issues when searching for articles or questions or using category drop-down lists.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click a category group name.
3. Optionally, click **Expand All** to display the full category hierarchy, or **Collapse All** to display only the top-level categories.
4. To edit a category's name or its unique API name, double-click it.
5. Use drag-and-drop editing to reposition a category in the hierarchy. As you drag, a red icon indicates an invalid destination, while a green icon indicates a valid destination.
 - Drag a category on top of another category to reposition it as a child of the destination category. For example, drag USA on top of North America to make USA one level below North America. After dragging, the category displays below the other child categories at that level.
 - Drag a category to a line that borders another category to reposition it as a sibling of that category. For example, to position USA between Canada and Mexico, drag it to the line between Canada and Mexico.
6. To reorder a category's children in alphabetical order, hover your cursor over its name, then choose *Order Child Categories Alphabetically* from the Actions drop-down list. This reorder only affects the first-level children, not grandchildren or deeper levels.
7. As you modify the category hierarchy, click **Undo** to cancel your last actions. Similarly, click **Redo** to step forward through your flow of performed actions.
8. Click **Save**. You receive an email when the save process completes.

The save process recalculates the following:

- The contents of the category drop-down menu.
- The articles and questions visible to each user.
- The articles and questions associated with categories.

Note: Save your changes frequently. The more actions you perform before clicking Save, the longer it takes to save.

EDITIONS

Available in: Salesforce Classic

To create, edit, or delete data categories:

- "Manage Data Categories"

 Example:

How Changing the Hierarchy Affects Article Visibility

Changing the category hierarchy potentially changes which articles readers can see. In the example shown in the following graphic, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics.

 **Note:** When a category moves to a new parent category, users that have no visibility on the new parent category lose their visibility to the repositioned category.

To understand how this change affects which readers can see articles classified with the PDAs category, see the following table.

When my role, permission set, or profile is mapped to:	Could I see PDA articles in their old location under Computers?	Can I see PDA articles in their new location under Consumer Electronics?	Why?
All products	Yes	Yes	When your role, permission set, or profile is mapped to the top-level "All products" category, you can see everything in the category hierarchy.
Computers	Yes	No	You don't have access to the branch of the category hierarchy where PDAs is now located.

When my role, permission set, or profile is mapped to:	Could I see PDA articles in their old location under Computers?	Can I see PDA articles in their new location under Consumer Electronics?	Why?
Consumer Electronics	No	Yes	PDA's has moved to the branch of the category hierarchy where you have been granted access.

How Changing the Hierarchy Affects Article Classification

Classifying an article with a parent category implicitly grants access to that category's children. You cannot explicitly apply both a parent category and one of its children to an article. From the article edit page, selecting a parent category grays out its child categories—you cannot select them in addition to the parent category. Salesforce respects this fact when you move a category to a new parent. It prevents explicitly adding a child category to an article when the new parent category is already present.

In the example depicted above, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics. As a result, articles' classifications might or might not change:

- Articles formerly classified with both Consumer Electronics and PDAs lose PDAs, because having Consumer Electronics now implies having PDAs.
- Articles formerly classified with only Consumer Electronics but not PDAs do not change. Access to PDAs is now implied.
- Articles formerly classified with only PDAs, but not Consumer Electronics, retain PDAs.

Delete a Data Category

Deleting data categories can result in long processing times, changes to the visibility and categorization of articles and questions, and other significant consequences. Read this entire topic carefully before deleting categories.

 **Important:** Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it might take a long time to complete. During processing, agents might experience performance issues when searching for articles or questions or using category drop-down lists.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click a category group name.
3. Click a category name. If necessary, click **Expand All** to display all categories in the category group.
4. Press **DELETE**, or choose **Delete Category** from the **Actions** drop-down list.
5. Click **OK** in the confirmation dialog box.
6. Choose how you want to reclassify articles associated with the deleted category or the deleted category's children. In all cases, the articles retain their categories from other category groups.
 - Assign the deleted category's parent category.
 - Assign a different category. You can select any other category in this category group.

 **Note:** The category you select cannot be deleted itself before you save your work.

- Do not assign the articles a new category in this category group.

Deleting a category:

- Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
- Permanently deletes its child categories.
- As applicable, removes the category and its children from the **Answers**, **Article Management**, and **Knowledge** tabs in all channels, and your company's public knowledge base.
- Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
- Removes its mapping to visibility. Readers lose their visibility to articles and answers associated with the deleted category.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Data Category Visibility

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that you can see.

There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, you can only see the data categories permitted by their role, permission sets, or profile.

Visibility Setting Enforcement

To ensure a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

 **Note:** Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

Category group visibility settings are enforced on the Answers tab, the Article Management tab, the Articles tab in all channels (internal app, partner portal, Salesforce.com Community, and Customer Portal), and the public knowledge base. In the following areas, users only see the categories that their visibility settings allow:

- On the Article Management tab, when creating or editing articles
- On the Article Management tab and the Articles tab, the category drop-down menu for finding articles
- On the Answers tab, the categories listed below the zone name

Initial Visibility Settings

If role, permission set, or profile data category visibility has not been set up, all users can see all data categories. However, if data category visibility is set up, users who are not assigned data category visibility by a role, permission set, or profile, only see uncategorized articles and questions unless you make the associated categories visible by default. Role, permission set, and profile visibility settings restrict default visibility settings. For example, if a data category is visible by default, it is not seen by a user whose role restricts access to that data category.

 **Note:** If data category visibility is defined with roles, permission sets, and profiles, Salesforce uses a logical OR between the definitions to create a visibility rule for each user.

Role-Based Visibility Setting Inheritance

Child roles inherit their parent role's settings and are kept in sync with changes to the parent role. You can customize and reduce the child role's visibility, but you cannot increase it to be greater than that of the parent role. By default, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers. You can change the category

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

group visibility settings for each portal role. Because high-volume portal users don't have roles, you must designate visibility settings by permission set or profile before these users can view categorized articles and questions.

Categorized Article Visibility

User's can see an article if they can see at least one category per category group on the article. For example, consider an article that is classified with *California* and *Ohio* in the Geography category group and *Desktop* in the Products category group:

- If you have visibility on Ohio and Desktop (but not California), you can see the article.
- If you don't have visibility on either California or Ohio but do have visibility on Desktop, you do not see the article.
- If you have visibility on California but not Desktop, you do not see the article.

Revoked Visibility

Data category visibility can be revoked (set to **None**) for a particular category group. Users in the target role, permission set, or profile can only see articles and questions that aren't classified with a category in that category group. For example, if a user's role has revoked visibility in the Geography category group but visibility to the Products category group, he or she can only see articles that have no categories in Geography and are classified with a category in Products. Because an answers zone can only be assigned to one category group, if the Geography category group was assigned to the zone and a member's role visibility was revoked for that group, the member could only see uncategorized questions.

For a detailed example, see [Category Group Article Visibility Settings Examples](#) on page 3055

How Category Visibility Differs from Other Salesforce Models

These settings are unique to articles and questions and differ from other Salesforce models

These settings are unique to articles and questions and differ from other Salesforce models:

Exclusive to articles and questions

[Category group visibility settings](#) determine who can access articles and questions. Although they are standard objects, articles and questions do not have organization-wide defaults, sharing rules, or manual record sharing.

Access

Category group visibility settings are based on the user's role, permission set, or profile. Child roles cannot see more categories than their parent role. To change a user's visibility to categories and therefore categorized articles and questions, you must [change the visibility settings for the user's role, permission set, or profile](#), or, if custom data category visibility is not assigned, [make certain categories visible to all users](#).

Broad interpretation of visibility settings

To ensure a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

 **Note:** Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Category Group Visibility on Roles

USER PERMISSIONS

To view role details:	"View Setup and Configuration"
To edit and delete roles:	"Manage Roles"
To edit and delete permission sets and profiles:	"Manage Profiles and Permission Sets"
To view users:	"View Setup and Configuration"
To edit users:	"Manage Internal Users"
To view categories:	"View Data Categories"
To manage data categories:	"Manage Data Categories" AND "View Data Categories"

The Category Group Visibility Settings related list summarizes which categories users in the role can see, according to category group.

To view a role's category visibility setting, from Setup, enter *Roles* in the *Quick Find* box, then select **Roles**, and select a role. To view the category visibility settings for a Customer Portal or partner portal role, from Setup, enter *Users* in the *Quick Find* box, then select **Users** and click the name of the role.

The following table explains the possible values in the Visibility column of the related list:

Visibility	Description
All Categories	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a category group, its visibility is defaulted to All Categories .
None	Users cannot see any categories in the category group.
Custom	Users can view a selection of categories in the category group.

In the Category Group Visibility Settings, you can:

- To view a category group's setting details, click its name.
- To [modify a category group's visibility settings](#), click **Edit** next to it.

EDITIONS

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional, Enterprise, and Unlimited** Editions.

Modify Default Data Category Visibility

You can edit the default data category visibility.

1. From Setup, enter *Default Data Category Visibility* in the Quick Find box, then select **Default Data Category Visibility**.
All active and inactive category groups are listed.
2. Pick a category group and click **Edit**.
3. To make all the categories in the category group visible by default, select **All Categories**. To make none of the categories visible by default, select **None**. To make some of the categories visible by default, select **Custom**.
4. If you chose Custom, move categories from the Available Categories area to the Selected Categories area as needed. Selecting a category implicitly includes its child and parent categories as well. Move categories from the Selected Categories area back to the Available Categories area to remove default visibility.

USER PERMISSIONS

To view categories:

- "View Data Categories"

To manage data categories:

- "Manage Data Categories"

AND

"View Data Categories"

To assign default category groups:

- "Manage Data Categories"

To modify category group visibility for users:

- "Manage Users"

Edit Category Group Visibility

You can edit your data category visibility.

- Go to the data category visibility settings page in Setup.
 - For roles: enter *Roles* in the *Quick Find* box, then select **Roles**.
 - For a role on the Customer Portal or partner portal: enter *Users* in the *Quick Find* box, then select **Users**.
 - For permission sets: enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
 - For profiles: enter *Profiles* in the *Quick Find* box, then select **Profiles**.
- Open a data category group for edit.
 - For roles, in the Category Group Visibility Settings related list, click **Edit** next to the category group you want to modify.
 - For permission sets and profiles:
 - Click a permission set or profile name.
 - Click **Data Category Visibility**.
 - Click **Edit** next to the data category group you want to assign.
- Select a visibility setting.

Visibility Setting	Description
All Categories	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a category group, its visibility is defaulted to <i>All Categories</i> .
None	Users cannot see any categories in the category group.
Custom	<p>Users see your custom selection of categories. For roles, you can choose from the categories that are visible to the parent role. If the parent role's visibility changes to be less than its child's visibility, the child role's category visibility is reset to its parent's category visibility.</p> <p>To select categories, double-click the category in the <i>Available Categories</i> box. Alternatively, select a category and then click Add. Selecting a category implicitly includes its child and parent categories as well. Categories that are grayed out are not available for selection because their parent has already been selected.</p> <p> Note: When you customize a role, permission set, or profile set to <i>All Categories</i>, first remove All from the <i>Selected Categories</i> box before you select specific categories.</p>

- Click **Save**.

Data Category Visibility Best Practices

- When you create a category group, its visibility is defaulted to **All Categories**.
- When you grant visibility to a category, you also grant visibility to its child and parent categories. If you want to give access to all categories in a branch of the category hierarchy, select the top-level category **All Categories**.
- Users who are not assigned to a category's visibility by role, permission set, or profile can only see uncategorized articles and questions unless:
 - The user has the "View all Data" permission.
 - A category group has been made visible to all users on the Default Data Category Visibility page in Setup.
- For role-based visibility, Customer Portal users and partner portal users inherit the role assigned to their account managers by default. You can change the category group visibility settings for each portal role.
- Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community
- For role-based visibility, always set up data category visibility in a top-down approach from the top of the role hierarchy down to the bottom. Give the highest roles the most visibility and give subordinate roles reduced visibility.

Category Group Article Visibility Settings Examples

Review examples of category group settings for article visibility permissions.

There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, you can only see the data categories permitted by their role, permission sets, or profile.

These examples are based on two sample category groups, Products and Geography:

 **Note:** Although category group visibility settings are available with answers communities (questions) and Salesforce Knowledge (articles), the examples below apply to articles only. Answers communities support one category group and one data category per question.

Products Category Group

- All Products
 - Consumer Electronics
 - Cameras
 - Audio
 - Printers
 - Enterprise Electronics
 - Routers
 - Switches
 - PEX
 - Computers
 - Laptops

EDITIONS

Available in: **Salesforce Classic**

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional, Enterprise, and Unlimited** Editions.

- Desktops
- PDAs

Geography Category Group

- All Countries
 - Americas
 - USA
 - Canada
 - Brazil
 - Asia
 - China
 - Japan
 - India
 - Europe
 - France
 - United Kingdom
 - Poland

Example 1: A Role Hierarchy

In this example, the Acme Electronics organization manufactures hardware and provides customer support for both consumers and enterprises. The Engineering department is organized by products. The Support department is organized geographically. Europe and the Americas are managed by corporate teams, but Asia is outsourced. Within the corporate and outsourced teams, there are subteams dedicated either to consumer or enterprise support.

The table below shows the categories visible to each role in the Acme Electronics organization, and states whether the visibility settings are inherited from the parent role or if they are [custom visibility settings](#).

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
CEO	All Countries	All Products
VP of Engineering	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
Consumer Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Consumer Electronics <i>Custom</i>
Enterprise Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Enterprise Electronics <i>Custom</i>
Computers Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Computers <i>Custom</i>

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
VP of Support	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
VP of Corporate Support	Europe, America <i>Custom</i>	All Products <i>Inherit from VP of Support</i>
Director of Corporate Consumer Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Consumer Electronics, Computers <i>Custom</i>
Director of Corporate Enterprise Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Enterprise Electronics, Computers <i>Custom</i>
Outsourced Support	Asia <i>Custom</i>	All Products <i>Inherit from VP of Support</i>
Consumer Support Team	Asia <i>Inherit from Outsourced Support</i>	Consumer Electronics, Computers <i>Custom</i>
Enterprise Support Team	Asia <i>Inherit from Outsourced Support</i>	Enterprise Electronics, Computers <i>Custom</i>

Example 2: Article Visibility

The table below is an in-depth example of how [category visibility settings](#) restrict what users see. This example has three sample users whose category settings are noted in parentheses.

Table 55: Example: How Category Visibility Settings Restrict What Users See

Categories	When User 1's visibility is All countries/Computers, the category is:	When User 2's visibility is America/All products, the category is:	When User 3's visibility is France/None, the category is:
All countries/Laptop	VISIBLE	VISIBLE	NOT VISIBLE
Canada/Computers	VISIBLE	VISIBLE	NOT VISIBLE
USA/All products	VISIBLE	VISIBLE	NOT VISIBLE
Europe/Switches	NOT VISIBLE	NOT VISIBLE	NOT VISIBLE
Europe/No Categories	VISIBLE	NOT VISIBLE	VISIBLE

User 1: The user must be granted visibility in each category that classifies the article, or each category that classifies the article must be visible by default. [In this example, User 1](#) can see Europe, because Europe is the child of All Countries, but he cannot see Switches, because Switches does not belong to Computers. That's why [User 1](#) cannot see articles classified with Europe/Switches.

User 2: When a category is made visible to a user through custom settings or is made visible by default, its child and parent categories are implicitly included; therefore, [User 2](#) can see articles categorized with All Countries because it is the parent category of America. He can also see Articles classified with USA because it is the child of America.

User 3: If a user has no access to the whole category group, he can only see articles that are not categorized in that group. [User 3](#) cannot see the articles categorized with All countries/Laptop because he has no visibility in the category group that includes Laptop, but he can see articles categorized with Europe/No categories.

Case Teams and Queues

Create teams of people who work together to resolve cases faster, and create queues to share workloads among teams.

Case Teams

Case teams help groups of people work together to solve a case, such as a support agent, support manager, and a product manager.

Queues

Prioritize, distribute, and assign records to teams who share workloads. Access queues from list views. Queue members can jump in to take ownership of any record in a queue. They're available for cases, leads, orders, custom objects, service contracts, and knowledge article versions.

Create Queues

Prioritize, distribute, and assign records to teams who share workloads. There's no limit to the number of queues you can create, and you can choose when queue members receive email notifications.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Case Teams

Case teams help groups of people work together to solve a case, such as a support agent, support manager, and a product manager.

If your admin has set up case teams, you can add people to the Case Team related list on cases. When adding a team member, choose one of the predefined roles that the person plays on the case. Roles determine the level of access to a case, such as read-only or read and write access.

You can add contacts to case teams, but they can only access cases when they're enabled as customer portal users assigned to case page layouts. Customer portal users can't update case teams or view case team roles. Case teams aren't available for the partner portal.

Note: Admins can predefine case teams so that you can quickly add people who you frequently work with. Admins can create assignment rules that add predefined teams to cases that match specific criteria. Admins can also create email alerts that notify team members when an action happens on a case.

Tip: To filter case lists when you're a team member, choose **My Case Teams**. To report on case teams that you belong to, run a case report, then choose **My team's cases** from the View filter.

Set Up Case Teams

Create case teams to help groups of people work together to solve cases. Before you create case teams, define team roles.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Create Case Team Roles](#)

Before you set up case teams or predefine case teams, create roles to determine team members level of access to cases.

SEE ALSO:

[Queues](#)

Set Up Case Teams

Create case teams to help groups of people work together to solve cases. Before you create case teams, define team roles.

To let people create and work on case teams, add the Case Team related list to case page layouts. Optionally, create email alerts that notify team members when actions happen on a case, such as when a comment is added. Also, if you've predefined case teams, create assignment rules that add teams to cases that match specific criteria, such as when cases originate from emails.

 **Note:** Case teams count toward your org's overall storage limit. Each team member on a case counts as 2 KB of storage space.

SEE ALSO:

[Case Teams](#)

[Create Page Layouts](#)

[Set Up Assignment Rules](#)

Create Case Team Roles

Before you set up case teams or predefine case teams, create roles to determine team members level of access to cases.

You can create an unlimited number of case team roles, but we recommend no more than 20 so as not to overwhelm team members.

1. From Setup, enter *Case Team Roles* in the **Quick Find** box, then select **Case Team Roles**.
2. Click **New**, and enter the role's name.
3. From Case Access, choose the role's level of access to cases.

Read/Write

Members can view and edit cases and add related records, notes, and attachments to them.

Read Only

Members can view cases and add related records to them.

Private

Members can't access cases.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up case teams:

- "Customize Application"
- AND
- "Manage Users"

To add team members:

- "Edit" on cases

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up case teams:

- "Customize Application"
- AND
- "Manage Users"

To add team members:

- "Edit" on cases

- If you want members in the role visible to customer portal users viewing cases, choose **Visible in Customer Portal**. Even if Visible in Customer Portal isn't chosen, customer portal users added to case teams can view themselves on Case Team related lists.
- Click **Save**.

 **Note:** You can't delete roles, but you can click **Replace** next to a role you want to replace across all cases. If your org has one role, you can't replace it.

 **Tip:** Roles don't change a case owner's access to cases, which is Read/Write by default.

[Predefine Case Teams](#)

After you define case team roles, you can predefine case teams so that support agents can quickly add people who they frequently work with to cases.

[Set Up Email Alerts for Case Teams](#)

Create email alerts for case teams so that each time a case is created or updated, team members are notified.

SEE ALSO:

[Case Teams](#)

[Set Up Case Teams](#)

Predefine Case Teams

After you define case team roles, you can predefine case teams so that support agents can quickly add people who they frequently work with to cases.

- From Setup, enter *Predefined Case Teams* in the **Quick Find** box, then select **Predefined Case Teams**.
- Click **New**, and enter the team's name.
- Add team members.
 - Choose a team member type: User, Contact, or Customer Portal User. Contacts can access cases only when they're enabled as customer portal users and assigned to case page layouts.
 - Click **Lookup** () and select a member.
 - Choose a role for the member.
- Click **Save**.

 **Note:** To delete a predefined case team, remove it from assignment rules first. If you delete a predefined case team, it's removed from all cases it's on, and you can't retrieve it from the Recycle Bin. When you remove members from a predefined case team, they're removed from all cases in which they were members of the team.

Set Up Email Alerts for Case Teams

Create email alerts for case teams so that each time a case is created or updated, team members are notified.

1. Create email templates for notifications.
2. Set up workflow rules that specify which actions on a case send email alerts to team members.
 - a. From Setup, enter *Workflow Rules* in the *Quick Find* box, then select **Workflow Rules**.
 - b. Click **New Rule**.
 - c. From *Select object*, choose **Case** and click **Next**.
 - d. Enter a rule name.
 - e. Choose the evaluation criteria. To ensure that every case is evaluated for an email alert, we recommend that you set the evaluation criteria to **Evaluate the rule when a record is: created, and every time it's edited**.
 - f. Enter your rule criteria. We recommend that you choose **criteria are met** and select the criteria that a case must match to send email alerts. For example, if you want team members to receive an email alert each time a case's status is set to New, set the criteria to *Case : Status equals New*.
 - g. Click **Save & Next**.
3. Add email alerts to your workflow rule's criteria.
 - a. Click **Add Workflow Action** and choose **New Email Alert**.
 - b. Enter a description and unique name for the email alert. Because you chose Case as the object for the workflow rule, object appears as read only.
 - c. Choose an email template.
 - d. Select who receives email alerts from the workflow rule. To select all members of a case team, choose **Case Team** from Recipient Type, and add the team as selected recipients. You can enter up to five more email addresses.
 - e. Click **Save**.
4. Activate the workflow rule and its email alert.
 - a. From Setup, enter *Workflow Rules* in the *Quick Find* box, then select **Workflow Rules**
 - b. Click **Activate** next to the name of the rule.

 **Note:** To prevent the rule from sending email alerts, click **Deactivate** at any time. If you deactivate a rule with pending actions, the actions finish as long as the case that triggered the rule isn't updated.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Queues

Prioritize, distribute, and assign records to teams who share workloads. Access queues from list views. Queue members can jump in to take ownership of any record in a queue. They're available for cases, leads, orders, custom objects, service contracts, and knowledge article versions.

You can manually add a record to a queue by changing the record's owner to the queue. Or, an assignment rule can add cases or leads to a queue based on specific record criteria. Records remain in a queue until they're assigned an owner. Any queue members or users higher in a role hierarchy can take ownership of records in a queue.

Example:

- Create a lead queue with members who are salespeople assigned to a specific sales territory.
- Create a case queue with members who are support agents assigned to different service levels.
- Create a knowledge article version queue members who are users that can translate new versions of articles into a specific language.

SEE ALSO:

[Create Queues](#)

[Case Teams](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Service contract queues available in: **Professional, Enterprise, Performance, Unlimited**, and **Developer** Editions with the Service Cloud

Lead queues and case queues are not available in **Database.com**

Create Queues

Prioritize, distribute, and assign records to teams who share workloads. There's no limit to the number of queues you can create, and you can choose when queue members receive email notifications.

1. From Setup, enter *Queues* in the *Quick Find* box, then select **Queues**.
2. Click **New**.
3. Enter a label and queue name. The label is the name of the list view that users work from.
4. Choose whom to notify when new records are added to the queue.
5. If your org uses divisions, select the queue's default division. Cases inherit the division of the contact they're related to, but when a case doesn't have a contact, it's assigned to the default global division.
6. Add which objects to include in the queue.
7. Add queue members. Members can be individuals, roles, public groups, territories, connections, or partner users.

Depending on your sharing settings, only queue members and users above them in the role hierarchy can take ownership of records in the queue.
8. Save the queue.
9. If you want, set up assignment rules for your lead or case queues so that records that meet certain criteria are automatically added to a queue.

"Manage Public List Views" and "Manage Users"

Adding Social Customer Service

Welcome to Social Customer Service

Social Customer Service lets you create cases or leads out of social media posts and send personalized responses on the same social media channels.

 **Note:** The Social Customer Service setup pages, the moderation and authorization pages, and the Reply action in the case feed are only available in Salesforce Classic.

 **Important:** If you have two or fewer social accounts to track, you can use the free starter pack. Otherwise, you must have sufficient Social Studio accounts.

Watch the following video for a brief overview on getting started with Social Customer Service:  [Support Your Customers on Their Social Networks \(Salesforce Classic\)](#)(2:58).

Social Customer Service integrates with Radian6 and Social Studio so service agents and sales representatives can engage customers by responding to cases and leads created from Facebook, Twitter, Instagram, and other social networks.

Social Network	Release State
Facebook	Generally Available
Twitter	Generally Available
Instagram	Generally Available
Google+	Pilot Program
Sina Weibo	Pilot Program

The social publisher action on the case or lead feed is the primary interface for replying to consumers or prospects. Inbound and outbound social posts appear as items in the feed, making it easy to follow the thread of the conversation. Permission sets allow you to grant access to your managed social accounts to different sets of users. Out of the box, default settings control how inbound social posts are processed. Optionally, you can modify an Apex class to apply your own custom business logic.

 **Note:** When a lead is converted to an account or contact, the social items in the feed are removed.

In Salesforce1, agents can see and reply to social content from mobile devices.

For Twitter accounts, agents can use case and lead feeds to see the content that they are responding to, retweet, mark as Like and follow tweets, send replies to tweets and direct messages, and delete tweets managed by your social accounts.

For Facebook accounts, cases and leads are created from your managed Facebook page and agents can use the feeds to see the content that they are replying to, like posts and comments, send posts, comments, replies, and private messages, and delete posts managed by your social accounts.

For both Facebook and Twitter, you can click the View Source link to open an item in its native social media Web site. This allows you to gain context so you can provide a more informed response.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Social Customer Service is available in API enabled **Professional** editions, **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- “Manage Users”
- AND
- “Customize Application”

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

To send and receive social media posts or messages:

- Case Feed enabled
- AND
- Access to a social account

You can sync your Instagram #hashtag to Social Customer Service to receive Social posts when your brand's #hashtag is mentioned on Instagram. To activate Instagram #hashtag listening, [create a rule](#) in your Social Hub account to receive posts when your brand's #hashtag is mentioned.

Social Customer Service Limits	Enterprise, Performance, and Unlimited editions.
Maximum number of active managed social accounts	2000 accounts. Social Customer Service Settings shows up to 500 managed social accounts per page.
Maximum number of post tags	200 post tags
Maximum number of errors before inbound posts are paused	100 errors. When errors reach 100, inbound posts are stopped until the errors are cleared. This allows administrators to ensure that posts are processed correctly.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in API enabled **Professional** editions, **Enterprise, Performance,** and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

Set Up Social Customer Service

Enable Social Customer Service, install the SocialCustomerService package, sync your social accounts, and assign social handles.

 **Important:** If you have two or fewer social accounts to track, you can use the free starter pack. Otherwise, you must have sufficient Social Studio accounts.

Radian6, part of Marketing Cloud's Social Studio, provides social media monitoring. With the free starter pack, you don't need an explicit Radian6 login. Simply connect up to two social accounts and Salesforce handles the rest of the details. If you are a Social Studio customer, set up data sources in Social Studio that can be synced with Service Cloud.

 **Important:** Case Feed Tracking for All Related Objects must be enabled for case feed items to be created. See [Set Up Cases for Salesforce Classic](#) on page 2691. For Leads, from Setup, enter *Feed Tracking* in the Quick Find box, then select **Feed Tracking** and ensure *Enable Feed Tracking* and *All Related Objects* are checked. When a lead is converted to an account or contact, the social items in the feed are removed.

1. From Setup, enter *Social Media* in the Quick Find box, then select **Social Customer Service**.

 **Tip:** Enter *med* as a shortcut to bring up the Social Media section more quickly.

2. On the Settings tab, check *Enable Social Customer Service*.

3. If you want posts approved before they send, check *Enable approvals for social posts*.

As part of a job training or quality review process, you may require some agents to have their posts approved rather than allowing them to post freely. With approval processes and user permissions, selected agents can submit social posts for approval, recall the posts, and retry or resubmit them. Approvers can approve and reject posts for publication. See [Enable Social Post Approvals](#) on page 3070.

4. If you want to map new posts to parent posts, which are the first posts that generated a case, select **Enable retrieval of parent posts for added context**.

5. Under *Radian6 Credentials*, either create a Social Studio account with the starter pack by clicking **Create Account**, or click **Login** and enter your Social Studio credentials.

 **Note:** With the Social Customer Service Starter Pack, you can enable Social Customer Service and up to two social accounts from any social network. For example, if you add one Twitter account, you can only add one Facebook account. You can't downgrade from a Social Studio account to the starter pack. The starter pack doesn't support the moderation feature (all posts become cases) and the default Apex code can't be customized.

6. On the Social Accounts tab, click **Add Account** and select your social network, for example Twitter or Facebook.

The social network opens and asks you to authenticate the account. Once your account is authenticated, Salesforce returns you to the Social Accounts tab.

 **Note:** If you receive an error "We're sorry, but we currently do not support Facebook business accounts registration." or "Your Facebook account can't be added due to unsupported features.", you might need to set a user name on your Facebook page.

7. Click the refresh icon next to **Add Account**.

 **Warning:** Deleting a Social Account deletes it everywhere, including in Social Studio. This action cannot be undone.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in API enabled **Professional** editions, **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

8. If you are using the Starter Pack, check the `Case Creation` box to indicate that you want cases created automatically when posts come from the social account.

For example, if you have two Twitter handles, one for support and one for marketing or brand-focused information, you can have cases created automatically only from the support handle. The tweets from the marketing handle go in a social post queue for review. See [Manage Social Posts](#) on page 2420.

 **Note:** If you are using the full Social Customer Service version, you can set up case moderation through Social Studio. See [Enable Moderation for Social Customer Service](#) on page 3071.

9. If you have a portfolio of managed social accounts, set the `Default Responses From` for each Twitter, Instagram (pilot), and Sina Weibo (pilot) account. This lets you standardize and raise awareness of your brand's support by setting a dedicated support handle, for example `@acmehelp` or `@acmesupport`. Also, agents have fewer clicks when they send outbound posts because the chosen account appears as the default value in the account drop-down in the social publisher. The default response handle doesn't apply for Twitter direct messages and doesn't affect Facebook, Google Plus, or LinkedIn, as they are restricted to the page handle itself.
10. On the `Inbound Settings` tab, you can see which Apex class controls how the inbound content is processed in your organization and which user it's set to run under. If you are using the default Apex class, you can select inbound business rules to determine how incoming social data is handled.

Enable Case Reopen

If a new post, from the same social persona, is associated to a closed case, the case is reopened within the designated number of days. The number must be greater than or equal to 1 and less than or equal to 3000.

Use Person Accounts

Assign a person account of the selected type for the social persona parent record.

Create Case for Post Tags

Override the social hub's case creation rules and create a case when selected post tags are present on a social post. Post Tags are used to answer the question "What is the topic of this one post?". Post tags, set in Social Hub, help to provide further context to what the individual post is about.

 **Note:** Social Customer Service only shows 200 post tags. If you have more post tags in Social Studio, you can view them in that program.

The default Apex class creates a social post, social persona, case, contact, and supports common use cases. For information on modifying the default Apex class, see [Modify the Default Apex Class](#).

 **Note:** If you are using the starter pack, the Apex class can't be changed but you can change the user it is run under.

11. To assign social handles to a profile or permission set, still within Setup:
- Enter `Profiles` in the `Quick Find` box, then select **Profiles**.
 - Enter `Permission Sets` in the `Quick Find` box, then select **Permission Sets**.
12. Click an existing profile or permission set or create a new one.
13. In the Apps section, click **Assigned Social Accounts**.
14. Click **Edit**.

15. Assign the social accounts you need to make available to your users with this profile or permission set.

Important: All users must have the profile or permission set you chose or created in step 8.

16. Save your changes.

17. Ensure that the profile or permission set has the correct field visibility.

- For profiles, from Setup, enter *Profiles* in the Quick Find box, select **Profiles**, then select the profile you chose or created earlier. Next, in the Field Level Security section, select **Social Post**.
- For permission sets, from Setup, enter *Permission Sets* in the Quick Find box, select **Permission Sets**, then select the permission set you chose or created earlier. Next, click **Object Settings**, and then select **Social Post**.

18. Click **Edit**. Under Field Permissions, ensure all fields available are set to Visible (not Read-Only) for profiles or Edit for permission sets. Click **Save**.

19. Optionally, set up Quick Text so agents can create ready-to-send responses to social networks. See [Enable Quick Text](#).

20. Optionally, give social post read access to external community and portal users.

There are three requirements to make social posts available in communities and portals.

- Ensure that the user has access to cases in the community.
- Give users read permission to social posts on their profiles.
- On your organization's Social Post object, enable visibility to individual fields through the field level security settings.

Note: Once these requirements are met, external users can see all social posts exposed to them. For example, if a case or lead feed is exposed externally, all social posts in the feed are visible. There is no way to limit visibility at the social post object level.

Turning on history tracking on for the Social Persona and Social Post objects is recommended for the first few months of using Social Customer Service. History tracking helps identify who made what changes when and for differentiating between automatic and manual changes.

You can synchronize up to 2,000 managed social accounts from Social Studio. However, the Social Customer Service Settings page in Setup only shows up to 500 managed social accounts. Agents can respond from all synced accounts from the social publisher on the case feed. If you are syncing more than 500 social accounts, allow at least a minute for the settings page to load.

If you use [Process Builder](#) to automate business processes note that it isn't currently supported for the social post and persona objects. You'll need to use a [workflow](#).

How to Reconnect a Social Account

Reconnect your social account for Social Customer Service.

Your social account can be disconnected from Social Customer Service if your social media network provider's connect, or token, has expired. Many providers have expiration policies of 60 to 90 days.

1. From Setup, enter *Social Media* in the **Quick Find** box, then select **Settings**.
2. On the **Social Accounts** tab, click **Reauthorize** in the **Action** column.
The social network opens and asks you to authenticate the account. Once your account is reauthenticated, you are returned to the Social Accounts tab.

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

To send and receive social media posts or messages:

- Case Feed enabled

AND

Access to a social account

Enable Social Post Approvals

Social care agents are both problem solvers for your consumers and the voice of your brand on social networks like Facebook and Twitter. You can have guidelines so your agents write with a consistent tone and syntax that's in line with your organization's social media strategy. For example, you require social agents to sign their tweets in a standard manner, such as "~John."

Salesforce Admins can create approval processes and assign agents and approvers permissions accordingly.

1. From Setup, enter *Social Media* in the Quick Find box, then select **Settings**.
2. Select **Enable approvals for social posts**.
3. Build and activate approval processes for social posts using either the [Jump Start Wizard](#) or the [Standard Setup Wizard](#).

 **Important:** The Jump Start Wizard is a streamlined way to create approval processes in Salesforce. However, the **Let the submitter choose the approver manually** option is not supported in the Jump Start Wizard. Choosing that option results in an error later when an agent submits a post for approval.

4. From Setup, go to **Administer > Manage Users > Permission sets**.
5. Enable the new **Require Social Post Approvals** user permission.
6. Assign the **Require Social Post Approvals** user permission with a [permission set](#) to agents that need their posts reviewed before they are sent.

When assigning user permissions, remember these two points.

- Because approving a post automatically submits it for publishing, approvers must have the same access to social accounts as the agents whose work they're reviewing. Otherwise, the posts they approve result in an error.
- If your user permissions include **Require Social Post Approvals**, then the submit button on the social publisher always reads **Submit for Approval** rather than "Comment," "Tweet," or other words. This is true even if no active approval process applies to the user. In that situation, clicking **Submit for Approval** publishes the social post normally since there is no active approval process in effect.

For more information, see [Create an Approval Process with the Standard Wizard](#) on page 5269, [Prepare to Create an Approval Process](#) on page 5265, and [Sample Approval Processes](#).

 **Tip:** If your agents work with social post record detail pages, rather than in the case feed, we recommend removing the approvals related list from the page layout. The same page layout is shared between inbound and outbound social posts. Removing the approvals related list avoids confusion when viewing an inbound post that is an invalid candidate for an approval process. Approvers can still approve or reject posts through all other normal means such as email, Chatter, and list views.

Enable Moderation for Social Customer Service

Use moderation to triage incoming posts and only create cases for posts that are actionable requests for help. Moderation helps your organization focus on real customer issues and avoid opening unnecessary cases.

Not all posts require a case, for example, a complimentary tweet or post does not need agent assistance. However, when the default social customer service is configured, cases are automatically created from each social post. Using moderation, agents can manage which posts get cases and which are ignored. Moderation is enabled with a Social Hub rule in your Social Studio account to turn off automatic case creation.

 **Note:** With the Starter Pack, you can decide if you want cases created automatically when posts come from a particular social account on the Social Accounts tab. See [Set Up Social Customer Service](#) on page 3067.

1. From your Social Hub account, click the **Rules** tab.
2. Create a rule, or use an existing one, to indicate that no case is created in Salesforce.
For example, the rule should have the following setup.
 - a. Action: send to Salesforce.
 - b. **Create Case** checkbox unchecked.
3. Save and enable your rule.

 **Note:** You can enable your rule for all social posts or only those coming from certain managed accounts.

Case creation can also be customized by implementing a custom Apex case logic. To do so, from setup, enter *Social Media* in the **Quick Find** box, then select **Settings**. See [Modify the Default Apex Class](#).

 **Note:** If you started using Social Customer Service before Spring '16 and have a custom Apex class, you may need update your Apex class to benefit from the latest moderation features. If your custom Apex is extended from the default Apex class, you get the update for the default apex functions you call. If your custom Apex isn't extended from the default Apex class (you copied the default and changed it), you must update manually.

To manually update your custom Apex class, add the following code and update your moderation social post list view.

1. Call this method directly before inserting the post, after all the relationships have been set on the post.

```
private void setModeration(SocialPost post){
    //if we don't automatically create a case, we should flag the post as requiring
    moderator review.
    if(post.parentId == null)
        post.reviewedStatus = 'Needed';
}
```

In the default Apex, see lines 50 and 61-65.

2. Update your moderation social post list filter from:

```
Parent EQUAL TO "" AND ReviewStatus NOT EQUAL TO "ignore"
```

To:

```
Parent EQUAL TO "" AND ReviewStatus EQUAL TO "Needed"
```

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in API enabled **Professional** editions, **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To ensure that you don't lose track of social posts currently in your moderation queue, make a list view with the new filter, and switch to it once the new and old filters show the same results.

Create the Social Action Interface

The social action is created when you install Social Customer Service. You can add, remove, and organize fields to suit your organization.

The social action is created when Social Customer Service is enabled.

1. From the object management settings for cases, go to Button, Links, and Actions.
2. Click **Layout** next to the social action.
3. Edit the desired fields.

 **Note:** Changing field values could invalidate incoming posts against the Social Customer Service [Apex class](#).

To send social content, the social action must have the following fields:

- In Reply To

 **Important:** The In Reply To field can't be read only.

- Managed Social Account
- Message Type
- Content

Headline and Name are required fields. To remove them, create a predefined value for each field and remove them from the action. See [Set Predefined Field Values for Quick Action Fields](#).

4. Click **Save**.
5. From the object management settings for cases, go to Page Layouts.
6. In Case Page Layouts, click **Edit** next to Feed-Based Layout.
7. In the palette, click **Quick Actions**.
8. Ensure that the social action is in the Quick Actions in the Salesforce Classic Publisher section of the layout.
9. Optionally, repeat steps 5 through 8 for the Leads object to enable the social action on leads (from the object management settings for leads, go to Page Layouts).

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

Modify the Default Apex Class

If you aren't using the Starter Pack, you can customize the default Apex class to specify how inbound social content is processed.

 **Note:** You can't modify the default Apex class if you are using the Starter Pack. The free Starter Pack lets you simply connect up to two social accounts and Salesforce handles the rest of the details, like a Social Studio account.

The [default Apex class](#) for Social Customer Service creates a social post, social persona, case, contact, and supports common use cases. To customize how information is processed, by create a new Apex class.

 **Important:** If your agents use the Social Customer Service feature to send private messages to Facebook users, prevent or resolve errors by upgrading your Apex classes to the latest available version of the Salesforce API. In particular, the Apex class that inserts the post must be version 32 or higher.

If you alter the default Apex class, be sure to select your new Apex class on the setup page, where you can also see Apex processing errors. From Setup, enter *Social Media* in the **Quick Find** box, then select **Settings**. An email is sent to the administrator when there are errors and, in most circumstances, the data is saved and can be reprocessed. If too many errors are waiting for reprocessing, the Salesforce Social Hub rules are automatically paused to ensure social content is not missed.

We have provided [tests for the default Apex class](#). If you alter your Apex class, you must alter the tests accordingly.

 **Note:** Social personas created after the Summer '15 release have a field indicating which social network created the persona: `Source App`. This field is set on creation and is not updateable. If your organization uses custom Apex, update it to use this field. Keep in mind that personas created before the Summer 15 release do not have the field. Also, every time new fields are added to the social action you must update your Apex version or the new fields aren't saved.

To create an Apex class, in Setup, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**. You can use the following code to:

- Support person accounts
- Designate a default account ID
- Change the number of days before closed cases are reopened

```
global class MyInboundSocialPostHandlerImpl extends
Social.InboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global override SObject createPersonaParent(SocialPersona persona) {
        String name = persona.Name;
        if (persona.RealName != null && String.isNotBlank(persona.RealName))
            name = persona.RealName;

        String firstName = '';
        String lastName = 'unknown';
        if (name != null && String.isNotBlank(name)) {
            firstName = name.substringBeforeLast(' ');
            lastName = name.substringAfterLast(' ');
            if (lastName == null || String.isBlank(lastName))
                lastName = firstName;
        }

        //You must have a default Person Account record type
        Account acct = new Account (LastName = lastName, FirstName = firstName);
    }
}
```

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in API enabled **Professional** editions, **Enterprise**, **Performance**, and **Unlimited** editions.

```

        insert acct;
        return acct;
    }

    global override String getDefaultAccountId() {
        return '<account ID>';
    }

    global override Integer getMaxNumberOfDaysClosedToReopenCase() {
        return 5;
    }
}

```

You can use the following code to implement your own social customer service process.

```

global class MyInboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
        SocialPersona persona, Map<String, Object> data) {
        Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();

        // Custom process

        return result;
    }
}

```

The [default Apex class](#) sets the contact as the persona parent. To set the persona parent as an account, person account, or lead, create a method to override the persona parent.

If you want a post to go to the error queue, so errors are not lost, your custom apex must do one of two things.

1. Bubble up an exception (recommended).

```

global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
    SocialPersona persona, Map<String, Object> rawData) {
    Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();
    result.setSuccess(true);

    try{
        //handle the post here
    } catch(Exception e){
        //log exception, etc
        throw e;
    }
    return result;
}

```

OR

2. Set the success flag on the response object to false.

```

global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
    SocialPersona persona, Map<String, Object> rawData) {
    Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();
    result.setSuccess(true);

    try{

```

```
//handle the post here
} catch(Exception e){
//log exception, etc
result.setSuccess(false);
}
return result;
}
```

Data Populated into Social Objects

Details on which fields exist in the standard objects, Social Post and Social Persona, and which fields are currently populated by data from Social Studio.

When Social Studio is configured to work with Social Customer Service (SCS), Social Studio sends data to Salesforce in raw format, which is then decoded by the SCS data intake system and appended to two standard Salesforce objects: Social Post and Social Persona. Social Post contains information that is post specific (posts in this context encompass tweets, Twitter direct messages, Facebook posts, comments, comment replies, etc.). Social Persona stores social identity information gleaned from the author information on posts received by SCS.

 **Note:** If you've modified the default Apex class, you may experience alternate mappings.

EDITIONS

Available in: **Salesforce Classic**

Social Customer Service is available in API enabled **Professional** editions, **Enterprise**, **Performance**, and **Unlimited** editions.

Social Post

The following fields exist on the Social Post object.

Table 56: Social Post Fields

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
AssignedTo	assignedTo	"Joe Smith" (user in Social Studio, not Salesforce)	Not updated
Analyzer Score	analyzerScore	5	Score set on a post in the R6 platform
Attachment Type	mediaUrls array	Image, Video	Populated by SCS when new data arrives in Salesforce - only the first attachment is mapped
Attachment URL	mediaUrls array	http://some.domain/image.jpg	Populated by SCS when new data arrives in Salesforce - only the first attachment is mapped.
Classification	classification	[Custom value]	Populated as admin defines
CommentCount	commentCount	N/A	Not updated
Content	content	Apple teases the new Mac Pro, what do you think	The actual content of the Social post
ExternalPostId	externalPostId	1111222233334444	Native Social Network Id
Handle	author	thehotclothes	N/A
HarvestDate	harvestDate	2013-06-11T13:07:00Z	Date post collected by Social Studio
Headline	source	N/A	Not updated
Id	salesforcePostId	12345678912345	Populated within Salesforce
InboundLinkCount	inboundLinkCount	N/A	Not updated

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
IsOutbound	N/A	Yes/No	Populated within Salesforce
KeywordGroupName	keywordGroupName	N/A	Not updated
Language	language	English	Populated in SCS
LikesAndVotes	likesAndVotes	N/A	Not updated
MediaProvider	mediaProvider	TWITTER	Social network
MediaType	mediaType	Twitter	Social network
MessageType	messageType	Tweet	Possible values: <ul style="list-style-type: none"> • Twitter: Tweet, Reply, Direct • Facebook: Post, Comment, Reply, Private
Name	source	TWEET FROM: mysamplehandle	System generated by Social Studio.
OutboundSocialAccount	N/A	Northern Trails Outfitters	Populated with Social Account used to publish - only for outbound posts
Parent	N/A	00001728 (linked)	Populated with parent case number if Post associated with case
Persona	N/A	Sample Persona	Populated with author Social Persona if one exists
Posted	postDate	2013-06-11T13:07:00Z	Date-time published on social network.
PostPriority	postPriority	High	Priority set within Social Studio.
PostTags	postTags	post tag 1, post tag 2	Tags are comma-separated.
PostUrl	postUrl	https://www.sample.com/11112222333444	Link to source post
Provider	mediaProvider	Twitter	Set to social network.
R6PostId	r6PostId	12345678	Native Social Studio post ID.
R6SourceId	r6SourceId	1234	Native Social Studio ID for author.
R6TopicId	r6TopicId	1234567890	Native Social Studio ID for either topic profile or managed account
Recipient	recipientId	12345678912345	Native ID of recipient on social network

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
RecipientType	recipientType	Person	N/A
ReplyTo	N/A	Another Social Post (linked)	Dynamically filled by Salesforce logic based on replyToExternalPostId from Social Studio
Sentiment	sentiment	Neutral	N/A
Shares	shares	N/A	Not updated
SourceTags	sourceTags	source tag 1, source tag 2	Source tags used to track types of authors
SpamRating	spamRating	NotSpam	N/A
Status	status	N/A	Not updated
StatusMessage	statusMessage	N/A	Not updated
ThreadSize	threadSize	N/A	Not updated
TopicProfileName	topicProfileName	@my_handle	Name of TP in Social Studio.sd
TopicType	topicType	Keyword Managed	Whether a topic profile or managed account.
UniqueCommentors	uniqueCommentors	N/A	Not updated
ViewCount	viewCount	N/A	Not updated
Who	N/A	Polymorphic relationship	Can be several other types of records, including Lead. Linked.

Social Persona

The following fields exist on the Social Persona object.

 **Note:** The Social Persona object is only updated when you get a post from someone with an existing persona record. Social Persona is not updated via a parallel process.

Table 57: Social Persona Fields

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
AreWeFollowing	areWeFollowing	N/A	Not updated
Bio	bio	Sample Twitter biography	N/A
ExternalId	externalUserId	1234567890	N/A
ExternalPictureURL	profileIconUrl	http://some.domain/image.jpg	N/A
Followers	followers	290	N/A

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
Following	following	116	N/A
IsBlacklisted	isBlacklisted	N/A	Not updated
IsDefault	N/A	true/false	This value specifies if this record is used to get the avatar image that is displayed on the contact/account. Its used by Social Contacts.N/A
IsFollowingUs	isFollowingUs	N/A	Not updated
Klout	kloutScore	N/A	Not updated
ListedCount	listed	4	N/A
MediaProvider	mediaProvider	Twitter, Facebook etc.	Social network of profile
MediaType	mediaType	Twitter	N/A
Name	author	Joe Smith	N/A
NumberOfFriends	friends	N/A	Not updated
NumberOfTweets	tweets	59546	N/A
Parent	N/A	Contact Name (linked)	Social Persona by default parents to a contact.
ProfileType	authorType	Person	N/A
ProfileUrl	profileUrl	http://twitter.com/mysamplehandle	N/A
Provider	mediaProvider	other	Similar to mediaType but allows fewer values.
R6SourceId	r6SourceId	123456789	Native ID for author
RealName	realName	Joe Smith	N/A
TopicType	topicType	Keyword or Managed	N/A

Additional Data From Social Studio

In addition to the data noted above, certain fields come in the raw data from Social Studio but are not automatically mapped to fields within the Social Post and Social Persona objects. You can access these fields through Visualforce or Apex.

Table 58: Additional Data Fields from Social Studio

Raw Data Field	Notes
authorTags	String
classifiers	Classifier[]

Raw Data Field	Notes
createLead	Boolean
firstName	String
jobId	String
lastName	String
mediaUrls	Raw data comes through as an array of all attachments. SCS matches the first attachment with a known type (image video) to SocialPost.AttachmentType and SocialPost.AttachmentURL
originalAvatar	String
originalFullName	String
originalScreenName	String
origins	String
privacy	String
r6ParentPostId	Long
recipientId	String
replyToExternalPostId	Raw data used to look up 'In Reply To' Social Post but field not directly written into Social Post
skipCreateCase	Used for the moderation feature introduced in the Summer '14 release; if Yes, SCS skips case creation in the default logic. This field can also be used in customer-specific logic

Default Apex Class History

Social Customer Service's full default Apex class for prior releases.

```

Reporting on Support Activity

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

[Using Custom Report Types to Report on Support Activity](#)

Cases and Solutions come with a number of custom report types that you can use to track your team's work with cases and solutions.

[Tips for Effective Support Reporting](#)

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Using Custom Report Types to Report on Support Activity

Cases and Solutions come with a number of custom report types that you can use to track your team's work with cases and solutions.

Use the built-in custom report types to create reports on the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of case fields.

You can also report on your organization's solutions, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date.

Some custom report types become available only when you enable their related features. For example, when you enable historical trend reporting for Cases, you automatically get a Cases with Historical Trending custom report type.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Cases with Historical Trending

Use the Cases with Historical Trending custom report type to analyze changes in case data over time. Available when Historical Trend Reporting is enabled.

Cases and Emails

Create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is available when Email-to-Case or On-Demand Email-to-Case is enabled.

Translated Solutions

Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.

Contact Role

Choose the Contact Role report to show all cases with their associated contact roles.

Cases with Articles

Choose the Cases with Articles report to see the articles attached to cases. This report is available if Salesforce Knowledge is enabled.

The report displays articles even if they're not marked as available for the internal app channel.

Case Lifecycle

Run case lifecycle reports to view the results of the `Range` field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Service Contracts with Entitlements

Use the Service Contracts with Entitlements report type to report on the services your customers are entitled to. Available when Service Contracts with Entitlements is enabled.

Accounts with Entitlements with Contacts

Lists accounts with entitlements that include contacts (named callers). Available when Service Contracts with Entitlements is enabled.

Service Contracts with Contract Line Items

Lists service contracts with contract line items (products). Available when Service Contracts with Contract Line Items and Entitlements is enabled.

Cases with Milestones

You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is available if entitlements is enabled.

Note: Milestone status in list views and reports is based on the related entitlement process' end time. If a user's profile doesn't include access to the `Entitlement Process End Time` case field, reports and list views that they view may show an incorrect milestone status on cases. The case record and Case Milestones related list will still display the correct milestone status values.

Case History/Solution History

Use the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields' old and new values. You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.

Entitlements and Contracts

Use custom report types to define report criteria from which users can run and create reports on entitlements, service contracts, and contract line items. After entitlement management is enabled, Salesforce automatically includes the following custom report types:

Custom Report Type	Description	Report Type Location
Accounts with entitlements with contacts	Lists accounts with entitlements that include contacts (named callers).	Accounts & Contacts
Service contracts with contract line items	Lists service contracts with contract line items (products).	Customer Support Reports
Service contracts with entitlements	Lists service contracts with entitlements.	Customer Support Reports

Tips for Effective Support Reporting

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

- When reporting on cases, add the `Parent Case Number` field to your report. This field indicates if a case is associated with a parent case.
- When reporting on first-call resolution of cases, add the `Closed When Created` field to your report. This field indicates cases that were closed by support reps via the **Save & Close** button during the creation of the case.
- You can create a case report containing contact email addresses, export that data to Excel, and then do a mass mail merge using Microsoft Word.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Standard Report Types

- Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.
- Choose the Contact Role report to show all cases with their associated contact roles.
- Choose the Cases with Articles report to see the articles attached to cases. This report is only available if Salesforce Knowledge is enabled.

The report displays articles even if they're not marked as available for the internal app channel.

Custom Report Types

- You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is only available if entitlements is enabled.
- Choose the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields' old and new values. You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.

- You can create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is only available to organizations with Email-to-Case or On-Demand Email-to-Case enabled.
- You can run case lifecycle reports to view the results of the `Range` field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Cases in Portals

If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

- When reporting on case comments, use the `Public Case Commented` field to indicate if the comment is private or public. Public comments are indicated with a check mark. To limit report results to public comments, customize the report and add a field filter where `Public Case Commented equals True`. Likewise, the filter `Public Case Commented equals 0` yields only private case comments.
- Choose the `Closed by Self-Service User` field to report on how many cases have been closed by users via suggested solutions on the Self-Service portal.

Solution Categories

Create a custom report that sorts solutions by category. Select the `Category Name` field to display the solution's category and the `Parent Category Name` field to display the category directly above the solution's category.

- If you restrict your report to solutions in a particular category, the report includes only solutions that are directly associated with that category. It does not include solutions in subcategories of the specified category.
- To report on uncategorized solutions, use the advanced report filters. Choose the `Category Name` field and the "equals" operator, and leave the third field blank.

Team Members

- You can report on case teams in which you are a member. After you run a case report, select `My case team's cases` from the `Show` drop-down.
- `Owner Role` for case reports is defined differently than for other objects. For most objects, `Owner Role` is defined in the `Role Name as displayed on reports` field on the user's role. Cases uses the `Label` field instead.
- You can limit any case report to cases owned by users or cases in queues. Choose `User Owned Cases` or `Queue Owned Cases` from the `View` drop-down at the top of a case report.

COLLABORATE WITH EVERYONE

No man is an island, even in Salesforce. Complete tasks quickly and efficiently by collaborating with people either inside or outside of your organization.

Here you'll find information on collaboration tools like Chatter, Salesforce CRM Content, and even documents. There's no limit to what you can accomplish with others—figure out the best way to do it here.

[Collaborate Within Your Company](#)

Stay current with what's happening in your company. Share your knowledge in Chatter posts and comments, collaborate in groups, and access files and data across your organization.

[Collaborate with Partners and Customers](#)

Share updates with customers and partners in Chatter groups.

[Other Resources](#)

Need more info? Check out these videos and tipsheets.

Collaborate Within Your Company

Stay current with what's happening in your company. Share your knowledge in Chatter posts and comments, collaborate in groups, and access files and data across your organization.

[Share Updates with People \(Chatter\)](#)

Share updates with coworkers, collaborate in Chatter groups, and view record updates.

[Create, Share, and Organize Files](#)

Post files to feeds and records, share files with customers in the Salesforce cloud, and sync files between your local drive and Salesforce.

[Skype for Salesforce \(Beta\)](#)

Skype for Salesforce integrates Salesforce and Skype for Business®, allowing your users to chat with and make audio and video calls to other users without leaving Salesforce. Skype for Salesforce is available only if your business has a Skype for Business online license.

Share Updates with People (Chatter)

Share updates with coworkers, collaborate in Chatter groups, and view record updates.

[Chatter Overview](#)

Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

[Get Started with Chatter](#)

Connect with people and share business information securely and in real time.

[Work with Feeds](#)

Stay up to date on posts and comments you and other people make, as well as record changes across your Salesforce organization.

Chatter Streams

Chatter streams are custom feeds that you create by combining multiple related feeds into one feed. Look for streams on your Chatter home page. Create up to five streams that combine posts from up to 25 different feeds and feed types. Create streams that combine feeds from people, groups, and records, like accounts, opportunities, cases, and more.

Work with Posts

Share information and collaborate with other people inside and outside your organization.

People in Your Organization

Update your personal profile and view the profile of other people in your organization.

Records and List Views

Configure your follow settings for records, view Chatter feeds on list views, and learn more about record recommendations.

Collaborate in Chatter Groups

Use public, private, or unlisted Chatter groups to collaborate with specific people in your company.

Chatter Messenger (Chat)

Chat instantly and securely with coworkers. Chatter Messenger is not available in new orgs created after the Spring '16 release.

Private Messages

Use Chatter messages for secure private conversations with other Chatter users.

Chatter Questions

Got questions? Use Chatter Questions to post a question in your Chatter feed, then watch the solutions roll in.

Chatter Overview

Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

Chatter works in accordance with all of the security and permission settings in your Salesforce organization. Chatter is enabled by default for organizations created after June 22, 2010. For existing organizations, your administrator must enable Chatter. You can access the Chatter app in the app menu in the top right corner of any page. If your administrator added Chatter tabs to other apps and you previously customized your display, you need to add the tabs manually.

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Chatter is not supported:

- Using Microsoft® Internet Explorer version 6.0
- For external users in Customer Portals or partner portals
- In the Console tab

Posts and comments that users make in Chatter are retained during the entire time that a customer's applicable org remains provisioned. We reserve the right to enforce limits on:

- The number of system-generated tracked feed updates. Currently tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the audit history for that field is still available.
- The number of email notifications that can be sent per org per hour.

The limits are subject to change. Contact Salesforce for more information.

EDITIONS

Get Started with Chatter

Connect with people and share business information securely and in real time.

[Chatter Tab Overview](#)

The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.

[The People and Records You Auto-Follow Initially](#)

[Like Posts and Comments](#)

Like posts or comments to show your approval and receive email notifications if others comment on that post.

[Replying to Chatter Email Notifications](#)

[Navigate to Chatter Email Settings](#)

Find your Chatter email settings so you can change your preferences for receiving email notifications and digests.

[Chatter Email Digests](#)

Email digests conveniently summarize recent activity in Chatter so you don't miss important discussions. You can choose to receive daily or weekly summaries of updates from your personal feed or any group's feed.

[Guidelines for Managing Your Personal Chatter Email Settings](#)

Control the number of Chatter emails you receive by choosing the most important emails and the appropriate frequency of personal and group digests.

[What do "company" and "organization" mean in Chatter?](#)

[Can I invite people from my company who don't have Salesforce licenses?](#)

Chatter Tab Overview

The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.

From the Chatter tab you can:

- [Make a post](#) that's shared with people who follow you, or comment on someone else's post.
- [Like posts or comments](#) to show your support.
- [Share a post](#) to your profile or to a group, or send a link to the post to other Chatter users in an email or instant message.
- [View, filter, and sort your feed](#) on the left side to view posts from people and records you follow and groups you're a member of, posts that mention you, posts you bookmarked, or all posts from your company.
- [Search the feed](#) to quickly find information in the feed posts and comments on the Chatter tab.
- [Bookmark a post](#) to keep track of future comments on the post, or to remember to follow up on the post later.
- [Add topics to a post](#) to categorize the post and give it more visibility.
- Access your [people](#), [groups](#), [files](#), and [topics](#) lists.
- [View or update your profile](#), such as your profile photo or your contact information.
- [Read or send private messages](#) that are only visible to certain people.
- [Access your favorites](#) to see the latest posts and comments for your favorite topics, list views, and Chatter feed searches.
- [View your recommendations](#) for people, groups, files, and records that closely relate to your job and interests.
- [View trending topics](#) that people are discussing in Chatter right now.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- [Invite people to join your Chatter network](#) if they don't have Salesforce licenses to use Chatter.

Chatter Desktop

Chatter Desktop Overview

Chatter Desktop is a free desktop application that lets you collaborate in Chatter without a browser. Use Chatter Desktop to post and comment in Chatter, and receive updates about your groups and the people, records, and files you follow. Chatter Desktop also supports chat, private Chatter messages, and displays Chatter updates and private messages as popup notifications in your Windows taskbar or Mac OS X Dock.

- **Note:** Customer users can install and use Chatter Desktop but can't access all of its functionality. For example, customer users can't follow users or records, chat, or access administration options.

Install Chatter Desktop

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- Windows
 - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
 - Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
 - 512MB of RAM (1GB recommended)
- Mac
 - Intel® Core™ Duo 1.83GHz or faster processor
 - Mac OS X v 10.5, 10.6, or v10.7
 - 512MB of RAM (1GB recommended)

- **Important:** Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The standard version:

- Requires administrator privileges on your machine
- Doesn't require administrator privileges in Salesforce
- Automatically installs the required version of Adobe® Integrated Runtime (AIR®)
- Requires acceptance of an end user license agreement the first time Chatter Desktop launches
- Posts "Installed Chatter Desktop" to Chatter the first time Chatter Desktop launches
- Periodically checks Salesforce for new versions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

To install the standard version:

1. From your personal settings, enter *Chatter Desktop* in the *Quick Find* box, then select **Chatter Desktop**.
2. Click the **Download Now** badge.
3. Follow the on-screen instructions.

Note: Administrators can disable the Chatter Desktop download page and block users from accessing Chatter Desktop.

Important: Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from [Adobe's website](#), install it, and open it at least once to complete the installation.

SEE ALSO:

[Uninstalling Chatter Desktop](#)

Connecting Chatter Desktop

If you have multiple Salesforce or Chatter logins, create a connection for each login. The connection lets Chatter Desktop access the Chatter data you can access with that login on the Web.

1. Click  and select **Settings**.
2. In the Connections section, enter a name for the connection and the URL from which you log in. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection *Europe*.

By default, Chatter Desktop connects to your main instance of Salesforce (Production) or your Force.com sandbox.

3. Click **Authorize** and follow the on-screen instructions to authorize Chatter Desktop to connect using the login.

Use the radio buttons on the Settings screen to specify a default connection. To quickly switch connections while using Chatter Desktop,

click , select **Switch Connection**, and choose the connection.

Note: You can create multiple connections, but Chatter Desktop can log into only one connection at a time. You cannot use Chatter Desktop to display data from multiple connections simultaneously.

Configuring Chatter Desktop

The default Chatter Desktop configuration is appropriate for most users, but several Chatter Desktop settings are configurable. To access Chatter Desktop settings, click  and select **Settings**. From the Settings screen, you can:

- Configure Chatter Desktop to launch when you start your computer.
- Configure Chatter Desktop to minimize when you close it.
- Turn popup notifications on or off. Popup notifications are enabled by default.
- Manage alerts for new feed posts and comments (advanced settings).
- Configure Chatter Desktop to always display in the foreground (advanced settings).
- Move the chat window to the foreground when you receive a new message.
- Play sounds when someone starts a new chat with you, or play a sound for every chat message when a chat is minimized or out of focus (for example, if you have multiple chats or are using another application).
- Edit your [connections](#).

SEE ALSO:

[Chatter Desktop Troubleshooting Tips](#)

Using Chatter Desktop

In the Chatter Desktop window:

Click: **To:**

Your profile photo Change your chat status. Select **Available**, **Away**, or **Offline**. People can't chat with you when you're **Offline**.

See feed updates from everyone and everything you follow, and post an update.

- For any feed post, click **Comment** to add a comment, **Like** to receive email notifications if others comment on that post, or **Delete** to delete the post, if you have access.
- To post a file from your computer, drag the file to , or click , which appears when you type a post.
- To post a link, type the link in the text box at the top of your feed, or click , which appears when you type a post.
- Use the **Sort By** filter at the top of a feed to sort updates:
 - Post Date—Sorts feeds by post date. To see comments, you must click **Show All Comments** below a post.
 - Post and Comment Date—Sorts feeds by post and comment date. Each comment appears again when you click **Show All Comments** under its associated post.

See and comment on updates directed to you.

Chat with people and see their updates. Chat messages are displayed in a separate window.

- Click **Chat Favorites** to see people or chats you've added as favorites. To add a favorite, click next to someone's name or in any active chat with one or more people.
- Click **Following** or **Followers** then click a person's name to see their updates or post to their feed.
- Hover over someone's name:
 - Click to send them a private message.
 - Click to add them as a favorite chat. Their name appears in your **Chat Favorites** list.
 - Click to follow someone or to stop following them.
 - Click to start a chat. You can then add up to 10 people to the same chat by clicking in the chat window and searching for people to add. You can't chat with people who are **Offline**.

Note: Chat is only available if it's enabled in your organization.

Read and reply to private Chatter messages. Click a message to view it, or click **New Message** to send a new message.

Note: Messages are only available if they are enabled in your organization.

See feed updates from groups:

- Click a group name or search for a group to view its feed or to post updates. You can post in all public groups and any private groups that you belong to.
- Click **Join** to join a group, or **Member** to leave the group.
- Click to view the group description.

See and comment on records you follow. From the drop-down menu at the top, select the type of record you want to view, for example, Account. If you're not following records, there won't be any records in the list. Click a record's name to view its details. Chatter Desktop shows the first eight fields on a record.

Edit your [Chatter Desktop settings](#) or [switch your connection](#).

Instantly synchronize your data. While Chatter Desktop synchronizes your data automatically, it does not always happen instantly.

The People and Records You Auto-Follow Initially

Starting in June 2010, when your administrator initially turns on Chatter, we help get you started by automatically following certain users and records in your organization. Who and what you auto-follow differ based on the size of your organization:

If Your Organization Has:	Users You Follow	Records You Follow
15 users or fewer	All users in your organization	<p>Up to 25 of your most recently used records, in the following order:</p> <ol style="list-style-type: none"> 1. Open opportunities you own 2. Accounts you own 3. Open cases you own 4. Contacts you own 5. Open opportunities you created 6. Accounts you created 7. Open cases you created 8. Contacts you created 9. Open opportunities you last modified 10. Accounts you last modified 11. Open cases you last modified 12. Contacts you last modified 13. Open opportunities you viewed 14. Accounts you viewed 15. Open cases you viewed 16. Contacts you viewed
16 or more users	<p>Up to 25 users in your organization, including (if available):</p> <ul style="list-style-type: none"> • Your manager • Users that report to your manager • Your subordinates • Teammates on your account teams • Teammates on your opportunity teams 	<p>Up to 25 of your most recently used records, in the following order:</p> <ol style="list-style-type: none"> 1. Open opportunities you own 2. Accounts you own 3. Open cases you own 4. Contacts you own 5. Open opportunities you created 6. Accounts you created 7. Open cases you created 8. Contacts you created 9. If Your Organization Users You Follow Has:

Records You Follow

11. Open cases you last modified
12. Contacts you last modified
13. Open opportunities you viewed
14. Accounts you viewed
15. Open cases you viewed
16. Contacts you viewed

 **Note:** The auto-follow setting for records only applies to the records that already exist at the time your administrator turns on Chatter. For any future records you create, auto-follow is disabled by default to reduce the number of updates you receive in your Chatter feed. However, if you want to receive updates on all future records you create, you can enable auto-follow in your personal settings.

Like Posts and Comments

Like posts or comments to show your approval and receive email notifications if others comment on that post.

Below a post or comment, click **Like**.

After you click **Like** on a post, you receive email notifications if others comment on that post. If you click **Like** on a comment, only the user who posted the comment receives an email notification. You receive an email notification for any subsequent comments. You can change your [email notification settings](#) on page 3148.

- To stop liking a post or a comment, click **Unlike**. When you stop liking a post or a comment, you don't receive email notifications for subsequent comments or likes.
- View the profiles of others who have liked a post by clicking their name at the bottom of the post or comment, for example, "**John Smith** likes this."
- If more than three people like a post, click the link to see the full list; for example, "You, **John Smith**, and **2 others** like this." From that list, you can follow or stop following people.
- Likes on comments show how many people have liked the comment, for example, "**1 person**" or "**7 people**". To see their names, click the link.

Replying to Chatter Email Notifications

When you receive certain email notifications, you can conveniently perform some actions by replying directly from your email. You can reply to the types of email listed in the table, or any notification that displays a From address of `reply@chatter.salesforce.com`.

 **Note:** To reply to email notifications, your administrator must enable email replies for your organization.

Action	Type of Email	Text to Include in Your Reply	Limits
Bookmark a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	<i>bookmark</i>	N/A
Comment on a post	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	The text of your comment	1,000 characters maximum. Replies that exceed the limit are truncated to the first 1,000 characters.
Follow someone	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	<i>follow</i>	N/A
Like a comment	Someone commented on your post or also commented after you	<i>like</i> or <i>+1</i>	N/A
Like a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	<i>like</i> or <i>+1</i>	N/A
Mute a post	Any post or comment email when you no longer want to receive notifications for the original post	<i>mute</i>	N/A
Respond to a Chatter message	Someone sent you a message	The text of your response	10,000 characters maximum. Replies that exceed the limit are truncated to the first 10,000 characters.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Action	Type of Email	Text to Include in Your Reply	Limits
Unfollow someone	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	<i>unfollow</i>	N/A
Unlike a post	Someone posted, commented on your post, or also commented after you on a post that you previously liked	<i>unlike</i> or <i>-1</i>	N/A

Consider these tips when sending email replies.

- Replies must be sent from the email address specified on your profile. If you use email aliases or email forwarding services that send replies from a different email address, your replies aren't processed.
- Replies to bookmark, mute, like or unlike, and follow or unfollow must contain only the single word or exact text, such as *like* (case insensitive) or *+1*. If you include extra white spaces or the original message that some email applications automatically include, we ignore them and process the reply as a like, bookmark, etc. However, if you include any other text in the body, such as *Like!* or *Like this?*, we process your reply as a comment rather than a like, bookmark, etc.
- If replies contain your personal email signature, the signature text is treated as part of your comment. Default signatures inserted by mobile devices, such as *Sent from my iPhone*, are automatically removed from replies. Before replying, delete custom signatures and any extra text you don't want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
 - Dash (–)
 - Equal sign (=)
 - Underscore (_)

You can also use any combination of these characters or dash dash space (– –), which respects [RFC 3676 4.3](#).

- Attachments and mentions in replies are ignored.
- Before replying, check the email address that displays in the **To** field of your email. Valid addresses contain tokens, or long character strings, both before and after the @ symbol, such as `w8t27apy1@j321imd9gbs.d8rx.d.chatter.yourInstance.salesforce.com`. Some email applications automatically use the **From** address from the original email, `reply@chatter.salesforce.com`, which is not a valid address for receiving replies. If you see this shortened address in the **To** field of your reply email, replace it with the valid reply-to address in the email header information. For example, in an application such as IBM® Lotus Notes®:
 1. Open the original email.
 2. Click **View > Show > Page Source**.
 3. In the **Reply-To** section, copy the email address that looks like:
`w8t27apy1@j321imd9gbs.d8rx.d.chatter.yourInstance.salesforce.com`.
 4. Paste the reply-to address in the **To** field of your reply email.

Navigate to Chatter Email Settings

Find your Chatter email settings so you can change your preferences for receiving email notifications and digests.

- From your personal settings, enter *Chatter* in the *Quick Find* box, then select **Chatter Email Settings** or **Email Notifications**—whichever one appears.
- Or, from any group page, click **Email Me... > Email Settings**.

To receive Chatter email notifications and digests, your administrator must enable email notifications for your organization. Select *Receive emails* to receive Chatter email.

 **Warning:** Deselecting this option prevents you from receiving all Chatter email notifications.

SEE ALSO:

[Chatter Email Digests](#)

[Guidelines for Managing Your Personal Chatter Email Settings](#)

Chatter Email Digests

Email digests conveniently summarize recent activity in Chatter so you don't miss important discussions. You can choose to receive daily or weekly summaries of updates from your personal feed or any group's feed.

Personal digests include the updates you see in your own Chatter feed, such as updates about the people, records, and files you follow and your groups. Group digests include the updates you see in a particular group's Chatter feed.

Daily digests include up to the 50 latest posts from the previous day while weekly digests include up to the 50 latest posts from the week. Both include the three latest comments on each post. Chatter sends daily digests at approximately 12:00 a.m. every day, and weekly digests at approximately 12:00 a.m. on Sunday. For user digests, the time is according to the user's time zone. For group digests, the time is according to the organization's time zone. Neither time is configurable.

When you join or are added to a group, you don't receive email notifications initially because they're turned off by default. You can use *Set default frequency for groups I join:* to choose how often you want to receive emails when joining new groups. Changing the default frequency doesn't affect the groups you already belong to. If your organization existed before Summer '11 and is a Professional, Enterprise, Unlimited, or Developer Edition organization, you might still be receiving daily digests by default.

Guidelines for Managing Your Personal Chatter Email Settings

Control the number of Chatter emails you receive by choosing the most important emails and the appropriate frequency of personal and group digests.

Email Me When Someone

Be selective about your personal email settings. They should help you stay on top of important discussions without becoming overwhelmed by too much email.

Option	Most Important	Recommendations and Notes
Follows me		If you're not already following the person, you can click a link in the email to start following your new follower.
Posts on my profile	✓	People reach out to you directly by posting questions or information on your profile, so make sure that you get notified.
Shares a post I made		
Likes a post or a comment I made		
Comments on my status or a change I made		This setting provides notification for actions taken on feed-tracked changes. A feed-tracked change is a change that you make in Salesforce that triggers an automatic post to your Chatter feed. Enabling this option notifies you when someone comments on that post.
Comments on a post on my profile		
Comments after me		After you've commented on an item, get notifications for up to 10 comments after yours. Commenting again later in the post resets the count, so you receive notifications for up to another 10 subsequent comments.
Comments on an item I bookmarked	✓	If you use bookmarks to track items you're interested in, get an email each time someone comments. If you typically use likes to track items of interest, then this option is less important.
Comments on an item I like	✓	After you like an item, get notifications for up to 10 comments after your like.
Mentions me in a post	✓	People use mentions to ask for your input and draw you into discussions, so make sure that you get notified.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Option	Most Important	Recommendations and Notes
Mentions me in a comment	✓	People use mentions to ask for your input and draw you into discussions, so make sure that you get notified.
Sends me a message	✓	Get Sends me a message notifications when people send you private Chatter messages, including notifications about files that have been shared with you.
Endorses me on a topic		

Set Frequency for Personal Digest

Option	Recommended	Recommendations and Notes
Daily	✓	Daily digests include the 50 latest posts from the previous day and the three latest comments on each post.
Weekly		Weekly digests include the 50 latest posts from the week and the three latest comments on each post.
Limited		If you're selective about the options in the "Email me when someone" section, you might not need to receive personal digests at all.

Personal digests aren't supported in communities.

Set Default Frequency for Groups I Join

Changing the default frequency for groups you join doesn't affect the groups you already belong to.

Option	Recommended	Recommendations and Notes
Email on every post		In communities, the Email on every post option is disabled once more than 10,000 members choose this setting for the group. All members who had this option selected are automatically switched to Daily digests.
Daily digests		Daily digests include the 50 latest posts from the previous day and the three latest comments on each post.
Weekly digests		Weekly digests include the 50 latest posts from the week and the three latest comments on each post.
Limited	✓	Keep this default setting for all new groups. Whenever you join a group that you expect to monitor and contribute to actively,

Option	Recommended Recommendations and Notes
	such as one for an important team or project, you can change to more frequent notifications for that specific group.

[Navigate to Chatter Email Settings](#)

What do “company” and “organization” mean in Chatter?

An organization is a single deployment of Salesforce with a defined set of licensed users who may or may not use Chatter. The words “company” and “organization” are used interchangeably in Chatter. So for example, if you see “share a file with all Chatter users in your company,” it means you’re sharing with everyone in a specific Salesforce organization who uses Chatter.

SEE ALSO:

[Chatter Overview](#)

Can I invite people from my company who don't have Salesforce licenses?

If enabled by your administrator, you can invite other people from your company. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

You can [invite users](#) from the People tab or when adding members to a group.

Additionally, you can add customers to private groups you own or manage.

Work with Feeds

Stay up to date on posts and comments you and other people make, as well as record changes across your Salesforce organization.

[Chatter Feeds Overview](#)

Follow people and records to see updates about them in Chatter feeds on profiles, groups, the Home tab, topic detail pages, and on record detail pages.

[View a Particular Feed](#)

Change your Chatter feed to display a particular subset of posts.

[Filter and Sort Your Feeds](#)

Use the filter and sort options to see updates that are relevant to you.

[Create a Task from a Post](#)

Read a post that you want to follow up on? Use the Create New Task action to create a task directly from that post.

[Viewing Your Recommendations](#)

[Chatter Favorites Overview](#)

Chatter Feeds Overview

Follow people and records to see updates about them in Chatter feeds on profiles, groups, the Home tab, topic detail pages, and on record detail pages.

Typically, following lets you see updates about:

- Chatter feed comments and posts
- Posts, comments, and files on Chatter groups you're a member of
- Shared files and links
- Tasks and events
- Converted leads
- Record field changes, like changes to record owner and closed opportunities and cases.

Record updates are also called system-generated posts. They are updates that Salesforce automatically generates when someone creates a record or changes a tracked field on a record. The record updates you see depend on how your administrator has configured feed tracking and whether you have access to the record. You don't see tracked feed updates that are older than 45 days and have no likes or comments, because they are deleted automatically.

SEE ALSO:

[Share a Chatter Post](#)

View a Particular Feed

Change your Chatter feed to display a particular subset of posts.

By default, you see your What I Follow feed when you go to your Chatter page. Use the feed selections on the left sidebar of the Chatter page to view a subset of posts in your feed. For example, view only posts that mention you, or posts you bookmarked, or all posts in your company.

1. Click  **Feed** to see the available feeds.
2. Click a feed to display the associated subset of posts in your feed.

What I Follow

Shows updates for everything you follow, including posts from people you follow, groups you are a member of, and files and records you're following. Use the drop-down list at the top of your feed to further narrow the subset of posts.

To Me

Shows posts that are made on your profile page, including

- Posts others make on your profile page
- Posts and comments where you have been mentioned
- Posts you made that have comments

Bookmarked

Shows your bookmarked posts in your feed.

All Company (Salesforce Classic)

Shows posts and comments from your entire company, including posts and comments from:

- People in your company
- Public groups

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Private groups you are a member of
- Feed tracked changes for records and fields and system-generated posts, if someone liked or commented on the post. You must have access to the record to see the post.

Company Highlights (Lightning Experience)

Shows the most popular posts across your entire company and posts with lots of engagement, like comments, likes, and views.

SEE ALSO:

[Filter Your Files List](#)

Filter and Sort Your Feeds

Use the filter and sort options to see updates that are relevant to you.

Filtering and sorting your feed is useful when you want to view a particular set of posts instead of all posts in your feed.

[Filter Your Feed](#)

Use filters to condense the number of posts that appear in your feed.

[Sort Your Feed](#)

Sort your feed by most recent posts or by most recent comments.

[Available Filters Per Feed](#)

The feed filter options vary, depending on how your administrator sets up Salesforce and which feed you're viewing. Not all filters are available on all feeds.

Filter Your Feed

Use filters to condense the number of posts that appear in your feed.

The filters you see depend on how your administrator has set up Salesforce. Filter your feed on the Chatter page, your profile, group pages, record detail, and search result pages. Not all filters are available on all feeds.

- Above a feed, click next to Show and select a filter option.

All Updates (Default)

Shows all posts and comments from people and records you follow, posts from groups you're a member of, and all [system-generated posts](#).

Fewer Updates

- Shows all posts and comments from people and records you follow and groups you're a member of
- Hides system-generated posts from records that nobody has commented on

People

Shows the posts and comments from people you follow.

Groups

Shows the posts in groups you're a member of.

Files

Shows posts that include:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Files you follow
- File posts that someone you follow has commented on

 **Example:** Use the Fewer Updates filter to hide system-generated posts. For example, you're following the Acme account, and the account executive for Acme creates an opportunity. Later, the account executive also changes a tracked field on the Acme account. In both cases, Salesforce automatically generates an update about each change and posts the updates in your Chatter feed and the feed on the Acme account detail page. The Fewer Updates filter hides these system-generated posts in your feed, unless someone has commented on the posts. If you want to see the system-generated posts, select the All Updates filter.

SEE ALSO:

[Available Filters Per Feed](#)

Sort Your Feed

Sort your feed by most recent posts or by most recent comments.

1. Above a feed, click  next to Show.
2. Below Sort By, select **Latest Posts** to sort by most recent posts, or **Most Recent Activity** to sort by posts with the most recent comments, including polls with new comments.
Your feed is sorted by Most Recent Activity by default. You can toggle between sorting by Post Date and Most Recent Activity at any time.

 **Example:** For example, let's say you're following many people and records and bookmarked the posts you're interested in. At the end of your work day, you want to know whether there are any updates for your bookmarked posts. You click **Bookmarked** to view all your bookmarked posts and then sort the posts using the Most Recent Activity filter. The posts are listed in the order of recent comments, starting with the post that has the latest comment.

SEE ALSO:

[Filter Your Feed](#)

Available Filters Per Feed

[The People and Records You Auto-Follow Initially](#)

Bookmark Posts

Bookmarks Overview

Bookmarking lets you keep track of individual posts you're interested in.

After you bookmarked a post, you can quickly find it using the **Bookmarked** feed on the left sidebar. The **Bookmarked** feed shows you only the posts you bookmarked.

When someone comments on a post you bookmarked, you receive an email notification. Email notifications for bookmarks are enabled by default, but you can change your [email notifications](#) on page 3148.

Bookmarks are private and other users can't see which posts you bookmark. There is no limit on the number of bookmarks you can add. When you are no longer interested in a post you saved, you can remove the bookmark and the post no longer appears in your saved posts when you click **Bookmarked**.

SEE ALSO:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Bookmark a Post

Track the posts you're interested in and view your saved posts in your Bookmarked feed.

1. Click  at the top right corner of the post you want to bookmark to expand the drop-down menu.
2. Click **Bookmark**.
The bookmark icon () displays next to the post to indicate that you successfully saved the post to your bookmarks.

Click  **Feed** > **Bookmarked** on the Chatter sidebar to see your saved posts in your feed.

There is no limit for the number of bookmarks. You can add as many bookmarks as you like.

SEE ALSO:

[Like Posts and Comments](#)

Remove a Bookmark

1. Click  **Feed** > **Bookmarked** on the sidebar to see your saved posts in your Chatter feed.
2. Find the saved post in your Chatter feed.
3. Click  at the top right corner of the post to expand the drop-down menu.
4. Click **Remove Bookmark**.

When you remove a bookmark from a post, the post no longer appears in your saved posts when you click **Bookmarked**.

Create a Task from a Post

Read a post that you want to follow up on? Use the Create New Task action to create a task directly from that post.

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

You can create a task from any post made by you or someone else in your organization, including posts with attachments. You can't create a task from a system-generated post, like a record update.

1. Click  on a post.
2. Click **Create New Task**.
If you don't see the Create New Task action, your Salesforce administrator didn't enable this action for your organization.
3. In the Create New Task dialog, add a subject and a due date. If applicable, associate the task with a contact or lead and an object, like an account. Use the search boxes to find available contacts, leads, and objects.
4. Click **Create**, when you're done.

The task is assigned to you and posted to your profile feed. The task also appears in your My Tasks section on your Home tab.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

Click the task subject link (1 or 2) to open the task. Click the post link (3) to display the post from which the task was created.

Viewing Your Recommendations

Chatter provides recommendations to help you identify the people, groups, files, and records that closely relate to your job and interests. The more recommendations you accept, the more updates you see in your feed.

- Click **Follow** next to the person, record, or file you want to follow.
- Click **Join** to become a group member.
- Click **x** to dismiss a recommendation.
- Click **More** to display the Recommendations page where you can use the side filters to narrow your recommendations to people, files, records, or groups.

Chatter Feed Search Results

Watch a Demo: [▶ Search in Salesforce Classic](#)

Search results for Chatter feeds display posts and comments that include your search terms.

Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches across all objects.

 **Note:** Changes to record fields aren't included in search results. For example, if you've enabled feed tracking on the `Billing Address` field for the Acme account and modified the Acme billing address, search results for *Acme* include **Acme — Suzanne Powell** *Looking for volunteers to help with the Acme account*, but don't include **Acme — Suzanne Powell** *changed Billing Street to 10 Main Road*.

- Sort your search results by posts only or by posts and comments, just as in feeds.
- Comment on, like, share, bookmark, and delete posts in the search results, just as in feeds.
- Add, edit, or delete topics on posts in the search results, just as in feeds.
- Follow, share, download, preview, and upload new versions of files in the search results, just as in feeds.
- View the detail pages for Chatter files, groups, topics, and people by clicking the respective name in the update.
- [View a single feed update](#) by clicking the timestamp below the update, for example, **Yesterday at 12:57 AM**.
- Click **Add to Favorites** to save a Chatter feed search to your [favorites](#) on the Chatter tab.

To view search results for records, such as accounts, contacts as well as Chatter people, groups, topics, and files, click **Records** at the top left of the page.

 **Tip:** For a more focused search of the feeds in a specific group, profile, record, or other Chatter feed, use [feed search](#).

Search a Feed

Use feed search to find information in a specific context.

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager**, and **Developer** Editions

You can search for information in feeds on records, groups, topic pages, user profiles, and on the Chatter and Home tabs. A contextual feed search is helpful when you want to confirm if something was once discussed in that specific feed.

1. Click  above the feed to look for information in that feed. For example, use the feed search on a group's page to find information in that group.

EDITIONS

Information

Sales team handling Acme's IT opportunities FY 12-13

Description

This is a group to discuss sales opportunities with Acme Inc.

2. Type your search terms and press ENTER or click .

You can search for hashtag topics, mentions, and files posted in the feed, or refine your search using wildcards, operators, and quotation marks to match on exact phrases.

 **Tip:** To search for hashtag topics with multiple words, use brackets after the hashtag and around the words. For example, to find all instances of #Universal Paper, type `#[universal paper]` in the search box.

Search results display with matching terms highlighted. Filters or sorting criteria used in the feed apply to feed search results as well.

Click  to clear your search results and return to the feed.

Feed search behavior may vary slightly depending on where you perform the search.

- Feed search is not supported for feeds on list views.
- You can only search feeds you have access to via sharing rules.
- On the Chatter tab, feed search results are also limited by your [feed type selections](#). For example, if you select the To Me feed type, and select additional [filters](#) and [sorting criteria](#), all of those criteria apply to the feed search results.
- Feed search results are limited to the [posts that are accessible](#) from the context you search within. For example, if you search the feed on a user's profile, the results include the posts and comments accessible from the user's profile. This includes both the posts and comments shared by or with the user.
- Feed search returns matches for file or link names shared in posts, but not in comments.
- Record field changes aren't included in record feed search results.

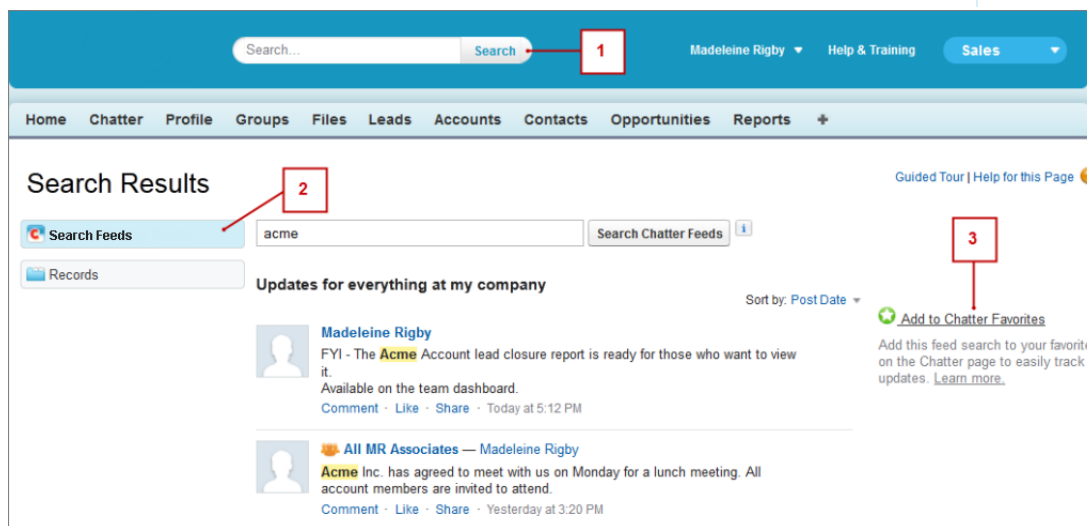

Adding a Chatter Feed Search as a Favorite

Add a Chatter feed search as a favorite to access feed updates quickly without leaving the Chatter tab.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

1. Enter terms in the header search box and click **Search**.
2. Click **Search Feeds** to see the posts and comments that include your search terms.
3. Click **Add to Favorites**.

 Example:

The favorite name on the Chatter page is the same as the search terms you entered. For example, if you searched for *competitive analysis*, your favorite is **competitive analysis**.

Tip: Save a search for a Chatter group name as a favorite to quickly access the group feed from the Chatter page. Similarly, save a search for a person's name as a favorite to quickly see that person's posts, comments, and mentions.

SEE ALSO:

[Chatter Feed Search Results](#)

Chatter Favorites Overview

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

Chatter favorites on the Chatter tab give you easy access to list views, Chatter feed searches, and topics that you want to stay on top of. For example, if you and your coworkers use the hashtag topic #acme to track information about your customer Acme, you might want to add #acme as a favorite so you can easily access these updates without leaving the Chatter tab.

You can have up to 50 favorites. If you haven't added any favorites, the Favorites section doesn't appear on the Chatter tab.

Chatter displays the four favorites most recently added or viewed.

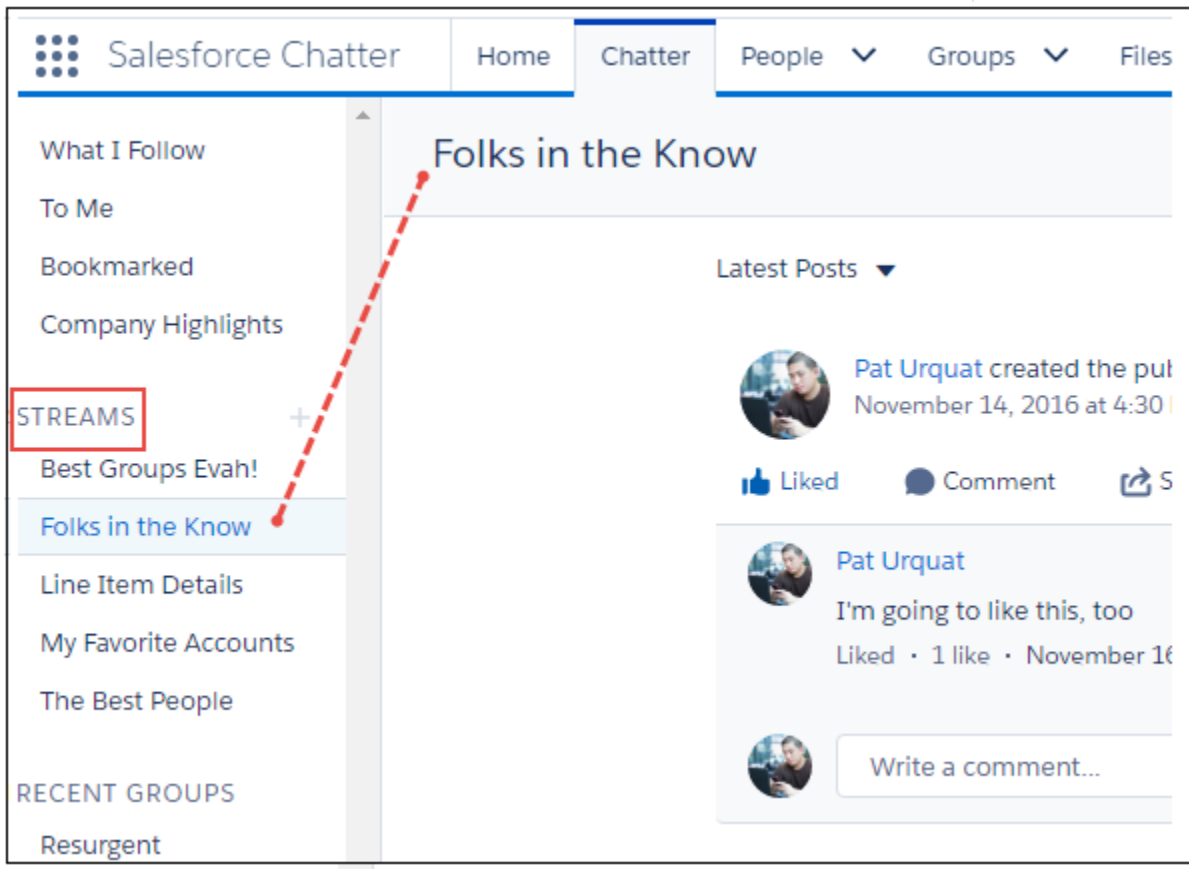

- Click a favorite to see the updates.
- Click **x more** to see all your favorites.
- Click **x**, which appears on hover, to remove a favorite.

Chatter Streams

Chatter streams are custom feeds that you create by combining multiple related feeds into one feed. Look for streams on your Chatter home page. Create up to five streams that combine posts from up to 25 different feeds and feed types. Create streams that combine feeds from people, groups, and records, like accounts, opportunities, cases, and more.

EDITIONS

Available in: **Group**, **Professional**, **Enterprise**, **Performance**, **Unlimited**, **Contact Manager**, and **Developer** editions

You don't have to follow a person, group, or record before you add it to a stream. The great thing about adding a feed to a stream is it doesn't count against the number of follows you're allowed.

Tip: To include a person account in your stream, add it as an Account in the Include in Stream field. If you add a person account as a Contact, the related feed posts don't appear.

Because a stream is made up of multiple feeds, no publisher is provided for posting to a stream.

Note: You can add 25 unique feeds, records, groups, and people to a stream. If your access to any of the 25 is removed, the removed entity is still counted as part of the 25. You can't replace it with something else.

[Create a Chatter Stream](#)

In Lightning Experience, create a Chatter stream to get a combined view of feeds from the profiles, groups, and records that you select. Create up to five Chatter streams. Include up to 25 objects in each stream.

[Edit a Chatter Stream](#)

Edit a stream to change its name or to add or remove some of its feeds.

[Delete a Chatter Stream](#)

Deleting a Chatter stream doesn't delete the records or posts it contains. It deletes only the stream, which frees up space for you to create new streams.

Create a Chatter Stream

In Lightning Experience, create a Chatter stream to get a combined view of feeds from the profiles, groups, and records that you select. Create up to five Chatter streams. Include up to 25 objects in each stream.

To create a Chatter stream, provide a title and select the feed types and feeds you want in your stream.

1. In Lightning Experience, go to the Chatter home page, and click the **+** icon to open the New Stream dialog (2).
2. Enter a name for your stream.
3. In the **Include in Stream** field, click the down arrow (3) and choose a type of feed you want to add to your stream.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** editions

4. When you've made a selection, click in **Include in Stream** again to search for the selected type of feed (5).

New Stream

Create your own personalized flow of feed posts from records you choose, such as opportunities, accounts, people and groups.

* Stream Name

From All Over

Include in Stream

Include in Stream

Search Groups

Resurgent × All JCBlitzee206 × 6

Cancel Save

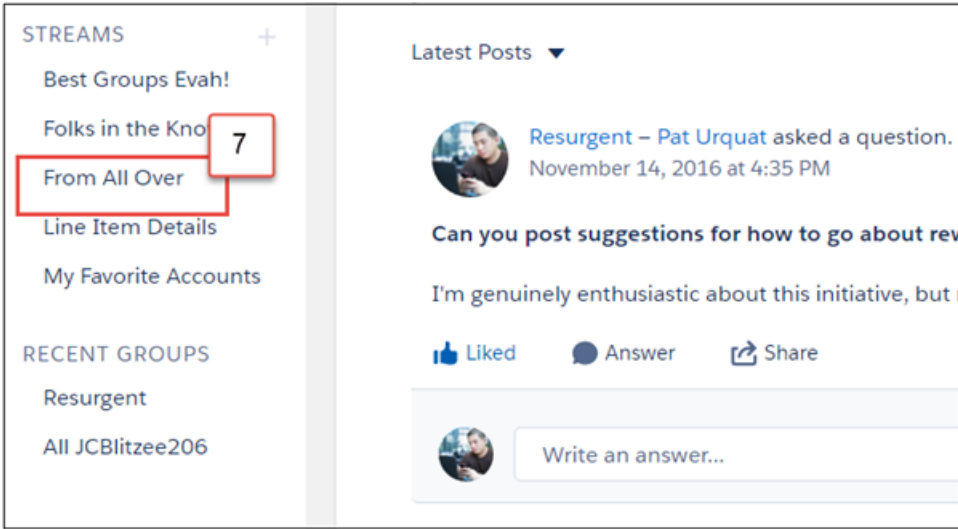

Repeat steps 3 through 5 until you have all the feeds (up to 25) that you want in this stream (6).

-  **Note:** You can add 25 unique feeds, records, groups, and people to a stream. If your access to any of the 25 is removed, the removed entity is still counted as part of the 25. You can't replace it with something else.

To include a person account in your stream, add it as an Account in the **Include in Stream** field. If you add a person account as a Contact, the related feed posts don't appear.

6. To save your selections, click **Save**.
7. To save your stream, click **Save** again.

Your stream is listed in the left column on the Chatter home page, under STREAMS (7). To see its contents, click its name.

SEE ALSO:

[Chatter Streams](#)

[Edit a Chatter Stream](#)

[Delete a Chatter Stream](#)

Edit a Chatter Stream

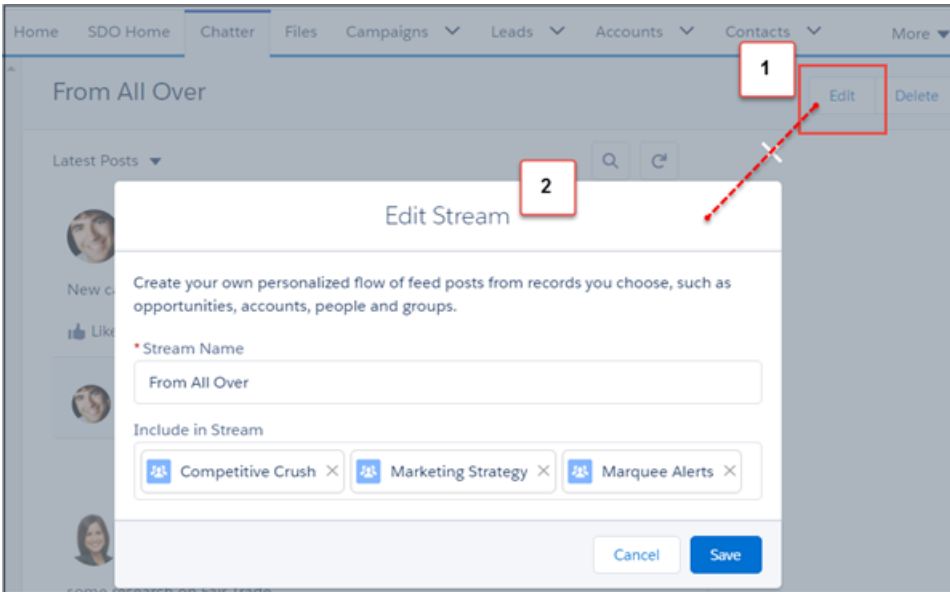

Edit a stream to change its name or to add or remove some of its feeds.

To edit a Chatter stream, go to the Chatter home page, open the stream, and click **Edit**.

1. In Lightning Experience, go to the Chatter home page, and click the stream you want to edit to open its home page.
2. On the right side of the stream's home page, click **Edit** (1) to open the Edit Stream dialog (2).

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

3. Edit the stream.
 - Edit the stream name.
 - To add more feeds to the stream, click in the **Include in Stream** field to select a feed type. And follow the steps in [Create a Chatter Stream](#).
 - To remove a feed from the stream, click its **×** icon.
4. To save your changes, click **Save**.
5. To save your stream, click **Save** again.

Work with Posts

Share information and collaborate with other people inside and outside your organization.

[Posting Overview](#)

Use the Chatter publisher to post, comment, ask questions, and create polls.

[Post Visibility](#)

[Can I prevent people from seeing my posts?](#)

[Do posts that I make on a group appear on my profile where others can see them?](#)

[Mute a Post](#)

Control what appears in your news feed and mute posts you're no longer interested in.

[Live Feeds](#)

When you're in a group in Lightning Experience, the Chatter feed is live. Live feeds offer real-time posts and comments without requiring a page refresh. You see content when it's posted.

[Live Comments](#)

In Lightning Experience feeds, comments are live. Live comments offer a real-time comment experience that doesn't require a page refresh. You see comments when they're posted.

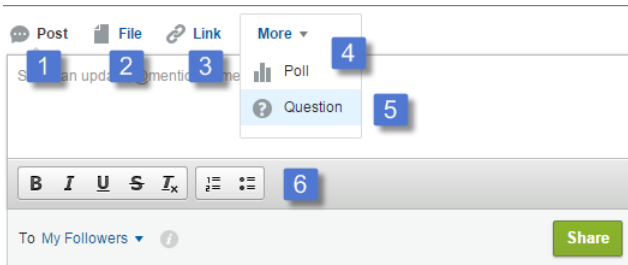

[Who Can See My Attached Files and Links?](#)

Share files and links with people by attaching them to posts or comments.

Posting Overview

Use the Chatter publisher to post, comment, ask questions, and create polls.

The publisher appears on your Home tab, Chatter tab, user profile page, group, and record detail pages. Use publisher to write a post (1), comment on a post, attach a file (2) or link (3) to your post, add a poll (4), or ask a question (5). Posts and comments can be up to 10,000 characters long. Use the rich text editor to format your posts (6).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

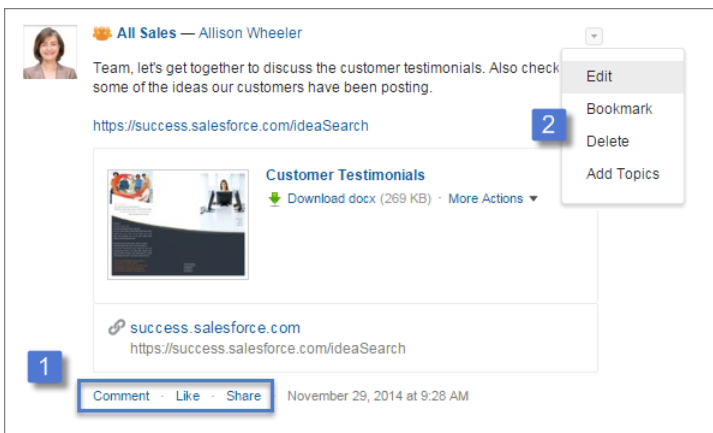

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Tip: In Lightning Experience, power users can use the keyboard to complete posts and comments. On Windows, enter content and press Ctrl+Enter. On macOS, press either Control+Enter or Command+Enter.

In questions, shortcut keys work with question details, but not on the question itself. So if you just ask a question, the shortcuts don't work. But if you include details with the question, shortcuts work.

By default, the publisher displays the Post, File, Link, Poll, and Question actions. Your Salesforce administrator can change the order of the actions and add more actions. Therefore, the actions you see depend on how your administrator configured the publisher.

When you post to a feed, everyone with access to the post can comment on the post, like the post, and share it (1). From the drop-down menu (2), they can also bookmark the post and add topics.

In Lightning Experience, comments are live and don't require a page refresh to update.

Note: Live comments is a new feature with lots of potential for enhancement and a few known issues.

- When new comments are made on a feed post that you're engaged in, you receive notifications only in Lightning Experience. Notifications appear when you're actively typing comments or you've clicked in the comments box.

- The number of participants supported for live comments depends on your org's subscription limits. If you're not getting live comments, click in a comment field. If comments still aren't live, looks like your org has hit its limit! You can still get updates the old-fashioned way by refreshing the page.

Click **Edit** to modify your own posts and comments. If you're a group owner or manager, you can also edit other people's posts on the group feed. Click **Delete** to remove your post from the feed. However, you can't delete other people's posts or posts that are automatically generated by Salesforce. For example, you can't delete record updates like a post about a changed field on an account.

 **Note:** If the Edit option isn't available, your administrator disabled this feature for your organization.

Everyone with permission to access the record can see your post on the record detail page, on your profile, in feed search results, and in the All Company feed.	If you attach a file to the post, the file is associated with the record. Everyone with sharing rights to the record has access to the file.

 **Note:** You can't create new posts on archived groups. Comments on existing posts in an archived group follow the same visibility settings as before the group was archived.

Can I prevent people from seeing my posts?

Anyone except [customers](#) can see your posts on your profile, and people following you can see your posts in their Chatter feed. However, if you change a record, only people who have permission to see the record can see the record update a feed.

SEE ALSO:

[Send Chatter Messages](#)

Do posts that I make on a group appear on my profile where others can see them?

Yes, but who can see the posts depends on the [type of group](#). If you post to a group that is:

- Public, anyone except customers can see the post on your profile.
- Private, only other group members can see the post on your profile.
- Private and allows customers, all members can see the post in the group. Customers who are members of the group can see your posts on the group page but not on your profile.
- Unlisted, only group members and users with the "Manage Unlisted Groups" permission can see the post on your profile. Customers who are members of the group can see your posts on the group page but not on your profile.

SEE ALSO:

[Chatter Groups](#)

Mute a Post

Control what appears in your news feed and mute posts you're no longer interested in.

You can mute posts from the feed and from a feed post's detail view. Muting is available on the Home and Chatter tabs and on groups, but not on profile or record feeds. If your admin enabled email replies, you can mute posts by replying to post emails with the single word *mute*.

 **Note:** In Lightning Experience, you can mute a feed item in a group from its detail view. To navigate to a group feed item's detail view, click the post's date/time information.

To mute a post in a feed, select **Mute** from the post's drop-down menu.

To mute a post from its detail view:

1. Go to detail view in the feed by clicking the post's date stamp, or, in an email notification, by clicking the **View/Comment** button.
2. From the post's drop-down menu, select **Mute**.

After you muted a post,

- In Salesforce Classic, the post no longer appears in your feed on the Home and Chatter tab. In Lightning Experience and in communities based on the Customer Service (Napili) template, the post stays in place.
- You no longer get notifications for updates to that post.
- You can use the Muted filter to view your muted posts.

EDITIONS

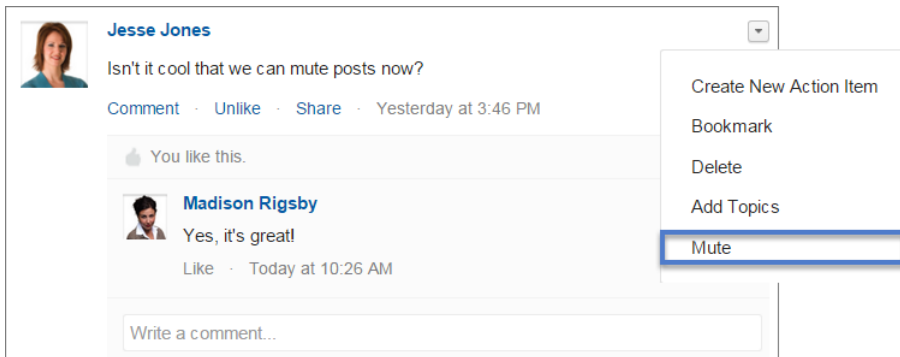

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

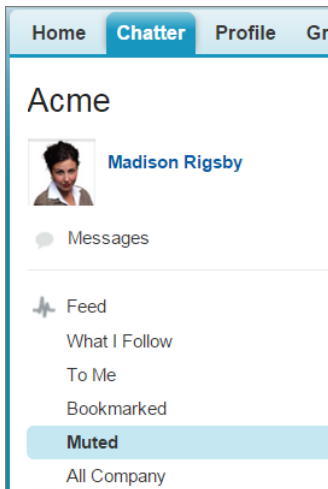

- If someone mentions you on a muted post, the post is automatically unmuted. It reappears in your feed and if you have email notifications enabled, you get a notification about the update.
- If the post was originally posted to a group, profile, or record feed, it still appears on that feed.

For example, someone posts to a group that you're a member of. The post appears on the group feed and your news feed on the Home and Chatter tab. You can mute the post in your news feed, but the post remains visible in the group feed.

 **Example:** Here's how you mute a post from the drop-down menu.

To view all posts you muted, select the Muted filter.

Live Feeds

When you're in a group in Lightning Experience, the Chatter feed is live. Live feeds offer real-time posts and comments without requiring a page refresh. You see content when it's posted.

In a live feed, new posts trigger a message that appears briefly at the top of the feed (1).

EDITIONS

Available in: Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager**, and **Developer** Editions

The screenshot shows a Salesforce Chatter group page for 'Balungalotl Packaging'. The group is private and owned by the user. The 'CHATTER' tab is selected, showing a post creation interface with options for Post, Poll, Question, and Announcement. A 'Share an update...' text box and a 'Share' button are visible. Below the post creation area, a blue button indicates '2 New Posts', which is highlighted with a red box. A small red box with the number '1' is positioned next to it. The 'Latest Posts' section shows a post by 'Balungalotl Packaging (Private) – Lisa Theiring' from 'Just Now'. The post content reads: 'We've started the group for our packaging exploration. If you have ideas, questions, announcements, or want to administer a poll about our efforts, post 'em here!'. Below the post are 'Like' and 'Comment' buttons. At the bottom, there is a 'Write a comment...' text box.

Live comments appear in all feeds in Lightning Experience and not just group feeds. While people are entering comments, an animation shows activity on the post (2). When a live comment is first posted, it briefly flashes yellow.

There are a few differences between live and non-live, or served, feeds:

- Live feeds show content posted by users—that is, by human beings. They don't show system-generated posts, like feed tracked changes (FTCs) and custom event posts. (To see these posts, refresh the feed.)
- Live feeds show content posted directly to the group feed. They don't show posts that were mentioned into the group nor edits made to existing posts. (Refresh the feed.)
- A live feed is as good as its network connection. It's possible that some posts are not served up live nor appear in the exact order that they were posted. Consider refreshing the feed from time-to-time to get all the goodness.

If you go idle for awhile or navigate away from a live feed, refresh the page to make it live.

For developers, live updates are not transactional. The server and the browser are a distributed system, and there is no transaction coordination between them. The served feed is a snapshot of the state of the feed in time. The live feed is a series of incremental updates to the current page, which are best efforts. They're not intended to be equivalent to the snapshot delivered by the next served page. Live feeds are optimized for human consumption. We don't recommend writing code that consumes them that depends on the delivery of specific entities or the format of the pushed (live) data.

-  **Note:** The number of participants supported in a live feed depends on your org's subscription limits. If you're not getting a live group feed or live comments, refresh the page or click in a comments field. If the feed still isn't live, it's likely that your org has hit its limit. You can still get updates the old-fashioned way by refreshing the page.

Live Comments

In Lightning Experience feeds, comments are live. Live comments offer a real-time comment experience that doesn't require a page refresh. You see comments when they're posted.

To see live comments in a feed, you must be subscribed. Subscription is easy:

- Click in the **Comment** field.
- Post something
- Click **more comments**

If you go idle for awhile or navigate away from a feed, click in a comment field to resubscribe.

When you are subscribed to live comments in a feed, a typing indicator shows you when people are actively entering comments.

Lou Briggs
Businesses often become known today through effective marketing. The marketing may be in the form of a regular news item or half column society news in the Sunday newspaper.

Write a comment...

- When new comments are made on a feed post that you're engaged in, you receive notifications only in Lightning Experience. Notifications appear when you're actively typing comments or you've clicked in the comments box.
- The number of participants supported for live comments depends on your org's subscription limits. If you're not getting live comments, click in a comment field. If comments still aren't live, it's likely that your org has hit its limit. You can still get updates the old-fashioned way by refreshing the page.

Mention People and Groups

@Mention People and Groups in Posts and Comments

@Mention individual people or a group to keep them informed when you're discussing something relevant to them.

1. When you write a post, type @ followed by the first few letters of the person or group name.
2. Select the person or group from the list of matches.

The list includes all matches for

- People, typically users you interact with the most
- Public groups
- Private groups you're a member of

You can have up to 25 mentions in a single post or comment. You can't mention archived groups, unlisted groups, customer groups, and private groups you're not a member of.

3. Click **Share** to post your update.

After you posted your update,

- The person's name becomes a link to their profile, and the group name becomes a link to the group page.
- For people you mention, your update appears on the mentioned person's profile feed and in their To Me feed.
- For people who choose to receive emails when mentioned, Chatter sends an email notification.

 **Note:** There's an exception: if you @mention yourself, you don't receive a notification.

- For groups you mention,
 - Your update appears on the group feed and each group member's What I Follow feed.
 - Chatter sends an email notification to the group members who enabled the Email Every Post preference for the group.

 **Note:** On mobile devices, we don't currently send push notifications for group mentions.

- If the mention is on a record feed, the record appears in the group records list.

 **Example:** Your coworker Madison posts that she's looking for information about an Acme product feature. You reply to Madison's post with the comment: "Talk to @Bob Smith—he's the Acme account manager. @Acme Products, do you have any additional information for Madison about this feature?" Both Bob Smith (if he chose to receive emails when mentioned) and members of the Acme Products group get an email notification about your post. Madison can click **@Bob Smith** in the update to view Bob's profile, or click @Acme Products to see their group page.

Chatter enforces security and sharing rules in Salesforce. Let's say you make a post to a record or a private or unlisted group and @mention someone who doesn't have access to that record or isn't a member of the group. In this case, the @mention appears as a gray link. The mentioned person can't see your post and doesn't get notified about the post. For example, Madison creates a private group for her project team and forgets to add her coworker Sandy Dunn to the group. When Madison posts an update to this group and @mentions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

Sandy Dunn, Sandy isn't notified about the update. Sandy also can't see the update because she's not a member of the private group. If Madison later adds Sandy to the group, Chatter doesn't notify Sandy about the previous mentions.

User and Group @Mentions—Visibility

When you @mention people or groups in an update, anyone who has access to the update can see the post and all comments.

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager**, and **Developer** Editions

This table describes where you can find posts and comments that mention people, public groups, and private groups. You can't mention private groups with customers and unlisted groups.

If the post was made on	And mentions	Then these people can see the post and comments
A person's profile	Other people	Anyone with access to the person's profile.
	Public group	Anyone with access to the person's profile.
	Private group	Anyone with access to the person's profile, even if they're not a member of the private group.
Public group A	Other people	Anyone with access to public group A.
	Public group B	Anyone with access to public group A.
	Private group	Anyone with access to public group A, even if they're not a member of the private group.
Private group A	Other people	Members of private group A.
	Public group	Members of private group A.
	Private group B	Members of private group A, even if they're not a member of private group B. People who are members of both private groups can also see the post in the feed of private group B.
Unlisted group A	Other people	Members of unlisted group A and users with the "Manage Unlisted Groups" permission.
	Public group	Members of unlisted group A and users with the "Manage Unlisted Groups" permission.
	Private group B	Members of private group B who are members of unlisted group A or have the "Modify Unlisted Groups" permission.

If the post was made on	And mentions	Then these people can see the post and comments
Record detail page	Other people	People with sharing access to the record.
	Public group	People with sharing access to the record.
	Private group	People with sharing access to the record, even if they're not a member of the private group.

The visibility of posts and comments depends on sharing access to the post. Anyone with access to the original post also has access to all subsequent comments on the post.

Who Can See My Attached Files and Links?

Share files and links with people by attaching them to posts or comments.

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

Attach links and files to posts and comments from your device, Salesforce Files, Files Connect external sources, and Salesforce CRM Content libraries. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs and image files. Audio and video files can be uploaded and downloaded, but not parsed or previewed.

This table describes who can see a file that you attached and where it appears:

If You Attach a File:	Who Can See It?	Where Does it Appear?
On a Chatter feed	All Chatter users in your company	<ul style="list-style-type: none"> • In your and your followers' Chatter feeds, and profile • On the Files list and Salesforce CRM Content of all Chatter users in your company
On your Chatter profile or on someone else's Chatter profile	All Chatter users in your company	<ul style="list-style-type: none"> • In your feed, their feed, your followers' feeds, and their followers' feeds and profiles • In the Files Owned list on your profile • On the Files list and Salesforce CRM Content of all Chatter users in your company
On a public group	All Chatter users in your company	<ul style="list-style-type: none"> • In your feed, your followers' feeds, and the group members' feeds • In your feed on your profile • In the feed on the group • In the Group Files list on the group

If You Attach a File:	Who Can See It?	Where Does it Appear?
		<ul style="list-style-type: none"> On the Files page and Salesforce CRM Content of all Chatter users in your company.
On a private group that you're a member of	Members of the group and users with "Modify All Data" and "View All Data" permissions	<ul style="list-style-type: none"> In your feed and the group members' feeds In your feed on your profile In the feed on the group In the Group Files list on the group On your Files lists, group members' Files lists, and Salesforce CRM Content
On an unlisted group that you're a member of	Members of the group and users with the "Manage Unlisted Groups" permission	<ul style="list-style-type: none"> In your feed and the group members' feeds In your feed on your profile In the feed on the group In the Group Files list on the group On your Files lists, group members' Files lists, and Salesforce CRM Content
On a record	Anyone with sharing rights to the record	<ul style="list-style-type: none"> Record detail page Your profile page Feed search results All Company or Company Highlights feed

Attach Files or Links

Attach a File to a Post or Comment

Share files and links from Salesforce or from your computer with people by attaching them to posts or comments.

You can attach all file types, including Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. The maximum file size is 2 GB.

When you attach a file, consider the following:

- When a file is posted to a feed, everyone in your company can see it even if the file started out as private. Only files posted in a private group stay private within that group.
 - Attaching a file from a group or library creates a reference to the file. If you update a file in Salesforce CRM Content, the updates are also reflected in the feed.
 - In Lightning Experience, you can attach up to ten files to a feed post.
 - You can post a file from an external data source. From the file selector, choose an external source and navigate through the folders to the file you want to post. A new file reference or copy is created in Salesforce for the corresponding external file. If a file reference already exists for the file you select, it will be reused.
1. Click **File** at the top of your feed to attach a file to a post, or **Attach File** below a comment to attach a file to a comment. If you're commenting on an update resulting from feed tracking on a file, the **Attach File** option isn't available.
 2. Do one of the following:
 - Click **Select a file from Salesforce** to attach a file that has already been uploaded to Salesforce, synced from your Salesforce Files Sync folder, or that exists in a Files Connect external data source.
 - Click **Upload a file from your computer** to attach new files from your computer.
 3. Browse for the file you want to attach.

Links, Google docs, documents from the Documents tab, and attachments from the Notes and Attachments related list aren't included in the Select a File to Attach list. For more information about finding files to attach, see [Searching for Files to Attach to a Chatter Feed](#).
 4. Add a post or comment about the file.

If you don't enter any text, a generic update is posted with your attachment.
 5. Below the text box, select **My Followers** to publish the post on your profile. To post to a group, select **A Group**. Type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.
 6. Click **Share**.

Searching for Files to Attach to a Chatter Feed

From the file selector, you can see a list of Salesforce files you own and have access to. In Salesforce Classic, click **File** above the feed, and then select a file from Salesforce. In Lightning Experience, click the paperclip icon below the post to open the Select File window. The 25 most recently viewed files are listed by default.

From the file selector you can see and search a certain group of files by clicking a specific filter on the sidebar.

- **All Files**—All files you own and have access to, including:
 - Files that have been shared with you
 - Files you're following
 - Files in your Chatter groups
 - Files in your libraries
 - Files attached by other people to a Chatter feed, including files attached to all public groups and private groups you're a member of. You don't have access to files attached to private groups you're not a member of.

This filter is only available in Salesforce Classic.

- **Recent**—The most recent files you've viewed.
- **MY FILES**—All files you own, files shared with you, and files you follow.
 - **Owned by Me**—Files you have:
 - Uploaded on the Home or Files page. These files are private and not shared with anyone, but you can view them, share them, and attach them to Chatter feeds.
 - Attached to Chatter feeds from your computer.
 - Synced using your Salesforce Files Sync folder.
 - Uploaded to Salesforce CRM Content libraries you're a member of and your private library.
 - **Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
 - **Following**—All files that you're following. (*Requires Chatter*)
- **FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your private library. The first five libraries you're a member of, including your private library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.
- **Synced**—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the "Sync Files" permission.
- **EXTERNAL FILES**—All files you have access to in Files Connect external data sources. Search is restricted to the selected external data source.

Note:

- Only files from libraries that you're a member of and where you have `Post Content to Chatter Feeds` or `Manage Library` checked in your library permission definition are listed.
- Users who have the "Sync Files" permission don't see the **All Files**, **MY FILES**, or **FILES IN MY GROUPS** filters. Users who don't have the "Sync Files" permission don't see the **Synced** filter.

To search for files from the search box:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the search box. You can search by file name, description, owner, type, or within the file's text.
3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click  to clear your search terms.

The Select a File to Attach list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.
- Links attached to posts in Chatter
- Files from your personal library

Performing Actions on a File in a Chatter Feed

You can perform the following actions on files in feeds.

- Preview—Click the file thumbnail or click **More Actions > Preview** next to the file.
- Download—Click **More Actions >  Download** next to the file.
- Upload new version—Click **More Actions > Upload New Version** next to the file.
- View file detail page—Click the file name or **More Actions > View File Details** next to the file.
- Follow—Click  **Follow** next to a file to receive updates about the file in the Chatter feed. Click  to stop receiving updates about the file.
- Share—Click **More Actions > File Sharing Settings** next to the file to share the file with people, groups, or via link.
- If you have the “Sync Files” permission and are the owner of the file, click  **Sync** to [sync a file](#) between your Salesforce Files Sync folder on your computer and Chatter. Click  **Unsync** to stop syncing the file.

To learn who can perform which actions on a file, see [Who Can See My File?](#)

Downloading and Previewing a File in a Chatter Feed

Not only can you download and save files posted to Chatter feeds, you can also preview files in your browser without downloading them.

There are several places in Chatter where you can download and preview files:

- On the **Files** page—Click  >  **Download** or click the preview () icon next to the file.
- On any Chatter feed—Click **More Actions** >  **Download** next to the file, or to preview the file, click on the file thumbnail or click **More Actions** >  **Preview**.
- On the Files Owned by list on a profile—Click  >  **Download** or click the preview () icon next to the file.
- On the Files Shared with list on a group—Click  >  **Download** or click the preview () icon next to the file.
- In the Notes and Attachments related list on a record, click **Download** next to the feed attachment, or to preview the file, click **Preview** next to the feed attachment.

Previewing a file opens it in your browser with the enhanced document viewer. The enhanced document viewer provides the following capabilities for viewing documents:

- In addition to using the next page () , previous page () , first page () , and last page () icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available for PowerPoint files.
- You can jump directly to a page by entering the page number in the page field and pressing Enter.
- From the right-click menu you can choose **Fit Width** to expand the width of the document, or **Fit Full Page** to preview the whole page of the document. The fit width icon () and fit full page icon () are also available on the toolbar.
- From the right-click menu you can choose **Full Screen** to preview the document in full screen mode, or **Exit** to exit full screen mode. The full screen icon () and exit icon () are also available on the toolbar.
- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon () and zoom-out icon () are also available on the toolbar.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
 - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
 - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
 - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
 - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Note:

- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- In Internet Explorer 11, the **Preview** option redirects to the file detail page.

SEE ALSO:

- [Who Can See My Attached Files and Links?](#)
- [Delete Files and Links from Feeds](#)

Delete Files and Links from Feeds

To delete a link from a Chatter feed, simply delete its post. To delete a file, go to the file detail page or content detail page. Only a file owner can delete the file. Users with the “Modify All Data” permission can delete all comments, posts, files, and links.

Delete a File from a Chatter Feed on a Record

There are two ways to remove a file on a Chatter feed on a record:

- Remove the file on a Chatter feed by deleting its post. This deletes the post, removes the file from the feed and from the Notes and Attachments related list, but the file remains in its original location. If the file isn't posted anywhere else, it goes back to being private, but can be shared again later.
- Remove the file on a Chatter feed by clicking **Del** next to the feed attachment on the Notes and Attachments related list. This action removes the file from all Chatter feeds where it's been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking the Recycle Bin, selecting the file, and then clicking **Undelete**. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list removes it from the post but doesn't delete it from its original location.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Deleting a link from a Chatter Feed

To delete a link on a Chatter feed, you must delete its post.

Deleting a File from a File Detail Page

Click **Delete** on a [file's detail page](#) to delete the file and remove it from all locations where it's been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

Deleting a File from a Content Detail Page

When you post a file in Chatter, the file also appears in Salesforce CRM Content. To delete the file from Chatter, Salesforce CRM Content, and all locations where it's been shared, click the name of the file on the Libraries, Content, or Subscriptions tab. From the content details page, click **Edit > Delete Content** to delete the file. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter. Select the checkbox for the content file you want to restore, and click **Undelete**.

Attaching a Link to a Post

Share links with people by attaching them to a post.

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

If you share a URL with rich media support, your post shows a preview of the linked content. For information about currently supported URLs, see [Sites That Generate a Preview in Posts](#).

1. Above your feed, click **Link**.
2. Type the URL to share.
3. Optionally, type a `Link Name`.
If you leave the Link Name field blank, the preview shows the title or name from the site URL.
4. Optionally, type a post.
If you don't type any text, a generic update is posted with your link.
5. Below the text box, select **My Followers** to publish the post on your profile. To post to a group, select **A Group**. Type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.
If you're posting on someone else's profile or on a record, the **My Followers** and **A Group** options aren't available.
6. Click **Share**.

SEE ALSO:

[Sites That Generate a Preview in Posts](#)

Sites That Generate a Preview in Posts

Salesforce provides rich media support for over 400 URLs. When you share a supported URL in a post, your post shows a preview of link content.

Embed.ly, a third-party service, powers file previews, which include thumbnails, descriptions, and video players for links to videos. If a post doesn't render a link as a rich preview, the URL domain isn't supported or Embed.ly was unable to return the preview content.

We don't share any content, user, organization, or account data with Embed.ly. We share only the URLs that are on Embed.ly's custom provider whitelist. The whitelist also includes versions of URLs that are shortened by third-party shorteners, like bitly, goo.gl, and tinyurl.com. All our URL requests pass through a Salesforce proxy. Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

 **Note:** For a look-up list of supported URL domains, see ["URL Domains for Rich Link Previews in Feeds."](#)

Post a Poll

Polls

Use polls to conduct a survey. A poll contains a list of choices in a feed post that lets people cast a vote by selecting one of the choices.

Polls are a great way to get people's opinions. For example, you are in charge of planning an annual sales meeting and need to find out when most people are available to attend the meeting. Instead of emailing everybody in the sales organization, you could create a poll in the Sales Chatter group that lists possible dates and ask people to vote for the date that works best for them.

When you create a poll, anybody with access to the feed or the poll can vote on the poll. So when you post a poll, consider who you want to participate. For example, if you post a poll in a private group, only the members of that group can see the poll and vote. Keep the following in mind about polls:

- When you create a poll, you can add up to ten choices.
- When voting on a poll, you can only select one choice.
- Polls are anonymous. You can see how many people voted, but you can't see who voted.
- Click **Refresh** to see the latest poll result and the number of votes that were cast.
- You can't repost a poll.
- People can only cast one vote, but they can change their vote.
- You can mention someone and include hashtag topics in the poll question.
- You and others can add topics to your poll question after posting.
- The email notification options you enabled in your Chatter Email Settings apply to polls just as they do to posts. For example, if you get a notification whenever someone comments on a post you made, you also get an email notification when someone comments on a poll you posted.

 **Note:** The poll result doesn't always add up to 100 percent due to rounding. For example, if a poll has three choices and each gets one vote, the result adds up to 99 percent.

Filters for Sorting the Topics List

Use the topic filters to narrow the topics list to your favorite topics or topics you use, and then sort the topics by the number of people talking about them or alphabetically by name.

On the [Topics list](#), under Show, you can filter the topics.

All

All topics that have been added to posts in your organization

My Favorites

Topics you added to your favorites

Topics I Use

Topics you added to posts and topics on posts that you commented on

Within the topics you filtered, you can sort by the following columns.

People Talking About This

Sorts by the number of people talking about the topic. This includes:

- The number of people adding the topic to updates
- The number of people commenting on posts with the topic

Name

Sorts alphabetically by the topic name.

View Details about a Topic

View a topic detail page to see the topic description and a feed with topic updates from all users and public groups.

To open a topic detail page, click a topic or hashtag. On the topic detail page, you can:

- [Search a topic feed](#) to quickly find relevant information. Or scan the feed to learn about the topic and discover which people and public groups are interested in it.
 - Add a post directly to the topic feed. Your followers automatically see the post, and you can even add the post to a group you're a member of by using an @mention. Because you added the post on the topic feed, the topic is automatically added to your post.
 - Discover [who's knowledgeable](#) about the topic and endorse people you think are knowledgeable. If you appear in the Knowledgeable People list and you don't want to, you can hide yourself.
 - Click  **Follow** to follow the topic and see updates to the topic in your feed.
 - Edit the topic name and description. In the upper right, click , and choose Edit Details. You can change only the capitalization and spacing of topic names.
-  **Note:** Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.
- If available, find out more about a topic using the lists on the right.

Related Topics

Other topics that were added together with the current topic.

USER PERMISSIONS

To add existing topics to posts and comments:

- "Assign Topics"

To edit topic names and descriptions:

- "Edit Topics"

Groups Talking

Public groups and groups you're a member of that most recently used the topic.

Following Topics

Follow topics so you can see updates in your Chatter feed.

To follow a topic, click  **Follow** on the:

- Topic detail page
- Topics list

You can follow a maximum combined total of 500 people, topics, and records. To see how many items you're following, view the Following list on your profile.

To stop following a topic, click  next to Following. After you stop following a topic, you don't see future updates to the topic in your Chatter feed.

If your administrator disables feed tracking for topics, you can't follow new topics but you continue to follow the ones you followed when feed tracking was enabled. These topics count toward the maximum number of people, topics, and records that you can follow. To stop following a topic after your administrator disables feed tracking, you must use the Chatter REST API.

Find and Endorse People Knowledgeable about a Topic

Discover and recognize experts using the Knowledgeable People section of topic pages and the Overview tab of user profile pages.

The topic page shows the five most knowledgeable people based on their activity on the topic and recognition received for the topic. For example, Chatter considers how often people:

- Were mentioned in posts or in comments on posts with the topic
- Received likes on comments on posts with the topic
- Received endorsements for the topic

Endorsements are a strong signal of knowledge, so if someone endorses you, you're automatically included in the list of knowledgeable people.

 **Note:** Knowledgeable people are calculated and updated once a day.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

To change endorsements:

- Endorse someone you think is knowledgeable about a topic by clicking **Endorse** under the person's name. If the person you want to endorse doesn't appear in the Knowledgeable People section, click **Endorse People** to see the full list and to search for other people. (You can't endorse yourself, Chatter Free users, or customers.)
- Remove your endorsement of someone at any time by clicking  next to Endorsed under the person's name. Removing your endorsement of someone doesn't necessarily remove them from the knowledgeable people list; they might be endorsed by other people or have significant activity on the topic.

To remove yourself from the knowledgeable people list:

- Opt out by clicking **Hide me** under your name. No one can see you in the list after you hide yourself. If you change your mind, you can opt back in by clicking **Endorse People** and then **Show me** next to your name.

To see a person's full range of expertise:

- Navigate to their user profile page, and click the Overview tab. Then click topic names to see topic detail pages, or click thumbs-up icons to add or remove your endorsements.

 **Important:** If Work.com Skills are enabled, they replace knowledgeable topics on profile pages. (For Salesforce Communities users, skills replace topics only in the default community.) Self-declared skills are considered when calculating knowledge levels.

SEE ALSO:

[Skills Overview](#)

Add Topics to Posts

Add topics to posts to organize them or to increase their visibility. You can add topics to your own posts immediately after posting, or you can add topics to any posts at any time directly in the feed.

 **Note:** All topic names appear in the topics list and all topic names and descriptions are searchable, including topics used solely in private groups or on records.

 **Note:** When you add topics to posts that contain files, the topics are also added to those files.

1. In the top corner of the post, click .
2. Click **Add Topics** or **Edit Topics**.
3. In the topic editor, start typing your text. As you type, you can pick a topic from the list of suggestions, or keep typing to create your own unique topic. To add more than one topic, type a comma after each topic.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

Posts can have up to 10 topics.

4. When you're done adding topics, click **Done** or press ENTER.

The topics you add become links to the topic detail pages.

SEE ALSO:

[Add Hashtag Topics to Posts and Comments](#)

[Adding a Topic as a Favorite](#)

Add Hashtag Topics to Posts and Comments

Add topics to posts and comments to organize them or to increase their visibility.

For example, if you post that you're working on a sales presentation for your customer Universal Paper, you might want to add the hashtag topic **#Universal Paper** in your update. Anyone can click the topic to find out more information about Universal Paper and to see which people and groups are talking about Universal Paper.

 **Note:** When you add topics to posts that contain files, the topics are also added to those files.

To add a hashtag topic:

1. When writing an update, type # followed by any text. As you type, you can pick a topic from the list of suggestions, or press ENTER at any time to add a new topic that can be up to three words.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

2. Click **Share**.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To add existing topics to posts and comments:

- "Assign Topics"

To add new topics to posts and comments:

- "Create Topics"

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To add existing topics to posts and comments:

- "Assign Topics"

To add new topics to posts and comments:

- "Create Topics"

The hashtag topic becomes a link to the topic detail page. The topic (without the hashtag) is also automatically added to the top-level post in the update. For example, if you include **#Universal Paper** in a comment under your coworker’s post, the topic **Universal Paper** is added to your coworker’s post.

Once you post an update, the only way to remove a hashtag topic is to delete the entire post or comment. You can, however, remove the topic from the top-level post.

SEE ALSO:

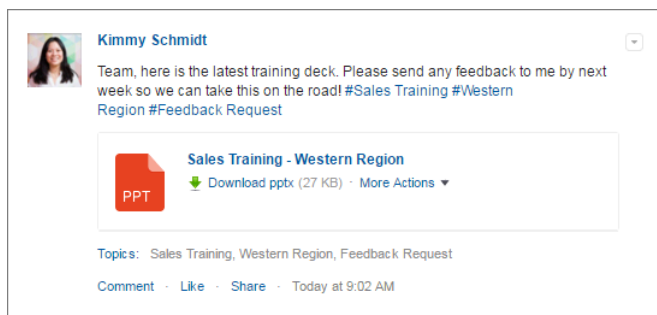

[Add Topics to Posts](#)

Add Topics to Files

Use topics to make files more visible. Topics added to feed posts are also added to any files in the post or its comments. When you search for those topics, the files are included in results.

To add topics to files posted in feeds, simply [add the topics you want to the feed post](#) on page 3196 where the file is attached. You can add regular topics or [hashtag topics](#) on page 3196. The topics are automatically added to any files attached to the post or its comments.

 **Note:** While Lightning Experience supports adding hashtag topics, searching and viewing topic details are available only in Salesforce Classic.

Example:

Since Kimmy added the topics *Sales Training*, *Western Region*, and *Feedback Request* to her post, these topics are also added to the file she attached. Now, her coworkers can click a topic to find other posts, files, and records associated with that topic. If the topic is associated with records other than files, go to the **Records** tab and choose **Files**. Otherwise, use the **Feeds** tab to see all posts and files for the topic.

USER PERMISSIONS

To add topics to files

- “Viewer” access to the file
- AND
- “Assign Topics” (to add existing topics)
- OR
- “Create Topics” (to add new topics)

Remove Topics from Posts

Remove a topic from a post if it no longer applies.

You can remove topics from posts in the feed, whether they're regular topics or hashtag topics. Removing topics doesn't delete them altogether; it only removes them from the post. Deleting the text of hashtags doesn't delete hashtag topics. Before you remove a topic from a post, consider whether you or someone else added it. Someone else may be tracking the update with topics you're not aware of.

1. In the top corner of the post, click .
2. Click **Edit Topics**.
3. Click  next to the topic you want removed from the post.
4. Click **Done** or press ENTER.

Removing a topic from a post removes the post from the topic feed on the topic detail page and from the feeds of any followers.

Adding a Topic as a Favorite

Add a topic as a favorite to quickly see the latest on the topics you're interested in.

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

1. Click a topic name to navigate to the topic detail page.
2. In the upper-right, click , and choose **Add to Favorites**.
The favorite name is the same as the topic name.

Tip: When viewing a topic favorite, you can click the topic name at the top of the feed to go directly to the topic detail page.

SEE ALSO:

[Viewing All Topics](#)

Viewing the Topics People Are Talking About

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

The topics you're talking about appear in your Chatter profile in the Recently Talked About section. This section helps people learn which topics you're knowledgeable about or interested in. These are the topics that you and others have frequently and recently (within the last two months) added to your posts and to posts you've commented on. For privacy reasons, Recently Talked About topics don't include topics used solely in private groups or record feeds. You can see up to five topics, with the most frequently and recently added topic appearing first. If you're new to topics or if you haven't used topics in the last two months, the Recently Talked About section doesn't appear until you start using topics more frequently. Click a topic in this section to see the topic detail page.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager**, and **Developer** Editions

USER PERMISSIONS

To remove topics from posts:

- "Assign Topics"

 **Note:** If the Knowledgeable About list or Work.com Skills are enabled, those features replace the Recently Talked About section on profile pages.

View the Topics Groups Are Talking About

The topics that a group is talking about appear on the group detail page in the Recently Talked About section. This section helps people understand which topics a group is knowledgeable about or interested in. These are the topics most frequently and recently added to group posts over the last two months. You can see up to five topics, with the most frequently and recently added topic appearing first. If a group isn't using topics, the Recently Talked About section doesn't appear until the group starts using topics more frequently. Click a topic in this section to see the topic detail page.

View Your Company's Trending Topics

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don't include topics used solely in private groups or record feeds.

Share Posts

Share a Chatter Post

Sharing lets you quickly copy a public post to your profile or a group. This feature is available in Salesforce Classic and Lightning Experience.

In Salesforce Classic, you can share public Chatter posts that contain text, links, or files. You can share to your profile, with a group, or using a link to the post. In Lightning Experience, you can share posts with your followers.

When you share a post, keep in mind:

- You can share a post to your own profile, but not to another person's profile.
- You can share the original post, including any files and attachments, but you can't share any comments or likes. In Lightning Experience, you share only the post; attachments, comments, and likes are not shared.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

- You can comment on the shared post, but you can't edit a shared post.
- You can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
- You can't share a post from a record feed.
- In Salesforce Classic, you can only share posts with a group you're a member of. In Lightning experience, you can't share posts with a group.
- In Salesforce Classic, you can share a post to a group that allows customers. However, customers and other group members can't share posts from a private group.
- Only Chatter users inside your company can see a post that you shared using a link in an email or instant message.

When someone shares your post, you receive an email notification. To change your email notifications, from Setup, enter *Chatter Email Settings* in the Quick Find box, then select **Chatter Email Settings**.

SEE ALSO:

[View a Single Chatter Post](#)

Share a Chatter Post to Your Profile

Copy a public post to your profile to share it with the people who follow you.

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.

1. Find the post you want to share in your Chatter feed.
2. Click **Share**.
3. Write a comment about the post or leave the comment field blank.
4. In the drop-down list, select **My profile**.
5. Click **Share**.
The shared post appears in the Chatter feed on your profile.

SEE ALSO:

[Post Visibility](#)

Share a Chatter Post with a Group

You can share posts with public groups and groups that you're a member of.

You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions. You can't share posts with archived or unlisted groups.

1. Find the post you want to share in your Chatter feed.
2. Click **Share**.
3. Type a comment about the post or leave the comment field blank.
4. In the drop-down list, select **A group**.
5. Type part of the group name and select the group from the list.

If you are sharing a post with a file, select **Viewers** to allow group members to only view the file, or select **Collaborators** to allow group members to download and modify the file.

6. Click **Share**.
The shared post appears in the feed of the group.

SEE ALSO:

[Post Visibility](#)

Share a Link to a Chatter Post

Share a post with other Chatter users via email or instant message.

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited,** and **Developer** Editions

When sharing a link to a post, keep in mind:

- You can't share a link to a post from a private group.
 - You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
 - To see the post, the people to whom you send the link to the post must be Chatter users.
1. Find the post you want to share in the Chatter feed.
 2. Click **Share**.
 3. In the top corner, click **Show link to post**.
 4. Copy and paste the link in an email or instant message and send it to the people with whom you want to share the post.
When recipients of the email or instant message click the link to the post, the post appears in their Chatter updates.

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

- Search for users by typing characters of a first or last name in the search box at the top of the page. The list automatically filters based on what you type.
- At the top of the list, click a letter to list everyone whose last name begins with that letter.
- Your organization's size determines what you see in the people list. For example, in the largest organizations, we don't display any users until you start searching for a person's name. We count all Salesforce user license types when calculating the approximate number of users, including internal users, Communities users, and Chatter users.

Approximate number of users	Defaults to view	All People filter defaults to
25 or fewer	All People	Everyone in the organization
26 to 25,000	Recently Viewed People	People whose profiles you recently viewed
More than 25,000	Recently Viewed People	No one until you start searching

- [Invite people](#) to join your Chatter network. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.
- View the people that Chatter recommends you follow. Click **More** in the Recommended People section to view all of your recommendations. If no recommendations appear, then you're already following all the recommended people.

Chatter, Profile, People, Groups, and Files tabs are available by default in the Chatter app. Select the Chatter app from the app menu in the top right corner of any page. If your administrator has added these tabs to other apps, you see the tabs in those apps unless you previously customized your display. In that case, add the tabs to those apps.

Profile Best Practices

When using profiles, consider these tips:

- Information in the About Me section is searchable and makes you more visible to others.
- Your posts display in your Feed tab and the feeds of people following you. To delete your posts from feeds, hover over the post and click .
- To change your email address in your contact information, you must click the link in the confirmation email sent to your new email address.
- Not all users have profiles. This includes portal users and the Connection User in organizations using Salesforce to Salesforce.

Use the Following and Followers Lists

View the Following and Followers lists on your profile to see who, what, and how many items you're following, and who is following you. If you're not following anyone, click **Find people to follow** in the Following list to view the People list and start following people. You can also view the Following and Followers lists on other people's profiles.

 **Note:** When your Salesforce admin enables Chatter, you automatically follow some users and records in your org.

In either list, click **Show All** to view the full list in alphabetical order.

- Use the **Next** and **Previous** links to see more of the list.
- Optionally filter the Following list by people or objects, for example, accounts or files.
- In your Following list, click  to stop following a person or record.
- In another person's Following list, click  **Follow** to follow a person or record.
- In any Followers list, click  **Follow** to follow a person, or  to stop following them.
- Click **Done** to close the window.

SEE ALSO:

[Post Visibility](#)

[People Recommendations](#)

People Recommendations

Chatter recommends people in your organization that you might want to follow based on similar interests. For example, Chatter recommends people who:

- Follow the same people as you.
- Are in your management hierarchy, such as your manager, people who report to your manager, and people who report to you.

Salesforce uses the `Manager` field on your personal information page to determine these recommendations. If this field is blank, Chatter won't recommend people based on your management hierarchy. Only your Salesforce administrator can edit the `Manager` field.

- Are popular, which means they have many followers.

EDITIONS

- Are new to Chatter.
- Are interested in the same records as you. For example, someone who has looked at or edited an account that you've recently viewed.
- Are often followed together with people you already follow. For example, if you follow Madison Rigsby, you get a recommendation for Suzanne Powell if many people who follow Madison also follow Suzanne.

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you're already following all the recommended people.

SEE ALSO:

[Chatter Profile Overview](#)

Give Thanks to Your Coworkers

Recognize your coworkers with badges and post your thanks directly to their Chatter feed.

-  **Note:** The Chatter Free license has limited functionality with Thanks features. Rewards features require a Work.com license. This includes giving, creating, or receiving badges tied to rewards.

Thank someone if they've done a great job or to recognize an achievement.

[Walk Through It: Give Thanks in Chatter](#)

1. From the Chatter publisher, click **Thanks**.
If **Thanks** isn't displayed, click **More** and select **Thanks** from the publisher's drop-down menu.
2. Type the name of the person you want to thank.
Currently, you can only thank one person at a time, but you can mention other people in your post's message.
3. Select **Change Badge** to select a different badge for your post or keep the default badge.
You can choose from twelve pre-defined badges. Select the badge image to see more information about the badge.
4. Type a message for the person you're thanking.
5. Select your audience.
 - **My Followers** to post to all your followers
 - **A Group** to post to a specific group. Search for the group and select the group from the list. The person you're thanking is @mentioned at the beginning of the post's message. When you post to a private group, only the group's members can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient's profile.
6. Click **Share**.

Your Thanks post appears in your feed and the feed of the person you're thanking. If you're posting to a public group or a record page, the post appears on the group or record feed and their profile. If you're posting to a private group, only members of the private group can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient's profile.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All Editions** that have Chatter enabled.

Files Owned Lists on Profile Pages

The Files Owned list on a person's profile shows the files that person most recently attached to a Chatter post.

The list includes files that the profile owner attached to a post on the profile, a group, or record page, or uploaded to Salesforce CRM Content libraries. Hover to see available options or click the file name to go to the file detail page.

Click **Show All** to see a list of all the files the profile owner attached and uploaded. The list doesn't include files you don't have access to, documents from the Documents tab, and attachments from the Notes and Attachments related list. On this list you can:

- Upload private files or share files with people, groups, or via a link
- Preview a file, if a preview is available
- Follow a file to receive updates in your feed
- Click the file name to view the file detail page

SEE ALSO:

[Filter Your Files List](#)

Chatter Activity and Influence

See your personal Chatter activity statistics, such as how many posts you've made and how many likes you've received, and check your relative Chatter influence.

Chatter activity statistics include how many posts and comments you've made, how many comments you've received, and how many people liked your posts and comments. Chatter influence shows how your activity stacks up to other people's.

- Top Influencers lead collaboration efforts by regularly sharing essential content.
- Active Influencers encourage others to get involved and share knowledge.
- Observers are quiet participants or just getting started in Chatter.

You can see your Chatter activity statistics and influence on your profile under your photo. You can also see your coworkers' Chatter activity and influence on their profiles. When viewing a profile, hover over  under the profile photo for details about how that person is uniquely influential.

Invite People to Join Chatter

You can invite people from your company that don't have Salesforce licenses to use Chatter. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

To invite people to Chatter:

1. Click **Invite People to Chatter** on the People page or **Invite Coworkers!** on the Chatter page.

 **Note:** You can only invite people with email addresses in your company's domains. Portal users can't send invitations.

2. To send invitations from Chatter, enter email addresses and click **Send**.
3. To send invitations using your own email account, click **send your own email invitation**. If you have a default email client set, an email containing an invitation link opens in your mail program. Otherwise, you see an invitation link that you can copy and paste into an email.

You can also invite coworkers to join a public group even if they don't use Chatter yet. Additionally, owners and managers of private groups can send invitations. If customer invitations are enabled, owners and managers can also invite [customers](#). When someone accepts an invitation to join the group, they join Chatter as well.

1. Click **Groups** and click on a group name.
2. In the Members section on the group detail page, click **Invite People**.

If you are the group owner or manager, you can also click **Add/Remove Members**, then click **Invite them to Salesforce Chatter!**.

3. Enter email addresses and click **Send**.

 **Note:** If a user doesn't accept the invitation within the first day, Chatter sends an email reminder the second day. If the user doesn't accept that invitation, Chatter sends another reminder the following day.

A user has up to 60 days to accept an invitation to join Chatter. If during that time, an administrator deselects **Allow Invitations** or removes the user's domain from the list, the user can't accept the invitation.

When delegated authentication single sign-on is enabled in your organization, invited users bypass the password registration page. If their username already exists, they won't be able to accept the invitation.

USER PERMISSIONS

To deactivate Chatter Free users:

- "Moderate Chatter"

Automatically Follow Records You Create

When you follow records you create, updates are sent to your Chatter feed when you or someone else changes a tracked field on those records.

In Lightning Experience, you follow the records you create by default. In Salesforce Classic, you don't automatically follow the records you create. If you want to automatically follow the records you create, enable auto-follow in your Chatter Settings.

1. From your personal settings, enter *My Feeds* in the **Quick Find** box, then select **My Feeds**.
2. Select **Automatically follow records I create**.
3. Click **Save**.

Consider the following tips around auto-following records:

- When you create a child record, the owner of the parent record becomes the owner of the child record by default. So you don't automatically follow the child record, unless you're the owner of the parent record.
- The **Account Owner** field of a record is updated to change the account owner. The new account owner only follows the account automatically, if the **Account Owner** field is feed-tracked and the new account owner has auto-follow enabled.
- If a workflow changes the **Account Owner** field while the record is created, the user who created the record doesn't automatically follow the account.

Consider the following scenario. You are creating a record. Saving the record starts a workflow that immediately reassigns the **Account Owner** field to another user and then saves the record. Meaning, the workflow changes the **Account Owner** field before the record is saved. In this case, you don't follow the record automatically, because you never were the record owner, even though you technically created the record.

- [Record Recommendations](#)

Viewing Record Feeds

View the Chatter feed associated with a record you follow to see updates about the record.

Available in both: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited**, and **Developer** Editions

Record feeds allow you to track information for records you have access to. On the record detail page, click **Show Feed** to display the record feed above the account details.

-  **Note:** Access is all-important. For example, let's say you reassign a record and then realize it needs an update. Often, you can open and update the record. But if, after the reassignment, you no longer have access, then you won't be able to see or update the record.

In the record feed, you can

- View posts, comments, and tracked field changes.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer**, and **Database.com** Editions.

USER PERMISSIONS

To view a record:

- "Read" on the record

- Write an update about the record and share it with other people who follow the record.

Updates on the record detail page also appear on the Chatter page of people who follow the record. Anyone who has access to the records can see the update in the All Company (Salesforce Classic) feed. They may see the update in the Company Highlights (Lightning Experience) feed, depending on the update's popularity ranking and engagement (such as comments, likes, and views).

- See who is following the record.
- Search the [record feed](#) ().

 **Note:** Record field changes in the feed aren't included in search results.

Can I create a custom report for records I'm following?

Currently, you can't customize a report based on records you're following in Chatter.

SEE ALSO:

[The People and Records You Auto-Follow Initially](#)

Can other people follow records I own?

Yes, provided that they can already see the record. People can only follow records they can see, and by extension, can only see updates to records they can see.

SEE ALSO:

[Record Recommendations](#)

Record Recommendations

Following records helps keep you up-to-date on important changes to accounts, contacts, opportunities, and more. Chatter recommends records that you've viewed or edited, records that you own (and aren't already following), and parent accounts of records that you're following.

Chatter won't recommend records that your Salesforce administrator has disabled feed tracking for. Only opportunities, accounts, leads, contacts, and articles are included in record recommendations.

To see an expanded list of your recommendations, click **More** in the Recommendations section. To see your record recommendations by object, click the object in the side filters. For example, click **Accounts** to view only your account recommendations.

If no recommendations appear, then you're already following all the recommended records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Viewing Chatter Feeds on List Views

Switch to an object's Chatter feed directly from a list view to see updates for the records included in the list view.

If Chatter is enabled for your organization, Chatter feeds on list views are available for most feed-tracked objects. Some feed-tracked objects don't have a Chatter feed associated with their list view. Currently, you can view Chatter feeds on list views for opportunities, accounts, cases, leads, campaigns, contacts, and custom objects.

- Click  **Feed** on a standard or custom object list view to see a Chatter feed with updates from the last 30 days for the records included in the list view.
If drag-and-drop scheduling on list views is enabled, you won't see Chatter feeds on the list views for accounts, contacts, or leads.
- Click **List** to display the list view again.

SEE ALSO:

[Viewing Record Feeds](#)

Adding a List View as a Chatter Favorite

Add a list view as a Chatter favorite to monitor key business processes directly from your Chatter tab.

1. Open an existing list view or create a list view for a set of records, like for example accounts, opportunities, or leads.
2. Click  **Feed** in the top-right corner to see the Chatter updates for the list items.
3. Click **Add to Favorites**.
The favorite name on the Chatter tab is the same as the list view name.

Dashboards and Dashboard Components

Follow Dashboards and Dashboard Components

If feed tracking is enabled for dashboards, you can view updates and field changes in the Chatter feed.

Only unfiltered data is used to generate alerts. This prevents alerts being sent out (incorrectly) because a component's value appeared to cross a breakpoint as a result of filtering.

If you don't see feeds, ask your administrator to enable feed tracking for dashboards.

For example, to receive alerts when total sales for a gauge fall below a certain amount, set conditional highlighting on that component, then follow it.

1. To follow a dashboard, click **Follow**.

When you follow a dashboard in Salesforce Classic, you automatically follow all eligible components.

When you follow a dashboard in Lightning Experience, you don't follow any components.

2. Optionally, to follow a specific dashboard component, if necessary, switch to Salesforce Classic.

Hover over a component to display the  menu. Then, click **Follow this Component**.

To clear the hover menu, click an empty part of the screen.

To stop following a component, click  and select **Following**.

Take note of these limitations to following dashboards and dashboard components.

- Lightning Experience doesn't support following components. To follow dashboard components, switch to Salesforce Classic.
- Dynamic dashboards don't support following components.

SEE ALSO:

[Viewing Record Feeds](#)

About Posting Snapshots to User and Group Feeds

When you post a component snapshot to a Chatter feed, consider who you would like to share and comment on the component.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed. Post a component snapshot to a user or group feed to share and comment on that component. For example, post a snapshot of this month's sales to your team.

Each snapshot has a "Viewing As" label. This is the name of the running user whose dashboard component you're viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they're taken to your filtered view of the dashboard if the filters are still valid. If the filters aren't valid, they see the unfiltered dashboard.

If you don't see the option to post a snapshot, talk to your administrator about enabling dashboard component snapshots.

 **Important:** Posting a snapshot to a user or group feed makes it potentially visible to the entire organization:

- Posting to a user feed makes the snapshot public. Anyone who views that user's profile can see it.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view dashboards:

- "Run Reports" AND access to dashboard folder

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- Posting to a public group makes the snapshot public. Anyone who views your profile or the group feed can see it.
- Posting to a private group shows the snapshot to all group members.

People can see it whether they have access to the dashboard or not. Make sure the component doesn't contain sensitive information!

SEE ALSO:

[Follow Dashboards and Dashboard Components](#)

Posting Snapshots of Dashboard Components to Chatter

Post a snapshot of a dashboard component to a Chatter feed to help other users follow changes in the data.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed.

- Post a component snapshot to its dashboard feed to share information with everyone following the dashboard. For example, post a snapshot of a regional sales chart to let your team know that sales are down in the Midwest.
- Post a component snapshot to a user or group feed to spark comment or action from that user or group.

Each snapshot has a “Viewing As” label. This is the name of the running user whose dashboard component you’re viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they’re taken to your filtered view of the dashboard if the filters are still valid. If the filters aren’t valid, they see the unfiltered dashboard.

If you don't see feeds, ask your administrator to enable feed tracking for dashboards.

1. In Salesforce Classic: Hover over a component to display the  menu. To clear the hover menu, click an empty part of the screen.
In Lightning Experience: First expand a component by clicking , then click **Share**.
2. In Salesforce Classic: Choose where you want your snapshot to appear.
 - To show it in a dashboard, click **Post Snapshot to Dashboard Feed**.
 - To show it to a user or group, click **Post Snapshot to User or Group Feed**.
 In Lightning Experience: Choose where you want to share your snapshot.
 - To share it in the dashboard feed, click **This dashboard**.
 - To share it with a group, click **A group**.
 - To share it on your own feed, click **My followers**.
3. Write a comment in the text box. In Salesforce Classic, click **OK**. In Lightning Experience, click **Post**. If you’re posting a filtered component, you may want to mention that in your comment.

The snapshot and comment immediately appear in the dashboard, user, or group feed.

 **Note:** Snapshot images display in feeds for four months. After four months, only the comments remain.

Collaborate in Chatter Groups

Use public, private, or unlisted Chatter groups to collaborate with specific people in your company.

Chatter Groups

Chatter groups let you collaborate with specific people. For example, if you're working on a team project, you can create a group for your team to share project-related files and information. Group feeds in Lightning Experience are live feeds that update in real time. They don't require a page refresh to update.

Unlisted Groups Overview

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the "Manage Unlisted Groups" permission can access unlisted groups in list views, feeds, and search results.

Broadcast Groups

Broadcast groups are a special type of public, private, or unlisted group where only group owners and managers can create new posts. Group members can comment on the posts created by the group owner or manager.

Using the Chatter Groups Page

The Groups page displays a list of the Chatter groups in your company.

Join or Leave Groups

Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

Chatter Groups

Chatter groups let you collaborate with specific people. For example, if you're working on a team project, you can create a group for your team to share project-related files and information. Group feeds in Lightning Experience are live feeds that update in real time. They don't require a page refresh to update.

You can join up to 300 groups, and your company can have a total of 30,000 groups. Chatter groups have different levels of access:

- **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
- **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's [owner or managers](#). Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
- **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
- Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.

After you allow customers in a group, you can't change the group access level.

If your administrator has enabled the archive feature, some groups can be archived. When a group is archived, users can't create posts but group data is retained for reference.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

 **Note:** Live group feeds is a new feature in Lightning Experience with lots of potential for enhancement and a few known issues.

- Content posted to the group is live, but mentions are not. If you post to group A, the post is live. If you mention group A in another feed, group A requires a page refresh to show that mention.
- When a group has a new post, you receive notifications only in Lightning Experience.
- When new comments are made on a feed post that you're engaged in, you receive notifications only in Lightning Experience and only when you're actively typing comments or you've clicked into the comments box.
- The number of participants supported in a live feed depends on your org's subscription limits. If you're not getting a live group feed or live comments, refresh the page or click in a comments field. If the feed still isn't live, looks like your org has hit its limit! You can still get updates the old-fashioned way by refreshing the page.
- If you're in a group feed that seems not to be live anymore, this is a known issue that we'll resolve!

[What Your Chatter Group Role Allows You To Do](#)

[About Chatter Customers in Private Groups](#)

[Live Feeds](#)

Unlisted Groups Overview

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the "Manage Unlisted Groups" permission can access unlisted groups in list views, feeds, and search results.

Unlisted groups are similar to private groups, in that, only members can view an unlisted group's detail page, feed, or files. However, unlisted groups provide more privacy compared to private groups.

- Unlisted groups don't display in list views, feeds, and search results for nonmembers. Only members and users with the "Manage Unlisted Groups" permission can find and access unlisted groups.
- Nonmembers can't visit the group detail page.

(With private groups, nonmembers can see a truncated version of the detail page, which shows the name, description, and member list, but not the feed or files.)

- You can convert unlisted groups to public or private groups, but not the other way around.
- Only group owners, group managers, and users with the "Manage Unlisted Groups" permission can add group members. Users can't ask to join them.
- Users can't see unlisted groups on other user profiles unless they have access to the group.
- Files shared in unlisted groups are visible only to the members of the unlisted group. If the file is shared outside the unlisted group, then other users with permissions can update the file.
- Even users with the "Modify All Data" or "View All Data" permissions can't access an unlisted group or its files unless they're members. They also can't change group settings unless they own or manage the group.
- Only users with the "Manage Unlisted Groups" permission can access or modify unlisted groups and its files and feed content without membership.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Limitations

If you decide to create an unlisted group, make sure that you consider these limitations.

- Custom pages or third-party applications integrated with Salesforce could expose unlisted group information to users who don't have access via the Salesforce UI. Check in with your administrator about who can access information in unlisted groups in your organization.
- You can't use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn't created, and the link won't work.
- You can't mention unlisted groups in posts or comments.

SEE ALSO:[Enable Unlisted Chatter Groups](#)[Unlisted Group Limitations](#)

Broadcast Groups

Broadcast groups are a special type of public, private, or unlisted group where only group owners and managers can create new posts. Group members can comment on the posts created by the group owner or manager.

By restricting the ability to post, group owners and managers can keep group discussions focused and relevant by cutting down noise from off-topic posts. Public, private, and unlisted groups support this feature.

To set a group to broadcast mode, select **Broadcast Only** in the group settings.

 **Example:** Creating broadcast groups are ideal when one person or a fixed set of individuals regularly needs to communicate or share information with a large group of people. Some examples include:

- Organization-wide updates from the executive leadership in the company
- Policy changes from your company's HR department
- Event updates from the organizer of large events or company conferences
- Important action alerts from key IT personnel, including their awesome Salesforce administrator

Broadcast group setting in Salesforce Classic.

Group Edit
Release Coordinators

Save Cancel Archive Delete

Basic Information

Group Name: Release Coordinators

Owner: Gordon Johnson

Description: A group to coordinate among all teams involved with the Winter '16 release.

Automatic Archiving:
 Archive this group if there are no posts or comments for 90 days.
 Don't automatically archive this group.

Group Access

- Public** Everyone can see updates and join.
- Private** Only members can see updates. Membership requires approval. [i](#)
- Unlisted** Group is hidden from lists, feeds, and search. Only members and users with the Manage Unlisted Groups permission can see updates. [i](#)
- Allow Customers** You can invite customers to this group. [i](#)
- Broadcast Only** Only group owners and managers can create new posts. Group members can comment on the posts. [i](#)

Save Cancel Archive Delete

Broadcast group setting in Lightning Experience.

- **My Archived Groups** shows the archived groups you belong to, own, or manage.

Click a column header to sort the list. The Group column sorts by group name; the Last Activity column sorts by the date of the last post or comment on a group; the Membership column sorts based on your membership status.

Search for a group

Search for groups by typing two or more letters of a group name or description in the **Find Groups** box. The list automatically filters based on what you type.

View a group

Click a group name to view the group. You can view all groups, but you'll only see updates and files for public groups, and for private groups you belong to. Groups that [allow customers](#) say (With Customers).

Join a public group or ask to join a private group

Click **Join** to join a public group. For private groups, click **Ask to Join** to email a request to join to the group's owner and managers. Users with the "Modify All Data" permission can directly join private groups, and therefore see **Join** for private groups.

Leave a group or withdraw a request to join a group

Click **x** to leave a group or to withdraw a request to join a group.

View the group owner's profile

Click a group owner's name to see his or her [profile](#).

Get a group recommendation

View the groups that Chatter recommends you join based on the group's popularity and the number of connections you have in the group in the Recommendations section. Click **More** to see the full list. If you don't see recommendations, you already belong to all the recommended groups.

SEE ALSO:

[Group Files Lists](#)

Join or Leave Groups

Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

1. Go to group's detail page.
2. To join a public group, click **Join** or **Join Group**. To join a private group, click **Ask to Join**. Your request is sent to the private group's owner and managers, who accept or decline your request.

You can join up to 300 groups. All groups count toward this limit, except archived groups. For example, if you're a member of 300 groups, of which 10 are archived, you can join 10 more groups.

To leave a group you joined or withdraw your request to join a private group, go to the group detail page and click **x** or **Leave Group**. If you don't see these options, ask your Salesforce admin to adjust the page layout.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Create and Manage Groups

Create Chatter Groups

Create public, private, and unlisted Chatter groups to collaborate with your teams and work together on projects.

- Navigate to the list of groups.
 - In Salesforce Classic, click the **Groups** tab.
 - In Lightning Experience, click  in the navigation menu.
- To the upper-right, click **New Group**, and enter a group name and description.

 **Note:** Group names must be unique across public and private groups. Unlisted groups don't require unique names.

If Communities is enabled, public and private group names must be unique within the community.

- Select an access level:
 - Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
 - Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's [owner or managers](#). Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
 - Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
 - Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.
After you allow customers in a group, you can't change the group access level.
- Optionally, if your administrator has enabled group archiving, change the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.
- Click **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

USER PERMISSIONS

"To create groups"

- "Create and Own New Chatter Groups"

 **Note:** You **own** groups you create. To assign a new owner, finish creating the group, then [edit the group settings](#).

SEE ALSO:

Edit Group Settings

Edit the group settings to change the owner, modify archiving settings, group access level, and delete the group.

You can edit settings for Chatter groups you own or manage.

1. Click **Group Settings** on the group detail page in the Salesforce Classic. In the Lightning Experience, click **Edit Group** from the buttons in the group header.
2. Optionally, edit the group name and description.
3. Optionally, type a name or click the lookup icon to search the group members to assign a new **Owner**. Only the current owner or people with the "Modify All Data" permission can change the owner, and you must choose the owner from existing members. Customers can't own groups.
4. Optionally, if your administrator has enabled archiving for groups, edit the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.
5. Optionally, change the access level for the group. For example, you can convert an unlisted group to a public or private group if you want to open it up to a wider audience.

 **Note:** If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can't be converted to other group types.

- **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
- **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's **owner or managers**. Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
- **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
- Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.
After you allow customers in a group, you can't change the group access level.

6. Click **Save**.

Customize Groups

Use record types to create group types with the layout and branding you want, and use them to create custom groups.

Creating a group record type creates a Group Type that users can choose when they create Chatter groups.

1. From Setup, enter *Groups* in the *Quick Find* box, then select **Record Type**.
2. Click **New**.
3. Choose an existing record type as the basis for the new group type.
4. Choose a label and the name of the new record type. The label is what appears when users select a group type and the name is the unique API name.
5. Enter a description, which is visible to users.
6. Select **Active** to activate the record type.
7. Select **Enable for Profile** next to a profile to make the record type available to users with that profile. Select the checkbox in the header row to enable it for all profiles.
8. Click **Next**.
9. Choose a page layout option to determine what page layout displays for records with this record type.
10. Click **Save**.

EDITIONS

Available in: **Lightning Experience**

USER PERMISSIONS

To create record types for groups:

- "Create and Edit Record Types for Groups"

Can I change a group's access level, for example, to make a private group public?

If you're a group owner or manager, you can change groups from private to public, or from public to private by [editing the group settings](#). If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can't be converted to other group types. You can't change the group access level for private groups that allow customers.

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

Add and Remove Chatter Group Members

Own or manage a Chatter group? Here's how you add or remove group members.

1. In Salesforce Classic, on a group detail page, click **Add/Remove Members**. In Lightning Experience, click **Add Member** from the group highlights panel (your administrator must add this quick action to the group publisher).
2. Start typing the name of the user you want to add or remove to filter the list of users.
3. Click **Add** to add a member, or **x** to remove a member. For people who have requested to join, click **Accept** to accept the request, or **x** to decline.
4. Click **Done** when you're finished.

SEE ALSO:

[View Chatter Group Members](#)

Accept or Decline Private Group Requests

z

As the owner or manager of a private Chatter group, you can accept or decline requests to join the group. Additionally, users with the "Modify All Data" permission can view and manage requests for all public and private groups, and users with "Manage Unlisted Groups" can manage group membership requests for all unlisted groups in the organization.

1. View the list of requests by doing one of the following:
 - On a group detail page, click the **Request** link, for example, **3 Requests**
 - On a group detail page, click **Add/Remove Members** and then click the **Requests** filter, or scan for requests in the **Everyone** filter
 - Click the link provided in the email request

2. Accept or decline the requests.

Note: An email is sent to each person to tell them that their request was accepted or declined.

- Click **Accept** to accept. If there are more than two requests, you can accept them all by clicking **Accept x of y**, for example, **Accept 3 of 3**.
 - Click **x** to decline. Optionally enter a message that will be included with your decline email and click **Send**. If you change your mind, you can click **Cancel** to go back.
3. Click **Done** to close the window.

If you make a private group public, any pending requests are automatically accepted.

Group Roles

What Your Chatter Group Role Allows You To Do

This table describes the actions that can be performed by members, managers, and owners of public and private Chatter groups. [Customers](#) can be group members and managers, but not owners.

Action	Owner	Manager	Member
Post, comment, and search group feeds	Yes	Yes	Yes
Add and remove records in groups (if configured)	Yes	Yes	Yes
Post group announcements	Yes	Yes	
Delete posts and comments	Yes	Yes	
Add and remove members	Yes	Yes	
Change member roles	Yes	Yes	
Edit group settings	Yes	Yes	
Edit the Information field	Yes	Yes	
Archive groups and activate archived groups	Yes	Yes	
Change group owner	Yes		
Delete group	Yes		

Users with the “Modify All Data” permission can perform all actions on all private and public groups, and users with the “View All Data” permission can view details of all private and public groups, regardless of membership.

Additionally, in unlisted groups:

- Users with the “Manage Unlisted Groups” permission can find and perform all of these actions in unlisted groups, even if they aren’t members.
- Users with the “Modify All Data” or “View All Data” permission can only find and access unlisted groups if they are members. Unlike public and private groups, users with the “Modify All Data” permission can’t perform group owner actions in unlisted groups. They can perform group manager actions if that role is assigned to them in the unlisted group.

Change Chatter Group Roles

To change Chatter group [roles](#) for groups you own or manage:

1. Click **Change Roles** on a group detail page.
2. To search for members, start typing in the search box. Optionally sort the list by toggling between **Managers** and **All Members**.
3. Select the Manager checkbox for people you want to be managers. If a customer is selected as a manager, they will be able to see people who ask to join the group, even if they aren't in other common groups, and will be able to approve requests.

 **Note:** To [change the group owner](#), you must own the group. Users with the “Modify All Data” permission can also change the owner in public and private groups, and users with the “Manage Unlisted Groups” permission can do this for unlisted groups. Click the **Group Settings** link next to the current owner to assign a new owner.

4. Click **Done**.

SEE ALSO:

[What happens when the owner of a Chatter group is deactivated?](#)

What happens when the owner of a Chatter group is deactivated?

The deactivated user still owns the group, but a user with the “Modify All Data” permission can assign a new owner for a public or private group. In the case of unlisted groups, a user with the “Manage Unlisted Groups” permission can assign a new owner.

[Change Chatter Group Roles](#)

Archiving and Activating Chatter Groups

Archived Chatter Groups

When a Chatter group is archived, group members can no longer post content or share files with the group. Previous posts, comments, and files remain available in the group.

Users can still comment on existing posts, mention people, and search the feed in archived groups. Users can also join and leave archived groups, create reports that include archived groups, and use global search to find archived groups and their content. Group owners and group managers can [archive](#) groups, [activate](#) them, and [enable and disable automatic archiving](#) at any time. Users with the “Modify All Data” permission can perform these actions on public and private groups in their organization. Users with the “Manage Unlisted Groups” permission can perform these actions on unlisted groups.

Archived groups allow users to focus on the active groups in your organization:

- Archived groups don't count toward a user's group membership limits.
- Posts from archived groups don't display in Chatter feeds, unless someone adds a comment. Posts with new comments display in the All Company (Salesforce Classic) feed. They may display in the Company Highlights (Lightning Experience) feed, provided they rank highly due to their popularity or degree of engagement (such as their comments, likes, and views). Posts with new comments also display in the feed of each group member.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- File and feed sharing is limited to active groups only, making group searches more efficient.
- Archived groups display only in My Archived Groups and not in the Active Groups list.

 **Example:** Archiving the group is useful for groups that have little or no feed activity, but contain useful information that you want to retain. Some examples include:

- A group that a sales team created while pursuing a deal. Though there probably won't be much group activity after lead conversion, the sales team can still access important information about the customer.
- A group used for planning a company event. It can be archived after the event to reuse vendor information and planning discussions.
- A service desk type group used to track key issues for a major deployment for a customer. Archiving it after deployment issues are ironed out still gives support agents access to relevant information for future troubleshooting.
- When a new group replaces a legacy group with the same or broader purpose, the legacy group can be archived to redirect traffic to the new group.
- Team groups can be archived when a team changes or team members leave the company, while preserving team discussions for future reference.

Turning off automatic archiving is useful for groups that contain important information but aren't updated on a regular basis, like a group used for company-wide announcements. Groups without activity for more than 90 days won't get archived, and users won't miss any important posts.

Archive Chatter Groups

Archive a group manually or edit automatic archiving settings.

Feed activity in groups is reviewed on a weekly basis. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. Mentioning a group doesn't count as feed activity and doesn't delay group archiving. Group owners, group managers, and users with the "Modify All Data" permission can manually archive or edit automatic archiving settings for groups at any time.

1. Click **Group Settings** on the group detail page in the Salesforce Classic. In the Lightning Experience, click **Edit Group** from the buttons in the group header.
2. Configure archiving for the group in one of two ways:
 - Click **Archive** to archive the group right away.
 - Select **Archive this group if there are no posts or comments for 90 days** and click **Save** to set up automatic archiving.

After you archive a group:

- The publisher on the group page is hidden and members can't create new posts or share files in the group.
- The group no longer appears in the Active Groups filter on the Groups tab.
- Previous group posts and comments no longer appear in the Chatter feed, unless someone adds a comment. Posts with new comments display in the All Company feed (Salesforce Classic) and the feed of each group member. They may appear in the Company Highlights feed (Lightning Experience), depending on the post's popularity ranking and engagement (such as likes, comments, and views).

Use the **My Archived Groups** filter in the Groups list to find the archived groups that you own, manage, or belong to. You can also use global search to find archived groups or associated content. Note that archived groups don't count toward your group membership limit.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

 **Note:**

- Group members don't receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- If your administrator disables archiving for groups, you can't archive groups or edit automatic archiving settings. You can activate archived groups at any time, even if the feature is disabled.

SEE ALSO:

[Archived Chatter Groups](#)[Activate Archived Chatter Groups](#)

Activate Archived Chatter Groups

Group owners, group managers, and users with the "Modify All Data" permission can activate an archived Chatter group from the group detail page.

1. Navigate to the group you want to activate.
 - Use the **My Archived Groups** filter on the Groups list view to find the archived groups you own, manage, or belong to.
 - To find other archived groups, use global search, run a report, or ask your administrator for help.
2. Click **Activate** on the group detail page. You can also activate an archived group from the group settings page.

After a group is activated, the group detail page displays with the publisher enabled so members can create new posts and share files with the group.

 **Note:**

- Group members don't receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- You can only activate one group at a time. To activate multiple groups at once, use the Salesforce API.

SEE ALSO:

[Archived Chatter Groups](#)[Archive Chatter Groups](#)

Delete Chatter Groups

Only the group owner and users with the "Modify All Data" permission can delete a group.

In Lightning Experience, you can delete the group by clicking **Delete Group** from the buttons in the group highlights panel.

In Salesforce Classic:

1. Edit the group settings. Click **Group Settings** on a group detail page.
2. Click **Delete**.
3. Click **OK**.

Deleting a group permanently deletes the updates of the group, including any links posted to the group. When you delete a group that includes files, you're not deleting the files, just the references

EDITIONS

Working in Chatter Groups

Get Familiar with Your Chatter Group

Click a group's name in a feed, in the Groups list, or on someone's profile to see the group's updates, files, and group members.

How much detail you see and what you can do on a group's page depends on the type of group, whether you're a member, owner or manager of the group, and on your group role.

Non-Members of Public Groups

If you're viewing the group detail page of a public group you're not a member of, you can

Post and comment

Type an update above the feed or comment below a post in the feed and click **Share**.

Join the group

Click **Join** to join the group.

View group description and information

The group description and information display in a separate column next to the feed.

View the group's members

The Group Members section shows the group's current members, including any customers invited to the group.

View, download, and search files posted to the group

Files posted to the group feed or shared with the group appear in the Group Files section.

View the topics the group is talking about

The group's topics display below posts in the group feed.

Search for group information

Click  above the feed to search for information in the group.

Non-Members of Private Groups

If you're viewing the group detail page of a private group you're not a member of, you can only

Ask to join the group

Click **Ask to Join** to send an email to the owner and managers of a private group requesting to join.

View the group's picture and description

The group description displays below the group photo.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

View the group's members

The Group Members section shows the group's current members, including any customers invited to the group.

Nonmembers of Unlisted Groups

If you're not a member of an unlisted group, you can't view the group detail page.

Group Members of Public, Private, and Unlisted Groups

When you're a member of a public, private, or unlisted group, you can also

Change Email Settings and In-App Notifications for Salesforce1 Mobile Apps

In Salesforce Classic, click **Email Me...** to be emailed about activity in the group, either every time someone posts, daily, or weekly. Selecting **Every Post** also turns on in-app notifications for groups in the Salesforce1 mobile apps. To stop receiving email and mobile notifications for the group's activity, click **Turn Off Group Email**. Click **Email Settings** to modify all your Chatter email settings.

In Lightning Experience, click **Email Notifications** from the group highlights panel to modify your group email settings.

Invite People

If your administrator has enabled invitations, click **Invite People** to [invite people not using Chatter](#) to join the group. For private groups, only the group manager, group owner, or users with the "Modify All Data" permission can invite people. For unlisted groups, only the group manager, group owner, or users with the "Manage Unlisted Groups" permission can invite people.

Leave the group

Click , or to withdraw a request to join a private group. To leave a group you own, you must first [assign a new owner](#).

Group Owners and Group Managers

When you're the owner or manager of a public, private, or unlisted group, you can also

Add or remove group members

Change the group photo

Edit group settings

Edit the Information section

Click **Add Information** or  in the Information section to add additional information for the group's members. You can customize this section, including its title, to say anything you want.

Edit the Description section

Click **Add Description** or  in the Description section to add a description of the group.

Change member roles

Accept or decline requests for private groups

[Group Files Lists](#)

View Chatter Group Memberships

The Groups list on your profile shows you the Chatter groups you belong to, sorted by the most recent activity date. You can join or create groups on the groups tab. You can also view the Groups list on other people's profiles to see their group memberships.

 **Note:** On other people's profiles, you can see unlisted group memberships only if you're also a member.

- To view the full list in alphabetical order, click **Show All**.
- To see more of the list, use the **Next** and **Previous** links.
- To leave a group or withdraw a request to join, click .
- To join a public group on another person's groups list, click **Join**.
- To send a request to join a private group on another person's groups list, click **Ask to Join**.
- To close the window, click **Done**.

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

View Chatter Group Members

The Members section on a Chatter group page shows all of the members of a group, including customers.

1. Click **Show All** in the Members section to view the full group member list in alphabetical order. In the Members window, you can:
 - Filter the list to see all members, managers, or the owner
 - Use the **Next** and **Previous** links to see more of the list
 - Search using the `Find Members` search box
 - Click **Follow** or  next to a person's name to start or stop following them. You can't follow customers.
2. Click **Done** to close the window.

Chatter Group Recommendations

Chatter recommends groups that you might want to join based on:

- The popularity of the group determined by the number of members.
- The number of people you're following in the group. Chatter recommends groups with the most members you're following.
- If the group is new (created in the last month).

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you already belong to all the recommended groups. Hover over the recommendations and click  to dismiss them, and they won't appear again.

Use Email to Post to Chatter Groups

Email your posts to Chatter groups you have access to.

If your admin has enabled this feature, you can email your posts to any public group. Additionally, your admin can allow you to include attachments. You can email posts to a private or unlisted group only if you're a member. You must use the email address associated with your Salesforce user account.

1. In Salesforce Classic, from the group detail page, click **Post by email** below the group description to launch a blank email to the group using your local email client.
2. Type your message in the email body, including attachments if needed, and send the email. Attachments to the email are added as files in Chatter and shared with the group.

The email content displays as a post on the group detail page. Any hashtags you include in the email body (for example, #TeamExcellence) are converted to topics on the post. If more than one attachment is included with the email, the first attachment is included as part of the post. Additional attachments are added in comments.

 **Tip:** Save the group's email address as a contact in your mail client or mobile device for easy access in the future. If you copy and paste the mailto: link directly into the contact's email field, some mail clients may consider the link invalid and prevent you from sending email to the contact. Try removing the parenthetical group name from the first part of the email address. For example, remove (My Group) from (My Group) 0f9b00000004cmkaq@post.k-pxyvmac.kp0.chatter.salesforce.com.

The following limitations apply to posting to a group using email:

- The 10,000 character limit for Chatter posts applies to posts created using email. Any text in your email beyond this limit is not included in the post.
- The maximum message size is 25 MB, including text and attachments.
- The email subject is not included in the post.
- You can create text posts using email and include links in the text. You can also include up to 25 attachments. You can't mention people, create polls, or give titles to links when posting to the group by email.
- Character-level formatting, such as the use of bold or different type sizes, is not supported.
- Email addresses must be unique at the group level. If multiple user profiles in your organization use the same email address, and that email address is used to post to a group, then the user profile associated with that particular group is used for the post in the group feed. If the email address is shared between multiple user profiles in the same group, the email is blocked.
- Signature text is treated as part of your post. Default signatures inserted by mobile devices, such as *Sent from my iPhone*, are automatically removed. Before sending your email, delete custom signatures and any extra text you don't want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
 - Dash (–)
 - Equal sign (=)
 - Underscore (_)

You can also use any combination of these characters or dash dash space (– –), which respects [RFC 3676 4.3](#).

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Post Announcements in Chatter Groups

Post group announcements to highlight important messages on the group page.

 **Note:** Groups display the global publisher layout by default. If the Announcement action doesn't appear in groups, ask your administrator to override the global publisher and add the Announcement action to a custom group publisher layout.

Only group owners, group managers, and users with the “Modify All Data” permission can post and delete group announcements.

1. On the group page, click **Announcement** in the publisher.
2. Type your message. The character limit is 5,000, and you can include links or mention users and groups in your announcement. Due to space constraints, approximately 137 characters of the announcement displays on the group page. Click **More** to see the rest of the message.
3. Specify an expiration date for the announcement.
4. Click **Share**.

Group announcements display until 11:59 p.m. on the selected expiration date, unless they're replaced by a new group announcement. Users can discuss, like, and post comments on announcements in the group feed. Group members receive an email notification when you post an announcement, same as for other posts, depending on their selected group email notification frequency.

Deleting the feed post deletes the announcement. To remove the announcement from the group page without deleting the feed post, click  in the top corner of the announcement, then select the option to dismiss the banner.

Send Email Notifications for Announcements

Group owners and managers can now send email notifications to all group members for group announcements. Previously, only group members who opted to be notified for each post in the group were notified. Group owners and managers require the “Send announcement emails” permission to do this. If this feature is enabled, select **Email all group members** next to the announcement expiration date to notify all group members.

SEE ALSO:

[Customize the Chatter Group Layout and Publisher](#)

Group Files Lists

The Group Files list on a Chatter group page shows the recent files posted to that group.

Hover to see available options or click the file name to go to the file detail page. To see a list of all the files posted to a group, to search for a specific file, or to perform actions on a file, expand the files list **Show All**. The 25 most recently viewed files are listed by default. On this list you can:

- Search for files that have been posted to the group. The list includes files that you and other people have [attached to the Chatter feed on the group](#). The list doesn't include:
 - Documents from the Documents tab.
 - Attachments from the Notes and Attachments related list.
- [Upload private files](#) or upload and share files with [people, groups](#), or via a [file link](#).
- [Preview a file](#) without downloading it.
- [Follow and receive updates about a file](#) in the Chatter feed. Click  next to the file you're following to stop receiving updates about the file. (Requires Chatter.)
- Click  to download, upload a new version, share with people, groups, or via link, and see sharing settings.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- To view the [file detail page](#), click a file name.
- To see a file owner's profile, click their name.

 **Note:**

- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.
- Files without a file extension or with an unrecognized file extension show "unknown" in the Type column.

SEE ALSO:

[View Chatter Group Members](#)

Records in Chatter Groups

Create Records in Chatter Groups

Use the group publisher to create records in Chatter groups.

The actions available to you in the group publisher depend on your permissions, your role in the group, the type of group, and how your administrator has [configured the group publisher](#).

- Depending on how your administrator configures the groups publisher layout, you can create account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren't supported.
- When you create a record in a group, a record creation post displays several places, including in the group feed, on your profile, in the record feed, and in your company's Chatter feed. Only users with the necessary permissions (via license, profile, permissions, and sharing rules) can view the record and the record creation feed post.

 **Tip:** Filter the group feed to **Show All Updates** to view record creation posts.

- All comments on the record creation post display in the group feed. This includes comments made on the post in the record feed, and those made by users who don't belong to the group.

For example, John creates a record in a private group and the record creation post displays in the group feed and in the record feed. Sally isn't a member of the same private group, but she has access to the record detail page and the record feed. Sally comments on the record creation post in the record feed, and it appears in the private group's feed.

- Record visibility in groups respects user permissions and sharing access rules in your organization. Group members with permissions can view the record and comment on it from any context (in a group, on the owner's profile, on the record detail page, in the company's Chatter feed).

Group members without permissions, such as Chatter Free users, can't see the record or the record feed in the group or anywhere else.

- You can't create records in groups that allow customers.
- If your administrator has enabled the ability to [add records to groups](#), as well:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To create a record in Chatter groups:

- "Create" on the object

- Creating a new record within a group automatically creates a group-to-record relationship, same as when you add an existing record.
- The group records list displays the records you create, in addition to the records you add.

You can [remove records from Chatter groups](#).

Add Existing Records to Chatter Groups

Add records to groups so you can collaborate on and discuss the records as a team.

1. From the group publisher, click **Add Record**.

 **Note:** If you don't see this option, your administrator needs to include the Add Record action to the group publisher. Groups that allow customers don't allow you to add records.

2. Select the type of record from the **Record** list.
You can add account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren't supported.
3. In the blank search field, type the name of the record you want to search for and click  .
Leave the field blank to search for all available records of the selected type.
4. From the lookup search results list, click the record you want to add to the group to select it.
5. Click **Create**.

A success message confirms when the record is added to the group and the record appears in the Group Records list. If your administrator has added the Groups related list to the record detail page, you can also see the list of groups the record is associated with on the record detail page. There is no limit to the number of records you can add to a group.

 **Note:** Adding a record to a group doesn't affect its visibility. Only users with the necessary permissions (via license, profile, permission sets, or sharing) can see the records in a group. For example, Chatter Free users don't see any records in groups. Or, a user with permissions to view accounts and contacts can't view any case records in the group. This sometimes means that users see fewer records than the actual count indicated on the group records list.

 **Example:** Here are some ways to use Chatter groups as a collaboration space for records that you're working on.

- A sales team working together on an account can track the related opportunities, contacts, and leads in one group. Team members with permissions can access records directly from the group. New team members can use the group as a one-stop reference to familiarize themselves with historical discussions about the account and its child records.
- Customer service teams can use groups to track the cases they handle. The group can become the team's forum to monitor cases, discuss solutions, and analyze trends in common problem areas.
- Marketing teams can use groups to track their campaigns, plan events, and discuss the potential leads and contacts to invite for the event. Groups also make for a great space to collaborate on marketing content or campaign artifacts.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To view a group record or add a record to a group:

- "Read" on the record
- Access to the group

Remove Records from Chatter Groups

Remove records you no longer use from your Chatter groups.

Anyone with access to the record in a group can remove it from the group.

1. On the group detail page, click **Show All** next to the Group Records list.

 **Note:** The group records list appears on the group detail page only if your administrator allows you to add existing records to groups.

2. Optionally, select an option from the **Filter By** list to view records of that type.
3. Find the record you want to remove, then click **Remove** next to the record's name.

Removing a record from a group deletes the group-record relationship, but not the record itself. You can restore the group-record relationship from the Recycle Bin.

- Access to the group

Chatter Messenger (Chat)

Chat instantly and securely with coworkers. Chatter Messenger is not available in new orgs created after the Spring '16 release.

Using Chatter Messenger

Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click  in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

Using the Chat List

Tips for using the chat list.

Adding People to the My Favorites List in Chat

The list of people you follow in Chatter can be long. Add up to 100 chats with one or more people to your My Favorites list and they'll always show up at the top of your chat list.

Removing People from the My Favorites List in Chat

Remove chats with one or multiple people from your My Favorites list if you chat with them less often. People you follow in Chatter will still show up in your People I Follow list.

Changing Your Chat Status

Let people know if you're available to chat, or set your status to **Offline** if you don't want to chat.

Chatting with People

Chat with one or more people in Chatter.

Chat History

View your chat history.

Adding Emoticons to a Chat

Typing certain combinations of letters and punctuation marks inserts a whimsical icon into your chat conversation.

Popping Out Chat Windows

Keep chatting—even when you minimize your browser or use other applications—by popping out a chat or your chat list into a separate browser window.

[Editing Chat Options](#)[Can I change the sounds I hear in chat?](#)

Using Chatter Messenger

Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click  in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

A few considerations apply to using Chatter Messenger:

- Chatter Messenger is not available in new orgs created after the Spring '16 release.
- Your administrator can disable Chatter Messenger at the organization level. In addition, you can access Chatter Messenger only if your administrator has selected "API enabled" in your profile permissions. If you don't see Chatter Messenger when you log in to Salesforce, ask your administrator if they have disabled the feature and granted the necessary permissions to access Chatter Messenger.
- Chatter Messenger is not available with Communities. It is available for internal users only when the organization-wide default for the user object is set to Public Read Only.
- Chatter Messenger is not supported on Microsoft® Internet Explorer® version 7.0. Internet Explorer 7 users appear offline to other Chatter Messenger users.

With chat, you can:

- [Let people know if you're available](#) to chat.
- [Chat with people](#).
- [Add people to](#) and [remove people from](#) your My Favorites list.
- [Pop out your chat](#) to a separate browser window.
- [Use emoticons when you chat](#) with people.
- [Customize your chat options](#), such as sounds and notifications.
- View your [chat history](#).

Adding People to the My Favorites List in Chat

The list of people you follow in Chatter can be long. Add up to 100 chats with one or more people to your My Favorites list and they'll always show up at the top of your chat list.

-  **Note:** Chatter Messenger is not available in new orgs created after the Spring '16 release.
- In an active chat with one or more people, click  to save the chat as a favorite.
- You can also click and drag a single person's name from the People I Follow list to the My Favorites list.
- You can rename a chat with multiple people in your My Favorites list. Click **Edit** next to My Favorites, click the multiple-person chat you want to rename, and type a new name. For example, if you have a favorite chat with *Sue, John, Jeff*, you could rename it to *Sales Team*. All names must be unique.

Changing Your Chat Status

Let people know if you're available to chat, or set your status to **Offline** if you don't want to chat.

People can see your status:

- In their chat lists
- On [your profile](#)
- On people hovers

To change your chat status, click **Available**, **Away**, or **Offline** at the top of your chat list. For example, if your status is set to Available but you don't want to chat with others, click **Available** and choose **Offline**.

Your status automatically changes to idle if you're idle for 15 minutes. To change this setting, click **Chat** >  > **Options**, then select **General Settings**.

 **Note:** Administrators enable or disable Chat for an organization. Chatter Messenger is not available in new orgs created after the Spring '16 release.

[Editing Chat Options](#)

Chatting with People

Chat with one or more people in Chatter.

 **Note:** Chatter Messenger is not available in new orgs created after the Spring '16 release.

1. Start a chat with any online Chatter user.
 - Use the search box at the top of Chatter Messenger to find and start a chat with anyone in your organization. Alternatively, click a name in the People I Follow or My Favorites list.
 - From a person's profile, click  **Start Chat**.
 - From any feed, hover over a person's name and click  **Start Chat**.
2. Optionally, add up to 10 people to the chat.
 - a. Drag people from your chat list to the active chat, or click  at the top of the active chat to search for and add any online user in Chatter.
 - b. Repeat until you've added everyone you need for the chat.

Click  to see a list of everyone in the chat.

 **Note:** When you leave a chat with multiple people, the other people in the chat can continue chatting without you. You need to be added back to the chat to participate again.

Editing Chat Options

 **Note:** Chatter Messenger is not available in new orgs created after the Spring '16 release.

To edit your chat options, click  in the top-right corner of the chat window, then click **Options**.

 **Tip:** When you click , you can also quickly toggle the visibility of **My Favorites**, **People I Follow**, and **Offline People** in your chat list. You can also toggle the options to **Play sounds** and **Show emoticons**.

General Settings

Option	Description
Change status to Idle after 15 minutes	When selected, your status changes to “idle” if you are idle in your Salesforce app for the length of time you specify.
Show emoticons	When selected, graphics such as 😊 or 😞 display when people you chat with type standard textual emoticons such as :-) or :- (.
Show a timestamp only when I hover over a message	When selected, the timestamp for chat messages displays only when you hover over an individual message. When not selected, the timestamp displays inline with each chat message and status change.

Sounds and Notifications

Option	Description
Play a sound for new messages	When selected, a sound plays when someone starts a new chat with you.  Note: Sounds play for all incoming messages when a chat is minimized, a chat is out of focus (for example, if you have multiple chats), or when you're using another application or browser tab.
Alert in browser tab for new messages	When selected, a notification saying “You have new chat messages” displays in your browser tab when someone sends you a new chat message.

[Chatter Messages](#)

Send your a question to another person privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages also notify people when a file has been shared with them.

[Searching for Chatter Messages](#)

[Send Chatter Messages](#)

Send messages to communicate privately in Chatter.

Chatter Messages

Send your a question to another person privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages also notify people when a file has been shared with them.

Messages don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

View your messages by clicking the **Messages** link in the Chatter tab. On the My Messages page, you can:

- See the most recent message in each of your conversations. The most recent message displays at the top of the list.
- See the photo of the person who sent the most recent message in a conversation.
- See if you have unread messages (●).
- See if you sent the most recent reply (↩) in a conversation.
- Click any message to view the full history of messages exchanged in that conversation.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Send a message by clicking **New Message**.

Your messages are organized into conversations, with each conversation defined by the unique combination of people participating in it. For example, let's say you send a message to Sally Smith. When Sally replies, her message continues your one-on-one conversation. Every new message you send to Sally—even if it's about a different topic—also continues the same conversation. Over time, you build a rich conversation history with Sally that contains every message you've ever exchanged with her. At the same time, let's say you send a message to both Sally Smith and Bob Johnson. That message is considered part of a separate conversation between you, Sally, and Bob. When Sally replies, her message continues a separate conversation from your one-on-one conversation with Sally.

Consider these tips for using Chatter messages.

- You can send messages to anyone in your Chatter organization. It doesn't matter who you follow, who's following you, what groups you belong to, or if the recipient is a customer.
- Conversations can involve just one other person, or up to 10 people total, including yourself. You can't send a message to yourself.
- Conversation participants are established when someone sends the first message in the conversation. No one can add people or remove people from the conversation after the first message is sent.
- As others reply, the **Messages** link on the Chatter tab shows the number of conversations with new messages. If you're already receiving Chatter email notifications, you'll automatically be notified of new messages.
- You can't delete messages or conversations.
- If after reading the messages in a conversation you want to mark the conversation unread, you can do so only via the Chatter REST API, not via the user interface.

Searching for Chatter Messages

To search for people and text in your Chatter messages:

1. In My Messages, enter your search terms in the search box above your messages. Keep in mind these simple search tips:
 - If you're viewing your list of conversations, search looks for matches across all conversations. If you're viewing a single conversation, search looks for matches only within that conversation.
 - Searching for a person's name (such as *bob johnson*) finds both the conversations where Bob Johnson is named in the text as well as conversations where he's a participant. If you search for your own name, search results will include all of your messages and conversations because you're a participant in every conversation.
 - Searching for *bob jo* finds both Bob Jones and Bob Johnson. We automatically search for terms starting with *bob jo*, as if you had entered the * (asterisk) wildcard (*bob jo**).
 - If you search for the term *customer*, you'll see matches on that term within the text of messages. Matches don't include people who are identified as customers in a conversation's participant list.
2. Click **Search**.
3. Once you see the search results, you can:
 - Refine your search by entering additional search terms or using wildcards or operators.
 - Click a message to view the full conversation if you initially searched across all conversations.

If there are matches on names in the participant list and the conversation involves lots of people, the match might not be visible because the participant list doesn't show everyone's name. In other words, you'll see the conversation included as a match but the highlighted name match might be hidden from view.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

Clear your search terms by clicking . Chatter automatically clears your search when you enter a reply, send a new message, or leave My Messages.

[Share Files with People in Salesforce Classic](#)

Send Chatter Messages

Send messages to communicate privately in Chatter.

To send a Chatter message:

1. Start the message from one of these locations:
 - Click the **Messages** link on the Chatter tab, then click **New Message** in My Messages.
 - Click a person's name anywhere in Chatter to view their profile and click **Send a message**.
 - Click **Send a message** on a person's hover.
 - When viewing the full message history of a conversation, use the text box under the most recent message to send a reply.
 - When viewing the email notification about a message you've received, if email replies to Chatter are enabled, reply to the email.

Sharing a file with people is another way to send a Chatter message. When you share a file, recipients automatically receive a message that lets them know the file has been shared, as well as any additional information you provided.

2. If you started in the Send a Message dialog box, you can add people's names to the recipient list. Type a name in the **To** field and click the name to select it. Add more people to the conversation by entering additional names. If you're replying within a conversation or via email, the conversation participants can't be changed.
3. Write your message. Messages can be up to 10,000 characters.
4. Submit your message using the appropriate method:
 - In the Send a Message dialog box, click **Send**.
 - If you're replying within a conversation, click **Reply** (or **Reply All** if the conversation involves multiple recipients).
 - If you're replying via email, use the Send option in your email application.

If your message continues an existing conversation, your reply is added to the conversation and appears at the top of the list in My Messages. If your message starts a new conversation because you haven't previously exchanged messages with that unique combination of recipients, your message appears at the top of the list in My Messages as a brand new conversation.

[Display Similar Questions and Articles in Chatter](#)

When users ask questions, Chatter Questions helps reduce duplicate content in Salesforce—and in any communities with Chatter—by showing similar questions and relevant Salesforce Knowledge articles when the user is typing the question.

[Display Similar Questions and Articles in the Customer Service \(Napili\) Template Search](#)

Your community users may ask similar questions. Chatter Questions helps reduce duplicate content in self-service communities built on the Customer Service (Napili) template by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in the Search field.

[Enable Similar Articles for Chatter Questions](#)

When users ask questions in Chatter, similar questions appear as they type. If you'd like relevant Salesforce Knowledge articles to appear as well as questions, enable Similar Articles.

[Selecting a Best Answer for a Question in Chatter](#)

One of the advantages of asking a question in Chatter is that users can select the best answer for a question. When a question has a best answer, your users can quickly resolve their issue by going directly to the best answer.

[Chatter Questions FAQ](#)

Chatter Questions lets users in communities and Salesforce ask questions in the feed. Take a look at some common questions about the feature.

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

Keep tabs on the use and adoption of Chatter Questions in your organization or community with out-of-the-box reports and dashboards.

[Differences Between Q&A Features in Salesforce](#)

Salesforce offers a variety of question-and-answer features that you can implement in your Salesforce organization and communities. Because some of these features use similar terminology, take a moment to review the differences between them.

[Question-to-Case Overview](#)

Question-to-Case lets moderators create cases from questions in Chatter, which makes it easier to track and resolve your customers' issues. Question-to-Case is available in the full Salesforce site and the Salesforce1 mobile browser app, as well as in communities where Chatter Questions is enabled.

[Set Up Question-to-Case](#)

Add Question-to-Case to your communities, your Salesforce organization, or both.

[Enable Question-to-Case](#)

Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers' questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

[Add the Question from Chatter Field to the Case Detail View](#)

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

[Add the Escalate to Case Action to the Feed Item Layout](#)

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

[Confirm Access to the Escalate to Case Action](#)

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

[Customize the Escalate to Case Action Layout](#)

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

[Automatically Assign Cases from Questions to a Queue](#)

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. You can write a workflow rule or process that automatically adds cases that were created from questions to a queue so agents can claim them.

[Automatically Create Cases from Unresolved Questions in Chatter](#)

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

[Create a Case from a Question in Chatter](#)

If a question in Chatter hasn't been resolved, moderators can create a case from the question. Question-to-Case must be enabled in your organization or community.

Chatter Questions

Extend the best possible self-service community by promoting community engagement internally and externally with questions in Chatter.

With Chatter Questions, users can ask questions in their Chatter feed, in groups, and in records by selecting **Question** in the action drop-down menu of the Chatter Publisher or clicking the Question tab in the Chatter publisher. After a question is asked, moderators and the person who asked the question can select a best answer. The best answer is prominently displayed in the feed, allowing other users to quickly and easily find the information they need.

Your users can organize their information with the question title and details about their question. They can ask the question to their followers, to a group, or to a specific person, as they can with other Chatter feed items.

EDITIONS

Available in both: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Developer, Performance, Enterprise, Contact Manager,** and **Unlimited** Editions

The screenshot shows the Chatter Question form. At the top, there is a navigation bar with icons for 'Question', 'Post', 'File', and 'More'. Below this is a text input field with the placeholder text 'What would you like to know?'. Underneath that is another text input field with the placeholder text 'Add details about your question...'. At the bottom of the form, there is a dropdown menu currently set to 'To My Followers' and an 'Ask' button.

To enable Chatter Questions in your organization, add the Question action to the global publisher layout. If your organization was created after Summer '14, the Question action is automatically added, but we recommend dragging it to the far left to increase its visibility. If you're using a customized publisher layout in groups or on records, make sure that the Question action is added to those layouts as well.

Chatter Desktop doesn't support Chatter Questions.

[Selecting a Best Answer for a Question in Chatter](#)

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

[Chatter Questions FAQ](#)

Display Similar Questions and Articles in Chatter

When users ask questions, Chatter Questions helps reduce duplicate content in Salesforce—and in any communities with Chatter—by showing similar questions and relevant Salesforce Knowledge articles when the user is typing the question.

Note:

- Communities with Chatter include those built with Salesforce Tabs + Visualforce.
- The Similar Questions and Similar Articles search features are also available in communities built on the Customer Service (Napili) template. For more information, see [Display Similar Questions and Articles in the Customer Service \(Napili\) Template Search](#).
- Similar Questions and Similar Articles aren't available in Salesforce1 or mobile browsers.

When a user enters a question in Chatter, similar questions automatically appear in a drop-down list below the question title field. To display relevant Knowledge articles along with similar questions, [enable Similar Articles](#).

Drop-down search results of similar questions and articles:

- **1:** Book and question mark icons indicate whether a search result is an article or a question.
- **2:** Question results show the question title, the number of answers, and a green flag with the text `Answered` if a best answer was selected.

Users see up to 10 results in the drop-down list, with questions appearing before articles. Salesforce displays an equal number of questions and articles, but if there aren't enough of one result type, extra results of the other type are displayed. If no question or article title matches the text entered by the user, the drop-down list doesn't appear.

The drop-down results are based on whether the question or article **title** contains the text entered by the user. The search accounts for partially matching terms and non-adjacent terms. For example, the results for "best backpack" could include a question titled "Which backpack is best for day hikes?", and the results for "backpack" could include an article titled "Backpacking Tips."

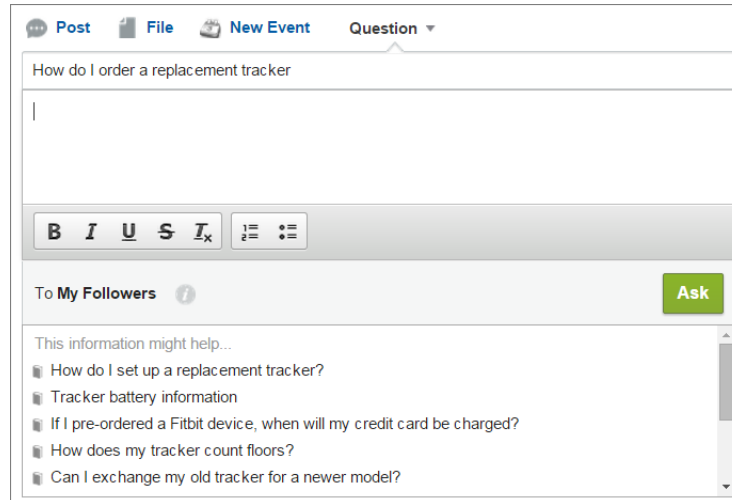

If the user wants to conduct a more in-depth search that also scans question descriptions and article text, they can press TAB or click out of the title field. This displays a separate drop-down list of results below the question publisher.

Advanced drop-down search results of similar questions and articles:

EDITIONS

Available in: Salesforce Classic

Chatter Questions is available in: **Group, Professional, Developer, Performance, Enterprise, Contact Manager, and Unlimited** Editions

If none of the results answer the user's question, they can post their question by clicking **Ask**.

SEE ALSO:

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

Display Similar Questions and Articles in the Customer Service (Napili) Template Search

Your community users may ask similar questions. Chatter Questions helps reduce duplicate content in self-service communities built on the Customer Service (Napili) template by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in the Search field.

 **Note:** Similar Questions and Similar Articles are also available in internal Salesforce organizations with Chatter and in communities built with Salesforce Tabs + Visualforce. To learn more, see [Display Similar Questions and Articles in Chatter](#).

When a user in a Customer Service (Napili) community enters a question in the Search field, similar questions and Knowledge articles automatically appear in a drop-down list below the field. The drop-down list contains two tabs: **Articles** and **Questions**. To also expose an **All** tab that shows combined results (recommended), [enable Similar Articles](#).

By default, each tab contains up to six results. The **All** tab shows both matching articles and questions, with articles appearing first. It displays an equal number of questions and articles, but if there aren't enough of one type of result, more results of the other type are displayed to reach the maximum. To see results of a particular type, users can click the **Articles** and **Questions** tabs. If a search only returns one result type (for example, questions), users still see all of the tabs.

 **Note:** For a community user to see similar articles, Knowledge must be enabled in the community and the user must have access to it.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- **1:** The **Articles** and **Questions** tabs let users view results of each type. Users can use the Up and Down arrow keys to navigate between results on any of the tabs. Clicking a question or article in the drop-down list navigates directly to it.
- **2:** Text and chat bubble icons indicate whether a search result is an article or a question.
- **3:** Questions in the list show the number of answers and a green checkmark with the text **Best Answer** if one was selected.
- **4:** The drop-down search results are based on whether the question or article title contains the text entered by the user. When the user performs a full search by clicking **Search**, the search engine also scans question descriptions and article text for matching terms.

You can customize the search settings by editing the properties of the Search Publisher component in Community Builder. For details, see [Using Templates to Build Communities](#).

 **Noah Larkin** asked a question. ▼

What is the best monitor for playing video games?

I was using a Cirrus 27" monitor before, but I want to move to a dual monitor setup. And I want the images to be really sharp. #Monitor #Videogames

Topics: Videogames, Monitor

Answer · Like · Today at 2:29 PM

 **Allison Wheeler**

I've actually found that dual monitors aren't great for video game play. I find it distracting and hard to use. Quite often the graphics card won't keep up. However, if you're set on using a dual-monitor setup, I recommend the AW-PX16 graphics card and any monitor will do.

Like Select as Best · Today at 2:32 PM

 **Yuko Ishikawa**

I have the AW-900a monitor, and I love it!

 **AW-900a**

Chatter Questions FAQ

Chatter Questions lets users in communities and Salesforce ask questions in the feed. Take a look at some common questions about the feature.

Why should I use Chatter Questions instead of asking my question in a Chatter text post?

Asking a question in Chatter saves you time. When you ask a question, similar questions and articles appear as you enter your question. Chances are that someone already asked the same question, and it could have many answers or a best answer. Chatter Questions harnesses the value of content that already exists in Chatter.

Can I filter the Chatter feed to show only questions?

Yes. At the top of your Chatter feed, click  next to **Show** and select **Questions**.

Can I search for questions in Chatter?

Yes. Use the Search This Feed button () at the top of your Chatter feed. Questions are included in the feed search results.

Is Chatter Questions available in Salesforce1?

Currently, Chatter Questions is available in the Salesforce1 mobile browser only.

What happens when someone asks a question?

Their question appears in the Chatter feed for their followers or the person or group they asked the question of. An email notification is also sent to the person or group they asked the question of. After a user asks a question, other users can then answer the question directly in Chatter.

Who can select a best answer for a question?

The person who asked the question and moderators can select the best answer for a question. Moderators can be the Chatter moderator or the community moderator. Your Salesforce administrator can also select the best answer for a question. For details, see [Selecting a Best Answer for a Question in Chatter](#).

Can I track Chatter Questions use and adoption in my Salesforce organization?

Yes. For details, see [Track Chatter Questions Use in Your Salesforce Organization and Communities](#).

Track Chatter Questions Use in Your Salesforce Organization and Communities

Keep tabs on the use and adoption of Chatter Questions in your organization or community with out-of-the-box reports and dashboards.

Reports on Chatter Questions help you answer questions such as:

- What kinds of questions are users asking?
- How many questions were asked in the past month?
- What percentage of questions go unanswered?
- Which topics do users ask the most questions about?
- Which departments are asking the most questions?

To track the use of Chatter Questions in your *Salesforce organization*, download the [Salesforce Chatter Dashboards](#) on the AppExchange. For help getting started, see [Report on Chatter with the Dashboards Package](#).

To track the use of Chatter Questions in your *communities*, download the [Salesforce Communities Management \(for Communities with Chatter\)](#) on the AppExchange. For help getting started, see [Report on Communities with the AppExchange Packages for Community Management](#) on page 3688.

Differences Between Q&A Features in Salesforce

Salesforce offers a variety of question-and-answer features that you can implement in your Salesforce organization and communities. Because some of these features use similar terminology, take a moment to review the differences between them.

Salesforce has released three features that let users post questions and answers in a public forum setting. While these features share a common purpose, they represent an evolution of Salesforce's Q&A features.

Q&A Feature	Description	Structure	How Users Access It
Version 1: Answers	Answers, released in Winter '11, was Salesforce's first Q&A feature for communities. Starting in Summer '13, Answers isn't available in new orgs.	Answers is built on the Question standard object.	Internal users access the Answers feature via the Answers tab in Salesforce.
Version 2: Chatter Answers	Chatter Answers, released in Spring '12, was intended for customers who liked the Answers user experience but wanted additional functionalities. Chatter Answers let companies maintain an out-of-the-box, self-service site where users could help address each other's questions, and provided a feed view of users' questions. Starting in Summer '16, Chatter Answers isn't available in new orgs.	Chatter Answers is built on the Question standard object.	Internal users access Chatter Answers via the Q&A tab, and moderators can view a list of questions in the Questions tab.
Version 3: Chatter Questions	Chatter Questions, released in Winter '15, represents the most advanced developments in Salesforce Q&A functionality. Because it takes advantage of	Chatter Questions is built on the Chatter data model, and uses the Feed Post and Feed Comment objects.	Internal users access Chatter Questions within Chatter. They use the Question action in the Chatter publisher to post a question, and all

Question-to-Case Overview

Question-to-Case lets moderators create cases from questions in Chatter, which makes it easier to track and resolve your customers' issues. Question-to-Case is available in the full Salesforce site and the Salesforce1 mobile browser app, as well as in communities where Chatter Questions is enabled.

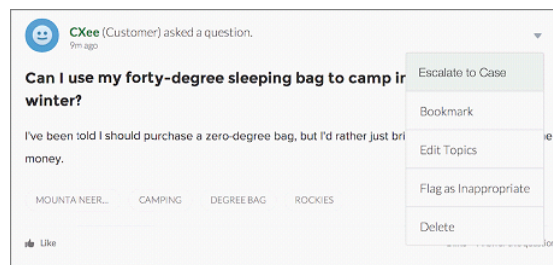

When a customer uses the Question action in Chatter to ask a question, similar questions and Knowledge articles appear below the Chatter publisher. If the similar questions and articles don't address the issue, the customer posts the question.

If a question isn't resolved, you can escalate the question to a case. Users with the "Moderate Chatter" or "Moderate Communities Feeds" user permission can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

When a customer's question is turned into a case, the customer receives an email with the case number and a link to the case. The customer can view the case via a link on the question that's visible only to them, while moderators see a note on the question indicating that a case was created.

 **Note:** The person who asked the question must have access to cases so they can view their case.

MOUNTAINEER... CAMPING DEGREE BAG ROCKIES

Like 1 person likes this

NTO Admin — Just Now

Hi there - we recommend purchasing a zero-degree bag for your trip. There are plenty of affordable options available, and night temperatures in that region will drop below forty degrees. Be safe, and happy camping!

To enable Question-to-Case:

- "Customize Application"

Add the `Question from Chatter` Field to the Case Detail View

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

First, use field-level security to specify which users can see the `Question from Chatter` field on case detail pages.

1. From the object management settings for cases, go to Fields.
2. Click **Question from Chatter**.
3. Click **Set Field-Level Security**.
4. Select **Visible** for any profile that you want to be able to use Question-to-Case.
5. Click **Save**.

After you make the field visible to users, you can choose to add it to the Case Details view.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to the page layout that you want to customize.
3. Drag the `Question from Chatter` field from the Fields section of the page layout editor palette to the Case Information section of the page.
4. Click **Save**.
5. Click **Page Layout Assignment** to confirm that the user profiles which need Question-to-Case are assigned to the page layout that you customized. In addition, assign internal users who need access to the `Question from Chatter` field on cases to that page layout.

Confirm Access to the Escalate to Case Action

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

First, check which record type is assigned to the profiles that need access to the Escalate to Case action.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the name of a profile.
3. In the Record Type Settings section, make a note of which case record types the profile uses.
4. In the Permissions section, make sure that the user profile has either the **Moderate Chatter** or **Moderate Communities Feeds** permission enabled.

Then, check which record type the Escalate to Case action uses, and change it if necessary.

1. From Setup, enter *Actions* in the **Quick Find** box, then select **Feed Item Actions**.
2. Click **Edit** next to the Escalate to Case action.
3. Confirm that the **Record Type** field shows a record type that's assigned to the profiles that need access to this action. If it doesn't, select an appropriate record type from the drop-down list.
4. Click **Save**.

SEE ALSO:

Automatically Assign Cases from Questions to a Queue

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. You can write a workflow rule or process that automatically adds cases that were created from questions to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue when the `Type` field on the case equals `QUESTION`. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions depends on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see [Create Queues](#).

SEE ALSO:

[Automatically Create Cases from Unresolved Questions in Chatter](#)

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

 **Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that's you? See [Differences Between Q&A Features in Salesforce](#) on page 3255.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than 10 likes, and a best answer hasn't been selected.
- Create a case from a question immediately if the question contains the word "competitor."

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- `BestCommentId`: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- `CommentCount`: The number of comments on a question.
- `LikeCount`: The number of likes on a question.

Tip:

- Each flow variable's data type must match the feed item field's data type. `CommentCount` and `LikeCount` are number fields, while `BestCommentId` is a text field.

[Lightning Process Builder](#)

[Cloud Flow Designer](#)

Create a Case from a Question in Chatter

If a question in Chatter hasn't been resolved, moderators can create a case from the question. Question-to-Case must be enabled in your organization or community.

1. Navigate to the question in the feed.
2. Select **Escalate to Case** in the action drop-down menu.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create a case from a question in Salesforce:

- "Moderate Chatter" OR "Modify All Data"

AND

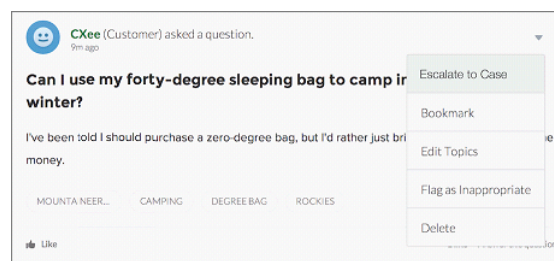

"Create" on cases

To create a case from a question in a community:

- "Moderate Chatter" OR "Modify All Data" OR "Moderate Communities Feeds"

AND

"Create" on cases

A window appears that's pre-populated with the case subject, contact, and description. Unless Question-to-Case has a queue associated with it, the case is automatically assigned to you.

3. If needed, edit the case details.
4. Create the case.

After a case is created from a Chatter question, the customer who asked the question receives an email notifying them that a case was created from their question. The email provides the case number and a link to the case.

Agents can post a response to the question directly from the case feed using the Community action in the publisher. Agents choose who can view the response by selecting either "Customer Only" or "Everyone". They can also navigate to the original question from the case's detail page by clicking the link in the `Question from Chatter` field.

Using Salesforce Files

Use Salesforce Files to share and collaborate on files, store files privately, manage version updates, and follow files that are important to you. Use Files Connect to connect to external file systems right from Salesforce.

Working with files in Salesforce means:

- Posting files to Chatter feeds to collaborate with coworkers.
- Adding files directly to records, such as Accounts, Cases, Leads, and more, to keep information right where you need it.
- Sharing files with customers in the secure Salesforce cloud.
- Connecting to external file systems with Files Connect.
- Syncing files between your local drive and Salesforce Classic.
- Running standard and custom file reports to understand how people work with files.

All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs and image files. Audio and video files can be uploaded and downloaded, but not parsed or previewed.

 **Note:** In Internet Explorer 11, the **Preview** option redirects to the file detail page.

As you work with files in Salesforce, keep these file limits in mind:

Feature	Limit
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048 versions
Maximum number of synced files and folders	Users can sync up to 10,000 files.
Maximum number of users who can sync the same file simultaneously	1,000 users

EDITIONS

- To refine the list of files you see, filter your file list (1).
- Access files in your libraries from **Libraries** in the left navigation panel.
- Search (2) to find the files you need. In Salesforce Classic, filtering your file list also filters your search. To search all files you have access to, select the Recent filter.
- Upload files to Salesforce (3).
- All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs and image files. Audio and video files can be uploaded and downloaded, but not parsed or previewed.
- Preview, download, share, and rename files directly from the file list (4).
- If Files Connect is enabled for your org, the left navigation panel displays a section for external file sources (5).

Files are automatically added to the file list when:

- You upload a file.
- You attach a file to a record.
- You or someone else attaches a file to a Chatter feed or comment.
- You sync a file in your Salesforce Files Sync folder.
- Someone else shares a file privately with you using the Sharing dialog box.
- You upload a file to a Salesforce CRM Content library.
- Someone else uploads a file to a library you're a member of.

- You or someone else creates a content pack or uploads a Web link in Salesforce CRM Content. You only see files from content packs and Web links you have access to.

[Filter Your Files List](#)

[Who Can See My File?](#)

Search for Files

Use the files-specific search field on **Files** home in Salesforce to find just what you're looking for.

Files home lists the files you own and have access to, including files posted to feeds. The 25 most recently viewed files are listed by default. You can see and search a certain group of files by clicking a specific filter on the sidebar. The search results are filtered based on the terms entered.

 **Note:** Users who have the "Sync Files" permission don't see the **All Files, MY FILES, or FILES IN MY GROUPS** filters. Users who don't have the "Sync Files" permission don't see the **Synced** filter.

- All Files**—All files you own and have access to, including:
 - Files that have been shared with you
 - Files you're following
 - Files in your Chatter groups
 - Files in your libraries
 - Files attached by other people to a Chatter feed, including files attached to all public groups and private groups you're a member of. You don't have access to files attached to private groups you're not a member of.

This filter is only available in Salesforce Classic.

- Recent**—The most recent files you've viewed.
- MY FILES**—All files you own, files shared with you, and files you follow.
 - Owned by Me**—Files you have:
 - Uploaded on the Home or Files page. These files are private and not shared with anyone, but you can view them, share them, and attach them to Chatter feeds.
 - Attached to Chatter feeds from your computer.
 - Synced using your Salesforce Files Sync folder.
 - Uploaded to Salesforce CRM Content libraries you're a member of and your private library.
 - Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
 - Following**—All files that you're following. *(Requires Chatter)*
- FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your private library. The first five libraries you're a member of, including your private library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.
- Synced**—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the "Sync Files" permission.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

- **EXTERNAL FILES**—All files you have access to in Files Connect external data sources. Search is restricted to the selected external data source.

In Salesforce Classic, to search for files using the Files search:

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the Search field on the **Files** tab. You can search by file name, description, owner, type, or within the file's text.
3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click  to clear your search terms.

In Salesforce Classic and Lightning Experience, you can search for files from the header search field. Use [feed search](#) to find files posted in a specific Chatter feed, such as on a profile, on a record, or in a group.

 **Note:** The feed search returns the matches for file or link names shared in posts, but not in comments.

The Files list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's name, description, type, and owner are.

File Type	File Extensions	Maximum File Size for Search
HTML	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.ppt, .pptx, .pptm	25 MB
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XLS	.xls, .xlsx, .xlsm	5 MB
XML	.xml	5 MB

[Filter Your Files List](#)

Filter Your Files List

Use the filters on the **Files** page to quickly access to your files in Salesforce.

The Files page lists all the files you have access to. Filters show you different groups of those files, letting you find what you're looking for quickly.

Filter Name	Description
All Files	All files you own and have access to.
Recent	The most recent files you've viewed.
Owned by Me	Only the files you own.
Shared with Me	Only files that have been shared with you either by a private share or a public post to your profile.
Following	Only the files you're following in Chatter. This filter is available only in organizations that use Chatter.
Synced	All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the "Sync Files" permission.
Libraries	Files anyone has uploaded to libraries you're a member of, as well as all files you uploaded to your private library, grouped by library name.

Create Folders in Libraries in Lightning Experience

Organize library files into folders to find what you need quickly.

Library Managers can create, rename, and delete folders in libraries in Lightning Experience. Folders are visible to all users who have access to the library. The **New Folder** button adds a folder to the library or creates a subfolder within a folder. You can create multiple levels of subfolders. The row-level **Move** action lets you move a file among folders and subfolders within a library.

EDITIONS

Available in: Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To add folders to a library:

- “Manage Salesforce CRM Content”

OR

Create folders in Lightning Experience to organize files already in libraries. To create libraries and share files with libraries, switch to Salesforce Classic. When viewing your libraries in Salesforce Classic or in mobile, you can see the folder structure that you created in Lightning Experience. Library folders can also be created, renamed, and deleted using the SOAP API.

Note:

- An Upload File button is available when you're in a library. However, when you upload a file here, it shows up in your Owned by Me filter rather than inside the library.
- To add a file to a library, switch to Salesforce Classic. From the library, choose **Contribute** and add the file. Or, from the file's row-level actions or from the file detail page, choose **Share with library**.

Getting Started with Library Folders

- In orgs with Lightning Experience enabled, folders are enabled by default in any new libraries you create. Folders are not enabled by default in existing libraries. To enable folders in a library, click the **New Folder** button. Depending on the size of the library, enabling folders can take a few moments.

Note: In order to enable folders in a library, you need the “Manage Salesforce CRM Content” permission. To enable folders from the user interface, verify that you’re a member of the library with Library Administrator permission. You can also use the SOAP API to enable folders in libraries.

- In orgs that don’t have Lightning Experience enabled, folders aren’t enabled by default in new libraries.
- Folders can’t be enabled in libraries with more than 5,000 files.

Anyone with the Manage Library permission can create, rename, and delete folders. You can view all folders in a library you have access to, and move files among folders within a library.

[Share Files via Link](#)

Upload and File Sharing Overview

Upload and share files from Files home, in feeds, and on opportunities or other records.

Upload and share files from:

- **Files** home
- Any Chatter feed post or comment field
- **Files** card or list on groups, user profiles, opportunities, and other records

All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs and image files. Audio and video files can be uploaded and downloaded, but not parsed or previewed. Files up to 2 GB can be uploaded by default. However, your organization determines the maximum file size.

Files Home

When you upload files, they're added to the **Owned by Me** filter on **Files** home, with you as the owner. Files you upload on **Files** home are automatically uploaded as private.

You can also add files to Salesforce by:

- [Attaching a file to a Chatter feed.](#)
- [Uploading files to Salesforce CRM Content](#) private and shared libraries.
- [Syncing a file in your Salesforce Files Sync folder.](#)
- [Creating content packs](#) or [uploading Web links](#) in Salesforce CRM Content.

The Files list doesn't include:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

 **Note:** Files without a file extension or with an unrecognized file extension show “unknown” in the Type column.

Private Files

A private file is private, not shared with anyone, and you are the file owner. Only file owners and users with the “View All Data” permission can see private files. Private files show a lock  icon in the Files list and on the file's detail page. You can search for your private files in Chatter and on the Files list.

Sharing Private Files

You can share private files from the file detail page or by [attaching](#) them to a Chatter feed, a profile, a record, or a group. You can also [share a file via a link](#). When you share a private file, it's no longer private. To learn who can perform which actions on a file, see [Who Can See My File?](#).

Upload a New Version of a File

Replace an old version of a file by uploading a new version.

Uploading a new version replaces all previous versions, but [previous versions](#) are still available by clicking **Show all versions** on the file detail page. If your original file was uploaded via a feed post, use **Upload New Version** to replace the old version.

1. Click **Upload New Version** from any of these locations:
 - The file detail page
 - The file previewer
 - The **Files** page, via the actions arrow for the file
 - On a file in a feed, via the **More Actions** arrow (available in Salesforce Classic only)
2. Click **Choose File**, and select a file from your computer.

At this point you have the option to enter a note about what changed in the **What Changed?** field. This information is shown on the [Version History](#) list.

3. Click **Upload New Version** (Salesforce Classic) or **Start Upload** (Lightning Experience).

The file detail page and any previous posts show the updated version.

 **Note:**

- Only file owners, collaborators, and users with the “Modify all Data” permission can upload new versions. To learn who can perform which actions on a file, see [Who Can See My File?](#)
- The file owner doesn't change when a collaborator uploads a new version.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- If the file is from Salesforce CRM Content, you can't upload a new version from the file detail page. You can click **Go to Content Detail Page** and upload a new version there. (Available in Salesforce Classic only.)

Who Can See My File?

Your files in Salesforce can be private to you, privately shared, or visible to your entire company. Learn how to identify a file's sharing settings and how you can change them.

This table describes file sharing settings which depend on how the file is shared. The sharing setting and icon appear on a file's detail page and on the Shared With list on a file detail page.

Sharing Setting	Definition	When Does a File Have This Setting?
 Private	The file is private. It hasn't been shared with anyone else besides the owner. The file owner and users with "Modify All Data" permission can find and view this file. However, if the file is in a private library, only the file owner has access to it.	A file is private when you: <ul style="list-style-type: none"> • Upload it in Files home • Publish it to your private library • Sync a file in your Salesforce Files Sync folder • Stop sharing it with everyone (Make Private) • Delete posts that include the file and the file isn't shared anywhere else
 Privately Shared	The file has only been shared with specific people, groups, or via link. It's not available to all users in your company. Only the file owner, users with "Modify All Data" or "View all Data" permission, and specific file viewers can find and view this file.	A file is privately shared when it's: <ul style="list-style-type: none"> • Only shared with specific people or a private group • Posted to a private group • Shared via link • Posted to a feed on a record • Published to a shared library
 Your Company	All users in your company can find and view this file.	A file is shared with your company when it's posted to a

Sharing Setting	Definition	When Does a File Have This Setting?
		feed that all users can see, a profile, a record, or a public group.

This table describes which actions you can perform on a file depending on your file permissions.

Action	File Owner	File Collaborator	File Viewer
View or Preview	Yes	Yes	Yes
Download	Yes	Yes	Yes
Share	Yes	Yes	Yes
Attach a File to a Post	Yes	Yes	Yes
Sync a File	Yes	Yes	Yes
Upload New Version	Yes	Yes	
Edit Details	Yes	Yes	
Change Permission	Yes	Yes	
Make a File Private	Yes		
Restrict Access	Yes		
Delete	Yes		

 **Note:**

- **No Access** means that only the people in your company with whom this file is shared can find or view the file. If the file is shared with a private group, only the group's members can find or view the file.
- Users with "Modify All Data" permission can view, preview, download, share, attach, make private, restrict access, edit, upload new versions, and delete files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users with "View All Data" permission can view and preview files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users must have the "Sync Files" permission to sync files.
- Groups (including group members) and records have viewer permission for files posted to their feeds.
- Permissions for files shared with libraries depend on the library.

[View Where a File is Shared](#)

[Prevent Others from Sharing and Unsharing a File](#)

Change File Access

Decide who can view and modify the files you own.

File owners and collaborators can change file permissions for people and groups from viewer to collaborator and conversely. They can also change file permissions for files shared with their company to viewer, collaborator, or no access.

1. On a file detail page, click **Share File > Sharing Settings**.
2. Find the person or group whose access you want to change. Or change access for `Any Chatter user in your company`.
3. Select **Viewer**, **Collaborator**, or **No Access** (for your company). Or, for files shared with records (Salesforce Classic only), change to **Set by Record**. The change happens immediately.
 - **Viewers** can view, download, and share files.
 - **Collaborators** can view, download, share, change permission, edit the file, and upload new versions.
 - **Set by Library** for a file in a library means that access to the file follows access to the library. This setting can't be toggled.
 - **Set by Record** for a file attached to a record means that access to the file follows access to the record. People with read/write access to the record have **Collaborator** access to the file. People with read-only access to the record have **Viewer** access to the file. This setting can be toggled in Salesforce Classic only.
 - **No Access** means that only the people in your company with whom this file is shared can find or view the file. If the file is shared with a private group, only the group's members can find or view the file.
4. Click **Close**.

Note:

- A file is shared with your company when it's posted to a feed that all users can see, a profile, a record, or a public group. `Any Chatter user in your company` is given viewer permission by default. If you change the permission from viewer or collaborator to no access, you remove the share to company and to public groups.
- When you share a file with someone, they are given `Collaborator` access by default. When you share a file with a group, the group members are given `Viewer` access by default. You can change the default access when you share a file for the first time. File owners and collaborators can change access after a file has been shared.
- File link recipients can only view and download files. They can't be collaborators.

SEE ALSO:

[Who Can See My File?](#)

[Make a File Private](#)

[Prevent Others from Sharing and Unsharing a File](#)

Make a File Private

You can restrict access to shared files you own by making them private.

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

To stop sharing a file you own or have the “Modify All Data” permission for, make the file and the file link private (🔒).

1. From the file detail page, click either  **Share File** > **Sharing Settings** or **Show All** on the Shared With list.
2. On the Sharing Settings dialog box, click **Make private** (or **Restrict access** if the file originated in a Salesforce CRM Content library).
3. On the confirmation dialog box, click **Make private** (or **Restrict access**).

Making a file private removes it from any posts it's attached to and removes it from everywhere it's been shared. Only the owner and people with the “Modify All Data” permission can access it. If the file originated in a Salesforce CRM Content library, it is removed from everywhere it's been shared, except the library.

If the file is shared using a content delivery, the content delivery becomes inaccessible, but is not deleted. If the file is shared using **Share via link** in Chatter, the link to the file is deleted.

SEE ALSO:

[Post Visibility](#)

[Prevent Others from Sharing and Unsharing a File](#)

Share Files with Groups

Share files in Chatter with public or private groups so that members of the groups can view and download the files from their feed.

Share a file with a private or unlisted group so only members of that group can see it, or share a file with a public group so members of that group and all Chatter users in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more Chatter groups:

1. Share the file from one of these locations:
 - On the detail page of the file you want to share—Click  **File Sharing Settings** > **With group**. Or click **Show All** on the Shared With list then click **Groups** on the Sharing Settings dialog box.
 - Next to the file in a feed—Click **More Actions** > **File Sharing Settings** then click **Groups** on the Sharing Settings dialog box.
 - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click  **Share with groups**.
 - On a file hover—Click  **Share File** then click **Groups** on the Sharing Settings dialog box.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share with groups**.
2. Type the name of the group you want to share the file with and click the name to select it. Repeat this step to share with more groups.
3. Select access levels for each group. By default, private group access is set to **Collaborator**, while public group access is set to **Viewer**.
4. Optionally, add a message to your post. You can @mention people and groups in your message to notify them and post the file in their feed.
5. Click **Share** and **Close**. The file is posted to each group you shared it with and @mentioned.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

A private file shared with a private or unlisted group becomes a privately shared file and displays the privately shared icon (👤). The file is posted to the group's feed and only the file owner and group members can find and view the file. Any file shared with a public group is viewable by all users in your company, displays the your company icon (🏢), and is posted to the group's feed.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

 **Note:**

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
- Content files may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:

[Group Files Lists](#)

[View Where a File is Shared](#)

Share Files with People in Salesforce Classic

Share files with people privately and set **Viewer** or **Collaborator** access for each person you share the file with.

Share a file privately so only specific people in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more users in your company:

1. Start by sharing the file from one of these locations:
 - On the detail page of the file you want to share—Click  **File Sharing Settings** > **Share with people**. Or click **Sharing Settings** and then click **People** on the Sharing Settings dialog box.
 - Next to the file in a feed—Click **More Actions** > **File Sharing Settings** then click **People** on the Sharing Settings dialog box.
 - Next to the file on the Files home page—Click  **Share with people**.
 - On a file hoverClick  **Share File** then click **People** on the Sharing Settings dialog box.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share with people**.
2. Type the name of the person you want to share the file with and click the name to select it. .
3. Choose the file permission you want them to have. By default, they have [collaborator permission](#) which lets them view, download, share, change permission, edit the file, and upload new versions. Select **Viewer** to give them permission to view, download, and share files.
4. If you want to share the file with more people, enter more names.
5. Optionally, add information to the message that recipients receive.
6. Click **Share** and **Close**. Recipients receive a message that you have shared a file with them, along with a link to the file. Lightning Experience users receive this message as an email notification. Salesforce Classic users get a private Chatter message on their My Messages page on the Chatter tab, and also get an email notification if they have email notifications for Chatter messages enabled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon (👤). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon (👥) and anyone in your company can find and view it.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them. If you don't want others to change who can access the file, select **Prevent others from sharing and unsharing**.

 **Note:**

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
- Content files may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:

[View Where a File is Shared](#)

Share Files with Libraries in Salesforce Classic

Share files with libraries to take advantage of the permission-setting capabilities of content libraries while still using the features of Salesforce Files.

If your admin has turned on this feature for your org, you can share any file with a library. The **Libraries** tab in Salesforce Classic lists the libraries in your company along with the permissions assigned to each. The **Share with library** option in Chatter lets you share Chatter files with a library, applying the permissions set for the library.

 **Note:** Sharing files with libraries requires that:

- Your user detail page has the **Salesforce CRM Content User** setting enabled. Your administrator can enable this setting.
- Your organization has the **Files user interface allows sharing files with libraries** setting enabled. Your administrator can enable this setting on the Salesforce CRM Content page in Setup.

1. On the **Files** tab, click  next to the file you want to share with a library.
2. Select **Share with library**. Or, for external file references (only applicable for Files Connect users), select **Share a reference**, and choose **Library** in the **Sharing Settings** dialog box.
3. Do one of the following, depending on what happens next:
 - If the **Publish Content to Multiple Libraries** dialog box appears, this means that another library already manages the file. Select one or more additional libraries, and click **Publish**.
 - If the **Share files with a library** confirmation message appears, it means that the file has been shared with people who have Collaborator access, or it has been synced. If you proceed, Collaborators and anyone who has synced the file will have only Viewer access. (A library administrator can give them editing access later.) Click **Share** to continue, or **Cancel** if you've changed your mind.
 - If the **Publish Content** dialog box appears, enter a title for the file. Select the library you want to share it with, and enter any tags as metadata. Select a record type, enter any optional information, and click **Publish**.

The file is now listed on the **Libraries** tab and in **Files in My Libraries** on the **Files** tab.

SEE ALSO:

[Create Folders in Libraries in Lightning Experience](#)

Attach Files to Records

Attaching files to records is a powerful way to collaborate and stay organized in Salesforce. You keep information on an opportunity, account, or case right where you need it. Share relevant documents with anyone with access to the record.

You can attach files—such as Microsoft® Office documents, Adobe® PDFs, images, and videos—to most Salesforce records. Add files using the Files related list.

 **Note:** If you don't see the Files related list on a record, ask your admin to [add it to the page layout](#) on page 3829 for that record type.

To attach files to records:

- In Lightning Experience on the Files related list, click **Add File** to add a local file or a Salesforce file.
- In Salesforce Classic, click **Upload File** file from the Files related list.

 **Note:** In Lightning Experience, all files uploaded to the Notes & Attachments related list are uploaded as Salesforce Files, not as attachments. In Salesforce Classic, files uploaded to Notes & Attachments are either Salesforce Files or attachments, depending on how your org's preferences are set. Files uploaded to the Files related list always become Salesforce Files, whether in Lightning Experience or Salesforce Classic.

Limits

- The size limit for an attached file is 25 MB when attached directly to the related list, including a file attached to a solution.
- The file size limit for Chatter feed attachments is 2 GB.
- The size limit for an email message, including attachments, is 25 MB.
- If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`.

Prevent Others from Sharing and Unsharing a File

You can prevent others from sharing and unsharing a file you own. This doesn't affect existing shares.

1. On **Files** home, find the file you want.
2. Go to **Sharing Settings** or **Share File** for the file. (Or, if the file is in a library, open the Content Detail page from the **Libraries** tab.)
3. Select the **Prevent others from sharing and unsharing** checkbox.
4. Click **Save**.

 **Example:** Let's say I post a file in Chatter, and share it with a private group. I'm okay with members of the group having access to the file, but I don't want them to share it further. I can prevent sharing and unsharing so the existing shares remain but new ones can't be added, except by me or an admin.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: , **Group**, **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To attach files to records:

- "Edit" on the object

You can also prevent others from sharing and unsharing a file in the API by using the `SharingOption` field on `ContentVersion` and other objects.

Share Files with People in Lightning Experience

Share files with people privately and set **Viewer** or **Collaborator** access for each person you share the file with.

Share a file privately so only specific people in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more users in your company:

- Start by sharing the file from one of these locations:
 - Next to the file on Files home—Click  **Share**.
 - On the detail page of the file you want to share—Click **Share**.
 - From the file preview player—Click 
- Type the name of the person you want to share the file with and click the name to select it. Enter additional names if you wish to share with more than one person.
- Choose the file permission you want them to have. By default, they have [collaborator permission](#) which lets them view, download, share, change permission, edit the file, and upload new versions. Select **Viewer** to give them permission to view, download, and share files.
- Optionally, add information to the message that recipients receive.
- Click **Share** and **Close**. Recipients receive a message that you have shared a file with them, along with a link to the file. Lightning Experience users receive this message as an email notification. Salesforce Classic users get a private Chatter message on their My Messages page on the Chatter tab, and also get an email notification if they have email notifications for Chatter messages enabled.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

From the Share File window, click **Who Can Access** to see everyone the file has been shared with. Update file permissions or click X next to the name of a person or group to stop sharing the file with them. If you want to prevent others from changing who can access the file, select **Prevent others from sharing and unsharing**.

Note:

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
- Content files may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

Share Files via Link

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

In Salesforce Classic, you can share a file with anyone by creating a file link and sending it via email or IM. Creating a link generates an encrypted URL that you can send to any recipient, such as leads, customers, partners, and coworkers, inside or outside of your company. When your recipients click the link, they see a web-based version of the file that they can easily view and download. Sharing via link is available in Salesforce Classic, and is on by default for most orgs. Administrators can enable sharing via link by enabling these permissions:

1. From Setup, enter *Content Deliveries* in the Quick Find box, then select **Content Deliveries**. Select **Enable content deliveries** and **Enable Creation of Content Deliveries for Salesforce Files**.
2. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**. Select a permission set, click **System Permissions**, and select **Create and Share Content Deliveries for Salesforce Files**.
3. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**. Select a profile, click **Edit**. In **General User Permissions**, select **Create and Share Content Deliveries for Salesforce Files**. You don't need this permission for files in a shared Salesforce CRM Content library. Instead, complete steps 1 and 2 and then ensure that the user is a library member and that **Deliver Content** is checked in the library permission definition.

Create and share a file link:

1. Start by sharing the file from one of these locations:
 - On Files home—Click **Upload files**, select a file from your device, then click **Sharing Settings** and choose **Anyone with Link**. Copy the link provided to share with people inside or outside your company.
 - On the Home page—Click **Create New > File**, click **Choose File** and select a file from your computer, then click **Share via link** from the dropdown menu.
 - On a file detail page—Click  **File Sharing Settings > Via link**.
 - On the Sharing Settings dialog box—Click **Anyone with link** from the Share with list.
 - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click  **> Share via link**.
 - Next to the file in a feed or on a file hover—Click **More Actions > File Sharing Settings**, then click **Anyone with link** from the Share with list.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share via link**.
2. Click **Copy** if available (or copy the link manually), and paste the link into an email or IM. File link recipients can only view and download files. They can't be collaborators.

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon (). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon () and anyone in your company can find and view it.

On the Sharing Settings dialog box, click  next to a link to stop sharing it. Anyone with the link will no longer be able to access the file.

 **Note:**

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

View File Details

To open file details, click a file name in a feed, on a files list, on a file hover, or by clicking **More Actions** > **Preview** next to the file in a feed. On the file detail page, you can see details about Salesforce Files.

From a file detail page, you can:

- View the file without downloading it. Use the arrow keys in the document previewer to see each page, zoom in or out, or change the preview width and screen size. Files owners and anyone with access to the file can preview it.
-  **Note:** Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.
- See if the file is private () , privately shared () , or shared with your company () .
- Click  **Download** to open or save the file. Anyone who can see a file can download it.
- Click  **File Sharing Settings** to share a file with [people](#), [groups](#), or via [file link](#), or see the [Sharing Settings](#). By default, anyone who can see a file can share it.

File and Content Engagement Report

See how many times a file has been downloaded, shared, liked, and commented on.

From the file detail page, click  **Show file report** to run and view the File and Content Engagement report, which has these fields.

Field	Number of times users...
Total Downloads	Downloaded the file.
Posts	Posted the file to a feed. This number doesn't count the number of times the file has been attached to comments on posts.
Post Comments	Commented on file posts in feeds.
Likes	Liked file posts on feeds. This number doesn't count likes received by comments on the file post.
Shares	Shared the file using Share with people and Share with groups . If a user clicks Share on a file post, it's counted as a post and not as a share.
Links	Shared the file using Share via link . If the file is uploaded to a Salesforce CRM Content library, then content deliveries are also counted.

 **Example:** Numbers in the File and Content Engagement report are cumulative for all versions of a file. For example, if there are 2 versions of the file, and version 1 has been downloaded 4 times while version 2 has been downloaded 5 times, then **Total Downloads** reports 9 downloads.

Get Started with Salesforce Files Sync

Salesforce Files Sync makes file management, syncing, and sharing easier than ever!

Watch a Demo: [Get Started with Salesforce Files Sync](#)

Getting started with Salesforce Files Sync is almost effortless. Just save your files in the Salesforce Files Sync folder on your desktop, and Salesforce Files Sync does the rest.

Access your synced files anywhere

Saving a file in Salesforce Files Sync means that the file is automatically available everywhere you need it. Just look in the Synced filter in Files home — it'll be there.

Share files right from the Salesforce Files Sync folder on your desktop

Right-click on a file to share it with people and groups in Chatter, or share the file with anyone using a link.

Always have the latest version of every file

Whenever you or one of your collaborators edit a file saved in the Salesforce Files Sync folder on your desktop, the file is instantly updated for everyone. Salesforce Files Sync supports versioning, so you can access older versions of the file, just in case.

Salesforce Files Sync System Requirements

Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Install Salesforce Files Sync

Install the Salesforce Files Sync client on your desktop to sync files between your computer, Salesforce, and Salesforce1 on mobile devices.

1. From your personal settings, enter *Files Sync* in the *Quick Find* box, then select **Salesforce Files Sync**. Multiple results? Select the one under Personal Setup.
2. Click **Download**.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.

After Salesforce Files Sync is installed, you're notified automatically when an update is available.

 **Note:** Salesforce Files Sync client must run on a local drive. External locations such as network drives or mounted devices are not supported.

Salesforce Files Sync System Requirements

Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Connect Salesforce Files Sync to Other Salesforce Organizations

Configure Salesforce Files Sync to connect to other Salesforce organizations.

After disconnecting Salesforce Files Sync from one Salesforce organization, your synced files are backed up in a folder called "Salesforce Files_Old." On Windows, the backup folder is located at `C:\Users\User Name\Salesforce Files_Old` where *User Name* is your Windows user name. On Mac, the backup folder is located at `/Users/User Name/Salesforce Files_Old` where *User Name* is your Mac user name. Your synced files are always accessible online in the Salesforce organization they're synced with.

 **Warning:** Before connecting Salesforce Files Sync to a new Salesforce organization, close all files and folders saved in your Salesforce Files Sync folder. Any files and folders that are open when you disconnect Salesforce Files Sync from a Salesforce organization aren't backed up and automatically sync with the next Salesforce organization that you connect Salesforce Files Sync to.

To sync files with a different Salesforce organization, set up a new connection for Salesforce Files Sync.

1. In your system tray or menu bar, right-click  **Salesforce Files Sync**.
2. Click **Preferences**.
3. If necessary, click **Log out** to disconnect your from your current Salesforce organization.
4. Under New Connection, enter a **Name** for the new connection.
5. Enter the `https://` login URL for your Salesforce organization.
6. Click **Log in**.
7. Enter your login credentials and click **Log in**.
8. Click **Allow** to enable Salesforce Files Sync.

After connecting to the new organization, any files you add to your Salesforce Files Sync folder sync with that organization. If you've already synced files with the organization that you're connecting to, the synced files automatically download to the Salesforce Files Sync folder on your desktop.

Sync Files and Folders

Sync files and folders by saving them in your Salesforce Files Sync folder on your computer or by clicking  **Sync** while viewing a file in a feed post, comment, file list, or file detail page.

Watch a Demo:  [Salesforce Files Sync \(Salesforce Classic\)](#)

Before you can sync files, you must install Salesforce Files Sync on your desktop.

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync folder on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.

You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files.

To sync your files:

1. From the Salesforce Files Sync client, either save your files in your Salesforce Files Sync folder or drag and drop the files you'd like to sync into your Salesforce Files Sync folder.

On Windows, your Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, your Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name.

From the **Files** tab, a feed post, or anywhere in the full Salesforce site where a file is posted or listed, click  **Sync**.

2. The files sync.

USER PERMISSIONS

To sync files:

- "Sync Files"

After your files sync, you can easily access them in Salesforce and in Salesforce1 on mobile devices. If you delete a file from your Salesforce Files Sync folder, you can still access the file in the Owned by Me filter in Files home.

Access Synced Files on Your Computer, Online, and on Mobile Devices

Access synced files in your Salesforce Files Sync folder on your desktop, in Salesforce online, and in Salesforce1 on your mobile device.

Find Synced Files on Your Desktop

On your desktop, your synced files are kept in your Salesforce Files Sync folder. On Windows, the Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, the Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name.

To open your Salesforce Files Sync folder from your system tray or menu bar, right-click  **Salesforce Files Sync > Open Salesforce Files Sync Folder.**

 **Warning:** Moving your Salesforce Files Sync folder from its default directory location prevents file syncing. To ensure that your files always sync, don't move your Salesforce Files Sync folder.

Find Synced Files in Salesforce

In Salesforce, your synced files are available in Files home.

From Files home, click **Synced** to view your synced files and folders. Your most recently synced files are listed first.

Find Synced Files on Your Mobile Device

On your mobile device, your synced files are accessible in Salesforce1.

From Files home, tap ▼ and select **Synced** to view a list of your synced files.

Working with Synced Files and Folders

Synced files and folders are just like any other file in Salesforce, but they have a few additional features.

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.

You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files in Chatter.

Share Synced Files

Synced files can be shared directly from the Salesforce Files Sync folder on your desktop.

Share synced files with people and Chatter groups in your organization, or people outside your organization using a generated link. Synced files are private by default, but when you share them you can assign view-only or collaborator privileges.

If you share a file with a person or group with Collaborator rights, then when collaborators download, edit, and upload a new version of the file, you'll get the latest version automatically synced. When you edit and sync a new version of the file, the people and groups you've shared with will automatically get the latest version too.

To share a file directly from your Salesforce Files Sync folder:

1. On your desktop, in your Salesforce Files Sync folder, right-click the file you'd like to share.

2. Choose a menu option under **Salesforce Files Sync**: share with people in your organization, with Chatter groups, or with people outside your organization via link.
3. When prompted, enter the names of the people or groups in your organization, assign `Viewer` or `Collaborator` permission, and enter an optional message to share the file with them. If you're sharing the file via link, copy the link.
4. Click **Share**.
An email notification is sent to everyone you shared the file with.

Manage Versions of Synced Files

Just like all Salesforce files, you can work with prior versions of a synced file as needed.

After you first sync a file, you see that file as Version 1 in your files list. If you make changes to it on your computer or mobile device, a new version is automatically created each time you save the file. To view previous versions, just visit the file detail page.

Anyone who is following the synced file receives a notification in their Chatter feed when new versions are created. File collaborators can upload new versions of your synced files.

 **Warning:** If a synced file is open on your desktop when a collaborator uploads a new version, then you won't receive the new version until you close the file without saving. If you save your open file, your version will overwrite your collaborator's changes.

Salesforce Files Sync Limits

Be aware of file syncing limits while using Salesforce Files Sync.

Feature	Limit
Organization-wide storage	Storage is based on the number of Salesforce licenses purchased. Additional storage can be purchased. For more information, refer to Salesforce Files Sync Storage Limits .
Maximum number of synced files	Users can sync up to 10,000 files.
Maximum number of synced folders	500 folders
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048
Maximum number of users who can sync the same file simultaneously	1,000 users
Maximum number of Connect API calls	10,000 per user, per hour, per connected application from the Salesforce Files Sync desktop client Salesforce Files Sync temporarily stops syncing files if you reach the Maximum number of Connect API calls. Syncing resumes automatically in about an hour.

Salesforce Files Sync continues to sync existing files, but won't sync new files if:

- Your Salesforce Files Sync folder exceeds 10 GB of files.
- Your organization reaches its shared file storage limit.
- Your Salesforce Files Sync folder contains more than 10,000 files or 500 folders.
- The new file's file size exceeds the individual file size limit.

Salesforce Files Sync stops syncing files if:

- You move your Salesforce Files Sync folder from its default directory location. On Windows, the default directory location is `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, the default directory location is `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name. Salesforce Files Sync resumes syncing after the Salesforce Files Sync folder is returned to the default directory location.

Salesforce Files Sync Storage Limits

Two storage limits affect Salesforce Files Sync: shared organization-wide storage and individual storage.

Shared Organization-Wide Storage

Your organization's shared file storage equals the file storage allocation per organization, plus the per-user allocation multiplied by the number of users in your organization.

If your organization is using its entire shared storage allocation, then Salesforce Files Sync will continue to sync your existing files, but won't sync new files unless you or your organization removes existing files or purchases more storage from Salesforce.

Salesforce Edition	File Storage Allocation Per Organization	File Storage Allocation Per User License
Contact Manager	10 GB	612 MB
Group	10 GB	612 MB
Professional	10 GB	612 MB
Enterprise	10 GB	2 GB
Performance	10 GB	2 GB
Unlimited	10 GB	2 GB
Developer	20 MB	N/A
Personal	20 MB	N/A

 **Note:** If your organization uses custom user licenses, contact your administrator to determine if these licenses provide additional storage.

Individual Storage

Salesforce Files Sync syncs up to 10 GB of files between the Salesforce Files Sync folder on your desktop, Salesforce on the Web, and mobile devices with Salesforce1. Salesforce Files Sync will continue to sync your existing files, but won't sync your new files if you add more than 10 GB of files to your Salesforce Files Sync folder. If you reach the individual 10 GB storage limit, you must remove existing files to sync new files.

File Names and Extensions that Prevent Syncing

Some file characteristics can prevent files from syncing between your devices and the Web.

- Zero-byte files
- Files without an extension
- Files with names that start with:
 - AUX.
 - CLOCK\$.
 - COM1.
 - COM2.
 - COM3.
 - COM4.
 - COM5.
 - COM6.
 - COM7.
 - COM8.
 - COM9.
 - CON.
 - LPT1.
 - LPT2.
 - LPT3.
 - LPT4.
 - LPT5.
 - LPT6.
 - LPT7.
 - LPT8.
 - LPT9.
 - NUL.
 - PRN.
 - ~
 - .
- Files with these names:
 - desktop.ini
 - thumbs.db
 - .DSStor
- Files with these extensions:
 - .tmp
 - .conflicted
 - .part
 - .partial

- .download
- .crdownload
- extensions starting with .sb-
- Different operating systems have different file name restrictions. Salesforce Files Sync syncs any file whose name is allowed by your operating system. That means that if you can name a file on your desktop, you can sync it using Salesforce Files Sync. If you sync a file from Mac® OS X®, it will sync to the Web, but if the file name isn't allowed by Microsoft Windows®, the file won't download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using these characters in file names:

- \ (backslash)
- : (colon)
- * (asterisk)
- ? (question mark)
- ' (apostrophe)
- < (less than sign)
- > (greater than sign)
- / (slash mark)
- | (pipe)
- ™ (trademark symbol)
- ∞ (infinity sign)
- § (section)
- • (bullet point)
- ≠ (not equal to)
- ` (grave accent)
- “ (quotation marks)
- ... (ellipsis)
- ≥ (greater than or equal to sign)
- ≤ (less than or equal to sign)
- & (ampersand)
- Files with names longer than 254 characters

Synced Folder Name Restrictions

Some folders aren't synced by Salesforce Files Sync because of folder name restrictions.

Different operating systems have different folder name restrictions. Salesforce Files Sync syncs any folder whose name is allowed by your operating system. That means that if you can name a folder on your desktop, you can sync it using Salesforce Files Sync. If you sync a folder from Mac® OS X®, it will sync to the Web, but if the folder name isn't allowed by Microsoft Windows®, the folder won't download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using folder names that:

- Contain these characters:
 - / (forward slash)
 - \ (backslash)

- : (colon)
 - * (asterisk)
 - ? (question mark)
 - " (quotation marks)
 - < (less than sign)
 - > (greater than sign)
 - | (pipe)
- Exceed 255 characters
 - Are identical to another folder name in the same directory

Files Connect External Files

Browse, search, and share files that are stored elsewhere right from Salesforce.

[Authenticate to Files Connect External Data Sources](#)

If your administrator configured a data source like SharePoint to employ per-user authentication, provide your credentials for that system in Salesforce.

[Access and Share External Files Using Files Connect](#)

After your admin enables Files Connect, you can access files from external sources like Google Drive and SharePoint, or share them via feeds and Files home.

[Search for External Files with Files Connect](#)

Search an external data source like Google Drive, Box, or SharePoint right within Salesforce.

Authenticate to Files Connect External Data Sources

If your administrator configured a data source like SharePoint to employ per-user authentication, provide your credentials for that system in Salesforce.

[Set Up Authentication to an External Data Source](#)

When you connect to a Files Connect external data system for the first time, set up your authentication in just a few clicks.

[Manage Your External Data Source Authentication Credentials](#)

You or your Salesforce admin can set up and manage your authentication settings for external data sources using Files Connect. With valid authentication settings, you can access files from external systems right from Salesforce.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access cloud-based data sources like SharePoint Online:

- “Files Connect Cloud”

To access on-premises data sources like SharePoint 2010:

- “Files Connect On-premises”

Set Up Authentication to an External Data Source

When you connect to a Files Connect external data system for the first time, set up your authentication in just a few clicks.

If you haven't set up your authentication to an external data system in My Settings, you are prompted to authenticate the first time you try to access an external system in Salesforce. Click the link or button to complete most of the authentication automatically.

- If you are connecting to Box, Google Drive, SharePoint Online, or OneDrive for Business:
 1. Select **OAuth 2.0** as the authentication protocol.
 2. When you see a message requesting permission for Salesforce to access information from your external system, click **Allow**.
 3. After the authentication process has finished, you are redirected to Salesforce.
- If you are connecting to SharePoint 2010 or SharePoint 2013:
 1. You are redirected to Authentication Settings for External Systems.
 2. Enter your username and password credentials for the external system.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access cloud-based data sources like SharePoint Online:

- "Files Connect Cloud"

To access on-premises data sources like SharePoint 2010:

- "Files Connect On-premises"

Manage Your External Data Source Authentication Credentials

You or your Salesforce admin can set up and manage your authentication settings for external data sources using Files Connect. With valid authentication settings, you can access files from external systems right from Salesforce.

Your admin defines external systems in external data sources and named credentials. Before you begin, your administrator:

- Sets up the external data source or named credential to use per-user authentication.
- Grants you access to the external data source or named credential.
- Tells you the authentication settings to enter.

If you don't see the expected settings or options, ask your admin for help.

1. From My Settings, enter *Authentication* in the *Quick Find* box, then select *Authentication Settings for External Systems*.
2. Click **New** to set up a new connection. Click **Edit** to modify an existing external data source.
3. From the *External System Definition* menu, select "External Data Source."
4. From the *External Data Source* menu, select a data source created by your administrator.
5. Select the authentication protocol required by the external system.

For SharePoint 2010 or 2013, set the following options.

Field	Description
Authentication Protocol	Choose Password Authentication
Username and password	Enter your SharePoint username and password

For Box, Google Drive, SharePoint Online, or OneDrive for Business, set the following options.

Field	Description
Authentication Protocol	Choose OAuth 2.0
Authentication Provider	Choose the provider created for this data source by your administrator
Scope	Leave blank
Start Authentication Flow on Save	Select to immediately verify your login credentials with the external data source. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org. Redo the OAuth flow when you need a new token—for example, when the token expires—or if you edit the Scope or Authentication Provider fields.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in:

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in:

Enterprise, Performance, Unlimited, and **Developer** Editions

USER PERMISSIONS

To access cloud-based data sources like SharePoint Online:

- "Files Connect Cloud"

To access on-premises data sources like SharePoint 2010:

- "Files Connect On-premises"

6. Click **Save**.

Access and Share External Files Using Files Connect

After your admin enables Files Connect, you can access files from external sources like Google Drive and SharePoint, or share them via feeds and Files home.

Download or Share Files on Files Home

Download external files to your local system or share them with a general set of people in your organization from Files home.

1. Navigate to Files home.
2. The External Files list in the left column shows available external data sources. Select one and navigate through the folders, or use the search bar to find a file.

 **Note:** Salesforce supports Google documents, spreadsheets, presentations, and drawings. In the Recent list, Google Drive content is limited to the 24 most recently accessed documents from the last 30 days.

3. Click  next to the file name, and choose one of the following:
 - **Open** the file in the external data source, such as SharePoint.
 - **Download** the file to your local system. (From on-premises systems like SharePoint 2010, 2 GB is the maximum download size.)
 - **Share** the file either as a copy or as a reference. Your admin has determined which type of sharing is used at your organization. When sharing, you do one of the following:
 - **Share a copy** of the external file stored in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system. Salesforce Files doesn't reflect any revisions to the file in external systems.
 - **Share a reference** to the external file stored outside Salesforce. Only users with access to the external system can download files. (Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup). Salesforce Files doesn't reflect any revisions to the file in external systems, but the reference does point to the latest version of the file in those systems.

 **Note:** To download files referenced from an external system, users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup.

When a user selects an external file from the file selector, a file reference or copy is created in Salesforce. If a file reference already exists, it is reused.

Share Files in the Feed

If you want to include external files in a specific Chatter conversation, use the feed. All files shared in the feed are either copies or references, as determined by your administrator.

In Salesforce Classic

1. While authoring a post, click **File** above the feed, and then click **Select a file from Salesforce**.
2. In the left column, click the external source, such as SharePoint.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

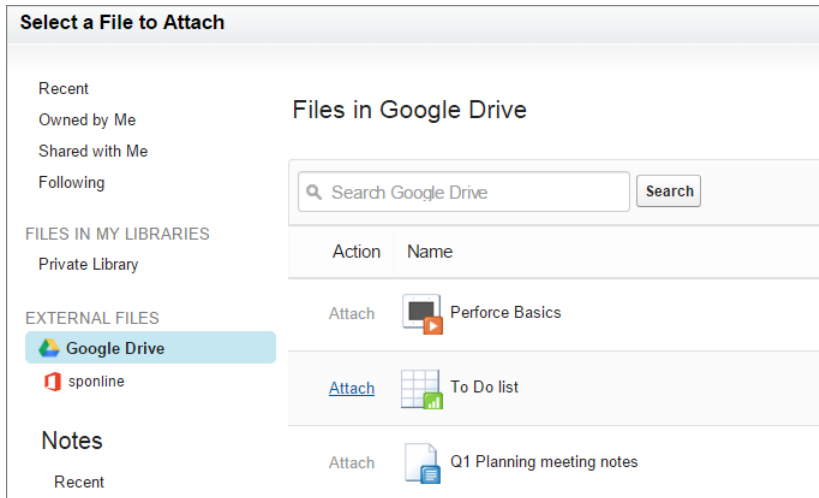

To access cloud-based data sources like SharePoint Online:

- "Files Connect Cloud"

To access on-premises data sources like SharePoint 2010:

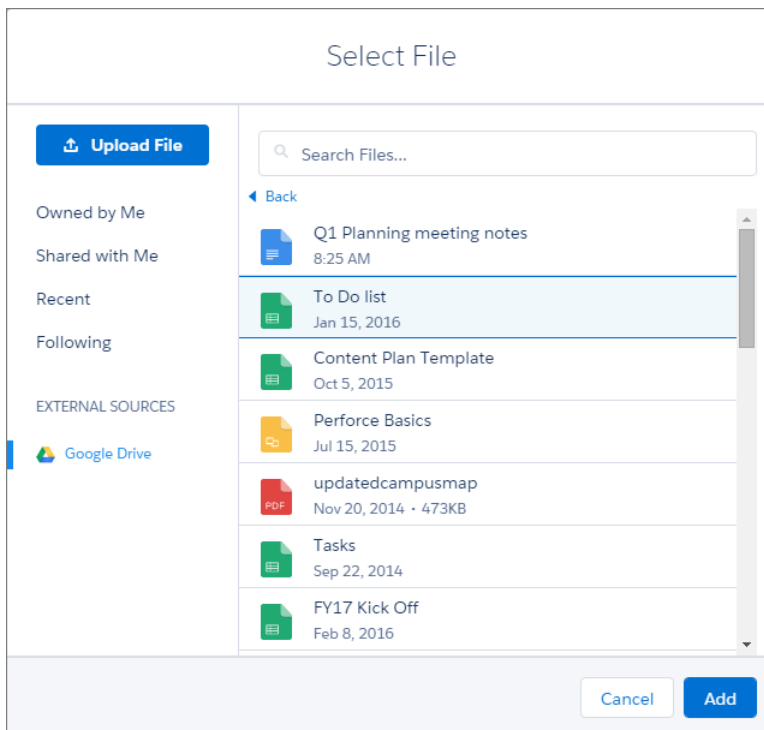

- "Files Connect On-premises"

- Next to the file you want to share, click **Attach**.
- In the body of your post, @mention the groups or people you want to share with.

In Lightning Experience

- While authoring a post, click the paperclip icon below the post to open the Select File window.
- From the left column, click the external source, such as SharePoint or Google Drive.
- Select the file you want to share and click **Add**.
- In the body of your post, @mention groups or people that you want to share with.

When you paste a link to an external document into a Chatter post, it's converted into a Files Connect file reference. Under the body of your post, the file title and icon appear. Click the icon to open the file preview right from your feed. A file reference is created for the first link in each post. File references are not created for links in comments.

Search for External Files with Files Connect

Search an external data source like Google Drive, Box, or SharePoint right within Salesforce.

Search in a Specific External Data Source

In Salesforce Classic

1. From the left column of Files home or your Chatter feed, click the data source name.
2. In the search box, enter terms such as *document title* or *author*. (The specific information you can search for depends on the configuration of the external data source.)

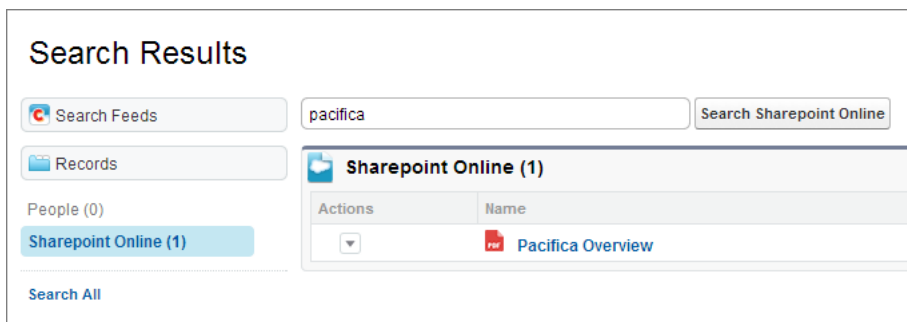

-  **Note:** You can also search external data sources from the file selector when attaching a file to a Chatter post. In Salesforce Classic, click **File** above the feed, and then select a file from Salesforce. In Lightning Experience, click the paperclip icon below the post to open the Select File window.

Search Globally for Salesforce and External Data

If your administrator enables global search for an external data source, you can conveniently search its contents along with your Salesforce data.

In Salesforce Classic

1. In the global search box at the top of the Salesforce window, enter your search terms.
2. To filter the results down to a specific external data source, click its name in the left column (for example, "SharePoint Online").

-  **Tip:** If you often want to see content from a specific external data source, pin it to the top of global search results: In the left column, hover over the data source name, and click the pin icon. (If you don't see the data source listed, click Search All.)

In Lightning Experience

1. From Files home, enter a search term into the global search box in the header.
2. You can filter your search results to return only Files by selecting "in Files" after entering your search in the global search box, or by doing a global search and then selecting Files from the global search results.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in: **Salesforce Classic**

Available in: **All Editions** except **Database.com**

Documents Home

Clicking on the Documents tab displays the documents home page.

 **Note:** If the Documents tab is not visible, you can customize your display to show it.

- Under **Find a Document**, enter keywords to search for a document.
- In the **Document Folders** section, select a folder to view all the documents contained in that folder.
- The **Recent Documents** section displays the last ten or twenty-five documents you viewed, with the most recently-viewed document listed first. This list is derived from your recent items and includes records owned by you and other users. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display.
- In the **Recent Documents** section, click **New** to upload a new document.

 **Note:** The Documents tab is not part of Salesforce CRM Content.

SEE ALSO:

[Upload and Replace Items on the Documents Tab](#)

[View Document Lists](#)

View Document Lists

The documents list page displays a list of documents in a selected folder. From this page, you can view detailed document information or manipulate the document.

- Click the document name to [view the document properties](#).
- Click **Edit** next to a document to [edit the document properties](#).
- Click **Del** to [move the document to the Recycle Bin](#).
- Click **View** to open the file in its associated application. If a file type is not recognized or the application is not loaded on your machine, Salesforce displays a standard download dialog prompting you to choose a save option.
- Choose a folder to view a list of documents stored in that folder.
- Click any column heading to sort the documents in ascending or descending order by the information in that column.
- At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
- Click **Next Page** or **Previous Page** to go to the next or previous set of documents.
- At the bottom of the document list, select **fewer** or **more** to view a shorter or longer display list.
- Click **Printable View** to display the current list view in a format that is ready for printing.

 **Note:** If you can't find a document, you may not have access to the folder that contains it.

Upload and Replace Items on the Documents Tab

You can store documents and images on the Documents tab without attaching them to records. You can then use these items in your Salesforce org, such as when creating an email template.

Upload a New Document

1. On the Documents tab, click **New Document**, or on the documents home page, click **New** next to Recent Documents. If you do not have a New Document option, check if you have the correct permissions.
2. On the Upload New Document page, specify a descriptive document name. If you want to use the file name, leave this field blank. The file name appears when you upload the file.
3. If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.
4. Select one of the following.
 - `Indicate Document is Internal`: When checked, a flag is added to the document indicating that document viewers should not share the file outside of the organization.
 -  **Note:** Checking this box does not expressly enforce any security rules.
 - `Externally Available Image` if the document is an image, such as a logo, that's not confidential. Check this box to:
 - Make the image available from HTML email templates without requiring a Salesforce username and password
 - Use the image as a custom tab icon or custom app logo, which do require a Salesforce username and password to view
 - Display the image as a custom logo in meeting requests

The `Indicate Document is Internal` and `Externally Available Image` checkboxes are mutually exclusive; you cannot select both.
5. Select a folder for the document.
6. Enter a description to use later as search criteria.
7. Enter keywords that you can use later as search criteria.
8. Select a document or path option.
 - To upload a document, click **Browse**, choose the file, and click **Open**.
 - To store a link to the document, enter the location of the document. Enter a path and file name or a URL such as:
`C:\Quotes\quote.doc`, `\\Server\Departments\Marketing\logo.doc`, or
`http://www.salesforce.com`.
9. Click **Save**.
 -  **Note:** To refer to this document using its URL, right-click the image and copy its URL address. When you use the URL, you reference the copy of the image on the Salesforce server.

Replace a Document

1. Display the document you want to replace. For instructions on locating a document in the document library, see [Search for Documents](#).
2. Click **Replace Document**.
3. Select a document or path option.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To upload new documents:

- Create on documents

To replace documents:

- Edit on documents

- To upload a replacement, click **Browse**, choose the file, and click **Open**.
- To store a link to the replacement, enter the location of the replacement. Enter a path and file name or a URL such as:
C:\Quotes\quote.doc, \\Server\Departments\Marketing\logo.doc, or
http://www.salesforce.com.

4. Click **Replace Document**.

Tips for Uploading or Replacing Documents

- Documents stored as links cannot be attached to emails, but they save space in your document library.
- If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.
- Salesforce stores the most recent upload date as the modified date.
- You can upload documents that have file names of up to 255 characters including the extension.
- The size limit for any document you upload is 5 MB. The maximum size for a custom-app logo is 20 KB.
- Your organization's used file storage includes all files stored in the document library.
- If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`.

SEE ALSO:

[Display and Edit Document Properties](#)

Search for Documents

To find specific documents, use the **Find Document** button on the documents home page.

1. Click the Documents tab.
2. Enter your search terms. Salesforce searches the following fields:
 - Document Name
 - Keywords
 - Description
3. Click **Find Document**.

The search returns a list of documents that match all your search terms. The search results are listed in order of the closest matches. The `Keywords` and `Document Name` fields are used to determine the closest matches. The fields you see are predefined and cannot be changed.

 **Tip:** Use quotation marks around a phrase to search for the words in that sequence. For example, a search for *"my logos"* returns documents whose fields or content contains that exact phrase, as well as *my* and *logos*. Without quotation marks, your search returns any document whose fields or content includes any of the words in the search. For example, *my logos* returns documents whose fields or content contains *my* and *logos*.

4. Select any document to jump directly to the detail page for that document, or click **View** to open the document in a new window.

If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To view documents:

- "Read" on documents

 **Note:** Salesforce automatically determines if the contents of a document can be searched. If the `Document.ContentSearchable` property is checked on a document, then its contents have been processed successfully and can be searched. If your document is large, it may take several minutes before Salesforce searches the contents of a document and marks the `Document.ContentSearchable` property.

You can also find documents using global search.

1. Enter your search terms in the header search box.
2. Select **Search Options...** from the drop-down and select `Documents` to narrow your search results.
3. Click **Search**.

The following file types are supported for a document content search.

 **Note:** The contents of documents that exceed the maximum sizes are not searched; however, the document fields are still searched. Only the first 1,000,000 characters of text are searched. Text beyond this limit is not included in the search.

File Type	File Extensions	Maximum Size
HTML (only the text within a <code><body></code> tag)	<code>.htm</code> , <code>.html</code> , <code>.xhtml</code>	5 MB
PDF	<code>.pdf</code>	25 MB
PPT	<code>.pot</code> , <code>.pps</code> , <code>.ppt</code>	25 MB
RTF	<code>.rtf</code>	5 MB
Text	<code>.c</code> , <code>.cpp</code> , <code>.css</code> , <code>.csv</code> , <code>.ini</code> , <code>.java</code> , <code>.log</code> , <code>.sql</code> , <code>.txt</code>	5 MB
Word	<code>.doc</code> , <code>.dot</code>	25 MB
XLS	<code>.xls</code> , <code>.xlt</code>	5 MB, or a maximum cell limit of 100,000 cells
XML	<code>.xml</code>	5 MB

In some instances documents are not searched. These include:

- If a file extension is changed to a different format, it is not searched, even if both extensions are valid. For example, a `.txt` file that is renamed to `.rtf` is not searched.
- PDF and Word documents may have security restrictions that prevent them from being searched. To ensure that the content is searchable, the “content extraction” property on your file must be set to “Enabled” when creating your document.

SEE ALSO:

[Search for Content](#)

[Search for Files](#)

Delete Documents

To delete a document, click **Del** next to the document on the documents list page. Alternatively, click **Delete** on the documents detail page.

When you delete a document, Salesforce stores it in the Recycle Bin. You can restore the document to your document library within that time by clicking **Undelete** from the Recycle Bin.

Note:

- You can delete any document in your personal folder but you can only delete a document in a public folder if you have the “Manage Public Documents” permission.
- If you delete a document that's included in a letterhead or HTML email template, any emails using the letterhead or template display a broken link in its place. You can fix the broken link by removing the document from the Recycle Bin.
- You can't delete a document that's being used as a custom logo in meeting requests. To delete it, you must either select another document to use as a logo or uncheck the option to display a custom logo in meeting requests.

Moving Documents to Salesforce Files

As you make the move to Lightning Experience, you may have questions about the files you have stored in the Documents tab in Salesforce Classic.

Can I see the files in the Documents tab in Salesforce Classic in Lightning Experience?

The Documents tab isn't available in Lightning Experience, but your document files aren't going away. In fact, some features continue to rely on files in your Documents tab, like email templates. Don't delete these documents, but do take this opportunity to add your working files and images as Salesforce Files so they're usable in Lightning Experience.

How will I work with my documents in Lightning Experience?

Lightning Experience uses Salesforce Files to manage and collaborate on files. Salesforce Files unifies various content types to streamline and improve your experience: they can be stored privately, shared to libraries and groups, and updated with version history.

How do I move files from the Documents tab into Lightning Experience?

While there isn't a one-click solution, you do have some options once you identify the files in the Documents tab that you want to use in Lightning Experience and your communities.

1. Export documents in the weekly export, and then upload the documents into Salesforce Files
2. Use a third-party data export tool from the AppExchange, like FileExporter from Salesforce Labs
3. Use an API-based tool (The Chatter REST API supports uploading asset files.)

Salesforce Files are the best way to save, organize, and share files in Salesforce. Salesforce Files continue to see improvements, so move your documents to Salesforce Files now and start taking advantage of them.

Displaying Documents - Once you have located a document on the documents home or list pages, click the document name to display detailed information.

Editing Document Properties - To update [document properties](#), click **Edit**.

Deleting Documents - To [delete a document](#), click **Delete**.

Updating Documents - To [replace a document with an updated version](#), click **Replace Document**.

Emailing Documents - To email a document to a contact, click **Email Document**, fill in the details of the email, and click **Send**. The document is sent as an attachment to the email and is logged in the Activity History for the contact. Documents that reference URLs rather than physical files cannot be emailed. For a document that is an image embedded in an HTML email template, such as a logo in a letterhead, make sure the document is marked as `Externally Available` on the Documents tab so that a user who does not have a Salesforce username and password can view the image when it is received in an email.

Searching a Document - To search for a document, enter search terms and click **Find Document**. A list of documents that match your search terms displays. You can search for terms using the following fields:

- Document Name
- Keywords
- Description

If `Document Content Searchable` is checked, the content of a document can also be searched.

Viewing Folder Contents - To view all the documents in a folder, click the folder name.

Moving Documents - To store a document in a different folder, click **Edit**, choose a new folder, and click **Save**.

[Change Document Authors](#)

Document Properties

Below is a description of the properties in alphabetical order that are stored for each document in the document library.

Field	Description
Author	The main point of contact for a document. Initially, the person uploading the document is the author. Thereafter, the author can be any selected user.
Created By	The name of the person who originally uploaded the file.
Modified By	The name of the person who last uploaded the file.
Folder	The name of the folder that contains the document.
Document Content Searchable	A checkbox that indicates if the content within a document can be searched via the Find Document button on the Documents tab. This checkbox is automatically set by Salesforce.
Document Name	The name of the document including its file extension.
Document Unique Name	A unique name used to refer to the document when using the Force.com API. In managed packages, this name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With this field, a developer can change certain components' names or titles in a managed package and the changes are reflected in a subscriber's organization.
Description	A statement distinguishing this document from others.
Indicate Document is Internal	A checkbox that adds a flag to the document indicating that document viewers should not share the file outside of the organization. Checking this box does not expressly enforce any security rules. The <code>Indicate Document is Internal</code> and <code>Externally</code>

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Field	Description
Externally Available Image	<p>Available Image checkboxes are mutually exclusive; you cannot select both.</p> <p>A checkbox that indicates if the document is an image available for HTML email templates, such as a logo in a letterhead, and does not require a Salesforce username and password to view in an email.</p> <p>This checkbox indicates if the document is an image used as a custom app logo or custom tab icon, which require a Salesforce username and password to view.</p> <p>The Indicate Document is Internal and Externally Available Image checkboxes are mutually exclusive; you cannot select both.</p>
Keywords	An open text field containing one or more words that describe the document. The program checks for matches in this field when doing a search.
Path	Stored in place of Document Name if you prefer to create a link to the document instead of uploading it.
Size	The size of the document in bytes.
Type	The file type is determined by the file extension. For example, filename.ppt is recognized as a PowerPoint file. If the Don't allow HTML uploads as attachments or document records security setting is enabled for your organization, you cannot upload files with the following file extensions: .htm, .html, .htt, .htx, .mhtm, .mhtml, .shtm, .shtml, .acgi, .svg.

[Change Document Authors](#)

Change Document Authors

Since documents are stored in folders that control user access, documents do not have owners like other types of records, but they do have authors. The author represents the user that originally uploaded the document file.

To change the author of a document:

1. View the document you want to modify.
2. Click **Change** next to the `Author` field.
The **Change** link displays only on the detail page, not the edit page. If you do not see the **Change** link, you may not have sufficient privileges to change a document author.
3. Enter a new author name. Alternatively, click the lookup icon to choose from a list of users.
4. Check the `Send Notification Email` box if you would like to alert the new author of this change.

 **Note:** When you change document authorship, Salesforce does not change the document's visibility.

[Manage Libraries](#)

Salesforce CRM Content Overview

Organize, share, search, and manage content within your organization and across key areas of Salesforce with Salesforce CRM Content. Content includes all file types, from traditional business documents such as Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs.

To learn the different ways files are used in Salesforce, see [Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).

Salesforce CRM Content simplifies content management by incorporating user-friendly features into the following tasks:

Organizing

Rather than keep files in folders that make content difficult to find, Salesforce CRM Content stores files in fully searchable file repositories known as libraries. Administrators can create

EDITIONS

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

multiple libraries based on any classification, such as department name, job function, or team, then configure user permissions within the library to balance content access with security. Authors assign descriptive labels called tags to help classify and organize content across libraries. You can view a list of all content that belongs to a particular tag or filter search results based on a tag or tags. Salesforce CRM Content also provides private libraries, which allow users to reduce the clutter on their desktops while using content-management benefits such as document search and version control.

Searching

The powerful Salesforce CRM Content search engine scans the entire body of the document as well as content properties such as the title, description, tags, categorization data, and author name. You can filter searches by featured content, file format, author, tags, libraries, or custom fields and then view the results with various levels of detail, providing an easy way to find relevant content quickly. If Chatter is enabled for your organization, you can also filter your search results by Chatter files. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare documents within a search result set.

Subscribing

Once a file is located, subscribing to it ensures that you receive an email notification when new versions are published or changes are made to the file's properties. You can also subscribe to authors, tags, and libraries, thus reducing the time spent searching for new or updated content. Notification emails will arrive real-time or once daily, depending on your preferences.

Previewing

In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

Contributing

Uploading new or revised files in Salesforce CRM Content is fast and easy. During the upload process you choose a library and record type for your file or Web link, write a description, assign one or more tags, and fill out any customized fields that help categorize and define your content. Version management does not require checking files in and out, rather, you simply upload a new version of the file and Salesforce CRM Content maintains a version list accessible from the content details page. You can download past versions of a file and read all reason-for-change comments that an author may have included with a new version.

Reviewing Usage and Providing Feedback

Salesforce CRM Content provides several methods for determining whether content is valuable to readers. Featuring a piece of content increases its visibility in search results. Voting thumbs up or thumbs down on a file, Web link, or Google doc and adding comments allow you to participate directly in content improvement. You can also see who has subscribed to a file, link, or doc and how many times files have been downloaded. The Reports tab allows you to create standard or custom reports on Salesforce CRM Content data. If the content delivery feature is enabled, you can send content to colleagues, leads, and contacts and then track how often the content has been previewed or downloaded.

Sharing Content in Salesforce

Salesforce CRM Content is also integrated with leads, accounts, contacts, opportunities, cases, products, and custom objects. If Salesforce CRM Content functionality is enabled on the Opportunity tab, for example, Salesforce CRM Content uses the fields on the opportunity detail page to search for files that may be relevant to that opportunity. You can drill down in the search results as needed or run your own search and then attach one or more files to the opportunity. The most current version of the file will be available on the detail page for the life of the opportunity.

Sharing Content in Salesforce Mobile Classic

Salesforce CRM Content is available in Salesforce Mobile Classic. Users can share content with customers and colleagues from the mobile application when they're away from their desks. Ask your administrator to set up mobile Content.

SEE ALSO:

[Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#)

Contribute Content

Publish Files to Libraries

Publish files to libraries by uploading them from your computer, contributing them from your private library to a shared library, or sharing them from Chatter.

1. On the **Libraries** tab, do one of the following:

- To upload a file, click **Contribute** and choose a file from your local drive.
- To publish files from your private library, click the **My Private Files** tab, select one or multiple files, and click **Publish Selected**.

Or, to share files from Chatter with a library, see [Share Files with Libraries](#) on page 3283 (and skip the rest of these steps).

2. Enter a title for each file. Optionally, enter descriptions.

3. If you are adding a new file that you just uploaded, choose either **Save in my private library** or **Publish to a shared library**. If you choose the second option, select a library. This becomes the managing (home) library, meaning that the content can be shared with another library but only revised by a user with author permissions in the managing library.

4. Optionally, choose a language. The **Language** drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.

5. To publish the content on behalf of another author, choose that author from the drop-down list.

6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

- If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
- If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
- If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

7. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.

8. After completing the custom fields, click **Publish** or **Save**.

Note:

- Unique values in custom fields that are set for the first version of a file aren't included if you upload a new version. You can set the unique values in the new version as long as they aren't the same as a previous version.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To upload and publish files to a public library:

- **Manage Libraries** checked in your library permission definition

OR

Add Content checked in your library permission definition

To upload and save files to a private library:

- **None**

- Files published to a shared library are added to your Files tab and available to other Chatter users in your organization. Files published to your private library are added to your Files tab, but are private and not shared with anyone. For information about the different file tools and solutions in Salesforce, see [Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

Upload and Publish Content

Add files to libraries to take advantage of the permission setting and content delivery capabilities of Salesforce CRM Content.

The Libraries tab has several publishing-related options at the top of the page that let you upload, classify, and publish files, content packs, Web links, and Google docs in Salesforce CRM Content.

 **Note:** The **Add Google Doc** button on the **Libraries** tab is available only if your Salesforce admin has enabled the Add Google Doc to Salesforce service.

To publish files, Web links, and Google docs in Salesforce CRM Content, or to create content packs, refer to the following topics:

- [Publish Files to Libraries](#)
- [Contribute Web Links to Salesforce CRM Content](#)
- [Create and Modify Content Packs in Salesforce CRM Content](#)

SEE ALSO:

OR

Add Content checked in your library permission definition

To publish Google docs:

- Google Apps account

Salesforce CRM Content File Size Limits

The following are maximum file size limits for files in Salesforce CRM Content:

- 2 GB
- 2 GB (including headers) when uploaded via Chatter REST API
- 2 GB (including headers) when uploaded via REST API
- 38 MB when uploaded via SOAP API
- 10 MB when uploaded via Bulk API
- 10 MB for Google Docs
- 10 MB when uploaded via Visualforce

SEE ALSO:

[File Size Limits in Salesforce](#)

Contribute Web Links to Salesforce CRM Content

To classify and publish a Web link in Salesforce CRM Content:

1. Click the **Libraries** tab.
2. To add a new link, click **Contribute > Do you want to link to a website instead?**, then enter the URL, and click **Contribute**. To publish a link that is already in your private library, click the **My Private Files** tab, locate the link, and click **Publish**.
3. Assign a title and description to your Web link.
4. Choose a library. This becomes the managing (home) library, meaning that the Web link can be shared with another library but its content details page can only be edited by a user with relevant permissions in the managing library. If you do not want the link to be visible to other users in your organization, choose **Save in my private library**.
5. Optionally, choose a language. The **Language** drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
6. To publish the content on behalf of another author, choose that author from the drop-down list.
7. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.

Update Content Versions

Clicking a file name on any Salesforce CRM Content tab opens the content details page.

Publishing a New Version

To publish a new version of the file and update its properties:

1. Click **Edit** > **Upload New Version**. This option does not appear for Web links, content packs, or Google docs.
 - To add or remove files from a content pack, see [Create and Modify Content Packs in Salesforce CRM Content](#).
2. Click **Browse** to find and select the updated file.
3. As needed, update the **Title** and **Description** fields.
4. Fill out the **Reason for change** field. This text is included on the email notifications sent to subscribers and the version list located on the content details page.
5. To publish the content on behalf of another author, choose that author from the drop-down list.
6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
7. Update any custom fields as needed.
8. Click **Publish**.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To add a new version:

- **Add Content** checked in your library permission definition

Notes on Content Versions

Consider the following information when creating or modifying a new version:

- You cannot edit a file within Salesforce CRM Content. To edit a file, download it from Salesforce CRM Content to your computer, make your changes, then upload the updated version using the **Upload New Version** button.
- The Versions subtab on the content details page lists all content versions. The Recent Activity list on the Libraries tab also notifies users of new content versions.
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

SEE ALSO:

[Upload and Publish Content](#)

Delete, Archive, and Restore Content

There are two methods for removing content from libraries: archiving and deleting.

Archiving lets you continue to store files in Salesforce without them being in a library or exposed in search results. Deleting files moves them to the **Recycle Bin**, where files remain for 15 days before being permanently, automatically deleted. Within 15 days of deleting a file, you can restore it from the **Recycle Bin**. You can also restore archived files.

Before you delete or archive content, it's important to know what's similar and different about these two methods:

Effects of Archiving or Deleting Content	Archived Content	Deleted Content
Counts towards file storage limits (storage size as well as number of documents)	✓	
Removed from libraries	✓	✓
New versions can no longer be uploaded	✓	✓
Content can no longer be downloaded (until restored)	✓	✓
Content no longer appears in search results	✓	✓
Content can be restored	✓	✓
Automatically removed from subscription lists (without notifying subscribers)	✓	✓
Permanently deleted by emptying recycle bin		✓

To archive or delete content files:

1. On the **Libraries, Content**, or **Subscriptions** tab, click the name of the file you want to remove.
2. On the **Content Details** page, click **Edit > Archive Content** or **Edit > Delete Content**.

To delete files in content packs:

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To archive and restore any content in the library:

- **Archive Content** checked in your library permission definition

To archive and restore content that you published:

- **Add Content** checked in your library permission definition

To delete content:

- **Delete Content** checked in your library permission definition

- By default, you must first delete the content pack, and then delete the file.
- If your admin has enabled the Salesforce CRM Content setting that allows files to be deleted from content packs, you can delete a file without having to first remove it from a content pack. This removes all versions of that file from all content packs, including content packs you don't have access to, like those in Private Libraries.

To restore archived content files:

1. Do one of the following to open the **Content Details** page for an archived file:
 - Follow a bookmark to the archived content.
 - On the **Libraries** tab, click a library name to open the **Library Details** page. Click the **View Archived Content** link to see a list of archived content on the **Content** tab. Click the name of the content file you want to restore.

 **Note:** The **View Archived Content** link only displays if you have the `Archive Content`, `Add Content`, or `Manage Libraries` privileges in your library permission. If you have the `Archive Content` or `Manage Libraries` privileges, you will see a list of all archived content in the library, regardless of author. If you do not have those privileges but have the `Add Content` privilege, you will only see archived content that you authored and archived.

2. On the **Content Details** page, click **Edit > Restore Content**.

To restore deleted content:

1. On either the **Libraries** or **Subscriptions** tab, or on the **Content Details** page, go to the **Recycle Bin**.
2. Select the checkbox for the content file you want to restore, and click **Undelete**.

 **Note:**

- Authors can always archive and restore their own content. Authors do not require the `Archive Content` library permission option.
- If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.
- Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

SEE ALSO:

[Delete a File from the File Detail Page](#)

Create and Modify Content Packs in Salesforce CRM Content

A *content pack* is a collection of related documents or files that are stored as a group in Salesforce CRM Content. For example, you may want to create a content pack with a product list, price quote, and contract to send to a particular customer. Any file in Salesforce CRM Content can be added to a content pack, from traditional business documents such as Microsoft® PowerPoint presentations and Adobe® PDF files, to audio files, video files, and Google docs. Using email or instant messaging, you can distribute the content pack to colleagues in your organization or leads and contacts outside your organization. The recipient of a *content delivery* can click a single URL to open a preview player with which he or she can preview and download the content. You can then view tracking information to see how often the content pack was viewed and which documents were downloaded. .

 **Note:** Content packs support all files types; however, the preview player launched by the content-delivery URL displays only PowerPoint, Word, Excel, and PDF files. The preview player does not display copy-protected PDFs. Also, working with content packs requires Adobe Flash® Player, version 9.0.11.5 or higher. If you do not have Flash installed, Salesforce provides a link to Adobe's website where you can download Flash for free.

To work with content packs:

1. Depending on whether you want to create, customize, or modify a content pack, use one of the following options:

 **Note:** The following options are available only if `Enable content pack creation` is selected on the Salesforce CRM Content page in Setup . If content pack creation is disabled after packs have been created, Salesforce doesn't delete the packs, but they can't be customized or modified.

- To create a new content pack, click the **Libraries** tab and then choose **Create New > Content Pack**.
 - To create a new content pack by copying an existing pack and adding, removing, or reordering files, open the content details page for the pack and click **Clone & Customize**.
 - To update a content pack and publish a new version, open the content details page for the pack and click **Edit > Edit Content Pack**.
2. Click **Search files** to display all the content in your libraries. To refine your results, select a specific library to search or enter a search term in the text box.

In addition to files and documents, search results also list content packs.

3. Drag the desired content from the search results into the assembly section in the lower half of the window. The following options help you assemble your content pack:
 - In the search results, click a document to preview it in the lower half of the window. Choose **Add to Content Pack** or **Hide preview** as needed.
 - In the search results, hover over a document and click the folder icon () to view the content packs that use the document.
 - In the search results, hover over a content pack and click the folder icon () to view all the documents in the pack.
 - In the assembly section, hover over a document and click the garbage can icon () to remove that document from the pack you are assembling.
 - Click **Clear** at any time to revert your changes; click **Cancel** to return to the Libraries tab.

 **Note:** The maximum number of files that can be included in a content pack is 50.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or modify content packs in Salesforce CRM Content:

- `Manage Libraries` checked in your library permission definition
- OR
- `Add Content` checked in your library permission definition

4. When you are done assembling or modifying your content pack, click **Save** and assign or change the content pack's name.
5. In the Save or Publish Content dialog:
 - a. Select a library. If you do not want the content pack to be visible to other users in your organization, for example if your work is still in progress, choose **Save in my personal library**.
 - b. Optionally, add or modify the content pack's description.
 - c. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
 - d. If you are modifying the content pack, complete the `Reason for Change` field.
 - e. To publish the content on behalf of another author, choose that author from the drop-down list.
 - f. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
 - g. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.
 - h. Click **Publish**. You can then view the content details page, return to the Libraries tab, or publish another file.

[Viewing and Editing Content Deliveries](#)

Find Content

Find Salesforce CRM Content Related to Records

Quickly find content files that are related to leads, accounts, contacts, opportunities, products, cases, or custom objects by using the related lists on those records.

If your organization has Salesforce CRM Content enabled, you can take advantage of Salesforce CRM Content functionality on detail pages for leads, accounts, contacts, opportunities, products, cases, or custom objects. The Related Content related list allows you to search for files, content packs, Web links, or Google docs and attach them to the record. When you attach a file, the latest version will be available for the life of the record unless the file is removed.

 **Note:** The **Related Content** and **Content Deliveries** related lists are only available on a record if they have been added to the corresponding page layout by an administrator.

From the Related Content related list, you can:

- Click the content's title to view the content details page where you can perform several tasks, such as commenting and voting on content, downloading files, opening Web pages and Google docs, and subscribing to content, authors, tags, or libraries. For more information, see [View and Edit Content Details](#).
- Click **Del** next to a piece of content to remove it from the record. This does not delete the content from the Salesforce CRM Content library.
- If content deliveries are enabled in your organization, click **Deliver Content** to create a content delivery. A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature. For more information, see [Creating Content Deliveries](#).
- Search for related content:
 1. Click **Find Content** or **Search All**. In both cases, Salesforce CRM Content searches within the libraries that you have access to. If you click **Search All**, the search results display all the content in your libraries. For the Find Content search, your search results contain content that is relevant to the record; Salesforce CRM Content searches for content with text or attributes that match the following fields:
 - On an opportunity, the `Opportunity Name`, `Account Name`, and all competitors and products.
 - On an account, the `Account Name` and `Industry`.
 - On a case, the `Case Reason`, `Subject`, `Account Name`, and `Industry`.
 - On a lead, the `Name`, `Company`, `Industry`, and `Title`.
 -  **Note:** On a custom object, clicking **Find Content** returns search results that contain the full custom object name in the document's text or attributes. If no content meets this criterion, the search results will be empty and a Search All search should be used instead.
 2. On the search results page, filter your results as needed by entering search terms or selecting filter criteria from the sidebar.
 3. Click **Attach** for any file that you want to attach to the record.
 4. Click the **Back** link to return to the detail page.

USER PERMISSIONS

To access Salesforce CRM Content:

- Salesforce CRM Content User checked in your personal information
- AND
- Member of the library

Search for Content

The Content tab displays files, content packs, Web links, and Google docs published in your Salesforce CRM Content libraries. If Chatter is enabled, and your administrator has enabled the setting to show Salesforce Files in Salesforce CRM Content, files posted to Chatter groups, and other files that aren't private or privately shared, are also displayed on the Content tab. The top twenty most recently modified items are listed by default. You can filter the list using the Filter Your Results sidebar.

To search for specific content:

1. From the Search drop-down list, restrict your search to a specific library or choose to search in all libraries. If available, restrict your search to just Salesforce Files or just files in Chatter groups you're a member of.

 **Tip:** To display all the locations where the content appears, click **Display Options** and select **Display Locations**. The locations are listed under each title.

2. Enter your search term(s) and click **Go!**. Salesforce CRM Content performs a full-text search of the following document types: rich text format (RTF), UTF-8 encoded TXT, HTML, XML, Adobe® PDF, and Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files.
3. If your administrator has enabled multi-language support, you can restrict your search to a specific language. By default, Salesforce CRM Content searches all the content in your libraries that is published in your default user language. Searching in all languages also searches the titles, author names, tags, file extensions, and custom fields of content in all languages.

 **Note:** Searching in all languages does not search the text or description of documents that were published in languages other than your default user language.

4. Optionally, in the Filter Your Results sidebar, filter your search results by file format, featured content, author, tag, libraries, language, custom field, or Chatter group (if available). The number in parentheses next to each filter type shows you how many matching files, content packs, Web links, and Google docs are in the search results.

The Content tab provides several options:

- Click **Display Options** to customize your view by adding sortable columns for various content criteria (such as Size and Publication Date), or choosing to display descriptions, tags and locations. **Display Locations** shows the libraries and Chatter groups where the content appears. **My Libraries: none** or **My Chatter Groups: none** means that the file is a Salesforce file and is not part of any libraries or Chatter groups. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare files, content packs, Google docs, and links within a search result set.

 **Note:** Chatter groups are only included in **Display Locations** if Chatter is enabled, and your administrator has enabled the setting to show files in Salesforce CRM Content.

- Select one or more files and click **Download** to create a zip file with your selected content. Web links and Google docs cannot be included in zip files.
- Hover over a file icon to see a snapshot of information about the specific file, content pack, Google doc, or Web link and options such as subscribing, voting, and downloading.
- Click the subscription icon next to the file name to toggle a subscription on or off. For more information, see [View and Edit Content Subscriptions](#).
- Click the file name to view the content details page. The content details page provides all the available information about a file, content pack, Google doc, or link. For more information, see [View and Edit Content Details](#).

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's author name, tags, file extension, and custom fields are.

To deliver content from a shared library:	Deliver Content checked in your library permission definition
To deliver content from a personal library:	Deliver Uploaded Files and Personal Content checked in your library permission definition
To post content from a library to a Chatter feed:	Post Content to Chatter Feeds checked in your library permission definition

Clicking a file name on the Libraries, Content, or Subscriptions tabs opens the content details page, which is a central access point to preview content and gather information about a particular file, Web link, content pack, or Google doc in Salesforce CRM Content. Starting with the Summer '10 release, if Chatter is enabled for your organization, files posted to Chatter are also listed.

The Preview tab displays if your file is one of the following types:

- Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint. Some Microsoft Office 2007 features don't display correctly in previews.
- Adobe® PDF. Copy-protected PDFs can't be previewed.
- JPG, BMP, GIF, and PNG.

The following options may be available on the Content Details page, depending on: the type of content you are viewing; your library permissions; and whether the content is in a public or private library, or from Chatter:

- Click the thumbs up or thumbs down icon to vote for the file, Web link, content pack, or Google doc. To change your vote, click the opposite icon. After you cast a vote, the Recent Activity list on the Libraries tab indicates whether you like or dislike the content.
- Click **Deliver Content** to [create a content delivery](#). Click **Deliver Content** > **Show Content Deliveries** to [view a list of deliveries](#) associated with the content.
- For Web links or Google docs, click the **Open** button to open the Web page in a separate window. For files, click the **Download** button to open or save the file.
- Click **Subscribe** or **Subscribed** to toggle your subscription on or off.
- For files, click the Content Packs subtab to see which content packs include this file.
 - Library administrators can click **Remove from all** to remove the file from all content packs that include the file.
 - Click the name of the content pack that includes the file to view the details of that content pack.
- For content packs, click **Clone & Customize** to create a new pack by adding or removing files and slides. Salesforce CRM Content saves or publishes your customized pack as new content, not a version of the pack you copied.
- Click **Edit** > **Edit Content Details** to modify standard and custom fields.
- Click **Edit** > **Edit Content Pack** to [create a new version of a content pack](#) by adding or removing files.
- For files, click **Edit** > **Upload New Version** to [replace the file](#) with a new version. The version option is not available for Web links, content packs, or Google docs.

Note: If the **Add New Version** button is grayed out, your organization has exceeded its file storage allowance and new content cannot be uploaded.

- Click **Edit** > **Archive Content** to [remove the file, Web link, content pack, or Google doc from the library](#). Authors can archive and restore their own content regardless of library permissions. If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.
- Click **Edit** > **Delete Content** to [delete the file, Web link, content pack, or Google doc from Salesforce CRM Content](#) by moving it to the Recycle Bin. Authors can delete and undelete their own content regardless of library permissions. Deleting a Google doc removes the doc's association with Salesforce CRM Content but does not delete the doc in Google Apps. You cannot delete a file that is

included in a content pack or content delivery. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

- Click **Edit** > **Library Actions** and choose **Move to Another Library** to move the content to a different managing (or “home”) library. Choose **Share to Another Library** to share content into additional libraries without changing the managing library. Sharing or linking content to other libraries enables members of those libraries to find your content. If the managing library and shared library have different tagging rules, the most restrictive tagging rule applies. If you want to remove content from a library where the content is shared, click **Remove from Libraries**. This option does not remove content from its managing library.
 - Click the Comments subtab to view, add, edit, or delete comments.
 - Click the Versions subtab to view a list of all file versions and the reason-for-change statements provided by the authors.
 - Click the Downloads subtab to view a list of all Salesforce CRM Content users who have downloaded the file. Download data is not available for Web links or Google docs.
 - Click the Subscribers subtab to [view a list](#) of all Salesforce CRM Content users subscribed to the file, Web link, or Google doc. To subscribe to an author, click the drop-down button next to the author’s name. To subscribe to a library, click the drop-down button next to the library name.
 - Click a tag name to view all the content associated with that tag. Click the arrow next to the tag to remove the tag or to subscribe to all content with that tag.
 - To add a new tag, enter a tag name in the **Add Tags** field and click **Save**. As you type a tag, Salesforce CRM Content autosuggests tags based on the tags in your My Recent Tags list in the Save or Publish window and the Popular Tags section on the Libraries tab.
-  **Note:** If your administrator applied a library tagging rule, you may not be able to enter new tags. If the guided tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags or enter new tags. If the restricted library tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags, but you cannot enter your own tags.
- Click the author’s name to see a list of the author’s published content. Click the arrow next to the author’s name and choose **Subscribe to Author** to subscribe to all content published by that author.
 - Click **Feature** or **Don’t Feature** to toggle the “feature” designation on or off. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. Featured content is also listed on the library overview and library detail pages for quick access.
 - Click a library name to view details about the library. Click the arrow next to the library name and choose **Subscribe to Library** to subscribe to all content in the library or **Show Library Content** to view a list of all files, content packs, Web links, and Google docs published to the library.

Using the Content Related List

The Content related list on a record detail page includes links to all of the content that has been associated with that record in Salesforce CRM Content. Click the file name to open the content details page.

Only Salesforce CRM Content users who are members of the library where the content was published can see the published file in the Content related list. For example, if you select the "Big Deal" opportunity when publishing `BigDealStrategy.doc` into the Sales Collateral library, the Content related list on the "Big Deal" opportunity includes a link to `BigDealStrategy.doc` only for members of the Sales Collateral library. Users who are not members of that library do not see the link.

You can use the Related Content related list to access Salesforce CRM Content from leads, accounts, contacts, opportunities, products, cases, or custom objects. For more information, see [Find Salesforce CRM Content Related to Records](#) on page 3327.

[Salesforce CRM Content Overview](#)

View and Edit Content Subscriptions

Clicking the Subscriptions tab displays the Subscriptions home page, where you can view your Salesforce CRM Content subscriptions and toggle them off or on.

 **Note:** To subscribe to a file, content pack, Web link, or Google doc, [view its content details page](#) and click **Subscribe**. From the content details page you can also subscribe to a tag, author, or library by using the drop-down menus next to the tag, author, or library name.

On the Subscriptions tab, click the Content, Tags, Authors, or Libraries subtabs to view your subscriptions. Depending on your notification settings, you are notified of changes to your subscribed content via real-time emails or a once-daily email.

 **Tip:** To configure your notification settings, go to your personal information page, click **Edit**, and select `Receive Salesforce CRM Content email alerts`. If you want to receive a once-daily summary rather than real-time email alerts, also select `Receive Salesforce CRM Content emails as daily digest`.

Subscriptions generate the following notifications:

- If you subscribe to a file, you are notified when a viewer adds comments to the file or when a new version of the file is published. If you subscribe to a Web link or Google doc, you are notified when comments are added but not when the link is changed or the doc is edited.
- If you subscribe to a content pack you are notified when a new version of the pack is published. Unless you are subscribed to the individual files within a content pack, you are not notified when new versions of the files are published.
- If you subscribe to a tag, you are notified of any newly published content that is associated to the subscribed tag. To be notified that new versions of the tagged content are available, subscribe to the content.
- If you subscribe to an author, you are notified when the author publishes new content. To be notified that new versions of an author's content are available, subscribe to the content.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Salesforce CRM Content:

View and Edit Libraries

Once you have located a Salesforce CRM Content library in the **My Libraries** area of the Libraries tab home page or on a content details page, click the library name to display detailed information. For details about the publishing options at the top of the page, see [Upload and Publish Content](#).

From the library title area, you can click the following quick links:

- **Browse** to [view search results](#) showing all the content in the library.
 - **Edit** to change the library name or description.
 - **Delete** to delete an empty library. If you want to delete a library that contains content, you must first move the content to another library or delete it and empty the Recycle Bin.
-  **Note:** If your Recycle Bin is empty and you are unable to delete the library, another user's Recycle Bin may contain deleted content from the same library. A library cannot be deleted until all its content is permanently deleted or moved to another library.
- **Edit Members** to [add or remove library members](#) or change their library permission.
 - **Tagging Rules** to [change the tagging method](#) permitted in the library.
 - **Record Types** to [restrict the record types](#) available to library contributors.
 - **View Archived Content** to [view a list of archived content](#) in the library. If you do not have the `Archive Content` or `Manage Libraries` privilege in your library permission, the archived content list only contains content that you authored and archived, not content that other authors archived.

The library detail page contains the following sections:

Members

This section lists all the Salesforce CRM Content users who are members of the library. To limit the member list, enter a username and click **Filter**. You can filter by the beginning of a username but not the last name.

To add new members to the library:

1. Click **Add Members**.
2. If the member you want to add isn't listed, start to enter their first name in the search box and click **Find**.
3. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To edit a library:

- "Manage Salesforce CRM Content"

OR

`Manage Libraries` checked in your library permission definition

To add or remove library members:

- "Manage Salesforce CRM Content"

OR

`Manage Libraries` checked in your library permission definition

 **Tip:** If you have many Salesforce CRM Content users, create a public group and add it to a library rather than adding users to the library individually.

4. Click **Add** to add the members to the library.
5. Click **Next**.
6. Select a library permission for each user or public group and click **Save**.

To remove a member from the library, click **Remove**. To change a member's library permission, click **Edit** and choose a new library permission from the drop-down list.

Featured Content

This section lists the five pieces of content in the library most recently designated as “featured.” If no content has been featured, this section does not display. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle the feature status on or off, go to its [content details page](#).

Top Content

This section includes lists that summarize content activity in your library. Within a list, click a file icon to download the content or click the title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.
- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

Popular Tags

This “tag cloud” shows you how the content in your library has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your library. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have uploaded content into your library most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

SEE ALSO:

[Manage Libraries](#)

[Update Content Versions](#)

Manage Libraries

On the **Libraries** tab, access your private library, create new libraries, choose libraries to view or edit, and analyze library usage and activity. For details about the publishing options at the top of the page, see [Upload and Publish Content](#). The libraries home page has two tabs: Shared Content, which provides information about shared libraries, and My Private Files, which contains information about your private library.

Shared Content

The Shared Content tab on the libraries home page contains the following sections:

My Libraries

This section lists all the libraries to which you have access. Click a library name to view details about that library or click **Browse** to view a list of all the content in the library. Click the **New** button to create new libraries, add users to a library, or assign library permissions to users.

Featured Content

This section lists the five pieces of content in your libraries most recently designed as “featured.” Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle a piece of content's feature status on or off, go to its [content details page](#).

Top Content

This section includes lists that summarize content activity across all your libraries. Each list sorts content according to specific criteria. Within a list, click a file icon to download content or click a title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create libraries:

- “Manage Salesforce CRM Content”
- OR
- “Create Libraries”

To edit libraries:

- “Manage Salesforce CRM Content”
- OR
- Manage Libraries checked in your library permission definition

- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

Popular Tags

This section, commonly referred to as a “tag cloud,” shows you how the content in your libraries has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your libraries. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have published content into your libraries most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

My Private Files

The My Private Files tab on the libraries home page is your private library. When you upload or create content and do not select a public library, your content is stored in your private library. You can publish content to a public library at any time or leave content in your private library indefinitely. Content in your private library can be assembled in content packs. It can also be sent to leads and contacts outside your organization using the content delivery feature. See [Set Up Content Deliveries](#) on page 3883 for more information. The My Private Files tab has the following sections:

Private Library

If you choose the **Save to my private library** option when publishing a file, Web link, content pack, or Google doc, your content is saved here. You can publish or delete files from this list or click the file's name to view its content details page. The following options that are available on the content details page for shared content are not available for private-library content: tagging, rating, subscribing, tracking downloads, tracking subscriptions, or using custom fields. If you publish a file from the Private Library list and click **Cancel** during the publishing process, your file is deleted.

Upload Interrupted

If an error occurs when you are uploading a new file, for example your browser crashes or your session times out, the file you were uploading is saved here. Click **Publish** to publish the file to a public library or save it to your private library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

Revision Upload Interrupted

If an error occurs when you are uploading a new version of a file, the file you were uploading is saved here. Users can continue to access the original version. Click **Publish** to publish the file to a public library or save it to your private library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

Content Deliveries

Creating Content Deliveries

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

A content delivery can be created from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

To create a new content delivery:

1. From the Content Deliveries related list, Related Content related list, or the content details page, click **Deliver Content**.
2. Upload a file or confirm the file name. If you are a Salesforce CRM Content user, search for the content in your libraries that you want to deliver. Salesforce CRM Content users can search for content in [shared libraries](#) or a [personal library](#).
3. Optionally, modify the `Delivery Name` field. This is the name that identifies your content delivery in Salesforce. We recommend using a name that will make the delivery easily distinguishable from other deliveries on the same record. The default delivery name includes the file name and today's date.
4. Select the delivery methods that determine how your content can be viewed. The options that appear depend on the file format you uploaded.
 - Choose `Allow Recipient to View in the Browser` to create an online version of the file that recipients can view in their browser.
 - Choose `Allow Recipient to Download as [file type] file` to allow the recipient of your content delivery to view the content in its original format. For example, if you uploaded a Microsoft® Word file, this field will be `Allow download as .doc file`.

 **Note:** If a preview of the file doesn't exist in Salesforce, users can download the delivered file regardless of whether or not downloading is allowed. File previews are made the first time they are requested in Salesforce, but not before. Viewing a file's detail page or posting it to a feed generate file previews.

 - Choose `Allow Recipient to Download as PDF` to allow recipients to download a .pdf version of the file. This option is only available for Microsoft® PowerPoint, Word, and Excel files.
5. Select `Notify Me of First View or Download` if you want to receive an email the first time your recipient clicks the content-delivery URL.
6. If the content you are delivering is time-sensitive, select the `Remove Access to Content` on checkbox and enter an expiration date. By default, the expiration date is 90 days from the current date. After creating your content delivery, you can change the expiration date at any time on the delivery detail page.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Salesforce CRM Content available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create content deliveries from a shared library in Salesforce CRM Content:

- Member of the library
- AND
- "Deliver Content" checked in your library permission definition

To create content deliveries from a personal library in Salesforce CRM Content:

- "Deliver Uploaded Files and Personal Content" checked in your general permission definition

To create content deliveries (non-Content user):

- "Deliver Uploaded Files and Personal Content" checked in your general permission definition

7. Optionally, select `Require a Password to Access Content`. When you create the content delivery you will receive a password to include with the delivery URL that you send to your recipients. The password is available for the life of the delivery on the delivery detail page.
8. Optionally, use the lookup to associate your content delivery with a Salesforce record. The record you were viewing when you clicked **Deliver Content** is selected by default.
9. Click **Save & Next**. Your delivery will usually be ready within a few moments, but you can click **Notify Me** to exit the content delivery wizard and be notified via email when your content delivery is ready.
10. If you did not exit the content delivery wizard, click **Preview** to verify that you are satisfied with the delivery.
 -  **Important:** Formatting in the original file may not display correctly in the online version. If you chose `Allow Recipient to View in the Browser`, preview your content delivery before sending its URL to your recipients. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or a PDF only.
11. Copy and paste the delivery URL and, if applicable, its password into an email or instant message for delivery. The URL is available on the delivery detail page. For more information, see [Viewing and Editing Content Deliveries](#).

SEE ALSO:

[Share Files via Link](#)

Viewing and Editing Content Deliveries

On the Content Deliveries related list or the Content Deliveries list page, click the name of a content delivery to open the detail page.

Viewing Content Delivery Details

The delivery detail page provides all the information associated with a content delivery, including the number of times the delivery has been viewed, and the delivery settings. The URL providing access to the content delivery is visible only if you have access to the content or to a record associated with the content, or are the content delivery owner. For a description of each field, see [Content Delivery Fields](#).

Editing Content Delivery Details

Click **Expire Now** to immediately remove access to the content delivery. Click **Edit** to modify details such as the delivery methods, expiration date, or the record the delivery is associated with. For a description of each field, see [Content Delivery Fields](#).

Deleting Content Deliveries

Click **Delete** to remove access to the content delivery and delete the delivery record from Salesforce. Salesforce CRM Content users cannot delete files that are associated with a content delivery until the content delivery is deleted.

Tracking Content Deliveries

Each time a content delivery's URL is opened, Salesforce records the event as a *view*. The Views related list on the content delivery detail page lists every view associated with the delivery. Information about the view includes the date and time, whether the view was by an internal (Salesforce) user, and whether the view included a download. If the content delivery provided the ability to download the file in its original file format or as a PDF file, the `FileDownloaded` flag indicates that a download occurred, but you cannot distinguish between file types.

SEE ALSO:

[Create and Modify Content Packs in Salesforce CRM Content](#)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Salesforce CRM Content available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the delivery detail page:

- Access to the associated content details page in Salesforce CRM Content

OR

Access to the record associated with the content delivery

To edit, expire, or delete a content delivery:

- Owner of the record
- OR
- "Modify all Data"

Using the Content Deliveries Related List

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

From the Content Deliveries related list on leads, business accounts, contacts, opportunities, cases, campaigns, and custom objects you can:

- Click **Deliver Content** to create a new content delivery and associate it with the record you are viewing. For more information, see [Creating Content Deliveries](#).
- Click **Preview** to open the content delivery. Each time you view a content delivery, it is recorded as one internal view on the Views related list.
- Click the content delivery name to open the detail page for that delivery. For more information, see [Viewing and Editing Content Deliveries](#).

Google Apps

Integrate Google apps like Google Docs and Gmail with Salesforce.

[Google Apps Overview](#)

[Use Google Docs in Salesforce](#)

[Add Google Docs to Salesforce](#)

Add an existing Google doc to any record or library in Salesforce.

Google Apps Overview

 **Note:** Not all Google Apps features are available in Lightning Experience. Those that are available may not look the same as they do in Salesforce Classic.

Google Apps™ is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. Salesforce integrates key Google Apps services and provides several AppExchange apps that enhance and customize Google-related functionality.

The following services for Google Apps are integrated with Salesforce and require a simple activation by a Salesforce administrator:

Add Google Docs to Salesforce

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators. When the Add Google Docs to Salesforce service is activated, you can:

- Use the Google Docs, Notes, & Attachments or Google Docs & Attachments related list on any Salesforce record to create, edit, or view Google docs and associate them to a record.
- Share a Google doc with any Google Apps user in your organization.
- Associate Google docs with Salesforce records even when you are not working in Salesforce by using the **Add Google Doc to Salesforce** browser button.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To create a content delivery:

- None

To edit a content delivery:

- Owner of the record
- OR
- “Modify all Data”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

- Add Google docs to Salesforce CRM Content, which allows you to manage all types of content in a centralized location.

Gmail to Salesforce

Gmail™ is a Web-based email application that operates on all standard browsers and can be used with your company's domain. Use Gmail to Salesforce to automatically log emails you send from your Gmail account as activities on lead and contact records in Salesforce.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History on leads and contacts. When you select a Gmail link or **Compose Gmail**, Salesforce automatically logs you in to your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

Use Google Docs in Salesforce

Use Google Docs™ to create and share on-demand documents, presentations, and spreadsheets ("Google docs") and see your changes in real time as you collaborate with other users. Because your content is stored within Google, there is no need to manage versions or send attachments by email—simply log in with your Google Apps account and view the current document or its revision history.

Salesforce and Google Apps allows you to integrate Google Docs with Salesforce. The Docs home page in your Google Apps account lists all the Google documents, presentations, and spreadsheets that you have created or that other Google Apps users have shared with you.

For information about Google Docs, refer to [Google's online help](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Using Google Docs in Salesforce

- "Read" on the appropriate record type
- AND
- Google Apps account

Add Google Docs to Salesforce

Add an existing Google doc to any record or library in Salesforce.

 **Note:** To use a Google Apps service in Salesforce, you must be logged in to your Google Apps business account. Business accounts use your organization's domain; for example, *john.doe@company.com*. If you are unsure of your Google Apps username and password, contact your administrator.

Add a Google Doc to a Salesforce Record

1. Open a case, opportunity, or other record.
2. On the Google Docs, Notes, & Attachments related list or the Google Docs & Attachments related list, click **Add Google Doc**.
3. Enter the name of the Google doc.
4. Enter the Google doc URL.
5. Click **Save**.

Add a Google Doc to a Salesforce CRM Content Library

1. On the **Libraries** tab or on a library detail page, click **Add Google Doc**. Log in to Google Apps if prompted.
2. Enter the Google Doc URL.
3. Click **Contribute**.
4. Enter a title and select a library. See [Publish Files to Libraries](#) for detailed instructions on publishing content to a library.
5. Click **Publish**.

 **Note:** While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only people with access to the Google doc in their Google Apps account can open the doc from Salesforce.

 **Tip:** For information about using Google Docs, refer to [Google's online help](#).

Skype for Salesforce (Beta)

Skype for Salesforce integrates Salesforce and Skype for Business®, allowing your users to chat with and make audio and video calls to other users without leaving Salesforce. Skype for Salesforce is available only if your business has a Skype for Business online license.

 **Note:** This release contains a beta version of Skype for Salesforce, which means it's a high-quality feature with known limitations. Skype for Salesforce isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for Skype for Salesforce in the [IdeaExchange](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Creating a Google doc and linking it to Salesforce records:

- "Edit" on the appropriate record type
- AND
- Google Apps account

EDITIONS

Available in: **Developer, Enterprise, Performance, Professional, and Unlimited Editions**

[Enable Skype for Salesforce](#)

Enable Skype for Salesforce in your org, and authorize Salesforce to access Skype for Business®.

[Give Users Skype Conversation Permissions](#)

Skype for Salesforce integrates Salesforce and Skype for Business®, allowing you to communicate with other users in your org. Your users can't use Skype for Salesforce until you've created a permission set and assigned it to them.

[Chat Using Skype for Salesforce](#)

Initiate Skype chat, video calls, and audio calls within Salesforce.

Enable Skype for Salesforce

Enable Skype for Salesforce in your org, and authorize Salesforce to access Skype for Business®.

1. From Setup, enter *Skype for Salesforce* into the **Quick Find** box, then click **Skype for Salesforce**.
2. Click **Enable Skype Presence, Chat and Audio/Video (Beta)**.
3. Click **Authorize Skype for Salesforce**, and ask your org's Microsoft Office 365® administrator to sign in. This gives Salesforce access to Skype for Business.
4. Deactivate the Enable Lightning LockerService Security critical update.
 - a. From Setup, enter *Critical Updates* in the **Quick Find** box, then click **Critical Updates**.
 - b. For the Enable Lightning LockerService Security critical update, click **Deactivate**.
 - c. Enter a comment, and then click **Deactivate**.
5. Enable Notes for your org if you want to give users the ability to save chat conversations.

 **Note:** Users can chat using Skype for Salesforce on any [supported browsers for Lightning Experience](#). Users can make audio and video calls using Skype for Salesforce only from Microsoft Edge or Apple Safari®.

SEE ALSO:

USER PERMISSIONS

To enable Skype for Salesforce:

- "Customize Application"

Give Users Skype Conversation Permissions

Skype for Salesforce integrates Salesforce and Skype for Business[®], allowing you to communicate with other users in your org. Your users can't use Skype for Salesforce until you've created a permission set and assigned it to them.

1. From Setup, enter *Permission Sets* into the **Quick Find** box, then click **Permission Sets**.
2. Either create a permission set or click an existing one.
3. Click **System Preferences**.
4. Click **Edit**.
5. Select the **Skype Conversation** permission, and click **Save**.
6. Click **Manage Assignments**.
7. Select which users you want to give access to Skype for Salesforce, and click **Add Assignments**.

When Skype for Salesforce is enabled, users who have the Skype Conversation permission see a banner prompting them to sign in to Microsoft Office 365[®]. After they link their Office 365 account to Salesforce, users can see who's online, initiate audio and video calls, and chat.

SEE ALSO:

[Enable Skype for Salesforce](#)

Chat Using Skype for Salesforce

Initiate Skype chat, video calls, and audio calls within Salesforce.

To use Skype for Salesforce, you must have a Microsoft Office 365[®] account. Also make sure that your Salesforce admin has enabled the feature, and given you the Skype Conversation permission.

1. When you log in to Salesforce, a banner prompts you to log in to Office 365. Click **Connect Office 365**.
2. Click **Sign in** and use your Office 365 or Skype for Business[®] credentials to sign in.

Now that you've signed into Office 365, on any Lightning Experience page, hover over someone's name. You see their Skype presence—whether they are online or offline—and the Message button.

To start a chat, click **Message**. If Notes is enabled for your org, click **Save Conversation** to save your chat as a note. Saved chats are accessible on the Notes tab in Salesforce.

To start a conversation, click **Message**. In the messenger window, click **Call** or **Video Call** to initiate a voice or video conversation, respectively.

 **Note:** Users can chat using Skype for Salesforce on any [supported browsers for Lightning Experience](#). Users can make audio and video calls using Skype for Salesforce only from Microsoft Edge or Apple Safari[®].

Collaborate with Partners and Customers

Share updates with customers and partners in Chatter groups.

[About Chatter Customers in Private Groups](#)

[Add or Remove Customers in Chatter Groups](#)

About Chatter Customers in Private Groups

Chatter customers are users outside your company's email domains who can only see groups they're invited to and interact with members of those groups; they can't see any Salesforce information.

Chatter customers:

- Can only be added to Chatter if:
 - A manager or owner of a group that [allows customers](#) invites them to the group.
 - An administrator adds them in Setup by entering *Users* in the **Quick Find** box, then selecting **Users**.
- Can only see:
 - Groups they belong to.
 - People in groups they belong to. Customers only see limited profiles including photo, name, title, email, common group memberships, common files, and activity statistics and influence. They can't post to profiles.
 - Files shared to groups they belong to.
- Can't see:
 - Records or other Salesforce information, even in search results.
 - Topics, including topics in the feed, the topics list, topic detail pages, Recently Talked About, and Trending Topics. (Customers can see hashtag (#) topics.)
 - Recommendations and can't be recommended to others. Additionally, groups that allow customers can't be recommended.
- Are identified as a customer in profiles and groups they belong to. Customers and groups with customers are easily identified by the orange upper left corner of their photo.
- Have limited profiles, including name, photo, title, company, email, feed, group membership, file ownership, and activity statistics and influence.
- Can't be followed. Additionally, customers can't follow people or files.
- Can be group members and managers. If the customer is a manager, they will be able to see users who request to join the group, even if they aren't in other common groups, and approve requests.
- Can't own, create, delete, moderate, join, or ask to join groups.
- Can invite people that they're in common groups with to join groups that they manage.
- Can't invite people inside your company's domain whose profiles they can't see.
- Can't [chat](#) on page 3238 with other users.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

 **Note:**

- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.
- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.
- If a customer loses their password, they can use the Forgot Password option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

Considerations for Mobile Users

Chatter customers are able to log in and use the Salesforce1 apps and the Chatter Mobile for BlackBerry app. The same restrictions are applied to customer users as when using Chatter on the Web.

SEE ALSO:

[Chatter Groups](#)

[Add or Remove Customers in Chatter Groups](#)

Add or Remove Customers in Chatter Groups

If customer invitations are enabled for your organization, you can add, remove, and invite customers in private groups you own or manage that [allow customers](#).

1. Navigate to a group detail page.
2. To add people who aren't already customers in your company, click **Invite People**, or **Add/Remove Members** > **Invite them to Salesforce Chatter!**. Enter email addresses separated by commas, and an optional message, and click **Send**.

When someone accepts your invitation, they join Chatter and become a member of the group.

3. To add people who are already customers in your company, click **Add/Remove Members**, then:
 - Search using the `Find People` search box.
 - Toggle between **Members** of the group and **Everyone** in your company.
 - Use the **Next** and **Previous** links to see more of the list.
 - Click **Add** to add a customer, or **x** to remove a customer.
 - Click **Done** when you're finished.

 **Note:**

- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.
- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- If a customer loses their password, they can use the Forgot Password option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

SET UP AND MANAGE SALESFORCE COMMUNITIES

Communities are branded spaces for your employees, customers, and partners to connect. You can customize and create communities to meet your business needs, then transition seamlessly between them.

You can use Communities to:

- Drive more sales by connecting your employees with your distributors, resellers, and suppliers
- Deliver world-class service by giving your customers one place to get answers
- Manage social listening, content, engagement, and workflow all in one place

Communities can be based on standard Salesforce functionality and tabs, or on one of our preconfigured templates. Communities can be used to share a subset of features and data from your internal Salesforce org. Communities can also be customized to use your company branding.

Communities live inside your org and can be easily accessed from the global header using the drop-down menu in the top left corner of Salesforce or in the Salesforce1 Mobile Browser App. Use this menu to switch between your communities and your internal Salesforce org.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

[Plan Your Implementation](#)

It helps to make a few key decisions well in advance of setting up your community and customizing it.

[Prerequisites](#)

[How Communities Uses Lightning](#)

There's lots of Lightning striking Salesforce these days and it can be tricky to know how it all works together. Here's the rundown.

[Supported Browsers for Communities](#)

Communities browser support varies by the device on which you access the community and the community template.

Plan Your Implementation

It helps to make a few key decisions well in advance of setting up your community and customizing it.

- Determine the business requirements of the community. What types of users are you creating the community for? You could start by identifying the main use cases you want to support, such as customer support, self-service, or marketing.
- Estimate the size of the community. This will help determine your licensing requirements.
- Decide if you want your community content to be publicly available to guest users without licenses
- Plan the look-and-feel of your community and then evaluate the available customization options. With Communities, you have the following choices:
 - **Use Visualforce to customize the out-of-the-box community tabs:** Communities comes with some out-of-the-box branding themes that you can use along with standard Salesforce tabs in your community. In addition, you can use Visualforce to extensively customize your community's appearance and leverage all the capabilities of the Force.com platform. This option requires programming capabilities.
 - **Use Community Builder with templates:** Community Builder comes with rich, stylized templates for communities targeted at customer support scenarios. Templates offer easy customization via an intuitive GUI and allow for a quick rollout of your community with minimal configuration in Site.com. This option doesn't require programming experience or knowledge of the Force.com platform. Need help deciding on a template? Check out the [template comparison](#).

For more information about these options, see [Choosing Between Community Builder and Force.com Sites](#).

- Determine if any of the [community limits](#) will affect your implementation.

Prerequisites

Before you enable Communities:

- Ensure that your organization has Communities licenses. From Setup, enter *Company Information* in the **Quick Find** box, then select **Company Information**. Your licenses are listed near the bottom of the page.
- [Enable the global header](#) for employees or internal users in your organization that you plan to add as members of your community. The global header lets you easily switch back and forth between your internal organization and your community. Note that the global header introduces some navigation and look-and-feel changes that will be unfamiliar to your users, so plan to alert them ahead of time.

How Communities Uses Lightning

There's lots of Lightning striking Salesforce these days and it can be tricky to know how it all works together. Here's the rundown.

What is Salesforce Lightning?

Lightning includes the Lightning Component Framework and some exciting tools for developers. Lightning makes it easier to build responsive applications for any device.

Lightning includes these technologies:

- **Lightning components**, which give you a client-server framework that accelerates development, and app performance.
- **The Lightning App Builder** lets you build apps and communities visually, without code, using standard and custom-built Lightning components. You can make your Lightning components available in the Lightning App Builder, so administrators can build custom user interfaces without code.
- **The Community Builder** is like the Lightning App Builder, except that it's used to design and build communities using Lightning components. Just like the Lightning App Builder, you can use standard or custom components so administrators can create community pages with point-and-click customization.

Some Salesforce products built with underlying Salesforce Lightning technology include:

- Lightning Experience
- Salesforce1
- The Koa, Kokua, Customer Service (Napili), and Aloha community templates
- Lightning Bolt solutions

What is Lightning Experience?

Lightning Experience is the name of for the desktop user experience, intended for internal Salesforce users only. For more information, see the [Lightning Experience section](#) in Help & Training.

When people talk about "Lightning communities", what do they mean?

Lightning in the context of communities means the use of Lightning components to build communities. This is done through out-of-the-box templates, like Customer Service (Napili), or [Lightning Bolt solutions](#).

How is Lightning used in communities?

Lightning Bolt solutions and community templates use the same *underlying* technology as Lightning Experience—namely, the Lightning platform and Lightning components—but you aren't required to enable Lightning Experience to use them.

Think of it this way: You have a dishwasher and a washing machine in your house. Can you turn one on without the other? Of course. Sure, they have a few things in common: They both need electricity to work, they both live in your house, and have the word "wash" in their names. But they run independently of one another.

 **Note:** Although Communities settings are available in Lightning Experience Setup, Communities isn't fully supported in Lightning Experience because the global header isn't available. The global header is what internal users use to switch between their Salesforce org and communities. Without the global header, internal users need to bookmark community URLs to access communities they're members of.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

If you enable Lightning Experience in your org, internal users must switch back to Salesforce Classic to access the global header.

Here are some common questions (and answers!) to consider when you're thinking of using Lightning component-based community templates.

Do I need to turn on Lightning Experience in my internal org to use Lightning-based template communities?

No! Koa, Kokua, Customer Service (Napili), and Aloha use the same underlying technology as Lightning Experience, *but are independent of one another*.

If I turn on Lightning Experience in my internal org, can I still use the Salesforce Tabs + Visualforce template for a community?

Yes! Turning on Lightning Experience for your internal users has no impact on what template you use in our external-facing communities.

Creating a community is essentially like building a web site. You can build it with Lightning or with Visualforce and Force.com. The UI enabled in your internal Salesforce org makes no difference to what UI technology you use for your community.

If I build a custom Lightning component for the App Builder, can I use it in Community Builder?

Yes! See [Configure Components for Communities](#) for more information.

Can I enable Lightning Experience for my Salesforce Tabs + Visualforce communities?

No. By definition, a community that uses Salesforce Tabs + Visualforce uses Visualforce and the Force.com technology framework. There's no toggle in a Salesforce Tabs + Visualforce community that allows you to switch to Lightning technology. Also, remember that Lightning Experience is a user experience for internal Salesforce users only.

If you want a community with the Lightning look and feel, you'll need to create a new community with a community template that uses Lightning technology.

If I turn on Lightning Experience in my internal Salesforce org, are there communities-related features that I can't use?

Switch to Salesforce Classic for the following functionality:

- The global header
- Creating and disabling partner accounts and users
- Creating and disabling customer accounts and users
- Logging in as a community user
- Using delegated administration

 **Note:** Most of the functionality currently available in Salesforce Classic only is for the Salesforce admin. You can always assign Lightning Experience permissions to various profiles in your Salesforce org, and keep your system admin profile on Salesforce Classic.

Supported Browsers for Communities

Communities browser support varies by the device on which you access the community and the community template.

Salesforce Tabs + Visualforce

Communities that use the Salesforce Tabs + Visualforce template are supported on desktop devices on all the browsers supported by Salesforce. These communities are also [accessible from Salesforce 1 apps](#).

Koa, Kokua, and Customer Service (Napili)

Communities that use the Koa, Kokua, and Customer Service (Napili) templates are supported in the following browsers.

Access Communities in Salesforce1

Accessing communities from the Salesforce1 mobile app depends on several factors, including the type of template used to create the community and the licenses and permissions of community members.

Grant the Necessary Permissions

Make sure that community members can access Salesforce1:

- Verify that Salesforce1 is enabled for your org (default) or enable it. From Setup, enter *Salesforce1* in the Quick Find box, then select **Salesforce1 Settings**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

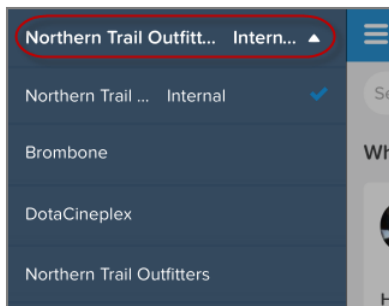

- Set up access to the Salesforce1 mobile browser app for external users in your community. On each external user record, select **Salesforce1 User**. (When the mobile browser app is enabled for your internal org, only internal users are automatically assigned the **Salesforce1 User** setting.)

Without this setting, community members must append `/one/one.app` to the community URL (for example, `https://universaltelco.force.com/customer/one/one.app`) to access the community via Salesforce1 from a supported mobile browser.

- Allow community access via the Salesforce1 downloadable apps by granting the “API Enabled” profile permission to external users with communities licenses.

Communities Using the Salesforce Tabs + Visualforce Template

Communities that use the Salesforce Tabs + Visualforce template are supported in all the Salesforce1 apps. Internal users use the switcher at the top of the Salesforce1 navigation menu to access their communities. External users see this menu when they belong to multiple communities and can use it to switch between communities. This switcher automatically populates with the communities the user has access to, so no additional setup is required.

Type of User	Salesforce1 Mobile Browser App	Salesforce1 Downloadable App for iOS Devices	Salesforce1 Downloadable App for Android Devices
<p>Users with standard Salesforce licenses</p> <p>Internal org users who are also in a community</p>	Log in to Salesforce from a supported mobile browser. Then use the switcher at the top of the Salesforce1 navigation menu and select a community.	Log in to the app. Use the switcher at the top of the Salesforce1 navigation menu and select a community.	Log in to the app. Use the switcher at the top of the Salesforce1 navigation menu and select a community.
<p>External users with the following community licenses:</p> <ul style="list-style-type: none"> Customer Community Customer Community Plus Partner Community Customer Portal Partner Portal High-Volume Portal User 	Navigate to the community URL and log in with the community credentials. If the community URL doesn't contain <code>one/one.app</code> , append it to the URL.	On the Salesforce1 login screen, tap . Add the community as a new connection, using the community URL for the host name: <code><domainname>.force.com/<path-prefix></code> . Then, select the community connection and log in with the community credentials.	On the Salesforce1 login screen, tap . Add the community as a new connection, using the community URL for the host name: <code><domainname>.force.com/<path-prefix></code> . Then, select the community connection and log in with the community credentials.

Unlicensed users (also known as guest users)	Navigate to the community URL. Guest users can only access public community content that doesn't require them to log in.	Not supported	Not supported

Communities Using the Koa, Kokua, and Customer Service (Napili) Templates

Because their styling doesn't display well in Salesforce1, we don't load communities built on the Koa, Kokua, or Customer Service (Napili) templates in the Salesforce1 apps. These communities are responsive and it's best to access them directly from a [supported mobile browser](#) using the community URL.

Community Management, Community Workspaces, and Community Builder

Community Management and Community Workspaces aren't available in Salesforce1. We recommend that you use the [supported browsers on desktop computers](#) to make customizations in Community Management, Community Workspaces, and Community Builder.

[Salesforce1 Settings for Communities](#)

Easily link to Visualforce pages from other Visualforce pages in Salesforce1 by selecting the checkbox under **Salesforce1 Settings for Communities** in Communities Settings.

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Customize Login, Self-Registration, and Password Management for Your Community](#)

Configure the standard login, logout, password management, and self-registration options for your community, or customize the behavior with Apex and Visualforce or Community Builder (Site.com Studio) pages.

Enable Salesforce Communities

Enabling Salesforce Communities is the first step to creating communities.

Enabling Communities enables the Salesforce Classic 2010 user interface theme, which updates the look and feel of Salesforce.

 **Note:** Once you enable Communities, you can't turn it off.

If your organization's access to Communities is suspended for non-payment of fees due, all of your communities are deactivated, including those in `Preview` status. When Communities is enabled again, all communities are in `Inactive` status. You can activate these communities, but can't return to the `Preview` status.

1. From Setup, enter `Communities Settings` in the Quick Find/Search box, then select **Communities Settings**.

 **Note:** If you don't see this menu, Communities may not be enabled for your organization. Contact your Salesforce account executive.

2. Select **Enable communities**.
3. Select a domain name to use for your communities, then click **Check Availability** to make sure it's not already being used.

We suggest that you use something recognizable to your users, such as your company name.

Although the domain name is the same for all communities, you create a unique URL for each community during the creation process. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

 **Important:** You can't change the domain name after you save it.

You can designate a completely custom domain by entering it in on the Domain Management page. From Setup, enter `Domains` in the Quick Find/Search box, then select **Domains**.

4. Click **Save**.

You can now [create communities](#).

The "Create and Set Up Communities" permission is required to create and customize communities. It also gives the user the ability to manage the Site.com site associated with the community.

After enabling Communities, we recommend that you give the "View Global Header" permission to internal users who need access to the community. The global header allows users to easily switch between their internal organization and any communities they're a member of. The global header isn't supported in Lightning Experience, so to create, manage, or access communities from the Global Header, switch back to Salesforce Classic. If your org is using Lightning Experience, users with the appropriate permissions must switch to Salesforce Classic to access the global header.

[Who Can See What in Communities](#)

Manage Your Community with Community Workspaces

Community Workspaces is your one-stop shop for building, setting up, and monitoring your community. You can access the Community Builder and Administration workspaces to manage your community's setup and branding. Community managers can view dashboards about groups, members, feed activity, and license usage, and manage the community's reputation system. Moderators can see which items have been flagged for review.

 **Note:** You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

To enable Community Workspaces, in Setup, type *Communities Settings* in the Quick Find/Search box. Under Community Management Settings, select **Enable Community Workspaces**. Community Workspaces is enabled by default for all communities created after Spring '17.

 **Important:** The options available in Community Workspaces are based on your community template selection and preferences. For example, if your community does not use topics, you don't see the Topics section. Some of the options in the following list might not appear in your community. To display all sections, go to **Administration Preferences** and select **Show all settings in Community Workspaces**.

Community Workspaces includes the following workspaces:

Builder

Community Builder lets you brand and design your community pages. Create and customize pages, modify or add Lightning components, customize the community's navigation menu, and manage page-level settings.

Moderation

From the Home tab in Moderation, view your community's home page dashboard and reports for flagged posts, comments, messages, and files. From the **Rules** tab, [administrators can set up moderation rules and content criteria](#) for the community.

 **Note:** If your home page still displays a message to install the Salesforce Communities Management package, your administrator hasn't mapped a dashboard yet.

Content Targeting

Manage your community's **Topics** and **Recommendations** from the Content Targeting workspace. Create a navigation menu and showcase popular topics in your community from the Topics tab. Drive community engagement from the Recommendations tab.

Dashboards

View dashboards and reports for your community. The administrator sets up dashboards that display in the Reporting **tabs**. Monitor activity and take immediate action in your community from the Engagement tab using Insights.

Administration

From the Administration workspace, you can update basic setup for the community, including:

- **Members**—Add or remove members by profiles.
- **Tabs**—Select the tabs you want members to see in communities built using the Salesforce Tabs + Visualforce template.
- **Branding**—Select an out-of-box branding theme for communities built using the Salesforce Tabs + Visualforce template.
- **Login & Registration**—Select the default community login and self-registration pages, or manage custom pages.

EDITIONS

- AND is a member of the community

Update Org-Wide Community Settings

Update org-wide settings for objects, sharing rules, roles, and permissions that affect community users as well.

[Set the Default Number of Community Roles](#)

Set the default number of roles created when adding partner or customer accounts to communities.

[Set Custom Community Roles](#)

Community members are typically assigned the role of partner, customer, or employee. However, you can create custom roles that replace standard ones. You can also choose to display the member's company name in place of a role.

[Enable Super User Access for Your Communities](#)

When you enable super user access, you can grant super user access to partner users in communities. Super user access allows partner users to view the data of other users with the same role in the partner role hierarchy.

[Enable Report Options for External Users](#)

Allow external users with Partner Community or Customer Community Plus licenses with the "Run Reports" permission, to view and modify report options so that they can summarize and filter reports.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Set the Default Number of Community Roles

Set the default number of roles created when adding partner or customer accounts to communities.

These settings apply if your community is set up with Partner Community or Customer Community Plus user licenses. The limit is three roles; the system default is one. For example, if three partner roles are currently created when an account is enabled for your community—Executive, Manager, and User—but you need only the User role for new accounts, you can reduce the number to one role.

 **Note:** For better performance, we recommend setting this value to 1. You can then use Super User Access to grant specific users access to data owned by other users in their account.

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. Select the number of roles per account.
 - a. If you're using Partner Community licenses, set the **Number of partner roles**.
 - b. If you're using Customer Community Plus licenses, set the **Number of customer roles**.
3. Click **Save**.

The number of roles for existing accounts isn't affected by this setting.

SEE ALSO:

[Portal Roles Limit](#)

[Enable Super User Access for Your Communities](#)

EDITIONS

Salesforce Communities available in: Salesforce Classic

Salesforce Communities Setup available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set the number of default roles:

- "Customize Application"

Set Custom Community Roles

Community members are typically assigned the role of partner, customer, or employee. However, you can create custom roles that replace standard ones. You can also choose to display the member's company name in place of a role.

Creating custom role names is done simply through member administration in community management. Using a company name instead of a role is simpler yet: just turn on the **Show Company Name as Community Role** permission enabled. If the permission is off, users may see the company name elsewhere, such as on a member's profile, but not in place of the role.

To create custom roles for communities:

1. In Setup, search for Communities in the **Quick Find** box and select **All Communities**.
2. Open [Community Workspaces](#) or [Community Management](#).
3. Under **Administration**, click **Members**.
4. Under **Community Role**, select **Custom**.
5. Enter the new name you want to use instead of the role name. You can replace any or all of the names. You can even remove a role by deleting the role name.
6. Click **Save**.

Enable Super User Access for Your Communities

When you enable super user access, you can grant super user access to partner users in communities. Super user access allows partner users to view the data of other users with the same role in the partner role hierarchy.

You can grant super user access to anyone with a Partner Community or a Customer Community Plus license.

Granting super user access to external users in your community lets them access more data and records, regardless of sharing rules and organization-wide defaults. Super users can access data owned by other partner users who have the same role or a role below them. Super user access applies to cases, leads, custom objects, and opportunities only. External users have access to these objects only if you expose them using profiles or sharing and add the tabs to the community.

1. From Setup, enter *Communities Settings* in the **Quick Find** box, then select **Communities Settings**.
2. Select **Enable Partner Super User Access**.
3. Click **Save**.

Next, [assign super user access](#) to individual users.

To disable super user access, deselect **Enable Partner Super User Access**. If you re-enable this feature, all users who were assigned super user access previously get super user access again.

[Grant Super User Access to Customer Users in Your Community](#)

Enable super user access so that external users in communities can access additional records and data.

SEE ALSO:

[Grant Super User Access to a Partner User](#)[Grant Super User Access to Customer Users in Your Community](#)

Grant Super User Access to Customer Users in Your Community

Enable super user access so that external users in communities can access additional records and data.

You can grant customer super user access to users with Partner Community or Customer Community Plus licenses.

The “Portal Super User” permission lets delegated external user administrators do the following for their own account:

- View, edit, and transfer all cases
- Create cases for contacts
- View and edit all contacts, whether communities-related or not
- View account details when they’re the contact on a case
- Report on all contacts, whether portal enabled or not, if the Reports tab is added to your community and the user has the “Run Reports” permission

Add the “Portal Super User” permission to a permission set and assign it to Customer Community Plus users so that they have access to their account and can view and edit all of its cases and contacts without having the ability to manage other external users.

1. From Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
2. Either create or clone a permission set.
3. In the App Permissions section, add the “Portal Super User” permission.
4. Click **Save**.
5. Assign the permission set to your Customer Community Plus users by clicking **Manage Assignments** and then adding the appropriate users.

SEE ALSO:

[Enable Super User Access for Your Communities](#)[Grant Super User Access to a Partner User](#)

Enable Report Options for External Users

Allow external users with Partner Community or Customer Community Plus licenses with the “Run Reports” permission, to view and modify report options so that they can summarize and filter reports.

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. Select **Enable report options for external users**.
3. Click **Save**.

External users with Partner Community or Customer Community Plus licenses that have the “Run Reports” permission, now see report options on the run report page.

SEE ALSO:

[The Report Run Page](#)

Sharing Set Overview

Grant portal or community users access to records that are associated with their accounts or contacts using sharing sets, based on their user profiles.

Previously, a sharing set granted access to any record that has a lookup field to an account or contact that matches the user’s account or contact. With Spring ‘14, you can also determine how access is granted using an access mapping in the sharing set, which supports indirect lookups from the user and target record to the account or contact. You can determine the objects to use in the access mapping, and they must both either point to an account or contact.

For example, you might want to use a sharing set if you would like to:

- Grant users access to all cases related to their account or contact record.
- Grant users access to all cases related to a parent account or contact that is identified on the user’s account or contact record.

You can use sharing sets to grant access to accounts, contacts, cases, service contracts, users, and custom objects. Sharing sets can be used with these user profiles:

- [Granting High-Volume Portal Users Access to Records](#)
- [Granting High-Volume Portal or Community Users Access to User Records](#)
- [About High-Volume Community Users](#)
- [Grant High-Volume Community Users Access to Records](#)
- [Share Records Owned By High-Volume Community Users](#)

About High-Volume Community Users

High-volume community users are limited-access users intended for orgs that have thousands to millions of communities users.

Unlike other community users, high-volume community users don't have roles, which eliminates performance issues associated with role hierarchy calculations. High-volume community users include the Customer Community, High Volume Customer Portal, and Authenticated Website license types.

Characteristics

High-volume community users:

- Are contacts enabled to access a community.
- Are assigned to the Customer Community, High Volume Customer Portal, or Authenticated Website license.
- Only share the records they own with Salesforce users in sharing groups.

Access to Records

High-volume community users can access records if any of the following conditions are met:

- They have "Update" access on the account they belong to.
- They own the record.
- They can access a record's parent, and the organization-wide sharing setting for that record is Controlled by Parent.
- The organization-wide sharing setting for the object is Public Read Only or Public Read/Write.

Admins can create sharing sets to grant high-volume community users additional access to records; see [Grant High-Volume Community Users Access to Records](#).

Limitations

- High-volume community users can't manually share records they own or have access to.
- You can't transfer cases from non-high-volume community users to high-volume community users.
- High-volume community users can't own accounts.
- You can't add case teams to cases owned by high-volume community users.
- You can't include high-volume community users in:
 - Personal groups or public groups.
 - Sharing rules.
 - Account teams, opportunity teams, or case teams.
 - Salesforce CRM Content libraries.

These limitations also apply to records owned by high-volume community users.

- You can't assign high-volume community users to territories.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Grant High-Volume Community Users Access to Records

Grant high-volume community users access to records using sharing sets.

A sharing set grants high-volume users access to any record associated with an account or contact that matches the user's account or contact. You can also grant access to records via access mapping in a sharing set, which supports indirect lookups from the user and target record to the account or contact. For example, grant users access to all cases related to an account that's identified on the users' contact records.

Sharing sets apply across all communities a high-volume community user is a member of. High-volume community users have either the Customer Community or High-Volume Portal User license. For more information, see "Sharing Set Overview" in the Salesforce Help.

To grant users access to selected users in the same community, you would typically create a sharing set if you deselected the `Community User Visibility` checkbox on the Sharing Settings page.

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. In the Sharing Sets related list, click **New** to create a sharing set, or click **Edit** next to an existing sharing set.
3. In the Sharing Set Edit page, fill in the **Label** and **Sharing Set Name** fields. **Label** is the sharing set label as it appears on the user interface. **Sharing Set Name** is the unique name used by the API.
4. Enter a description.
5. Select the profiles of the users to whom you want to provide access.
6. Select the objects you want to grant access to.

The Available Objects list excludes:

- Objects with an organization-wide sharing setting of Public Read/Write
- Custom objects that don't have an account or contact lookup field

7. In the Configure Access section, click **Set Up** or **Edit** next to an object name to configure access for the selected profiles, or click **Del** to remove access settings for an object.

 **Note:** Objects with **Set Up** in the Action column aren't configured for high-volume user access. Until you configure an object, high-volume users have limited or no access to its records.

8. Grant access based on an account or contact lookup:
 - Select a value in the User drop-down list to determine the account or contact lookup on the user.
 - Select a value in the Target Object field to determine the account or contact lookup on the target object.

For example, to grant access to all cases associated with an account identified on the user's contact record, select `Contact.Account` and `Account` respectively.

 **Note:** Both selected fields must point to either an account or contact. For example, `Contact.Account` and `Entitlement.Account` both point to an account.

9. Choose an access level of Read Only or Read/Write. (If the object's organization-wide sharing setting is Public Read Only, then only Read/Write is available.)
10. Click **Update**, then click **Save**.

EDITIONS

Salesforce Communities available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To grant high-volume community users access to records:

- "Customize Application"

After creating a sharing set, [create share groups](#) to give other users access to records created by high-volume community users.

SEE ALSO:

[About High-Volume Community Users](#)

Share Records Owned By High-Volume Community Users

Share groups allow you to share records owned by high-volume community users with internal and external users in your communities.

High-volume users are limited-access users intended for organizations with many thousands to millions of external users. Unlike other external users, high-volume users don't have roles, which eliminates performance issues associated with role hierarchy calculations. Because high-volume community users are not in the role hierarchy while Salesforce users are, a *share group* allows you to specify the Salesforce other external users who can access records owned by high-volume community users.

Share groups apply across communities.

To set up share groups for your communities:

1. From Setup, enter *Communities Settings* in the *Quick Find* box, then select **Communities Settings**.
2. In the Sharing Settings for High-Volume Community Users related list, click **Edit** next to an existing sharing set.
3. Click the Share Group Settings tab.
4. Click **Activate** to turn on the share group.

Activating the share group can take a while. An email is sent to you when the process finishes.

 **Note:** Deactivating a share group removes *all* other users' access to records owned by high-volume community users. An email isn't sent to you when the deactivation process finishes.

5. Click **Edit** to add users to the share group. You can add both internal users from your organization as well as external users from the same parent account as the high-volume user.
 - a. From the *Search* drop-down list, select the type of member to add.
 - b. If you don't see the member you want to add, enter keywords in the search box and click **Find**.
 - c. Select members from the Available Members box, and click **Add** to add them to the group.
 - d. Click **Save**.

Community Setup Basics

Setting up a community involves adding members, defining what records are shown in your community and to whom, branding, and enabling other features such as SEO.

[Customize Communities](#)

Update basic community settings like your URL, community name, members, login options, and general preferences in the Administration section of Community Workspaces or Community Management.

[Brand Your Community](#)

If you are using the Salesforce Tabs + Visualforce template, you can customize the look and feel of your community in Community Workspaces or Community Management by adding your company logo, colors, and copyright. This ensures that your community matches your company's branding and is instantly recognizable to your community members.

[Enable the Global Header for Communities](#)

When Communities is enabled, the global header allows you to easily switch between your communities and your internal org.

[Share a Link to Your Community](#)

You can allow members to preview your community before making it active.

[Update Your Community Settings](#)

Manage your community name, description, URL, community status, and community template all from one spot.

[Deactivate a Community](#)

[Enable Optional Community Features](#)

Enable other optional features in your community such as user nicknames, guest access, private messages, direct messages, content flagging, and reputation levels.

[Set Up Search Engine Optimization \(SEO\) for Your Community](#)

Have search engines, such as *Google*™ or *Bing*®, index your community so that customers, partners, and guest users can easily discover community pages via online searches. SEO can significantly improve discovery for public communities.

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Communities Users

To allow an external user to access your community, add them to an account as a contact record and then enable the contact record as a customer user or partner user, depending on your business relationship.

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

A few things to bear in mind about creating users:

- When you enable a contact record as an external user, you can assign a Partner Community, Customer Community, or Customer Community Plus license to them, depending on your business relationship.
 - Only business accounts (and not person accounts) can be partner accounts, and you can use only partner accounts to create partner users.
1. On the account record, view or add the contact record for the person you want to add to a community.
 2. On the contact detail page, click **Manage External User**, then **Enable Partner User** or **Enable Customer User**.

This creates a user record in your Salesforce org with some details prepopulated from the contact record.

 **Note:** If you don't see the Enable Partner User or Enable Customer User buttons, ask your administrator to check whether they're included in the Contact page layout. If the buttons are included, ensure that your org has customer or partner community licenses available.

3. Edit the user record for this external user and assign the appropriate user license: Partner Community for partners and Customer Community or Customer Community Plus for customer users.
4. Select the appropriate profile and role for the partner or customer user.

 **Note:** Make sure that you choose a profile that has the appropriate tabs exposed. Also, each customer or partner account has a role hierarchy associated with it. All customer and partner user roles roll up to the account owner.
5. If you haven't yet activated the community you want to add the external user to, deselect **Generate new password and notify user immediately** so that users don't receive a password before the community is activated.
 - If you opt to notify the user immediately but the user is not a member of any active community, Salesforce doesn't send the email.
 - You can send a welcome email with the login information by selecting the **Send welcome email** option when you activate a community.
 - If you don't send a welcome email when you activate the community, you must manually send this information to the user.
6. Click **Save**.
 - Customer or partner users can't directly log in to Salesforce; they must use a community to access your Salesforce data. To add a customer or partner user to a community, [add their user profiles to a community](#).

USER PERMISSIONS

To create partner users:

- "Manage External Users"

To create customer users:

- "Manage External Users"

OR

"Edit Self-Service Users"

 **Important:** When creating customer users, the account that the new contact is associated with must have an account owner that is assigned a role.

To log in as an external user:

- "Manage Users"

AND

"Edit" on Accounts

- Customer Users don't see the Notes & Attachments related list on accounts or contacts.
- Creating an external user with a Customer Community Plus license is similar to creating a partner user. On the contact record, select **Manage External User**, then **Enable Partner User**. Also, when editing the user record, select the Partner Community User profile or a profile cloned from it.
- To troubleshoot issues or ensure that the community is configured appropriately, on the contact detail page, click **Manage External User** and choose **Log in As Partner User** or **Log in as Customer User**. You must have Edit permission on Accounts to log in as a Partner User or Customer User. A new browser window opens and you are logged in to the community on behalf of the external user.
- When you log in as an external user, you see the behavior that the external user sees. For instance, external users only see the community drop-down menu if they have access to more than one active community. Also, if an external user who is only a member of one active community is given the URL for a community in preview, the user doesn't see the drop-down menu when in the preview community.
- As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.
- External users can't be deleted. If you no longer want an external user to have access to a community, deactivate the user.

Create Communities

Create communities using a wizard that helps you choose a community template that meets your business needs.

The number of communities you can create for your organization is listed on the All Communities page in Setup.

1. To start creating communities, from Setup, enter *Communities* in the Quick Find box, select **All Communities**, then click **New Community**. The Community Creation wizard appears, with different out-of-the-box template options for you to choose from. If you have Lightning Bolt solutions available in your org, you see them in the wizard as well.
2. To see more information about a template, select it.

Customer Service (Napili)

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, collaborate, and contact support agents by creating cases. Supports Knowledge, Chatter Questions, and cases.

Salesforce Tabs + Visualforce

Standard Salesforce structure and tabs that you can customize using Visualforce. Allows full platform access with a flexible configuration. Requires developer experience and

EDITIONS

- "Create and Set Up Communities"

AND

Is a member of the community

advanced setup skills. Supports most standard objects, custom objects, and Salesforce1. Keep in mind that the Salesforce Tabs + Visualforce template doesn't work with Community Builder.

Kokua

A graphic-based community ideal for handling simple customer interactions. Community members can search for and view articles, and contact support. Requires Knowledge and supports cases.

Koa

A text-based community ideal for handling simple customer interactions. Community members can search for and view articles, and contact support. Requires Knowledge and supports cases.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication, including social logins.

3. Select the template that you want to use.
4. Read the template description and key features, and click **Get Started**.
5. If you selected Koa or Kokua, specify the categories and Company Name for your template, then click **Next**.

Data Category Group Name

Unique name of the data category group that contains the data categories for your site. The name reflects the hierarchy of categories that you've set up for your community and is used throughout the site to organize articles.

Top Level Category

Highest-level category that you want to display. Only the children of this category appear in the community. You can have several nested layers of categories above this category, but the page shows this category as the parent and show its subcategories as children.

Company Name

Name of your company as you want it to appear in the community header.

6. Enter a community name.

Note: If you're creating multiple communities, keep in mind that community names may be truncated in the global header drop-down menu. Users can see up to 32 characters of the name, and the `Preview` and `Inactive` status indicators count toward that number. Make sure that the visible part of the name is distinctive enough for users to distinguish between multiple communities.

7. Enter a unique value at the end of the URL field.

This value is appended to the domain you entered when [enabling communities](#) to create a unique URL for this community. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

Note: You can create one community in your organization that doesn't have a custom URL.

You can change your community name and URL after the community is activated, but users won't be redirected to the new URL. If these changes are necessary, be sure to inform your community members before changing it.

8. Click **Create**.

The community is created in `Preview` status. Now you're ready to build and customize, or manage and moderate your community.

When you create a community, default pages for login, self-registration, change password, forgot password, and your home page are set based on your community template. You can customize or change these default pages at any time in [Community Management](#) or [Community Workspaces](#).

! **Important:** After you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it's `Active`. If you don't want all users with your profile to have access to the community, you can remove the profile and give yourself access through a different profile or permission set.

Customize Communities

Update basic community settings like your URL, community name, members, login options, and general preferences in the Administration section of Community Workspaces or Community Management.

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click Administration, then select the part of the community you want to customize:
 -  **Important:** The options available in Community Management or Community Workspaces are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you don't see the Topics section. Some of the options in the following list might not appear in your community. To display all sections, go to **Administration > Preferences** and enable **Show all settings in Community Management** or **Show all settings in Community Workspaces**.
3. To share the community with stakeholders while it's still in Preview status, copy the URL displayed on the **Administration > Settings** page and share it.

- [Members](#)
- [Tabs](#)
- [Branding](#)
- [Login & Registration](#)
- [Emails](#)
- [Pages](#)
- [Preferences](#)
- [Settings](#)

This allows you to get their feedback, and take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

Keep in mind that you can only share the URL with users who you added as members of the community.

After you finish your customizations, activate the community to make it available to members. If [welcome emails are enabled](#) when you activate, a welcome email is sent to all members. If any of those users are new portal users, their welcome email includes their username and password.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Community Workspaces or Community Management:

- "Access Community Management" OR "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community

To access moderation rules and criteria:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community

To customize administration settings or use Community Builder:

- "Create and Set Up Communities"
- AND is a member of the community

Add Members to Your Community

Use profiles and permission sets to manage community membership during the setup process.

Using profiles and permission sets, you can:

- Grant or remove access for groups of users. Once you add a profile or permission set, all users assigned to that profile or permission set become members of the community.
- Enforce a membership policy. New users added to a profile or permission set that is already associated with a community automatically gain access.

Permission sets allow added flexibility for adding members. You can grant community access to a subset of users from the same profile, without needing to clone the profile.

Standard, Chatter, and portal profiles can be added to communities; Chatter customers, from private groups with customers, can't be added to communities even if they're assigned permission sets that are associated with communities.

 **Note:** Profiles and permission sets associated with communities can't be deleted from Salesforce. You must remove the profiles or permission sets from the communities first.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration > Members**.
3. To add members using profiles:
 - a. To filter profiles, select a profile type from the drop-down menu. To search for a specific profile, enter a search term and click **Find**.
Search returns profiles for the selected filter.

 **Note:** Search results include profiles that are already part of the community.

- b. Select the user profiles you want to allow access to your community. Press CTRL to select multiple profiles.
- c. Click **Add**. To remove a profile, select it and click **Remove**.
If you remove a profile from a community, users with that profile lose access to the community, unless the users are assigned permission sets or other profiles that are still part of the community. Their posts and comments still appear.

 **Important:** If you're an administrator and accidentally remove yourself from a community, you can't access the Administration settings in Community Management or Community Workspaces. To add yourself back to the community or make other membership updates, [use the API](#).

4. To add members using permission sets:
 - a. To search for a specific permission set, enter a search term and click **Find**.
 - b. Select the permission sets you want to allow access to your community. Press CTRL to select multiple permission sets.
 - c. Click **Add**.
If you remove a permission set from a community, users with that permission set lose access to the community, unless the users are associated with profiles or other permission sets that are still part of the community. Their posts and comments still appear even after they lose access.
5. Click **Save**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

If the community is **Active** and [welcome emails are enabled](#), users with the profiles or permission sets you added receive a welcome email. The welcome email includes a username and a change password link if it is sent to an external user who hasn't logged in to a portal or community yet.

When the community is **Active**, welcome emails are sent and the community is discoverable by members. When a community is in **Preview** status, only members with the login URL can view the community. If a community is **Inactive**, only users with the "Create and Set Up Communities" permission can access it through the Community menu, regardless of membership.

There are additional options for granting access to your community:

- Enable self-registration so that external users can register on their own
- Enable authentication providers, such as Facebook, so that external users can log into the community without creating an account

For more information about these additional options, see [Customize Login, Self-Registration, and Password Management for Your Community](#).

SEE ALSO:

[Customize Communities](#)

[Enable the Global Header for Communities](#)

Determine User Visibility in Your Community

User sharing lets you decide whether all users in a community are visible to each other.

User sharing for external users is turned on by default when you enable Communities. This setting applies to all communities in your organization.

The default setting allows an external user to see other external users under the same account and users in common communities. You can change the organization-wide default for Users to make your communities more restrictive or open, depending on your use case.

If you deselect **Community User Visibility**, external users can't see each other. For example, John and Sally are external users. John can't:

- Search for Sally
- Find Sally in the community People tab, even if Sally is a member of the community
- Add Sally to a group
- Share a file or record with Sally

If John and Sally are members of the same group or share the same record, then they can see each other's conversations and updates within the group or on the record, but nowhere else.

If Sally belongs to the same account as John, and John has delegated external user administration privileges, then John can see Sally. Delegated External User Administration takes priority over user sharing.

 **Note:** User sharing doesn't apply to the Recently Viewed list on the People tab in Chatter or on user lookups. From that list, users can view people they have viewed before, but who aren't members of the community.

To view or change user sharing settings:

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Deselect the **Community User Visibility** checkbox make external users visible only to themselves and their subordinates. The setting applies to all communities in your organization.
4. Click **Save**.

For more information, on user sharing see the following topics in the Salesforce online help.

- [Understanding User Sharing](#)
- [Controlling Who Community or Portal Users Can See](#)

Reset An External User's Password for Communities

An external user's password can be reset either by the user or by the administrator of the organization hosting the community.

In either case, when someone initiates a reset of an external user's password, an email is sent to the user with a link to reset their password. User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don't expire. When the user clicks the link, they will be required to reset their password before proceeding.

If a user-initiated password reset request can't be processed, they receive an email telling them why. Password reset requests fail if a user's account is temporarily or permanently locked due to too many unsuccessful login attempts or if the request was sent outside approved login hours, IP ranges, or network locations.

SEE ALSO:

[Create Communities Users](#)

[How do external community members get login information?](#)

How do external community members get login information?

External users get their login credentials in welcome emails from a community.

When you enable a contact as a customer user or partner user, they don't receive their login credentials until you add them to a community with welcome emails enabled. If welcome emails are disabled for the community, the external user won't receive credentials and you must manually send them. To do so, from Setup, enter *Users* in the **Quick Find** box, select **Users**, select the checkbox next to the user's name, and then click **Reset Password**. An email containing the user's username and a link to reset their password will be sent to the user. The link in this email doesn't expire.

How do I update community membership using the API?

If you aren't a member of a community, you can't access Community Management to update administration settings, including membership. As an alternative, you can use the API and Data Loader to add yourself and others to a community.

 **Tip:** You can also use other data loaders to update your community membership such as Workbench.

1. Get the `networkId` for your community.

From Setup, enter *All Communities* in the **Quick Find** box, select **All Communities**, and then right-click your community URL and select **Inspect**. The `data-networkId` property provides your `networkId`.

2. Get the `profileId` or `permissionsetId` you want to add.

From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** or **Permission Sets**. Click on the profile or permission set that you want to add. The ID is the last part of the URL.

For example, at *mycompany.salesforce.com/00aa11bb22*, the ID is *00aa11bb22*.

3. Create a .csv file with columns for `networkId` and `parentId`. For `parentId`, list the `profileId` or `permissionsetId` you want to add.
4. Open Data Loader and select the **Network Member Group** object. Specify the location of the .csv file you created and complete the Data Loader steps.

Once you have successfully added members using Data Loader, the members will be able to access Community Management from the **Manage** link on the **All Communities** page in Setup.

 **Note:** In order to access Community Management, the member must also have “Create and Set Up Communities” or “Manage Communities” permission.

SEE ALSO:

[Insert, Update, or Delete Data Using Data Loader](#)

Add Tabs to Your Community

If you’re using the Salesforce Tabs + Visualforce template, you can add tabs to your community.

 **Tip:** If you want to use all custom pages in your community, you can choose to hide tabs. Not sure which option works best for you? Check out [Tabs vs. Community Builder](#) on page 3383.

Before you begin, keep these things in mind:

- The tabs you enable should be required for the type of activity you’re performing in this community, whether it be sharing accounts and opportunities with your partners or sharing cases and solutions with customers who need support. Don’t clutter your community with tabs that users don’t need.
- Profiles control access to tabs, so some tabs you choose may be hidden for profiles associated with the community. In that case, you must manually expose the tabs in the profiles for your community members so that they can see the tabs in the community.
- Lightning Component tabs aren’t supported in Communities.
- Chatter Free users in your community don’t see any tabs except the Chatter tab.

After you identify the features you want your community members to see, you can expose those features by choosing the corresponding tabs during setup. The tabs that you select also determine community navigation in Salesforce1.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration > Tabs**.

 **Tip:** If you’re using one of the preconfigured templates instead of Salesforce Tabs + Visualforce, the **Tabs** page is hidden by default. To display the page, click **Administration > Preferences**, then select **Show all settings in Community Management** or **Show all settings in Community Workspaces**.

3. Select the tabs to include in your community from the Available Tabs list. Press CTRL to select multiple tabs.
4. Click **Add** to add the tab. To remove a tab, select it in the Selected Tabs list and click **Remove**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- “Create and Set Up Communities”

AND

Is a member of the community

5. Click **Up** or **Down** to change the order that the tabs display.

The tab at the top of the list is the landing tab for the community. When members access the community, it is the first tab they see.

If members don't have access to the community landing tab, they see the first tab they have access to from the selected community tabs. If they don't have access to any of the tabs, they see the Home tab.

6. Click **Save**.

Important: Changing from the Salesforce Tabs + Visualforce template to a Community Builder-based template removes all tabs from your community.

SEE ALSO:

[Customize Communities](#)

[Rename the Chatter Tab](#)

Tabs vs. Community Builder

Not sure whether to use standard Salesforce tabs or the Community Builder when setting up your community? Here is some more information about each option to help you decide.

Tabs

Selecting the Salesforce Tabs + Visualforce template when creating your community means you will use out-of-the-box Salesforce tabs or Visualforce pages.

Pros

- Some theming options available out-of-the-box for tabs
- Support for all sales, service, marketing, and platform features
- Full Force.com platform capability

Cons

- Visualforce is the preferred approach for better customization, yet Visualforce requires coding capability
- Requires some knowledge of the Force.com platform

Community Builder

Selecting one of the preconfigured templates when creating your community means that you will use the WYSIWYG user interface of the Community Builder.

Pros

- Out-of-box app targeted at self-service communities
- More CSS styles available
- Great for a quick rollout of simple self-service community use case

Cons

- Limited to self-service functionality (cases, Salesforce Knowledge, and Chatter Questions)
- Doesn't support other sales, service, or platform use cases

- Doesn't have full platform capability

SEE ALSO:

[Add Tabs to Your Community](#)[Community Builder Overview](#)

Rename the Chatter Tab

Most likely, many of your community members will use the Chatter tab as their home base. You can customize it to meet your company's branding.

The Chatter tab is the fastest way for your community members to see what's most important to them: activity feeds, groups, bookmarks, files, and more. Many of your community members will most likely use the Chatter tab as their home base. Customize the name of the Chatter tab in your community to match your company branding—for example, you can use your company's name or any other name that would be recognizable to your members.

1. From Setup, enter *Rename Tabs and Labels* in the *Quick Find* box, then select **Rename Tabs and Labels**.
2. Select your default language from the *Select Language* drop-down list at the top of the page.
3. Under Chatter Tabs in Communities, click **Edit** next to the community you want to edit.
4. Type the singular and plural versions of your preferred tab name, for example, Partner and Partners. Select *Starts with a vowel sound* if appropriate.
5. Click **Save**.

EDITIONS

Brand Your Community

If you are using the Salesforce Tabs + Visualforce template, you can customize the look and feel of your community in Community Workspaces or Community Management by adding your company logo, colors, and copyright. This ensures that your community matches your company's branding and is instantly recognizable to your community members.

Important: If you are using a self-service template or choose to use the Community Builder to create custom pages instead of using standard Salesforce tabs, you can use the Community Builder to design your community's branding too.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Branding**.
3. Use the lookups to choose a header and footer for the community.

The files you're choosing for header and footer must have been previously uploaded to the Documents tab and must be publicly available. The header can be .html, .gif, .jpg, or .png. The footer must be an .html file. The maximum file size for .html files is 100 KB combined. The maximum file size for .gif, .jpg, or .png files is 20 KB. So, if you have a header .html file that is 70 KB and you want to use an .html file for the footer as well, it can only be 30 KB.

The header you choose replaces the Salesforce logo below the global header. The footer you choose replaces the standard Salesforce copyright and privacy footer.

4. Click **Select Color Scheme** to select from predefined color schemes or click the text box next to the page section fields to select a color from the color picker.

Note that some of the selected colors impact your community login page and how your community looks in Salesforce1 as well.

Color Choice	Where it Appears
Header Background	Top of the page, under the black global header. If an HTML file is selected in the Header field, it overrides this color choice. Top of the login page. Login page in Salesforce1.
Page Background	Background color for all pages in your community, including the login page.
Primary	Tab that is selected.
Secondary	Top borders of lists and tables. Button on the login page.
Tertiary	Background color for section headers on edit and detail pages.

5. Click **Save**.

Customize Email Sent from Communities

You can customize email sender information, Chatter email branding, and templates in your community emails. You can perform customizations in either the user interface or the Network object in Salesforce APIs.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration > Emails**.
3. Enter custom values for the email sender's name and address to replace the default values.

 **Note:** If you change the sender's email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn't take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

If you enter a custom value for the sender's address and you have enabled mail relay, your Chatter emails will use the relay.

4. Customize what displays in the footer of Chatter emails.

 **Important:** Both a logo and email footer text are required. Keep in mind that:

- All Chatter emails display the Chatter logo and Salesforce information by default unless you replace them with your organization's own logo and information.
- If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to `null`.

- a. Choose a logo to replace the default Chatter logo.

The logo must be an existing document in the Documents tab and must be marked `Externally Available Image`. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

- b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.

The default text includes Salesforce's name and physical address. We strongly recommend including your organization's physical address to comply with applicable anti-spam laws.

5. Select `Send welcome email` to send email to users when they're added to the community.

 **Important:** Welcome emails contain login information for external members. If you don't select this option, you'll have to manually send external members their usernames and passwords.

The link provided in the welcome email is valid for 6 months.

Welcome emails are sent when:

- A community changes from `Preview` status to `Active` status. Emails are not sent when a community is in `Preview` or `Inactive` status.
- An administrator adds a new profile or permission set to a `Active` community.
- A user is assigned a profile or permission set that is part of a `Active` community.

 **Note:** If a profile or permission set is part of multiple communities, users with that profile or permission set receive a welcome email from each community. The first email contains login credentials, but emails from subsequent communities simply contain a link to the community.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

6. Use the default email templates or use the lookups to select different templates for welcome emails to new community members, forgotten password emails, and notification emails about reset passwords. If your organization uses email templates to submit case comments, you can select a template (none is provided by default).

User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don't expire. You can customize any default template.

 **Note:** If you customize the contents of an email template, we recommend that you use the `{!Community_Url}` merge field. This custom merge field populates the unique URL for a community, ensuring that emails to users contain URLs with the correct parameters and direct users to the appropriate community to log in or change a password.

7. Click **Save**.

Emails sent as a result of approvals, workflows, and case comments are sent based on community membership. For example, if a workflow triggers an email, all the recipients are grouped based on community membership and then one email is sent to each group. If the user is a member of multiple active communities, the email comes from the oldest active community.

Another way to customize community emails is to use these fields on the API Network object.

- `CaseCommentEmailTemplateId`—ID of the email template used when submitting a comment on a case.
- `ChangePasswordEmailTemplateId`—ID of the email template used when notifying a user that their password has been reset.
- `EmailFooterLogoId`—ID of the Document object that displays as an image in the footer of community Chatter emails.
- `EmailFooterText`—Text that displays in the footer of community Chatter emails.
- `EmailSenderAddress`—Read only. Email address from which community emails are sent.
- `EmailSenderName`—Name from which community emails are sent.
- `ForgotPasswordEmailTemplateId`—ID of the email template used when a user forgets their password.
- `NewSenderAddress`—Email address that has been entered as the new value for `EmailSenderAddress` but has not been verified yet. After a user has requested to change the sender email address and has successfully responded to the verification email, the `NewSenderAddress` value overwrites the value in `EmailSenderAddress`. This becomes the email address from which community emails are sent.
 - If verification is pending for a new email address and you set `NewSenderAddress` to null, this cancels the verification request.
 - `NewSenderAddress` is automatically set to null after `EmailSenderAddress` has been set to the new verified address.
 - If verification is pending for a new email address and you specify a different new address for this field, only the latest value is retained and used for verification.
- `OptionsSendWelcomeEmail`—Determines whether a welcome email is sent when a new user is added to the community.
- `WelcomeEmailTemplateId`—ID of the email template used when sending welcome emails to new community members.

Merge Fields for Communities

You can add merge fields to Communities email templates.

When you enable Salesforce Communities in your organization, three text-based email templates are created:

- Communities: Changed Password Email
- Communities: Forgot Password Email
- Communities: New Member Welcome Email

These templates use unique merge fields. These merge fields are not available to select and copy when editing a template, but you can enter them manually. These merge fields will only work properly if used in a text or HTML template selected for a community.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Field Name	Description
<code>{!Community_Name}</code>	The name of the community, as entered during community creation.
<code>{!Community_Url}</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if:</p> <ul style="list-style-type: none"> • The template containing this field is selected as the Welcome New Member template for a community, and Send welcome email is selected, OR • The template containing this field is selected as either the Forgot Password or Change Password template and the user receiving the email is an external user who is a member of the community.
<code>{!Receiving_User.Username}</code>	The user name of the user who will receive the welcome email.

You can create custom email templates for communities using Visualforce, which allows you to use custom company branding in your email templates. For Visualforce email template, use the `$Network` global merge field type and its properties, as described in this table.

Field Name	Description
<code>\$Network.Name</code>	The name of the community, as entered during community creation.
<code>\$Network.NetworkUrlForUserEmails</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p>

Field Name	Description
	This field is populated only if it is used in a Visualforce email template for one of three email types supported for Communities.

If your community is using cases, approvals, or workflows, emails created from an email template that use the `{!<any_object>.Link}` or `{!Case.Link}` merge fields include a link to the record in the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

Field Name	Description
<code>{!Case.Link}</code>	Used in: <ul style="list-style-type: none"> Case comment notifications to contacts and owners Case creation and update notifications to contacts
<code>{!<any_object>.Link}</code>	Used in: <ul style="list-style-type: none"> Approval requests sent to approvers and delegated approvers Workflow email alerts

To find out if your email templates use these merge fields, from Setup, enter *Email Templates* in the Quick Find box, then select **Email Templates**, then click **Edit** next to any email template.

[Customize Email Sent from Communities](#)

[Manage Email Templates](#)

[Customize Email Sent from Communities](#)

[Manage Email Templates](#)

Enable the Global Header for Communities

When Communities is enabled, the global header allows you to easily switch between your communities and your internal org.

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

Communities must be enabled in your org to use the global header.

 **Important:** The Global Header is visible only in Salesforce orgs using Salesforce Classic. Salesforce orgs using Lightning Experience can't use the Global Header.

USER PERMISSIONS

To create permission sets:

- "Manage Profiles and Permission Sets"

To assign a permission set to a user:

- "Assign Permission Sets"

The `View Global Header` permission is disabled by default for all standard profiles. To view the global header, users must be assigned the “View Global Header” permission either by selecting it on standard profiles, creating custom profiles, or by creating a permission set. Create permission sets to easily assign this permission to specific people.

1. From Setup, enter `Permission Sets` in the `Quick Find` box, then select **Permission Sets**.
2. Click **New** and create a permission set that includes the System Permission `View Global Header`.
3. Assign the permission set to the appropriate users.

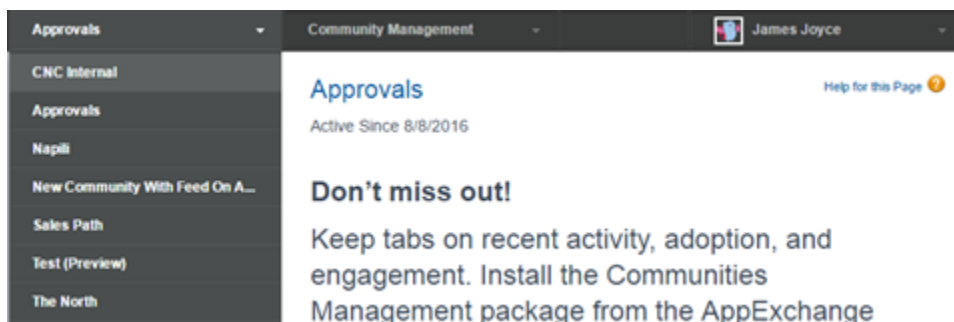

Users with this permission set see the Global Header at the top of all pages. They can use the menu on the left to switch between their internal org and any communities they have access to.

The `Your Name` menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to `Help & Training` and may also contain links to `Setup` and other tools depending on user permissions and enabled features.

Important: The global header isn’t supported in Lightning Experience, so to create, manage, or access communities from the Global Header, switch back to Salesforce Classic. If your org is using Lightning Experience, users with the appropriate permissions must switch to Salesforce Classic to access the global header.

- When in a Salesforce Tabs + Visualforce community, users with either the `Manage Communities` or the `Create and Set Up Communities` permission see a gear icon (⚙️) they can use to switch to `Community Workspaces` or `Community Management`.

Note: Within `Community Workspaces` or `Community Management`, users see the global header and the `Community Management` menu, even if they don’t have the “View Global Header” permission. However, we recommend that you still assign the “View Global Header” permission to users who need to switch between your internal org and communities.

- When in a Lightning community, users with either the `Manage Communities` or the `Create and Set Up Communities` permission can switch to `Community Workspaces` or `Community Management` by clicking on their name.

SEE ALSO:

[Access Your Communities from Salesforce](#)

Share a Link to Your Community

You can allow members to preview your community before making it active.

You can only share the link for a preview community with users who were added as members of the community.

Sharing a link to a community in `Preview` status allows you to easily gather stakeholder feedback. The community functions just as it will when you make it active, so stakeholders can try out all functionality and review your branding and customizations. Additionally, you can take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Settings**.
3. Copy the URL displayed on the page and share it with your stakeholders.
Keep in mind that you can only share the URL with users who you added as members of the community.

SEE ALSO:

[Customize Communities](#)
[Communities Statuses](#)

Activate Your Community

Activate your community to make it accessible to community members. The effect of activating a community differs by template.

- **Salesforce Tabs + Visualforce:** Activating the community makes the community URL active and enables login access for community members. If [welcome emails are enabled](#) when you activate, a welcome email is sent to all members. If any of those users are new portal users, their welcome email includes their username and password.
 - **Koa, Koa, or Customer Service (Napili):** Activating the community sends out a welcome email to all community members and registers the site with Brombone™, a search engine optimization service. To make the community URL active and enable login access for community members, [publish the community](#).
1. Open [Community Workspaces](#) or [Community Management](#).
 2. Click **Administration** > **Settings**.
 3. Click **Activate Community**.

Communities Statuses

Communities can have one of the following statuses.

Status	Description
Preview	<p>Customization of the community isn't complete, and the community has never been activated. Once you activate a community, you can't go back to <code>Preview</code> status.</p> <p>Users with "Create and Set Up Communities" can access communities in <code>Preview</code> status if their profile or permission set is associated with the community. They can also share a link to these communities with users whose profiles or permission sets are associated with the community. The link for sharing a <code>Preview</code> community is located on the Community Management page. If you're using Community Workspaces, the link for sharing a <code>Preview</code> community is located under Administration.</p> <p>No welcome emails are sent even if <code>Send welcome email</code> is selected.</p> <p> Note: If your organization's access to Communities is suspended for non-payment of fees due, all of your communities are deactivated, including those in <code>Preview</code> status. When Communities is enabled again, all communities are in <code>Inactive</code> status. You can activate these communities, but can't return to the <code>Preview</code> status.</p>
Inactive	<p>The community was previously <code>Active</code> but was deactivated.</p> <p>You may want to deactivate a community if you need to:</p> <ul style="list-style-type: none"> • Add or remove members • Add, remove, or change the order of tabs • Change the color scheme • Change the community URL <p>When you deactivate a community, it no longer appears in the drop-down menu. Users with "Create and Set Up Communities" can still access the setup for <code>Inactive</code> communities regardless of membership. If members try to access <code>Inactive</code> communities using a direct link, they see an error page.</p>
Active	<p>The community is active and available to members.</p> <p>Welcome emails are sent to new members if <code>Send welcome email</code> is selected.</p>

Update Your Community Settings

Manage your community name, description, URL, community status, and community template all from one spot.

You can change your community name and URL after the community is activated, but users won't be redirected to the new URL. If these changes are necessary, be sure to inform your community members before changing it.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Settings**.
3. Edit your community settings as needed:
 - Edit your community name, description, and URL, by clicking  next to your community name.
 - Manage the status of your community.
 - Change your community template.

SEE ALSO:

[Change Your Community Template](#)
[Communities Statuses](#)

Deactivate a Community

You may want to deactivate a community if you need to:

- Add or remove members
 - Add, remove, or change the order of tabs
 - Change the color scheme
 - Change the community URL
1. Open [Community Workspaces](#) or [Community Management](#).
 2. Click **Administration** > **Settings**.
 3. Click **Deactivate**.

Your community is inactive and offline.

When a community is inactive, members still see it in the menu, but can't access it unless they have the "Create and Set Up Communities" permission.

Change Your Community Template

If you use the Salesforce Tabs + Visualforce template, you can change your template to Koa, Kokua, or the Customer Service (Napili) template in Community Builder.

 **Note:** Starting with Winter '17, the ability to change templates is no longer supported for communities using the Koa, Kokua, and Customer Service (Napili) templates. The functionality is still available for these templates, but we recommend that you start afresh with a new community instead. If you do change your template from Koa, Kokua, or Customer Service (Napili) to another template type, Salesforce Customer Support will be unable to assist you if any problems arise.

 **Important:** There is no data loss when you change templates, but some customizations are lost. Be sure to review [Considerations for Changing Your Community Template](#) before changing your template.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Settings**.
3. Click **Change Template**.
4. Choose the template you want to switch to.
5. When prompted, select **Change Template** to confirm your changes.

After you change the template, you are taken back to Community Workspaces or Community Management.

Check to make sure your community pages, such as the Login page or Community Home page, are still the best choice for your updated community template. For example, if you previously had a Salesforce Tabs + Visualforce template and switch to the Customer Service (Napili) template, update your pages to use Community Builder pages instead of Visualforce pages. If necessary, customize your community in Community Builder and publish any changes you make.

To learn more about using the Kokua, Koa, and Customer Service (Napili) templates, see the [Using Templates to Build Communities](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

 **Note:** Starting with Winter '17, the ability to change templates is no longer supported for communities using the Koa, Kokua, and Customer Service (Napili) templates. The functionality is still available for these templates, but we recommend that you start afresh with a new community instead. If you do change your template from Koa, Kokua, or Customer Service (Napili) to another template type, Salesforce Customer Support will be unable to assist you if any problems arise.

- When you change your template, Salesforce object data carries over, but some branding and component customizations do not. Prepare to redo customizations as necessary.
- Changing the community template updates the navigation options in Community Workspaces or Community Management. To view all available navigation options regardless of template selection, select **AdministrationPreferences** > **Show all settings in Community Workspaces or Community Management**.
- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to any other template type. Specifically, `/s` is appended to the community URL. Be sure to update any links to your community with the updated URL.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- In active communities
 - When you switch over to the Koa, Kokua, or Customer Service (Napili) templates, your template change is saved in a draft version. Use the draft version to further customize your community in Community Builder. Your community is updated only after you publish your changes.
 - When you switch to the Salesforce Tabs + Visualforce template from any other template, your changes immediately reflect in your active community. In this scenario, we recommend that you deactivate your community before you change your template. Once you've made all your changes, reactivate the community.
 - If your template is listed as `None`, it means you're not using a predefined template or you are using a modified version of one of our templates.

To learn more about using the Kokua, Koa, and Customer Service (Napili) templates, see the [Using Templates to Build Communities](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

Enable Optional Community Features

Enable other optional features in your community such as user nicknames, guest access, private messages, direct messages, content flagging, and reputation levels.

To use these settings, Chatter must be enabled in your organization.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Preferences**.
3. Change the desired settings.

General

- [Display nicknames instead of full names](#) in your community. Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.
- [Enable access to public Chatter content](#) in your community so that guest users can access it without logging in. Allowing this access is a way to boost adoption and helps customers easily find information they need without having to log in, register, or contact your company directly.
- Enable Chatter messages, which allow community members to have secure private conversations with other Chatter users. To expose Chatter messages for external users, administrators must also enable the Chatter tab in communities using the Salesforce Tabs + Visualforce template.
- [Enable direct messages](#), which allows community members to have secure private conversations in communities built using the Customer Service (Napili) template.
- [Use custom Visualforce error pages](#), if you want authenticated users to see your custom branded Visualforce error pages.
- Show all settings available in Community Management or Community Workspaces that are hidden by default based on how you set up your community. Enabling this setting overrides the dynamic navigation provided in Community Management and Community Workspaces.

Community Management or Community Workspaces

- [Allow members to flag posts, comments, or files for moderation](#) on page 3653 within your community. Members may want to flag items that contain inappropriate language or sensitive information.
- [Enable Reputation](#) on page 3683 to allow community managers to set up a point system that rewards users who participate in the community. Administrators set up corresponding reputation levels that users see on their profile.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

- [Enable knowledgeable people](#) on page 3683 so you can discover who's knowledgeable on topics and endorse people for their knowledge on a topic.

Files

- Set the maximum size in MB for files uploaded to the community.
- Specify the types of files that can be uploaded in the community.

4. Click **Save.**[Show Nicknames Instead of Full Names in the Community](#)

Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.

[Enable Public Access to a Community](#)

Enable access to communities for guest (unlicensed) users, without requiring them to log in or register with the community.

[Use Custom Visualforce Error Pages for Authenticated Users](#)

If you have customized Visualforce error pages, you can have those pages display for authenticated community users.

[Limit Files in Your Community](#)

Restrict the size and types of files that your community members can upload. This whitelist of file types lets you control what your community members upload and also prevents spammers from polluting your community with inappropriate files.

[Configure a Custom Domain for Your Community](#)

Set up a custom domain so that your community URLs reflect your company brand.

[Add the Global Search Box to Your Customized Community HTML Header](#)

If you customize your Salesforce Communities with an HTML header, you hide the global search box. To take advantage of this search functionality, add a form to your custom header.

[Choose a Landing Tab](#)

If you are using the Salesforce Tabs + Visualforce template, you can select a landing tab for your community.

[Migrate Communities From Your Sandbox to Production](#)**SEE ALSO:**

[Show Nicknames Instead of Full Names in the Community](#)

[Enable Public Access to a Community](#)

[Use Custom Visualforce Error Pages for Authenticated Users](#)

[Enable Members to Flag Items in Your Community](#)

[Enable Reputation in Your Community](#)

[Limit Files in Your Community](#)

Show Nicknames Instead of Full Names in the Community

Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.

All users have nicknames by default, which they can modify by going to *Your Name* > **Edit Contact Info** in the global header or from their Chatter user profile.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Preferences**.
3. Select **Enable nickname display**, then click **Save**.

Nicknames are shown in place of first and last names in almost all locations in the community, including in feeds, list views, groups, search results, recommendations, and on user profiles and files. Additionally, Salesforce1 and any community sites activated using community templates show nicknames as well.

A few restrictions to keep in mind about nickname display:

- Private messages display full names. You can choose to turn off private messages to avoid this.
- Records and user lookups on records show full names. Keep in mind, though, that you can control record and user visibility with sharing rules.
- Mobile notifications in Salesforce1 show full names. You can turn off mobile notifications in Salesforce1 to avoid this.
- Searches by first, last, and full names aren't restricted and return matches, but the search results display only nicknames. The auto-complete recommendations in global search and the recent items list show any first, last, and full names that the user has already searched by or has accessed via a record or another location.

SEE ALSO:

[Enable Optional Community Features](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable nickname display:

- "Create and Set Up Communities"

AND

Is a member of the community

Enable Public Access to a Community

Enable access to communities for guest (unlicensed) users, without requiring them to log in or register with the community.

Public communities lend themselves well to business-to-consumer (B2C) type scenarios and allow you to reach a broader audience. Consider the example of a customer support community. A community with public discussions, known issues, and solutions posted by other community members or customer support allows existing and potential customers to view information without logging in.

Public access to any community depends on the level of access you grant to the guest user profile. Make sure that you enable access to Chatter content for guest users via the API.

 **Note:** You can also control access to public content at the page level from Community Builder.

Guest User Profiles

Whenever you make a community using the Community Creation wizard, Salesforce automatically creates a guest user profile for the community. You can access the guest user profile in one of the following ways and change the profile settings to open up or limit access to your community's public content.

1. Open [Community Workspaces](#) or [Community Management](#).
2. For communities using the Salesforce Tabs + Visualforce template:
 - a. Under Administration, click **Pages** and then click **Go to Force.com**.
 - b. On the site settings page, click **Public Access Settings** to edit the guest profile page.
 - c. To update the profile access permissions, click **Edit** and make your updates.
 - d. Click **Save**.

For template-driven communities, you can also access the guest user profile from Community Builder settings. Click **General** and then click the link under the Guest User Profile section.

Important:

- If you have enabled profile-based rollout for Chatter in your organization, guest users can't access public communities until you enable Chatter access on the guest user profile. For more information, see *Control Chatter Access through User Profiles* in the Salesforce Help.
- Page variations and page-level settings gate access to your community pages.
- When you add custom components to your community, they can bypass the object- and field-level security (FLS) you set for the guest user profile. Lightning components don't automatically enforce [CRUD and FLS](#) when referencing objects or retrieving the objects from an Apex controller. This means that the framework continues to display records and fields for which users don't have CRUD permissions and FLS visibility. You *must* manually enforce CRUD and FLS in your Apex controllers.

Enabling API Access to Chatter for Guest Users

The following Lightning and Visualforce pages and components in communities need access to underlying Chatter capabilities to load correctly for guest users.

- Case
- Featured Feeds
- Feed
- Group

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable public access to community content:

- "Create and Set Up Communities"
- AND
- Is a member of the community

- Group Detail
- Headline
- Record Information Tabs
- Related Lists
- Reputation
- Search & Post Publisher

To enable access to Chatter functionality, access [Community Workspaces](#) or [Community Management](#).

1. Click **Administration > Preferences**.
2. Select **Give access to public API requests on Chatter**, then click **Save**.

Enabling public access through the guest user profile and the API exposes data for guest users through Chatter in Apex which is helpful when you're building your own community pages from scratch.

SEE ALSO:

[Enable Optional Community Features](#)

[Methods Available to Communities Guest Users](#)

Use Custom Visualforce Error Pages for Authenticated Users

If you have customized Visualforce error pages, you can have those pages display for authenticated community users.

To assign or customize your Visualforce error pages, in Community Workspaces or Community Management, click **Administration > Pages** and click **Go to Force.com**. The **Error Pages** section lists your current page selections.

When **Use custom Visualforce error pages** is selected, users who are logged in to the community will see your custom Visualforce error pages. When **Use custom Visualforce error pages** isn't selected, users logged in to the community see the default Visualforce error pages. Guest users who aren't logged in to the community will always see the custom Visualforce error pages, regardless of whether or not you select the checkbox.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration > Preferences**.
3. Select **Use custom Visualforce error pages**, then click **Save**.

SEE ALSO:

AND

Is a member of the community

Limit Files in Your Community

Restrict the size and types of files that your community members can upload. This whitelist of file types lets you control what your community members upload and also prevents spammers from polluting your community with inappropriate files.

Community file moderation must be enabled for your org before you can limit files in your community. If you don't see the option to limit files in Community Workspaces or Community Management, contact Salesforce.

Your community file limits apply to files uploaded by community members anywhere in the community—in posts and comments, directly in the Files tab, and also from Salesforce1. You can also set community file limits using the SOAP API or Metadata API.

Files uploaded before setting your file limits are unaffected. However, newer versions of those files must meet the limits you specify.

Keep the following things in mind:

- A file must meet the file limits set in the community in which it's uploaded. For example, if a customer uploads a file on a case and then an agent uploads a newer version in your Salesforce internal org, the limits from the customer community still apply.
- Files uploaded in your internal Salesforce org that are shared in a community aren't subject to community file limits.

1. Open [Community Workspaces](#) or [Community Management](#).

2. Select **Administration > Preferences**, then enter your limits in the Files section on the page.

- **Maximum file size in MB**—Enter a number between 3 MB and your org's maximum file size. To use the default limit of 2 GB, leave this field empty or enter *0*.
- **Allow only these file types**—Enter file extensions separated with a comma (for example: *jpg, docx, txt*). You can enter lowercase and uppercase letters. You can enter up to 1,000 characters. To allow all file types, leave this field empty.

3. Click **Save**.

After you set your community's file limits, members receive an error message if their file is larger than the size you set or if their file extension isn't allowed.

When a member tries to upload multiple files at once and a file is found that doesn't meet your limits, none of the files are uploaded.

Configure a Custom Domain for Your Community

Set up a custom domain so that your community URLs reflect your company brand.

 **Note:** Custom domains are supported only in non-sandbox instances. You can configure a custom domain in a sandbox instance and then migrate it to a production instance, but the custom domain is only active in production.

When you add a domain, you also have the option of attaching a certificate and key for connection security. If you're going to use a certificate, make sure you've already added it using Certificate and Key Management before you try to attach it to your domain. Only CA-signed certificates are supported, and they must be 2048 bits in length. To support all domains that are hosted by sites in your organization, use a wildcard or Subject Alternative Name certificate.

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. Click **Add a Domain**.
3. Enter the Domain Name.
4. Add a certificate if you have already set up a CA-signed certificate that supports this domain.
5. Click **Save**. Alternatively, click **Save & New** to add multiple domains.

If you plan to host more than one community on a domain, you'll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the communities within that domain. From Setup, enter *Custom URLs* in the **Quick Find** box, then select **Custom URLs**.

Before you switch the CNAME of your domain name to point to a new target name, ensure that the new target name exists in the DNS by using `dig` or `nslookup`. When you created your domain names affects the target of your CNAME:

- Domain names that were added before Summer '13, typically need to have their CNAME adjusted to point to the fully qualified domain followed by `.live.siteforce.com` instead of to the organization's `force.com` sub-domain. For example, if your pre-Summer '13 domain is `www.example.com`, then the target of its CNAME will need to be `www.example.com.live.siteforce.com` instead of `example.force.com` before HTTPS will work.
- Domain names that were added in or before Summer '13, don't have the 18-character organization ID in the CNAME target.
- Domain names that were added in or after Summer '13, already point to the proper place for setting up HTTPS in a custom domain.
- Domain names that were added in or after Winter '14, use a CNAME that points to the fully qualified domain followed by your organization's 18-character ID and `.live.siteforce.com`. For example, if your domain name is `www.example.com` and your 18-character organization ID is `00dxx0000001ggxeay`, then the target of its CNAME will need to be `www.example.com.00dxx0000001ggxeay.live.siteforce.com`.

[Manage Your Domains](#)

[Managing Domains and Custom URLs](#)

[Adding a Domain](#)

USER PERMISSIONS

To view domains:

- "View Setup and Configuration"

To add domains:

- "Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Set Up Communities"

To edit or delete domains:

- "Customize Application"

To associate certificates with a domain:

- Contact Salesforce if you aren't using Communities. Organization with Communities can associate certificates with a domain.

Add the Global Search Box to Your Customized Community HTML Header

If you customize your Salesforce Communities with an HTML header, you hide the global search box. To take advantage of this search functionality, add a form to your custom header.

1. In your customized HTML header, embed a form similar to this one.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

```
<form action="/<community name>/search/SmartSearch" method="get">
  <input id="phSearchInput" type="text" name="str"/>
  <input type="submit" value="Search"/>
</form>
```

2. Replace `<community name>` with the unique value you used for the URL when creating the community.

For example, if you entered `customers` as the unique value for your community URL, the form would look like this example:

```
<form action="/customers/search/SmartSearch" method="get">
  <input id="phSearchInput" type="text" name="str"/>
  <input type="submit" value="Search"/>
</form>
```

Choose a Landing Tab

If you are using the Salesforce Tabs + Visualforce template, you can select a landing tab for your community.

Open [Community Workspaces](#) or [Community Management](#). Go to **Administration > Tabs**, the first tab in the Selected Tabs list is the landing page.

There are multiple options for the landing tab in your community, and you should select the one that best meets members' needs.

- Chatter tab—If you select this tab, the feed is the first thing members see when they log in. This option is good for communities where people will spend a lot of time in Chatter and won't need a customized home page with additional components. You can also rename the Chatter tab.
- Home tab—If you select this tab, the Salesforce Home tab for your organization is the first thing members see when they log in. The components that display on the tab were added in the Home Page by your administrator. This is a good option if you're not using Chatter or don't want a feed-based home page view.
- Custom Visualforce tab—Selecting this option allows you to build a completely custom landing page.

Migrate Communities From Your Sandbox to Production

In order to properly set up and test the implications of Communities on your organization, we recommend that you deploy Communities in your sandbox first. You can then use the Metadata API to retrieve your data and migrate it over to your production environment.

 **Note:** In the API, the `network` represents a community.

For additional information on the Metadata API and instructions on migrating data, see the [Metadata API Developer's Guide](#) and the [Force.com Migration Tool Guide](#).

Prerequisites

Before migrating data to an organization, ensure that:

- An administrator has enabled Communities for your org. To enable Communities in an organization, from Setup, enter *Communities Settings* in the Quick Find box, select **Communities Settings**, and then select **Enable**. If you don't see this option, contact your Salesforce representative.

 **Note:** When you enable Communities, you must select a domain name. Ensure that you enter the same domain name that you used in your sandbox organization or you will get an error.

Considerations

- When a community is created, we create the following behind the scenes.

- Custom site

The custom site is migrated with the community. Check the XML file to make sure all custom site dependencies are brought over as well. If any are missing, you may need to explicitly state them all in the XML file.

- Every network has a unique name and URL path prefix. When we retrieve the network, a file is generated. The name of the file is based on the name of the network. When migrating, the API looks at the file name and if it already exists, updates the community. If it doesn't exist, the API creates a new community. If someone changes the community name in the sandbox and then tries to migrate, they will see an error because the API is trying to create a new community with the existing path prefix.
- Once profiles are migrated, users are added to the community in the production organization. Subsequently, emails are sent to members as if it was a new community.

Sample Template

The following template contains all of the fields that can be migrated through the Metadata API.

```
<Network xmlns="http://soap.sforce.com/2006/04/metadata">
  <changePasswordEmailTemplate>unfiled$public/
CommunityChangePasswordEmailTemplate</changePasswordEmailTemplate>
  <emailSenderAddress>admin@yourorg.com</emailSenderAddress>
  <emailSenderName>Admin User</emailSenderName>
  <forgotPasswordEmailTemplate>unfiled$public/
CommunityForgotPasswordEmailTemplate</forgotPasswordEmailTemplate>
  <invitationsEnabled>false</invitationsEnabled>
  <networkProfiles>
    <profile>
      <fullName>Admin Profile</fullName>
      <classAccesses>
        <apexClass>*</apexClass>
        <enabled><boolean></enabled>
      </classAccesses>
      <pageAccesses>
        <apexPage>*</apexPage>
        <enabled><boolean></enabled>
      </pageAccesses>
      <userLicense>Salesforce</userLicense>
    </profile>
  </networkProfiles>
  <networkTabSet>
```

```

    <defaultTab>home</defaultTab>
    <standardTabs>Chatter</standardTabs>
</networkTabSet>
<portal>FirstNetwork</portal>
<sendWelcomeEmail>true</sendWelcomeEmail>
<site>FirstNetwork</site>
<status>UnderConstruction</status>
<urlPathPrefix>brand</urlPathPrefix>
    <welcomeEmailTemplate>unfiled$public/
CommunityWelcomeEmailTemplate</welcomeEmailTemplate>
</Network>

```

Sample `package.xml` Manifest File

A manifest file defines the components you are trying to retrieve. The following sample shows a `package.xml` manifest file for retrieving all the components of a community.

```

<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">

Set Up Search Engine Optimization (SEO) for Your Community

Have search engines, such as *Google*™ or *Bing*®, index your community so that customers, partners, and guest users can easily discover community pages via online searches. SEO can significantly improve discovery for public communities.

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

 **Note:** For communities that use the Koa, Kokua, and Customer Service (Napili) template, activating a community automatically registers it with Brombone™, an SEO service.

To manually set up SEO for your community, there are a few standard files and SEO properties that you need to know about.

sitemap.xml

`sitemap.xml` contains a list of the URLs of your community. Search engines use this list to find out which pages of your community are available for crawling and indexing. The `sitemap.xml` file is automatically generated at the root level of your community.

To view the site map, navigate to `https://<community_URL>/s/sitemap.xml`.

If your community supports multiple languages, the site map automatically includes an entry for each supported language as follows:

```

<xhtml:link rel="alternate" hreflang="language_code"
href="page_URL?language=language_code" />

```

For example, `<xhtml:link rel="alternate" hreflang="fr" href="https://mycommunity.com/s/?language=fr" />`.

You can submit the `sitemap.xml` file directly to search engines, such as [Google™ Webmaster Tools](#) and [Bing® Webmaster Tools](#) to allow users of those search engines to discover content in your community.

robots.txt

`robots.txt` uses include and exclude rules to inform web spiders and robots about which areas of your community to index. This standard file is used across the Web for SEO and gives you complete control over what users can discover via search engines.

`robots.txt` is automatically generated if your community exists at the root level (without a subpath in the URL). To view the file, navigate to `https://<community_URL>/robots.txt`.

The auto-generated file allows your entire community to be indexed. However, you can choose to allow indexing of specific areas only by creating a Visualforce page to host the information.

Page Title and Description properties

The `title` and `description` tags in the page `<head>` are important for SEO because they represent the link title and description that appear in search results pages.

[Salesforce.com: The Customer Success Platform To Grow Yo...](#)
<https://www.salesforce.com/> ▾ Salesforce.com ▾
 Build more meaningful and lasting relationships and connect with your customers across sales, customer service, marketing, communities, apps, analytics, and ...

You can customize the title and description for your community's standard pages in the [Page Manager](#) area of Community Builder. However, some pages, such as the Article Detail and Topic Detail pages, set these properties dynamically according to the components on the page. For example, for the Article Detail page, the title and description values are updated according to the article's title and summary, respectively.

[Create a Custom Robots.txt File for Your Community](#)

The `robots.txt` file uses include and exclude rules to inform web spiders and robots about which areas of your community to index. To allow only specific areas of your community to be indexed, create a Visualforce page to host this information. After you specify your rules, search engines use the file to index your community pages.

[Best Practices for Using SEO in Your Community](#)

Follow these guidelines and best practices when using SEO in your community.

[SEO for Communities FAQ](#)

Answers to common questions about using SEO in your community.

Create a Custom `robots.txt` File for Your Community

The `robots.txt` file uses include and exclude rules to inform web spiders and robots about which areas of your community to index. To allow only specific areas of your community to be indexed, create a Visualforce page to host this information. After you specify your rules, search engines use the file to index your community pages.

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To create a Visualforce page and `robots.txt` file for your community:

- "Create and Set Up Communities"

Your custom `robots.txt` file must contain the path to the auto-generated site map—for example, `https://<community_URL>/s/sitemap.xml`. `robots.txt` is placed at the root level of your community.

Here's an example of a Visualforce page with indexing rules for a community:

```
<apex:page contentType="text/plain">
User-agent: *
Disallow: / # hides everything from ALL bots
Allow: /<path-prefix-1>/s # add path you want to open to bots
Allow: /<path-prefix-2>/s # add path you want to open to bots
Sitemap: http://<community_URL>/s/sitemap.xml
Sitemap: http://<community_URL>/<sub_path>/s/sitemap.xml
</apex:page>
```

-  **Note:** You may have more than one community, each with various subpaths. Keep in mind that they all share the same file, so be sure your indexing rules account for the pages in all your communities. The Visualforce page with the `robots.txt` info must be within the community that has no subpath name at all, so at the root level.

To create and use a custom `robots.txt` file:

1. Create a list of include and exclude rules for the different areas of your community that you want to expose or hide from search engines. Save this information in a text file.

2. In Setup, enter *Visualforce Pages* in the Quick Find box, then select **Visualforce Pages** and click **New** to create a Visualforce page. Give it any name; you can even call it `robots`.
3. Paste the list of indexing rules in the Visualforce page. The final contents should look similar to the example above, with more rules as required.
4. Click **Save**.
5. From Community Workspaces or Community Management, click **Administration > Pages** and click **Go to Force.com**. Then click **Edit** on the Site Details page.
6. In the **Site Robots.txt** field, enter the name of the Visualforce page you created, or click  to search for the file.
7. Click **Save**.
8. Optionally, submit your `sitemap.xml` file directly to search engines. For example, submit the file to [Google™ Webmaster Tools](#) and [Bing® Webmaster Tools](#) to allow users of those search engines to discover content in your community.

To confirm that the `robots.txt` file is available for robots and spiders, navigate to `https://<community_URL>/robots.txt`. Similarly, to view the site map, navigate to `https://<community_URL>/s/sitemap.xml`.

SEE ALSO:

- [Set Up Search Engine Optimization \(SEO\) for Your Community](#)
- [Best Practices for Using SEO in Your Community](#)

Best Practices for Using SEO in Your Community

Follow these guidelines and best practices when using SEO in your community.

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

- Don't create a custom site map; use the auto-generated `sitemap.xml` file.
- If you create a custom `robots.txt` file, ensure that it points to the auto-generated site map—for example, `http://<community_URL>/s/sitemap.xml`.
- If your org supports multilingual Knowledge articles, we recommend against replacing the URL of translated articles with language-specific URLs. Instead, retain the same URL as the base language article.

If your community supports multiple languages, the site map automatically includes an entry for each supported language as follows:

```
<xhtml:link rel="alternate" hreflang="language_code"
href="page_URL?language=language_code" />
```

- In Page Manager, ensure that each page's Title and Description fields have meaningful entries, where applicable. The page title is used in the browser tab or window, search engine results, and bookmarks. Content in the Description field is shown in search engine results to help people quickly decide whether it's the page they want.
- Before submitting the `sitemap.xml` file to search engines for crawling, navigate to `https://<community_URL>/s/sitemap.xml` as an unauthenticated user. (We suggest using Google Chrome's incognito mode.) Ensure that the URLs listed in the site map are appropriate for guest users.

If a URL is mistakenly included in the list available to guest users, ensure that the correct permissions are enabled on the guest user profile and that your org is set up correctly. For example, to prevent Case Detail URLs from being included in the site map, from

Setup, enter *Sharing Settings* in the **Quick Find** box. Then, click **Edit** and set the Default Internal Access for Case to *Private*.

- Redirecting HTTP requests to HTTPS is an SEO best practice. Therefore, we recommend against disabling the **Require Secure Connections (HTTPS)** setting on the Site Details. To verify that the checkbox is selected, in Community Management, click **Administration > Pages > Go to Force.com**.
- 301 redirects are a great way to ensure that users and search engines are directed to the correct page. For example, for a URL such as `www.my_community.com`, we recommend creating a redirect to `my_community.com`. You can set up these redirects with your DNS provider.

SEO for Communities FAQ

Answers to common questions about using SEO in your community.

Available in: Salesforce Classic

Available in: **Enterprise, Performance**, and **Unlimited** Editions

Why does `sitemap.xml` have references to other site maps?

The auto-generated `sitemap.xml` file is an index file that lists other site maps. `sitemap.xml` can contain only a limited number of URLs, so if your community contains many site map URLs, we partition them into several smaller site map files.

Does the site map include URLs for Salesforce object pages that come with my community template?

If you created a detail page for the object and enabled the object's "Read" permission on the guest user profile, the URLs for the object's pages are included in the site map.

Does the site map include URLs for the custom object pages that I create?

If you created a detail page for the object and enabled the object's "Read" permission on the guest user profile, the URL for the detail page is included in the site map. However, URLs for the list and related list pages aren't included.

How do I exclude the URLs for Case Detail from the site map and prevent them from showing up in search engine results?

To prevent Case Detail URLs from being included in the site map, from Setup, enter *Sharing Settings* in the **Quick Find** box. Then, click **Edit** and set the Default Internal Access for Case to *Private*.

Why doesn't the auto-generated `robots.txt` file appear when I navigate to

`https://<community_URL>/robots.txt`?

Your community must be at the root level of your custom URL for the auto-generated `robots.txt` file to show up. If you don't have a custom URL set up and are using the `*.force.com` domain, then a community without the path prefix must exist for `robots.txt` to show up.

How do I override the content of `robots.txt`?

You can override `robots.txt` by [creating a Visualforce page to host the information](#).

Can I remove the `/s/` from the default community URL?

No, the `/s/` is required in the default community URL.

Is URL rewriting for creating custom vanity URLs supported?

No, URL rewriting isn't currently supported for template-based communities.

Does each article have its own URL?

Yes, each article that appears in the Article Detail page has its own URL, which is retrieved from the Knowledge article's `URL Name` field.

If your org supports multilingual Knowledge articles, we recommend against replacing the URL of translated articles with language-specific URLs. Instead, retain the same URL as the base language article.

Can I add titles and descriptions to articles for SEO purposes?

Each Knowledge article has a `URL Name`, a `Title`, and a `Summary` field. When the article is displayed in the Article Detail page in Community Builder, these fields are used for the page URL, and the `title` and `description` tags in the page `<head>`, respectively.

The `title` and `description` tags in the page `<head>` are important for SEO because they represent the link title and description that appear in search results pages.

Brand Your Community's Login Page

If you selected the Salesforce Tabs + Visualforce template, you can add your company logo and custom footer text to the standard login page that comes out-of-the-box with your community.

The header and page background colors used on the standard login page are inherited from the community's [branding color scheme](#).

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Login & Registration** and make your changes in the Header and Footer section.
3. Upload a logo for the community login page header.
The file can be .gif, .jpg, or .png. The maximum file size is 100 KB. Images larger than 250 pixels wide or 125 pixels high aren't accepted. Uploading a logo automatically creates a Communities Shared Document Folder on the Documents tab and saves the logo there. Once created, you can't delete the folder.
The header logo displays at the top left of the standard login page. It is also used when you access the community in Salesforce1. The header logo doesn't appear on custom login pages.
4. Enter custom text for the community login page footer, up to a maximum of 120 characters.
The footer displays at the bottom of the login page. This footer text doesn't display on custom login pages.
5. Click **Save**.

The logo and custom footer text display to all users (internal, external, and unlicensed guest users) on the login page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

Customize Your Community's Login Experience

Customize the default login process for external users in your community. You can also use a custom Community Builder, Site.com Studio, or Visualforce login page, support multiple authentication providers, and configure single sign-on with any template.

External users are users with Community, Customer Portal, or partner portal licenses.

- The login page you select in Community Workspaces or Community Management overrides other login page assignments in the Site.com or Force.com site settings.
- If your community uses the Salesforce Tabs + Visualforce template, the login page assigned to the community by default is called `CommunitiesLogin`. Use Visualforce to customize the appearance of this page.
- If your community uses the Customer Service (Napili) template, the login page assigned to the community by default is called `Login`. Use Community Builder to customize its appearance.
- To update the login behavior for both Visualforce and Community Builder pages, update the `CommunitiesLoginController` Apex controller.
- You must publish custom Community Builder pages before they can be assigned to a community. Before you use your custom login page, remember to modify the `CommunitiesLoginController` Apex controller and the `Site.login()` Apex method.

1. Open [Community Workspaces](#) or [Community Management](#).

2. Click **Administration** > **Login & Registration** and make your changes under the Login section.

3. Optionally, choose a custom login page for your community. Select the page type (**Community Builder** or **Visualforce**), enter the name of the page in the search field, and click . In the search results window, click the name of the page to select it.

 **Tip:** To revert to the default login page for your community's template, select **Default Page**.

4. Optionally, select `Allow internal users to log in directly to the community`. This setting allows your internal users to use their internal username and password on the community login page.

Internal users must be members of the community to log in directly from the community login page. After your internal users log in, they land on the community home page.

5. Select which login options you want to display.

By default, users log in to the community using the default community username and password. If you want to allow them to log in with other credentials, such as their Facebook®, Janrain®, or Salesforce credentials from another organization, select those from the list.

 **Important:** Configure these [authentication provider options](#) in advance to be able to use them for community logins. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.

6. Optionally, allow external users to log in with their SAML single-sign on identity.

This option is available only if your organization has successfully [set up SAML for your community](#) on page 3442 including:

- SAML settings for single sign-on, which enables login to Salesforce using your corporate identity provider. Note that you must enter an Identity Provider Login URL.
- A custom domain name, which changes the application URLs for all your pages, including login pages. Contact Support if you want to enable My Domain.

EDITIONS

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

To offer multiple SAML single sign-on options, enter *Single Sign-On Settings* in the **Quick Find** box, select **Single Sign-On Settings**, and then click **Enable Multiple Configs**. If you already had SAML enabled, and you then enable multiple SAML configurations, your existing SAML configuration is automatically converted to work with multiple configurations.

Users see the option to **Log In with Single Sign-On**. If you have enabled multiple SAML single sign-on options, each login button displays labeled with the SAML configuration's `Name` field.

7. Click **Save**.

 **Note:** Renaming or deleting the default login page can cause problems with the default community login flow.

SEE ALSO:

[Customize Login, Self-Registration, and Password Management for Your Community](#)

Customize the Login Process with Apex

You can provide community members outside your company with a completely custom login page that reflects your organization's style and branding. Use Visualforce and Apex to either customize the `CommunitiesLogin` page and `CommunitiesLoginController`, or create your own Visualforce page.

To redirect from the default community login page to your custom login page:

1. From Setup, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**.
2. Click **Edit** next to `CommunitiesLoginController`.
3. Add the following code:

```
global PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');

    return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' +
        EncodingUtil.urlEncode(startURL, 'UTF-8'));
}
```

4. If you created a completely custom login page, replace `SiteLogin` with the name of your Visualforce page.
5. Click **Save**.
6. Click **Edit** next to `CommunitiesLandingController`.
7. Add the following code:

```
public PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');

    return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' +
        EncodingUtil.urlEncode(startURL, 'UTF-8'));
}
```

8. If you created a completely custom login page, replace `SiteLogin` with the name of your Visualforce page.
9. Click **Save**.
10. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.

USER PERMISSIONS

To create and edit Visualforce pages:

- "Customize Application"

To edit Apex classes:

- "Author Apex"

AND

"Customize Application"

11. Click **Edit** next to `CommunitiesLogin`.

12. In the first line of code, add the following:

```
action="{!forwardToCustomAuthPage}"
```

13. Click **Save**.

14. Click **Edit** next to `CommunitiesLanding`.

15. In the first line of code, add the following:

```
action="{!forwardToCustomAuthPage}"
```

16. Click **Save**.

Redirect Community Members to a Custom URL on Logout

Specify the URL that community members should be redirected to when they log out from your community.

When community members log out, they are taken to the community login page by default. You can choose to point them to a different location, such as your company web site for example.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **AdministrationLogin & Registration**.
3. In the Logout section, enter the URL you want to redirect community members to.
4. Click **Save**.

Use Custom Change Password and Forgot Password Pages in Your Community

Use a custom Community Builder or Visualforce page instead of the default Change Password and Forgot Password pages.

The Forgot Password page can be customized in Community Builder or Visualforce. If you want to use a custom Community Builder Forgot Password page, first publish your page in Community Builder.

The Change Password page can only be customized in Visualforce.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration Login & Registration**.
3. In the password section, select the Page Type: **Community Builder** or **Visualforce**.
4. Enter the name of the page or leave the field blank to search for all available pages.
5. Click , then click the name of the page in the search results to select it.
6. Click **Save**.

To revert to the default login page for your community's template, select **Default Page** as the page type.

SEE ALSO:

[Customize Login, Self-Registration, and Password Management for Your Community](#)

Set Up Self-Registration for Your Community

Enable self-registration to allow unlicensed guest users to join your community. You can choose to save them as contacts under a business account or create a person account for each self-registering user.

When you enable self-registration, these Visualforce pages and Apex controllers are associated with your community.

- `CommunitiesSelfReg` page and `CommunitiesSelfRegController`—Provide the form for partners or customers so they can register with your community. You can [modify the `CommunitiesSelfRegController` Apex controller](#) to change the default self-registration process, but it is no longer required starting with the Spring '15 release.

Note: Apex customizations for the self-registration process take precedence over the defaults specified in Community Workspaces or Community Management. In organizations created prior to the Spring '15 release, existing Apex customizations for self-registration remain in effect as before.

- `CommunitiesSelfRegConfirm` page and `CommunitiesSelfRegConfirmController`—If a user doesn't create a password during self-registration—either because they left the password field blank or your organization customized the self-registration form to omit the password field—this page confirms that a password reset email has been sent. Users landing on this page can't log in until they reset their password.

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

The default self-registration pages and controllers are shared by all of your organization's communities. If you enable self-registration for multiple communities, you must further customize the self-registration experience to direct users to different pages, assign different profiles or permission sets for different communities, and so on.

 **Note:** Renaming or deleting the default self-registration page can cause problems with the default self-registration flow.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Login & Registration**.
3. In the Registration section, select **Allow external users to self-register**.
4. Optionally, choose a custom self-registration page for your community. Select the page type (**Community Builder** or **Visualforce**), enter the name of the page in the search field, and click . In the search results window, click the name of the page to select it. To revert to the default self-registration page (`CommunitiesSelfReg`), select **Default Page**.
Community Builder pages must be published to be included in the page lookup search results. Remember to modify the self-registration `CommunitiesSelfRegController` and `CommunitiesSelfRegConfirmController` Apex controllers if you use a custom page.
5. Select the default **Profile** to assign to self-registering users.

 **Note:** You can only select portal profiles that are associated with the community. If a profile is selected as the default for users who self-register, and you remove it from the community, the self-registration `Profile` is automatically reset to `None`.

6. Select the business **Account** that you want to assign self-registering users to.

The self-registering user is assigned as a contact of the account you specify. To [create a person account \(if enabled\) for each self-registering user](#), leave this field blank.

Ensure that the account you use is enabled as a partner. To do so, go to the account, click **Manage External Account**, then click **Enable as Partner**.

7. Click **Save**.

After you set up self-registration, a **Not a member?** link directs external users to the self-registration page from the login page. When a user self-registers to join your community:

- Salesforce creates a new user record with the information they provide on the self-registration page.
- The user is assigned the profile you specified when you set up self-registration.
- The user is associated with a business account or a person account, depending on how you set it up.
- Customer Community Plus and Partner Community licenses require user records to be associated with a role in your organization. If you don't specify a role in the default self-registration profile, Salesforce assigns them the `WORKER` role.

 **Note:** Keep in mind that each time a user self-registers, they consume one of your Communities licenses. When setting up your self-registration page, be sure to add some criteria to ensure that the right people are signing up. Additionally, to prevent unauthorized form submissions, we recommend using a security mechanism, such as CAPTCHA or a hidden field, on your self-registration page.

SEE ALSO:

- [Customize Login, Self-Registration, and Password Management for Your Community](#)
- [Customize the Community Self-Registration Process with Apex](#)
- [Create Person Accounts for Self-Registering Users](#)

Create Person Accounts for Self-Registering Users

If your business deals mostly with individuals, instead of creating them as contacts under a single business account, you can assign each self-registering user to a person account.

Important: You must have Person Accounts enabled in your organization. Only Customer Community and Customer Community Plus licenses support the creation of person accounts.

In Community Workspaces or Community Management, under **Administration > Login & Registration**, enable self-registration and leave the **Account** field blank. Specify a default profile to assign self-registering users to.

Salesforce creates separate person accounts for each self-registering user. Each user is assigned the default profile you specified while setting up self-registration, and a default role. If you don't specify a role, either on the profile or via the self-registration Apex controller, Salesforce assigns the `Worker` role to the self-registering users. You can further customize this functionality by using the [self-registration Apex controller](#) (`CommunitiesSelfRegController`), but it's not required.

You can also manually create person accounts and assign them to community users with Customer Community and Customer Community Plus licenses.

SEE ALSO:

[What Is a Person Account?](#)

[Enable Person Accounts](#)

Customize the Community Self-Registration Process with Apex

Update the `CommunitiesSelfRegController` to customize the default self-registration process for your community. You can use the same controller for the default self-registration page (`CommunitiesSelfReg`) or a custom Visualforce or Community Builder self-registration page.

You can configure self-registration entirely in Community Workspaces or Community Management. This customization is recommended only if you want to modify the self-registration behavior beyond the defaults, if you have more than one community in your organization, or if you are using a custom self-registration page.

Note: You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Click **Edit** next to `CommunitiesSelfRegController`.
3. Optionally, enter a value for `ProfileId` to define the type of profile the user should be assigned.

If you selected a default profile while setting up self-registration, the value in the Apex code will override that default.

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

 **Note:** Note that regardless of which role you enter for the `roleEnum`, the role for new users will default to `None`. Once a user self-registers, you can update their role on the user detail page.

4. Enter the account ID for the partner or customer account that users who self register should be associated with.
If you selected a default account while setting up self-registration, the value in the Apex code will override that default.
Ensure that the account you use is enabled as a partner. To do so, go to the account, click **Manage External Account**, then click **Enable as Partner**.
5. If you're enabling self-registration for multiple communities, add code to create appropriate types of users for each community, that is, assigning the correct profile, role, and account ID per community.
6. Click **Save**.
7. Enable access to accounts and contacts for the guest profile. The guest profile is automatically associated with your community's Force.com site.
 - a. From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click **Community Workspaces** or **Manage** next to a community.
 - b. Click **Administration > Pages** and then click **Go to Force.com**.
 - c. Click **Public Access Settings**.
 - d. Click **Edit**.
 - e. In the Standard Object Permissions section, select Read and Create next to Accounts and Contacts.
 - f. Click **Save**.
 - g. In the Enabled Apex Class Access related list, click **Edit**.
 - h. Add the `CommunitiesSelfRegController` and click **Save**.
 - i. In the Enabled Visualforce Page Access related list, click **Edit**.
 - j. Add the `CommunitiesSelfReg` and click **Save**.
8. Optionally, if you want to customize the contents of the default self-registration page, edit the `CommunitiesSelfReg` page.
 - a. From Setup, enter *Visualforce Pages* in the Quick Find box, then select **Visualforce Pages**.
 - b. Click **Edit** next to `CommunitiesSelfReg`.
 - c. Add code to customize the fields required for self-registration or the page's look and feel.
In the default form, all fields except `Password` are required.
 - d. Click **Save**.

Once setup is complete, external users who submit the completed self-registration form (including a password) are logged in to the community.

 **Note:** If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user.

If you're using a custom Visualforce self-registration page instead of the default `CommunitiesSelfReg` page, add the following code to `CommunitiesSelfRegController`. Replace `CommunitiesCustomSelfRegPage` with the name of the custom self-registration page. Then add this to the first line of code in the `CommunitiesSelfReg` page.

Enable Other Salesforce Features in Communities

Salesforce Communities offers a platform to expose a ton of Salesforce features and functionality to community members. For example, enable Salesforce Knowledge so customers can view knowledge articles in your community. Enable case feeds to facilitate discussions over customer cases. Or, let partners view Wave Analytics dashboards in your community. There's also Chatter Questions, direct messages, Question-to-Case, and field service data. It's all fair game!

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Enable Cases for Communities Users

Enable cases for external users so that they have access to and can create cases in your communities.

When you enable cases for external users in your community, you can assign cases to those members. Additionally, external members can edit cases, create new cases, add case comments, reassign cases, find case solutions, and create case teams.

 **Note:** Case comments added by external users in communities are public and can be viewed by any user that can view the case. Also, external users can't edit case comments, associate assets with cases, delete cases, or update the case status.

1. Add the Cases tab to the list of available tabs in your community.
2. Set tab visibility and "Read," "Create," and "Edit" object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.
 - a. If using a profile, such as the Partner Community profile, set the cases tab setting to `Default On` and enable the "Read," "Create," and "Edit" object permissions for cases.
 - b. If using a permission set, create a permission set with the following settings for cases:
 - In the Tab Settings, select Available and Visible.
 - In the Object Settings, select "Read," "Create," and "Edit".

If case comment notification to contacts is enabled, emails sent to external users include a link to the community. Emails sent to contacts for case creation and update notifications also include a link to the community.

USER PERMISSIONS

To enable cases for Communities users:

- "Manage Profiles and Permission Sets"

Community Case Feed

With the community case feed, agents and community members see the life cycle of a case from start to finish. All case interactions appear in a unified, chronological Chatter case feed. Community members benefit from the added functionalities of Chatter, while support-side features help agents provide efficient, personalized support.

The community case feed gives community users an intuitive environment where they can manage their cases. Internal and external users see the following interactions in the community case feed:

- Chatter text, file, and link posts
- Questions in Chatter that are associated with the case
- Case emails

Note: To learn more about case email visibility, see [Emails in the Community Case Feed](#).

- Read-only social posts on cases if your Salesforce administrator enables them

x

Community case feed in a community built on the Customer Service (Napili) template:

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Using the publisher **(1)**, users create posts and attach files to the case. The feed **(2)** comes fully equipped with Chatter’s collaboration tools: users can bookmark, like, and comment on posts, and mention other users. Images and comments appear inline, making it easy to scan the feed for details. The Attachments component **(3)** displays all case attachments.

When the community case feed is enabled, support agents can:

- Use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases
- Expose or hide a published post or email in the community case feed of external users

The community case feed is available in all communities that use the self-service community templates or Salesforce Tabs + Visualforce.

Known Issues

- In communities built on templates, emails in the community case feed don’t display inline images or clickable links.

- In communities built on the Koa or Kokua community templates, users' names in the community case feed look like links but don't lead anywhere.

SEE ALSO:

[Community Case Feed Considerations](#)

[Set Up the Community Case Feed](#)

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

Set Up the Community Case Feed

The community case feed lets community users and support agents see all case interactions in a unified feed. Also, agents can take more actions directly from the console. To set up the community case feed, enable it in your organization and make sure that the case page in your community is properly configured.

Important: Before setting up the community case feed, read [Community Case Feed Considerations](#).

1. Enable the community case feed:
 - a. From Setup, enter *Support Settings* in the Quick Find box, then select **Support Settings**.
 - b. Select **Enable Community Case Feed**.
 - c. Optionally, select **Enable Email Notifications for Case Posts** (recommended).
 - d. Click **Save**.
2. If your community was built using Salesforce Tabs + Visualforce, make sure that your case page includes a Chatter feed.
3. If your community uses the Koa, Kokua, or Customer Service (Napili) template, confirm that your active case detail page supports the community case feed:
 - a. In Community Builder, click .
 - b. Click **Page Management**.
 - c. Find Case Detail in the Name column, and make sure that the active page assigned to it is either Chatter Case Detail (the default) or Record Detail.

If you change the active case detail page, publish your change.

Important: If the community case feed is enabled and you use Basic Case Detail as your active case detail page, external users only see case comments—not Chatter posts or emails—in their case feed. This gives external users far less visibility into their cases. To give users a full view of their case interactions, use Chatter Case Detail or Record Detail as your active case detail page.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable the community case feed:

- "Customize Application"
- Compact case feed enabled in your organization

Community Case Feed Considerations

Before setting up the community case feed, review this essential information.

If the community case feed is enabled:

- Agents can use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases.
- Agents can expose or hide published Chatter posts and emails in the case feed of external community users.
- External community users with access to a case see associated Chatter posts, questions, and emails in their case feed.

If email notifications for case posts are enabled:

- When someone makes an externally visible post on a case, all case contacts are notified by email. They can comment on the post by replying to the email.
- If you're already using custom email notification settings, such as those triggered by workflows, selecting this preference can create duplicate email notifications.
- In communities built on the Customer Service (Napili) template or Salesforce Tabs + Visualforce, you can turn off these notifications. In your email notification settings, deselect **Posts on one of my cases** under "Email me when someone...".

SEE ALSO:

[Emails in the Community Case Feed](#)

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

[Set Up the Community Case Feed](#)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Emails in the Community Case Feed

When you enable the community case feed, external users with access to a case see case emails in their feed. Emails in the community case feed include the email's author, recipients, text, and time sent.

By default, if the case contact sends or receives a case email, that email appears in the feed of all users—both internal and external—with access to the case. For an external user to view the case, their profile must include access to cases in the community.

For example, suppose Rita, an external user, posts a question in a community. The question remains unresolved, and a community moderator creates a case from it using the Question-to-Case action. If the support agent assigned to the case emails Rita from the email publisher, Rita and all other users with access to the case see the email in their case feed. Users with access to a case typically include the assigned support agent and the case contact.

If the community case feed is enabled, you can write an Apex trigger or process to hide or expose all case emails in the feeds of external community users. The `IsExternallyVisible` field of the `EmailMessage` object controls the visibility of email messages in the community case feed. When the field is set to `true` emails sent or received by the case contact are visible to external users with access to the case.

 **Example:** The following trigger exposes all case emails in the feeds of external users with access to the case. This means that case emails between internal users will also be visible to external users with access to the case (for example, if the assigned support agent used the email publisher to email their shipping vendor). To *hide* all case emails from external users' case feeds, simply change `true` to `false`:

```
trigger makepublic on EmailMessage (before Insert) {
    for (EmailMessage oe:trigger.new) {
        oe.IsExternallyVisible=true;
    }
}
```

```
}
}
```

SEE ALSO:

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

Expose or Hide a Published Post or Email in the Community Case Feed

When necessary, support agents can expose or hide individual case emails and published Chatter posts in the case feed of community users.

To change the external visibility of a published Chatter post or email on a case:

1. Navigate to the post or email in the compact case feed.
2. In the post or email's drop-down menu:
 - Select **Make Public** to expose an internal Chatter post or email in the case feed of external users with access to the case
 - Select **Make Private** to remove a Chatter post or email from the case feed of external users with access to the case

Make Public option on a case Chatter post:

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit the external visibility of a published Chatter post or email on a case:

- "Edit My Own Posts"
- "Edit Posts on Records I Own"
- Compact case feed enabled in your organization
- Community case feed enabled in your organization

Make Public option on a case email:

The agent who owns the case and their superiors see the **Make Public** and **Make Private** options on all case emails and Chatter posts on the case. Internal users who don't own the case also see these options on case posts or emails that they authored.

Making Emails and Chatter Posts *Private*

Clicking **Make Private** on a case Chatter post or email means that the case contact and any other external users with access to the case no longer see the post or email in their case feed. (It still appears in the feeds of internal users with access to the case.) An agent might choose to make an email or post in the community case feed private if they want to hide their correspondence with the case contact from the case feed of other external users with access to the case.

 **Note:** Keep in mind that when you make an email private, the email recipient(s) already received the email. Similarly, when you make a Chatter post private, remember that external users with access to the case may have been notified by email when it was first posted.

Making Emails and Chatter Posts *Public*

Clicking **Make Public** on a case Chatter post or email means that the case contact and any other external users with access to the case now see the post or email in their case feed. An agent might choose to make an email or post in the community case feed public in order to keep the case contact updated about internal progress on the case.

 **Note:**

- The case feed offers handy visual cues to help agents quickly identify which case posts are externally visible. To learn about enabling these visual cues, see “Feed View Options” in [Settings for Feed Views in Case Feed](#).
- You can write an Apex trigger or process to hide or expose all case emails from the community case feed of external users. For more information, see [Emails in the Community Case Feed](#).

SEE ALSO:

[Community Case Feed](#)

Post on Cases and Community Questions with the Community Action in the Case Feed

The Community action in the case feed is your default option for responding to customers on cases that originated from a community or customer portal.

To post on cases in a customer portal or community:

1. Click **Answer Customer** on the Case Feed page.
2. Click and select **Community**.
Depending on how your administrator has set up Case Feed, you may be able to click **Community** without first having to click **Answer Customer**.
3. Enter the message to the customer.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create case posts in customer portals or communities:

- "Edit" on cases

4. If you're working on a case that was escalated from a question in Chatter Questions or Chatter Answers, choose who you want your post to be visible to:
 - Select **Customer Only** to post your answer as a private reply, or **Everyone** to post it as a public reply.
 - Select **Customer Case** to make a post visible to all internal and external users with access to the case, or **Community Question** to post a public answer on the community user's question. If you select **Customer Case** and your Salesforce administrator has enabled the community case feed, you'll be creating a Chatter post instead of a case comment.

5. Optionally, select **Send Email** to send a message to the customer letting them know that a reply to their question has been posted to the case.

 **Note:** This option is only available if your administrator has enabled it, and if the customer you're replying to is associated with the case and has a valid email address. If your organization uses the community case feed and email notifications for Chatter case posts are enabled, users are automatically notified by email about public posts on their cases and this option doesn't appear.

6. Optionally, attach a Knowledge article to the post.
7. Click the button to publish your post.

 **Note:** If the community case feed is enabled in your organization, you can change the visibility of case posts after they are published. For details, see [Expose or Hide a Published Post or Email in the Community Case Feed](#).

SEE ALSO:

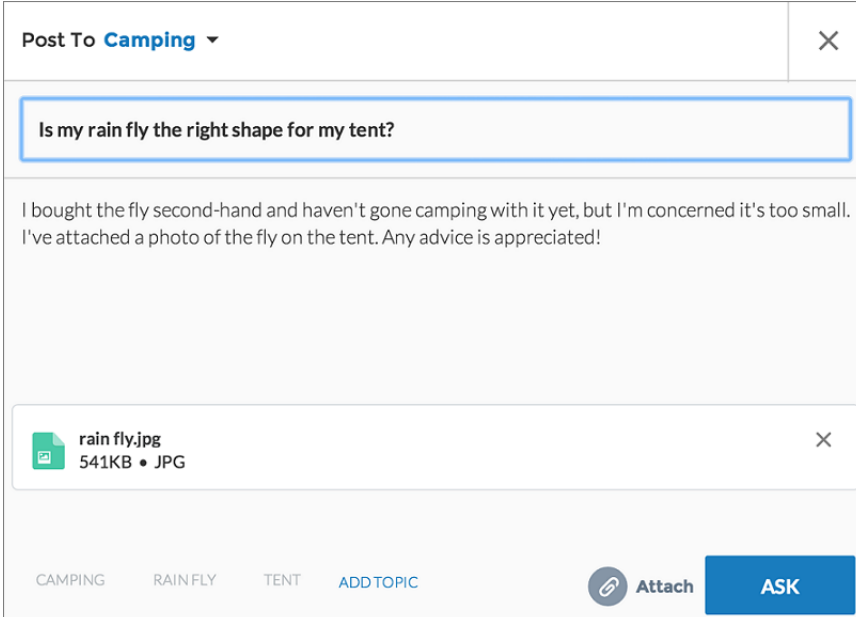

[Send and Reply to Email from Case Feed](#)
[Case Feed Overview](#)
[Community Case Feed](#)

Enable Chatter Questions in Your Community

Chatter Questions helps you promote community engagement by giving users the ability to ask and answer questions in their Chatter feed, in groups, and in records. Members in your users' groups and communities can answer questions in Chatter just as they would comment on a Chatter post. Users in communities built on the Customer Service (Napili) template can also attach files to questions.

To set up Chatter Questions in your community, simply add the Question action to the global publisher layout. In organizations created after Summer '14, the Question action is automatically added, but we recommend dragging it to the far left to increase its visibility.

 **Note:** Chatter Questions is not available in communities built on the Koa and Kokua community templates.

1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select **Publisher Layouts**.
2. Click **Edit** next to the global publisher layout.
3. Drag the Question action from the palette to the global publisher layout. If the Question action already appears in the layout, drag it to the location where you want it.

EDITIONS

Available in: Salesforce Classic

Chatter Questions is available in: **Group, Professional, Developer, Performance, Enterprise, and Unlimited** Editions.

USER PERMISSIONS

To edit the global publisher layout:

- "Customize Application"

4. Click **Save**.

-  **Note:** If you're using a customized publisher layout in groups or on records, make sure that the Question action is added to those layouts as well.

SEE ALSO:

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

Enable Direct Messages in Your Community

Allow community members to send direct messages to start a private conversation with one or more members. Direct messages are supported in all communities based on the Customer Service (Napili) template and in Lightning Bolt solutions, such as the Lightning Partner Management solution.

-  **Note:** Review the [the limitations](#) that apply before you enable direct messages for your community.

Direct messages offer privacy for more sensitive conversations. Imagine a scenario where a customer brings up an issue they have with a product in the community feed. A support rep can share that post and address the customer's concerns privately in a direct message. Similarly, a channel manager can discuss sensitive sales data with one or more partner users in a partner community.

-  **Note:** Private messages and direct messages are separate features. Direct messages are newer and offer a richer feature set for private communication in communities. Direct messages are based on Chatter and offer a rich text editor that supports inline images and attachments. With direct messages, you can start a message right from a feed post.

1. Make sure that Chatter is enabled in your org.
2. Open [Community Workspaces](#) or [Community Management](#).
3. Under Administration, click **Preferences**.
4. Select **Enable direct messages** and save your changes.
5. In Community Builder, click the **Profile Header** component on the community Home page and select **Include My Messages**. This displays the My Messages link in the user profile dropdown menu.
6. Optionally, add other components to your community pages to facilitate easy access to direct messages.
 - Add the **Messages** page to your community's navigation menu for prominent placement and easy access.
 - Add the **New Message Button** component to any page you want to allow community members to create messages from.
 - Add the **Message Notification** component to the community home page.
7. Publish your community.

After enablement, community members can start a direct message conversation:

- From the Messages page.
- From user profiles and from hovers on users names.
- From the Message Notification and the New Message Button components on community pages.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable direct messages:

- "Access Community Management" OR "Manage Communities" OR "Create and Set Up Communities"

AND

Is a member of the community

To make all posts available to moderation, including direct messages, in Communities Settings under Community Moderation Rule Settings:

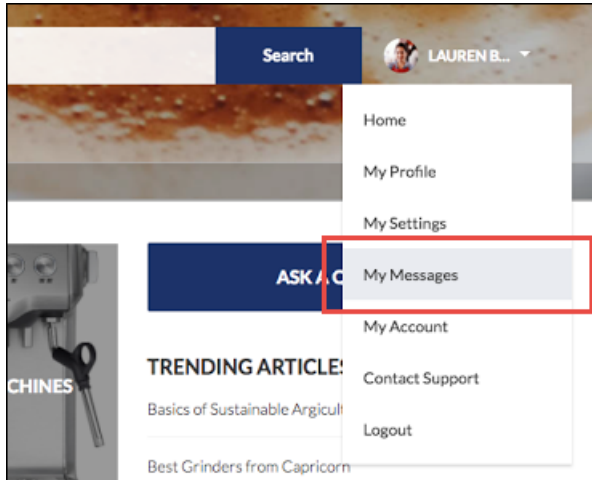

- Moderation applies to all feed posts regardless of where they are visible

To enable Chatter:

- "Customize Application"

- By sharing a feed post as a direct message.

Members can also flag messages that are spam or inappropriate. They can also opt to receive email notifications when someone sends them a direct message or responds to a conversation they're a part of. Community members can access their direct message conversations by clicking **My Messages** in their user profile dropdown menu.

Here's what the messages list view looks like:

The screenshot displays the Capricorn Cafe community interface. At the top, there is a search bar with the text "Search the community" and a "Search" button. The user profile "LAUREN B..." is visible in the top right corner. Below the search bar, there are navigation links for "TOPICS", "PRODUCTS", "GROUPS", and "SUPPORT".

The main content area is divided into two columns. The left column, titled "Messages", contains a list of messages with the following details:

Sender	Subject	Date
EricW	Need new grinder	Jan 18, 2017
EricW	Hi Eric - Could use your help!	Jan 18, 2017
Donatelle, Romain Ayot	Pour Over Coffee	Jan 18, 2017
Donatelle, east, eric...	Local Meetup	Jan 18, 2017
A Schreiner	Re: My Robusta Coffee Espr...	Jan 18, 2017
EricW	Grinder Recall	Jan 18, 2017
EricW		Oct 2, 2016

The right column, titled "Pour Over Coffee" by Donatelle and Romain Ayot, shows a message from Lauren Boyle (Customer) dated December 16, 2016 at 3:39 PM, with the text "Isn't it just the best!". Below the message is an image of a pour-over coffee maker. A "Write a reply ..." text box is located at the bottom of the message content area. A "Remove Flag" button is visible in the top right corner of the message content area.

At the bottom of the page, there is a copyright notice: "© 2014 Capricorn Coffee. All Rights Reserved." and links for "Terms of Use" and "Privacy".

[Manage Your Community Email Notifications](#)

[Implementation Guide: Using Templates to Build Communities](#)

Direct Message Limitations

Before you enable direct messages for your community, review these considerations.

- Direct messages require Chatter to be enabled in your org.
- Direct messages can only be enabled in communities built using the Customer Service (Napili) template and in Lightning Bolt solutions.
- Users with the “View All Data” and “Modify All Data” permissions can’t access direct message data unless they are participants in the conversation.
- Only users with the “Manage Chatter Messages and Direct Messages” permission can view all the direct messages data in your org.
- To moderate flagged direct messages, the moderator needs “Manage Chatter Messages and Direct Messages” permission and the “Moderate Communities Chatter Messages” permission.
- Community search doesn’t show direct message in the search results to maintain privacy.
- When community members flag a direct message, the entire conversation is flagged. Individual messages can’t be flagged.
- If you have private messages enabled in your community, they remain available. However, direct messages are better integrated with Lightning technology and we recommend that you switch to direct messages.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

For Developers

Direct messages are supported in the Chatter REST API. Under the hood, direct messages are a special implementation of feed posts and comments parented to a direct message entity. If you use the Chatter REST API to create a custom implementation of direct messages, a few things to keep in mind:

- The first message is stored as a feed post and the responses are stored as comments.
- Unlike other objects, direct messages can’t have multiple feed posts associated with a single direct message conversation.
- You can’t follow, like, share, mention people in, mute, and bookmark feed items associated with direct messages. You also can’t associate topics with direct message feed items.
- Feeds associated with direct messages aren’t accessible via search, public feeds, or streams.
- Email notifications for direct messages aren’t supported for custom implementations built for the internal Salesforce org.
- In the community UI, direct messages display only to the participants in the conversation. However, Apex code runs in system mode, which means that the permissions of the current user aren’t taken into account. This limitation has implications for pages that use Apex and Visualforce.
 - Review your Visualforce pages to ensure that direct message data isn’t exposed.
 - Review your AppExchange apps that are written in Apex to ensure that direct message data isn’t exposed.
 - Visualforce and Apex developers in your organization might be able to access direct message data.

Use permission sets, profile-level permissions, and sharing checks in your code to limit user access.

Enable Chatter Answers in Your Community

Chatter Answers is a self-service support community where users can post questions and receive answers and comments from other users or your support agents.

To set up Chatter Answers in Salesforce Communities, follow these high-level steps:

1. Enable Chatter Answers.
 - a. From Setup, enter *Chatter Answers Settings* in the **Quick Find** box, then select **Chatter Answers Settings**.
 - b. Select **Enable Chatter Answers**.
2. Ensure that your community members have access to the following objects within your organization:
 - Questions
 - Knowledge Articles
 - Data Categories
3. Create a zone for Chatter Answers.
 - a. Enable the zone for Chatter Answers.
 - b. Set the **Visible In** setting to the community that you want the zone shown in.
 - c. As a best practice, select a public group from your organization to designate as a Customer Support Agents Group.
4. Add the Q&A tab to your community.
 - a. From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities** and click **Community Workspaces** or **Manage** next to a community.
 - b. Click **Administration > Tabs**.
 - c. Add the Q&A tab to the Selected Tabs list.
 - d. Click **Save**.
 - e. Click **Close**.
5. Make the Q&A tab visible on profiles that need access to it.
 - a. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
 - b. Click **Edit** for the profile that you want to make the Q&A tab visible for.
 - c. Under Standard Tab Settings, set the Q&A tab to Default On.
 - d. Click **Save**.

After you have enabled Chatter Answers in your community, consider the following extra deployment options:

- A public-facing Force.com site with or without a portal.
- A Visualforce tab, which provides branding, a customized landing page, and custom access to Chatter Answers within your community.

If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user. Set permissions for Chatter Answers on the community user.

Set Up Question-to-Case

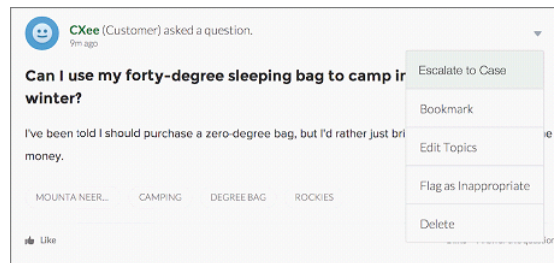

Add Question-to-Case to your communities, your Salesforce organization, or both.

Question-to-Case lets moderators create cases from unresolved questions in Chatter, which makes it easier to track and resolve your customers' issues. Moderators can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Question-to-Case is only available in communities where Chatter Questions is enabled.

1. [Enable Question-to-Case](#)

Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers' questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

2. [Add the Question from Chatter Field to the Case Detail View](#)

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

3. [Add the Escalate to Case Action to the Feed Item Layout](#)

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

4. [Confirm Access to the Escalate to Case Action](#)

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

5. [Customize the Escalate to Case Action Layout](#)

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

6. [Automatically Assign Cases from Questions to a Queue](#)

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. You can write a workflow rule or process that automatically adds cases that were created from questions to a queue so agents can claim them.

7. [Automatically Create Cases from Unresolved Questions in Chatter](#)

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

USER PERMISSIONS

To enable Question-to-Case:

- "Customize Application"

Add the `Question from Chatter` Field to the Case Detail View

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

First, use field-level security to specify which users can see the `Question from Chatter` field on case detail pages.

1. From the object management settings for cases, go to Fields.
2. Click **Question from Chatter**.
3. Click **Set Field-Level Security**.
4. Select **Visible** for any profile that you want to be able to use Question-to-Case.
5. Click **Save**.

After you make the field visible to users, you can choose to add it to the Case Details view.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to the page layout that you want to customize.
3. Drag the `Question from Chatter` field from the Fields section of the page layout editor palette to the Case Information section of the page.
4. Click **Save**.
5. Click **Page Layout Assignment** to confirm that the user profiles which need Question-to-Case are assigned to the page layout that you customized. In addition, assign internal users who need access to the `Question from Chatter` field on cases to that page layout.

Confirm Access to the Escalate to Case Action

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

First, check which record type is assigned to the profiles that need access to the Escalate to Case action.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the name of a profile.
3. In the Record Type Settings section, make a note of which case record types the profile uses.
4. In the Permissions section, make sure that the user profile has either the **Moderate Chatter** or **Moderate Communities Feeds** permission enabled.

Then, check which record type the Escalate to Case action uses, and change it if necessary.

1. From Setup, enter *Actions* in the **Quick Find** box, then select **Feed Item Actions**.
2. Click **Edit** next to the Escalate to Case action.
3. Confirm that the **Record Type** field shows a record type that's assigned to the profiles that need access to this action. If it doesn't, select an appropriate record type from the drop-down list.
4. Click **Save**.

SEE ALSO:

[Customize the Escalate to Case Action Layout](#)

Customize the Escalate to Case Action Layout

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

1. From Setup, enter *Actions* in the **Quick Find** box, then select **Feed Item Actions**.
2. Click **Layout** next to the Escalate to Case action.
3. Drag any fields you want to add to the action from the action layout editor palette, and reposition them if necessary.
4. Click **Save**.

 **Note:** In public communities, you can't look up a contact when the case is submitted, so we recommend that you remove the **Contact** field from the Case Action layout.

Automatically Assign Cases from Questions to a Queue

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. You can write a workflow rule or process that automatically adds cases that were created from questions to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue when the `Type` field on the case equals `QUESTION`. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions depends on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see [Create Queues](#).

SEE ALSO:

[Automatically Create Cases from Unresolved Questions in Chatter](#)

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

 **Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that's you? See [Differences Between Q&A Features in Salesforce](#) on page 3255.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than 10 likes, and a best answer hasn't been selected.
- Create a case from a question immediately if the question contains the word "competitor."

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- `BestCommentId`: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- `CommentCount`: The number of comments on a question.
- `LikeCount`: The number of likes on a question.

Tip:

- Each flow variable's data type must match the feed item field's data type. `CommentCount` and `LikeCount` are number fields, while `BestCommentId` is a text field.

EDITIONS

Available in: Salesforce Classic

Question-to-Case is available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Question-to-Case is available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The Lightning Process Builder is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- The creation of a feed item can trigger a process, but updates to feed items (such as likes and comments) cannot. Depending on your process, you might need to specify how much time must pass before a related flow runs.

Let Guest Users Create Cases

When you set up Web-to-Case along with a case quick action, guest users can create a case without having to log in.

To let guest users create cases, first create a case page layout for unauthenticated users. This allows you to capture and create basic information that would already be associated with a registered user.

Tip: Assign case field-level security and guest user actions appropriately so guest users have access to what they need but can't see your company private information.

Note: Guest users can't attach files when creating a case.

1. From Setup, enter *Web-to-Case* in the **Quick Find** box, then select **Web-to-Case**.
2. Select **Enable Web-to-Case**.
3. To ensure that guest users can log cases through contact support, from Setup, enter *Communities* in the **Quick Find** box, then select **All Communities**.
4. Select **Builder** next to the community you want your guest users to log cases via contact support.
5. Click the drop-down arrow next to your community name and select **Community Management**.
6. On the left-hand panel, click **Administration**.
7. Click **Pages**.
8. Click **Go to Force.com**.
9. On the Sites Detail page, click **Edit**.
10. Enable **Guest Access to the Support API**.
11. Add **NewCase**, or a custom quick action to add cases, to the Selected Quick Actions.
12. Click **Save**.

Note: When using a self-service template, it's unnecessary to set up the other options on the Web-to-Case Settings page.

Enable Salesforce Knowledge in Your Community

Enable Salesforce Knowledge to let community users view Knowledge articles.

You can use Communities to access your knowledge base articles if your Salesforce org has a Salesforce Knowledge license. Once Salesforce Knowledge is enabled, complete the following steps to view articles in your communities.

1. Update profiles:
 - Clone the Customer Community User, Customer Community Plus User, or Partner Community User profiles and enable the “Read” permission for article types you want to share with community users.
 - Verify that the tab visibility for the Articles (or Knowledge) tab is Default On.
 - Remember to click **Edit Profiles**, at the bottom of the detail page, and activate the new profile.
2. Add the Knowledge tab to each community.
 -  **Note:** Community members without the Knowledge One permission cannot access Knowledge through Communities. They also can't access Knowledge in communities via the Salesforce1 mobile browser and downloadable apps.
3. If you want your community users to have different category group visibility settings, change the visibility settings by permission set, profile, or role. For example, you can prohibit users with the Customer Community User profile from seeing articles in a certain category group by changing the data category visibility for that profile.
4. Notify users who create articles that they must select **Customer** for users with Customer Community or Customer Community Plus licenses, or **Partner** for users with Partner Community licenses, as a channel option when creating or modifying an article. If the appropriate channel is not selected, the article is not published in the community.

 **Note:** Lightning Knowledge isn't available in communities.

Available in: Salesforce Classic

Communities is available in: **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** Edition.

USER PERMISSIONS

To create, customize, or activate a community:

- “Create and Set Up Communities”

AND is a member of the community they're trying to update

To set up Salesforce Knowledge, create article types and article actions, and modify category groups assignments:

- “Customize Application”
- AND
- “Manage Salesforce Knowledge”

To assign user licenses:

- “Manage Internal Users”

To create data categories:

- “Manage Data Categories”

Enable Ideas in Your Community

Ideas enable a group of users to post, vote for, and comment on ideas. Enabling Ideas in a community provides an online, transparent way for you to attract, manage, and showcase innovation.

To manage organization-wide settings for Ideas, follow these high-level steps:

1. From Setup, enter *Ideas Settings* in the Quick Find box, then select **Ideas Settings**

- a.** To enable Ideas for your organization, select the **Enable Ideas** checkbox.
- b.** Optionally, select **Enable Text-Formatting**, **Images** and **Links** to enable the Ideas HTML editor, which gives users WYSIWYG HTML editing and image referencing capabilities when they post or comment on ideas.

Once you enable the HTML editor, you can't disable it.

- c.** Ensure that the multi-select **Categories** field is enabled by clicking the **Enable** button located below the Categories message at the top of the page. This button is not displayed if your organization already has the **Categories** field enabled.
- d.** To let Ideas members associate more than one category with an idea, select **Enable Categories**. Once you enable multi-select categories, you can't disable it.
- e.** To let users earn points and ratings based on their activity in each zone, select **Enable Reputations**.
- f.** In the **Half-Life (in Days)** field, enter the number of days.

The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life.

2. Define and customize fields for Ideas:

- a.** Define picklist values for the **Categories** and **Status** fields.

Make sure that you add the categories and statuses to the zones you'll be including in the community.

- b.** Set field-level security for standard and custom fields.
- c.** Create custom fields and set validation rules on them.

Custom fields appear in the Additional Information section on the Post Idea and Idea Detail pages.

- d.** Optionally, add the **Attachment** field to the layout and set field-level security to enable users to add files to their ideas.

- 3.** To enable experts within your zones, create a public group that includes these users.
- 4.** Optionally, enable Idea Themes in your organization.
- 5.** Create one or more zones to organize ideas into logical groups, and associate the zones with the community.
- 6.** Customize your Ideas page layouts to display the information you want to see.
- 7.** Create validation rules that prevent offensive language from being used in the zone
- 8.** Set up Apex triggers and validation rules for comments on ideas.
- 9.** Enable user profiles for community members and moderators and ensure the profiles can access Ideas.
- 10.** Add the Ideas tab and the Idea Themes tab to the community.

Set Up Approvals for External Users in Your Community

Customer and partner users in your community can be assigned as approvers on records or added directly to queues. They can see and take action through the My Approvals and Approval History related lists on the record. Approvals can also be triggered directly from the Chatter feed.

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

Note:

- Users with high-volume licenses, such as High Volume Customer Portal and Authenticated Website, can't approve records.
- External users with legacy portal licenses can approve records in communities, but not in portals.

When setting up approvals or queues, use the lookup fields to find customer and partner users.

For example, when setting up an approval, if you want to automatically assign a customer user as an approver use the lookup list to find and specify the user.

If you set up email notifications for your approval workflows, emails are sent based on community membership. If the user is a member of multiple active communities, the email comes from the oldest active community. Any links included in the email point users directly to the approval within the community.

In Salesforce1, users can see and take action from the Approval History related list, but they can't submit requests for approval. To submit requests for approvals, the user must do so from the full Salesforce site.

Enable Wave Analytics in Your Community

Enable Wave for Communities to allow your partner and customer users to view and explore Wave Analytics dashboards in your community.

 **Note:** Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

Complete the following steps to share Wave dashboards in your community.

1. Set up Wave Analytics in your Salesforce org, as described in the [Wave Platform Setup](#) section.
2. Enable Wave for Communities and set up community members. See [Enable Wave Analytics for Communities](#).
3. In Wave, create dashboards and save them in a Wave app. Designate that app for sharing with the community. For more information about working with Wave, refer to the [Wave Analytics Library](#).
4. Embed your Wave dashboards in Visualforce pages in your community. For more information, see [Add a Wave Analytics Dashboard to a Visualforce Page](#). If you embed a dashboard in a new Visualforce page, create a tab for the page and add the tab to your community.
5. From the Wave app containing your dashboards, give access to community members by selecting **Share**. In the Share dialog, select **Enable sharing with Communities**. Invite community partners and customers to share the app.

For information, see [Share Wave with Communities](#).

Track Field Service Data in Your Community

Keep customers and field service technicians in the loop about field service work in communities. The following field service objects can be used in communities: Service Appointment, Product, Work Order, and Work Order Line Item objects. These, in addition to previously available objects like Asset, Account, and Contact, allow customers to easily schedule appointments, while technicians can check on work orders straight from their community.

 **Note:** Field Service is available only in Visualforce and tab-based communities.

1. To set up field service objects in your community, create a new object page in Page Manager in Community Builder.
2. When prompted to choose a Salesforce object, choose a field service object (Service Appointment, Product, Work Order, and Work Order Line Item). Page Manager automatically creates three related pages for the new object page: a record detail page, a record list page, and a related list page.
3. To expose the field in your Customer Service (Napili) community, add it to the Navigation Menu in the Page Editor.

- Analytics Cloud - Wave Analytics Platform permission set license with “Manage Wave Analytics” permission

To view, explore, and share embedded Wave dashboards:

- Analytics Cloud - Wave Community Users permission set license with “View Wave Analytics on Communities Pages” permission

Community Security and Authentication

You can help keep your community more secure by authenticating users and encrypting some of the community's data.

[Authenticate Community Users](#)

You have several options for authenticating users in your community. By default, external users authenticate by logging in with the username and password that Salesforce assigns them for the community. (External users are users with Community, Customer Portal, or partner portal licenses.) Your organization's internal users just follow the employee login flow using their Salesforce username and password.

[Encrypt Community Data](#)

You can add a measure of security to your community by encrypting files, attachments, and many popular data fields.

Authenticate Community Users

You have several options for authenticating users in your community. By default, external users authenticate by logging in with the username and password that Salesforce assigns them for the community. (External users are users with Community, Customer Portal, or partner portal licenses.) Your organization's internal users just follow the employee login flow using their Salesforce username and password.

Note: All authentication options also work with custom HTTPS web addresses.

[Configure SAML for Communities](#)

If your organization uses an existing single sign-on capability to simplify and standardize your user authentication, you can extend this capability to communities.

[Configure Authentication Providers](#)

External users can log in using their credentials from Facebook[®], Janrain[®], or another Salesforce organization if you set up authentication providers on the Auth. Providers page in Setup and choose to display them on the community login page.

[Configure Authentication Flows with OAuth](#)

If your organization wants to build integrations between communities and custom-branded apps, such as mobile or desktop apps, you can use OAuth to create a branded login page.

SEE ALSO:

[Customize Login, Self-Registration, and Password Management for Your Community](#)

Configure SAML for Communities

If your organization uses an existing single sign-on capability to simplify and standardize your user authentication, you can extend this capability to communities.

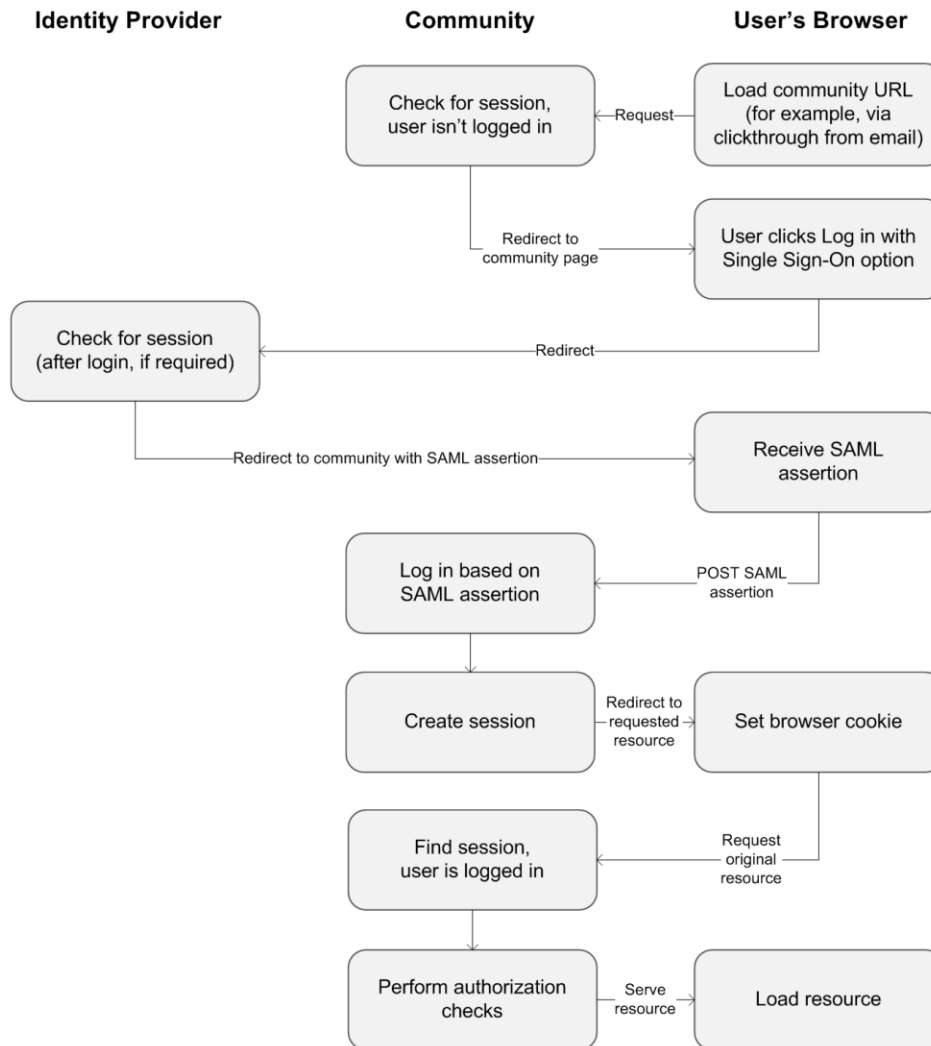

The following information assumes that you are already familiar with Security Assertion Markup Language (SAML) authentication protocols and know how to work with your identity provider to configure single sign-on for your organization. When implementing SAML for communities, the key is to use the community URL associated with login for the single sign-on flow. Also make sure that the community URL in the SAML assertion POST includes `/login`.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Here is a summary of how SAML requests and responses are processed between the user's browser, the community, and your identity provider.

This table compares what's required for community SAML assertions to what's required for other types of Salesforce domains.

Requirement	Standard	Portal	Force.com Sites	Community
URL where SAML assertion POST is made.	login.salesforce.com	login.salesforce.com	login.salesforce.com	<i>community URL</i>
Are <code>organization_id</code> and <code>portal_id</code> required in assertion?	No	Yes—passed as an attribute	Yes—passed as an attribute	No  Note: Required if using Just-in-Time provisioning to create portal users in the community. Community-specific portal users can be provisioned with <code>portal_id</code> excluded.

Requirement	Standard	Portal	Force.com Sites	Community
Is <code>siteUrl</code> required in assertion?	No	No	Yes—passed as an attribute	No

The following sample SAML assertion shows the community URL specified as the Recipient, for a sample customer community in the Acme organization. This example applies to an organization that has a single SAML configuration.

      </saml:AuthnContext>
    </saml:AuthnStatement>
  </saml:Assertion>
</samlp:Response>
```

```
</saml:Assertion>
</samlp:Response>
```

If your organization has multiple SAML configurations, the previous sample SAML assertion applies but note these differences in the Recipient.

- The trailing slash after `login` is not required
- The `so` parameter is required and must specify the organization ID

The Recipient would look like this:

```
Recipient="https://acme.force.com/customers/login?so=00DD000000JsCM"
```

When logging out of a community, external users authorized using SAML for single sign-on are redirected to the Identity Provider Logout URL, if one is set in the community's SAML settings. To access the SAML settings, from Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**.

SEE ALSO:

- [Example SAML Assertions](#)
- [Best Practices for Implementing Single Sign-On](#)
- [Single Sign-On with SAML on Force.com](#)

Configure Authentication Providers

External users can log in using their credentials from Facebook[®], Janrain[®], or another Salesforce organization if you set up authentication providers on the Auth. Providers page in Setup and choose to display them on the community login page.

 **Note:** The following information assumes that you are familiar with the use of authentication providers for single sign-on.

If you're using a custom Visualforce login page instead of the default login page, use the *Single Sign-On Initialization URL* from an Auth. Provider detail page as the target URL of a custom login button. For example:

```
https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?community=https://acme.force.com/support
```

If you're using Janrain as the authentication provider you can pass the following to the Janrain login widget that's deployed on your site.

```
janrain.settings.tokenUrl='https://login.salesforce.com/services/authcallback/orgID/URLsuffix'+
'?flowtype=sso&community='+encodeURIComponent('https://acme.force.com/customers');
```

SEE ALSO:

- [External Authentication Providers](#)
- [Use Request Parameters with Client Configuration URLs](#)
- [Customize Login, Self-Registration, and Password Management for Your Community](#)

Configure Authentication Flows with OAuth

If your organization wants to build integrations between communities and custom-branded apps, such as mobile or desktop apps, you can use OAuth to create a branded login page.

The following information assumes that you're familiar with OAuth protocols and authentication flows for remote access applications. Communities support all available authentication flows, except for the username-password OAuth authentication flow and the SAML assertion flow. When implementing branded OAuth flows for communities, you configure the authorize URL to use the community URL. The authentication flow then directs users to the application approval page.

 **Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.

For example, to authenticate a user using an authorize URL like the following:

```
https://login.salesforce.com/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri
```

Replace the `login.salesforce.com` host name with the full path to the community URL:

```
https://acme.force.com/customers/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri
```

When implemented successfully, this URL directs users to the community login page. After they authorize the app, you then set a user access token and refresh token for future authentication. In requests for the token endpoint, replace the host with the community, like this:

```
https://acme.force.com/customers/services/oauth2/token
```

 **Note:** After you acquire the `access_token`, you can pass it as a Bearer token in the Authorization header request. Following is an example of a REST API call to communities: `https://acme.force.com/customers/services/data/v32.0/-H "Authorization: Bearer 00D50000000IehZ\!AQcAQH0dMHZfz972SzmPKb58urFRkgeBGsxL_QJWwYmFAbUeeG7c1E6LYUfiDUkWe6H34r1AAwOR8B8fLEz6n04NPGRrQ0FM"`

[Digging Deeper into OAuth 2.0 on Force.com](#)

[Using OAuth to Authorize External Applications](#)

["Step Three: Connect to Chatter REST API Using OAuth" in the Chatter REST API Developer Guide](#)

Encrypt Community Data

You can add a measure of security to your community by encrypting files, attachments, and many popular data fields.

 **Note:** Beginning with Spring '17, Shield Platform Encryption no longer masks encrypted data. This may affect some users' ability to work with encrypted data. If you have data you don't want specific users to see, revisit their [field-level security settings](#) on page 542, record access settings, and [object permissions](#) on page 545.

Keep the following things in mind:

- You can encrypt data in communities, but not in portals.
- If you are using Classic Encryption, data in encrypted custom fields is still masked.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

- Your community's specific settings for personally identifiable information (PII) apply regardless of whether data is encrypted.
- Data encryption doesn't change anything about the community user experience. However, encrypting the Account Name field has an effect on how users' roles are displayed to admins. Normally, a community user's role name is displayed as a combination of their account name and the name of their user profile. When you encrypt the Account Name field, the account ID is displayed instead of the account name.

For example, when the Account Name field is not encrypted, a user belonging to the Acme account with the Customer User profile would have a role called `Acme Customer User`. When Account Name is encrypted, the role is displayed as something like `001D000000IRt53 Customer User`.

Plan Your Community Design Strategy

If you chose to use custom pages in your community instead of out-of-box tabs and branding, you need to [decide whether to use Community Builder or Force.com](#). Once you make the decision, use the following sections to help you customize community pages:

- [Use Community Builder with Templates](#)
- [Use Visualforce and Force.com Sites](#)

You can also customize these other areas of your community:

- [Add the Global Search Box to Your Customized Community HTML Header](#) on page 3402
- [Configure a Custom Domain for Your Community](#)
- [Rename the Chatter Tab](#)

[Choosing Between Community Builder and Force.com Sites](#)

[Use Community Builder with Templates](#)

Community Builder and community templates for self-service let you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company's branding.

[Use Community Builder \(Site.com\) Without Templates](#)

[Use Visualforce and Force.com Sites](#)

Each community has one associated Force.com site that lets you make advanced customizations to your community.

Choosing Between Community Builder and Force.com Sites

If you want to add new pages or customize existing pages in your community, you can use Force.com Sites or Community Builder. With either option, you can create branded, publicly available pages such as landing or marketing pages, and private custom pages that only community members can access.

So which option should you use to customize your community? Well, that depends on your skills and the needs of your organization. You can even use a mixture of Force.com pages and Community Builder pages for complete control over your customizations.

Community Builder

[Community Builder](#) is an intuitive, convenient tool for customizing your community. Community Builder lets you create a community based on a preconfigured template, and then apply branding, edit pages, update your template, and publish changes all from one user-friendly interface.

Here's what you can achieve with Community Builder:

- Use one of the self-service templates—Koa, Kokua, or Customer Service (Napili)—to easily create a responsive self-service community.
- Use the Aloha template to create a configurable App Launcher.
- Design pixel-perfect, branded pages.
- Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
- Build and iterate quickly using drag-and-drop reusable page elements.
- Use ready-made forms to create web-to-lead forms or gather customer feedback.
- Create data-driven pages, such as product catalogs or other listings, using your organization's data.
- Set a home page and set up multilingual support for your community in Site.com Studio, a Web content management system that provides extra configuration options. Site.com Studio is easily accessible from Community Management.

Force.com Sites

Suitable for developers with experience using Visualforce, Force.com Sites lets you build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you. Here's what you can achieve with Force.com:

- Create public, branded pages that anyone can access.
- Leverage Visualforce to create private pages that you can add as a tab within your community.
- Write your own controllers, or extensions to controllers, using Apex code.
- Create custom login or self-registration pages.
- Build dynamic web applications, such as an event management application.

Features At a Glance

Still unsure which product to choose? Take a look at this table to learn more about each product's features.

Feature	Lightning Communities	Tabs + Visualforce Communities
Public pages		
Community templates (Koa, Kokua, Customer Service (Napili), Aloha)*		
Authenticated pages*		
Visualforce pages		
Out-of-the-box login, logout, self-registration, and error pages		
Drag-and-drop environment		

Feature	Lightning Communities	Tabs + Visualforce Communities
Reusable components	✓	
Pixel-perfect designs	✓	✓
IP restrictions	✓	✓
Access to data, such as cases, leads, and opportunities	✓	✓
Ready-made forms	✓	
CMS	✓	
Programmatic page creation (using Apex, APIs, and controllers)		✓
Web applications		✓
Analytics, reports, and workflows		✓
Full Force.com platform capability		✓

*Available in Community Builder for Communities users only.

Use Community Builder with Templates

Community Builder and community templates for self-service let you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company's branding.

With Community Builder and templates, you can:

- [Quickly style the community](#) to match your company's branding.
- [Edit community pages and components with the Community Builder](#) and customize their design and content.
- [Preview your community](#) and ensure that it appears correctly on different devices.
- [Publish your changes](#) so you can make them available to everyone in your community.

You can use the Community Builder to customize communities created using these templates:

Kokua

A graphic-based community ideal for handling simple customer interactions. Community members can search for and view articles, and contact support. Requires Knowledge and supports cases.

Koa

A text-based community ideal for handling simple customer interactions. Community members can search for and view articles, and contact support. Requires Knowledge and supports cases.

Customer Service (Napili)

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, collaborate, and contact support agents by creating cases. Supports Knowledge, Chatter Questions, and cases.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication, including social logins.

To access Community Builder and continue customizing your community or update its template version:

1. From Setup, enter *All Communities* in the *Quick Find* box, then select **All Communities**.
2. Beside the community name, click **Build** or **Community Workspaces** > **Builder**.
3. In Community Builder, you can:
 - [Brand your community](#) on page 3579.
 - [Edit community pages and page components](#).

To learn more about using the Kokua, Koa, and Customer Service (Napili) templates, see the [Using Templates to Build Communities](#) guide.

SEE ALSO:

[Choosing Between Community Builder and Force.com Sites](#)

Use Community Builder (Site.com) Without Templates

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don't require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.

Before You Begin

Communities users with the "Create and Set Up Communities" permission automatically have full site administrator access to a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See [About Site.com User Roles](#) on page 5348.

Tips and Considerations

- Communities users with the "Create and Set Up Communities" permission are assigned the role of site administrator in a community's Site.com site. However, they don't appear in the User Roles section on the Overview tab of Site.com Studio.
- You can't create, delete, or duplicate community sites in Site.com.

- When working with data-bound components, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
- When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global Property` as the source, and select `Current userID` as the value.
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **AdministrationPages** and **AdministrationLogin & Registration**. Community error pages are specified in Force.com Setup, under Error Pages.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.
- The contributor's view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See *About Feature Licenses* in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending `?iscontrib` to the site's URL. For example:
`https://sitestudio.na1.force.com/?iscontrib`

[Use Site.com to Customize Your Community](#)

[Create Branded Pages Overview](#)

When you create a Community site, Salesforce automatically creates a new Site.com site and associates it with your community.

[Site.com Authorization Overview](#)

[Display Current Community User Information](#)

Site.com designers creating authenticated pages for a community site can display the current user's information by accessing `CurrentUser` namespace expressions.

[Expressions Available for Displaying Current User Information](#)

[Determine the URL of a Site.com Page](#)

[Add Authenticated Site.com Pages to Community Tabs](#)

After you create a private Site.com page, you can add the page to a tab in your community.

[Add Chatter News or Group Feeds to Community Site.com Pages](#)

Use the Chatter News Feed to display a Chatter feed on your site pages, or display the feeds of a particular group using the Chatter Group Feed.

[Improve Performance with HTML Page Caching for Communities in Site.com](#)

HTML caching lets you improve the performance and page rendering of your community's Site.com site by controlling how often the generated markup of the page is reloaded.

SEE ALSO:

[Choosing Between Community Builder and Force.com Sites](#)

[Use Site.com to Customize Your Community](#)

[Set Up and Manage Salesforce Communities](#)

Use Visualforce and Force.com Sites

Each community has one associated Force.com site that lets you make advanced customizations to your community.

For example, with Force.com Sites you can:

- Add public pages to your community that don't require login.
- Use branded self-registration and login pages to enable users to register for or log into your community.
- Customize out-of-the-box error pages to reflect the branding of your community, including "Authorization Required (401)" and "Page Not Found (404)" pages.
- Leverage Visualforce pages to create private pages that only community members can access.

For detailed information about using Force.com Sites, refer to the online help.

Tips and Considerations

- Force.com Sites pages automatically include the branding styles you specify in the Create Community wizard. To disable these styles, set the `standardStylesheets` attribute on the `<apex:page>` tag to `false`.
- Consider these limitations when using Force.com Sites with Communities:
 - Out-of-the-box RSS feeds, analytics tracking, and custom portal profile pages aren't available.
 - Custom change-password pages aren't available.
 - Login to custom domains is only available with HTTPS.
- Because Force.com sites are served directly from the Force.com organization, a site's availability is directly related to the organization's availability. During your organization's maintenance window for major releases, your sites will be unavailable; users who try to access a site will see a Force.com-branded maintenance page or your custom Service Not Available Page.
- You can redirect a community home page to its companion Site.com home page. To do this, set a URL Redirect on the Force.com site detail page. Set the Source URL to `/`, which represents the home page for the community, and set the Target URL to `s`, which represents the home page for the Site.com site.

SEE ALSO:

[Choosing Between Community Builder and Force.com Sites](#)

Override Default Pages in Your Community with Custom Pages

Use company-branded Community Home and Service Not Available pages by overriding the standard pages in your community.

- [Use a Custom Community Home Page](#)
- [Use a Custom Page for Service Unavailability](#)

You can override other default community pages in the Site.com or Force.com settings for your community. To do this, open Community Workspaces or Community Management. Next, under Administration, click **Pages** and then click **Go to Force.com** or **Go to Site.com Studio**. Page selections in Community Management or Community Workspaces automatically override any previously specified page selections in the Site.com or Force.com settings.

Use a Custom Page for Service Unavailability

On rare occasions, if your community is not available because of a service outage, Salesforce displays a generic Service Not Available page with Force.com branding. You can replace this page with a custom company-branded static resource page for a personalized user experience for your community members.

The Service Not Available static resource:

- Must be a public .zip file 1 MB or smaller.
- Must contain a page named `maintenance.html` at the root level of the .zip file. Other resources in the .zip file, such as images or CSS files, can follow any directory structure.
- Must contain only files that have file extensions.

For more information, refer to *Assigning Force.com Site Error Pages* in the Salesforce Help.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Navigate to **Administration > Pages**.
3. Click  next to **Service Not Available** to search for and select your custom page.
4. Click **Save**.

If there is a service outage at any time, your community displays your selected page. A couple things to keep in mind:

- This page selection doesn't affect communities that use Site.com Studio pages.
- The Service Not Available page, once customized, is available for all communities in the same domain. Depending on the needs of your organization, this might not be desirable. To avoid using the same page for all the communities in your domain, create and assign separate Service Not Available pages for each community.

For example, consider a scenario where you have two communities in your domain: a customer community (`universaltelco.force.com/customer`) and a partner community (`universaltelco.force.com/partner`). If you use a custom Service Not Available page for only the customer community, then the partner community will display the same page during a service outage, unless you create and assign a separate Service Not Available page to the partner community.

[Override Default Pages in Your Community with Custom Pages](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

Use a Custom Community Home Page

Personalize the standard community home page with company branding by using a custom Community Builder (Site.com Studio) or Visualforce page.

The community home page is shown to unauthenticated users in a public community and it allows you to specify a landing page for guest users without setting up redirects. This page is also known as your Active Site Home page.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration** > **Pages**.
3. For the Community Home page:
 - a. Select the page type: **Community Builder** or **Visualforce**.
 - b. Enter the name of the page or leave the field blank to get a list of available options.
 - c. Click , then click the name of the page in the search results to select it.
 **Note:** Only published Community Builder (Site.com Studio) pages are included in the search results.

4. Click **Save**.

Page selections in Administration automatically override any previously specified page selections in the Site.com or Force.com site properties.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community

Configure the Default Community Login Page to Use a Custom Home Page

If you're using external authentication providers and a custom home page, ensure that users are accessing the correct home page.

To do so, edit the `CommunitiesLandingController` so that it has the correct `startURL` for your community. The `CommunitiesLandingPage` is the Active Site Home Page for your community, meaning that it is shown when someone enters a direct URL to your community. For instance, if your domain is `universaltelco.force.com` and your community URL is `customers`, the `CommunitiesLandingPage` is shown when someone enters `http://universaltelco.force.com/customers`.

There are 2 methods for using a custom home page:

- Update the `CommunitiesLandingController` code to redirect to the new page:
 1. From Setup, enter `Apex Classes` in the Quick Find box, then select **Apex Classes**.
 2. Click **Edit** next to `CommunitiesLandingController`.
 3. Replace the code so that it reads:

```
public with sharing class CommunitiesLandingController {
    // Code we will invoke on page load.
    public PageReference forwardToStartPage() {
        String communityUrl = 'https://universaltelcom.force.com';
        String customHomePage = '/apex/hello';
        if (UserInfo.getUserType().equals('Guest')) {
            return new PageReference(communityUrl + '/login?startURL=' +
EncodingUtil.urlEncode(customHomePage, 'UTF-8'));
        }else {
            return Network.communitiesLanding();
        }
    }
    public CommunitiesLandingController() {}
}
```

4. Replace `https://universaltelcom.force.com` with the URL for your community.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Community Management or Community Workspaces:

- "Access Community Management" OR "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community

To customize administration settings:

- "Create and Set Up Communities"
- AND is a member of the community

To edit Apex classes:

- "Author Apex"

5. Click **Save**.

- Alternatively, you can replace the Active Site Home Page with a custom Visualforce page.

1. From Setup, enter *All Communities* in the *Quick Find* box, then select **All Communities**.

2. Click the **Manage** button next to the community name.

3. Click **Administration Pages > Go to Force.com**.

4. In the Site Detail section, click **Edit**.

5. In the *Active Site Home Page* field, select your custom Visualforce page.

6. Click **Save**.

When a user enters the community URL, they see the new Active Site Home Page.

SEE ALSO:

[Use a Custom Community Home Page](#)

Add Custom Pages That Don't Require Login

Within a community, you can have publicly available pages that are accessible without requiring login, making them ideal for landing or marketing pages.

Communities leverage Force.com Sites technology to set a custom domain for your organization and a URL prefix for each community created in your organization. If you want to further customize your communities beyond what's available in setup, you can use Force.com Sites or Site.com to create completely customized pages.

Tip: Communities can have a combination of Visualforce and Site.com pages. By default, the pages you create don't require login, but you can add authenticated pages if needed.

1. Open [Community Workspaces](#) or [Community Management](#).

2. Click **Administration > Pages** and then in the Advanced Customizations area, click either:

- **Go to Force.com** to create pages that don't require login or edit out-of-the-box error pages.
- **Go to Site.com Studio** to open Site.com Studio, where you can create public, branded pages. (You can also create authenticated pages that require login.)

3. After you create a public page in Site.com Studio, you must publish the Site.com site to allow users to access the page.

For more information about creating pages, refer to these resources:

- [Creating Site.com Pages](#) on page 5400
- [Managing Force.com Site Visualforce Pages](#) on page 5542
- [Managing Force.com Site Standard Pages](#) on page 5543

Which Community Template Should I Use?

Community templates let you build a community that gives customers the same visual and functional experience on tablets, mobile devices, or their desktops.

Your customers want an easy way to interact with your company whenever and wherever they are. A self-service community gives your customers an easy way access the information they need when they have questions. With communities built on the Koa and Kokua templates, customers can search for information using knowledge articles and contact support, if necessary. They can search for articles, ask questions, and get crowd-sourced answers from the community in communities built using the Customer Service (Napili) template. If they still can't find what they're looking for, they can contact support without having to log in. The self-service templates let you extend your community to various devices with a consistent user experience every time.

EDITIONS

Available in: **Salesforce Classic** and **Lightning Experience**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

A wizard guides you through selecting a template and then walks you through the initial setup, including topic and data category setup.

- Kokua is a visually rich self-service template that presents users with knowledge articles organized by data categories. Users can also submit cases to get help from agents.
- Koa is a text-based self-service template that's optimized for mobile devices. It lets users search for and view articles by text representations of data categories, and contact support if they can't find what they're looking for.
- Customer Service (Napili) template lets your customers post questions to the community and search for and view articles. If they don't find what they're looking for, they can contact a support agent.

Community Builder makes it super easy to customize your community. Simply edit a few components to include information about your community, add images to extend your branding, and you're ready to go—without any coding! Also, if you want a more custom experience, you can create custom pages, add components to pages, use custom Lightning components, and expose more Salesforce objects.

Communities are automatically displayed in a logged-in user's profile language, so you don't need to create and manage a separate community for each language. With Community Builder, you can extend the language support for guest users in communities. If a guest user's language isn't supported, they can choose one from a language picker on each community page. And because all languages are maintained within the community, you don't have to create and manage a separate community for each language.

Customer Service (Napili) Template—Community Setup Checklist

Building a community is the result of research, mapping of goals, and defining your audience. At the same time, you must have all your ducks in a row so the actual implementation process is seamless. You know your org best, but use this general checklist to help you organize what you need for a community using the Customer Service (Napili) template.

Have you considered everything on these lists?

Before you begin:

Gather your branding assets:

- High-resolution image of your company logo
- Color scheme (or an image to upload to automatically generate one)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Image to use as a header
- Thumbnail images (385x385 pixels), if you're using [Featured Topics](#)

In your internal Salesforce org:

- [Enable Salesforce Communities](#). Choose a unique URL that works for your business, because you can't change it after it's been set.
- [Set up email templates](#) for any communication between the community and its members (welcome email, resetting password email, and so on).
- [Enable the Global Header for Communities](#) for the system administrator profile and any other profiles that can access your community from the internal org.
- Enable any Service Cloud features you plan to use in the community, such as Salesforce Knowledge.
- Review [profiles](#) and add [permission sets](#) as needed.
- [Set up Web-to-Case](#).

If you're using Salesforce Knowledge:

- Review your [data categories](#).
- Enable [feed tracking](#) for your Knowledge article types.

As You're Making Your Community:

In your internal Salesforce org:

- [Add members to your community](#).

Configure the Guest User Profile (access using Community Management or the Community Builder):

- Give read and create permissions for the case object.
- If using Salesforce Knowledge, give guests access to your data categories.

In Community Management or Community Workspaces:

- [Set up navigational topics and subtopics](#), and associate articles to each topic.
- [Set up featured topics and associated images](#)
- [Download the latest Salesforce Communities Management](#) from the AppExchange.
- [Set up moderation criteria and rules](#).
- Enable and set up [reputation](#).

In Community Builder:

- [Customize your community to match your company's branding](#).
- [Add standard and custom Lightning components to customize their design and content](#).

After Making Your Community

- Set up an internal Chatter group for feedback, and invite people to take a test drive while the community is still in preview mode.
- Incorporate their feedback, and then [publish your community](#).
- Seed the community with some initial content: welcome posts, groups, and relevant or fun articles.

Which Components Can I Use with Each Template?

The Customer Service (Napili), Koa, Kokua, and Aloha templates are each composed of pages, which in turn are made up of customizable components. Consult this table to find out which templates each component can be used in, and when it became available.

 **Tip:** The Components panel in Community Builder lists all components that you can add to the page you're editing.

Communities that are based on Salesforce Tabs + Visualforce don't use Lightning components.

Article Content

The Article Content component lets users view and vote on an individual article after they've selected it from search results or browsing topics.

 **Note:** Before Spring '16, this component was named Single Article View.

The article's title, latest revision date, and article type appear with the body of the article. Users can follow navigation links to browse other topics.

 **Note:** When a user views an article that's been returned from a Web search, the navigation breadcrumbs show the path to the first topic associated with the article.

If you enable article voting for this component, authenticated users see a prompt to vote below each article. Users can give articles a thumbs up or thumbs down vote. If your organization uses star rating on articles, thumbs up votes are recorded as five stars and thumbs down votes are recorded as one star. Article voting is available in the Winter '16 version of community templates.

When a user votes on an article, a confirmation message appears next to their vote. The user can return to the article later to view their vote, but can't change it or see voting data from other community members. You can view an article's voting data at the top of the article in your organization.

1. Select the **Article Content** component in the page you're configuring.
2. In the property editor, configure properties for the component:

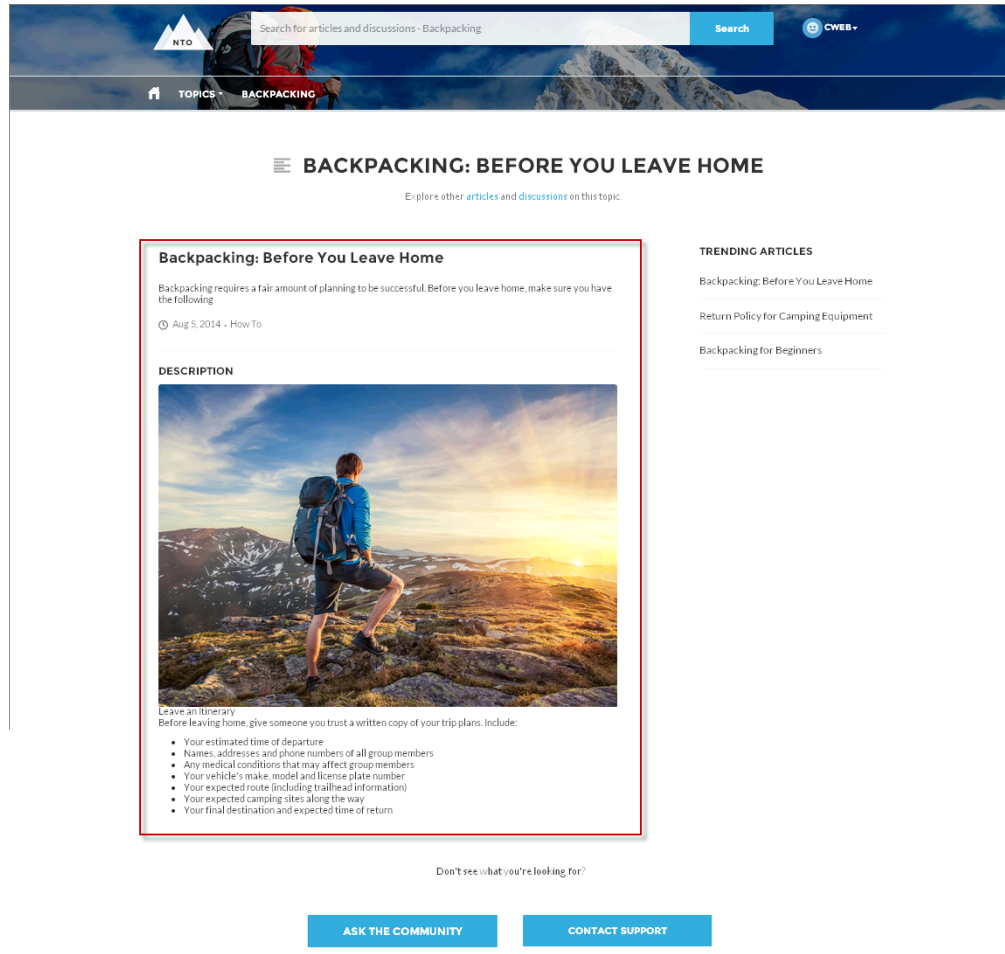

Property	Details
URL Name	This value is retrieved when the individual article is selected.
Enable Article Voting	Select this option, which by default is not selected, to let users vote on articles. This functionality is available only in the Winter '16 and later versions of community templates.
Voting Prompt Text	Enter the text that appears above the voting buttons. The default text is <code>was this article helpful?</code> This functionality is available only in the Winter '16 and later versions of community templates.

Property**Details**

Voting Confirmation Text

Enter the text that appears when a user votes on an article. The default text is `Thanks for voting`. This functionality is available only in the Winter '16 and later versions of community templates.

 **Example:** Sample Article Content component:

BACKPACKING: BEFORE YOU LEAVE HOME
Explore other [articles](#) and [discussions](#) on this topic.

Backpacking: Before You Leave Home
Backpacking requires a fair amount of planning to be successful. Before you leave home, make sure you have the following

Aug 5, 2014 · How To

DESCRIPTION

Leave an itinerary
Before leaving home, give someone you trust a written copy of your trip plans. Include:

- Your estimated time of departure
- Names, addresses and phone numbers of all group members
- Any medical conditions that may affect group members
- Your vehicle's make, model and license plate number
- Your expected route (including trailhead information)
- Your expected camping sites along the way
- Your final destination and expected time of return

Article List

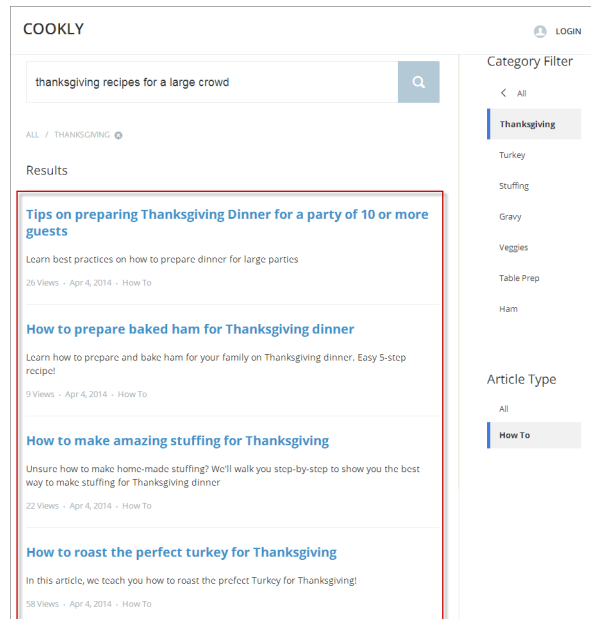

The Article List component lets users view articles that result from a search or from filtering without needing to leave the page.

The list includes the name and the type of article, its most current revision date, as well as how many views it's received. The list of articles can be filtered using the Article Type Filter component. The component also includes a breadcrumb component with navigation links, and a button that controls the appearance of the right menu for tablets and mobile display.

1. Select the **Article List** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Category Name	The top-level category that contains the subcategories for articles is automatically set using an expression that uses the top-level category you specified in the template's Custom Properties.
Page Size	Enter the number of articles per page of the list. The default is 25.
Article Type	Specify the type of article to appear in the list.
Search Term	Leave this field blank. It's the field in which users type their search queries.

 **Example:** Sample Article List component:

The screenshot shows a search results page on the COOKLY website. The search term is "thanksgiving recipes for a large crowd". The results are filtered by the "Thanksgiving" category and "How To" article type. The first three results are highlighted with a red box:

- Tips on preparing Thanksgiving Dinner for a party of 10 or more guests**
Learn best practices on how to prepare dinner for large parties
26 Views - Apr 4, 2014 - How To
- How to prepare baked ham for Thanksgiving dinner**
Learn how to prepare and bake ham for your family on Thanksgiving dinner. Easy 5-step recipe!
9 Views - Apr 4, 2014 - How To
- How to make amazing stuffing for Thanksgiving**
Unsure how to make home-made stuffing? We'll walk you step-by-step to show you the best way to make stuffing for Thanksgiving dinner
22 Views - Apr 4, 2014 - How To

The fourth result is:

- How to roast the perfect turkey for Thanksgiving**
In this article, we teach you how to roast the perfect Turkey for Thanksgiving!
58 Views - Apr 4, 2014 - How To

SEE ALSO:

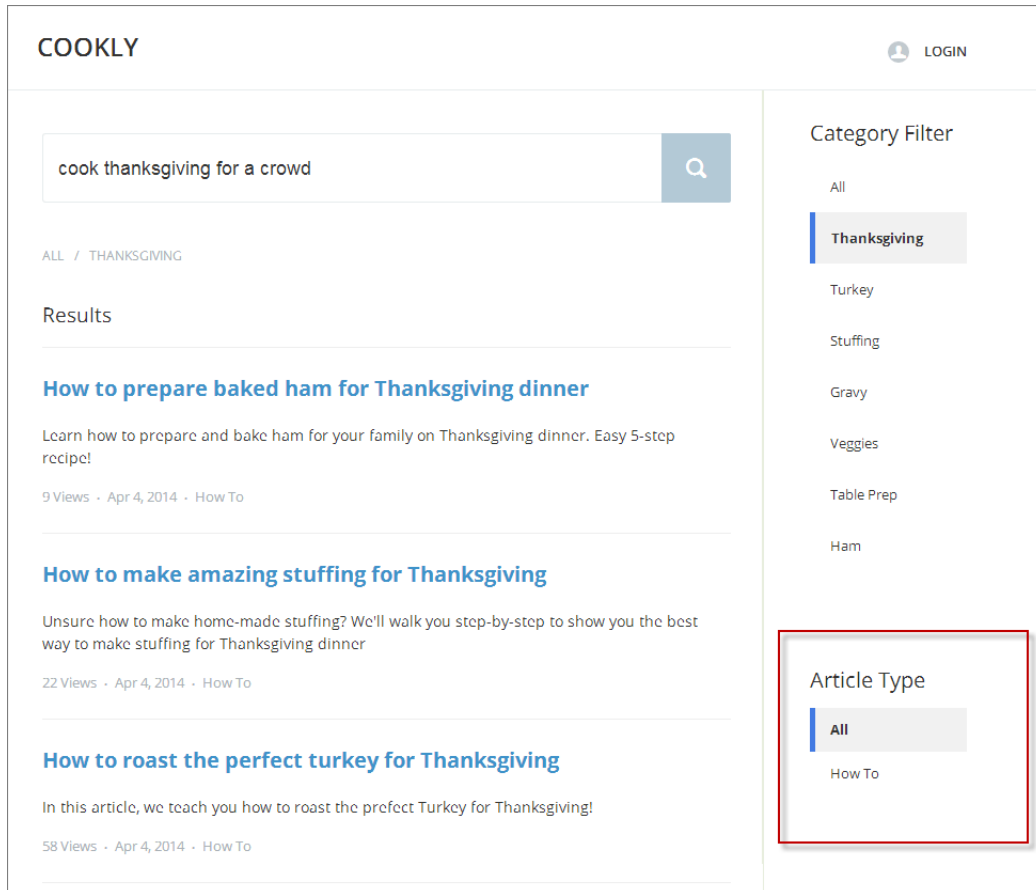

[Which Components Can I Use with Each Template?](#)

Article Type Filter

The Article Type Filter component lets users filter the article list based on the selected article type after they've viewed search results. An article's type determines the type of content it contains, its appearance, and which users can access it.

1. Select the **Article Type Filter** component in the page you're configuring.
There are no properties to set for this component.

 **Example:** Sample Article Type Filter:

The screenshot shows the COOKLY community interface. At the top left is the logo 'COOKLY' and at the top right is a 'LOGIN' button. Below the logo is a search bar containing the text 'cook thanksgiving for a crowd' and a search icon. Below the search bar, the breadcrumb 'ALL / THANKSGIVING' is visible. The main content area is titled 'Results' and displays three article cards:

- How to prepare baked ham for Thanksgiving dinner**: Learn how to prepare and bake ham for your family on Thanksgiving dinner. Easy 5-step recipe! 9 Views · Apr 4, 2014 · How To
- How to make amazing stuffing for Thanksgiving**: Unsure how to make home-made stuffing? We'll walk you step-by-step to show you the best way to make stuffing for Thanksgiving dinner. 22 Views · Apr 4, 2014 · How To
- How to roast the perfect turkey for Thanksgiving**: In this article, we teach you how to roast the perfect Turkey for Thanksgiving! 58 Views · Apr 4, 2014 · How To

On the right side, there are two filter panels:

- Category Filter**: A list of categories with 'Thanksgiving' selected. Other categories include All, Turkey, Stuffing, Gravy, Veggies, Table Prep, and Ham.
- Article Type**: A list of article types with 'All' selected. Another option is 'How To'.

Article View

The Article View component lets users view and vote on an individual article after they've selected it from search results.

The article's title, latest revision date, and article type appear with the body of the article. Users can click **Back** to return to the article list or follow navigation links to browse the parent categories.

 **Note:** When a user views an article that's been returned from a Web search, the navigation breadcrumbs show the path to the first category associated with the article.

If you enable article voting for this component, authenticated users see a prompt to vote below each article. Users can give articles a thumbs up or thumbs down vote. If your organization uses star rating on articles, thumbs up votes are recorded as five stars and thumbs down votes are recorded as one star. Article voting is available in the Winter '16 version of community templates.

When a user votes on an article, a confirmation message appears next to their vote. The user can return to the article later to view their vote, but can't change it or see voting data from other community members. You can view an article's voting data at the top of the article in your organization.

1. Select the **Article View** component in the page you're configuring.

2. In the property editor, configure properties for the component:

Property	Details
URL Name	This value is retrieved when the individual article is selected.
Enable Article Voting	Select this option to let users vote on articles. This option is not selected by default. This functionality is available only in the Winter '16 and later versions of community templates.
Voting Prompt Text	Enter the text that appears above the voting buttons. The default text is <code>Was this article helpful?</code> This functionality is available only in the Winter '16 and later versions of community templates.
Voting Confirmation Text	Enter the text that appears when a user votes on an article. The default text is <code>Thanks for voting.</code> This functionality is available only in the Winter '16 and later versions of community templates.

ALL / PANCAKES / BANANA

How to make Banana Berry Pancakes

Recipe by Martha White® "Banana-nut pancakes are topped with yogurt and sliced berries then folded in half for a special breakfast or brunch treat."

🕒 Apr 4, 2014 · How To

ADDITIONAL RESOURCES

Directions

1. Heat griddle or large skillet (if electric, heat to 350 degrees F). Spray lightly with no-stick cooking spray. Combine egg, milk, oil and muffin mix in medium bowl; stir until large lumps disappear (batter will be slightly lumpy).
2. Pour about 1/4 cup batter for each pancake onto hot griddle. Cook 1 to 2 minutes or until bubbles begin to break on surface. Turn, cook 1 to 2 minutes or until golden brown.
3. Spoon yogurt and berries on half of each pancake. Fold over. Sprinkle with powdered sugar, if desired.

[Which Components Can I Use with Each Template?](#)

Articles with This Topic

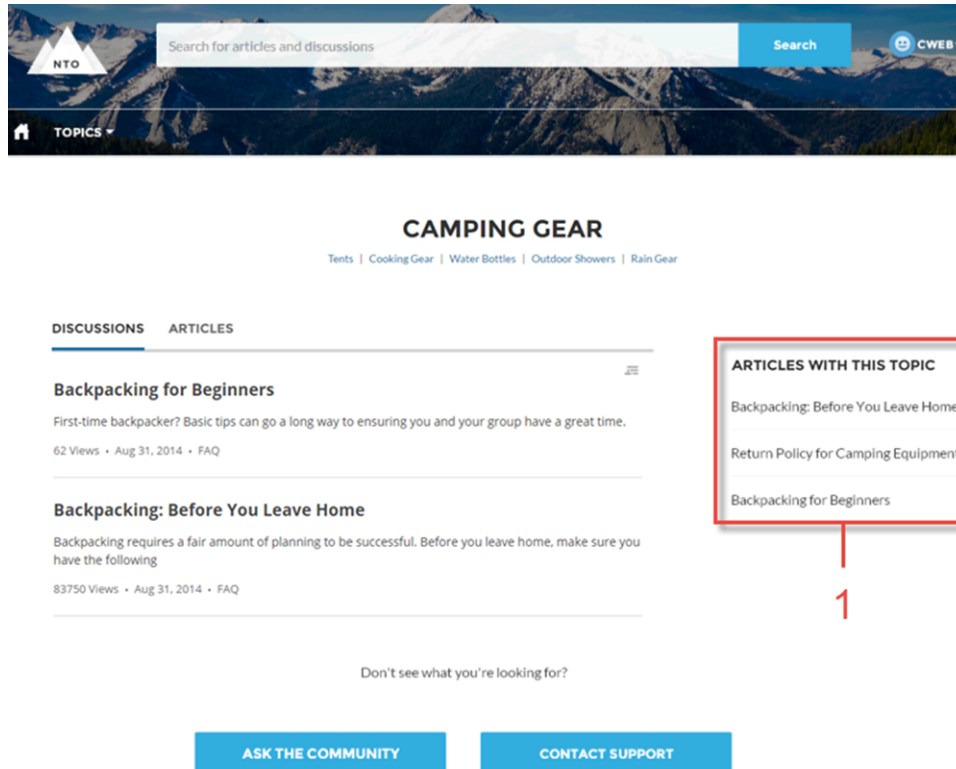

The Articles With This Topic component is used on the Topic Detail page in communities built using the Customer Service (Napili) template. It shows articles that have been tagged with the topic in question.

1. Select the **Articles With This Topic** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Topic ID	The system supplies this value, and populates the component with articles specific to the topic shown on the topic detail page.
Title	Enter text for the title. The default text is <code>Articles With This Topic</code> .
Show Title	Show the title by checking this box.

Property	Details
Number of Articles	Select the number of articles you'd like to show at a time. The default number is 10.

 **Example:** Sample Articles With This Topic component:

The screenshot shows a community page for 'CAMPING GEAR'. At the top, there is a search bar with the text 'Search for articles and discussions' and a 'Search' button. Below the search bar, there are navigation links for 'TOPICS' and 'CWEB'. The main content area is titled 'CAMPING GEAR' and includes sub-links for 'Tents', 'Cooking Gear', 'Water Bottles', 'Outdoor Showers', and 'Rain Gear'. There are two tabs: 'DISCUSSIONS' and 'ARTICLES'. Under the 'ARTICLES' tab, two articles are listed: 'Backpacking for Beginners' (62 Views, Aug 31, 2014) and 'Backpacking: Before You Leave Home' (83750 Views, Aug 31, 2014). To the right of the articles, a red box highlights the 'ARTICLES WITH THIS TOPIC' component, which lists three related articles: 'Backpacking: Before You Leave Home', 'Return Policy for Camping Equipment', and 'Backpacking for Beginners'. A red arrow points to the number '1' below the box.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Ask Button

The Ask Button component lets users click a button and ask a question that is published to the community. Guest users must log in to ask questions and participate in discussions.

 **Note:** Before Spring '16, this component was named Ask the Community.

The Customer Service (Napili) template pages come with two Ask Button components: one at the top of the page, and one at the bottom. The two aren't linked, so you can also remove one button or use different text for each button.

1. Select the **Ask Button** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Button Label	Enter the text you'd like to display on the button that users can click to ask a question. The default text is <code>Ask a Question</code> .

 **Example:** Sample Ask Button component:

SEE ALSO:

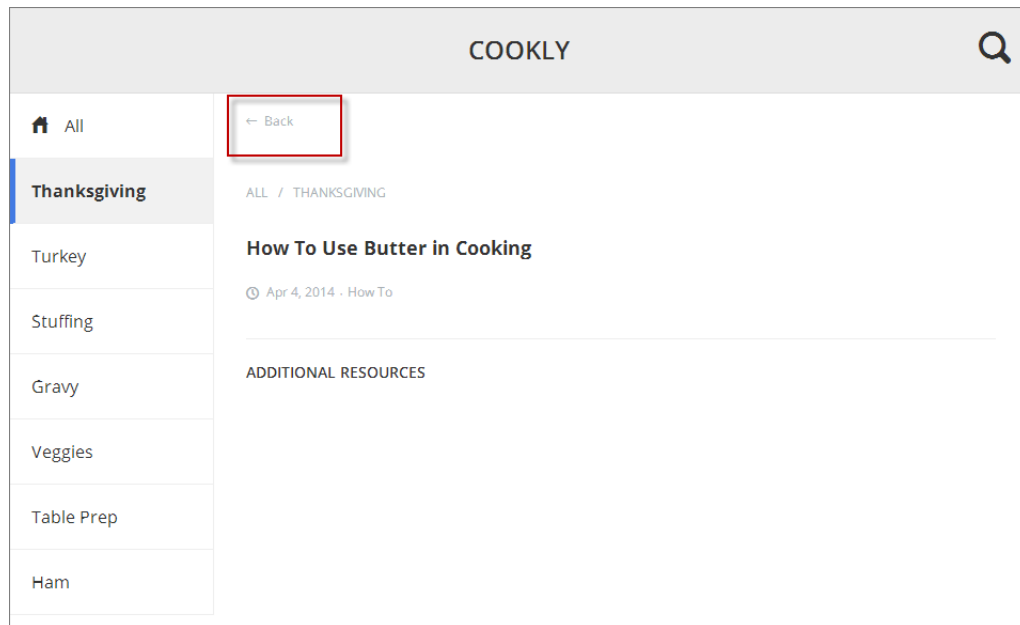

[Which Components Can I Use with Each Template?](#)

Back Button

The Back Button component displays a button that lets users navigate to the previous context.

1. Select the **Back Button** component in the page you're configuring.
There are no properties to set for this component.

 **Example:** Sample Back Button component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Breadcrumb

Use the Breadcrumb component in the Customer Service (Napili) template on topic, article, or feed detail pages to let your customers easily navigate back to parent or grandparent topics.

1. Select the **Breadcrumb** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Unique Name or ID	Use <code>{!topicID}</code> on topic pages, <code>{!feedItemID}</code> on question or feed item pages, and <code>{!urlName}</code> on article pages.
